16,973. You will agree that a very abstemious man is liable to lead poisoning, but you implied that the majority take alcohol to excess, which is a very different thing?—No I did not.

16,974. That is how I understood it?—I do not think in the transcript of my evidence you will find that I have used the expression "majority," or have even indicated that, because the majority of painters are not poisoned, and it would be necessary for such a condition to obtain before you could impute to me that I had used an expression that would imply what you suggest.

16,975. You would agree that a painter who is a total abstainer or very abstemious is quite liable to take lead poisoning?—I quite agree.

16,976. You agree that the man who takes alcohol to excess is more liable?—Exactly, and I think that I have fairly clearly indicated that I am neither the excess man nor the other.

16,977. Now with regard to enforcing regulations, you seemed rather to take the view that the workman would be the man who would be inclined to evade the regulations rather than the employer?—I am afraid that you have misunderstood my evidence. I hope I never said such a thing.

16,978. You did not say so, but I gathered that you suggested it?—No, I did not suggest that. I have suggested regulations, and I would not suggest them if I thought they were useless.

16,979. You would force the employer to see them carried out?—Yes.

16,980. And provide proper washing accommodation?—Yes. I think you will find that I have mentioned washing accommodation particularly.

16,981. (Mr. Rice.) With regard to washing apparatus, do you think that it would be necessary to use hot water for washing purposes?—If he could get hot water all the better, but if not, it does not matter if he will use pumice soap.

16,982. The point is, is hot water necessary?—No, it is not necessary if pumice soap is used. I have used it and I have tried a great many of such soaps.

16,983. (Mr. Sutherland.) Soap mixed with pumice?—Yes. You can buy it. It gets a grip on the hand. I have had a number of samples sent to me and I have tried them on my own hands.

16,984. (Mr. Gardner.) In answering Mr. Sutherland you said that outside conditions tended to lead poisoning, but you did not say what these outside conditions were?—Did I use the expression "outside conditions"?

16,985. Yes?—If I did use the expression "outside conditions," by outside conditions I mean the home conditions.

16,986. In what respect would the home conditions tend to lead poisoning?—Because it has been generally observed that bad home conditions mean a badly nourished condition of the body.

16,987. (Sir Godfrey Baring.) Decreased vitality?—Decreased vitality, and, therefore, decreased resistance.

16,988. (Mr. Gardner.) Bad conditions such as overcrowding and insufficient food?—Any single factor that will have the effect of reducing a man's resistance is dangerous.

16,989. Then in that case you could not have good home conditions without having good wages?—I quite agree. Lead painters should be paid good wages. People who are in the habit of handling dangerous materials should have good wages.

16,990. We are told that in Scotland the rate of lead poisoning is less than it is in England. Would the fact that wages, generally speaking, are higher in Scotland, and that no red lead is employed, not have an effect on the statistics?—I put it down to porridge.

16,991. Do you think that what I put to you has that effect?—It would assist, and I should also put it down to porridge. It may seem rather a blunt statement, but a stomach full of food is an excellent antidote

22 February 1912.]

Mr. CARL ADOLPHE KLEIN.

[Continued.]

to lead poisoning. The giving of milk in white lead factories has been an incalculable help.

16,992. May I point out that not 75 per cent. of the painters in Scotland get porridge for breakfast. Are you aware that a man who is carrying his food to his work, as at least 75 to 80 per cent. of painters do in the summer time, has no facilities for getting porridge. The men take a can of tea and carry food with them?—The expression "porridge" is rather intended to indicate to you the type of food.

16,993. But it cannot be had?—"The type of food" I said.

16,994. (Mr. Mason.) Is there anything in the course of your experience which would suggest a reason for a case of lead poisoning in a man employed solely in varnishing, and that in a room apart from where lead is used?—No. I am afraid the description is far too general. I should have to see the room and know something about his materials.

The witness withdrew.

Professor E. C. C. BALY, F.R.S., recalled and examined.

16,998. (Lord Henry Bentinck.) In your previous evidence to the Committee you gave an account of your observations regarding the absorption of light by emanations from paste paints made up of white lead and zinc white?—That is so.

16,999. Will you please re-state shortly the result which you found in the previous experiments?—Putting it very briefly, the stiff pastes, such as one obtains from the dealers, were put into a tube, which was closed at each end with a transparent window, and then a beam of light was passed through and examined spectroscopically afterwards to determine whether any absorption of the light took place. Then these tubes were gently heated to various known temperatures, and a record was obtained in that way of the amount of absorption which is exerted by any possible emanation at the various temperatures. It was found at that time that white lead, a basic carbonate material, gave emanations (using the word without specifying anything whatsoever at the moment) which absorb light very strongly at temperatures considerably below those at which the zinc white and the basic sulphates of lead did. These did not give any emanations until one reached a sufficiently high temperature for the linseed oil itself to volatilise off and come to a state of vapour.

17,000. What was the broad conclusion you deduced from this?—The conclusion I arrived at was that there was some volatile produce or material given off by the white-lead paint not given off by the other two substances.

17,001. You stated that the emanations from white lead were poisonous?—Yes, I did, because I suffered several times somewhat severely myself from what is known as painter's colic.

17,002. And that definite evidence had been obtained that these emanations contain volatile compounds of lead?—I cannot go so far as to say that. That is why I confess I was wrong. I was rather misled by the doctors telling me that I had had lead poisoning.

17,003. Have you pursued that investigation further?—Yes, I have taken it very much further in two stages.

17,004. What results did you obtain?—In the first place, as I think I told the Committee at the time, it was necessary to prove whether that volatile and poisonous material really did contain lead or not. Although when I appeared before the Committee I was strongly under the impression that it contained lead, yet by steadily improving the technique of the method, I found that the amount of lead obtained was less and less, until finally I did not get any evidence of lead at all. But at the same time the substance remained just as poisonous.

17,005. Did you condense the emanations?—Yes, with liquid air.

17,006. You found that they were poisonous?—Yes.

16,995. Would you consider that varnish was a dangerous thing?—It depends so largely on the varnish. There are so many varnishes that I could not answer.

16,996. Would you indicate the type of varnish which you consider dangerous?—I should say generally that they are all much about the same, and that there ought to be little or no danger in the application; but I am a chemist and I have not had much practical experience of varnish, so I do not presume to be able to discuss it.

16,997. (Mr. Sutherland.) In Scotland the workmen have an hour for their breakfasts; in England they have half an hour, and I, personally, attach a very great deal of importance to that. When they are working in towns, near their homes, they can go home in that hour and get breakfast. When they are working at a job not near their homes they have the hour for food and Mr. Parsonage agrees with me that it is a very important point?—Yes.

17,007. Did you find any definite evidence that the condensed emanations contained lead?—No.

17,008. Did you make comparative experiments with lead sulphate and zinc white?—Yes.

17,009. What results did you obtain in these cases?—I got no emanations condensed in the case of the two latter, or practically none. Perhaps I should say that.

17,010. Did you then think it possible that the poisonous element in the emanations of white lead might be due to an oxidised product of linseed oil?—That is my present opinion.

17,011. Did you make an experiment to test this?—Yes, quite recently, in the last three weeks, I have made a series of experiments, and I have not the slightest doubt in my own mind that there is a definite poisonous compound given off, not only as given off from the original stiff material, but which is somewhat increased, in fact very considerably increased, by the addition of linseed oil, so as to bring the paint nearer to the ordinary conditions of use.

17,012. Do you also think emanations might be due to the fact that white lead is a hydrated carbonate?—I should like to explain to the Committee that my original idea was that the hydrated condition that ordinary white lead exists in, was really the origin of the trouble, and in order to test that point I investigated what you might describe as a paint made up with pure hydrated lead oxide, and then I found that the amount of this emanation was very considerably increased. I think that my conclusion is a fair one. The basic sulphate of lead, which is not a hydrated compound, gives exceedingly little, if any, emanation, while the hydrated carbonate gives a very considerable amount, and the hydrated oxide gives a very large amount indeed of the emanation.

17,013. Do these experiments lead inevitably to the conclusion that there is no lead in the emanations?—Yes, I think I can say that, certainly.

17,014. To what then do these emanations owe their poisonous character?—If I may speak in chemical language for a moment, it is due to the presence of what we call unsaturated aldehydes.

17,015. Will you please explain that to the Committee?—I will endeavour to do so. When a compound of linseed oil and various compounds of that type are oxidised, one of the first products one can get is what we call aldehydes. These aldehydes are undoubtedly poisonous substances, and I think there is no doubt that any scientific person would agree with me that if they are what we call "unsaturated" they are still more poisonous. Linseed oil is what we technically call an unsaturated compound. It would make the matter clearer to the Committee if I took another example perhaps. It is well known, I think, that raw whisky when first distilled has poisonous compounds in it, and it has been proved pretty conclusively that the poisonous action is not due to what

22 February 1912.]

Professor E. C. O. BALY, F.R.S.

[Continued.]

is known as fusel oil, but to the presence of the aldehydes, which come from the original grain.

17,016. Have you made comparative experiments with other compound substances?—Yes, I have, with practically only one other substance, namely, manganese dioxide, which I took because it is a recognised oxidising material, and exactly the same thing happened there. These aldehydic compounds were given off, and they were equally poisonous.

17,017. Have you made any tests with turpentine?—Yes. Do you mean turpentine alone or paint mixed with turpentine?

17,018. Mixed?—Yes, I have. I found that if anything it was a little more increased.

17,019. Do I understand that your present conclusion is that the poisonous emanations are due to oxidation in the presence of water?—Yes.

17,020. Can you tell us whether the emanations would be increased by the presence of turpentine?—I have practically answered that. You will understand what I mean, Dr. Collis?

17,021-2. (Dr. Collis.) Yes?—I would like to say that since I sent in the précis of my evidence I carried out one or two experiments yesterday under ordinary proper conditions, that is to say, I made paints of these various materials, and mixed them with linseed oil and turpentine, exactly as an ordinary painter would use them. I put each one inside a tube, and passed a slow current of air over. I examined the air which came off by the test I was using, and I found perfectly clear and undoubted evidence that poisonous emanations were given off, that is to say, the aldehydes, and as regards the relative amounts, by far the greatest amount was given off by hydrated oxide of lead, and the least amount by the basic sulphate of lead and by zinc white, and any other material we liked to use, such as sand, or anything of the sort, to make a surface. From white lead there was a very decided amount of aldehyde given off. In fact I have got now so that I can always smell it perfectly easily, and detect it in that way.

17,023. (Mr. Sutherland.) Is not manganese dioxide what they use as drier?—No, they do not really use that substance, but they use a compound of manganese for the driers.

17,024. Do you think that a humid climate is more hurtful than a dry one in the use of paint?—I should say that would be a natural conclusion, but I could not answer definitely. I am certainly of the opinion that any water present in the paint is bad.

17,025. Are we to take it that whisky contains unsaturated aldehyde?—Freshly prepared whisky contains aldehyde.

17,026. That accounts for much?—It accounts for very much of the headache experienced, and the workmen themselves who are dealing with the stills suffer.

17,027. Your further experiment really disposes of your first evidence?—Yes, as regards volatile lead, but nothing more than that. I was wrong, I confess, but I was misled somewhat by the doctors, and somewhat by my own tests.

17,028. (Mr. Mason.) Am I to understand now that the aldehyde is what gives the painter lead poisoning?—Oh, no. I have consulted doctors on the matter, and they divide what used to be known as lead poisoning into two classes. There is the real lead poisoning which you get by handling lead pipes and lead paint, when you actually absorb compounds of lead and that, I imagine results in the blue line on the gums, and that sort of thing. But painter's colic, which I have suffered from now half a dozen times, is not due, I think, to lead poisoning. I do not know whether Dr. Collis agrees.

17,029. (Dr. Collis.) No?—Then how is it that one gets it?

17,030. A painter who is never exposed to any aldehyde at all in other lead trades gets colic all right?—I got what the doctor said was a pure and specific case of painter's colic. There is no volatile lead in the aldehydes at all.

17,031. Aldehyde may produce similar symptoms, and that is the interesting point?—That is what I

feel. Of course, you have to go very carefully when you are up against doctors, but there are certain symptoms which one can get which somewhat resemble painter's colic.

17,032. (Mr. Mason.) If you got rid of the aldehydes, what proportion of lead poisoning would disappear?—I could not answer that; I do not know.

17,033. Do I understand that the aldehydes were only obtained from carbonate of lead?—I thought that I had made it fairly clear that you get very very small amounts from any material whatsoever, but the white lead gives a very distinct amount—very much larger!

17,034. And this is due to the presence of linseed oil?—Yes.

17,035. If we used some other kind of oil should we get rid of the aldehydes?—That is a difficult question to answer straight off, because I do not know. If you were to use a fatty oil, what we really call a fat, as linseed oil is, you would probably always get it, but if you started using mineral oil I do not suppose you would. But could you use mineral oil in practice?

17,036. Take tung oil and Chinese wood oil?—That is fat.

17,037. You do not consider, then, that there is any drying oil which would not produce these aldehydes?—I am not an oil expert, but I think that it would be exceedingly difficult to get rid of these compounds. I think the simplest answer is that the painter should be advised not to use driers, and to use as little white lead as possible in painting.

17,038. (Mr. Sutherland.) Under what circumstances?—What was the question? The question suggested to me how we could get rid of the difficulty of these aldehydes coming off?

17,039. (Mr. Mason.) Still using white lead?—I think that you would decrease the amount very considerably by using no driers. There is not the slightest doubt that you would get less without the driers, but you would still have it there.

17,040. Is it possible to use white lead and still get rid of this danger?—I should say no, but to properly answer the question is really rather difficult, because it is a question of relative amount. All I am prepared to say to the Committee is that white lead when mixed with linseed oil gives a distinct, and one might say a large amount, of these aldehydes, even without the presence of driers, but when you say, could you get rid of the danger altogether, still using white lead, I would say in the first place, no, you could not, because even when you use a substance, such as very finely divided sand or anything of the sort, you still get it in very small amounts.

17,041. Could you ever get it down to the same proportion as with zinc?—No.

17,042. (Mr. Sutherland.) Mr. Parsonage has raised the question whether that emanation of aldehyde would give the nausea and sickness that ensues very often when people are working in a room or using a room that is newly painted?—I think so. I think that those are the very symptoms that you would expect. I have had a sample of one of these very high aldehydes (when I say "high" I mean complicated) given to me by one of the professors in order to see whether it resembled in its character these emanations which I have been dealing with. In the first place its smell is singularly like that which you get with white lead, and, secondly, it makes one feel uncommonly bad after smelling it.

17,043. Should we have to revise our vocabulary as to poisoning from paint?—I think so. I think that there is a certain amount of poisoning which arises from these aldehydes without any connection with lead as lead.

(Mr. Sutherland.) That is my point.

17,044. (Mr. Parsonage.) Sir Thomas Oliver, in a lecture which I have read, spoke of a person being put in a newly-painted room and getting lead poisoning. Now the suggestion is that that should not be termed white-lead poisoning at all, but some other name?—I have heard of that lecture by Dr. Oliver before. Do you know what the symptoms were in the case that he was dealing with?

22 February 1912.]

Professor E. C. Baly, F.R.S.

[Continued.]

17,045. I do not know the symptoms, but he described it as lead poisoning?—Perhaps Dr. Collis will help me. It has been quoted to me over and over again.

17,046. (Dr. Collis.) He does not describe the case. He does not give us the symptomology of the case.

(Mr. Parsonage.) I know that painters when they are not doing rubbing down, but painting, are ill, and go to the doctor, and the doctor says they are suffering from lead poisoning, and they get compensation for it, too. The doctors on both sides accept it. This is a new theory altogether. I have one particular case in my mind at the present time, of a man who was a very abstemious man, indeed; in fact he was practically a teetotaler. He was foreman in charge, and he simply walked about the works. He was a particularly clean man, but he died from lead poisoning. He never did any work himself for years.

17,047. (Dr. Collis.) The suggestion is clearly that these aldehydes have a similar effect to what alcohol has?—I would like to say that the ordinary person, not a painter, in freshly painted rooms may get another symptom of poisoning arising, which has been mixed up with lead poisoning.

17,048. That in fact you can get poisoned by aldehyde in the same way as you can with alcohol?—Yes.

17,049. (Mr. Parsonage.) Take a room which has been freshly painted with ordinary white-lead paint mixed with oil and turpentine and driers. Suppose you took zinc white, oil, and turpentine, mixed in the same way. A person would not get ill from that in the same way as from ordinary lead paint, even if he was in the room for some hours?—That I am not so sure about. Some people would be more susceptible than others. A very susceptible person put into a freshly painted zinc white room would get affected. I have heard of cases.

17,050. But not in the same way as in the other case?—Yes. It is a very very small amount that comes off zinc white paint; I would not say none, because there is evidence of a very very small amount.

17,051. But the lead is a danger?—I think that the lead is a very considerable danger. White lead and driers themselves are inadvisable, because they both of them bring the question of poisoning really into practical politics. When a chemist is studying these things his tests are exceedingly delicate. I am able to say that you get a vanishingly small quantity, but I cannot say that there is none in the case of zinc white.

17,052. The base of the evil action is the white lead?—I think it is.

17,053. (Mr. Sutherland.) I think that your evidence very seriously modifies the position which we have had put before us up to now, because it introduces a further element that we have never before regarded as a danger, except when Dr. Goadby was before us. You have the

danger from white lead. You have the danger from white lead plus aldehydes?—Yes.

17,054. And the danger from ordinary zinc paints? I think that it is infinitesimal, but I cannot say that there is none.

17,055. But your evidence is very definite that a large amount of nausea and cases of sickness that arise and have been ascribed to lead poisoning would not come under that description except in an indirect way. The effect is due to aldehydes given off by the paint, you think?—I am rather of that opinion certainly.

17,056. (Mr. Mason.) How much aldehyde is given off in the case of zinc white?—I have no quantitative evidence at all.

17,057. Where does it come in the scale? You put white lead at the top and the sand at the bottom?—You have at the bottom sand and linseed oil only. Up at the top you have white lead.

17,058. Call that 100?—I would say 10 for zinc white—something of that sort. I hesitate to pin myself down. My impression is 10 for zinc white and basic sulphate of lead and other materials of that type, without any water in the compound at all. Then white lead about 100, and a very hydrated compound like oxide of lead somewhere about 250.

17,059. (Mr. Fell.) Do you get aldehydes given off with turps and oil?—Linseed oil alone with turps in the experiment I have described gives an exceedingly small amount; a slightly larger amount with zinc white, and the hydrated sulphate a very much larger amount indeed with the basic carbonate.

17,060. (Mr. Sutherland.) Would the litharge that is used in the boiling of varnishes be a contributory cause to the giving off of aldehyde?—I think so, certainly. I think that boiled oil will be a still further danger, because there is unmistakably a very large chemical change in the oil when it is being boiled, and you are aware that a very unpleasant material is given off, and the workmen suffer very considerably.

17,061. An unpleasant smell?—I had a large quantity of the material sent to me—the condensed fumes, and those fumes contained no lead whatsoever, but they were most unpleasant. Those fumes convinced me that there was nothing in my idea of lead. What I say is, that boiling oil with lead oxide, litharge, is a bad thing, because if you use that oil in practice you have half the process done already, namely, the hydrolysis of the oil.

17,062. (Mr. Mason.) A witness, Professor Armstrong, gave us experiments conducted with aucuba leaves exposed to the fumes of various compounds. These aucuba leaves were turned black by certain compounds and not by others. Would the aldehydes be the agent that turned them black?—I could not say; I do not know what the aucuba leaf contains or gives off.

17,063. (Dr. Collis.) It is the Japanese aucuba, the variegated laurel?—I could not answer that question.

The witness withdrew.

Mr. HEDLEY MILLER.

Evidence to 17,084 handed in and taken as read; witness then called and examined.

17,064. I am an official of the London Chamber of Commerce, which has been specially requested to collect certain statistics and to present them on behalf of the members of the chamber directly or indirectly interested in the various industries affected by the inquiry.

17,065. The manufacture of white lead is a British industry, and has been carried on for centuries. 58,000 tons were manufactured in this country in 1910, as against 14,500 tons imported from abroad. About 15,000 tons of white lead are exported, of which I estimate that 7,500 tons are of British manufacture. Over 85 per cent. of the white lead manufactured in this country is therefore consumed in the United Kingdom.

17,066. The British white lead manufacturers employed, in 1910, 2,489 men (having some 8,100 persons dependent upon them), and paid 158,300*l.* in

wages; they have expended more than 80,000*l.* on structural and other alterations required by the factory inspectors during the last twelve or fifteen years, in pursuance of the special regulations for white lead corroding works and other factory regulations (which regulations have much reduced lead poisoning in white-lead works). A capital of at least 23,000*l.* (taking lead at 15*l.* the ton, the average of the last five years) is required for an annual output of 1,000 tons of white lead. The total capital which is employed at the present time may therefore be put at 1,334,000*l.* as a minimum figure.

17,067. The closing down of the British white-lead works would leave other industries entirely dependent upon the foreigner for one of their raw materials. Potters, colour and wallpaper manufacturers may be mentioned in this connection.

22 February 1912.]

Mr. HEDLEY MILLER.

[Continued.]

17,068. The white-lead manufacturers annually expend—

|                  |   |   |   |   |                 |
|------------------|---|---|---|---|-----------------|
| 8,980 <i>l.</i>  | - | - | - | - | On pots,        |
| 9,850 <i>l.</i>  | - | - | - | - | On timber,      |
| 13,680 <i>l.</i> | - | - | - | - | On tin,         |
| 15,890 <i>l.</i> | - | - | - | - | On acetic acid, |

the producers of which, if the demand ceased, would be affected.

17,069. In addition, the white-lead manufacturers expended 864,660*l.* in 1910 on pig-lead. The total annual consumption of pig-lead in this country amounts to 200,000 tons. If the demand for white lead ceased, that consumption would be reduced by 25 per cent. This would be proportionately increased by any restriction in the use of red lead and lead colours also. Such a reduction could not fail to have a disastrous effect on the lead market, upon smelters and refiners, and upon lead mining, not only in the United Kingdom, but also in other parts of the British Empire and in foreign countries.

17,070. I have communicated with the leading representatives of lead mining in every district in the United Kingdom where that industry is carried on, and all express the gravest fears as to the effect upon British lead mining of the very large reduction in the demand for pig-lead which would be caused by wholesale restriction of the use of lead in pigments. It is not too much to say that probably only the largest mines could remain open. Returns have been obtained from mines producing (in 1909) 24,547 tons of lead ore out of the total production for that year of 29,744 tons. On the basis of those returns it is seen that, for the total 1910 production (25,534) the number of workmen employed was 2,687 having 6,945 dependents upon them, and earning 151,308*l.* annually in wages.

17,071. I have collected the following figures (for 1910) from the British smelting and refining firms:—

|  |                  |
|--|------------------|
| Total output from native ores              | 16,444 tons,     |
| Total output from imported and silver ores | 87,480 "         |
| Total workmen employed                     | 780              |
| Total dependents                           | 2,439            |
| Total wages                                | 72,970 <i>l.</i> |

17,072. I estimate that the capital required to smelt 1,000 tons per annum would be 6,600*l.*

17,073. Five firms treat native ores alone, and these would be affected to the same extent as the English mines, *i.e.*, would shut down if the mines were closed. Four out of the five are directly connected with the mines. The remaining works, those, namely, which handle imported silver lead, would presumably be affected to the extent of 25 per cent. of their output. Any prohibition of the use of lead in paints would consequently disastrously affect smelting and refining in the United Kingdom; would mean, at best, a 25 per cent. reduction in the output, number of workers employed, total wages paid, &c.

17,074. There is no substance in any way comparable with pure red lead for the special purposes for which it is used. The manufacture of red lead and litharge in this country is by no means unimportant. In 1910 the output amounted to 11,800 tons. I estimate that the capital required to produce 1,000 tons annually is 12,000*l.* and the total capital involved in the industry is not less, therefore, than 150,000*l.* Any interference with this industry would, as in the case of white lead, proportionately affect the lead trade and lead mining.

17,075. The possibility of eradicating lead poisoning from the occupation of the house-painter by abolishing, or very largely restricting, the use of white lead depends first and foremost upon the existence of a substitute comparable with it as a paint base. Alternative lead compounds, being open to the same objection as white lead, cannot be considered. It is suggested that the substitute is to be found in zinc oxide. It is abundantly clear that no other pigment can be seriously considered in this connection; it is common ground that lithopone is very far from the required standard. Patents for the manufacture of white-lead substitutes to the number of over 200 have

been taken out during the last 60 or 70 years, covering a wide range (barium, zinc, lead, strontium, manganese, calcium, antimony, magnesium, sodium, sand, china-clay, limestone, stearite, alumina, potassium, gypsum, &c.). Apart from lead compounds and one or two zinc compounds none of these appear to have any real commercial value at the present day.

17,076. Zinc oxide is by no means a new or unknown pigment. It has been commercially known under the name of zinc white for over 50 years in this country. An English firm has used it for the last 50 years. Patents on the subject of "zinc white" as a pigment have been numerous in England, and date back from the year 1786, the term "zinc white" being employed in patent specifications in the '50's. The words "the undercoats may be zinc white or white lead" occur in a specification dated 1862. In France, a powerful commercial organisation has been pushing the sale of zinc white since 1850, and it has been used on a considerable scale in that country for certain purposes since that epoch. In Holland, it has been experimented with for perhaps a longer period.

17,077. These particulars are of importance in view of the suggestion that the continued allegiance of the painting trade to white lead is due principally to prejudice, which prejudice has hampered the diffusion of knowledge in so far as zinc white, for instance, is concerned. This is incorrect. *First*, of master painters, especially those doing what may be termed the higher-class work, a large number have tried zinc white for exterior work, and nearly all use it to-day for interior finishes (more often as enamel), having discarded it for other purposes; it is indeed rare, in this part of the country at any rate, to find a master painter who has not used or does not use zinc white for some purpose. Over 15,000 tons of zinc oxide, valued at some 324,000*l.*, were imported into this country in 1910, of which I estimate that only 10 per cent. was used for enamels. The export of British-ground zinc oxide in 1910 was 1,911 tons, value 44,595*l.* The re-exports of foreign zinc oxide was 70 tons, value 1,556*l.* Zinc oxide imports have been given separately since 1905, and even in that year the quantity totalled 144,192 tons, value 282,358*l.* *Secondly*, an example can be given of a pigment produced and placed upon the market thirty years after zinc white, which, at the present day, is widely used and well known to all—it is lithopone (patented in 1874, and brought into general use from about 1880); it is an admittedly inferior pigment, and yet prejudice, in this instance, has been conspicuous by its absence. Numerous other cheap and inferior pigments have been brought out and promptly rejected by the trade. It cannot be seriously contended that 99 per cent. of the master painters in the Kingdom find zinc white of considerable use in interior work, whilst obstinately refusing to test it for other purposes. As already stated it is demonstrable that a large percentage of the better class of painters and decorators have tried zinc white for exterior work and discarded it. If this were due to a lack of knowledge in the workman applying the paint, the same result would have to be recorded in interior work. The painting trade necessarily understand their business better than others, as its members alone can thoroughly appreciate the requirements. That white lead has remained supreme for centuries would be admitted in commercial circles everywhere to be the best possible proof of its superior all-round qualities.

17,078. The chamber of commerce caused a set of questions upon the subject to be addressed to the leading painting and decorating firms in the largest cities in the United Kingdom outside London; the names being supplied by the local chambers of commerce. One hundred and twenty-three replies were received from the following 29 cities:—Aberdeen, Belfast, Birmingham, Blackburn, Bradford, Bristol, Burnley, Cardiff, Coventry, Derby, Devonport, Dublin, Dundee, Edinburgh, Glasgow, Halifax, Huddersfield, Leicester, Liverpool, Manchester, Middlesbrough, Norwich, Nottingham, Oldham, Plymouth, Portsmouth, Sheffield, Swansea, Wolverhampton.

22 February 1912.]

MR. HEDLEY MILLER.

[Continued.]

17,079. The replies may be summarised as follows:—

111 said that there was no substitute for white lead for outside painting equally effective for body, covering power, and durability.

78 said that they had had experience of zinc white for exterior work; of whom 52 said that it was unsatisfactory and not equal to white lead. A few said that zinc white is unsatisfactory except when used with enamel or varnish.

110 said that they have had experience of the use of zinc white for inside work.

93 recommend the use of under-coats of white lead for inside work.

91 have no objection to simple regulations, such as quarterly medical inspection; the use of overalls; provision of soap and water, &c., and the use of them before meals.

17,080. As one of the results of these questions, the following facts came to light unsought:—

One firm, established 20 years; never had a case of lead poisoning.

|           |   |     |   |                                 |   |
|-----------|---|-----|---|---------------------------------|---|
| Two firms | " | 28  | " | "                               | " |
| "         | " | 30  | " | "                               | " |
| "         | " | 50  | " | "                               | " |
| One firm  | " | 40  | " | only two or three slight cases. |   |
| "         | " | 20  | " | no serious case.                |   |
| "         | " | 34  | " | only one case.                  |   |
| "         | " | 100 | " | no record of any case.          |   |

17,081. Several other firms, on the same occasion, wrote that they had never had any case of lead poisoning in their business.

17,082. In this connection the report of M. Stas, "rapporteur" of the jury (Class 10) of the Paris Exhibition of 1855, is of great interest in view of the contention that zinc white is a more or less new pigment, for 56 years ago M. Stas, who was intimately acquainted with the two pigments, and was a chemist of high reputation, wrote (translation): "To-day zinc white disputes with white lead for pride of place." The qualities of zinc white, he states, were first recognised in 1779. It failed because of its high price and lack of drying properties. Before the year 1800 a French Minister of Marine attempted its adoption for the interior of vessels, but without success. In 1805 the French Academy of Science presented a report which states that the inferior covering power can be got over by an extra coat, which M. Stas confirmed as his own opinion. In 1844, M. Leclair discovered a process of manufacture which brought zinc white to a reasonable price, and, further, discovered a more or less inadequate drier. He sold his rights to the Vieille Montagne company, which, even at that date, says M. Stas, "owned most of the zinc mines of Europe." In 1855 the jury were informed by a manufacturer of zinc white that during the preceding year some 6,000 tons were consumed in France alone, but he added that "already the consumption showed a notable diminution." The jury concluded that whilst, apart from the question of cost, zinc oxide could replace white lead in interiors, having indeed the advantage of conservation of colour, for the outside this was impossible. "White lead," they said, "forms a combination with oil; zinc white is almost entirely inert." But M. Stas's most interesting observations are the following:—"Zinc white cannot replace white lead for all purposes; it is not prejudice or custom, that enemy of progress, and less still, ill-will, that is responsible, but the very nature of zinc white itself, which it is not in the power of man to change." M. Stas had no prediction for white lead, for he concludes his report by saying that the adoption of the use of zinc white for certain purposes constituted one of the glorious conquests of the century.

17,083. Finally, the report of the Departmental Committee of 1893, on the various lead industries stated that:—

"In the past a large amount of thought, labour, time, and money have been expended by many experts in the search for a substitute for carbonate of lead. Several compounds have been mentioned

to the committee as being equal to white lead and capable of taking its place, if only the prejudice of middle-men and dealers could be removed so as to secure for them a fair field in the paint market. One of these compounds, and the one on which most stress has been laid, is oxide of zinc. This has been used with success for internal decoration, but for rough surfaces and for exposure to heat, cold, and rain it does not possess the qualities for which white lead is conspicuous, namely, covering power and durability. Moreover, the price of oxide of zinc is greater than that of carbonate of lead. With regard to all these so-called substitutes the committee have invariably found that on closer inquiry of persons competent to judge, and unprejudiced on either side, the substance in question was in some particulars inferior; and they have come to the conclusion that there is at present no substitute that can take the place of carbonate of lead."

17,084. No new pigment has been discovered since that year.

17,085. (Chairman.) In paragraph 17,064 you state that the London Chamber of Commerce has been specially requested to collect certain statistics. Will you please tell us by whom the request was made?—By the white lead corroders' section of the chamber.

17,086. In paragraph 17,065 you state that about 15,000 tons of white lead are exported from Great Britain, and that you estimate that 7,500 tons of this are of British manufacture. How did you arrive at that estimate?—By taking the opinion of various people in the trade in London with whom I come in contact.

17,087. The official figures are: Exports 1910, 20,220 tons. Of this, re-exported foreign imports, 1910, 2 tons?—But the official figures, the Board of Trade figures, include as British manufacture foreign white lead, which is simply ground in this country and exported. That I think accounts for the difference.

17,088. In paragraph 17,067 you state some of the results of closing down the British white-lead works. Why should they be closed down?—Prohibition of the use in painting, or any limitation or restriction of the use of white lead, to a small percentage would clearly have the effect of closing white-lead works, because a very large proportion of their output is used in painting.

17,089. Would they not retain their foreign markets as well as their trade in white lead for potteries and other manufactures?—I think I have shown that the proportion of their foreign trade is so small that they would not be able to keep going on it.

17,090. You have no statistics of how much white lead is ground and how much is re-exported?—No. I do not think that there is any method of ascertaining that, beyond what I have stated above.

17,091. Therefore the official figures really stand?—They do not stand to this extent—that they are not British manufacture.

17,092. How do you estimate to get those figures. You make a very vague statement?—It can only be an estimate because there is no possibility of getting the precise figures. There are 7,500 tons of British manufacture it is estimated, exported. There is in addition to that a large quantity of foreign dry white lead merely ground in oil in this country which is exported.

17,093. But there are no figures?—There are no figures.

17,093a. Would not also the loss of subsidiary trade, dependent on the manufacture of white lead, be counterbalanced by subsidiary employments arising in connection with the increased use of leadless paints?—That is a hypothetical question which I should prefer not to answer.

17,094. In paragraph 17,069 you state that the total annual consumption of pig lead in this country amounts to 200,000 tons. I note that the actual figure for 1910 is 187,000 tons. Can you give the figures for previous years?—No, not the exact figures. It varies from about 200,000 tons.

17,095. The average is 194,000?—I do not give the figure as being correct to a ton.

L 1 2

22 February 1912.]

Mr. HEDLEY MILLER.

[Continued.]

17,096. You state that, if the demand for white lead ceased altogether, consumption would be reduced by 25 per cent. Taking your own figure of 200,000 tons, and accepting for the moment your assumption that the demand for white lead ceased altogether, there would still be an annual consumption of 150,000 tons of pig-lead in this country?—Yes.

17,097. You are aware that the total production of pig lead in Great Britain in 1910 was 21,000 tons and the rest was imported. Can you tell us why the production of pig-lead in this country should be affected at all?—The production of pig-lead in this country is, as I have shown, over 100,000 tons, and this is what is known in the market as "English" lead, which commands a superior price. The figure mentioned, viz., 21,000 tons, is the product of English mines and depends entirely on the price, and a reduction in the consumption of some 25 per cent. would presumably have the effect of bringing down prices very considerably, adversely affecting both the "English" production of pig-lead and the mines in Great Britain.

17,098. Why should not the reduced consumption of some 50,000 tons bring about a reduction of the importations by 50,000 tons?—The British lead-mining industry is in a very poor way, and has been for some years, and I believe that the cost of bringing up the ore and so on is very much more than in other countries where lead principally comes from, such as Spain. The almost complete absence of silver from English ore would make the mines in this country the first victims of a fall in the price of lead.

17,099. In any case there seems no reason why the proportion of English pig-lead to foreign pig-lead should be reduced. At the present time English pig-lead represents almost exactly one-ninth of the total used. A reduction of 50,000 tons in the demand would therefore cause at the most a reduction of one-ninth of 50,000, that is about 5,500 tons, in the demand for English pig-lead?—For the time being there would be a very large over-production temporarily, at any rate. I am pre-supposing, as you are, I take it, that white lead is no longer manufactured here, and that the consumption is reduced by 25 per cent. It would result in a fall of prices which would get below the figure at which the mines could be kept open.

17,100. All your figures then regarding British mining, smelting, and refining must at any rate be divided by nine?—I do not quite follow that.

17,101. One-ninth is home production?—Certainly, but it is not so much a question of the actual amount which is produced in this country as a question of price. It is the price which keeps the English lead-mine open or not. It is not a question of the possibility of selling it. It is well known that "English" lead is worth a little more than foreign lead. It has a separate quotation of its own—a few shillings more per ton. But "English" lead, as I have explained, is five times as much as the product of mines in Great Britain.

17,101a. Surely it would hold the market then?—It might; that cannot be said for certain.

17,102. In paragraph 17,071 you refer to imported and silver ores. Will you please explain this? Is the silver ore English or foreign?—It is Colonial and foreign, principally the former.

17,103. In paragraph 17,073 you state that five firms treat native ores alone. How many people are employed by those five firms?—252 workmen is the figure I think; no, that needs modification.

17,104. The Home Office figures show that one of those firms employs about 5 people, another under 20, the other three about 25 each; that is a total of about a hundred?—The figure should be 128.

17,105. At the beginning of paragraph 17,074 you state that there is no substance in any way comparable with pure red lead for the special purposes for which it is used. Would you tell us your experiences and qualifications as an expert authority on the relative values of red lead as compared with iron oxide, bituminous paints, carbonising paints, graphite paints, and others, which are to-day very largely used in place of red lead for the painting of engineering structures and the like?—I am not an expert authority on the subject. I am simply giving the result of my

experience. Naturally I am thrown up against the trade and have been for years, because of the position that I hold, but I do not speak as an expert.

17,106. You tell us in paragraph 17,074 that 11,800 tons was the out-put in 1910 of red lead and litharge. What do you understand by "litharge"? Do you mean Massicot or flaked litharge?—I should include all. That includes Massicot and flaked.

17,107. Massicot is entirely used up in the manufacture of red lead, is it not?—I should not care to answer; I could not say for certain that I understand this last question correctly. There is no litharge or Massicot included here which is afterwards used for the manufacture of red lead which is also included in the figure. Have I made myself clear?

17,108. Do you include the litharge which is the product?—I have not included the Massicot and then again included the red lead.

17,109. In paragraph 17,077 you give an interesting estimate that only 10 per cent. of the zinc oxide used in this country is used for enamels. What is the other 90 per cent. used for; is it for ordinary paints?—Stiff paint mostly.

17,110. At the end of paragraph 17,077 you say that the continued use of white lead proves "its superior all-round qualities." Do you use the word "superior" deliberately?—Yes, I mean by that as a general utility paint. I do not mean to say that it is superior from every point of view, but as an all-round general utility paint.

17,111. If substitutes of equal value are on the market, surely they would not necessarily displace the substance which has been used for a considerable length of time?—I think that if they were non-poisonous they would.

17,112. In paragraph 17,080 you give replies to questions issued to leading master house-painters. Among the many witnesses that we have examined we have doubtless heard a number of those you quote?—That may be so.

17,113. Your figures are also of doubtful value as they do not state the average number of painters employed by each of those firms?—No; I simply give those returns for what they may be worth.

17,114. As an illustration of the fact that statements collected in that manner are not very reliable, may I inform you that the Institute of British Carriage Manufacturers collected similar replies, and it was found that a number of recorded lead cases were overlooked in the replies?—We did not ask for any returns of lead poisoning. One would necessarily imagine that the employers would not be able to give them completely at all. These questions were on the subject of the comparative use of zinc oxide and white lead for interior and external painting. The excerpts which I give there as to the number of cases of lead poisoning were given voluntarily as notes, but were not asked for in any way.

17,115. In paragraph 17,082 you refer to M. Leclair, who introduced zinc white at a reasonable price in 1844. You are doubtless aware that for the last 50 years all the painting by the Maison Leclair has been and is to-day done with zinc white only?—Not all. They admitted using lead where their customers required it up to the time that the argument was used against them in the French controversy. Since that time, I believe somewhere about 1905, they have, I believe, used only zinc oxide.

17,116. In your final quotation in paragraph 17,083 you refer to a statement that in 1893 the price of oxide of zinc was greater than that of carbonate of lead. White lead has increased considerably in price since then. Can you give us the prices of ready-mixed lead and zinc paints of the same quality at the market prices of to-day, gallon for gallon, ready for use?—That is a somewhat difficult question to answer, because zinc oxide is sold in a number of different qualities, whereas white lead, although it is sold pure and reduced by various percentages, is not sold in different qualities.

17,117. (Dr. Collins.) What is the highest price per gallon?—I could not give that.

17,118. (Mr. Sutherland.) There is no standard of price for paints. Between pure zinc oxide and genuine

22 February 1912.]

MR. HEDLEY MILLER.

[Continued.]

lead you can get a standard, but not for paint. Every proprietor has his own price?—Yes.

Mr. E. L. COLLIS, M.B., in the Chair.

17,119. (*Dr. Collis.*) You state in paragraph 17,067 that "the closing down of British white-lead works would leave other industries entirely dependent upon the foreigner for one of their raw materials. The potters, colour, and wallpaper manufacturers may be mentioned in this connection." Do you mean that these manufacturers use white lead?—Yes.

17,120. Do you think that the call that they make for white lead would not be sufficient to keep any individual white-lead factory in existence?—I do not think it would. I think that the percentages are too small.

17,121. The percentages that they use?—Yes.

17,122. What percentage would you consider that they do use?—It is a very difficult matter to say, but I think that 95 per cent. of the white lead is used for painting. That is what is thought in the trade.

17,123. So that these manufacturers you mentioned do not consume as much white lead as to-day comes in from the Continent?—No, certainly not.

17,124. So that they are therefore to-day, partially, at any rate, dependent upon the foreigner for one of their raw materials?—They are not dependent, but they can and do purchase from the foreigner occasionally.

17,125. There is more white lead used in English trades to-day than is made at home?—Yes, possibly.

17,126. So that in that sense England is to-day dependent on the foreigner?—Yes, possibly, in that sense.

17,127. In paragraph 17,071 you give the total output from native ores, and then the total output from imported and silver ores. Are silver ores imported or native?—Imported.

17,128. But surely some of the native ores contain silver?—Only to a very small extent, I believe. The percentage of silver is very much more in the Spanish ore for instance, than it is in the English. It is quite inconsiderable in this country. It is the trade term that I am using.

17,129. "Silver ore is practically what is known in the trade as bullion ore, containing precious metals "over a certain amount"; that is what you are referring to?—Yes.

17,130. I have not quite followed you on the number of workpeople employed. You state in paragraph 17,071, 780, and in paragraph 17,070, 2,687?—Paragraph 17,070 refers to mining, and paragraph 17,071 to smelting and refining.

17,131. So that 780 are those who are employed in the smelting and refining, and the others in mining?—Yes.

17,132. So that if the same amount of British ore was raised, it would only leave the question of the 780 in the smelting furnaces?—Yes.

17,133. You give a list in paragraph 17,080 of seven firms who reported that they had had no case of lead poisoning. You had answers from a great many more firms than that, I believe?—We had answers from something over 100. I believe that I give the exact number in my evidence.

17,134. You do not wish us to conclude that all the rest had had cases?—No; I have already explained that these were simply added as notes. We did not ask them any questions on lead poisoning at all. We simply asked their opinion with regard to the use of zinc and lead for exterior and interior work.

17,135. Some of them volunteered the information that they had not had a case of lead poisoning?—One of our questions was whether they would have any objection to certain regulations, and a certain number of them did object, adding that they did not see the use of them, because they had been established for so many years without any case of poisoning.

17,136. So that those firms would object to regulations?—I could not say that offhand.

17,137. That is the impression that they left on your mind?—That was one of the reasons for which the information was given; but it was not only that. It was entirely voluntary.

17,138. You give us some information as regards the amount of zinc oxide imported. Have you any information as to whether this amount has been rising or falling in recent years?—It has been rising considerably.

17,139. Could you give us the figures?—No, I am afraid I cannot.

17,140. Or to what extent it has been rising?—No, I am afraid I cannot. I could obtain them for the Committee. I believe that zinc oxide was put in a special category in the official returns about the year 1905. Since then it has been rising regularly.

17,141. That would be six years. Has there been any alteration in the price of zinc oxide during that period of six years?—I should hardly like to say off-hand. The quality question comes so much into it.

17,142. Yes, but still, the price must bear a relation. It varies a little?—Obviously it varies, also with the price of spelter, which varies, as you know, very largely, just the same as lead.

17,143. The point is, then, that it has varied more with the price of spelter than with the call for this material for painting purposes?—Yes, I should think the price of spelter would be the principal factor.

17,144. My point is, that up to the present the increased demand for zinc oxide for painting purposes has had no effect upon the price of zinc oxide for painting purposes?—It probably has to a small extent. With the increased consumption the price has probably come down to a certain extent.

17,145. We always have to look upon that question—does increased demand increase price or does increased demand give the opportunity to the manufacturer to manufacture on a larger scale and absolutely lower the price. That is a point I thought you might have considered?—I do not think that the price of zinc oxide has varied very much in the last few years.

17,146. So that we have no reason, as far as we can go on the figures that we have before us, to think that an increased demand for zinc oxide would advance the price of the material, as far as we know?—Probably not.

17,147. In paragraph 17,077 you instance the fact that there is no lack of knowledge on the part of the workpeople in applying the zinc oxide paint. You think that that is so because it is being used for internal work?—They have had practice in applying it. Special workmen are always employed.

17,148. But there is a body of men at present painting in England who have knowledge of applying zinc paint?—Yes, but I should not like to say that that body of men was sufficient for the demand.

17,149. No, but you think there is at any rate a certain number?—Certainly.

17,150. If your argument is sound, that follows, does it not?—Yes, certainly.

17,151. I ask you the question in connection with the suggestion that has been made, that a long time ought to elapse, if the Committee thought it was necessary by restricting the amount of lead used, to force the trade to use zinc, to allow the workpeople to obtain knowledge of how to apply it?—At the present time the number of men whom one might call fully qualified men, who are used to the better class of work, zinc-white enamelling, and so on, is only a small proportion relatively of the whole body of painters, and if zinc oxide only were used, necessarily a certain amount of time would be required in order that everybody might get used to it.

17,152. Have you any knowledge as regards the respective amounts of zinc ore and lead ore which exist in the British Isles?—Do you mean the unmined?

17,153. No, the ore used year by year?—Do you mean the stock on hand, or simply the quantity raised?

17,154. Raised from English mines?—It varies from year to year. Sometimes there is more lead ore raised, sometimes more zinc.

17,155. Possibly the amount raised is not so very different?—I think it more or less approximates.

17,156. A little perhaps in favour of lead?—Do you mean to say more lead than zinc?

17,157. Yes?—I think that if you go back twenty years, year by year, you will find that it is the other

22 February 1912.]

Mr. HEDLEY MILLER.

[Continued.]

way round, but really I have no knowledge on that subject; I think it goes in cycles, if I remember correctly.

17,158. The amount of lead raised has been falling, and the amount of zinc raised as ore has been almost stationary; and the two now bear rather close relation one to the other?—Yes, they do now.

17,159. So that an increased use of zinc may call for more zinc mining in England than in the past, while it does not appear that at present, from the amount of lead raised, that lead mining is to-day a flourishing industry?—No. Of course the total amount of lead mined in this country is very small compared with the total consumption.

17,160. Yes; so that we are dependent on the foreigner to a great extent for our ore, are we not?—Yes, and the Colonies.

17,161. And we shall be very little differently placed as regards the paint industry from that point of view if zinc is used instead of lead?—Are you presuming that zinc oxide would be manufactured here?

17,162. I am speaking from the ore point of view only at the moment, leaving the manufacture on one side. As regards the amount of lead ore raised and zinc ore raised, zinc appears, except for the last two years, to be about holding its own as a mining industry, while lead has gone back from 73,000 tons in 1873 to 28,000 tons in 1910?—Yes. Of course, it must be remembered that the principal zinc mines in England belong to the foreign manufacturers of zinc oxide.

17,163. Yes, but the labour of raising the ore is carried out here as far as that goes. Do the Vieille Montagne manufacture under patent?—It is a secret process. No one is ever allowed to go into that part of their works in which the zinc oxide is manufactured. I have known of parties being conducted over other parts of their works. Their works are very large.

17,164. Have they no protected patent in England?—They do not manufacture in England.

17,165. Have they a patent?—I do not think so. It is a secret process.

17,166. The Patent Act does not cover it?—No, not so far as the Vieille Montagne secret is concerned. It has never, I believe, been divulged since Leclaire originally discovered the process.

17,167. A certain amount of foreign zinc is to-day ground at home, is it not?—Yes, quite a considerable amount.

17,168. And re-exported. You mention that in paragraph 17,077. "The export of British ground zinc oxide in 1910 was 1,911 tons; valued at 44,595*l.*"—It is nearly all consumed in this country.

17,169. That is about one-seventh of the total amount of zinc oxide which is imported, which is an appreciable amount?—Yes.

17,170. So that if there is an increased call for zinc oxide, and that material is probably used in the country, British labour is used in the grinding, if not in the manufacture?—But the grinding is a very simple process, and gives employment to very few people.

17,171. There are a good many people employed in colour works?—Zinc oxide is received dry in the barrels, and simply put into the machine. It gives rise to very little labour indeed.

17,172. My point is that there is a certain amount of zinc ore raised at home, though it goes to France and the Vieille Montagne Company, and is there turned out as zinc oxide, a certain amount appears to come back to be ground here, and from the point of view of British labour we only lose the moment while it is being converted from the ore to the oxide?—But that is the principal item.

17,173. You do not know the number of people employed in that process?—No, I could not say. May I come back to one question you asked me? I think we rather misunderstood each other. It was as to the price of zinc oxide, and the question of increased demand. Obviously, at the present time, if the use of white lead was prohibited, and nothing but zinc oxide could be used, the supply would be very much below the demand for the whole of Europe, and consequently the price might go up to anything; because it is not possible under existing circumstances for the white-

zinc factories to supply anything like the quantity of zinc white that would be required.

17,174. Do you not think that that would equalise itself very rapidly if a certain time was given for them to have an opportunity. If there was a sudden greatly increased demand, I quite agree with you, but I was asking whether the demand has not been increasing in recent years steadily without an increase of price. I think it is correct to state that the price of zinc oxide is this year *l.* a ton less than it was two years ago?—Yes, that may be.

17,175. While lead carbonate has risen at least this amount, I think in that period?—Yes.

17,176. Possibly more?—Possibly more. I take it what I meant to say is clearly down on the note. When you were speaking about the price of zinc oxide, I was imagining the present condition of open competition between the two, and not a prohibition of white lead, which, as I say, even if it ran over a number of years, say ten, would clearly send up the price of zinc oxide. Have I made myself clear?

17,177. The price of zinc oxide must depend a good deal on the price of zinc, must it not?—Yes, but it would depend very much more on the supply and demand, if white lead were used no longer.

17,178. But the amount of zinc used in other commercial processes is very much greater than will ever be used in regard to zinc oxide for paint?—Yes, possibly. I do not think that the supply of zinc would be the principal factor in the case.

17,179. A great deal of zinc oxide is made by the indirect method from spelter?—It is made from strippings from houses when they are pulled down. It is made from the refuse from galvanising works, and so on—zinc in many forms.

17,180. Yes, but it must depend on the price of spelter practically?—Certainly, to some extent.

17,181. And the price of spelter is almost ruled to-day by the demand for it in the galvanising trade?—Yes. But with any such thing as prohibition, the supply would be so very much below the demand that the price would for some time, at any rate, be quite artificial.

17,182. It would very much depend upon the rapidity with which the demand came, would it not?—It would very much depend upon the rapidity with which white lead was done away with.

17,183. That is the same thing. I say it would depend upon the rapidity with which the demand came?—Yes.

17,184. You have no knowledge of the length of time that it takes to construct a works where zinc white can be made?—No, but I know that in one particular works in France they have been experimenting with it for a matter of five or six years, and they have not yet reached the point where they can produce an article sufficiently good to be put on the market.

17,185. (*Mr. Sutherland.*) What do wallpaper manufacturers use white lead for?—As a base for the colours. White lead is stained, so to speak, with the colouring agent, and then printed on the paper.

17,186. Purely in the printing?—Yes.

17,187. Zinc oxide has an open market in England, and has always had, and if its merits had been what are claimed for it, would it not have made a larger impression on the paint trade than it has?—You say if its merits were what is claimed for it.

17,188. Yes, by the manufacturers, and by its advocates?—By its special advocates? Presumably it would have taken its place. I see no reason why it should not have done.

17,189. Is not the strong preference in the painting trade for white lead a very strong presumption that it has merits which justify its popularity?—Most undoubtedly.

17,190. Would you be surprised to hear that of the large number of master painters who have given evidence before this Committee, many have no actual experimental knowledge of zinc oxide, and the bulk of those who have tried it have abandoned it as inadequate, except for finishing purposes?—I should be very surprised to hear that many master painters have no

22 February 1912.]

Mr. HEDLEY MILLER.

[Continued.]

knowledge of zinc oxide. Speaking for London, it is a difficult matter to find a master painter who has no knowledge of zinc oxide for one purpose or another.

17,191. The question goes on, "and the bulk of those who have tried it have abandoned it as inadequate except for a finishing coat."—That is so as far as my knowledge of the trade goes.

17,192. These gentlemen came from Scotland and from various parts of England. They tried it some time back, and they all say it is inadequate. This Committee cannot regard enamels as affecting the question of zinc oxide at all?—I think not at all.

17,193. Enamels stand in a category of their own?—They stand in a category of their own, and it is not a question of the treatment of the pigment so much as of the vehicles, the oils and varnish, and so on, which are used with it. It is an entirely different question.

17,194. Though zinc oxide and lead are both largely imported into this country, zinc oxide manufacture is largely a monopoly of foreign firms, is it not?—Entirely, one might say.

17,195. Are there any manufacturers in England producing zinc oxide?—There is one small manufacturer.

17,196. There is obviously a large market for it already, so why are there not more?—Because the production of zinc oxide has been for 50 years in the hands of the foreign manufacturers.

17,197. I wanted to get that answer. If the prohibition of lead is enforced in France, which all the French witnesses have expressed grave doubts about, would not that make the question still more difficult for this country, assuming that they prohibited lead?—Most certainly it would. It would very largely affect the price and the supply of zinc oxide.

17,198. In view of the answer you gave to a question by the Chairman, that one firm, experimenting for five years, had not produced a satisfactory product, would not a very considerable interval have to elapse to enable zinc manufacturers to establish works and perfect processes in this country?—In my opinion it would take many years. Indeed, it is difficult to put a limit to it under existing circumstances.

17,199. Is not that a very strong argument in favour of the Committee recommending a good trial of regulations to see how they would affect the incidence of lead poisoning rather than prohibiting?—Most undoubtedly it is, because it would be a generation before, under the most favourable conditions, you could produce sufficient zinc oxide in this country to meet the demand. It is very doubtful if the right kind of spelter would be obtainable at all.

17,200. It is your opinion that zinc oxide could not replace white lead for all external uses?—Certainly not.

17,201. (Mr. Parsonage.) In paragraph 17,079 you have a summary of four different questions. One reads that 110 said they had had experience of the use of zinc white for inside work. There is no mention of any of them saying that they found it suitable, or that they were favourable to the use of zinc white?—Six of the replies gave zinc white as being equally effective.

17,202. You speak about special men for painting with zinc. Have you any practical knowledge?—No.

17,203. None whatever?—No; but I am constantly thrown amongst the trade—the manufacturers.

17,204. And workmen?—Not workmen.

17,205. You have no knowledge that a man who could paint that door with white lead could not paint it equally well with zinc white?—I have no direct knowledge.

17,206. That evidence may only be taken as an opinion?—It is not my opinion. I personally have no opinion upon it; but it is the result of what I hear in the trade.

17,207. The use of zinc oxide is increasing in the country?—You are including enamels.

17,208. Including everything?—Yes, certainly.

17,209. You say that nearly all the master painters in London use zinc white, or are acquainted with the use of it?—Certainly.

17,210. Can you explain how, if once they tried it and abandoned it, the use of it can continue to be increasing? Do you mean that someone else is fool enough to take it up?—Have I said that after one trial it is abandoned?

17,211. The question was put to you, "Is it not the fact that after trying it the majority of those who have tried it have abandoned it?"—That was for external painting.

17,212. (Mr. Sutherland.) I was responsible for the question, and I based it on the testimony of witnesses before this Committee?—I think the question was, "except for internal finishing."

17,213. (Mr. Parsonage.) Not at that time. If you intended to say so, very well?—I feel sure that the question was, "except for internal finishing."

(Mr. Sutherland.) I will read the question, "except for a finishing coat."

17,214. (Mr. Parsonage.) They have abandoned it but for that, and yet the use of it is continuing to increase?—Yes. It is being continually used for finishing coats internally.

17,215. Do you term the finishing coat the last coat of all?—It depends on the quality of the work being done. In the very best work you would put more than one coat.

17,216. (Mr. Gardner.) The question was put about the supply of zinc oxide being controlled by practically a syndicate, I think, of manufacturers. Is it not the case that white lead in Great Britain is controlled by a combine?—I believe so.

17,217. In view of the fact that the use of zinc has been increasing so rapidly of late years, does it not betray a want of business capacity on the part of the colour manufacturers and grinders here in not catering for the public supply?—Do you mean in not opening factories in this country?

17,218. Yes?—I think I have already explained that it is almost an impossibility under present circumstances to successfully establish zinc oxide works.

17,219. Why, if there is a demand for the article?—Of course it is a question of competition with existing concerns.

17,220. I should have thought that you could manufacture and supply just as readily as the foreigner?—Theoretically, perhaps, there is no reason why we should not do so; but when we come to practice it is quite another problem.

17,221. In paragraph 17,074 you say: "There is no substance in any way comparable with pure red lead for special purposes." What are these special purposes?—In view of the fact that I have already answered a question on that, and said that I have no personal knowledge, I would prefer not to answer that question.

17,222. But you put this in your evidence; you make a definite statement?—I have practically withdrawn it by means of my other answer.

17,223. (Mr. Sutherland.) Is not zinc oxide and lithopone largely used by linoleum and oil-cloth manufacturers?—Lithopone is very largely used, but I could not say whether zinc oxide is largely used. It is used.

17,224. Do you know whether the zinc oxide that comes into the country is all consumed in the painting trade, or are there any other markets for it?—All of it most certainly is not.

17,225. You do not know what other markets there are for it besides that?—No, I am afraid I could not say.

17,226. I thought that it might throw light on the increased consumption?—It is used, I should imagine, wherever colouring is done.

17,227. Is not there a difficulty in getting zinc oxide paint to cover on mouldings and sharp arras and surfaces of that kind?—That is the principal difficulty, but I have no practical knowledge of painters' work.

17,228. (Mr. Kinggate.) How do you arrive at the fact that 95 per cent. of the white lead is used for painting only?—That is the opinion in the trade.

17,229. In what trade?—Amongst the manufacturers of white lead, colour manufacturers, and so on.

L 1 4

22 February 1912.]

Mr. HEDLEY MILLER.

[Continued.]

17,230. How do they know? They cannot know for certain, but they have a guide to it in their own sales.

17,231. That does not at all follow?—It certainly does.

17,232. It does not in the slightest degree, as far as I am concerned?—Most certainly it does. They know what goes to the Potteries.

17,233. May I point out to the Committee that 50 per cent. of the white lead sent to the coachmakers' shops is not used for painting. I know what I am talking about. It is used for jointing, and that kind

of thing, and is not used for painting at all. There is a tremendous amount of lead used in coach-building?—Do you say 50 per cent.

17,234. Yes. Such a broad statement as this, that 95 per cent. is used for painting, without statistics to prove it, is entirely valueless?—It is impossible to get statistics on this.

17,235. (Mr. Parsonage.) The manufacturer does not know what use it is applied to. He only knows what he sells?—But he knows where it goes. He knows that it goes to the Potteries, for instance.

The witness withdrew.

## TWENTY-NINTH DAY.

Thursday, 21st March 1912.

### PRESENT:

SIR ERNEST HATCH, F.G., BART. (Chairman).

Lord HENRY BENTINCK, M.P.  
Sir GODFREY BARING, Bart., M.P.  
Mr. E. L. COLLIS, M.B.  
Mr. W. G. SUTHERLAND.  
Mr. F. G. RICE.  
Mr. A. GARDNER.

Mr. J. PARSONAGE.  
Mr. A. L. C. FELL.  
Mr. C. L. MASON.  
Mr. C. KINGGATE.  
Mr. W. ROBINS.  
E. A. R. WERNER (Acting Secretary).

Captain MATTHEW FRANCIS.

Evidence to 17,244 handed in and taken as read; witness then called and examined.

17,236. I am senior partner in the firm of Matthew Francis and Son, Halkyn, near Holywell, Wales, and have practised as a mining engineer for 50 years in the Flintshire district.

17,237. I manage the following mines:—

- (1) The Halkyn Mines.
- (2) The Mount Halkyn Mine.
- (3) The South Halkyn and Rhydymwyn Mines.
- (4) The Bryngwog Mines.

17,238. And I am consulting engineer of the Holywell-Halkyn Mines and of the Pantymwyn Mine in the same county of Flint, and of Bog Mines, Limited, in Shropshire. The productive capacity of the foregoing mines in Flintshire is upwards of 3,000 tons per annum.

17,239. Being intimately acquainted with all the conditions of lead mining in Wales, I am able to say of my personal knowledge that the industry would be most prejudicially affected by any prohibition of the use of white lead by house-painters and coach-builders. Welsh lead is peculiarly free from silver, and suitable for the production of white lead, and I learn that from 25 to 30 per cent. of the output is used by the white lead corrodors. Even a 5 per cent. difference in the demand would most seriously affect the lead-mining industry, and a very slight excess of supply over demand always creates a most disproportionately great difference in the price realised for the whole output.

17,240. Even with the demand for lead for corrosion into white lead the average price of the metal for many years has been so small as to allow a bare margin of profit on the whole to the Welsh mine owners, who have a very large capital sunk in the industry, and, with a demand for lead paint destroyed or seriously diminished, it is not unreasonable to infer that British lead mining would very shortly be numbered among the ruined industries of the country. Not only the lead mine-owner and miner and their respective families would be involved in the misfortune, but other lead industries, such as lead smelting and spelter manufacturing, would be adversely affected.

17,241. Great Britain is now the dumping ground for foreign supplies of lead, and the British producer

of that metal is greatly prejudiced thereby. Not many years ago Great Britain was the greatest contributor to the world's production of that metal, but she now occupies only a very subordinate position. The first place is at present held by the United States of America, whose production for 1910 was estimated at 382,408 tons, whereas the British was only 29,300 tons. The disparity would be less marked were it not for the protective policy that the United States have adopted whereby a price is secured there several pounds a ton in excess of the British price; more especially would this be so if the whole of the American production was retained for home consumption, or no part of it was put in competition with British lead except at the American price, which, unfortunately, is not the case, for it is the rule and not the exception for American or Mexican lead to be sold in London at many pounds per ton below the New York price.

17,242. Having to compete with foreign lead under such conditions, the British producer is already seriously handicapped, and he is in no position to withstand the inevitable decline in price that would result if the consumption of lead were diminished to the extent which would be involved by a prohibition of the use of white lead for painting purposes.

17,243. I am accustomed to deal with substances even more dangerous than white lead. In every instance the methods of user are carefully defined by regulations which are strictly enforced, and the men who use the substances are carefully trained and fully cognisant of the dangers to be avoided.

17,244. The prohibition of the use of white lead, if classed as a dangerous article, whilst an attractively simple method of obviating its dangers is available, would, if the principle were applied in other industries, upset the whole industrial arrangements of the country. An element of danger even greater than that to which the painter is exposed is an incident of many industrial occupations, and in my opinion, whilst the dangerous processes should be reduced to as few in number as possible, the true remedy to be applied is the regulation of the conditions under which the dangerous article is used, and the training and education of the men who use it to the nature of the risks which they are running.

21 March 1912.]

Captain MATTHEW FRANCIS.

[Continued.]

and the best methods of securing immunity from that danger.

17,244a. (*Chairman*.) You are the manager of several very important lead mines in North Wales, are you not?—Yes.

17,245. To whom do you supply the ore which is raised from those mines?—To English smelters. A good deal of it is used for pottery purposes.

17,246. Do you smelt any portion on your own premises?—No, we do not.

17,247. In paragraph 17,239 of your evidence you state that you learn that from 25 to 30 per cent. of the output is used by the white lead corrodors. From whom have you ascertained that?—There is one mine that used to produce between 2,000 and 3,000 tons a year, and they say that the whole of it is used for white-lead making. I hear from the smelters themselves that the larger proportion, if not nearly all, is used for making white lead.

17,248. But have you any authentic information, or is it merely hearsay?—I hear it from the smelters.

17,249. But have they given you any figures?—They have not given me any figures.

17,250. Simply the firms have told you that fact, but you do not know from your own knowledge?—I do not know from my own knowledge. Smelters have told me. The late Mr. Quirk used to tell me that nearly the whole of the lead that he bought from us was sold to the Warrington White Lead Company for white-lead making exclusively.

17,251. But you make a very definite statement here. You say that you learn that from 25 to 30 per cent. of the output is used by white lead corrodors. Where did you get that information?—I have had an opportunity of reading evidence that has already been given, and there that statement is made.

17,252. It is a statement that you have got from other people, and you do not know it yourself?—No, I have no personal knowledge, but I speak from what I read and hear from the smelters who buy our ore.

17,253. Are you aware that practically eight-ninths of the pig-lead used in this country is imported from abroad?—I know that we import over 200,000 tons a year.

17,254. But are you aware that eight-ninths of what is used in this country is imported from abroad?—Yes, that is true.

17,255. A previous witness, sent by the white lead corrodors, estimated that a quarter of the pig-lead was used for making white lead?—That is in accordance with the information I received. That is the English production. I cannot say as to the whole production.

17,256. This refers to the whole consumption of pig-lead in Great Britain?—Yes; that would correspond with what I have heard from other quarters.

17,257. That leaves three-fourths of the demand for pig-lead unaffected by any restriction in the use of white lead for house or coach painting?—Yes, that would be the case.

17,258. Then what grounds have you for suggesting that the one-ninth which is supplied by British firms, would be disastrously affected when as much as three-fourths of the present amount will still be required for purposes other than the manufacture of white lead?—We know that when the Broken Hill lead came into the English market the price of lead declined from about 20*l.* to 9*l.* a ton. That is solely owing to the excessive supply. A very slight difference, even 5 per cent. excess in the production over consumption, will account for an enormous difference in the price. I feel assured that if the consumption of lead was reduced, as it would be by restricting the use of lead for paint, the price that we should get would be a wreck price, which would extinguish lead mining in this country. You see it is in a very precarious condition as it is. Nearly the whole of our lead is used for making paint and for pottery purposes. It is in demand for those purposes. We should be very disastrously affected if you restricted the use of lead in the way that it is proposed to do.

17,259. In paragraph 17,240 of your evidence you state that the average price of the metal has been very low for many years?—Yes.

17,260. Have not the prices risen considerably of late?—Recently; the last few months.

17,261. But have not they risen in the last year or two?—Yes, it has been a little better.

17,262. There has been a gradual rise in the last three years?—It may be so. I cannot speak positively. There has been a little increase, but the price has been very moderate.

17,263. What is the price to-day?—It is about 16*l.* a ton—foreign lead.

17,264. What was it three years ago?—To the best of my recollection about 12*l.* a ton. The price of English lead is governed by the price of foreign lead.

17,265. What was it before the Broken Hill lead came into the market?—18*l.* to 20*l.* a ton, and over. The average price of our lead ore used to be 12*l.* to 15*l.* a ton. I have worked a large mine at Halkyn. The average has been under 8*l.* 10*s.* a ton.

17,266. You will agree that the price has risen very considerably during the last three years?—Yes, it has.

17,267. Can you tell us the reason of this rise?—It has fluctuated, and there is very little stability in the price when it gets high. There is no security at all.

17,268. But can you tell us the reason for this very considerable rise in the last three years?—The importation has been a little less. I attribute it entirely to that.

17,269. But do I understand that the consumption of lead has increased?—The consumption may have increased, but we know that the importation is a little less. The Spanish importation has fallen off a little.

17,270. Now, at the end of paragraph 17,240 of your evidence you state that spelter manufacturing would be adversely affected by the restriction in the demand for lead. Why do you say that?—Because the zinc ore from which spelter is made is associated with the lead in every case, and if we do not get a remunerative price for lead there will be no inducement to mine for zinc. Zinc ore alone will not pay for working, but associated with lead, if we get a fair price for it, it is worth working.

17,271. Would not the increased demand for zinc paints lead to a great increase in the demand for spelter?—Spelter would be of no value in our district. Even if the price of spelter appreciated 50 per cent. it would not be worth working. The bulk of the ore is lead. If the lead has no value, or lead has depreciated in price to a very small extent even, it would not be worth working.

17,272. But you do not tell us seriously that if lead is prohibited in house-painting and coach-painting the price of lead is going to depreciate to a comparatively low figure?—I know that if the price of lead depreciated to a very small extent, the little zinc ore that is associated with lead would not be worth mining.

17,273. But you have told us that the price of lead has increased very considerably in the last three years, from 12*l.* to 16*l.*?—We have had an increase before, but in every case it is only temporary. We have never had a spurt for more than 12 months, and there is no security that the spurt will last longer.

17,274. When you take into consideration the small amount of lead out of the total consumption that is used for house-painting and coach-painting, you do not mean to tell us seriously that the abolition of lead in these industries is going so seriously to depreciate the price of lead that it is going to ruin the industry?—Yes, I am fully conscious of what I am saying. I am sure that if you restrict the consumption of lead it will extinguish lead-mining in our district. It is in a very precarious condition. That will be the last straw that will break the camel's back, I feel sure of it. The price depends entirely on the consumption, and when the consumption is restricted so seriously as you propose to restrict it, it would mean the ruin of our industry.

17,275. But we have heard these pessimistic opinions before when legislation has been suggested for the amelioration of the condition of the working classes?—Yes, and in many cases I should think they have been verified up to the hilt.

21 March 1912.]

Captain MATTHEW FRANCIS.

[Continued.]

17,276. You can recall the introduction of the Factory Acts and similar Acts for the amelioration of the condition of the working classes? I sympathise up to the hilt.

17,277. Do not you remember that all these pessimistic predictions were put forward by manufacturers in the case of those measures?—It may be so.

17,278. They would you go so far as to repeat what you said just now—that all these pessimistic suggestions have been verified up to the hilt?—I should say a great many.

17,279. Do you remember the Workmen's Compensation Bill? That was introduced into the House of Commons in my time, and the employers said that it would ruin them if it was passed?—Some of the predictions have been verified, and a good many men have been scrapped in consequence of it.

17,280. You might possibly be on the side of those pessimistic gentlemen who were mistaken?—Unfortunately, there is an excuse for my pessimism. I have been associated with an industry all my life the price of the produce of which used to be 12*l.* to 15*l.* a ton; for many years the average has not been more than 8*l.* a ton, and we have not been getting more than under 6*l.* a ton sometimes. One place alone used to yield 24,000 tons of pig-lead a year. Now the production is 8,000 or 9,000 tons, or less than that. The industry is in such a precarious condition that I feel assured that you would menace it with extinction if you persist in carrying out the restriction which is suggested.

17,281. In paragraph 17,243 of your evidence you state that you are accustomed to deal with substances even more dangerous than white lead. Please tell us what they are?—Explosives.

17,282. Do you suggest that the workpeople are generally in the habit of handling such explosives?—Yes, all our miners are in the habit of using them daily in their work.

17,283. But only occasionally?—Every day, every miner.

17,284. But they are not using these explosives from morning till night, whereas those who come into contact with the dangerous elements of lead are in contact with them all day?—You see the miners go down in shifts. They work eight hours. They bore two holes and blast them between six and nine, say, then they bore two holes and charge them and blast them between one and two o'clock.

17,285. How long are they engaged in each operation?—The explosives are in proximity to them all the while, and they handle them twice during each shift, and in many cases more frequently.

17,286. But they are not continuously exposed to danger in handling explosives, as those people are continuously exposed to danger who come into contact with lead dust?—Not continuously, but intermittently.

17,287. In paragraph 17,244 you state that there is an "attractively simple" alternative to the prohibition of the use of white lead. Will you please describe what you mean?—I just jotted down roughly what I thought the precautions should be.

17,288. I understood that we had had them all before. Have you something quite new?—No, nothing, unfortunately. I cannot suggest anything new, but I would say that no lead paint should be sold and distributed unless labelled as containing lead, and no such paint should be sold unless mixed with oil so as to form a paste. All paint made with white lead should be sold wet, mixed with oil.

17,289. (Mr. Sutherland.) Would you apply that to the white-lead compounds like chrome and that sort of thing?—Yes; I should think it could be applied to those.

17,290. Chrome is required for tinting in distemper and a number of colours? Then none of those paints should be rubbed down unless precautions are taken against dust. I do not know whether any respirator could be used by the painter.

17,291. (Chairman.) Would you like to wear a respirator all day?—I do not think I should be very comfortable. Then, with regard to personal contact with the lead, neither the hands nor any part of the body to be brought into contact with the paint;

washing accommodation should be provided, hands should be washed and overalls should be worn when painting. Those, roughly, are what you had before. I cannot suggest anything else.

17,292. I quite understand now why you call them "attractively simple"?—If I take a pessimistic view, I am justified. If there were any substitute for lead, it would be a different case, but I am told that no paint is so efficient as lead paint, and for many purposes it cannot be done without.

17,293. Now I will put this question to you, and I want your answer as a sympathetic gentleman. Supposing we found that no regulations could be properly enforced, and that the evils arising from coming in contact with lead dust are very serious, would not you then consider that this Committee should, notwithstanding that it might be slightly injurious to the lead industry, prohibit the use of lead?—Are you prepared to apply the same restriction in other cases? There are many industries that are dangerous.

17,294. We must deal with one industry at a time. I quite agree that we must look after the health of all the workpeople of the country, but will you answer the question with regard to the lead industry?—You place me in a very awkward position. I am afraid I should have to say in that case you would be justified, but first you must prove that no precautions against the danger can be taken. I maintain that they can.

17,295. Then I will ask you this: How can you provide for washing accommodation, mess-rooms, and dust removal at every painting job throughout the country?—I should think there would be no difficulty.

17,296. I know; because you call the precautions "attractively simple," and I want you to tell us how you would go to work to introduce those precautions. You must remember that these jobs are spread all over the country. How could you be quite sure that the washing accommodation is provided?—But is the use of lead paint associated with such danger; that is the point. I am not aware that the danger from the use of this paint is so great as you lead me to understand.

17,297. There is no question about the injury that ensues from it; everybody admits that. The Home Office figures are incontrovertible in that respect?—I should think that in every house where painters are engaged provision could be made to enable them to carry out the regulations.

17,298. But you do not know of your own knowledge, do you, how you could protect the workman from the dust?—If painters were engaged in my house, I think it would be very easy.

17,299. Because you might look after them yourself?—I think it would be very easy to carry out the regulations.

17,300. Do you know all the operations in painting? Do you know that there is a lot of dust generated?—Yes, but that can be avoided by rubbing down wet-saturating before scrubbing.

17,301. But, even if you rub down wet, there is a great deal dropping on the floor, and on their clothes and hands. You state in one of your suggestions that their hands should not come into contact with lead. That is one of your "attractively simple" suggestions?—They might wear a cap.

17,302. What would they wear on their hands?—In the first place, I would obviate dust by rubbing down wet.

17,303. But there are droppings on their heads and hands and their clothes. You have no practical suggestions for getting rid of that danger?—No.

17,304. Now you state that greater dangers are incidents of many industrial occupations. Will you please say what do you mean by this?—The coal-mining industry is very dangerous; the use of, and handling of, explosives is very dangerous, and those who use them have to work under certain regulations to obviate these dangers. The brakeman, engaged on railways coupling trucks and so on, is engaged in a dangerous occupation, but it is necessary avocation, and the risks are reduced to as low as they possibly can be by compelling the men to observe certain rules and regulations.

21 March 1912.]

Captain MATTHEW FRANÇOIS.

[Continued.]

17,305. You mean to say that, if the danger of lead poisoning were removed, the painter's work might become more healthy than some other occupations. Is that what you mean?—No.

17,306. But is it not that the sum and substance of what you tell us?—No, it is not what I intended you to understand.

17,307. But is it not the fact that, if the dangers of lead poisoning were removed from house painters, their position would be more healthy and more comfortable and safer than that of men engaged in some other occupations?—Yes.

17,308. (*Dr. Collis.*) Could you give me the proportion of ore which came in from Broken Hill which lowered the price from 18*l.* and 20*l.* to 9*l.*?—Twenty-five years ago the production from Australia (New South Wales) was nil. Now it is fully 100,000 tons. One mine alone used to produce about 60,000 tons a year. That excessive production and the excessive production of America, owing to the bounty of 6*l.* a ton that is given to the producer, accounts for the low price and the depreciation in price from the standard that I mentioned.

17,309. One hundred thousand tons came in from Broken Hill while we were raising, taking the figure for 1896, about 41,000 tons?—I do not think the production of 1896 was 41,000 tons.

17,310. Yes; I have the figure from the Blue-book. So that it took 100,000 tons to drop the price from 18*l.* to 20*l.* to 9*l.*, and notwithstanding that the Welsh mines just live?—They have had a very precarious existence for many years, unfortunately.

17,311. Yes; but to follow your argument, with this Broken Hill ore still coming the price has now risen to 16*l.*?—That is the present price. That is exceptional. We have only had it for the last few days. It has gradually got up. It was as low as 9*l.*, and it has gradually got up with many fluctuations to 16*l.* Three months ago it was only about 13*l.* a ton, or something like that.

17,312. But your own estimate of the effect of any restriction of the use is that about 25 per cent. of the output would not be required for making white-lead paint. Surely the effect of the Broken Hill ore coming in was far more than 25 per cent. alteration in your output. Your outputs vary from 41,000 tons in 1896 to 28,500 in 1900. I am talking entirely of the United Kingdom?—Is that pig-lead or lead ore?

17,313. Lead ore?—The pig-lead would only be about three-fourths of that.

17,314. I have given the figures for lead ore each time. Twenty-five per cent. is all the reduction that the importation of 100,000 tons from Broken Hill made, which would hardly seem to justify your inference. Would 25 per cent. reduction have a more serious effect on the lead mines of Wales than the importation of that large amount from Broken Hill. At any time there may be a discovery of lead ore somewhere in the world?—But the importation into this country would not be more than 65,000 tons. 100,000 is the production.

17,315. I asked for your figure. I thought you gave rather a high figure, but I had not looked it up. The pig-lead is given here separately from the lead ore, so we have to make a calculation. Would you say about a quarter more for the ore?—It would be a third more.

17,316. Your figures are not so far wrong. There were about 75,000 tons raised in New South Wales and imported into this kingdom last year?—It is a little higher than I thought. I thought it was about 60,000 imported.

17,317. Still the lead mines live, and the proposed alteration is not going to be anything like as severe a test to the lead-mining industry of North Wales even if it produces the result which you yourself estimate?—I know how the importation of this extra quantity from Australia has affected the price, and if the consumption is reduced in the way that is suggested, I think I can maintain, with justice, that the presumption is that it will affect the mines of our district very seriously.

17,318. I am not putting before you any suggestion that it will do good to the industry for a moment, but I am only looking at the blow that the industry received when the Broken Hill importation came about, and suggesting to you that even on your own estimate nothing like a similar blow will be dealt to the industry if the use of lead in the production of paint is entirely abolished. And it is also possible, of course, to find lead elsewhere in the world which might deal an equal blow to you. You might ask us to hold our hands to-day and to-morrow, but they might find lead elsewhere and ruin your industry. It may be found in the Argentine or Brazil, and all the good we shall do will be to increase the product from the Argentine or Brazil and do you no good, and not protect our workpeople. You would not ask us to take up that position, would you?—We employ a great number of men who have been brought up in mining, who cannot turn their attention to any other industry, and they claim some consideration. You propose practically to extinguish us. We have been so handicapped in the past that we are on the verge of extinction now, and what you propose to do would, in my opinion, deal us the final blow.

17,319. But I point out that the blow, even if as heavy as you suggest, would not be as heavy a blow as you have received in the past, and although your industry is going down, you are still existing. You were raising 80,000 tons in 1877. That was the top figure you reached. This year you have only raised 28,500 tons. What is the cause?—It is not because the deposits are exhausted. We have proved in our district that we have as good a deposit as ever, but there is no encouragement to go after it because the price has been so low.

17,320. It is not the price I am dealing with. Your industry has come from 81,000 tons in 1877 to 28,500 tons in the present year, without any restriction in the use of lead for lead paint, and you are being hit elsewhere in the world. The finding of other mineral deposits seems to have a far greater influence on your trade than any question of the use or non-use of lead in paint?—That is your argument, but because we are handicapped in other ways, is that a justification for handicapping us further?

17,321. No, it is not, but I point out to you that had we in 1877 restricted the use of lead in paint, and the reduction of output which then followed had taken place, you would probably have put it on our shoulders, but I suggest that as a matter of fact the figures show that there would be no justification for it whatever. Your industry is one which has not been flourishing because of the extra mineral deposits that have been found in the world and have come into competition with you. This question of the use of lead in paint is quite a minor point?—I daresay it occurs to you why there has been such an excessive production. It is owing to the duty. The Americans impose a duty of 7*l.* per ton. When the price is 16*l.* in London it is 23*l.* in New York. The Australians impose a duty and ship the excess to this country at any price they can get for it. We have been terribly handicapped. I am not a Tariff Reformer, and I do not advocate duty.

17,322. Has Mexico a tariff?—I do not know.

17,323. Before going further into this question of the importation of American lead, let me tell you that information will be given to us later on that American lead does not come into England because of the high wages, but that Mexican lead does. The bulk of the American lead does not affect the market. The person who has apparently looked up the question does not agree with you, so I suggest you should not be so emphatic on the point?—The American lead is quoted in the statistics. I always thought that it was the excess of production in the United States.

17,324. Now you made a statement which astonished me. You said that the bulk of zinc ore contains lead, and that it was by obtaining lead from this ore that the industry exists. May I read to you from a White Paper on Dangerous or Injurious Processes [Cd. 5152]. With regard to zinc ores, "Lead occurs in zinc ores as an impurity. Its presence is undesirable. It is present in amounts varying between 1 per cent. and 10 per cent. About 3 per cent. is the average"?—In some

21 March 1912.]

Captain MATTHEW FRANÇOIS.

[Continued.]

cases the zinc ore preponderates, but it is nearly always associated with lead.

17,325. I am speaking of the zinc ore dealt with by the spelter manufacturer. The only ore which contains any thing like 10 per cent. is the Broken Hill ore, which is used in one smelting factory only and they have to get rid of it?—I know mines in Wales where there is scarcely any lead associated with it; it is pure. At Halkyn lead would form about 30 per cent.

17,326. I suggest that the English smelter never uses ores which contain an appreciably high percentage of lead. He will not use them?—We separate the zinc ore from the lead ore.

17,327. You separate it out first?—We separate it out first.

17,328. You could not afford to separate the two out unless you could get value for your lead?—No.

17,329. You consider that it would be fairly simple to follow out the precautions that you suggest? At present at your mines do you supply washing accommodation for the men?—No.

17,330. It is suggested in the Coal Mines Bill?—We supply places for them to change, but not washing accommodation. There is no necessity in our case.

17,331. I only wondered whether you did?—It is a comparatively clean occupation—lead mining.

17,332. So that you have no experience with regard to the supplying of washing accommodation?—No.

17,333. (Mr. Gardner.) You speak at the end of paragraph 17,244 of the training and education of the men who use white lead. What do you mean by that? Do you mean that no one should be allowed to use

white-lead paints unless he had been previously trained in the use of them?—I do not think I have made any observation to the effect that you have mentioned. It is not in my evidence, I think.

17,334. You say just at the very end of your evidence: "The true remedy to be applied is the regulation of the conditions under which the dangerous article is used, and the training and education of the men who use it to the nature of the risks which they are running." Do you mean that no men should be allowed to use white-lead paint unless they have had a previous education and training?—I think it desirable that the men who use it should be apprenticed and should be habituated to the regulations.

17,335. And to the use of paint?—Yes.

17,336. That is to prevent adult workers from going into a trade and using an article of which they know nothing?—Yes.

17,337. You speak about washing accommodation being provided as one of the regulations?—I think it is desirable.

17,338. I suppose you do not know that there are great difficulties in the way of providing washing accommodation; do you know, for instance, that washing accommodation should be provided in workshops coming under the Factories Act for men who are using paint? We are continually receiving complaints about the lack of washing accommodation in factories?—I am not associated with factories.

17,339. That is a difficulty even where you have men massed together in great numbers, whereas in the house-painting trade you have men working in twos, threes, and dozens?—Yes.

The witness withdrew.

Mr. EDWARD NOEL HUMPHREYS.

Evidence to 17,350 handed in and taken as read; witness then called and examined.

17,340. I am a Fellow of the Institute of Chartered Accountants, having my office at Old Bank Buildings, Chester. I have been personally acquainted with the lead mines of the Flintshire district for the past twenty-five years.

17,341-3. I am now, and have been for some years, a director of the East Halkyn Mining Co., Ltd., and joint managing director of the New North Halkyn Mines, Ltd. The registered office of each of these companies is at my office, and all their business passes through my hands.

The capital expenditure of the above two companies has been:—

|                              |            |
|------------------------------|------------|
| East Halkyn Mining Co., Ltd. | - 50,916l. |
| New North Halkyn Mines, Ltd. | - 20,215l. |

The average number of men employed by these companies is about 200, and the average amount of wages paid, 11,000l. to 12,000l. per annum. The average price of lead ore over a number of years has been small, and only a bare margin of profit is made by the successful mines, while others make nothing. For example, the average dividend paid by the East Halkyn Co. (which is considered a very successful mine) during the last four years has only been 15 per cent. per annum, out of which shareholders have to make their own sinking fund to replace capital; while the New North Halkyn Mines, Ltd., has been working since its commencement, upwards of seven years ago, without earning any profits at all, though it has spent already 20,215l. I am informed by the South Halkyn and Rhydymwyn Co. (whose invested capital is 50,000l., and who pay an average of 4,200l. in wages per annum) that their dividend for the past ten years has averaged only 6 per cent. per annum. I am informed by the Pantymwyn Mining Co., whose invested capital is 33,500l., and who pay an average of 3,800l. wages per annum, that they have paid only one dividend during the past 10 years, or an average of 1 per cent. per annum.

17,344. I have the negotiation for sale of the output from both the above mines, and am able to say that any reduction in the demand for Welsh lead ore would at once prejudice the price, and this would most seriously affect the lead-mining industry.

17,345. I am acquainted with seven other lead-mining companies now in operation in the county of Flint, whose invested capital, added to that of the East Halkyn Co. and New North Halkyn Co., exceeds a quarter of a million pounds, and the total number of men employed will exceed 500. There is also a sum of 75,570l. invested in the Halkyn District Mines Drainage Co. in the construction of a drainage tunnel in the district, which depends entirely on lead-mining industry for a return by way of royalty, as the mines are only able to work by reason of the gravitation drainage this tunnel affords.

17,346. The lead-mining industry is, therefore, a most important one of the county of Flint, giving employment, directly and indirectly, to a large number of men, who, being brought up in this industry, would not be able readily to turn to other employment.

17,347. I am informed that about 25 per cent. of the output of Welsh lead is used by white-lead corrodors, and if the use of white lead is prohibited, it would so reduce the demand as to cause a serious reaction upon the price of lead ore. This would in its turn extinguish the present small margin of profit to those venturing capital, and must result in diverting capital from the lead-mining industry, thus causing the closing of mines and throwing out of employment the men now engaged therein.

17,348. I am able to say of my own knowledge that the industry of lead mining involves no special danger to health to those engaged in it by reason of the lead produced. Those engaged in this industry are accustomed to deal with substances even more dangerous than white lead, but there is not found any practical difficulty in defining by regulation the methods of their use, and the men who use the substances are well aware of the dangers to be avoided, and are carefully trained to follow the regulations laid down.

17,349. It is submitted that there is an element of danger inseparable from the pursuit of certain trades, and that the danger to which the painter is or may be exposed by the use of white lead is less than the risk of many industrial occupations.

21 March 1912.]

Mr. EDWARD NOEL HUMPHREYS.

[Continued.]

17,350. It is further submitted that, having regard to the importance of the industry, the true principle to apply is suitably to regulate the conditions under which the dangerous use does or may take place, and, by the education and training of the men using it, to reduce the risk to its lowest point, if not to eliminate it altogether.

17,351. (Chairman.) I understand that you are a director of two lead-mining companies in North Wales?—Yes.

17,352. You say that you are informed that about 25 per cent. of the output of Welsh lead is used by white-lead corrodors. Would you tell us who your informant was?—My last informant was a smelter.

17,353. But do you make a statement of that importance on the information of one smelter?—No. The previous information we got from the London Chamber of Commerce.

17,354. Shall I ask you again; who informed you that 25 per cent. of the output of Welsh lead is used by white-lead corrodors?—The London Chamber of Commerce.

17,355. Can you tell us whether it was published in any document?—That I do not know.

17,356. Who told you at the London Chamber of Commerce?—That came to us in a circular letter last June.

17,357. Was it from the Corrodors' Section of the London Chamber of Commerce?—This is a circular signed by Charles E. Musgrave, the secretary.

17,358. You have taken the information, that you have given us in your proof of evidence, from this circular?—I thought I would verify that by making an independent inquiry from smelters.

17,359. Have you inquired of more than one smelter?—No; from one firm of smelters only.

17,360. And did that firm verify it?—They put it at 20 to 25.

17,361. Even if we accept the estimate that you have given us on the strength of that information, there remains three-fourths of the demand for pig-lead unaffected?—Yes, that would be so.

17,362. You are no doubt aware that only about one-ninth of the pig-lead used in this country is the product of British mines?—Yes, that would be so. There is this to be said, that the lead ore produced in this country is low in its percentage of silver, and high in lead, which makes it more suitable than other ores for certain purposes.

17,363. What reason have you for believing that the producers of white lead in this country will be disastrously affected by the reduction in the demand for pig-lead by 25 per cent.?—We have to sell our lead upon the basis of the pig-lead prices, and we have always found (it is a matter of common knowledge to anyone engaged in the industry) that the actual price depends not upon the total, so to speak, as upon the margin of overlapping between the supply and the demand.

17,364. The total consumption of pig-lead in this country is about 180,000 tons per annum. A reduction of one-fourth would leave the demand at about 135,000 tons per annum, would it not?—Yes.

17,365. The total home production of pig-lead is about 20,000 tons. Why should this home production of 20,000 tons be affected at all if the demand in this country remained as high as 135,000 tons?—But if you withdraw 25 per cent. of the demand, you are withdrawing a serious percentage of the demand, and particularly at certain times and conditions of trade. You are coming to just that point of overlapping or the narrow approach of the supply and demand which affects prices out of all proportion to its own figures.

17,366. I do not understand that; but I will put it in this way; why should not the importer of foreign pig-lead suffer at any rate eight-ninths of the loss, if not the whole, seeing that the demand for pig-lead in this country would still be nearly seven times what the native mines can produce?—Well, I am unable to say.

17,367. Then your suggestion of the disastrous effect is purely hypothetical?—No.

17,368. Then I must put my question again to you if you do not admit that. It is either one or the other.

This is the question which you say you cannot answer. Why should not the importer of foreign pig lead suffer at any rate eight-ninths of the loss, if not the whole, seeing that the demand for pig-lead in this country would still be nearly seven times what the home mines could supply?—Well, that is not how it appears to us to go. If you have even 1 per cent. excess supply, you will affect the price out of all proportion to even the 1 per cent., and if you withdraw your demand so that your demand is 1 per cent. below you will affect the price.

17,369. But you have not answered the question: I want to know why the foreign importers should not suffer proportionately? I cannot say why they should not, but I do not admit that they would.

17,370. You cannot answer the question at all, so that the corollary of that is that your suggestion, that it would have a disastrous effect is hypothetical?—I do not agree that it is purely hypothetical. I say that it is a matter of common knowledge that if you withdraw any serious percentage of the demand for an article, you affect the price; and you affect the price out of proportion to the percentage you withdraw from demand if you bring it to the point when the demand falls below your supply.

17,371. Then why should not the foreign importers suffer proportionately to the English supplies of pig-lead?—I cannot say why they should not. I do not quite know that we, producing ore of the class that I mentioned, with a high percentage of lead, should not possibly suffer even out of proportion to the others.

17,372. But that is hypothetical?—I grant that it is hypothetical.

17,373. Then I think that I will leave it where it is. Now, in the paragraph 17,348 of your evidence you state that workers engaged in lead mining are accustomed to dealing with substances even more dangerous than white lead. Will you kindly tell us what substances you are referring to?—Blasting gelatine (high explosive).

17,374. You state that the danger of handling those substances is removed by regulations?—Yes.

17,375. Those substances, however, are entirely handled on your own premises, and under close inspection by your own officials as well as by inspectors of mines. Is that not so?—Yes.

17,376. How would it be possible, then, to apply any such inspection to painting operations which are scattered throughout the country and are carried on for a few days, or at most a few weeks, at a time in the private dwellings of the house decorator's customers? Do you know anything about the intricacies of house-painting operations?—Well, I know what a business man, a man who is accustomed to employ painters and so on, knows and sees. I am not in the trade or interested in the trade.

17,377. But do you know the various operations that a painter would have to be engaged in ordinary house-painting operations?—Do you mean in the preparation of the colour or the preparation of the substance for the colour and putting it on?

17,378. I mean the actual work—the painting, the rubbing, the messing of his hands, the stippling and all the rest of it. Do you know anything about those operations?—Yes; I know what a man sees.

17,379. Do you know that these operations are likely to engender, in the course of a day's work, a considerable amount of dust?—I know you cannot work on dry surfaces without engendering dust. That is true.

17,380. Do you know of your own knowledge any regulations that could be introduced to remove those dangers?—To minimise the danger of dust, not to remove it altogether. You cannot work on a dry surface without some dust.

17,381. So that your illustration in regard to these workmen in your industry, who handle dangerous substances and who are protected by regulations, would not apply to house-painting operatives in the same way?—For instance, as to the handling of explosives in frosty weather, it is necessary for them to heat the gelatine. They might very easily get into trouble if they did not do it carefully.

21 March 1912.]

Mr. EDWARD NOEL HUMPHREYS.

[Continued.]

17,382. I am not questioning the danger of the operations which may obtain in your industry, but I am asking you whether you can suggest from your own knowledge any regulations which would remove the dangers that I have depicted which occur in house-painting?—You cannot remove dust from a dry operation.

17,383. (Mr. Fell.) Can you say at all what percentage of the lead that is produced is used for white lead manufacture?—Are you speaking of our particular lead?

17,384. Yes?—No; I am not able to say that; we cannot follow it.

17,385. (Mr. Parsonage.) You say in your proof that the average number of men employed by these companies is about 200 (East Halkyn Mining Co., Ltd.; New North Halkyn Mines, Ltd.)?—Yes.

17,386. The average amount of wages paid is 11,000*l.* to 12,000*l.* per annum?—Yes.

17,387. Is a large proportion of boys employed?—Not a large proportion; but there is a proportion of boys.

17,388. About what would be the number?—I would not like to say offhand, but it is not a large proportion.

17,389. 12,000*l.* per annum would include the wages of the managers, and the higher-paid officials too?—I think not.

17,390. Only the workmen?—Only the workmen.

17,391. One mine has paid an average dividend of 1 per cent. per annum. Do you think it is worth while trying to save an industry which cannot pay a living wage to its workmen and can only pay 1 per cent. interest on its capital?—The average rate of wages works out at 2*s.* per week. We do not admit that it is not a living wage.

17,392. Well, calculations of the cost of living at the present day show that 2*s.* per week for an adult workman, having perhaps, a family to keep on it, is not a living wage; and if on those wages you can only pay 1 per cent. I should say that the sooner the mine was closed the better and the men given a chance to earn a

higher rate of wages at some other industry?—Any material fall in the price of this lead ore will have that effect, undoubtedly. Their hour shifts are not long, and they live up there, and a good many of them have their cottage and pigs and garden.

17,393. (Lord Henry Bentinck.) It depends on the rent that they pay. What is it?—Perhaps a couple of shillings a week.

17,394. Then they are not getting a bad wage?—No.

17,395. (Mr. Robins.) You lay special stress on educating men to the dangers of these dangerous products. Do you make provision in your mine for educating your men to the danger?—In what way do you mean?

17,396. Do you make provision for educating your men to the danger of their occupation?—It is explained to them. They learn it as they come on. The danger of the substance is explained to them and they are acquainted with it.

17,397. Are there courses of classes for youths and boys?—Do you mean particularly in regard to the employment of these substances?

17,398. Yes?—No.

17,399. You point out that they should be educated to recognise the danger of their occupation and you lay stress on that, and I say do you educate your men in a manner like that which you have recommended here?—We make sufficiently clear to them the danger of the substance they are using, and they are able to follow and observe the regulations which are laid down. We do not put them to school for it.

17,400. But, at the same time, there is no special effort made in that direction?—I did not think I was suggesting that they should be put to school. In this case it is a matter of hygiene and cleanliness, and so on, in the use of this substance.

17,401. You carry out that in your mine?—Yes, there is a change house. Our miners change their clothes when they go down and when they come up, and so on. Their things are dried and various things are done.

The witness withdrew.

Mr. HENRY GARDNER.

Evidence to 17,407 handed in and taken as read; witness then called and examined.

17,402. I am a director of the firm of Henry R. Merton & Co., Limited, and the Merton Metallurgical Co., Limited, who carry on business both in London and in Frankfort as metal merchants. I have had 35 years' experience of the metal trade in general, and am well acquainted with the circumstances of the lead trade in particular. My firm are responsible for the production of the annual volume of "Comparative Statistics of Lead and other Metals," which is the standard statistical record for the metal market.

17,403. For some considerable time the prices of lead have been very unremunerative, owing principally to the increased production in Germany, America, Spain, and Australia, which has also caused Great Britain, once the first producer of lead, now to be subordinate.

17,404. It has been estimated that the consumption of lead in Great Britain for corrosion into white lead is about 45,000 tons, and that of red lead and litharge about 12,000 tons. The whole world production has been calculated at about 1,100,000 tons, or if the 370,000 tons produced in America be taken out of the calculation, as owing to the American tariff the bulk of this does not affect the market, the whole world production may be taken at 730,000 tons. I do not include Mexican lead in deducting American lead, as Mexican lead comes on to the English market at cheap prices.

17,405. If the use of lead compounds were to be prohibited for house-painting and coach-painting, this would decrease the demand by a very large percentage of the 57,000 tons used for white lead and red lead and litharge, and would have the effect of decreasing the world prices. There is no probability of

the development of any new channels of consumption which would carry off the excess supply.

17,406. British lead is of very good quality and peculiarly adapted for the manufacture of white lead. British mines, however, are specially expensive to work; and whereas in other parts of the world lead is produced in conjunction with silver and gold, and the prices of lead are therefore not of primary importance to the working of such mines, this is not the case in Great Britain. The reduction of prices would, therefore, practically result in the closing down of British mines which have already been worked for some time at a very slender margin of profit.

17,407. There is also no doubt that such a prohibition would most seriously affect, and probably destroy, the special industry which deals with the production of double refined lead and production of selected raw material free from small impurities which are specially required by white-lead corrodors. Desilverisers use raw materials from various sources, and the apparatus of selection is by way of an analysis of the impurities, and a special price is always to be obtained for such selection.

17,408. (Chairman.) You are a director of two firms who carry on business in London and Frankfort as metal merchants?—Yes.

17,409. You state that for some considerable time the prices of lead have been unprofitable?—That refers to the English makers.

17,410. Is there not a likelihood that this state of affairs may tend to increase?—At the present moment the price of lead is better than it has been for some considerable time. Since last October there has been quite a good market, and the price paid is about 3*l.* per

21 March 1912.]

Mr. HENRY GARDNER.

[Continued]

ton over the average price of last year; but these things are apt to alter, and we do not know what the future may bring.

17,411. Accepting for a moment the standpoint of your own evidence, if the price dropped the manufacture of lead and lead compounds in this country would altogether cease to be profitable?—Yes.

17,412. On the other hand, you admit that there has been a considerable increase in the price of lead quite lately?—Yes.

17,413. Has not there been a rise in the price of lead for the last three years?—No, I do not think there has. I think that I can give you the average figures. The price has remained at about 13*l.* for some time past. The average price for 1910 was 13*l.* 1*s.* over the whole year; for 1909, 13*l.* 1*s.* 8*d.*; for 1908, 13*l.* 10*s.* 5*d.* In 1907 there was a high price—19*l.*

17,414. What was the 1911 price?—About 13*l.* It is not worked out here.

17,415. You have had rather a large increase these last few months?—Yes.

17,416. (Mr. Sutherland.) Are you speaking of blue lead?—Yes.

17,417. What is the price to-day?—16*l.* 5*s.*

17,418. (Chairman.) Has this increase that has recently occurred in the price of pig-lead been owing to the combination of the employers?—It has partly been that. There is a selling agency. We are the selling agency, and we have regulated sales in such a way as not to press upon the market; that, in conjunction with an improvement in trade, has enabled us to put the price up.

17,419. I notice, in the table published by the Board of Trade in the Mines Report, Part III., for 1910, that the prices of foreign lead were lower than those for English. Can you tell us why?—The reason is that the English lead is of rather better value for some purposes than the foreign lead. It can be used for more purposes.

17,420. For what purposes?—People like it very much for white lead. It is a purer lead.

17,421. Are there any other reasons?—It is a great favourite for chemical lead, as it is called; that is, for making tanks containing acid. English lead goes up and down with foreign lead. There is a certain amount of preference given to English lead, but it does not stand by itself. "English lead" is not merely the product of British mines—but is a product of English smelting and desilverising work; but we are talking here of the effect upon the English lead mines.

17,422. (Dr. Collins.) English lead keeps its price above foreign lead?—The margin varies from perhaps 2*s.* 6*d.* per ton to 7*s.* 6*d.* per ton.

17,423. (Chairman.) You state that the consumption of lead in Great Britain for corrosion into white lead is about 45,000 tons?—Yes.

17,424. And the total consumption of pig-lead in this country is 180,000 tons?—Yes.

17,425. Therefore, if the manufacture of white lead ceased, there would still be a demand for about 135,000 tons of pig-lead in this country?—Yes.

17,426. The output of the British lead mines is about 20,000 tons, is it not?—I think it is more than that. I think it is nearer 30,000 tons.

17,427. Other witnesses have told us 20,000; will you take that figure?—I have no figures to controvert that.

17,428. You state that British lead is of very good quality?—Yes.

17,429. Can you give any sufficient reasons for believing that there would not still be a market for the 20,000 tons of home lead of good quality; seeing that the total demand for pig-lead in this country would still be almost seven times the amount that was supplied from the home mines?—I do not think that anyone would say for a moment that you could not sell all the lead manufactured in Great Britain very easily for other purposes, but that is not the point.

17,430. Would you kindly tell us what the point is?—The point is that if the use of white lead ceased or partially ceased there would be less lead required all over the world, and that small amount might have the effect of putting prices down. If prices were put

down, English lead miners and smelters would get such a bad price for their lead that they could not go on.

17,431. What you fear is not that there would be such a diminution in the use of lead as to make it difficult to sell the English lead?—Not at all.

17,432. But that it might affect the price here and in foreign countries?—It would affect the general price of lead all over the world. If you have a scale which exactly balances, and you put the smallest weight on one side or the other, the scale goes down.

17,433. What are your reasons for the opinion you hold?—The lead market, like all the other markets in the world, is in a state of equilibrium more or less. A little more consumption will make the price go up; a little less will make the price go down.

17,434. When did the Broken Hill mines begin to compete with the lead industries of the world and send their lead into this country?—About 1890.

17,435. What is the output of the Broken Hill mines?—The ordinary lead that comes over here is something like 80,000 tons, and silver lead comes over for desilverising purposes.

17,436. That is very considerably more than the total output of the English mines?—Yes.

17,437. Did the advent of lead from Broken Hill seriously interfere with English prices?—Yes; it put the price down in 1894 to 9*l.* 11*s.* 6*d.* average for the year. It had been, in 1890, 13*l.* 7*s.* I have no previous figures with me.

17,438. It has recovered itself to such an extent that it is now 16*l.* 5*s.*?—Yes; things do adjust themselves in this world, fortunately.

17,439. And do not you think that things will adjust themselves equally if lead were prohibited in house-painting?—I think from a broad point of view things would adjust themselves, but in the meantime a difficult situation is created.

17,440. You are bound as a lead manufacturer to be pessimistic?—I am not a lead manufacturer; I am a lead merchant, and it does not matter very much to me whether the price of lead is 16*l.* or 10*l.*

17,441. But your suggestion that these dire conditions are going to be brought about is purely hypothetical?—You can argue from experience.

17,442. I do. I take the advent of the lead found in the Broken Hill mine, and I say that it probably had the effect of lowering the price, but that has been re-adjusted in the course of time?—The chief reasons of the re-adjustment has been the very large increase in the use of lead for covering electric cables. No doubt that will go on increasing to a certain extent. And there may be other things. You see, you are knocking out one source of demand entirely.

17,443. But that does not amount in the aggregate to anything like the effect of the importation of lead from the Broken Hill mines?—That is quite true, but I do not think your argument is very good. If you look back at the whole history of the lead market, you will find that in the last 20 years it has increased nearly 50 per cent.

17,444. (Mr. Sutherland.) The price?—I refer to the production and the consumption. If you wipe out one part of the trade entirely, you have nothing to replace that.

17,445. (Chairman.) You are extremely pessimistic in regard to the lowering of the price of lead, because you say there will be a certain decreased quantity used if we prohibit lead in the house-painting industry?—Yes.

17,446. I point out to you that when the Broken Hill began to send lead to this country it was very much larger in quantity than the amount by which the demand would be depleted by the prohibition of lead in the house-painting industry?—That is quite right. The point I want to make is that the way in which that was adjusted was by a new industry springing up.

17,447. Then you must remember that a new industry may spring up?—That is what we have to pray for. If we pray hard enough, no doubt we shall get it.

17,448. In paragraph 17,407 of your evidence you refer to desilverisers?—Yes.

21 March 1912.]

Mr. HENRY GARDNER,

[Continued,

17,449 Do you mean that desilverisers endeavour to obtain specially pure lead for their work?—Yes, they try to get it as pure as possible, but that is not an absolute necessity. What is wanted is a pure lead for white-lead making.

17,450. I want to ask you in what way can this possibly bear on the lead question which is before us?—The argument there is that people like to have English lead and object very much if they cannot get it, which they are afraid they will not do if the price goes down too much.

17,451. I should think they would get more of it if the price goes down?—No, they will not, not English lead.

17,452. Why?—Very few of the English mines are making any money at all.

17,453. You have said that they will sell their lead if they make it?—But if the price was to remain at the level of 13*l.*, in a few years you would find none was made.

17,454. When it went to 9*l.* a ton they did not cease to make it?—People do not all die all at once.

17,455. They have been a long time dying?—At that time the production of English lead was between 60,000 and 70,000 tons a year.

17,456. You have recently made an employers' combination?—Yes.

17,457. Will not that assist you in keeping up prices?—We are doing our best for all our friends to keep prices up.

17,458. And I suppose that that will continue?—I hope so.

17,459. (*Lord Henry Bontinck.*) If the market was very adverse to you, you could not keep up your combination?—We should have to adapt ourselves to circumstances.

17,460. You are in a strong position now?—Yes.

17,461. There is no reason to think that the abolition of white-lead paint would deal such a blow to your industry. You are strong enough to form a combination?—At the present time the lead market is in an exceedingly favourable position, and 30,000 or 40,000 tons dropping out might not affect it, but then you have the other side of the picture; you do not have always one side.

17,462. "Sufficient for the day"?—But are you looking sufficiently ahead?

17,463. The price of raw material inclines to go up, if anything, all over the world?—Yes.

17,464. There is no tendency to a fall anyhow?—Not at present.

17,465. (*Dr. Collis.*) You stated that when lead was 9*l.* a ton about 60,000 or 70,000 tons of ore were being raised?—No, previously to that period 60,000 or 70,000 tons of lead were being produced in the United Kingdom.

17,466. How long before that?—I cannot give you the exact date, but I should think within the last thirty years.

17,467. You have to go back some years to get 60,000?—What was it in 1894?

17,468. 40,500. It would appear that there had been a great fall in the amount of lead ore raised in England even before the Broken Hill lead came in to interfere with the situation?—There was, undoubtedly.

17,469. It had fallen from 80,000 in 1877 to 40,000 in 1893?—In 1877 the price of English lead was 20*l.* 1*l.* 3*d.*; in 1894 it had fallen to 9*l.* 1*l.* 6*d.* Taking the figures for 1878 and the next year, that rather supports the argument.

17,470. But, quite apart from the Broken Hill production interfering with the situation, the amount of ore got had halved itself between 1877 and 1892?—Yes; but I did not state that the Broken Hill production was the only factor that had caused the fall in the price of lead.

17,471. Nor did I. From when we had the Broken Hill importation, about 1892 or 1893, the price of lead has steadily risen; but notwithstanding the rise in the price of lead, the quantity of ore raised has fallen from 40,500 to 28,500?—Yes.

17,472. So that is against you?—I do not agree with that. It simply proves that the price of lead is not sufficient to encourage the British people to produce it.

17,473. Take 1910, when it was 13*l.* 9*s.* 2*d.* In 1899 it was 15*l.* You have to go back to 1899, when the price was below the price of to-day. In 1889, 48,000 tons were got, 20,000 tons more than now, at the same price?—But you must not forget that the last two or three years the average price has been only 13*l.*

17,474. But the average prices just before the year I quoted were very close—13*l.*, 12*l.*, 13*l.*, 11*l.*?—You mean prior to 1899?

17,475. Yes?—Yes.

17,476. The price of ore got was far in excess of what is got now. My point is that the amount of ore got does not seem to bear any relation whatever to the price per ton of lead?—These British producers have been fighting a losing battle all along.

17,477. I grant that they are fighting a losing battle. Notwithstanding the fluctuations that the table shows in price, there is a steady fall in the quantity of ore got?—There is no doubt at all about that.

17,478. There has been a greater reduction of output than 25 per cent., notwithstanding that the price rules where the price was before, and there is nothing to show that the matter of 25 per cent. reduction of output is ruled by the price of lead?—I think that if you were to go into the balance-sheets and profit and loss accounts of some of these English lead people you would find that, as I say, they have been fighting a losing battle all along. They have made very little money, and a series of low-price years is not by any means compensated by one or two years of better prices.

17,479. The amount of ore they raise in better-price years would certainly seem to show that your contention is not substantiated by the figures. Take the year 1883, 56,000; it has fallen in 1910 to 28,000 without any marked alteration whatever in the price of lead. So that it does not seem that a slightly decreased production will have much influence on the price. The relation does not hold. The two curves do not run together. If they ran together I should agree with your argument, but they do not?—Take the curve from 1877, the 20*l.* price, to the price of last year; you get the two things running absolutely together.

17,480. No, they do not. You fall in 1884 to 11*l.*, and you have a rise again. The fall of production is even, but the fall of price varies with constant ups and downs?—You cannot make money out of a lead mine if you only have one or two good years and all the rest of the years are bad. You have to take the average of the whole period. You may make a loss one year, and get it back in the next year, but you have to take the average.

17,481. The ten-year average of 1900 to 1910 for the price of ore is considerably higher than the average price of ore from 1890 to 1900. At the same time it is quite the reverse with regard to the amount of ore got?—That does not get rid of my argument that the price from 1900 to 1910 was not high enough to be remunerative.

17,482. The production still goes on falling the whole time. The obvious arguments from these figures is that if you are dealing with an industry in such a position as this, the influence of anything that may be done in the way of limiting the amount of lead required in the production of white lead is infinitesimal, or rather not so great as the influence brought on the lead-mining industry from other sources?—I put it in this way: that now you have arrived at the survival of the fittest, and if you reduce the price of lead you will extinguish the industry.

17,483. Your point is that the mines which are now raising ore are the fittest of the mines in England?—Yes.

(*Dr. Collis.*) That is a new light.

17,484. (*Mr. Sutherland.*) Is the English ore purer than the foreign for the manufacture of white lead?—It is of a purer character. It does not contain so much silver, and does not require to be refined to the same extent, and does not as a rule contain bismuth or arsenic or any deleterious matter.

21 March 1912.]

Mr. HENRY GARDNER.

[Continued.]

17,485. When they get to the point at which the corrodors get them, they all have to go through a preparatory process?—Most of the foreign lead which comes in for white lead purposes is what we call "double refined." It goes through the ordinary refining process to make it soft lead, and it is refined again to make it into corrodors lead. The English lead is only once refined.

17,486. And yet foreign lead can compete with English lead, notwithstanding the double process?—

Yes, because nearly all the foreign lead contains precious metals to some extent.

17,487. Why has not the production of British lead responded to the increased outlets for lead which you have referred to?—Because they can only produce it at a very small profit.

17,488. (Mr. Mason.) Has the cost of producing the ore increased in England?—It has increased to some moderate extent, owing to natural causes.

The witness withdrew.

Mr. JULIUS MATTON.

Evidence to 17,495 handed in and taken as read; witness then called and examined.

17,489. I am a member of the Metal Exchange, and have carried on business in London for 35 years in the lead trade, after having been employed for nine years in the same branch. It has been part of my business to devote special attention to the statistics of lead production and consumption, and my statistics are still subscribed to all over the world. I estimate that the total consumption of lead in England is about 200,000 tons, of which approximately 45,000 tons are used for corrosion into white lead and 12,000 for red lead and litharge.

17,490. My estimate of the figures is as follows:—

Estimate of Consumption in Great Britain.

|  | Tons.     | Tons.          |
|--|-----------|----------------|
| Pig lead, pipe, and sheet                        | - 117,000 |                |
| Less—Old lead                                    | - 8,000   |                |
|  |           | 109,000        |
| White lead                                       | - - - -   | 45,000         |
| Red lead and litharge                            | - - - -   | 12,000         |
| Other uses, particularly electrical accumulators | - - - -   | 42,000         |
|  |           | <u>208,000</u> |

17,491. A very large percentage of the white lead and red lead is for use in house-painting and coach-painting.

17,492. I estimate the whole world production of lead to be approximately 1,100,000 tons. For the purpose of calculating the effect of the decreased demand which would be caused by the prohibition of the use of lead compounds for house-painting and coach-painting I would err on the side of caution and deduct 370,000 tons of the United States of America, because at any rate the greater part of this does not come into competition owing to the United States protective policy; this would leave a total world production of 730,000 tons. The sudden diminution of demand by the greater part of 57,000 tons which are at present required in Great Britain for white lead and red lead and litharge could not fail to have a very serious effect on prices, which have already been depressed for a long period.

17,493. Such a decrease in price would have a very serious consequence for Great Britain and for British industries, and in particular for the lead-mining industry, which has already been working for many years at barely remunerative profits; indeed, some mines have already been given up in consequence of low prices. The product of British mines is good and peculiarly adapted for the manufacture of white lead, for which reason it has had a preference over the product of foreign mines.

17,494. The cost of production for British mines is very much greater than for others, such as the Australian and the Spanish, and they would be even more directly affected than foreign mines by a decrease of price, because in most other mines the lead is produced with gold or silver, and is therefore in a sense a bye-product, so that the price of lead is for such mines only of secondary importance.

17,495. There can be no doubt that the result of prohibition of the use of lead compounds for house-painting, &c., would be the practical destruction of the British lead-mining industry.

17,496. (Chairman.) You have been a lead merchant for a great number of years, have you not?—Yes, I have been in the trade for 44 years.

17,497. You estimate the consumption of pig-lead in this country at about 200,000 tons?—Yes; a little bit more now.

17,498. Do you know that the Board of Trade returns give an average for the last few years of, roughly, 180,000 tons. That is very near your own estimate?—I am very close to those figures.

17,499. Of this you estimate that 45,000 tons is used for corrosion into white lead, and a further 12,000 tons for red lead and litharge?—Yes.

17,500. In paragraph 17,492 of your evidence you lay stress on the effect which would be produced by the sudden diminution of demand by the greater part of 57,000 tons?—Yes.

17,501. Why should the diminution of demand be sudden?—If white lead was prohibited, there would be so much less used in this country.

17,502. Is it your opinion that market conditions would adjust themselves if the element of suddenness were obviated?—I do not think that such a large quantity taken from what is sold on the market would be easily adjusted.

17,503. If, for instance, two years were allowed before any measure of prohibition came into force?—It is my opinion that the production of lead at present is already more than the consumption.

17,504. One witness who has recently been before us told us that, even if white lead were prohibited, there would be no difficulty whatever in selling the lead in other quarters?—Of course, I do not know what another witness has told you.

17,505. Your opinion is that that is not the case?—I do not think that it is. At present the lead is in the hands of a very strong syndicate, of which the witness before me is one of the heads. At present they have got the price up by taking care of the stocks of lead.

17,506. The total consumption of pig-lead in this country is, as I say, about 180,000 tons per annum, according to the Board of Trade returns. A reduction of one quarter would leave the demand at about 135,000 tons, would it not?—Yes.

17,507. The total home production of pig-lead is about 20,000 tons?—Yes, apart from that produced in the United Kingdom from colonial and foreign ores and bullion.

17,508. Why should this home production of 20,000 tons be affected at all if the demand in this country remains as high as 135,000 tons?—As soon as you threw 30,000 tons on the market, or even more, the price would naturally go down, and the mining industry in this country already gives a very poor profit. I will tell you how the price acts on the production. I have here the figures for 1877, when the average price was 20l. 3s. and the production was 61,403 tons. Three years after we have the average price at 16l., and the production goes down to 56,949. In 1886 the price is down to 12l. 16s. and the production to 39,482 tons. Then, again, six years afterwards, in 1892, the price is 10l. 9s. 6d. and the production goes down to 29,654 tons. In 1896 it is 11l. 3s. 3d. The production goes a little bit higher again—to 30,316. In 1902 the price is 11l. 2s. 7d.

M m

x 7790

21 March 1912.]

Mr. JULIUS MATTON.

[Continued.]

17,509. Now let us take 1900?—In 1900 the price is 17l. and the production 24,964 tons. Then it must be remembered that two years before the price was much lower. The production had gone down.

17,510. The two years before had been a little lower, but very much higher than 1896?—In 1899 the price was only 14l. 18s. 7d.

17,511. Yes. What was it in 1898?—12l. 19s. 9d.

17,512. So there was a general increase in the price between 1896 and 1900?—Yes.

17,513. Do you wish to state that when the price is low the production falls too?—Yes. Then you must remember that the production cannot be increased at once. The two previous years had been very low in price, and so the production had gradually fallen off. So that even at the high price of 17l., we cannot get the production up so quickly. And that was a phenomenal year. The next year was 12l. 10s. 9d. again.

17,514. Give me the 1901 figures?—12l. 10s. 9d. and the production 20,034 tons.

17,515. 1902?—11l. 2s. 7d. and the production 17,704 tons.

17,516. 1903?—11l. 11s. 8d. and the production 19,958.

17,517. It goes up again there, you see, does it not? Now take 1904?—I am afraid that I have not the figures here for 1904. I have them for 1903 and 1910. The fact is that if the price goes down so the production must. Those mines which cannot produce at that price must shut up.

17,518. Why should not the importer of foreign pig-lead suffer at any rate eight-ninths of the loss, if not the whole, seeing that the demand for pig-lead in this country would still be nearly seven times what the home mines can supply?—Lead is produced now, for instance, in Australia, at a much cheaper rate than here. The mines are more productive there. They make a very good profit out of it at 13l. or 12l. They want to sell the lead, and they beat the mines here. As long as they can get a profit they sell their lead.

17,519. Yes, but there is a syndicate existing now to keep the prices up, you told us?—Yes, by taking care of the stocks, but they would not be able to carry the 45,000 tons for any length of time. They carry now 10,000 to 20,000 tons, perhaps in the hope that trade will mend.

17,520. Do you mean to tell us seriously that, if there is a diminution in the use of lead in England, the whole of the loss will fall on the English mines?—No.

17,521. Is it not much fairer to say that it would proportionately fall on the foreign importers?—No.

17,522. Tell me why not, because it is rather an interesting point. Why would it not fall proportionately on the foreign importers?—The London market is the market for Europe. The London market gives the price. The lead market of London is really the market which gives the price, for Europe at all events. Foreign lead is brought into this market. If the price goes down here it goes down in the whole of Europe.

17,523. That does not answer the question. I asked you whether you assumed that if there is a diminution in the use of lead in England the whole of the loss would fall on the English mines. You said "No." I then asked, "Is it not much fairer to assume that it would fall proportionately on the foreign importers?" Why should not it fall proportionately on the foreign importers?—Because the foreign mines are worked cheaper than the English.

17,524. But then the price of English lead is a little higher than that of foreign lead?—There is another thing that is against you.

17,525. It is not against me, because I have no interest, save to get at the real facts?—I mean it is an argument against abolishing white lead. English lead is very good lead, and therefore it is mostly used for white-lead purposes.

17,526. But is it not a fact that the price is regulated by the quality in a sense—that the English lead is a little higher in price because it is of better quality?—It is because it can be used for white lead, but if you throw it out and it cannot be used for white lead, then the price is no better for other purposes.

17,527. Would you suggest that foreign lead cannot be used for making white lead?—Some of it—not so much. If it is used for white lead it commands a higher price.

17,528. Can you tell us what lead produced in foreign countries could not be used for making white lead?—In Germany, for instance, they use a good deal. They mine it there and they refine it.\*

17,529. The quantity of lead from Germany is comparatively small?—From Germany we do not get so much now. We get very little.

17,530. What countries send lead over here in large quantities which could not be used for white-lead purposes?—There is very little sent over for white lead purposes. The desilverisers here refine the foreign lead. It does not go into consumption for white lead direct as it arrives here, but it is refined again.\*

17,531. I am afraid that you have not given me a very clear answer to the question why the foreign importers should not bear their proportion of the loss caused by diminution of the quantity of lead used if lead is prohibited for painting. You mentioned Germany just now. I see that the importation of lead from Germany is comparatively infinitesimal?—I admitted that.

17,532. But you used Germany as an illustration. What is the use of giving an illustration if you take it away again immediately afterwards? Can you tell me definitely why the loss caused by a diminution of the use of lead should not fall proportionately on the foreign importers?—I say that there would be so much less used in England, and there would be so much more lead in the market. London, being the principal market for lead in Europe, takes generally the surplus of lead.

17,533. (Dr. Collis.) You suggested that English lead is the best for making white lead?—Well, yes, it is the best.

17,534. It has a special market for that purpose?—It has a special market for that purpose.

17,535. We understand, from evidence which has been given, that 25 per cent. of it is used for that purpose?—Yes, quite that.

17,536. That will give us an absolute figure. Our home production of lead is 20,000 tons per year?—Yes.

17,537. Twenty-five per cent. of that is 5,000 tons?—Yes.

17,538. The total amount of lead converted into white lead is 45,000 tons, and 5,000 off that gives 40,000?—Yes.

17,539. So that 40,000 tons of what is converted into white lead must be foreign lead?—Foreign and colonial lead refined in England.

17,540. The total consumption of lead in Great Britain is 180,000 tons, of which 20,000 is home production, which leaves 160,000?—Yes, except that foreign and colonial ore and bullion refined in the United Kingdom is known as "English lead."

17,541. The proportion of 40,000 to 160,000 is 25 per cent?—Yes.

17,542. Then what is the superiority of English lead over foreign lead for making white lead?—As long as the lead is not used for white lead it must be used for some other purpose.

17,543. Quite so, but the statement that the English lead is used specially for making white lead absolutely falls, because 25 per cent. of the lead coming from abroad is used for exactly the same purpose?—Yes, after it has been refined. I said at least 25 per cent.

17,544. You gave us that figure?—The English lead is used for other purposes because the manufacturers are nearer the mines.

17,545. But we want to stick to the point that English lead is specially suitable for making white lead?—It is specially suitable.

\* The witness stated subsequently that he understood both these questions to refer to foreign lead which could be used for white lead, and answered accordingly.

21 March 1912.]

Mr. JULIUS MATTÓN.

[Continued.]

17,546. And yet the proportion of foreign lead used for that purpose is precisely the same—25 per cent. P—Yes.

17,547. How can you say, then, that there is any special market for English lead when the same proportion of foreign lead is used?—I will not say any special market.

17,548. But that point has been specially made to-day—that there is a special market, and that by interfering with the manufacture of white lead, by restricting the use of white lead in paint, English lead is being specially hit?—Yes: English lead is specially hit in the respect that the price goes down, and it cannot be raised at the price.

17,549. The point is that precisely the same proportion of English lead and foreign lead is used in making white lead, so that there is no special advantage in the use of English lead in the manufacture of white lead. The statement does not hold?—They can refine the foreign and colonial lead to such an extent that they can use it, and about 100,000 tons so refined are sold as English lead annually.

17,550. So that we are doing no more damage to the English industry by restricting the use of white lead in paint than we are to the foreign industry?—Yes.

17,551. Why?—Because if you throw so much lead on the market you will bring the price down, and English lead cannot be mined at the same rate as lead in other countries can be mined: They can raise the lead much cheaper in foreign countries than here.

17,552. But we are not specially hitting the English lead. It has been represented to us that by restricting the manufacture of white lead or the use of it we are hitting the English lead out of proportion to foreign lead. We have been told that the proportion of English

lead used in the manufacture of white lead is greater. I have shown that the proportions used are precisely the same for this purpose; and that if restriction was made it would hit the home and the foreign industries alike. The fact that our mines may not be able to stand it is another point?—That is not my argument. My argument is that if you throw so much lead on the market you will bring the price down, and foreign and colonial lead will be just as much hit as English, but the English cannot stand it. The foreign can stand it.

17,553. (Chairman.) If the use of lead for paints was prohibited; the foreigners would bear more than their proportion?—They would bear their share, but you would ruin the industry here. Everyone would lose by it, but in other countries the industry would go on. They would not make so much profit.

17,554. You say that the industry would be ruined here because you take an infinitesimal amount less of white lead for a particular industry?—Yes, and I say that other countries can stand it, but the English cannot. Other countries would lose by it, but the industry here would be ruined altogether.

17,555. (Mr. Sutherland.) I take it you mean that the other lead-producing countries do not mine lead primarily for lead as lead so much as for what it contains?—They may mine it for lead, but at the same time, having so much silver in it, they make so much profit and can mine it cheaper.

17,556. And they can import cheaper?—Yes.

17,557. English lead is not so rich in silver?—It is very poor in silver.

17,558. Your contention is that the reduction of price would make it unprofitable to mine, and therefore throw the mines out of work?—Yes.

The witness withdrew.

Mr. HARRY O. LANCASTER.

Evidence to 17,568 handed in and taken as read; witness then called and examined.

17,559. I am technical director of Messrs. Locke, Lancaster, and W. W. and R. Johnson and Sons, Limited, desilverisers and manufacturers of lead in all its branches, and grinders of zinc oxide. I am a member of the Institute of Metals, having studied physics, chemistry and metallurgy at the Royal School of Mines, South Kensington.

17,560. One of the most important facts to be considered in this inquiry is the difficulty, or practical impossibility, of preparing zinc oxide of good commercial quality from any available British ores. The type of lead ore available from Great Britain or British possessions is a complex ore of zinc and lead sulphides.

17,561. My company, in conjunction with two other firms, for many years had the whole of the output of silver-lead from the Broken Hill mines of Australia. The existing ore, for the most part, is a complex one consisting of zinc and lead sulphides, with varying quantities of silver, which the ordinary jigs in use for the recovery of lead ores fail to separate.

17,562. There were at one time enormous quantities of this ore available, and my company has given much consideration to the question of the treatment of this ore for the purpose of the preparation of commercial zinc oxide. Numerous experiments were carried out in our works under the direction of Professor Thorpe, and with my personal supervision, but with a negative result.

17,563. Since 1903 there have been various processes tried to recover the different values in these concentrates, notably the "Potter," "Delprat," "De Bavay" mineral separation companies and other processes, and in the year 1910 no less than 470,000 tons were produced, averaging 47 per cent. zinc.

17,564. This concentrate is unfortunately quite unsuitable for the direct production of good quality zinc oxide, and although there have been many attempts to overcome the difficulties, up to the present they have all resulted in more or less failure, essentially owing to the high lead contents, together with the loss

of silver value which affected both the colour and texture very seriously.

17,565. In 1899 the Smelting Corporation, Limited, erected large and costly works at Ellesmere Port, on the Manchester Ship Canal, for the treatment of these complex zinc and lead sulphides, based upon experiments carried out at Llansamlet, Swansea. These works treated several thousand tons, and after fifteen months closed down. The zinc oxide produced proved useless as a pigment, and had to be disposed of to zinc smelters for producing spelter. The company proved a colossal failure, and only lost a part of the whole of the works and plant were disposed of.

17,566. When the processes afore-mentioned developed, they not unnaturally attacked all the dumps which contained the most value in zinc, lead and silver, and consequently the remaining dumps are, as a whole, much poorer in value, and only produce a concentrate containing 20 per cent. zinc, 6·5 per cent. lead, and 10 ozs. silver per ton.

17,567. Speaking generally, the only known way of producing a marketable zinc oxide from these products is by first recovering the zinc in the form of metal, and then converting the same into zinc oxide. This is a costly method, and can never compete with the direct method as employed at the works of the New Jersey Zinc Company, of the United States, which I have visited, and where I have investigated the process. This company has the advantage of obtaining a certain class of ore, known as franklinites, on the spot, free from lead and other deleterious impurities, which is converted direct without any expensive retort work, and with a minimum consumption of fuel, into zinc oxide of high quality as regards purity, with physical properties eminently suited for a pigment.

17,568. From the foregoing, it will be seen that it has so far been found impracticable to prepare zinc oxide from any available British ores; and the effect of prohibition of white lead would be to make the British paint quite dependent for its supply of raw material upon a foreign corporation.

M n 2

21 March 1912.]

Mr. HARRY C. LANCASTER.

[Continued.]

17,569. (*Chairman.*) You are a director of two very important lead firms, are you not?—A combination of Locke, Lancaster, and W. W. and R. Johnson and Sons, Ltd. It is all one firm.

17,570. You have also had experience of zinc oxide?—Yes.

17,571. You state that the type of lead ore available from Great Britain or British possessions is the complex ore of zinc and lead sulphides?—Yes.

17,572. These are similar ores to those in which zinc predominates, are they not?—No, not necessarily.

17,573. Can you tell us anything regarding the zinc ores which contain less than one part of lead to 20 of zinc?—In this country.

17,574. Yes, in Great Britain and British possessions?—The zinc ores in this country vary enormously. You may get certain portions of them containing a very small quantity of lead; taking the bulk of them, I suppose they will certainly contain an average of 5 to 10 per cent. of lead.

17,575. You have laid stress in your evidence on the difficulties of separating lead from zinc in such ores?—Yes.

17,576. You realise, do you not, that if not more than 5 per cent. of lead is to be allowed in a paint, ores containing not more than 1 part of lead to 20 of zinc can be used direct, without any separation, to make zinc oxide by the direct method?—Well, I do not know. I am afraid that I could not give a negative or positive answer to that. I think that there would be the greatest difficulty in producing a zinc oxide that was of any use commercially.

17,577. You say in paragraph 17,567 of your evidence that the only known way of producing a marketable zinc oxide from these products is by first recovering the zinc in the form of metal, and then converting the same into zinc oxide?—Yes.

17,578. This is what is known as the indirect process, is it not?—Yes.

17,579. You say this is costly and can never compete with zinc made by the direct process?—That is so.

17,580. Are you aware that the Vieille Montagne Company manufacture their zinc oxide by the indirect process?—Yes; they make all their zinc by the indirect process.

17,581. How is it, then, that they have such a very large business in zinc oxide in the open market?—I cannot answer that question, but I can tell you this: you must not imagine that all the zinc oxide that comes into this country is used as pigment. Very large quantities are used in the rubber trade, and for enamelling and many other purposes. I know that the zinc oxide produced by the direct process makes an infinitely better pigment than one made by the indirect process. It takes less oil, and it has other decided qualities, which always, I consider, make it a better pigment.

17,582. You warn us of the risk of making the British paint trade dependent for its supply of raw material upon a foreign corporation?—Yes.

17,583. Suppose for a moment we accept your view that zinc oxide cannot be manufactured commercially in this country. Why do you say that the paint trade would be dependent upon a foreign corporation?—Because we have not facilities for making zinc oxide in this country. We have not the material for making it in this country, nor have we the knowledge of making it even by what you might call the indirect process.

17,584. You are aware, of course, that there are many competing firms and syndicates making zinc oxide abroad?—Yes, of all kinds.

17,585. To what extent is there free competition in the white-lead industry?—Do you mean in this country?

17,586. Yes?—I am afraid that that is rather more a commercial question than I could answer. I do not profess to be a commercial man. I am a technical man.

17,587. Do you know that there is a combination for maintaining prices of white lead?—Yes.

17,588. How is it that the prices of all brands of white lead have risen so materially of late?—I think because of the combination partly, but also owing to rise in the price of pig lead, labour, fuel, and oil.

17,589. (*Mr. Sutherland.*) Is not the process by which the Vieille Montagne Company make the zinc oxide a secret process?—No, I should not say that it was a secret process, but there is no doubt that, to produce the article they do, they depend upon certain technique and certain knowledge and practice which other competing firms do not possess. I do not think that it is a secret process. It is known generally.

17,590. There is no serious competitor with that company on the Continent or in this country?—No.

17,591. And French witnesses who have attempted to make zinc oxide have told us that it is a secret process?—Every process depends for commercial success on certain little things, a combination of little things for making a good product. To that extent you might call it, perhaps, a secret process, but it is common knowledge to technical men.

17,592. Quite so; but they stand out from all other makers of zinc oxide, do they not, as eminently successful?—Yes, because they have a very large control.

17,593. But they have no monopoly. The Vieille Montagne will take precedence of any. It is the first brand in the market?—If I were offered by the New Jersey Zinc Company and by the Vieille Montagne two samples of zinc at the same price, and they were submitted to me, and I put them down in my laboratory and had certain tests made, I have not the slightest doubt in my own mind that I should advise my buying director to purchase the American zinc.

17,594. Why?—Because it will take less oil, and therefore it is cheaper to produce, and because it has certain qualities in it. It is not in quite such a fine state of division, and in our opinion it will make a better paint.

17,595. (*Chairman.*) But I did not quite gather that that was your answer to the question I put just now. It will make a better paint because of the amount of lead in it, do you mean?—No; on the contrary, very frequently the New Jersey contains under 0.1 per cent. of lead. They have a class of ore which is remarkably free from lead.

17,596. Is it not possible to make zinc oxide in England?—Well, you can make anything. You can recover gold from sea water, but it is a question of cost.

17,597. But I am speaking of a commercial product?—Do you mean to say if we had the men with the knowledge?

17,598. No, I do not mean anything beyond this: if it is possible to make it commercially, why has it not been made, because there is a big demand for zinc oxide?—Because it does not pay to do so. Look, for example, at the Vieille Montagne. They have taken over mines in Cumberland; they have spent many thousands of pounds in developing that property; they spent 40,000*l.* on the dressing floor alone for dressing the ores. They are recovering now a little over 3,000 tons of ore a year, containing approximately 40 per cent. of zinc. What do they do with it? They send it over to their own works to recover the zinc from it. If it could be produced in this country, why does not the company, who is sending into this country nearly 6,000 tons of zinc oxide a year, produce it here? Why do they not convert it into zinc oxide in this country? It is for the simple reason that they have not a suitable clay. Clay enters very largely into the cost of the production of metallic zinc, and fuel is a very big element too.

17,599. Are you quite sure that that is the reason?—That is one of the reasons. Very probably there are other reasons.

17,600. Would not the main reason be the question of the magnitude of the business which is done in zinc oxide to-day in England?—I do not say necessarily that the ore is used for conversion into zinc oxide. They convert it into metal.

17,601. If the demand for zinc paint in England was very much larger, would it not follow that they would make proper arrangements for making zinc oxide in England?—Possibly. The question is what would the tonnage amount to. The 3,000 tons they are producing now will give about 1,000 tons of zinc, and if you convert that into zinc oxide it will give probably

21 March 1912.]

Mr. HARRY C. LANCASTER.

[Continued.]

another 20 per cent. It would be about that figure. It is in the same way with the zinc recovered in Wales. There the tonnage is very small.

17,602. Do I understand you to mean that the production of zinc in England is so small that it would not pay to establish works to turn it into zinc oxide?—I doubt very much if it would. The total tonnage of zinc ores raised in this country was about 11,000 tons last year; the year before it was about 9,000, and you may take that at about 40 per cent. of zinc. Zinc oxide contains 80 per cent. of zinc.

17,603. (Mr. Sutherland.) There was a big attempt to treat it in England, I see by your proof?—It has been going on for 26 years.

17,604. The Smelting Corporation at Ellesmere Port made a big attempt to make zinc oxide?—Yes.

17,605. Did that prove a failure?—A dreadful failure.

17,606. Can you tell me why?—Because they did not get the class of oxide that they hoped to get. It was absolutely useless as a pigment. It had to be all sold to the zinc smelter; and I daresay, apart from that, there was a want of technical knowledge about the whole thing. But there it was; it was a dreadful failure. It happened that the head chemist who was conducting those works, and had charge of them, is manager of one of our works, and I got to know a good deal about it in that way, in addition to going over the works myself and seeing them.

17,607. There is no other firm in the country that produces zinc oxide, is there?—It is a little difficult to say no to that.

17,608. There is nominally one?—I would put it in this way: we have tried to get a quotation and we have not been able to get it.

17,609. Do you think that if lead were abolished in paint we should be able to command sufficient zinc oxide or other substance to meet the call for paint—especially in view of the abolition in 1914 of lead in France?—Honestly I do not quite see where you would get it from.

17,610. (Chairman.) Are you aware that the production of lead in Great Britain is about 22,000 tons a year?—Yes.

17,611. In Greater Britain it is 204,000 tons?—Yes.

17,612. Of zinc the production in Great Britain is 4,000 tons, in Greater Britain 150,000, and in the rest of the world, 700,000?—I have to accept those figures.

17,613. So that comparatively there are about the same proportions of lead and zinc produced throughout Great Britain, Greater Britain, and the rest of the world?—Yes, I accept that.

17,614. (Mr. Sutherland.) In view of what I have put to you, would there be sufficient zinc to meet the requirements of the painting trade in this country if paint were made from zinc oxide, seeing that we have failed hitherto to make zinc oxide in this country?—I fail to see where it would come from. The quantity the Chairman spoke of is already being used. Look at the enormous quantities being used in France, for instance; it is not as if the stuff were lying idle and you could take it.

17,615. Assuming that the use of lead were prohibited and assuming that paint is made from zinc, and that there is capacity on the part of our English manufacturers and others to make zinc oxide, would not the price of paint be put up enormously?—I think that that is the natural sequence.

17,616. (Chairman.) I see, in the Home Office Report on Mines, Part III., 1910, that the importation of zinc ore was 92,000 tons; of roughly smelted zinc, 121,117 tons, and of manufactured zinc, 18,168. What becomes of all the other zinc if it is not manufactured in this country?—An enormous quantity is used in the brass trade.

17,617. (Dr. Collis.) And in galvanising?—Yes, and in galvanising. Enormous quantities are used for boiler purposes—for zinc plates. We ourselves supply very large quantities of zinc to the Admiralty.

17,618. (Chairman.) Would you go so far as to say that none of this large quantity is made into zinc oxide?—None whatever.

17,619. It is all used for some other purpose?—Yes.

17,620. (Dr. Collis.) Would a ton of zinc when made into zinc oxide give you as much material, or less, as a pigment for making paint (that is to say, for making so many gallons of paint), as a ton of lead when made into lead carbonate?—Do you mean when mixed up in oil? May I answer the question in this way; if you had a gallon of ready-mixed white-lead paint as against a gallon of ready-mixed zinc paint, you would have probably in that gallon (these are test figures) about 22 lbs. of lead, and you would probably have about 12 lbs. of zinc. I will put it in another way. A gallon of white-lead paint might weigh about 28 lbs., and a gallon of zinc paint about 18 lbs., but you have, roughly speaking, about 6 lbs. of oil in the case of the white-lead paint and 6½ lbs. in the case of the zinc paint. Those are rough figures. But what I would like to point out is that that is by measure; by the gallon. If you are going to coat, say, for the sake of argument, that wall, and put a gallon of white-lead paint on one part of it and a gallon of zinc paint on the other part of it, you would probably find that you would have to put two gallons of zinc on to meet the requirements. But, mind you, I am only giving that roughly. You must not pin me down to a concrete case.

17,621. No. If we used 2 gallons of zinc, at any rate we should get 24 lbs. of zinc to 22 lbs. of lead. It would be almost fair to say on that computation that equal amounts of zinc and lead are to be used?—If you are on the weight question, yes.

17,622. There are 45,000 tons of lead at present used in the kingdom converted into white lead?—Yes, 45,000 tons of pig-lead.

17,623. So that we should want, if we were replacing that with zinc, 45,000 tons of zinc to do it?—If you accept the fact that one coat of zinc oxide is equivalent.

17,624. I am taking your own estimate of two. The world's total production of zinc is 856,000 tons, and an increase of 45,000 tons is not a very large increase on that total amount?—I should call it a very big one, Dr. Collis.

17,625. You would?—Yes, enormous.

17,626. We have not the figures to show how the total world's output has increased in recent years?—But you have to put that against the increase of other metals too. It is no argument because it is so with regard to every other metal, and coal.

17,627. But my point is that, if there is an increased demand, there is the possibility of meeting it? I do not know how many years it would take to produce it; that is all I say.

17,628. We have 856,000; add 45,000 tons; that gives 900,000. 856,000 tons has to become 900,000 tons. It is not a very large increase?—I call it an enormous increase.

17,629. I do not know how fast the increase has gone on. I am sorry that I have not the figures ready, but it is not improbable that the increase has taken place in a few years. The difference between 1910 and 1909 was 19,000 tons of crude zinc, and zinc ore, imported, in one year without any special demand for a new purpose?—The increase was for other purposes—not zinc oxide.

17,630. Certainly. We do not use by any means all the zinc in the world. The 45,000 tons increase I do not suggest will be made in a month or several months?—It is a difficult question to answer. Where are you going to get the material from—this country?

17,631. I am talking of the whole world's output?—But are you going to get the Germans to put it here? The zinc in our dependencies is controlled by the German Syndicate—

17,632. Wherever the total amount comes from, we ourselves and our dependencies are producing the proportion of the total production of the world that I have already put?—There are enormous quantities of these complex ores in South Australia. Twenty-six years ago, when we started taking sulphide of lead from the Australian mines, they were only treating the sulphide and the carbonate. They were accumulating enormous dump heaps of zinc. Only last year they treated 470,000 tons. In another three or four years it will be wiped out; and where are they going to get more from?

21 March 1912.]

MR. HARRY C. LANCASTER.

[Continued.]

If you rush the price of zinc oxide up to 40l. or 50l. or 60l. a ton, it is quite possible that huge syndicates would develop to find out other properties, but whether they would find them or not is another question.

17,633. (Mr. Sutherland.) That would kill the painting trade?—Yes.

17,634. (Dr. Collis.) Taking your own estimate of two coats of zinc to one of lead, if we are dealing with a matter of 856,000 tons (it has increased in our own country in twelve months by 19,000 tons), the 45,000 does not bear such a large proportion to the total amount?—I look at it purely from a metallurgical point of view, and from that point of view it is an enormous increase, and would be absolutely impossible to find. It must be borne in mind that this 45,000 tons has to be converted into zinc oxide.

17,635. (Mr. Sutherland.) What is the total production of zinc oxide?—About 15,000 to 16,000 tons.\*

17,636. That would require to be doubled, would it not?—Trebled, if France is going in for abolition, too.

17,637. (Dr. Collis.) Is that the production in the world?—No. I cannot give you the figures.

17,638. (Mr. Sutherland.) We should have to treble it if white lead were abolished?—The Vieille Montagne last year made about 10,000 tons, I understand. What the New Jersey Company made I do not quite know. When I was over there about six or seven years ago they turned out about 80 tons a week, but I know that they have increased their output since then.

17,639. Are those the two big sources of supply?—Undoubtedly—the New Jersey and the Vieille Montagne.

17,640. The others are all small, are they not? Is there not a German syndicate?—The Vieille Montagne and the German syndicate are in the same combine.

17,641. Your opinion is that as we have not been successful in making zinc oxide in this country hitherto, although many attempts have been made, and unless the price were put up enormously, we should not be successful in the future?—I do not see how you could. You are dependent on the right kind of clay in the right place, and even right freights. Take, for example, Swansea; the output there is not a very big one, but they are able, and they are doing it now, to take a freight of coal to Spain, and bring back a freight of zinc ore.

17,642. The New Jersey Company are specially favoured with a particular ore, are they not?—Yes.

17,643. Assuming that the Committee recommend prohibition, have you formed an idea of the length of time that should be given before it came operative?—No.

17,644. Would you say five years, like the French?—You might do that. I am quite convinced in my own mind that you would not get the zinc oxide. Undoubtedly zinc oxide is the next best pigment to white lead, and if it means that you must have that, it is impossible to say how many years it would take.

17,645. It is not as good as white lead for outside work, is it?—No; I do not think that the most biased man would say that it was.

17,646. (Chairman.) The Office of Works say it is. In some of the departments they have tried it, and they found it just as good. What do you think of that?—I do not know whether the evidence of that has

\* The witness subsequently corrected this to "53,000 tons about (1910)."

depended on a certain chemist, or what it is. No doubt it is a very vexed question. One man will get up and swear on zinc oxide, and another man will swear on lead; and there you are.

17,647. And they both might be right?—I would not go so far as to say that, but both lead and zinc oxide are useful for pigments, and they have their specific uses.

17,648. (Mr. Mason.) Given a zinc ore containing less than 5 per cent. of lead, would you say that there would be difficulty in converting that into zinc oxide by the direct process?—I think that it would be practically an impossibility. Zinc ore of that class first of all would have to be roasted, and after roasting put on a special grate with about half its weight of coal. It has a blast underneath it, and the zinc together with the lead is volatilised. The whole of the oxides are drawn off by enormous fans, and practically blown into bags. The New Jersey Zinc Company, that I was with some years ago, had about 26 miles of bags. The bag room covered two or three acres. Not only would it be almost impossible to produce zinc oxide containing less than that percentage of lead, but there are other points. With regard to those that we have had submitted to us containing anything like 5 per cent. of lead the colour goes off at once. Then there are other points. Very often zinc oxide with lead in it will have zinc sulphate in it (I do not know why), and a very small percentage of zinc sulphate affects the zinc oxide pigment tremendously. It has a tendency of making it chalk and wash off. I do not say for a moment that it is absolutely impossible to produce a pigment from such an ore, but it is not being done commercially at the present time. There are hundreds of people working at this, and there have been for the last twenty years, trying to produce a good pigment, but such a pigment has not come on to the market.

17,649. Do I understand that your answer is that the resulting pigment is not fit for use as a paint?—No.

17,650. There is no difficulty in volatilisation?—No.

17,651. The resulting pigment is not good paint?—We are in this position as manufacturers: I may say "That is all right" or "That is no good," but we have to convince another man. What does he do? He takes it to his laboratory first of all and then puts it to a practical test. He says, "It is no good to me."

17,652. (Mr. Sutherland.) Does it discolour in the atmosphere?—I do not think that there is very much in that.

17,653. It is not as pure a white?—No; and that has an enormous effect on painters. They will not look at anything that is not pure white. It is astounding. They look on zinc oxide as being very much whiter than ordinary white lead. It is used largely for decorating interiors. They ask for white, and they expect to get it.

17,654. What is the effect of zinc on colours as compared with white lead?—Taken generally, zinc has not the same body.

17,655. But I mean as to enriching, or intensifying, or dulling colours for decorative purposes. Does zinc dull the colour as compared with white lead, or does white lead make a softer colour?—White lead makes a softer colour.

17,656. Zinc would make the harder colour?—Generally.

The witness withdrew.

**THIRTIETH DAY.**

Friday, 22nd March 1912.

## PRESENT:

SIR ERNEST F. G. HATCH, BART. (*Chairman*).

Mr. E. L. COLLIS, M.B.  
 Mr. W. G. SUTHERLAND.  
 Mr. A. GARDNER.  
 Mr. J. PARSONAGE.  
 Mr. A. L. C. FELL.

Mr. C. L. MASON.  
 Mr. C. KINGGATE.  
 Mr. W. ROBINS.  
 E. A. R. WERNER (*Acting Secretary*).

Mr. JOHN SIBTHORPE.

Evidence to 17,692 handed in and taken as read; witness then called and examined.

17,657. I am a master painter of 45 years' experience from the days of my apprenticeship, and have carried on business for many years in Dublin, where my Company has been established since 1747. I am a past Master of the Dublin Guild, past President of the Irish Association of Master Painters, and Vice-President of the Incorporated Institute of British Decorators. I am also a member of the Urban District Council of Rathmines, on the outskirts of Dublin.

17,658. I have given considerable attention to the question of lead poisoning among painters. It is desirable to take some legislative or administrative steps to abate lead poisoning, but I am strongly of opinion that this should be by way of regulation of the use of white lead and other compounds as paint and not by way of prohibition, which would be both costly and difficult to enforce, as well as being unnecessary and ineffective.

17,659. To make regulations effective it is necessary that they should have the adherence of masters and men.

## GENERAL REGULATIONS.

17,660. Regulation 1.—I would make compulsory the labelling of all receptacles in which lead colours are kept, sold, or sent to the job, with a clear statement that they contain lead. This would meet such a danger as is frequently caused by the use of chrome without any knowledge of its poisonous nature.

17,661. Regulation 2.—(a) I attach great importance to the licensing or certifying of each master painter; the licence should be one for the use of lead as a paint, and it should affect all users, including the private individual temporarily employing painters, who should take out an occasional licence. The licence should in terms bind all who took it out to observe all regulations in force or to come into force for the use of lead as paint.

(b) I would license or certify each operative painter and oblige him to keep a card upon which should be noted places and times of employment for at least twelve months, and any attacks of lead sickness. This card should be produced for inspection when applying for work, and whenever else desired by the inspector or examining doctor. There might well be used in this connection an extended form of the declaration already in use in regard to section 8 (1) (b) of the Workmen's Compensation Act, 1906, of which declaration I produce a copy.

The decay of the old apprenticeship system has caused the ranks of the painters to be swelled by a number of undesirables, careless of their own health and unskilful in the use of the brush, whose presence among us must have added to the ill repute of our trade from a health point of view.

17,662. Regulation 3.—I would prohibit the use of white lead otherwise than in the form of paste.

## PREPARATION.

17,663. Regulation 4.—I would prohibit dry pumice-stoning and glass-papering of old paint or surface that has been burned off, as on this the oil is absent and much dust results.

I would restrict dry scraping of painted woodwork to the very few cases (not 5 per cent.) where it is absolutely necessary, and permit it then only after notice to the inspector, so that safeguards should be used.

There is no danger from the dry scraping of iron, because, rust being underneath, the paint comes off in flakes, not dust.

I do not consider dangerous the glass-papering between the coats, as the oil is still present. The object is to remove the nibs; fine paper is used and almost all that is taken off adheres to it. But, if desired, I would insist on the use of waterproof glass-paper or ground pumice being used with water for the purpose.

If the use of lead were prohibited the prohibition of dry pumice-stoning, &c., would need to be enforced for at least 20 years afterwards.

17,664. Regulation 5.—Burning off I do not consider to be dangerous.

## PERSONAL CARE OF HEALTH.

17,665. Regulation 6.—I would make it compulsory upon the workman to provide overalls (not merely aprons). This is the present practice of painters in good employment.

It would be unfair to put this burden on the employers, because (a) they provide all the brushes; (b) owing to the difficulties and delay arising from fitting; and (c) the liability to loss which the men can much more easily prevent.

The foreman should see to the carrying out of this regulation, and make sure each Monday that these overalls are properly washed.

17,666. Regulation 7.—(a) Facilities should be provided for washing:—i.e., nail brushes, soap, and towels, also hot water. The employer should be absolutely responsible for the first three, and primarily responsible for the last, but in an occupied home he should have the right to receive it from the occupier.

(b) A separate place should also be provided for eating, and also for storing out-of-doors clothes, apart from the place where the paint is stored and mixed; and the incidence of responsibility for this should be the same as in the case of hot water.

(c) It is most necessary that w.c. accommodation should be provided. The responsibility for this in occupied houses should rest on the occupier; the employer being liable to make good any damage.

M m 4

22 March 1912.]

Mr. JOHN SIBTHORPE.

[Continued.]

## INSPECTION.

17,667. Regulation 8.—It should be obligatory for all the licensed employers to permit their paint shops to be inspected whenever called on.

17,668. Regulation 9.—It should be obligatory for all the licensed workmen to be medically inspected at least three times in the calendar year.

The individual employer or the local Master Painters' Society should keep a register in which the doctor should make notes of his inspection, and the dates of each inspection should be entered on the workman's card by the inspecting doctor.

17,669. Regulation 10.—I would cause all those whom the recurrence of lead poisoning has shown to be specially susceptible to be deprived of their licence to use lead. Men thus deprived should thenceforth be restricted to some other employment, as paperhangers, distemperers, or users of non-lead paints. Or if they were obliged to give up the painting trade they might receive reasonable compensation, to be paid *pro rata* by those who employed them during the previous 12 months. I am sure that most employers would prefer to save three lives at a cost of 50*l.* a-piece than pay 150*l.* for one death.

17,670. I believe that a set of regulations as indicated above would be most effective in the prevention of lead poisoning, and that they would not impose an unreasonable burden upon the employer.

17,671. I am convinced that such regulations could be efficiently enforced without any great cost to the community, certainly at a cost to the community far less than would be involved by prohibition. The operation of inspection would be very simple and such as could be performed by one of the better type of painters; it might indeed be possible to provide in this way for some of those disqualified by special susceptibility to lead poisoning; such a man would, in my opinion, be better able to discover whether the regulations were being observed than would a factory inspector. He would be able to visit a large number of places in the course of a week. I have made a rough calculation for the city of Dublin, which has a population of 402,000, with townships out to Kingstown, and I reckon that four inspectors at a salary of 2*l.*, rising to 3*l.*, a week, could easily perform the work of inspection. It is true that the inspection would be relatively more costly in the country, but prohibition would be even more difficult to enforce.

17,672. The most important thing is to bring home to the workmen the fact that they are working with a dangerous substance, and the necessity of observing the rules of personal cleanliness.

17,673. In my opinion one of the promoting causes of ill-health is the fact that in most districts house painting is a seasonal occupation; the men eke out a somewhat precarious existence during the winter and come on to the rush of work in the spring ill-fed and with lowered vitality. They are at first largely engaged on outside work, and the tendency is for them to ignore the first symptoms of trouble. It is important that men should commence work decently fed, and that their midday meal should not take place too long after their first meal. I would also lay great stress upon the avoidance of smoking during work and the avoidance of over-drinking. I have noticed that the men who suffer are either those who are under-fed, who drink too much, or are personally dirty.

17,674. The alternative to regulation is prohibition, which, to my mind, is quite impracticable; it would, in the first place, greatly increase the cost of painting, as the average life of paint would be at least a quarter less.

17,675. The only substitute for white lead is zinc white, which lasts a very much shorter time on the outside. For the inside, it is occasionally desirable where pure white is required, but it involves an extra cost, and has disadvantages.

17,676. The cost of prohibition would fall on the community. It is true that the substitution of zinc white for white lead might well be financially advantageous to the master painters, but they are practically unanimous in condemning it.

17,677. In many branches of work, such as painting on ironwork, on ships, and wherever there is much exposure to moisture, there is really no practical substitute for red lead.

17,678. I would point out that prohibition would involve inspection equally with regulation, and, in my view, it would be a more difficult kind of inspection, and would be more unpopular both with employers and men.

## ADDENDUM.

17,679. I beg to submit the following supplementary notes:—

17,680. I am acquainted with the methods adopted by the Commissioners of Irish Lights who are responsible for the maintenance of all the lighthouse and fog-signal stations, &c., round the Irish coast. Their engineer issues instructions for painting, based on long practical experience, from which I have extracted the following:—

*Four-coat Work.*

17,681. If the finishing colour is to be red, apply the first two coats in red lead and the third and fourth coats in equal parts of red lead and venetian red. If the finishing colour is to be white, black, brown, cream, or green, the first two coats are to be white lead, and the third and fourth of the finishing colour.

*Three-coat Work.*

17,682. Omit the second coat. All ironwork which is scraped clean down to the base and repainted is to be three-coat work.

*Instructions for Work.*

17,683. All internal doors and frames and the inside of external doors, windows, casings, presses, architraves, cupboards, and skirtings are to be primed, and second coated with white lead and painted with the service standard dark brown, the panels being of a lighter shade of brown.

17,684. These I consider most important, as being the result of constant inspection by a man quite unprejudiced in favour of one paint more than another, as the following extract shows:—

"Oxysulphide of zinc may be used for special purposes in place of white lead where extra pure white is required."

17,685. One purpose for which zinc is used with good effect is on corrugated iron. This is first treated with mordant, and then receives two coats of zinc white, which stands well. I would not have expected this, but suppose it results in some way from an affinity between the paint and the zinc which forms the galvanizing.

17,686. The conditions under which paint is used in these buildings is very trying, because of the salt spray which takes the oil out of the paint leaving it chalky.

17,687. The spray is carried many miles inland. The greater part of Ireland and Scotland, Wales and the North and West of England are therefore subject to the same sort of test in a greater or less degree. This country should, therefore, be slow to give up the use of its best protective paint.

17,688. I submit also the following extract from the contract form for painting work required by the Commissioners of Public Works, Ireland:—

"Oil painting with paint as specified No. 121. 121 paint strained, composed of some or all of the following ingredients, viz., white lead or zinc any colour-ground in oil, oils, turpentine and driers. 129 white lead, —'s genuine."

17,689. My firm were for many years the sole contractors for the Dublin district, and I can state that white lead practically was used alone, and I am able to form an estimate of the extra cost which the substitution of zinc for lead would entail on the taxpayers in connection with that section of the Board's operations. I am sure that to keep the buildings in an

22 March 1912.]

Mr. JOHN SIBTHORPE.

[Continued.]

equally good condition to the present would mean an increase in the vote of at least 1,500*l.* per annum.

17,690. I am constantly engaged on work for Messrs. Guinness. The conditions of a brewery are specially trying on account of the steam and the glucose which it deposits on iron. This firm is at all times willing to give any new invention a full and impartial trial, and I have used, under their directions, some of the patent paints, and other contractors have done likewise. The question of cost does not weigh with them. They want the best and are prepared to pay for it. But they have come back to the old method of using red lead on the parts of ironwork which are scraped and polished bright, followed by succeeding coats of white lead stained to certain standard tints.

17,691. From my experience I am convinced that if lead is prohibited, all the scraping and painting of our mercantile marine will be done in foreign ports, both outside and between the skins, as red lead is absolutely without an alternative for this purpose.

17,692. I also submit:—1st. A panel showing the relative covering properties of lead and zinc. 2nd. Two pieces of ornamental moulding showing the relative sharpness of ornament when painted with lead in the ordinary way, and with zinc sufficiently stiff to cover. 3rd. A series of tints in which lead and zinc are used as bases respectively.

17,693. (*Chair*.) You are a master painter of Dublin?—Yes.

17,694. How many painters do you employ on the average?—I did not make a calculation of that, but I should say off-hand that my summer average would be considerably over 50.

17,695. How many cases of lead poisoning have you had in the last ten years?—One.

17,696. You have, of course, studied the statistics of lead poisoning among house painters?—Not very carefully, but I have seen a good deal of the literature on the subject.

17,697. And I notice you agree that some action should be taken to remove this evil?—It should.

17,698. So you admit that the evil is sufficiently great to justify some action being taken?—I think that goes without saying.

17,699. You state that you would prefer regulations and you suggest a code?—I do.

17,700. The regulations which you suggest are very interesting. I suppose you agree that such a code would be considered troublesome and vexatious and would meet with opposition from employers and probably from workmen?—I do not think so.

17,701. We have had evidence from a large number of employers, and I think I can say confidently that a considerable proportion have told us that they prefer prohibition to regulations of any kind?—Well, I can only say that I differ from them.

17,702. I should like to take a few points in your suggested code of regulations in detail. In paragraph 17,661 of your proof, you state that the ranks of the painters have been swelled by a number of undesirables. Have you any statistics on this point?—No, I have not. It is merely my own experience, and it is of comparatively recent date.

17,703. What do you mean by "undesirables"?—Men who have never properly learnt the trade and who come amongst us purporting to be painters but have not learnt either how to mix paint, how to prepare the brushes for use, or how to prepare work. In point of fact there is a name in the trade that describes the man I mean by an "undesirable." He is spoken of as a "paint spreader." If everything is put into his hands he may go the length of spreading paint, but of the technique of painting he is lamentably ignorant.

17,704. Do you wish us to draw the conclusion that there is more lead poisoning amongst those whom you call undesirables than amongst the regularly trained painters?—Well, now, let me say that I have very little experience of the undesirable, because as soon as he is discovered we get rid of him.

17,705. But is it not rather a dangerous thing for you to come and speak of such a set of men unless you have some specific knowledge of their disabilities?—

I have knowledge of the disabilities. They must get employment somewhere, and if they practised, in the employment which they get, the tricks that I have stopped them at, then undoubtedly they would lie open to lead poisoning far more than the trained painter. I may be allowed to give an instance, if I am not too long. Last summer was a busy season, and we would occasionally get a number of men from the labour bureau. One of these came to our place. He had not a set of overalls, but simply an apron, and he was given the usual kit of tools. The last thing which the colour man handed him was a large lump of pumice-stone and two small lumps of pumice-stone. He asked in the most innocent manner possible, "What are these for?" He was promptly deprived of his set of tools and told he had better look for employment somewhere else.

17,706. You are aware, no doubt, that the House Painters' Trade Unions accept only genuine operative painters as members?—I cannot endorse that.

17,707. Is not that the fact?—I would like to explain what I mean. In stress of circumstances I know of cases where the Unions who have branches in Dublin accept men whom they would not accept if it were not for the stress. They take in the sort of man I have described sooner than have him going as a free lance.

17,708. Can you speak of that from your own knowledge?—Yes. I can speak of men who have had no regular training being accepted as members.

17,709. How many men do you think you could suggest come under that category?—Suppose you take our number in Dublin (I cannot speak with absolute certainty about this), it is somewhere about 800. I should not say that it would be more than one-twelfth or one-sixteenth of the whole number, but that is the merest guess judged by my own experience.

17,710. What is your own experience?—My own experience is that it is one-sixteenth of the total.

17,711. Does that mean that one-sixteenth of the men you employ are what you call undesirables?—No. It means one-sixteenth of those in the trade societies. That was the question I was asked.

17,712. I was trying to ascertain how you arrived at that conclusion?—By the number of men who present themselves to us for employment, and who, on proof, show that they are not skilled painters.

17,713. Do I understand that you discourage the employment of undesirables?—As much as we possibly can, and in the only way that we are recommended by the societies to do it, and that is by getting rid of them directly we find them out.

17,714. Have you formed your conclusions, that the trade unions accept these undesirables as members, from the questions you have put to these men who have applied to you for employment?—As a rule not from questions but from their work.

17,715. But you said just now that you do not employ them?—If I did, I did not state exactly the thing as it occurs. When we discover, as we did in that particular case, that a man knows nothing about the use of pumice-stone—

17,716. You told us very definitely that one-twelfth or one-sixteenth of the members of the trade unions of Dublin are undesirables. I want to know how you arrive at that conclusion?—By the number of men that I have to dispense with year by year.

17,717. But you said just now that you did not form your conclusions from the number of people that you employed?—If I did, I did not mean to say that. I will amplify my answer. What I meant to convey was this: We as a rule only employ men that we know. In the busy season we are glad to get men who offer themselves, and I am judging by the number who offer themselves and get employment, and who subsequently prove to be undesirables.

17,718. But how do you know that they subsequently prove to be undesirables, unless you employ them?—By the character of their work.

17,719. Then you employ them?—We have employed them. We, like the trade unions, have taken them on through stress. They do not do it willingly. They would much rather keep up the

22 March 1912.]

Mr. JOHN SIDTHORPE.

[Continued.]

standard of their men. I want to be clear about that, because my relations with the trade unions are friendly. In that we are entirely at one.

17,720. But I am still in doubt as to how you arrive at the conclusion that one-twelfth to one-sixteenth of these men who belong to the trade unions are undesirable?—When you get a man to work for you, you can tell.

17,721. But it is no use telling me about one or two men. What I want to know is how you arrive at such a large figure?—Suppose for a moment our number to be 50. We will at least discharge, as incapable, four during a season.

17,722. Then do you ask, when you employ these men, specifically whether they belong to a trade union or not?—We do not.

17,723. Then how do you know that they belong to the trade union?—I will tell you how we know. We do not know as a matter of legal judicial knowledge, but we have always been recognised as a union shop and, although we profess to have the right to employ non-union men, paying them union wages, as a matter of fact I believe we very seldom ever get a non-union man.

17,724. Do you consider that that is sufficient justification for your stating to the Committee that one-twelfth or one-sixteenth of the men who belong to the trade unions are undesirable?—I think it goes a good deal further than that. Our shop has the reputation of doing good work, and they would not come to us if there were other places where a more sloppy kind of work would be allowed.

17,725. You think, from the simple fact that the men know that you are a trade union shop, that these men who apply to you are trade unionists?—I think that in most cases they are. I never ask them the question, but I believe as a matter of fact they are.

17,726. As you say, that would not be admitted as legal proof?—No, by no means; neither would my guess of 8 per cent. That is only a surmise.

17,727. Do you know that the statistics of these Trade Union Societies show a most distressing amount of illness and death from lead poisoning?—I do not of my own knowledge know that, but I suppose it is a matter of common knowledge. My own experience and knowledge are rather the other way.

17,728. From what you have told us, we must conclude that amongst the unskilled and untrained painters the state of things is still worse?—That is my opinion, but it is only opinion.

17,729. So that necessity for precautionary measures is more vital than ever?—For untrained and unskilled men.

17,730. As you suggest, you cannot keep the unskilled men from employment, sometimes, when you are rushed?—We do not, as a matter of fact. Whether we could or not is another thing. We do as much as we can.

17,731. In the middle of paragraph 17,663 you state that there is no danger from the dry scraping of iron?—Yes.

17,732. Now, other witnesses have told us that there is very great danger from this process?—Well, again I do not agree with them, and if you like I will give you my reasons.

17,733. I should like to have the reasons, please?—We do a very considerable amount of work for Messrs. Guinness, and they insist, as indeed all good engineers do, that where ironwork is being repainted, the scaly paint shall be removed, the iron laid bare, and the iron itself polished, either with emery paper or steel brushes. Now that is done, in Dublin, not by the painters but by a class of men called painters' labourers, and I have never known a case of lead poisoning amongst these painters' labourers who are engaged on that work. I think the reason that I have given in my proof is the reason why that is so, namely, that where the paint is scaly it gets a sharp blow from a hammer or some sharp-edged tool and the scale comes off as a scale, and what is underneath is not lead at all but iron rust. So that the dust that is made there is the dust of oxide of iron, and ought to be a tonic if anything.

17,734. Would you go so far as to say that the scraping down of iron is beneficial to the men?—Well, I will not go that far. I do not mind saying that I do not think that it does them the least harm. The evidence that I am prepared to give from my own knowledge points to that.

17,735. But the conclusion at which you have arrived that there is no harm in the scraping down of iron painted with lead paint, because there have been no cases of lead poisoning within your knowledge, applies equally to your statement that you have only had one case of lead poisoning in your industry in the last ten years, and yet you admit that the prevalence of lead poisoning is very serious in the whole trade?—Quite so, but may I qualify that in this way: You ask if I have had any experience of lead poisoning within my own knowledge, and I mention one case. I know that there have been a great many more than one case in Dublin. It is also right to say that there are four or five contractors who, with us, work for Messrs. Guinness, and they have exactly the same experience. They have had no cases of lead poisoning. And, as far as I know, there has not been a case of lead poisoning among the employees of the railway companies who do this work for themselves on their bridges. So that, not my direct knowledge but my indirect knowledge goes a good deal further.

17,736. I should like to draw your attention to the examples from three different branches of the industry—first, where an iron bridge has been painted with lead, repeated cases of lead poisoning have been reported, and the majority of these are ascribed to the dust from scraping off?—I can only answer that that is not my experience.

17,737. But if that is the experience of other eminent gentlemen in the business, you will probably feel inclined to reconsider your emphatic decision?—Well, I would like to sift their evidence. When I have a solid fact of my own, I am very slow to give it up.

17,738. But your solid fact equally applies to the fact that you have had no case of lead poisoning in your own works?—Except one.

17,739. You might on the same hypothesis make a similar deduction and say that there is no lead poisoning in the country at all?—I would not say that at all.

17,740. But why not?—I think that probably lead poisoning occurs more among the unskilled, the dirty and the careless painters, whom, as a rule, we do not tolerate.

17,741. You assert that there is no lead poisoning from scraping lead paint from iron, because there have been no cases to your knowledge. Would it not be an equally fair deduction to say that, as you have had only one case in ten years, there is no lead poisoning in house painting generally?—I will put my answer to the question in this way: I have no evidence that the scraping of bridges among the people to whom you refer, has been done by a different class of workman from the man who subsequently lays on the paint.

17,742. But you do not know?—No; but I do know that in my own case it is done by a different class of man.

17,743. But you could not say, because you have had no case of lead poisoning in your own experience from the scraping of iron painted with lead paint, that the people who do that work are immune from lead poisoning?—Of course I could not say that.

17,744. The second point to which I wish to draw your attention is that the Admiralty have been taking steps to reduce the dangers of lead poisoning. One of the first directions in which they took action was to substitute red oxide of iron for red lead in the painting of confined spaces in ships, because of the great danger of lead poisoning which has been found to arise when old paint was scraped off the iron surfaces in holds, and the like?—I do not think that they could do that.

17,745. Do what?—Substitute red oxide of iron for red lead.

17,746. They have done it. They have been here and given evidence to us that for many years they

22 March 1912.]

Mr. JOHN SIBTHORPE.

[Continued.]

have done it?—Well, then, the spaces between the skins of their ships must be a great deal stauncher and a great deal freer from damp than is the case in the commercial navy.

17,747. You do not put that forward seriously, do you?—I put this forward: that red lead is the only thing I know that will dry under water.

17,748. But I have told you exactly what the Admiralty are doing. May I suggest that you in Dublin are not quite up-to-date?—I regret to say that we have very little shipwork to do in Dublin at all of the kind you speak of; that is to say, the painting of these spaces; but I know something about it where it is done elsewhere.

17,749. The third point I want to present to you is in regard to locomotive engine repairing shops. Several cases of lead poisoning have arisen from the chipping off of old paintwork. Does that fact surprise you?—It does, as there is very little white lead used in the painting of an engine.

17,750. But you see the inference from this information we have already received, as compared with your own rather striking statement?—I do, but I would like to have the evidence before me and to know what part of the engine the white lead is put on.

17,751. It does not matter what part, does it?—I do not think any is put on.

17,752. (*Mr. Kinggate.*) Do you mean the locomotive engines?—Yes.

(*Mr. Kinggate.*) There is any amount used.

17,753. (*Chairman.*) The big surfaces of the tender tanks, for instance?—In the tanks themselves?

17,754. On the outside of the tenders?—They are generally painted with one or other of the standard paints of the various companies.

17,755. But I am giving an illustration of where they are painted with lead paints?—It is very curious. That is all I can say. The greens may have any amount of chromes, for instance. It reminds me of a specification given out by our Corporation in Dublin for the painting of certain work, which was to be painted olive green, and nothing but white lead was to be used.

17,756. (*Mr. Gardner.*) Could not you get an olive green with white lead in it?—Of course you could, but this was to be nothing but white lead.

17,757. (*Chairman.*) What do you suggest is the principal substance or base of coloured paints?—I have no knowledge whatever. I have never had an analysis made.

17,758. Would you be surprised to hear that the basis must generally be either lead or zinc?—I should not be at all surprised with regard to the white or light coloured paints, but for dark paints there is no necessity. There are paints commonly known as Torbay paints.

17,759. If that is the case with regard to this particular class of work, we can prohibit the use of lead without any danger to the particular work that is being done. I am referring to what I understand is the case—that in some instances no lead is used in paints for this kind of ironwork?—I do not agree to that, because my experience points to nothing being equal to red lead for the first coat of ironwork.

17,760. You cannot have it both ways. Either there is lead in it or there is not. If there is no lead then there is no danger. If there is lead in it then the evidence we have received shows that the scraping off of lead is highly dangerous to the worker. You have made the statement that there is no danger in scraping lead off iron work. I have given several illustrations where danger has arisen and I want to know what you say about that?—I am only speaking of cases where lead is put on, not where it is not. Coming back to my own experience with Guinness's work, I dare say that some of you gentlemen know the circumstances of breweries. It is about as trying a position for paint as you can have, on account of the vast amount of moisture that is always present and constantly being deposited and constantly drying off. Their practice there is invariably to touch up all the bare places—all places which have been treated as I have described—with red lead, and then give two

coats, of which the basis is undoubtedly white lead, only the smallest amount of colouring matter being used of certain standard colours. They give us the colour and we have to make it up, guaranteeing that the lead shall be genuine. In that case we are dealing with lead in its worst form, I suppose, and it is on that that I base my statement or my opinion that the danger, if it exists at all, is of a very remote character. What I want to point out is this: that you will not get rid of the danger, supposing that there is danger, from hammering and scraping ironwork for the next twenty years by merely prohibiting the use of lead now, because you have to get rid of all the lead which has been put on, which has to come off sooner or later.

17,761. That is obvious. In paragraph 17,664 you state that you do not consider burning off to be dangerous?—That is so.

17,762. What experience have you had of that, because that is a remarkable contrast to the evidence we have already received. I do not think that a single witness has told us that it is not dangerous?—I do not know whether you have ever seen the thing in process.

17,763. Yes, I have?—There you do not get any dust.

17,764. No, but you get the fumes of lead?—Of the oil. You will not volatilise lead in the process of burning off. You cannot do it.

17,765. Your opinion is that, in the actual burning off, no lead could be volatilised?—I do not think that it could, but I am very strongly of opinion that after the burning off has taken place very very frequently danger arises from glass-papering the surface. I think that that should be prohibited, because there you deprive the lead of its oil, and it is just in the very state in which dust is easily blown about.

17,766. Would it be possible to prohibit the sand-papering?—Surely. My practice is to pumice down either with water or with spirit—which I prefer.

17,767. Would not that be rather an expensive operation?—No. As a matter of fact, it is the cheapest thing to do, but the other has been the old custom. If it is properly done and laid off with a broad filling knife, it is almost as good as a coat of priming paint.

17,768. In paragraph 17,665 of your evidence you suggest that it would be unfair to ask the employer to provide overalls?—I think it would.

17,769. Why?—Well, there are a variety of reasons. In the first place you can hardly supply overalls quite as carelessly of the stature of the men as is the case with some of the territorial uniforms.

17,770. Do you want that put on the notes?—I do not mind a bit. I am not at all ashamed of it. My experience is that the painter is rather a natty man, especially a good painter, and he likes to be tidy, and he likes his suit of overalls made for him with some regard to what sort of man he is. He does not want to have them hanging in loose folds about him. Under those circumstances an employer would be obliged to keep a small tailor's shop of overalls to fit the men out, and there would be the trouble of fitting them on. And there is another thing too. I do not say it at all in an invidious sense, but I should take more care of my own clothes than I would of the clothes of any gentleman round the table here, supposing that I were allowed to wear them.

17,771. Are you aware that in every other industry for which regulations have been made for the prevention of lead poisoning, the employers have accepted the principle that they should provide and maintain the necessary means of precaution, including overalls?—I do not think it is on all fours, because painters constantly come and go. At all events, with us it is in one way a great hardship to the men and a great pity, and nobody is sorrier for it than the employer—that a great number of men have to be dispensed with and that the men in a particular shop are constantly changing. It is not so, as far as I know, with manufacturers.

17,772. If the Committee felt it imperative, as one of the essential rules to be introduced, to recommend

22 March 1912.]

Mr. JOHN SIBTHORPE.

[Continued.]

that overalls should be provided for the workpeople, would you agree to that?—I would.

17,773. Now we come to the question of the question of the enforcement of regulations. In paragraph 17,667, you say it should be obligatory for all licensed employers to permit their paint-shops to be inspected. In the term "paint-shops," do you include every place where painting operations are being carried on?—No. Technically, in the trade, the "paint-shop" is a dépôt from which the various jobs are supplied.

17,774. Are you aware that those places are already subject to inspection under the Factory Act?—Well, I am very glad to hear it, but I have never seen an inspector in my shop.

17,775. Would it, in your opinion, be possible to maintain efficient inspection in regard to all the private dwelling-houses where painters may be employed from time to time?—I think so; I have no reason to doubt it at all.

17,776. Now, will you tell us how many inspectors you think would be required in Ireland?—I have not made any calculation for Ireland.

17,777. But you have made a very positive statement that you agree to it?—Yes.

17,778. Without thinking it out?—No. I have made a calculation for Dublin.

17,779. How many inspectors do you think would be sufficient to cover Dublin?—I think that three would do for Dublin very fairly well.

17,780. (Mr. Sutherland.) You say four in your proof?—I put down four, but my opinion is that three would be enough. Four would be ample.

17,781. (Chairman.) How many private dwelling-houses would they have to inspect?—I will tell you my calculation; or the basis of it. We have, as I say, roughly about 800 painters. When they are in full work, it is a fair supposition that there would be about four painters to each job. That will give 200 jobs. I reckon that once a week would be quite enough to visit the places. It is a mere matter of arithmetic. It would be 12 visits a day.

17,782. (Mr. Sutherland.) For each of the four men?—For each of the four men.

17,783. (Chairman.) I have made a rough computation of what that would mean if it was applied to the whole country. You think that four would be sufficient for the town, but in country districts you would want a somewhat larger proportion of inspectors?—You must either have a larger proportion or less frequent visits.

17,784. I find that it would require 450 more inspectors to do this particular work in Great Britain and Ireland?—I daresay. I can only speak of Ireland, judging from my knowledge of Ireland and the amount of painting. There we are an agricultural country, and the farmer does not get a painter to paint his house very frequently. The figures might be applicable to the whole country. Very likely they would, but they certainly would not be applicable to some parts.

17,785. Do you think that the master house painter should pay the cost of the inspection?—My idea is that the registration fees would go a very long way towards doing it.

17,786. What registration fees?—You would naturally charge some fee in connection with the licensing.

17,787. At the present moment the number of Factory Inspectors existing under the Factory Act is 200 for the whole country?—Yes.

17,788. Taking it at 300*l.* per year, per Inspector, without adding to that the cost of travelling, office expenditure, stationery, &c., it would reach the huge sum of 135,000*l.* a year. Do you seriously suggest that the Government should be asked to provide that sum for the protection of the house-painter?—It is perfectly immaterial to me whether the Government pay it or whether the customers pay it. Either the one or the other will have to pay it.

17,789. Of course, if this scheme of inspection were adopted by the Government, it would be an incentive for other dangerous trades to insist on similarly frequent inspection, and so the amount of the Home Office Vote would go up by leaps and bounds?—Well you cannot have omelettes without breaking eggs.

17,790. I do not think that the Treasury would accept your simile as a suitable one. Now you suggest the prohibition of dry pumice-stoning and glass-papery. Do you think that the inspection of these jobs once a week would be sufficient to prevent the infringement of that rule?—Well, if the man knew his work it would.

17,791. If he did not?—If he did not, it would not. If he was a painter, it would do quite well. The condition of the pumice-stone would tell the tale.

17,792. But there would be difficulty even with this frequent inspection?—With regard to the men who were not very fully qualified workmen.

17,793. Are you speaking about inspection?—Yes, I am talking of the inspection. My theory is that an Inspector who knew his business would jolly soon get information from either of two sources that would put him on the track of infringement in this respect—either the clogged condition of the pumice-stone or the condition of the work which had been rubbed with the pumice-stone,—the scratched and torn appearance that the dry pumice-stone had given to the work.

17,794. Do you advocate medical inspection of the workers?—Yes.

17,795. Of course, you agree that this should be paid for by the employer?—I have no objection. I see that the employers have long been contemplating doing this on their own account.

17,796. You state that you believe that such regulations would be most effective in the prevention of lead poisoning?—I believe that they would. I believe that the regulations I have sketched there are of a sort that would commend themselves to the thinking workman and the humane employer.

17,797. But do you not think that in a great many cases they would result in the disease of lead paints?—Well, if they do, they will have attained the object that some people want, without the necessity for prohibition.

17,798. Yes, but they would attain the result of prohibition coupled with a very enormous expenditure?—I do not think so. You must have the inspection in any case. If you prohibit, you must inspect equally.

17,799. That is a question for us to consider, but supposing we come to the conclusion that prohibition does not necessitate any inspection, then my suggestion holds good?—If you do not have inspection, I do not care how soon you prohibit, because we will put on the lead without asking any questions.

17,800. But is there not such a thing as regulating the distribution of lead?—No; I do not know how you will do it without an elaborate scheme.

17,801. You think that if we prohibited lead, some of the employers in Dublin, for instance, would evade the law and use it?—We would love to do it. You could not offer us a greater inducement to use lead than to say, "You must not."

17,802. Now, if a considerable number of employers of painters state that they would prefer restriction of the use of lead to the burden of such regulations, would that not weigh with you?—Restriction I do not understand. You mean prohibition.

17,803. I use the word "restriction" because it is suggested that, if they were allowed to use 5 per cent. of lead, that would be sufficient?—Personally, to commence with, I do not see the great advantage of 5 per cent. I think that possibly if you gave the painters the idea, by allowing this restricted amount of lead, that they were handling an entirely innocuous article you might do more harm than good. What I should prefer would be to impress upon them the danger of the article they were using by every means I could very well adopt.

17,804. You state towards the end of your evidence that zinc white lasts a much shorter time on the outside than white lead, and also that on the inside it has disadvantages?—Yes, that is my experience.

17,805. Now, several witnesses who have been before us have given an opposite opinion. For example, the Savings Bank Buildings in London were painted in 1906 inside and outside with zinc paints, and reported in excellent condition in 1910 when they became due for re-painting. A large number of post

22 March 1912.]

Mr. JOHN SIBTHORPE.

[Continued.]

offices and sorting offices in the London district have been similarly painted with zinc paints. The top structures of the Orient Steamship Company's liners, and of the Royal Yacht "Victoria and Albert" have been painted with zinc white?—How much zinc paint? Where did it come in? I ask that because I happen to know a good deal about yacht painting: I do not know much about ship-painting. Kingstown is a fairly good yachting centre.

17,806. In regard to the public offices, I can tell you details?—I do not know anything about those.

17,807. The evidence we have received is that the cost of zinc paints is no more than that of lead paints?—I would suggest that probably the zinc paint used on those public buildings (I have no knowledge of it) is used in some form of enamel.

17,808. But your suggestion is not correct in this case with regard to these standard paints applied by firms?—I have used some of them, and as far as I could judge they have depended for their life on the vehicle that has been used—the higher or lower class of varnish in which the zinc is mixed.

17,809. I understand that the paints in question contain from 5 to 17 per cent. of varnish, but I do not think it is right to say that they are enamels. And moreover we have had evidence that various gasometers and other ironwork painted with zinc and iron oxide paints have been reported as very satisfactory. The exterior of the Stock Exchange is painted with leadless paints, which have been reported by the Official Architect as very satisfactory. We have this evidence before us, and that controverts what you stated as your opinion?—Well, my experience of zinc put on in similar conditions to that of ordinary lead is that zinc parts with the oil much sooner than the lead does, and the paint becomes chalky.

17,810. With regard to the painting of ironwork on ships and wherever there is much exposure to moisture, you say that there is really no practical substitute for red lead?—That is my opinion, for the reason that I gave.

17,811. What experience have you had of good red oxide of iron paints, graphite paints, and bituminous paints?—That none of them will dry on a wet surface or a surface that is wet during the process of drying.

17,812. Will you admit this—that for ironwork that is not moist, you could use graphite paints?—Certainly. We frequently use so-called Torbay paints.

17,813. Your suggestion, with regard to the painting of ironwork on ships and wherever there is much moisture, is that in that case lead is essential?—That is my opinion.

17,814. I understand that you wish to put in an addendum to your proof of evidence?—Yes.

17,815. What do you wish to say about the Commissioners of Irish Lights?—What I wish to say about them is this: that their experience is one that gives us in Ireland what the Americans call a pointer for a large part of the Kingdom; that is to say, that the salt which they have in a large measure distributed over their buildings is in a lesser measure distributed over a very large area in Ireland, on account of the way in which the western seaboard is indented with bays, and the prevalence of westerly winds. What their experience has taught them is the best and the only thing that will stand is, to a certain extent, applicable to all outside painting on the western and southern coasts of Ireland, and for a considerable distance inland.

17,816. Is any provision made for the use of zinc paints in the place of lead?—Yes. Their specification provides for zinc paint under certain circumstances. It is principally used where it is desirable to have a very white surface, altogether apart from the question of standing, as, for instance, on railings which a man wants to see at night, so as not to fall over a cliff. They also find, which I must say was a surprise to me, that, on corrugated iron treated with mordant, zinc paint as a base stands very well. But, as far as I know, they only use it for finishing where a white surface is an object, and on corrugated iron, and nowhere else.

17,817. Has zinc paint on corrugated iron ever been exposed under trying circumstances?—Yes, they have it there in the shape of fences round yards, and sometimes it is used on roofs.

17,818. You have ascertained that it stands very well?—That is what their engineer told me.

17,819. Do you wish to put in a contract form of the Commissioners of Public Works, Ireland?—Yes, an extract. The original can be easily got in detail, but it is a thing of many articles.

17,820. Have you had experience as a contractor for public works?—Yes, ranging over a quarter of a century, or more.

17,821. Do you wish to state the effect on your contract price that the demand for the substitution of zinc for lead would entail?—It would certainly add to our price per coat. Each coat is priced separately according to a schedule. If zinc were used, a higher price would be put on each coat, and in my opinion an extra coat would be necessary in most of the work. The specification is to coat with two oils plain, commonly abbreviated to "2 O.P."

17,822. On what practical experience do you base that estimate?—For many years, when I was a junior member of our firm, I superintended all the Board of Works contracts myself.

17,823. But I want some more recent information than that. What recent information have you acquired to justify your statement?—How do you mean "recent"?

17,824. I do not want to know anything about what happened 25 years ago?—It did not happen 25 years ago. I said that I have had 25 years' experience of it. I have carried out work for them within the last two or three years.

17,825. Is your statement based on your experience of two or three years ago?—Yes.

17,826. Can you tell us what that experience actually was?—The last job of any magnitude that I did for them was to paint the whole of the outside of Dublin Castle. That would, I should think, have required an extra coat of paint if it had been done with zinc.

17,827. Would that have cost considerably more?—Yes, it would have cost considerably more.

17,828. (Mr. Sutherland.) You mean the cost of the additional coat plus the extra cost of material?—Yes.

17,829. (Chairman.) Witnesses who have been before this Committee have given quite a different view of the relative cost of lead and zinc. For instance, in the painting of the Post Office Savings Bank, the Office of Works have told us that the cost has not been more than it would have been if they had painted with lead. How do you account for that?—Because of the extra cost of material, and the need for a third coat over and above.

17,830. Why should you need an extra coat of paint for Dublin Castle, when it was not necessary for the Post Office Savings Bank in London?—I cannot answer that, but I know that you cannot get the same effect with two coats of zinc that you can with two coats of lead. You cannot get it to cover to the same extent. This question has been discussed among the Dublin painters, and some of them have said that it would be a very good thing for us if you do prohibit lead, because it will run up our accounts by 50 per cent.

17,831. But that is a very extravagant statement, is it not?—I do not think that it is an extravagant statement.

17,832. You do not say seriously that the substitution of zinc for lead paints will increase the cost of painting 50 per cent.?—I think it is nearly as plain as that two and one make three, or very nearly so.

17,833. You are quite right in stating your opinion, but that does not agree with the majority of the witnesses?—I have no prejudice one way or the other.

17,834. What do you mean by "no prejudice one way or the other"?—I should be perfectly happy to use zinc if I thought that it was nearly as good as lead.

22 March 1912.]

Mr. JOHN SIBTHORPE.

[Continued.]

17,835. What do you wish to say with regard to Messrs. Guinness?—I have practically said all I have to say with regard to them.

17,836. Will you tell us about the leadless paints that you tried in connection with the work at their brewery?—I cannot say whether they were leadless or not. They were mixed paints.

17,837. (Mr. Sutherland.) Patent paints?—Patent paints. I will give you one instance—a large storehouse. We commenced at the top and finished at the bottom, and by the time we got to the bottom the rust was out through the paint at the top.

17,838. Through the new paint?—Through the new paint.

17,839. (Mr. Kinggate.) The rust had not been got off then?—Certainly it was. You do not get soft jobs like that from Guinness. The engineer was round with a little hammer of his own.

17,840. (Chairman.) What do you suggest was the reason?—Simply that the patent paint did not resist the rust in the same way that red lead would have done.

17,841. We do not know the ingredients of the paint. You do not ask us to say that all zinc paints are equally bad, because one has failed?—No, I do not. That was a concrete case, and the firm I am speaking about are absolutely open-minded in their trial of any new thing that can be brought to them. They are absolutely determined to have the best they can get, and if you come to them with any new thing you like to suggest (I did not suggest this paint but someone did) it will get a fair trial.

17,842. It was simply a very unfortunate selection. That is all you can say?—I believe that they have made other selections.

17,843. They have made several unfortunate selections of paints?—I can go no further.

17,844. (Mr. Sutherland.) Would not that be exactly the problem that the painting trade would be up against if red lead were prohibited?—They would have to make a series of experiments at the public expense.

17,845. And their own discredit?—Yes. It would have to be said, "This is recommended to me. You will have to take it and be a purchaser with notice."

17,846. (Mr. Gardner.) With regard to the extreme case which you have just mentioned with regard to rust, do you believe that any other paint would have kept the rust from coming through?—It has been since painted red lead in the way I have described, and the rust has not come through.

17,847. Under exactly the same circumstances?—Under exactly the same circumstances.

17,848. (Chairman.) You refer also to ships of the mercantile marine which you suggest would be repainted at foreign ports if the use of lead were restricted?—I believe that that is what would happen.

17,849. Some time ago I mentioned that the Orient Steamship Company use no lead in the painting of their ships. The answer to my question which their witness gave was as follows: "We use no lead paint at all, with the exception of the funnels and the ventilators." I might mention that I then went through almost every part of the ship to ascertain precisely from the witness whether zinc was used exclusively except for the funnels and the ventilators. He stated in reply to Mr. Sutherland that he bought the zinc in paste form, and mixed it himself with linseed oil and driers, but no varnish. I put this last question to him, which is important: "It is very interesting to hear that on your Line of steamers you never use lead," and he said: "To my recollection lead is hardly ever used. I remember hearing about white lead when I first went to sea, and I know the trouble they used to have in keeping the paint white?"—What colour is the top sides of the Orient boats painted? If they are black, then you do not want zinc white for that. It is quite right that white lead will discolour.

17,850. They do not use it for any part of the ship. That is the point. You are probably not aware that lead has been abandoned voluntarily by many important shipowners in addition to the Orient Steamship Company, whom I have just spoken about. The

Great Eastern Railway Company have decided to abandon the use of lead in painting their ships. I understand that you wish to submit comparative tests?—Yes.

17,851. Now what are those comparative tests? When were they made?—Within the last ten days.

17,852. They are of no use to us in regard to durability?—The tests are simply as to the relative covering powers of lead and zinc under similar circumstances, and under circumstances which were made particularly favourable to zinc, with a view to seeing if it was possible to get it to cover. A set of tests was made with regard to the effect of lead and zinc as a basis for various tints, and the decorative value of paints composed of lead and pigment as compared with zinc. The paints were both brought to exactly the same consistency (*the witness produced some specimens of painting*). The upper one is lead, the lower zinc. They are all painted on the same black surface; painted black all over to begin with. In another test, the zinc was made much thicker than the lead, and in point of fact much thicker than I should ever like to put on paint. Calling the three test surfaces A, B and C, A is three coats of white lead, with the usual proportions of oil and turpentine over black; B is three coats of zinc of much stouter consistency over black; C is a fourth coat of the same. B and C are both zinc.

17,853. What is the deduction?—The difficulty you see there is this: that the low portions of the zinc-painted moulding, the portions down on the surface, catch the colour and are nearly filled up, and the prominences are stripped. Zinc has not the toughness of lead and the brush draws it away off the prominences.

17,854. (Mr. Parsonaga.) It would be better to use the same kind of moulding for both zinc and lead?—Yes, but I have given the zinc the better chance, because I have given it the pattern with the least sharp arrises.

17,855. (Mr. Sutherland.) The most open pattern?—The most open pattern. The next two, I will call these L and Z.

17,856. (Chairman.) What are your deductions from those?—They are pretty much the same. In one place the brush has removed the zinc.

17,857. (Mr. Parsonaga.) How many coats each?—Three—one, two, three. The effect is visible right through. On that there is no difference. As a painter would expect, the finishing coat is about relatively as dense as the first coat in each.

17,858. (Mr. Gardner.) The first coat was not dry when the second coat was put on?—Yes.

17,859. (Mr. Fell.) How long a time elapsed between the coats?—A couple of days.

17,860. (Mr. Parsonaga.) They would both be dry?—They were both dry.

17,861. (Mr. Sutherland.) It is zinc oxide, not lithopone?—I do not know what lithopone is. It is the zinc of commerce, and, if you want to know, it is zinc supplied in a ground paste from Messrs. ———.

(*The witness produced a card of coloured paints.*)

17,862. (Mr. Kinggate.) There is not much in this?—I believe that some of the witnesses have made a point about the relative effect of lead and zinc as a base for tints, and I made these from practically the rainbow tints lightened down with eight parts by weight of lead to each one of the others. *These* are lead, and *these* zinc. In my opinion the lead gives a softer colour. There you get the true value of the colours with a neutral. The black takes from the value and the white adds to it.

17,863. (Mr. Sutherland.) The zinc is more brilliant?—Yes, but not soft. The lead requires more staining.

17,864. For decorative purposes you want a soft colour?—Yes. *This* is a better green than *that* in my humble judgment.

17,865. (Dr. Collis.) Could you give any estimate of the amount of extra labour which, in your opinion, is entailed by painting with zinc paints rather than with lead paints?—In the actual work of painting do you mean, or in the preparation?

22 March 1912.]

Mr. JOHN SIBTHORPE.

[Continued.]

17,866. I mean in painter's work, taking that of a painter only?—It is merely the labour.

17,867. It is merely the labour?—Except that another coat is necessary.

17,868. One coat extra in three—four instead of three?—Yes, four instead of three, or three coats instead of two. I think myself, as a painter, there may be more care needed in painting mouldings, but in broad surfaces I think that probably the zinc will be slightly easier to spread than lead. It will not have what a painter knows as the same "drag."

17,869. Would you consider that if zinc paints were used instead of lead paints, roughly speaking, there would be a quarter more labour to be expended in painting than there is in the use of lead paints?—Quite.

17,870. When that has been done, do you think that the surfaces will want repainting more often than they do if lead paint is used?—I believe that they would.

17,871. How much more often?—For outside work I should say at least a fourth more often.

17,872. And inside?—Well, I will give you my own experience. I think that people do not paint inside if they can help it, and probably the zinc will keep clean quite as long as the other. In the ordinary decorative work I fancy that the length of life will be very little less.

17,873. With regard to the number of times painting has to be done, we have really only the outside to consider?—Yes.

17,874. In your opinion, comparing lead paints with zinc paints, there will be a quarter as much more labour required in putting zinc paints on?—Yes.

17,875. That will call for an extra number of people, I suppose, to do it?—I expect so; that is to say, if the same amount of painting is done.

17,876. If there were 100 people employed painting with lead paint, you would require 125 to put on zinc?—Yes; if there was the same amount done, as I said before.

17,877. I am assuming the same amount?—Quite so. If you prohibit lead the chances are that zinc will not be used, but some cheaper substitute in the lower class of work. Zinc is a pure paint that we get some guarantee with. Lead is so, also. Once we get into patent paints, we do not know what we are getting, because we have not a laboratory on our premises.

17,878. We have been asking about zinc up to the present. Could you give me any information about these substitutes of which you are speaking. Will they require more labour to apply?—No; I think I could make up a paint out of barytes or out of common whiting that would spread and cover probably better than zinc.

17,879. To apply that, you think, would require no more labour, and would only require the same coats as lead?—Probably less labour than zinc.

17,880. But with regard to lead?—About the same as lead.

17,881. Would it require repainting more often?—Surely.

17,882. How much sooner would it require repainting?—Quite as soon as zinc, probably a little sooner.

17,883. You said that inside zinc will not need repainting any quicker than lead, did you not?—This stuff would certainly require repainting more frequently.

17,884. But how much more frequently?—Probably a third more, or a quarter.

17,885. The increased amount of labour would be not far off that which we put for zinc against lead?—The cheaper substitute would not have the ultimate advantage to the customer.

17,886. Because it ought to be painted more often?—Yes; because it ought to be painted more often, and the inside painting is vastly larger in amount than the outside.

17,887. With regard to substitutes, probably a quarter more labour would be right again?—Yes.

17,888. So we come to the same point—100 painters to-day and 125 in the future?—Yes.

17,889. (Mr. Sutherland.) Along with other master painters who have been before the Committee, you

have no interest in contending for the continued use of white lead, except that from your experience you know it to be the best of all basic white pigments?—I do not own a share in any white lead manufacturing company, nor have I any other interest.

17,890. Except for its toxic defects, could there in your opinion, be any possible competitor from other white pigments?—I have never seen such.

17,891. Is it your opinion that zinc paints could replace white lead for interior work without any serious inconvenience or loss, speaking broadly?—I do not understand.

17,892. More frequent painting would be a loss to the customer?—And the extra cost of using zinc would be a loss to the customer.

17,893. There are a lot of zinc paints which are not zinc oxide, and zinc paint will much more readily work than zinc oxide?—Yes.

17,894. You are quite convinced that for outside work there is no efficient substitute for white lead?—I have never seen any.

17,895. You are familiar with the trade in this country and in Scotland?—I have never worked in Scotland.

17,896. You know many Scottish employers?—I am very intimate with a large number of Scottish employers, and we have talked over this business with the absolute freedom that exists amongst painters, as you know.

17,897. Do you know that in Scotland lead poisoning is very slight, and that if you omit the Glasgow area it is almost negligible?—I am very glad to hear it.

17,898. (Chairman.) You do not know that of your own knowledge?—No, not of my own knowledge.

17,899. (Mr. Sutherland.) You know many of the leading Scottish decorators, and are familiar with the class of work they do. Many of them have appeared before this Committee, and have told us that they use nothing but white lead for their painted work, except for occasional finishing, and that they have no experience of lead poisoning. From your knowledge of the thorough way in which they conduct their business and the large nature of their transactions, can you account for this remarkable fact—that what is poisonous in England is comparatively innocuous across the border?—Well, I do know this, and I want to say it with all honesty—that the Scottish journeyman painter is a very fine type of man, and he probably knows the business as thoroughly as, or more thoroughly than, any other painter that I have come in touch with, and I think that probably this may account for it, because he is more careful. This is harking back to where I was originally. He will be more careful than the less instructed painter. Speaking generally of Scotland, that is my impression. It is only a kind of impression.

17,900. Do you think that any serious harm would be inflicted on the trade, or that the work would suffer by the prohibition of dry rubbing down?—I do not think so. I have thought this matter out, and I see nothing that we could not overcome.

17,901. If the process of dry rubbing down were prohibited, do you not think that the trade would loyally accept it, and devise some method to meet the position?—I do. So soon as you got the men convinced that a certain thing is harmful to them, I am perfectly certain that nineteen-twentieths of them would loyally carry out the regulations for their own health.

17,902. (Chairman.) Have you discussed it with them?—I have known them to do it in other matters.

17,903. But have you discussed this particular suggestion with them?—No, I have not. The twentieth man would be a crank, who would take some looking after.

17,904. (Mr. Parsonage.) It would be an employed man who would be the lunatic, not the master, surely?—A much larger proportion of the masters would be cranks.

17,905. (Chairman.) You said that if we made this illegal, the Irish, at any rate, would love to break the regulation?—That is concerning the use of lead.

22 March 1912.]

Mr. JOHN SIBTHORPE.

[Continued.]

17,906. (*Dr. Collis.*) You said that if we make anything illegal, you would love to break it?—Quite right. You have me on the horns of a dilemma there. My point is this: you would have this among a number of other arrangements, all of which would commend themselves to the judgment of the men. A painter who drinks beer tells you that he believes it is for his health, and he honestly does believe it is for his health, and he thinks he is keeping lead poisoning at a distance by doing it. If you were to convince him that he was doing wrong, I do not say that he would give up the beer.

17,907. (*Mr. Sutherland.*) Dr. Legge of the Home Office, who is an authority on the subject, lays down five sources of danger. He places them in this way: (1) inhalation of dust from dry rubbing down; (2) inhalation of dust arising from mixing dry white lead; (3) inhalation of dust arising from paint drying on the clothes; (4) contamination of food; the pipe, or cigarettes—from dirty hands; (5) possibly the fumes arising from burning off paint. Of these, No. 2, that is inhalation of dust arising from the mixing of dry white lead, does not arise in our practice?—No.

17,908. No. 5 has been abandoned as a source of lead poisoning, that is, the fumes from burning off paint. No. 4—contamination of food—would be met by cleanly habits. There remain No. 3 and No. 1. If dry rubbing down is prohibited, the danger from dust is confined to No. 3—the lead dust accruing on the overalls. Under normal conditions does much paint get on the overalls?—No.

17,909. Is not the dust which gets on the overalls the dust arising from stripping, distempering, the handling of scaffolding, and the numerous other processes in a painter's daily work, and not painting?—I think I would undertake to eat all the dust that came off a man's overalls. If we have no green distemper, or an old flock paper in which the flock has been dyed with an arsenical pigment, the danger would be less. I look to that as the greatest danger.

17,910. Have you ever tried to get a spot of paint off the floor of a room when once it has dried? Is it easy to do?—You would take away the surface of the wood underneath in many cases before you got the spot out.

17,911. If paint spots dry on the overalls, would they, in your opinion, come off in the shape of dust?—Do you mean, supposing a man starts with clean overalls on Monday, and that he gets those overalls spotted with paint, would it come off in the shape of dust during that week?

17,912. Yes?—I hardly think it possible. The spot will be a very small one.

17,913. (*Mr. Parsonage.*) It would crack when the overall was folded?—You could not fold the spot.

17,914. (*Mr. Sutherland.*) Therefore, bearing in mind Dr. Legge's statement that lead poisoning cannot come through the skin, can you tell the Committee how the washing of these overalls can be a source of danger to those who wash them, or to the home where they are washed?—What exactly is the process of washing? Does not the wife put the thing down on Saturday night to boil with soda, and get rid of it all in that way in a liquid form? I do not think that it could come off as dust.

17,915. Dr. Legge says that lead poisoning cannot come from absorption through the skin?—I am very glad to hear that.

17,916. You attach great importance to the educational value accruing to the trade (to both employers and employed), from the promulgation of regulations, the insistence on their observance, and the labelling of all lead compounds as dangerous?—I do. I am very keen upon the labelling, because we have been going on in gross ignorance with regard to chromes, for instance.

17,917. And greens?—And greens. I have taken up a lump of chrome myself, and carefully shredded it off with a palette knife before putting the turpentine to it.

17,918. But in drafting regulations—if regulations be adopted—they should, so far as is compatible with their avowed purpose, conform to the established

usages of the trade?—As far as possible. My experience of painters is, that they are the most conservative animals on the face of the earth. They hate changes, and consequently you must make the changes as little different as possible from their general practice.

17,919. So far as is compatible?—Yes.

17,920. Do you not think that the providing of overalls by the employers is an unnecessary departure from the established practice of the trade, and an unworkable one?—I think I have said to the chairman all I want to say on that. The difficulties are great, and I do not know that such a regulation would be taken very kindly to.

17,921. I was going to ask that. Do you not think that the great bulk of the men would resent having to wear overalls which were common property to all and sundry?—I do.

17,922. (*Chairman.*) Why do you say that?—I would not like to put on another man's clothes.

17,923. But have you consulted the men at all?—Mr. Sutherland asked my opinion, and that is it.

17,924. (*Mr. Sutherland.*) Would not all sorts of inconvenience arise from the employer having to provide overalls, and does their provision by the workman impose any hardship upon him financially or otherwise?—Well, it must impose a financial charge upon him.

17,925. I said a hardship?—I do not think it is a hardship, and I will tell you my reason for saying that. The painting trade, as far as I know it, differs from almost all other trades in that the employer supplies all the tools which the man uses, and they only ask him to supply his own overalls—his own personal wear.

17,926. In any regulations which may be framed you would put compulsion on the householder (the customer), as well as on the employer of the workman, to give him conveniences?—Indeed I would. It would strengthen our hands immensely.

17,927. This would contribute to simplifying the provision of hot water?—Yes.

17,928. And separate rooms for meals, would it not?—Yes.

17,929. The other provision of nail brushes and soap and towels would readily be complied with by the employers?—It would.

17,930. Do you see any difficulty in a medical examination at stated intervals, quarterly or bi-monthly?—No difficulty from the employer's point of view. Whether the men would consider that at all as an interference I do not know. I have not consulted them, and therefore, having regard to what the chairman said, I would be sorry to give an opinion. I think that they would probably soon overcome the difficulty and get used to it.

17,931. Arising from that, would there be any practical difficulty in putting a man, certified to be showing symptoms of lead poisoning, to other work such as washing off, stripping, distempering, rubbing down with pumice-stone and water, &c., until he was certified clean?—There would be difficulty, but not difficulty that could not be overcome if the master set himself to do it. It would need a little arrangement.

17,932. (*Mr. Parsonage.*) Might I interpolate one question here? There would be special difficulties in Dublin with regard to that?—Why?

17,933. It may not apply to your shop, but there is a society of labourers called the Whiteners' Society, who advertise to do this kind of work at the rate of 5*d.* per hour in Dublin. It would mean placing these men out of the ranks of the painters into the ranks of the Whiteners. You know we have continual trouble with them, but not with you?—May I take the opportunity of, to a certain extent, correcting you with regard to that, because the history of this Whiteners' Society in Dublin, is an extremely interesting one. These men were not labourers, they were the old paper-stainers, and with the advent of machine-made papers, the paper-staining business has practically gone from Dublin; from their experience as paper-stainers they were expert colourers, and expert in the use of whitening with a size medium. It is the remains of these men who have come down to us from the last 30 years or so that are the whiteners of to-day. What I have to

22 March 1912.]

MR. JOHN SIBTHORPE.

[Continued.]

say with regard to them is, that they are a vanishing body, and I am sorry to say it, because they were exceedingly useful in their own way, but they never did to any large extent the preparation which Mr. Sutherland speaks of now, as far as I know. I never allowed them to do any punicing. Sometimes they stripped walls; they sometimes washed off ceilings, but when I tell you that I have 2 whiteners to 50 painters, you will see that they do not interfere much with the painters' work. But the effect of this would be the other way up. It would kill the Whiteners' Society rather than drive the painter downwards, because he still would be receiving his full wages.

17,934. (Mr. Sutherland.) This suggestion would be a valuable check on the development of the symptoms of lead poisoning, would it not?—Yes, invaluable.

17,935. The compensation you mentioned in your proof to be given to a man who is compelled to give up his work from lead poisoning, exists now under the Compensation Act, does it not? Or is your suggestion to compensate him before he is liable under the existing Act? If so, would not that open the door to malingering?—What I suggest is, that when a doctor certifies a man to have been repeatedly, so to speak, on the verge of being incapacitated through lead poisoning—

17,936. (Chairman.) I do not quite understand what you mean by "repeatedly on the verge"?—There are some men, and not only men but families, who ought never to have been painters, because they seem to have a marvellous facility for lead poisoning.

17,937. Because they are more susceptible than others?—Because they are more susceptible than others. If we have a man of that type, the circumstances may be such that he ceases to be useful as a painter. What I hold is this—that it is not enough to give that man his half wages for a certain number of weeks, five or six weeks or whatever it may be, when he is actually suffering from lead poisoning. It is much better to deal with him in a fair and reasonable way, and give him a lump sum down to start him in some other business. That is the idea that I had at the back of my mind.

17,938. (Mr. Sutherland.) Does that assume total incapacity, because in that case he is covered under the Compensation Act?—No; he does not get the compensation. While he is incapacitated he gets it. After he is certified sound, you send him out to get incapacitated again and again. Looking at it from a merely mercenary point of view, it is much cheaper as well as being more humanitarian, to give him another chance of something else, rather than have him tied to this thing, which means tying him to sickness.

17,939. Are you familiar with the Scotch system of dividing the day into three periods of 3 hours each with a break of an hour between each for breakfast and dinner?—I know that is so.

17,940. Do you think that this may explain or contribute to their comparative immunity from the evil of lead poisoning?—I think that on the whole the well nourished man is much less likely to contract lead poisoning.

17,941. You think that the additional time of rest between is very valuable?—Very valuable.

17,942. (Mr. Parsonage.) If he puts it to the best use?—Yes; I cannot go further than that.

17,943. (Mr. Sutherland.) Do you know that the great storm centres in this country are London and Lancashire, and that outside these areas (excepting Birmingham) the cases do not present any grave problem?—I have heard that.

17,944. Does not this postulate a combination of conditions in these areas which is provocative of the evil?—I am afraid there is something in that; there must be. There is no reason why Birmingham, for instance, should be comparatively immune if Manchester is not.

17,945. But Birmingham and Manchester are both bad. Is it not a baffling question to determine that, whilst in Edinburgh, where the amount of lead used per painter is quite the equal of Glasgow, there is, according to Dr. Legge, practically no lead poisoning. In five years, in Glasgow, there are 12 reported cases?—I cannot account for it.

17,946. Then you agree that it is a baffling question to determine?—Yes.

17,947. Knowing both cities and the firms there, you would not say that they do less sand-papery in Edinburgh than they do in Glasgow?—No, I do not think they do.

17,948. (Chairman.) Do you know yourself?—I do not know myself; I have never asked.

17,949. Have you come to speak with very intimate knowledge of Scotch painting?—I have never worked in Glasgow and I mentioned that my intimate knowledge was simply due to my acquaintance with men in the trade, and I do not know of any serious differences in the practice.

17,950. (Mr. Sutherland.) Why should dry rubbing down be so innocent in Edinburgh and generally in Scotland and so hurtful in London and Lancashire? Can you form an opinion on that?—I cannot.

17,951. Have you had any experience of painting with zinc white outside?—Yes.

17,952. Do you know how it compares in cost with paint made on a white-lead base—I mean with regard to the cost of the paint as well as the cost of painting?—I cannot give figures.

17,953. A witness from Vienna, who claims to be the largest contractor for bridges and outside iron structures on the Continent, told the Committee that it is his practice to give a six years' guarantee to his lead-painted work, but that he makes it a practice to decline all guarantees for painting done with zinc oxide when he has to do it. Is not that a tremendous tribute to the value of white lead over zinc oxide?—I think he is a wise man.

17,954. Do you know anything of the report of the Commission appointed by the Dutch Government, whose investigations and experiments extended over seven years?—I have not looked carefully through it. I have glanced at it.

17,955. Taken altogether, this is the most complete and exhaustive experiment of the comparative values of lead and zinc paints of which we have records. Let me read you their final conclusions premising two things: first, that they state that for interior work zinc oxide and zinc white paints (lithopone) can be used equally well; second, that the Dutch painter is familiar with the use of zinc paints, and uses them daily. I have conceded the point as to interior work. As to outside painting, the Dutch Commission say, "zinc white paints applied on wood, if not exposed much to the action of vapours containing sulphurous acid, will in many cases during five years remain in an equally good condition in the open air as white lead paints, and can replace the latter with good results." Now you see there are important qualifications. "But in all places where accumulations of water remain during a long time, such as on window sills, the lower side of cornice work, &c." (and this, I submit bears out your experiment) "they will even after three or four years deteriorate in the course of a short period to such a degree that repainting will become necessary for the preservation of the wood. In this respect, therefore, they are inferior to white lead paints." That bears out your experiment that, on arries and the edges of wood frames and sills, zinc white does not cover as well as white lead. Now, viewing this report from an impartial standpoint, is it not a justification for white lead for outside work and a weak defence for zinc oxide for the same purpose?—From your reading of it, the only thing that I would take exception to in the report is the life that they give to zinc. I do not think it is five years, so that it is probably quite as strong a defence for zinc as they could make.

17,956. The report clearly indicates greater expense in that, according to the Commission, zinc oxide paint costs more to prepare for repainting, and it may have to be repainted more frequently. Are not these important facts, and should they not have weight with this Committee in determining its action?—That is a very important point about the preparation of work which has been treated with zinc for subsequent painting.

22 March 1912.]

Mr. JOHN SUTHERLAND.

[Continued.]

17,957. (*Chairman.*) Have you studied very carefully this Duteli report?—No.

17,958. Then are you qualified to speak upon the various conclusions of it?—Taking the portions read to me, standing by themselves, undoubtedly they are important facts.

17,959. (*Mr. Sutherland.*) You are qualified to form an opinion, as a master painter of long experience, on what I have put before you. If the facts are, as expressed in the report, do you agree?—Well, if they are facts, I have got to agree with them.

17,960. Have you ever thought of the difficulty which the abolition of white lead will create in standardising white paint?—This is not a fanciful objection, is it?—I have thought of that, and thought very seriously of it. You are aware that the Institute strove to standardise paints other than white lead some few years ago, but their effort was quite a failure.

17,961. An architect to-day can and does specify, and it is the formula of the R.I.B.A.; "genuine white lead," "best Baltic linseed oil," and "pure American turpentine," as the basis of the paint to be used, and he knows that if the specification is followed he gets the best possible white or light paint for general use. He can check it too. Abolish white lead, what can he specify as a standard paint to take its place?—I do not know.

17,962. It would leave the door open for a great deal of trouble?—Immense.

17,963. (*Chairman.*) But, supposing that the master painters had two years' interval before lead was prohibited, they would begin to arrange their formula?—It is possible, but judging by some eight or ten years that we have been anxiously seeking for standardisation, I doubt if the results would be very good.

17,964. (*Mr. Sutherland.*) White lead, though a small item in the volume of our national trade, has a preservative office to property and structures of all kinds out of all proportion to its monetary value. Is it a thing to be lightly set aside without first finding a satisfactory substitute?—I think that one, probably the greatest advantage in what the Chairman pointed out as likely to result from regulations, is the trying of these other paints. That would be absolutely necessary before you could prohibit white lead.

17,965. But what do you say to two years' test? You could not go on for two years?—It would be absolutely useless.

(*Chairman.*) It might go on *ad infinitum*. Supposing the Committee resolved to give trials (some of the witnesses have said 10 years) and if they did not succeed, then you might have another 10 years' trial, and so on.

17,966. (*Mr. Sutherland.*) You do not know, of your knowledge, any satisfactory substitute for white lead for outside purposes?—No, I do not think there is any, as a basis for white paint.

17,967. You, therefore, are of opinion that, before proceedings of so drastic a nature as prohibiting white lead are adopted, a trial should be given to regulations?—I think, from the reasons I have mentioned, on account of our insular position and on account of the quantity of salt there is round our coast, we ought to be the last and not the first to prohibit white lead.

17,968. You know that this is the opinion of the National Association of Master Painters, passed at the Derby Convention?—I was not at the meeting, but I was at the meeting succeeding, where the minutes of that session were read.

17,969. Now, as to cost. Whether regulations or prohibition be adopted, it means an inspectorate, does it not?—Certainly, I believe so. I think I told the Chairman that I do not know of any other way if you have prohibition.

17,970. Therefore, the cost would be the same in either case; whether you have regulations or abolition of lead. I will put it that a large cost would be involved in either case?—I think you must have regulations in any case, because you must do something. If you are fighting the dust question you must have regulations to deal with it. It would be much more

difficult for an inspector to satisfy himself that there is no white lead being used than it will to satisfy himself that regulations with regard to the use of white lead are being enforced.

17,971. Do you know that medical and scientific witnesses have demonstrated to this Committee that all paints give off a substance which they term aldehyde?—No, I cannot say that I know that of my own knowledge.

17,972. Which may account for some of the effects hitherto attributed to lead?—I know this of my own knowledge—I do not know whether it all bears on it, but if the Committee like I will tell them—that 30 years ago we had the idea that painters' colic was the result of flating largely; that is to say, putting on the final coat which is composed mainly of turpentine, but we found that a turpentine varnish was almost as potent, if it was put on in large quantities, in producing painter's colic.

17,973. Spirit varnish?—Yes. Then we were told by the doctors at the time that, what really took place, was that the turpentine irritated the mucous membrane and produced colic.

17,974. Do you know that the War Office and the Admiralty are the largest consumers of white and red lead in this country?—I should think it is very likely; I do not know of my own knowledge.

17,975. (*Mr. Fell.*) Have you had anything to do with carriage or coach painting?—No.

17,976. In your opinion, is there any difficulty in using zinc white where the paint is varnished?—Let me see if I understand.

17,977. Take, for instance, a tramcar which is frequently varnished; do you see any difficulty in using non-poisonous paint such as zinc white?—You see, my difficulty is that I have no practical experience of that, and I do not want to say anything more than I really know.

17,978. (*Mr. Parsonage.*) The painters in Dublin take their breakfast before they start work in the morning?—Yes.

17,979. And yet you agree with Mr. Sutherland that it is better to have the Scotch system where they work three hours before breakfast, as he stated?—I do not say so. He asked me that, and the answer I gave him was that a well-nourished painter was less susceptible to lead poisoning than one who was not so well-nourished; and my great reason for advocating, as I did 11 years ago, breakfast the first thing, was that it gave the man an opportunity of getting a comfortable meal at home altogether free from the possibilities of lead, and one of the danger points would be removed.

17,980. There is far less lead poisoning in Edinburgh than there is in Dublin. The painter in Edinburgh works for three hours before breakfast, but the painter in Dublin starts after he has had a meal. Doctors recommend now that a painter should not work on an empty stomach?—Then I am very glad that I am on the side of the angels.

17,981. You were speaking about the number of incapable men. You put it at 8 per cent.?—8 per cent. is the highest I would put it at.

17,982. You estimate the number of painters in Dublin at about 800?—Yes.

17,983. You know that there are two societies in Dublin?—I know there are two societies, and two branches of one society.

17,984. Two branches of the National Society, and there is the local society?—Yes.

17,985. You could not form any idea as to what society these incapable men belong to?—No.

17,986. Your work generally is above the average of the ordinary work in Dublin?—I think I can honestly say it is.

17,987. I should say it is?—But though an Irishman, I do not want to blow my own trumpet.

17,988. You have not very much knowledge of lead poisoning?—The only case within the last 10 years was that of a member of your Society, I think.

17,989. Yes?—That is an exceedingly curious case. If the Committee would like I will tell them about it.

[22 March 1912.]

Mr. JOHN SIBTHORPE.

[Continued.]

17,990. I could give some very curious ones at the same time. We have had six deaths in Dublin from lead poisoning since 1907. I will not be positive as to the date 1907. We have paid out in six cases of total disablement and blindness from lead poisoning?—Yes; I know that.

17,991. I daresay you know some of the men?—I daresay I know most of the cases. One man has been totally disabled. He is only 80 years of age. He said it was lead poisoning. Most people said it was senile decay. He was a full grown man when I was a boy.

17,992. In Dublin?—Yes.

17,993. At the present time there is a man lying totally paralysed at the hospital in Dublin from lead poisoning. He has been examined by three of the best doctors in Dublin. They have all certified him as suffering from lead poisoning. He is totally paralysed. I have a case now in my annual report of a man 40 years of age certified as dying from lead poisoning. The cases of death vary from 23 years of age up to 46. We have some totally blind from lead poisoning?—In the totally blind cases that you speak of, unfortunately they allowed the time to pass; several doctors are prepared to certify that it has no more to do with lead poisoning than with the colour of the carpet, and it is a case of the act of God.

17,994. We do not pay our money away unless we get the best medical evidence?—I am merely telling you that of my own knowledge.

17,995. I should not take your shop, as a fair criterion of the ordinary risks of a painter?—Possibly not.

17,996. I should not. I should have preferred to have seen two others who I know have cases, at the present time, of lead poisoning, and frequent cases. Dublin is rather a bad place for lead poisoning. I will leave that. Now with regard to the use of zinc and lead, if lead was prohibited, the painter could use zinc paint just as easily as he could lead?—No doubt.

17,997. You agree with that?—Certainly.

17,998. He would not require any special training?—Oh, dear no.

17,999. I entirely agree with you, but a good many witnesses have stated the reverse?—Well, I am very much surprised if they say that a good painter could not use zinc.

18,000. Now with regard to the question of dry rubbing down, you say in your statement that it can be dispensed with?—I believe it can.

18,001. Dry rubbing down between coats?—Certainly.

18,002. Then you would not rub down at all?—I would.

18,003. Would you rub down wet?—There is nothing in the world to hinder them from sponging the surface and then rubbing down with waterproof sand-paper.

18,004. Is there a waterproof sand-paper on the market?—It can easily be made.

18,005. Just as easily as a substitute for lead?—By no means.

18,006. They have been 30 years trying and have never produced a waterproof sand-paper yet?—They should try.

(Mr. Parsonage.) They have tried and they say that they cannot produce it.

18,007. (Chairman.) Then your acquiescence in the abolition of dry rubbing down depends on finding a waterproof sand-paper?—No, because there are many other ways of doing it. It does not depend on that. I think that the danger of dry rubbing down between the coats has been enormously exaggerated. My experience is that dry rubbing down between the coats is only resorted to to take off the sort of nib that is left on by the brush mark. It is done when the paint has a considerable amount of oil in it, and most of the stuff that comes off comes off on the face of the sand-paper itself. That is my experience, but I am not going to the stake for it.

18,008. (Mr. Parsonage.) With regard to inspectors, how would you go on with a job that only lasted a day? A man might be at half-a-dozen jobs in a week?—A

painter will not do very much dry rubbing down, pouncing, and three-coat work in a day.

18,009. I am not speaking of dry rubbing down. What sort of a job would it be that would only last a day?—I want to understand the question.

18,010. They may have a shop to do in a day and night?—Then it would all be distempored and no lead would be used at all.

18,011. Yes. Hundreds of jobs are done between Good Friday and Easter Tuesday, flattening ceilings and painting and all that?—If you have a hurried job of that kind, you will do precious little preparation.

18,012. (Mr. Sutherland.) Very little rubbing off?—Very little rubbing off.

18,013. (Mr. Parsonage.) I am referring to the notification of the jobs?—My theory is that all you would need to do in a case of that kind would be to give the notification that the job commences at such and such time and will probably end at such and such a time. You or I would know when the danger was likely to come of infringement, and we would make it our business to drop in without advertising when we were coming.

18,014. (Mr. Gardner.) The only thing that the inspector would do would be to see that there was no dry rubbing down done. It would be hardly worth while providing a staff of inspectors just for that?—He would have a good deal more than that to do. He would have to see about the provision of a separate place for paint to be stored and mixed and a separate place for the meals to be eaten in. He would have to see that there was provision made of water for washing. He would have to see that there was (a thing which I know is a very great difficulty with painters) proper lavatory accommodation. One customer of mine (only one) will not allow our painters to use the servants' closet, and the men have to go a quarter of a mile to the public-house for the call of nature. I consider that cruel. One of the dangers that we suffer from, which you know as well as I do, is the danger of constipation.

18,015. If you are of opinion that lavatory accommodation should be provided, soap and hot water, towels, and so on, and are also alive to the dangers of lead poisoning, can you tell us why the master painters have never made any effort to get these things put into force?—There is no difficulty about soap or towels in my shop.

18,016. (Chairman.) For instance, how do you know whether your men get hot water?—I have frequently dropped in on them at lunch time, and I have always seen them washing their hands with hot water. I cannot go further than that.

18,017. (Chairman.) Do you think that that is regularly supplied to them?—I think they take care of that themselves.

18,018. You think; you do not know?—I am judging by the experience I have had. I want to make it clear that our effort with regard to lead poisoning, it would seem now, has been altogether directed to a wrong point, but although it has been directed to the wrong thing it probably has attained some at least of the objects. We were altogether proceeding on the assumption that the danger arose from absorption, and that consequently specially clean hands were the things to be aimed at. Of course, the clean hands were a good thing anyhow. Whereas when I was serving my time we had two bad cases of dropped wrist in our shop, I have not seen a case since.

18,019. (Mr. Gardner.) You are speaking only of your own shop; but speaking of the trade in Dublin, and Ireland generally, the employers have made no provision whatever in the past for facilities for hot water, for instance?—They have not boiled the kettle, but they knew that the kettle was boiled.

18,020. But they have made no provision?—No.

18,021. Now, where do all the unskilled, careless and dirty painters you spoke of come from. Do you consider that these are all men who have served their time?—No. I know that a great majority of them have not served their time.

N n 2

22 March 1912.]

Mr. JOHN SIBTHORPE.

[Continued.]

18,022. Then who is responsible for the introduction of these men into the trade?—Not the masters.

18,023. Is it the men? The men do not bring these men into the trade?—Yes, they do.

18,024. How do the men bring these unskilled men into the trade?—Simply in this way: when there is any chance of labour trouble affecting a particular branch, there is an effort made to get all and sundry into the society, so that the society may speak with a stronger voice.

18,025. Yes, but in that case your answer admits that these men are already working at the trade?—Certainly, but every man who handles a brush is not a painter. The first brush that some of them handle is a broom as a scavenger.

18,026. I take it from your evidence that you would be inclined to prohibit adults entering the trade who had not served a previous apprenticeship?—Yes.

18,027. You told us that a painter is a very conservative animal. Does that not tend towards his present adhesion to the use of red lead and white lead in many cases? Does he not make it a sort of fetish and think that he cannot do away with lead without trying to find anything else in its place?—It is up against the master to find a substitute, and not the painter, who uses what he is given.

18,028. I take it that the master is just as conservative as the man, and possibly more so?—I agree.

18,029. You spoke about red lead drying under water, what do you mean by drying under water?—You are a practical painter, and you have often had the gutters round a house to paint?

18,030. Yes?—You just simply stop the water out of it. You put on your red lead; the water comes back. You come back the next day and the red lead is hard.

18,031. Does not that apply to other materials?—No. Your white lead will float off, or most of it.

18,032. It all depends on the medium which it is mixed with?—I only know of one medium.

18,033. You have tried zinc on outside work. Was it a failure?—Comparatively.

18,034. What did you make it up with?—With raw and boiled oil.

18,035. Ordinary boiled oil?—Yes.

18,036. Have you ever tried pale boiled oil?—Yes.

18,037. How did it work?—I have not used it with zinc outside, but I have inside.

18,038. You used zinc as you would use lead?—Precisely.

18,039. Would it not have been better to have given it particular treatment?—I do not know what you mean by particular treatment exactly.

18,040. What suits one material will not suit another material. Did it never strike you that you might try to do the work by using the material in another form from that in which you would use it with white lead in order to do justice to the material?—No, because from the fault the material had, it did not promise any better result with a change of vehicle.

18,041. But you have not tried it?—No, but a painter would naturally see. For instance, how, except by the introduction of the gum, that is to say, the making of a varnish, can you get rid of the chalk which I complain of in zinc?

18,042. White lead chalks too?—Yes, but in a much longer period.

18,043. Under certain circumstances?—Under all circumstances.

18,044. With regard to red lead, do you think it is the only protection for ironwork?—I think it is the best protection for ironwork.

18,045. The engineer of the Commissioners of Irish Lights thinks that white lead is quite as good a protection?—He does, apparently.

18,046. Why is red lead such an efficient protection of ironwork?—I cannot tell you that.

18,047. You can tell us why white lead is an efficient protection for woodwork or work exposed to outside influences?—Can I tell you?

18,048. You know the generally accepted statement that white lead and oil saponify?—Precisely.

18,049. But red lead and oil do not saponify?—No. I do not use it as a finish in any case.

18,050. You use it as a protection?—Yes, for the rust underneath.

18,051. If the red lead is an effective protection against rust, where does the rust come from?—You might as well ask me why we die when we come to 80 years of age. The life of the thing is gone.

18,052. But one substance would do as well as another?—No. You may shorten your life.

18,053. You spoke about work rubbed down with pumice-stone being scratched and torn?—Yes.

18,054. Is that your experience?—Yes. You will not get the same smooth surface. You and I would detect the difference.

18,055. But it will not be much scratched or torn?—I do not say that the man in the street would tell the difference, but you or I would tell the difference.

18,056. You have to recollect that other people are going to read your evidence?—I am very much obliged to you for helping me to make it clear.

18,057. Now, outside work is not all painted with white lead or a white lead base. How is it that projections on outside work painted with other colours stand so well against the weather if zinc will not?—I can only speak of my own knowledge. I know of exceedingly little outside painting that is not on a white lead base.

18,058. Dark paint?—If painting with dark paint, it is my practice to give a coat of lead colour first.

18,059. But take a one-coat job?—I do not take one-coat jobs.

18,060. I wish that all painters were in the happy position that they could refuse to take one-coat jobs, but unfortunately they cannot. They have to take them too often?—It would be to the advantage of the customer if they did not.

18,061. Why do you think that it is more costly to prepare a zinc painted surface for repainting than a white lead painted surface?—Did I say that?

(Mr. Sutherland.) That was a question I put to you on the evidence of Mr. Nooijen.

18,062. (Mr. Gardner.) You admitted that it was so, and I want to know why?—I did not intend to make my evidence amount to that. It would be the merest guesswork.

18,063. (Mr. Sutherland.) I do not think you did give a reason?—I can well imagine a reason for it, but I do not know one.

18,064. (Mr. Gardner.) I should not have put the question unless something had been said to make me ask the question. It was simply guesswork to say that it would be more costly?—Mr. Sutherland stated what the Dutch people said, but I neither assented nor dissented from it. If you ask my opinion, I think it is exceedingly likely, but I have no knowledge.

18,065. (Mr. Sutherland.) I read from the Dutch report, and you assented to the question which I put?—If it is in the form of enamel, you can easily understand how you will have considerably more trouble.

18,066. (Mr. Gardner.) I am not speaking of enamel paints. We all know that a varnish paint is much harder to grind down?—Yes.

18,067. (Chairman.) You have stated that in your view regulations would be preferable to prohibition of lead?—Yes, I think it would be the wiser.

18,068. But I take it you mean by that that the regulations should be thoroughly and continuously enforced?—And on all users of paint. I want to make that very clear—and I mean the man who paints a house for himself as well.

18,069. You have told us that there should be at least four inspectors for the population of Dublin, and anything less than that you would not think sufficient?—My evidence was that four would be enough.

18,070. You would not think that half would be sufficient?—I think that that number would do it in a very perfunctory way. When the thing is fresh and new, until you have educated the men, I think you want to follow them fairly closely.

22 March 1912.]

Mr. JOHN SIBTHORPE.

[Continued.]

18,071. You still maintain that to follow them fairly closely, and to have very efficient inspection, you would require four inspectors in Dublin?—Yes.

18,072. You made an observation in connection with susceptible cases. Do you mean that, if a man has had lead poisoning, he should not be allowed to again be employed in the work. You said after one case, did you not?—No, I mean after repeated cases.

18,073. What do you mean by that?—Some men get it time after time. Other men get it only once, and then are more likely to be careful.

18,074. They say that some workmen are more susceptible?—Yes.

18,075. It is not a case of how often, but of susceptibility?—Yes.

18,076. You made what I thought a very good suggestion—that in the case of these susceptible people, they should receive a lump sum sufficient to enable them to start in some other business?—Yes.

18,077. How many times should they be afflicted with the disease before they became qualified?—I would say anything over three times.

18,078. For how long do you think they should have suffered before they became entitled?—I cannot go into the duration. I would say a well-marked case.

18,079. However slight?—Yes.

18,080. (Mr. Sutherland.) However slight! Do you mean that?—A case that would involve compensation, if it was repeated, would point to the man being susceptible.

18,081. (Chairman.) Would you go so far as to say that any man who was not actually suffering from lead poisoning, but who the certifying surgeon thought was on the verge of it, should be taken away from the employment before the actual poisoning took place, and under those circumstances should receive compensation from the employer?—No. I think that his case would be met by giving him the other employments that were suggested till the certifying surgeon could be satisfied that he was clear.

18,082. Would you, as a large employer, make that a *sine qua non*? Would you make it a condition of being allowed to use lead?—Yes.

18,083. If a man was on the verge of becoming poisoned, he should be taken from that work and given work in surroundings that were not dangerous?—Yes.

18,084. At equal wages?—Yes; you cannot do otherwise. He is still a member of the society, and the society will take care that you do not cut him down, or if they do not they are of very little use, and not what I think they are.

18,085. You would agree that that should be one of the new rules?—Yes.

18,086. You spoke of the insular position of England?—I was speaking more of my own island, but it applies to Scotland even more.

18,087. You said that owing to our insular position you think that we should be the last country in the world to prohibit lead, and not the first?—Yes.

18,088. Do not you know that we have always led the van in regard to the social amelioration of our own

workpeople?—I do not think so. I think we have only taken up the Insurance Act after Germany.

18,089. That is the case, but in other instances we have always been proud of being the first in the field, not the last?—Yes, but if we are the people to take it up last we should be satisfied of its efficacy elsewhere. If we are the people to whom it would be the most ruinous to adopt, I think we ought to have the evidence of other countries that the adoption of it is a success.

18,090. If I may say so, you have given very humane and kindly consideration to this question before us. Would you go so far as to say that if we cannot get the other employers to agree to a rule such as you have suggested, including this very efficient inspection, or supposing that that very efficient inspection was impracticable from a financial point of view, you would then think that this Committee should, from the humane side of the question, decide to prohibit the use of lead in the industry?—I cannot see how you are going to prohibit any cheaper than you are going to regulate. You mention the "financial point of view." If you dispose of the financial question, I do not think that there is any point in it.

18,091. If any of your suggestions prove to be impracticable, would you suggest that we should recommend prohibition of lead, or that the men should go on suffering as they do to-day?—I would put it in this way: that the regulations should be given a fair trial.

18,092. I am supposing that the regulations and the very efficient inspection which you have foreshadowed are not workable?—But from what point of view, except that of cost?

18,093. I am assuming that it is not practicable?—If regulation is not practicable, then prohibition is not practicable.

18,094. But you are assuming that you want regulation even with prohibition?—You do.

18,095. Supposing that we thought that we could have prohibition with every safety to the worker without regulations, but that regulations for the protection of the workers in the ordinary working of the trade were impracticable, then would you agree to prohibition, rather than that men should go on suffering?—I am afraid it is too hypothetical a question. I cannot conceive how it can be carried out, but supposing we had the millennium, then we might prohibit lead.

18,096. What do you mean by millennium?—When everybody will do what he ought to do.

18,097. That does not answer the question?—I cannot; I should be very glad if I could.

18,098. It comes to this, if we cannot frame a set of rules on the basis of your suggestion this morning —?—Or some others.

18,099. Yes, or others—and if we cannot concurrently feel quite confident that they can be enforced by very efficient inspection, then I ask you whether you would agree to prohibition, or would you say that the thing must drift on as it is now?—I am a great deal more interested in the painter than I am in the public, and I would say, do anything you can that will safeguard the painter and let the public go. That is what it comes to.

The witness withdrew.

Mr. GEORGE PLUMB.

Evidence to 18,112 handed in and taken as read; witness then called and examined.

18,100. I am foreman of the painting and decorative department of Messrs. George Trollope, of Belgrave Works, 77, Grosvenor Road, Pimlico, S.W. I have had 44 years' experience as a house painter, and have been nine years in my present position, where I control a large number of men, varying seasonally from 150 to 350. I can claim to have had the widest possible practical experience in all kinds of paint and all kinds of painting.

18,101. I have no doubt as to the all-round superiority of white lead to any other kind of pigment for house-painting purposes, for use both for the outside and for the inside. Where a very superfine

finish and delicacy is required, and money is no object, zinc white may be used in place of white lead, at any rate, in the interior, but even then it is my practice to mix a considerable proportion of white lead with the zinc white. For similar reasons, and under similar circumstances, zinc white with an enamel finish may also be used. Apart from such considerations, no practical man can doubt the superiority of white lead over zinc white in point of (1) efficiency and (2) durability.

18,102. As to efficiency, it is well known that, although by reason of its greater volume zinc white has a greater "spreading" power, yet, because it has

22 March 1912.]

Mr. GEORGE PLUMB.

[Continued.]

to be mixed with larger quantities of linseed oil, its true "covering" power, *i.e.*, power to render opaque, is notably less. As to durability, zinc white does not "petrify" as it dries as does white lead; that is to say, zinc white continues to oxidise or burn, and speedily scales and is worn away. White lead as it dries forms a hard sort of glaze and resists rain and weather. I estimate that zinc white will at the outside last some two years, while white lead will be good for eight. These two factors of greater durability and efficiency, of course, mean that, even apart from the greater cost of zinc white paint, white lead is the more economical pigment, especially by reason of the greater amount of labour required for zinc white, labour being by far the greatest factor in the cost of painting. The element of cost becomes, of course, the greatest factor in the maintenance and redecoration of property.

18,103. I have had to do with the painting of iron, for which purpose there is really nothing, which can generally supersede red lead. To some extent the coal tar bituminous paints can take the place of red lead, but never where other than black paint is required.

18,104. I am accustomed to the painting of ships, such as the "Lusitania," and materials for ships, and here, also, am convinced of the superiority of white lead. I am accustomed to use zinc white paint for special decorative finish in special parts of ships, when I use either a top coat of zinc white mixed with white lead, or an enamel with zinc white.

18,105. I see no sense in the suggested use of zinc white with a five or six per cent. mixture of white lead; this would add nothing to the good qualities of white lead to so large a proportion of zinc white, and it would increase the painter's danger because he would think that he was working with zinc white only, which has for many the reputation of being harmless. I do not myself agree as to the harmlessness of zinc white, as I think just as much dust is caused with it as with white lead, and breathing of metal dust of any kind must be harmful.

18,106. I do not think that the dangers of dry rubbing down or burning off are so great as supposed. It is only on the highest class work that there is any quantity of lead dust. Nevertheless, I see no strong objection to the prohibition of dry rubbing down. In certain classes of work, however, rubbing down with water is not always practicable to the extent required, as it would cause the work to swell and push off the new paint in drying out. Whether done with water or oil, it has, in my opinion, the tendency to soften the painter's skin and promote absorption of lead. The amount of burning off done is also much exaggerated; it is an advantage in most cases to retain the old painted surfaces, except where they are cracked, blistered, or perished, or the mouldings and enrichments have been choked up. In any case, I consider that the dangers of burning off are slight, as it is mostly done out of doors. The stripping of old paint by a spirit solvent is dirty and unpleasant, and there is much evaporation. An alkali stripper is also dirty and creates a danger of absorption by the hands.

18,107. I have no doubt of the real gravity of lead poisoning, or of the considerable number of cases of lead poisoning, but I am convinced that they have come into greater prominence of late on account of the Workmen's Compensation Act, as before that Act there were a great number of cases of colic and indigestion of which no notice was taken; there is now an obvious incentive to get these grouped with other more serious cases of lead poisoning. In my opinion, the great necessity is the greater personal cleanliness of the painter. This has improved to my knowledge in late years, and will increase as education increases. The great thing is that the painter should really be aware of the danger of white lead.

18,108. I should approve of medical inspection, and of some machinery by which those who have a special tendency to lead poisoning might be excluded from the occupation, and I should, therefore, approve of some system of registration.

18,109. So long as all were equally obliged, I should approve of masters being compelled to supply washing

materials, as is already done by all large firms, although it would add somewhat to the cost. In regard to the provision of blouses and overalls, I would point out that even at the present time it is only the inferior class of workman that does not wear blouses and aprons or overalls of their own will and at their own cost.

18,110. Whatever regulations are suggested, they should be such as would have the support of the painters themselves, and should be compulsory upon masters and workmen alike. They should also, so far as necessary, be compulsory on the occupier of the house painted, &c., so as to remove the difficulty of obtaining separate rooms for meals, &c.

18,111. I see no grave difficulty in instituting a system of inspection for the purpose of supervising the observance of the regulations. Whether there be prohibition of white lead or regulations, there will have to be inspection. The inspectors should have a thorough knowledge of the trade, practical and otherwise, and, if they had experience similar to myself, I see no reason why there need be a very large number of them. It would not be necessary to visit every job daily, and therefore there is no reason why an inspector should not cover quite a large area in the course of a day.

18,112. In conclusion, I would like to repeat that the most important thing is to bring the danger of lead poisoning to the knowledge of painters, as there are a large number of men working in the trade who are very careless about cleanliness. Further, I cannot help thinking that a very large proportion of the serious cases are among those who have come into the trade comparatively late in life and without the advantage of a training under an experienced master such as was obtained under the old apprenticeship system.

18,113. (Chairman.) Are you the foreman painter or Messrs. Trollope, of Pimlico?—Yes.

18,114. How many painters are employed, on the average, by that firm?—An average of about 230. They fluctuate from about 120 to over 300. At the present time the number is considerably over 200.

18,115. How many cases of lead poisoning have here been during the nine years that you have been foreman of this firm?—Only three cases of compensation.

18,116. Are there any without compensation?—Yes; at the present moment there is one man away for a day or two with colic, but they are not serious cases; they go away for a day or two and come back to work.

18,117. Do you have a good many cases of slight attacks?—Not a large number considering the number of men.

18,118. What proportion do you think it would be?—Certainly not 5 per cent.

18,119. About 5 per cent, we may take as the average?—That is a very full average, and those mostly happen in the country on what we call country work.

18,120. I suppose that means that there they have not the same opportunity of getting washing accommodation and so on?—They have not the convenience of their home, and are perhaps a little bit neglectful of themselves.

18,121. Would they have the same opportunities of getting washing appliances, &c. in the country districts as they would in London?—No. The lodgings which they have are not equal to what they have in their own houses.

18,122. You state in your evidence that white lead paints have great advantages over zinc white in point of efficiency and durability?—Yes.

18,123. Now we have had several witnesses before this Committee who have given us an opposite opinion?—That is my opinion.

18,124. For instance, the Savings Bank buildings in London, under the direction of the Office of Works, were painted in 1906 inside and outside with zinc paints, and reported in excellent condition in 1910, when they became due for re-painting?—Was the paint that was used analysed?

18,125. It was a formula which the Office of Works assures us is free from lead?—There is a paint now

22 March 1912.]

Mr. GEORGE PLUMB.

[Continued.]

being used (I must not say by whom it is made) as a zinc paint, but I know that it is largely adulterated with white lead.

18,126. I may tell you that the paints which the Office of Works used were analysed by the Government laboratory?—The samples were.

18,127. You do not suggest that they would send in samples of non-lead paints; and then add a little lead?—I suggest nothing.

18,128. No, but you rather demurred, I thought?—A traveller brings me along an article, and says, "This is so-and-so." I take it and, to the best of my ability, I test it. I buy, and buy, and buy, and find, in the course of buying, that the goods actually delivered are not up to sample.

18,129. (Mr. Sutherland.) Is the zinc paint you refer to as being adulterated with lead used by the Office of Works?—I cannot say.

18,130. (Chairman.) Then there have been a large number of post offices and sorting offices in the London district similarly painted with zinc paint, and it has proved to be efficient?—I can only say that every paint used is not analysed. The samples are all right.

18,131. Do you cast a doubt on the propriety of the Office of Works in this respect?—I am not casting any doubt at all.

18,132. But you are?—I am simply saying that I have found paint, which I have bought as zinc paint, adulterated with white lead.

18,133. But the Office of Works, as I am trying to put to you, have painted the insides and outsides of some of their buildings with zinc paints, which they assure us they have had analysed by the Government laboratory?—All I can say is that wherever I have used zinc paint alone it has not given me satisfaction.

18,134. Then the Orient Steamship Company for their liners have used almost exclusively non-lead paints for some years, and various gasometers and other ironwork have been painted with zinc and iron oxide paints. The exterior of the Stock Exchange was painted with leadless paints, which were reported by the official architect as very satisfactory. Are you surprised to hear that?—Very.

18,135. Then, with regard to the painting of ironwork on ships and wherever there is much exposure to moisture, you say there is really no practical substitute for red lead?—I think not. It is used in all the dockyards.

18,136. What experience have you had of good red oxide of iron paints, of graphite paints, of bituminous paints, and so on?—I have used them. They are very good, but are not equal to red lead. Red lead would be used, in a sense, as an under-coating, not as a finish coating.

18,137. You think that the red oxide of iron paints or graphite paints are very good?—Yes.

18,138. We have been told that there are a great many paints, besides zinc paints which have been successfully used for iron structures?—My work has been mostly among the high-class decorating domestic work, ecclesiastical and theatrical.

18,139. Have you had any experience at all of the painting of ships?—I have done the decorative portions of about five or six ships for the Royal Mail Steam Packet Company, and one for the Orient Line. I had something to do with the "Mauretania," and the "Tasmania." Our work is principally among the cabins de luxe, reading rooms, library and so on.

18,140. In the case of the Orient Line, did you use lead?—I had an under coat of lead, and to get extreme whiteness, mixed zinc and white lead together.

18,141. In every case?—Yes.

18,142. Was that stipulated for in the specifications?—It was to be painted so many times, and a certain finish given.

18,143. Did the Orient Company ask you to use leadless paints?—No.

18,144. Did you tell them that you used lead in your paints?—No.

18,145. So they probably were not aware of what you did?—I should say that they were. There was nothing to say to the contrary.

18,146. What I put to you is that they might have allowed you to use lead without their being cognisant of it?—They might have done. If it was in our specification that we should not, we should observe it.

18,147. When did you do this decorative work in the cabins of one of the Orient liners?—It is only on the new boats that we do it. We are now doing about four boats for a different line. We contract with such people as Harland and Wolff or others.

18,148. But I am particularly interested in what you have said about the Orient liner. Do I understand you that you do the painting for the contractors?—Yes.

18,149. Not for the Orient Line itself?—They have the supervision of it. We have to please them.

18,150. But have they any cognisance of the kind of work that is done?—Of the material that is used, do you mean?

18,151. Yes?—I could not say that they have, but I could not say that they have not.

18,152. You say that you do the painting for the contractors?—Yes.

18,153. Who hand the ships over to the Orient Line?—Yes.

18,154. Would the Orient Line be likely to dictate to the contractors what kind of paint was to be used?—They might.

18,155. You do not know that?—No.

18,156. Then you tell us that you do not agree as to the harmlessness of zinc white?—Not altogether.

18,157. Are you aware that the Home Office officials have had opportunities of observing for many years the health of zinc workers, who would certainly have shown signs of poisoning; had your view been correct?—No, I am not aware of it.

18,158. Can you tell us in what way you think that zinc paints are harmful?—In rubbing down to get a highly finished surface you get a lot of dust, and I take it that to inhale dust of any kind is harmful.

18,159. Then your criticism is only in regard to the dust that is generated?—Yes.

18,160. Not in regard to its poisonous nature?—No; I cannot say that I know about that.

18,161. When you say that zinc white paints are harmful you mean with regard to the dust that is created?—Yes.

18,162. Nothing else?—Nothing else.

18,163. In paragraph 18,106 you state that the dangers of dry rubbing down and burning off are not so great as supposed. How then do you account for the lead poisoning from which painters suffer?—I think that they get lead poisoning equally as much by inhalation.

18,164. Through the mouth?—Or nose.

18,165. Yes, through the mouth or nose. That is, I suppose, in the shape of dust?—No, not necessarily. I think that with any paint that is largely oil, or mostly composed of turpentine and lead there is great evaporation and evaporation I fancy carries a certain amount of deposit. In a good many cases men do not do very much rubbing down.

18,166. Have you any specific knowledge as to the truth of that statement?—I have seen the effect of inhalation on the men. If you have a vessel of water in a room where painting is going on, although no dry rubbing down takes place, you can skim off the top of the deposit in the water, and if you analyse it I believe you can get a certain amount of lead from it—from the evaporation.

18,167. Have you ever had it analysed?—I have in my own simple way.

18,168. It is a very interesting point. In what way have you analysed it?—I had a friend, a chemist, and I took it along to him and asked him what he thought of it, and he told me that it showed signs of lead in it.

18,169. Just simply signs?—He found lead in it.

18,170. He could not tell you what quantity?—No, he could not tell me the quantity, but he could tell me what it was.

18,171. Your suggestion is that the fumes which arise in this way are more harmful than the dust which is generated?—No. In whatever way lead gets into the system I think it is equally dangerous, but there

N n 4

22 March 1912.]

Mr. GEORGE PLUMB.

[Continued.]

are a great many painters who never do any dry rubbing down, or very, very little, and they get lead poisoning. It is only on the best class work that dry rubbing down takes place.

18,172. Would not that be accounted for by the greater susceptibility of the worker?—Not necessarily.

18,173. How then would you account for small quantities of lead being so dangerous?—I see what you mean. There are some more susceptible than others, and generally it shows early.

18,174. I suppose you would agree that the inhalation of lead dust is dangerous to the workpeople?—Very. In some cases where we have a very heavy job, I have known my men put muslin over the nose and mouth to prevent it. But you do not get rid of it in that way. It is floating about in such minute particles that you cannot see it.

18,175. That is the difficulty, I take it, that it floats about in the air, and the men must more or less breathe it?—Yes, but that only happens on not more than 10 per cent. of the jobs.

18,176. That probably is the cause of a good deal of the lead poisoning?—That is one cause, but there are many men who do not do dry rubbing down—painting outside.

18,177. I am speaking of the people on heavy jobs where dust is generated and floats about in the air. If they breathe that dust I suppose that is a cause of a great many cases of lead poisoning?—Yes, that is a cause.

18,178. You say that in certain classes of work, rubbing down with water—I take it you mean water and pumice-stone—is not always practicable?—It is not.

18,179. Can you tell us what is the percentage of work where it would be impracticable?—I could not say what the percentage is. It would depend on the class of work which the shop or the firm did.

18,180. But in what class of work would it be impracticable to introduce wet rubbing down?—If you go into a very old house where the surface is loaded up with paint, you could rub down sufficiently to get a surface, but in a house very poor with paint you could not possibly rub it down as much as you ought to rub it down, because you would rub through the coats of paint, and water would get into the woodwork. If you cut the joints or shoulders down, they would swell, and you would be creating trouble for yourself.

18,181. I notice that you object to rubbing down with water or oil, because it has a tendency to soften the painter's skin and so promote absorption of lead through the skin?—I think he gets it through his finger nails and absorbs it through his skin.

18,182. Are you aware that medical opinion is entirely against you as to the possibility of absorption of lead through the skin?—Yes, quite so; and against that I would ask them how, years ago, men who stirred up paint with the hand got dropped hands. You do not see one case in a hundred now compared with what you did when I was a boy.

18,183. The French do not agree with the English in that respect, because they have enacted in their rules that dippers in potteries, for instance, should wear gloves, or should have pincers to catch hold of the work?—If it cannot be absorbed through the skin, why is that necessary?

18,184. In England it has been demonstrated beyond question that there can be no absorption through the skin?—I must be obstinate on that, I am afraid.

18,185. I notice in your remarks to the Committee that you agree as to the real gravity of lead poisoning?—Undoubtedly.

18,186. And you admit that before the Workmen's Compensation Act came into force there must have been a great number of cases of colic and the like of which no notice was taken?—Yes.

18,187. What is your suggestion as to a solution of this very grave state of affairs?—I do not know of any solution at all. I am afraid that if you introduce a commodity which is dearer than white lead you will reduce employment.

18,188. Do you think that regulations would completely stamp out or practically stamp out lead poisoning?—I think they would improve the conditions; the better the conditions are, the better it will be for the men, surely.

18,189. But the difficulty that the Committee see is that if you had the very best regulations that can be suggested, there would be very great difficulty in carrying them out, or in seeing that they were carried out?—No doubt there will, and there always is with regard to everything you want to regulate. The regulations will be a nuisance to people who will be made answerable for obeying them.

18,190. For instance, how will it be possible if you have regulations introduced, to ensure that painters working in country districts would carry them out? How could you be quite sure that they were enforced?—It would be necessary to let them understand that someone was coming along to supervise them.

18,191. Do you mean that you would instil into the men's minds the fact that factory inspectors would be in and out?—I do not think it would be the men that would require so much supervision as the employers. And another thing, if the men knew there were inspectors appointed, and there was any abuse of the regulations taking place at a place, I feel pretty sure that they would find some means to make it known.

18,192. Do not you think that the men should equally be forced to observe any regulations that are introduced for their good?—I do. I think that the men are largely to blame for a good deal of what takes place.

18,193. Unless the precautionary measures were pretty handy, the men would not take the trouble to adopt them?—You cannot make a dirty man clean. You may have twenty at work on a job; fifteen out of the twenty will use the facilities given to them—a pail of water, and a nail-brush, and canvas to wipe the hands—but five will not.

18,194. I went with Mr. Sutherland and paid a surprise visit. There were six men engaged by a most excellent employer. When we went into the yard where the men were washing their hands, we found them wiping their hands on their handkerchiefs, although there was a towel not very far off. So that you see the difficulty, even if you have rules, of getting the men to abide by them?—Yes. I have seen men come to work in the morning early with hands so dirty that I have felt pretty sure that they had not washed them at all before coming—not what you would call washing.

18,195. You think that, even if rules were introduced, there would be a good deal of difficulty in enforcing them, both with regard to masters and men?—Yes, I do.

18,196. So that if we wished to get rid of this admitted evil, the only possible means would be to prohibit the use of lead?—But if you prohibit lead, what steps can you take to ensure that lead will not be used?

18,197. We should have to be careful about that too. I mean to say, provided that the distribution of white lead was properly regulated by the Home Office, the prohibition of the use of lead in house painting would be the only means of preventing this admitted evil, would it not?—In my opinion you will have to analyse every tin.

18,198. I am taking it for granted that the Home Office would introduce specific safeguards against the improper use of lead. That is a very important point which will have to be very carefully considered?—I think it will be more difficult than supervision.

18,199. That is not the point. In view of the great difficulty which you have admitted of introducing rules and being quite sure that they will be carried out, both by masters and men, do not you think that the prohibition of lead is the only means by which we can reduce or get rid of this evil?—If you prohibit a dangerous article you are bound to do away with risk, and if that is your only point, I say, yes; but do not think for a moment that I think that zinc will supersede lead.

22 March 1912.]

Mr. GEORGE PLUMB.

[Continued.]

18,200. You have told us about that?—I wanted to make my meaning plain.

18,201. I wanted an answer to the question, as you have admitted that the rules cannot be efficiently carried out?—I do not say they cannot be. I say that it will be a great difficulty.

18,202. Then I must ask you in what way you think they could be efficiently carried out?—You have inspectors under the Factory Act to supervise other dangerous trades, and they are pretty efficient.

18,203. Workpeople who are working in factories can be inspected fairly easily, but if you had a vast number of men scattered all over the country at odd jobs in private houses and so on, you would have very great difficulty in inspecting them?—In London I should think certainly four or five practical men who are known in the trade could pretty easily supervise the work as inspectors.

18,204. But have you thought out how it could be done?—They would have to be continually making calls, and no doubt if they were good and honest men, and had the interest of the trade at heart, they could do it.

18,205. That is very excellent sentiment, but we have to be practical on this Committee. Have you any idea how many places they would have to call at?—Some thousands.

18,206. Some thousands a day?—No, they would not need to call on some thousands a day.

18,207. You may not be able to answer this question; in fact, I feel sure that you will not; taking the population of London as being six millions, how many houses do you think there would be painting operations going on in, in one year?—I could not answer that question; I could only make a guess, and it would not be fair.

18,208. There would be thousands and thousands?—Not shops.

18,209. No; thousands and thousands of jobs, and that is what we are speaking about. Now, how could four men properly inspect the thousands and thousands of jobs?—They could not do it weekly or monthly; but the fear of the inspector calling would keep a lot of people honest.

18,210. There are people who have no fear, and who are not honest. Do you know that there are over a quarter of a million of factories and workshops in England that have to be inspected to-day?—I should not be surprised.

18,211. Besides that, there are many other places not in the category of factories and workshops that have to be inspected, and there are only two hundred inspectors to do it?—I should not be surprised.

18,212. With thousands and thousands of jobs in London alone, you would want double that number of inspectors to make the inspection efficient?—I think not. When you say thousands and thousands of jobs in London, I do not think there would be thousands and thousands of jobs at once.

18,213. I thought you admitted that?—No; during the year there may be, but not going on at once.

18,214. A witness who preceded you told us that he considered that in Dublin, where there are only 400,000 people, they would require four inspectors to supervise properly all the painting that is done in the Dublin area?—That is his opinion, but I think myself that there could be some regulation.

18,215. But you have not thought it out?—Not beyond that it is possible to do it.

18,216. Supposing you had the power to put inspection into operation to-day, how would you begin? How many jobs would an inspector be able to visit in a day?—I myself visit 20 jobs a day.

18,217. Four inspectors—80 jobs a day?—It would not be necessary for them to go every day or every week. Some of them are small jobs that will not last a week.

18,218. You have not any idea how many visits an inspector would require to make, have you?—Some firms the inspector would need to continually visit, and others he would not need to visit so often. And on a good many of the jobs there would be no lead paint used at all.

18,219. (*Dr. Collis.*) How would the inspector have information about what places to visit? It is not like a factory that is always there?—He could go to the shop and ask what jobs they had; and it could be made a rule for every employer to return weekly the work he had in hand.

18,220. Return weekly the work he was to do in the following week?—Yes.

18,221. Do you think that the employer would be likely to do that?—If he was made to do it, he would have to. If it was made compulsory by Act of Parliament, he would have to do it or be liable to some penalty.

18,222. Do not you think that each piece of work would want inspecting?—Oh, no. If the employer were to send in a report weekly of the jobs he had in hand, or would have in hand next week, and the class of work he was doing, the inspector, if he was a practical man, would see whether there was any necessity for him to call.

18,223. It is taken as a general axiom that every factory requires visiting once a year at least to keep it up to the mark, and dangerous trades four times a year. Each of these pieces of work would be a factory; so that if you are going to take the same basis each individual piece of work must be visited once while it is being carried on?—Yes.

18,224. So that it means visiting almost once a week?—Not necessarily. In some work there would be no lead paint used. That would not require visiting.

18,225. We are taking work where lead paints are used, so that it would lead to a very large number of visits by the inspectors?—They would have plenty of work to do, but I think it is possible that they could keep it in order.

18,226. How many visits do you think it reasonable to expect a man to do every day?—That would depend on circumstances. If I was visiting (as I do), and I thought there was anything going wrong, I would pay three visits instead of one. It would just depend on what I found. If, as an inspector, I went along and found something suspicious that caused me to think that the employer or the men were shirking the regulations, then instead of calling there once a week, I should call three times.

18,227. But that is not quite the point. I said: "How many visits do you think it would be reasonable to expect a man to make in a day"?—It depends on whether the jobs are grouped together or not. If they were spread over a large area he could not do so many, but if they were somewhere in the same neighbourhood no doubt he could do 30 quite easily.

18,228. Take an ordinary small country town, and the outlying districts, a place like Margate and the outskirts of Margate?—There should be men appointed for different districts, some for London and some for the provinces.

18,229. Quite so; but how many visits would you expect him to make in a day?—It would depend on the distance he had to travel.

18,230. I put to you a place like Margate and the outskirts?—If the work was in the town he could do a good many, but if it was 12 miles from Margate on one side, and 12 miles away on the other side, he could not do so many, unless he had a conveyance and direct trains.

18,231. He might not be able to do more than three or four a day in some cases, so an average of about 12 a day might be about right, taking everything into consideration?—I have not gone into the figures, but I would say, yes.

18,232. We have to think of these figures?—I was thinking more of the part of London that I am associated with, and not of the country. I go to the country to spend a day or two—not to go here, there, and everywhere.

18,233. Any form of inspection has to include the whole of the British Isles—outlying places like Ireland, Cornwall and Wales, for instance, and it comes to a big lot of work to get through. A man can only inspect about 12 places per day on an average. Each separate piece of work has to be considered as a factory

22 March 1912.]

Mr. GEORGE PLUMB.

[Continued.]

and on the basis of one visit per year and four in dangerous trades, you could not ask for less than one visit per piece of work?—If the men only get lead poisoning by inhalation of lead dust, I am surprised to know that any lead poisoning takes place in country places.

18,234. You consider that the scum taken off the water which showed there was lead present, is some indication that there is something besides dust which affects the men?—Lead particles.

18,235. What was the water contained in which you exposed?—A pail.

18,236. What had it been used for?—All kinds of things.

18,237. Probably it had contained lead?—I do not think so. We do not put lead in pails: It is in casks.

18,238. The men might have washed their hands in it when they had paint on them?—No.

18,239. What was it there for?—It was simply deposited there with hay to carry off the smell. Some people are faddy, and adopt that method.

18,240. I have heard of that idea; the men might have washed their hands at some previous time in the pail: I do not say that they had done so?—If you draw a glass of clean cold drinking water, and put it on the mantelpiece in a room where there is new paint, and drink some of it, or tea which has stood in such an atmosphere, you will taste something.

18,241. You had a definite specific test carried out, and it is of some importance. Now what was the vessel which contained that water made of?—A wooden pail.

18,242. Did you make certain that it was a perfectly clean one which had just come from the maker?—No. It was an old pail painted inside, and the water was perfectly fresh.

18,243. You did not have it stood outside in the open, and then have some of the scum, if any had gathered, tested as a comparative test?—No. After heating what I had heard on the subject, I thought I would do what I did.

18,244. It is very interesting, but a test of that kind has to be made with great care?—I did not do it for the sake of giving evidence about it.

18,245. I quite understand that?—The same scum can be got off a glass of water or a clean earthenware vessel. There are painters on the Committee, and they will know that men have felt that they could taste paint after they have been working with it.

18,246. You mentioned a time years ago when men stirred up paint with their hands?—Yes.

18,247. Did they stir the dry white lead into the paint then with their hands?—We always get our white lead ready ground. Years ago they would break it up, as they break up distemper. All the colours that we get ground now by machinery were ground on a stone.

18,248. By the men?—Yes, and boys. I have done it myself when trade has been slack in the winter months.

18,249. Is there not the possibility of danger from dust in dry grinding?—Not so much danger from dust as from getting it down your finger nails, and through the pores of your hands.

18,250. We have rather said good-bye to that antediluvian idea?—We used to grind with oil. We stood them in oil or turpentine as we wanted them, and soaked them: It made it easier. Nowadays, all white lead for painting is delivered in bulk, ground in oil or turps, and is broken down to a thinner paste with oil or turps, and a thick stick is used for that purpose, but I have seen a man do it with his hands.

18,251. Did you mix dry white lead, in those days, for any purpose?—It was not in use so much when I was a boy, as filler. We mostly filled up with distemper.

18,252. We have been told that there is less dry white lead used now than there used to be. Your evidence is to the contrary?—I am speaking of 35 or 36 years ago; 25 years ago it was largely used, and is now, I think.

18,253. Do you think it is more so now than it used to be?—No. In some cases there is not enough old paint on the surfaces to cut down and give you the surface you require. Consequently you plaster it over

with lead mixed with some liquid, and when it is dry and hard you cut it down to a smooth surface. If you will allow me, I will show you a board which I have.

18,254. For that purpose do you use dry white lead?—Yes, in a powder mixed with a gum or varnish thinners.

18,255. It comes to you as powder?—Yes.

18,256. Do you get more of it in powder now than you used to 25 years ago?—I do not think so. On some jobs I might not use a pound; on other jobs I would use 100 pounds. It depends on the class of job, and the state of what I have to work on.

18,257. Could you do it without having dry white lead?—You could use distemper filling, but it is considered not so quick for one thing, and otherwise it is not considered so satisfactory. It takes a better tradesman to make a lasting job with distemper filling than it does with white lead, and, unless the surface, after it was cut down, was charged with oil, rendering it waterproof, there would be a risk of bringing it right away from the woodwork. With dry white lead you do not run that risk.

18,258. You are suggesting that there is really a far greater use of dry white lead in the painting trade than we have heard of before?—Since I received my first appointment, and during the time I was a journeyman, I have always seen as much dry white lead used as I see now; but, as I say, it entirely depends on the class of job.

18,259. In the earlier years of your knowledge of the trade was there no greater tendency to mix by the hand than there is to-day?—I never saw dry white lead for filling purposes treated in that way.

18,260. Or for any purpose at all?—I knew one man in particular who did it. I told him about it, but I never knew him to be ill with lead poisoning. He did not hesitate to put his hand into the pail of white lead and oil to break it up to the consistency of paint. He would not hesitate any more than I should hesitate to put a stick into the pail.

18,261. Do you say that there was no more dry white lead mixed up by hand, if ever such a thing was done 25 years ago, than there is to-day?—I never saw dry white lead mixed by hand. You do not as a rule require it in such bulk. You generally mix it with a knife on a board, and do not use your hands at all. You make it into a paste with a broad knife, and you put it on the surface. When it is hard you rub it down to a very smooth surface.

18,262. What do you rub it down with?—Glass paper.

18,263. You rub it down dry?—Yes.

18,264. That applies to filling and stopping?—Yes, filling.

18,265. Are fillings always done like that?—Yes.

18,266. Could you treat it in any other way?—If you rubbed it with water, I do not think it would stand it. The water would soak through it and bring it away.

18,267. So that that process cannot be got rid of?—I do not see that it can.

18,268. You were speaking of the use of a zinc paint. Do you think that a similar dust would come off from the paint process if zinc was used?—Not zinc paint—zinc filler.

18,269. But if zinc were to take the place of lead, and was used in the same way, do you think that the dust might be harmful?—Yes.

18,270. Why?—It would clog the lungs.

18,271. But what evidence have you that all dust is harmful, because I am prepared to make a statement to meet that?—A sweep is harmed by soot, and a coal miner is harmed by coal dust.

18,272. But is he?—So I have read in books.

18,273. But the coal miner has less chest trouble than any of the people among whom he lives, and a remarkably low mortality?—Soot or coal dust do not lacerate their lungs like the lungs of the grinders in Sheffield are lacerated.

18,274. All inquiry into dusts seems to show that they vary very considerably in their capacity to do harm, and some do no harm whatever?—I am not a medical man, but my idea is that anything that clogs

22 March 1912.]

Mr. GEORGE PLUMB.

[Continued.]

the breathing-organs cannot be anything other than detrimental. That is only my own opinion.

18,275. It is an important question that you raise with regard to damage caused by dust from zinc paint?—Would not zinc dust be an irritant?

18,276. We have no evidence of it whatever?—You might say that a noose would not hang a man until you put it round his neck and tried it. Until we have tried it we do not know whether it will do it or not.

18,277. But we have tried lead, and we know it does harm?—Perhaps when you use zinc you will find it out too.

18,278. But we have used zinc, and it does not do harm?—It has not been tried to the same extent to which it will be used if lead is abolished.

18,279. But there are thousands of tons of zinc paint used to-day in England, and we must have heard of it if it had done harm?—You cannot use prepared paints in an ordinary decorative job. You have to make it up yourself. I use about 1½ tons of crude zinc white myself yearly to about 45 to 50 tons of lead. I only buy zinc paints in the form of enamels, and some of these have white lead in them. They are not wholly composed of zinc, although they are sold as zinc enamels.

18,280. Zinc is used, and dust of zinc is given off in the rubbing down?—Zinc white is a crude white by itself, and, whilst it improves the whiteness of the lead, the lead also improves the tone of the zinc.

18,281. Have you ever in the course of your experience heard of a person having any illness different from lead poisoning which could be called zinc poisoning?—No, I have not. If a man went away bad, they would at once attribute it to lead colic.

18,282. (Mr. Sutherland.) You have had a large experience of the house-painting trade, and of the operative painter?—Yes.

18,283. The large nature of the operations carried on by your firm enables you to make a comparison between the different branches of workmen and working conditions in the building trade?—Yes.

18,284. Have you found painters as a class a very respectable, healthy, contented body of men?—About the same as men in other trades.

18,285. How does the painting trade compare with the other branches of the building trade for pleasant, wholesome conditions?—The conditions are not pleasant. The bricklayer very often is working out in the open air. It is the same with carpenters. The joiner is working in a shop among shavings and sawdust, but a painter is often shut up in a room. I have two jobs going on; for instance, one is a suite of rooms. The men have to get into the house and leave it by a ladder, and they are not allowed access to any other part of the house. In another place I have an outside to do. They are pushed into the coal cellar, and the w.c. is locked up against them.

18,286. Those are extreme examples?—I am afraid they occur in a good many cases.

18,287. In London?—Yes.

18,288. In the country you might have better conditions?—There is more open air, but in country places they have to work longer hours, and live in places which are not so good as their own homes. They have to have their food on the job. It is not always convenient to set aside a place for meals. If you are doing up a mansion, and have a portion given to you to take your food in, whatever it is like you have to be content with it. You could not call that pleasant?

18,289. I have been through it, and I found it pleasant. Do you know that medical and scientific witnesses of eminence have established before this Committee that lead poisoning cannot arise from the fumes of burning off paint, nor from emanations given off by paint in the process of drying. That traverses your statement?—I do not believe it, because I have heard that people in houses where we have been working have been taken ill; a physician has been called in, and he has certified it as painter's colic.

18,290. Dr. Legge of the Home Office has told this Committee that lead absorption cannot arise through the skin, and he doubted whether it would arise even

through a cut?—I would not mind putting a piece of white lead on to a cut on my hand, or on a sore.

18,291. The same authority has laid it down that so far as the painting trade is concerned, the great danger arises from and centres round the lead dust created by the rubbing down?—Next to no dust would be created.

18,292. Have you ever formed an estimate of the number of hours spent per week by painters in dry rubbing down, taken over a period of, say, three months?—A man rubbing a room down would create next to no dust.

18,293. I am not referring to filling. Have you formed an estimate of the number of hours?—I should not think that the time taken in dry rubbing down is more than 7 per cent.

18,294. Would not many men go through a job and hardly touch the sand-papery down?—Yes.

18,295. Do you consider dry rubbing down a necessity of the trade, or should it be dispensed with, and its place taken by the wet process?—In some cases, yes, and in some cases, no. With very rich relief work, mouldings and so on, you could not possibly give satisfactory rubbing down with pumice-stone and water.

18,296. Mouldings on doors?—Yes.

18,297. You could do that with pumice and felt?—How could you do that without cutting the paint off the arrises?

18,298. I want your opinion. Is there not an enormous amount of painting work done which is quite innocent of all rubbing down?—Yes.

18,299. And even with smooth painted surfaces in good class work, it is only a small proportion of the surface that has much time spent on it?—It depends on the condition you find the work in, and so on. If you go to a place which has been badly painted previously and have to make a high class job of it, you have more preparation to do than in the ordinary way.

18,300. Could it not be done with pumice-stone and water?—In some cases, yes, and some not. You as a practical painter know that in some cases the water would swell the wood. If it was a jerry-built house, you would have to be careful.

18,301. When you say that the dangers of dry rubbing down are not so great as supposed, you probably mean that the amount of dry rubbing down is not so great as it is thought to be?—I do mean that.

18,302. Would you consider it a hardship to have dry rubbing down prohibited?—No.

18,303. If it was abolished, it would avoid the danger?—Yes, but I would like to know what you would do.

18,304. Do you think that it would be worth while to abolish it for the sake of retaining white lead?—Yes.

18,305. You think that there is no other basic white pigment which gives such durable and efficient results as white lead?—Yes.

18,306. Have your men experienced much difficulty in getting facilities for hot water and separate places for their meals and so on?—Yes.

18,307. Would not this difficulty disappear if, in any regulations passed, it was made compulsory on the part of the householder to give these facilities when workmen were in the house?—Yes, but how would you get on when every room in the house was being painted?

18,308. But you do not paint every room at once?—Yes.

18,309. You leave some rooms to the last when you have possession of the whole house. You have a paint shop and a meal room which you leave to the last?—Sometimes circumstances do not admit of that.

18,310. But speaking generally?—Generally we have them all being done at once.

18,311. Your experience differs from mine?—Possibly. If we have a paint shop or a meal room, that is charged with fumes and the evaporation of paint.

18,312. You have had a larger experience than I have?—It seems like boasting, but I suppose that no one has had greater experience in London.

22 March 1912.]

Mr. GEORGE PLUMB.

[Continued.]

18,313. You do not object to providing towels, soap, and nail brushes, and facilities for washing?—No. I do it.

18,314. You do not think it necessary to depart from the existing custom in relation to the provision of overalls and their being kept clean?—No. I cannot quite understand where the danger is with regard to overalls. A man works in his shirt all day long, and sleeps in it at night. He keeps his trousers and waistcoat and so on tidy if he wears overalls. If there is no deposit, I do not see that it will make any difference to his health.

18,315. Have you ever heard of the men complaining at having to provide overalls and keep them clean?—No. They look upon them as part of their kit. It has been the custom always.

18,316. Do you think there is any serious danger arising from the painter having his overalls washed at home?—No. I have never heard of the wife or children having lead poisoning.

18,317. The idea that the painter's overalls are loaded up with lead dust is not quite in accordance with fact, is it?—No.

18,318. Would you agree that the dust that gets on his clothes is the dust coming from dusting down, washing off, stripping walls, distemping, rubbing down the walls for papering, handling the steps and planks, and that anything of the nature of paint on his clothes is dry and does not constitute a danger?—I quite agree.

18,319. If there is any interference with the existing custom, either by way of prohibition of white lead or regulation of its use, it means inspection?—Yes.

18,320. Unless the manufacture and sale of white lead were prohibited, the inspection would need to be equally searching in the one case as in the other, would it not?—Yes.

18,321. So that the Government, whatever course they take, will have to face the cost of an inspectorate?—Yes, either one way or the other.

18,322. You yourself are quite agreeable to regulations and would enforce them under your own jurisdiction?—Yes, but I cannot make dirty men clean.

18,323. Do you not think that this would be the attitude of all reputable master painters?—Yes, and of the better class of men. If they knew that an inspector was appointed, I think in their own way they would help him.

18,324. You are of opinion that regulation by compelling the labelling of all materials containing lead, and by enforcement of the observance of certain conditions, such as prohibiting dry rubbing down, providing towels, nail brushes and soap, and a separate place for meals, would educate both masters and men to the necessity of carefulness and cleanliness?—In a way it would educate the men, but not the masters. Very few master painters in London are practical painters, and in some cases they hardly go on a job.

18,325. They would have to take the responsibility?—Taking nearly all the large firms in London, I do not suppose there is a practical painter in the firm, as a master or director or on the board.

18,326. You would not apply that to a large number of the smaller men?—Yes, in London.

18,327. You are speaking of companies?—Yes, I am taking cases I know specially.

18,328. Now you painted an Orient Company's ship?—Yes, one ship.

18,329. They did not debar you from using lead?—No. They handed over the cabins, saloon, and library for us to make the joinery, do the cabinet work, and decoration.

18,330. Do you know what Harland and Wolff use for the preparatory painting of ships?—White lead, I believe.

18,331. The undercoatings right through would be white lead, whatever the subsequent coats were?—Yes. We are led to suppose that the finishing coat of enamel is zinc.

18,332. (Mr. Parsonage.) Do you say that Harland and Wolff use all lead?—No.

18,333. (Mr. Sutherland.) I asked if you knew what Harland and Wolff used for the preparatory painting of the ship?—My opinion is lead.

18,334. (Chairman.) But do you know?—Yes.

18,335. How?—By what my men who have worked in their yard have told me.

18,336. We cannot use that as evidence?—I am not giving it as evidence, but only as my opinion.

18,337. (Mr. Parsonage.) I was taken through their works and workshops a few weeks ago, by the foreman, and I know there is a great deal of zinc white used. I saw the preparation of the paint. They use red lead and white lead and zinc white?—Yes.

18,338. (Mr. Sutherland.) Do you know that an eminent doctor and scientist demonstrated to this Committee that all paints give off a substance called aldehyde, which is a very noxious product and which produces disturbance of the system and inconvenience which is not lead poisoning?—I can quite believe it.

18,339. Perhaps these effects have in the past been attributed to lead poisoning?—I know from personal experience that there are times when I have felt bad after I have inhaled it. I have never been much troubled with colic. I went to work for my father just after I was 10 years of age. From that day to the present I have worked in the trade and never been troubled with lead, although I dare say I have it in my system.

18,340. Though there would be difficulty in enforcing rules, this is no reason why they should not be put in force?—No.

18,341. Do not the French finish the filling with knives and never rub down after finishing with the knife?—They do rub down, but not to the extent that we do. They have a different kind of method. They do not create the dust that we do, but they do create dust. I have worked in France.

18,342. They finish with the knife mostly?—The dust they make is next to nothing.

18,343. I gather that you are of opinion that regulations should be given a trial before resorting to so drastic a course as prohibiting the use of white lead?—Yes.

18,344. (Chairman.) You told us that in a considerable number of cases in London there are no facilities for the men to have separate rooms, separate rooms in which to keep their clothing or proper accommodation in other ways?—Yes.

18,345. How would you get over that difficulty if a rule was made that those facilities were to be granted?—We should have to have a longer time for the work and say, "we cannot do this room" or "that room until we have finished every other part of the house." That would be the only way. I have a job which I have to clear out of in time for the people to go in by the 25th. It must be done. I am working late to do it, and every room in the whole house is under way at the same time.

18,346. How would you get over the difficulty in such a case as that?—We would have to say, "you must leave us this room and that room; we want them for ourselves, and we will paint them after you have come in."

18,347. Would that be practicable?—If it was the law it would have to be obeyed.

18,348. There would be no law that the owners of houses should make such a provision. It would be a law applying to employers?—Inasmuch as every contractor would be under the same obligation he could embody that in his contract. It would be one of the conditions under which he would take the work. The contractor would say, "you must provide a place for the men to have their food and to put their clothes."

18,349. Do I understand that when you suggest rules for meeting the evil of lead poisoning, you mean that you would make it obligatory by statute that the owners of houses should do that?—Yes.

18,350. (Mr. Mason.) If you are going to do away with white lead for painting, and you have other people in the house using white lead, the inspector must have the right to go into the house?—Yes. The inspector should have as much right to walk on to the

22 March 1912.]

Mr. GEORGE PLUMB.

[Continued.]

job and take a sample here and a sample there, like the man who goes into the butter shop and gets a sample of margarine and so on. If all contractors were compelled to observe that condition they would all be on the same footing, and they would put it into their contracts.

18,351. (*Chairman.*) Do not you think that there might be contractors who might leave that clause out when the competition was very keen?—The contractor would put the clause in, but he would not observe it; he would not inconvenience his client.

18,352. What would become of the men under the circumstances?—The men would convey to the inspector that that condition was not being observed on such and such a job. That would make his labours a little lighter.

18,353. In any case, even if you did not put part of the obligation on the householder, it would mean that the inspector would have the right to visit any house where a painting job was going on?—Yes.

18,354. (*Mr. Fell.*) Have you ever felt unwell after using zinc paint?—I have never used zinc paint alone, so I could not tell whether I felt unwell from that or not.

18,355. Do you know of any men who have ever had so-called colic after using zinc paint?—No. I never knew of a job begun and finished entirely with zinc. They might be taken ill, and it might be through the zinc or lead.

18,356. Have you ever had anything to do with the painting of coaches or carriages?—No.

18,357. You do not know the conditions?—I know people in the trade, and I know that the conditions are different from those of house painting. Their shops are very much more confined. They have to exclude a great deal of air on account of the dust.

18,358. Do you see any difficulty in using substitutes for lead paint on vehicles where the surfaces are afterwards varnished?—I should say that you could use zinc as far as I know. I am not a coach painter. I would not put my opinion against that of a coach painter, but I should think that you might use it on vehicles, especially if you preserved it with a coat of varnish. Zinc is so porous and of such a drying nature that it is not so lasting as lead; but supposing that you seal the pores with a coat or two of varnish, it may be all right.

18,359. Do you think that it would cost as much for inspectors to see whether the prohibition was carried out, as for inspectors to see whether regulations were carried out?—I do not think that it would make a great deal of difference.

18,360. On what ground do you base that statement?—It is only an opinion. I do not believe that there is any compound adulterated so much as paint. Prepared paints sold in the market, both the fluid and the paste, are made of things which could not be sold by themselves. They are made up into a compound and called paint. It begins with that and ends with that. A lot of the zinc white would be adulterated largely, and it would be necessary for an inspector to take samples frequently to see that the men were not using white lead. The ordinary painter could not possibly tell whether he was using a compound other than zinc white.

18,361. (*Chairman.*) Could not the inspectors take the samples from the workshops?—You might have 50 casks of lead in; you might take samples from 40 and you might find them all perfect, but the other 10 might be adulterated.

18,362. (*Dr. Collis.*) You have to run that risk in all cases?—You might have 20 cans of turpentine; you might take samples from half of them and find every one of those adulterated to a certain degree, and the others might be perfectly pure. If there was no supervision it would give the dishonest merchant a big chance of selling adulterated stuff.

18,363. (*Mr. Mason.*) Is there any insuperable difficulty in using a patent filling on house work such as is used for coaches?—No, but where you would use a few pounds on a coach, in a house you would use 100.

It is in a very very much worse condition than a coach. Generally a coach body is finished in the highest possible way by the body maker, and the wood work that he has to paint is very very much superior to that which the house painter paints.

18,364. What about the metal body, that is all painted over?—That is different from a piece of wood which has been badly painted. The coach body is very very different from a wall which has been plastered by a very inferior plasterer.

18,365. I do not gather yet why putting on sufficient filling, even if it was not lead, would not fill up the holes?—You could fill up with anything, but what do you rub down with—water?

18,366. We use water?—If the filling became so hard that you could not cut it with sand-paper, but could only polish it, that would add to the expense considerably.

18,367. Do you know of no filling other than a lead-filling which would do the work?—My experience is that fillings are largely composed of lead. They may not be called lead-fillings, but they are largely composed of lead whether they are patent fillers or not; the French filling is. If you tell me yours is not a lead filler that is another matter.

18,368. There is very little lead?—If it is the same material you get the same results. It does not matter whether you use it here or use it there.

18,369. (*Mr. Parsonage.*) You do not take apprentices at your place?—No, and I do not know any place in London where they do.

18,370. Do you think that if a painter had to be registered, as a plumber has to be, and only such men were allowed to work at the trade, that would tend to reduce lead poisoning by keeping out the unqualified men?—I do.

18,371. There are a large number of men introduced into the trade in London, particularly in the spring, who have no knowledge of the danger?—Yes; they are generally broken down men who have worked at some indoor sedentary kind of business and been thrown out of it, or they are men who have served their time in the Army and Navy. They are perhaps good climbers, rough-and-ready fellows, and they get work outside for a few seasons. Then somebody takes a fancy to them, takes them by the hand, gives them a few wrinkles, and they are painters.

18,372. They are more liable to lead poisoning than men who have been properly trained?—Yes. A doctor told me, and this gentleman here will confirm it, that when a man has been out in the tropics and his kidneys have become rather affected, he does not get rid of lead poisoning so readily as another man would. I have noticed that these men, what I called substitutes for painters, are more often taken ill than the ordinary mechanic who serves his apprenticeship and goes on right through to the end of his life as a painter. I have the balance-sheet of the Painters' Society. There are some painters 87 years of age and 91 years of age. These men have all served an apprenticeship or the equivalent of an apprenticeship, and have been in the trade from boyhood up. They have never had any other trade but painting. A lot of the men such as you refer to who are taken ill are walking about the streets the greater part of the year and in the spring or autumn they get a few weeks' work.

18,373. (*Mr. Parsonage.*) If one of the regulations made was that every man in the trade had to be registered, as plumbers are, it would be a very good thing?—It would be better for the men and better for the customer. There would be a better class of work, and it would probably be cheaper in the end.

18,374. Have you known men of extremely cleanly habits who have suffered from lead poisoning?—Yes.

18,375. Some men are more susceptible than others?—Yes. I would make it compulsory for any young man who went into the painting trade who showed himself susceptible to lead poisoning to clear out of it. In one case the doctor to the Housepainters' Society said to a youngster who was susceptible: "You had better clear out." His father thought he was doing a

22 March 1912.]

Mr. GEORGE PLUMB.

[Continued.]

good thing in bringing his boy into the business, but he went out of it. He is a compositor now.

18,376. If you were going to use pumice-stone and water for rubbing down between coats, you would have to let the paint stand longer between each coat?—Yes.

18,377. That would add considerably to the cost of the job?—Yes, and if I was obliged to use pumice-stone and water I could not afford to put so much oil in it. It would not cut down; it would simply clean.

18,378. Have you ever known smoothing done with glass-paper, moistened with turpentine?—No.

18,379. A witness said that that was done?—I should laugh at a witness who stated that because it is the first thing one uses to remove paint, and to use it in the way described would work up the surface and roughen it or remove the paint.

18,380. A large employer in the West-End of London said it?—Perhaps he is one of the gentlemen whom I class as non-practical men. The turpentine on the paper would soften the surface of the work, and instead of smoothing it it would rub it up.

(Mr. Parsonage.) Your experience is the same as mine with regard to that.

18,381. (Mr. Sutherland.) It was a question of lightly rubbing down the top surface?—Some think that you rub a lot of paint off, but you do not. You only smooth the surface. We do not cut down the surface of the work. We do not cut through the face of the work. We simply cut off the ribs to smooth it. Often-times those are not lead ribs; they are deposited by draught carrying the dust on.

18,382. Do you think that no lead dust gets into the air?—Not in my opinion. I cannot see how it is possible in cases of this kind.

18,383. (Mr. Parsonage.) You consider that it would not make the conditions any better to moisten the glass-paper with turpentine?—I have never known it done, and I have never heard of it; and if a man suggested it to me I should think he was pulling my leg. He would work up the surface into a lead soap.

18,384. (Mr. Gardner.) If dry rubbing down is the great cause of the evil of lead poisoning, and there is so little of it in the trade, how is that we have the evil of lead poisoning?—That only strengthens my opinion that inhalation, breathing paint fumes, is the cause of it.

18,385. And absorption through the skin?—Yes, and absorption through the skin.

18,386. Painters all hold that opinion. You have not had a great deal of experience with zinc?—I use about a ton to one and a half tons a year. I think that is a good deal.

18,387. I understood you to say to Mr. Fell that you had not had a great deal of experience with zinc paint?—Not by itself. I have painted houses throughout or parts of houses by special request with zinc, and I have experimented with zinc. I have painted parts of my own house where I live with zinc, both inside and outside, and also parts with lead. I have also used prepared zinc paint. I maintain as a painter that you cannot get the same class of job with prepared paint sent to you by the manufacturer as you can with paint you make yourself.

18,388. All we practical painters agree?—I consider that prepared paint affords great facilities for adulteration.

18,389. How did you find the zinc stand outside?—In about 18 months it shelled off like distemper.

18,390. It stripped?—Yes.

18,391. Did you give it any special treatment as zinc or did you use it as ordinary white paint?—I used it as ordinary white paint. One was an enamel paint, and one was a zinc ground in oil. I used the one ground in turpentine thinned with oil and the enamel paint on top.

18,392. Ordinary linseed oil?—Ordinary linseed oil.

18,393. You have never tried any special treatment of zinc paint?—No. I tried it by the ordinary treatment to satisfy myself and get at the truth.

18,394. Just from trying it at home you think that two years is the life of zinc paint?—In exposed parts I do not think it would last that time, where it gets sun and rain.

18,395. You have not had much experience in the painting of iron-work?—No, not a great deal.

18,396. Where did you get your opinion about red lead?—Wherever I have had anything in the way of iron and I have treated it that way, I have found, when I have gone back two or three years afterwards, it is in a good state of preservation. I have been round dockyards and seen the Government ships painted with red lead, and I take it that they would not use it unless they had satisfied themselves about the efficacy of it.

18,397. The painter is very conservative?—I have been told that by many and many a traveller.

18,398. Have you ever tried white lead instead of red lead?—Yes.

18,399. Have you ever made a comparison?—No, I have not made a comparison, but I do not think that white lead will dry as hard and be as efficacious as red lead.

18,400. You have had no experience of ship work in that respect?—No.

18,401. On the question of inspection, do you know anything about tenement work?—Yes.

18,402. Because all work is not done in large houses?—I have done all buildings from the cottage to the palace.

18,403. I am not speaking about cottages in England, but about tenements in Scotland. If the regulations provided for a separate meal room and everything to be done away from the room where work was going on, in a one or two-roomed house the people would have to clear out?—Yes. In the tenement house that you speak of, there would be next to no danger, and in fact I think it would be a good thing in some of the tenements. It would be a disinfectant.

18,404. Suppose it was a six-roomed tenement and there was dry rubbing down?—I should think you would not have much dry rubbing down in a six-roomed tenement.

18,405. Your opinion is that there is danger from inhalation and absorption?—The little dry rubbing down that would take place in a small house would not have any effect unless the people were very susceptible to lead.

18,406. Would not the painters suffer just as much whether there are one or two apartments or more?—If lead is going to kill him, it will kill him. We all have to die when we are about 60 or 70, and if one thing does not kill us another will.

18,407. (Chairman.) As I understand it, it is a question first whether there is the same danger to a painter if it is a small house as if it is a large one?—In the class of property spoken of, the jobs are so short and such a little paint is used that there is not the same danger.

18,408. (Mr. Gardner.) You could not carry out regulations on that class of property at all unless you turned the people out of the house?—You could put up a shed in the back yard or something of the kind.

18,409. Supposing you had to do a tenement with a few rooms, you could not put up a temporary shed?—How many men would you have?

18,410. You might have two. What would you do in that case?—I would have one man and not let him stop there all day.

18,411. (Chairman.) Would not there be the same danger in the aggregate to the painter working day after day, week after week, in small houses, as there is if working in big houses?—Well, anyone susceptible to lead would probably get colic. Would you care to see the boards which I have brought?

18,412. (Chairman.) Yes. (The witness produced some boards. There were two boards, one filled up with a lead filler and one old painted board. The lead filler was cut down with sand paper and the other with pumice stone and water.)

22 March 1912.]

Mr. GEORGE PLUMB.

[Continued.]

(Witness.) We plastered *this* over with a compound of dry white lead and medium, and cut it down with sand-paper. It is only in extreme cases that we have to use a lead filler. People think that we have to take off every particle of old paint before we can paint

inside a house, but it is not always necessary. It depends on the state of the old paint. We cut down with pumice-stone and water.

18,413 (Mr. Sutherland.) There is no dry rubbing down in this case?—None whatever.

The witness withdrew

## THIRTY-FIRST DAY.

Thursday, 9th May 1912.

PRESENT:

SIR ERNEST F. G. HATCH, BART. (Chairman).

Lord HENRY BENTINCK, M.P.  
Mr. E. L. COLLIS, M.B.  
Mr. W. G. SUTHERLAND.  
Mr. A. GARDNER.  
Mr. J. PARSONAGE.

Mr. A. L. C. FELL.  
Mr. C. L. MASON.  
Mr. C. KINGGATE.  
Mr. W. ROBINS.  
E. A. R. WERNER (Acting Secretary).

Professor WEFERS BETTINK.

Evidence to 18,416 handed in and taken as read; witness then called and examined (through an interpreter).

18,414. I am a doctor of chemistry and a pharmaceutical chemist, and was for upwards of 30 years Professor of Pharmaceutical Chemistry and Toxicology at the University of Utrecht. I have acted for the Government for many years in the investigation of cases of poisoning, industrial and otherwise.

18,415. A White Lead Commission was appointed by the Government of our country on the 13th of September 1903, and was charged to investigate "to what extent white-lead paint could be replaced by zinc-white paint or in other manner in Holland, and what objections of a technical as well as of a financial nature would eventually be connected therewith." It was composed of 15 members, comprising Government officials, chemists, technical persons, architects, and three master painters. In 1907 it issued a Provisional Report, which I produce, dated October 1906. This report was criticised extensively by Mr. O. P. van Hoek, of Gorinchem, who remarked that there were no exact data given for the comparative trials made as to the covering power of white lead and zinc oxide, upon which the Commission based its opinion:—"Zinc-white paint is in no respect inferior to white-lead paint as regards covering power, and may be said to cover even slightly better." Van Hoek proves that the coat of zinc oxide which was applied was much thicker than that of white lead, and also that the prepared paint of zinc oxide used was much thicker than the paint of white lead. All this is explained by him in his brochure, which I now produce.

18,416. The Netherlands Master Painters' Association issued a pamphlet No. 1 (which I now produce), dated October 1907, addressed to the Minister of Agriculture, Industry, and Commerce, criticising the conclusions of this Provisional Report, and pointing out that the zinc-oxide paint used by the Commission was much too thick and that it is quite impossible to work with such a paint. Following this opinion, without any doubt the test of spreading power results in favour of white lead; 106.6 grams of zinc oxide are wanted against 83.2 grams of white lead to obtain, spreading these quantities on the same surface, an equal coat (page 6). The Master Painters' Association did not confirm the advantages of grinding the paint of zinc oxide three times in a roller-mill, as was recommended by the Commission.

18,417. The Commission issued a Second Provisional Report, dated February 1908, which was again criticised by the Master Painters' Association in their pamphlet (No. 2), which I now produce, date

August 1908, addressed to the Minister as before. The Commission stated on page 8 of such Second Provisional Report:—

"There exists a difference between the various sorts of linseed oil and also between the quantities of paint they absorb."

and, dealing with the master painters' first pamphlet, go on to say:—

"If they (the master painters) had taken into consideration this circumstance instead of following to the letter the recipes given in the report, they would have obtained the same results as the Commission."

To this, however, the reply of the master painters in their No. 2 pamphlet is:—

"Zinc-white paint prepared in accordance with the recipes given by the Commission cannot be worked with."

18,418. Upon this point I may state that the criticisms offered by the master painters in their first (No. 1) pamphlet are not adequately answered by the Commission in their Second Provisional Report, as when a recipe or prescription is given in which specified quantities of materials are indicated, upon which conclusions about covering capacity and cost are founded, the recipes ought to be strictly followed and no arbitrary deviations permitted, otherwise there can be no standard of comparison between two sets of experiments.

18,419. In 1909 the definite Report was issued by the Commission, the principal conclusions of which are to be found on pages 26-28, and are as follows:—

### FINAL CONCLUSIONS.

18,420. "Taking everything together, the Commission are of opinion that their labours lead to the following conclusions:—

18,421. "1. Zinc-white paints are much better able to withstand the action of sulphuretted hydrogen gas than white-lead paints, which soon become motley and black. Where such gas occurs much—e.g., near stinking canals in our cities—zinc-white paints can be substituted for white-lead paints with good results."

18,422. "2. Zinc-white paints are not so well able to withstand frequent recurrent action of vapours containing sulphurous acid as white-lead paints are."

9 May 1912.]

Professor WEFERS BETTINK.

[Continued.]

"As the vapours occur in coal-smoke of locomotives, steamers, tall chimneys, &c., zinc-white paint which is much exposed to such-smoke, for instance, in railway stations, &c., will soon become corroded, and is certainly not able to replace white lead there."

18,423. "3. Zinc-white paints applied on zinc, Portland cement, or iron (the latter having previously been provided with first coats of red oxide of lead or iron) are able to withstand the action of the open air during five years quite as well as white-lead paints, and can entirely replace the latter, provided they are not exposed to the action of vapours containing sulphurous acid."

18,424. "4. Zinc-white paints applied on wood, iron, zinc, Portland cement, and plaster remain in an equally good condition in the interior of buildings as white-lead paints, and can entirely replace the latter there, provided they are not exposed much to vapours containing sulphurous acid or to great dampness."

18,425. "5. Zinc-white paints applied on wood, if not exposed much to the action of vapours containing sulphurous acid, will in many cases remain, during five years, in an equally good condition in the open air as white-lead paints, and can replace the latter with good results. But in all cases where accumulations of water remain during a long time, such as on window-sills, the lower side of cornice-work, &c., they will, even after three or four years, deteriorate in the course of a short period to such a degree that re-painting will become necessary for the preservation of the wood; in this respect, therefore, they are inferior to white-lead paints."

18,426. "6. Zinc-white paints, such as the White Lead Commission have used successfully, cover at least equally well as the white-lead paints customary in this country."

"The zinc-white putty used by the White Lead Commission is quite as serviceable as ordinary white lead putty."

18,427. "7. Painting with zinc-white paint, such as the Commission used on new woodwork in the open air is not dearer than painting with the white-lead paints customary for that purpose."

18,428. "8. Painting on existing paint-work, so-called re-painting, in the open air with zinc-white paints, such as the White Lead Commission used, is dearer than with the white-lead paints hitherto in use, inasmuch as the wood painted with zinc-white paints involves a greater expense in rendering it fit for re-painting than does wood painted with white lead in rendering it fit for further painting with white lead."

"In the case of painted wood which is exposed to the open air the possibility is not excluded that where such wood is in an unfavourable condition of humidity it may have to be re-painted sooner than if it had been painted with white-lead paints."

"In these circumstances the cost of maintenance of wood painted with zinc-white paint, and exposed to the open air, is further increased in connection with this shorter duration as compared with wood painted with white-lead paint."

18,429. "9. Lithopone paints cannot replace white-lead paints in the open air, because they have proved to be altogether unfit in this respect."

18,430. "10. For paint-work above water, first coats of oxide of iron have, during five years, proved to be quite as good and serviceable as first coats of red oxide of lead."

"For coats of paint under water, oxide of iron cannot be used."

"Coats of oxide of iron paint are cheaper than coats of red oxide of lead paint."

"When oxide of iron is used for the first coat much more technical ability is required for the painting of the covering coats than is the case when red oxide of lead is used for the first coat."

18,431. As to the advantage of zinc oxide, which is there stated, *i.e.*, that the zinc-oxide paint resists the influences of hydrogen sulphide ( $H_2S$ ) better than white lead, this is a fact which every painter will admit readily, knowing that white lead gets a darker tint after having been exposed to hydrogen sulphide. However, this circumstance has little or nothing to do with the durability of the paint, as the white-lead paint remains, although the colour changes. On the other hand, zinc oxide does not possess the same resistance as white lead against the influence of vapours containing sulphurous acid.

18,432. In the following conclusions (2-5) the equivalence of zinc oxide is stated, but every time the reservation has to be made: "Provided that the paint of zinc oxide is not exposed to the frequent influence of vapours containing sulphurous acids or to great moisture." But who can warrant this? In cities, in the neighbourhood of manufactories, in places where the atmosphere is defiled by the smoke of carbon, in rooms where gas of carbon is burnt, sulphurous acids always are present; nobody has it in his power to regulate the quantity of it, and its influence is of great importance, especially in the Dutch climate. So the equivalence of zinc oxide and white lead stated by the Commission is very conditional.

18,433. As to the conclusion in paragraph 6 that "zinc-white paints cover at least equally well as the white-lead paints," the criticisms pronounced by van Hoek and the Master Painters' Association must not be forgotten. My own observations and experiments have shown me that in fact zinc oxide possesses a less covering power than white lead; that is to say, a less opacity for the same quantity. The smaller density or lower specific weight of zinc oxide makes it possible to cover a greater surface than with the same quantity of white lead, the proportion being 355 to 307. Yet, because of the less opacity of zinc oxide it requires more coats of it to cover the same surface as well as white lead, three coats of zinc oxide being required for two of white lead. The true proportion which represents the comparative covering power of zinc oxide and white lead is therefore  $\frac{355}{3} = 118.3$  for zinc oxide and  $\frac{307}{2} = 153.5$  for white lead.

18,434. As to the conclusion in paragraph 7 that "painting with zinc white on new woodwork in the open air is not dearer than painting with white-lead paints," there must be taken into consideration with this what is said in paragraph 8: "Painting on existing paint-work, so called re-painting, in the open air, with zinc-white paints . . . is dearer than with the white-lead paints."

18,435. On page 16 of the Report the Commission informs us that all materials used have been examined in the chemical laboratory, and states the tests to which they were submitted. However, it does not appear that during the painting samples of the paint were taken and that those have been examined; this would have been desirable, especially in view of the complaint of many practical men that zinc-white paint such as is recommended by the Commission practically cannot be used.

18,436. That superficies of thousands of quadrato metres of Government buildings were painted with it is true; however, it is not correct that this was done with paint prepared as has been prescribed by the Commission. In fact, it was quite impossible to use so thick a pigment; the paint was often diluted with oil; sometimes without asking, sometimes with the consent of the persons who were appointed to control the tests, because these persons were convinced of the impossibility of working with such a paint.

18,437. Of course, the inference from all this is not that zinc oxide is not fit for use, but that the prescription given by the Commission is not fit for practical use. The Commission itself—as was shown in its Second Provisional Report—did not make any difficulty in increasing the quantity of oil, if this was necessary or desirable in the actual execution of the work.

9 May 1912.]

Professor WEFERS BETTINK.

[Continued.]

18,438. It has been well known, since the researches of Stas in 1855, that white lead forms a certain chemical combination with linseed oil when mixed with it, which has been called a process of saponification. It is in consequence of this that, as it oxidises, white lead forms an elastic varnish, which expands and contracts with changes of temperature. Zinc oxide, on the other hand, does not enter into any combination with the oil, but remains inert, and the zinc oxide and the oil do not form a varnish as white lead does. In consequence of this, zinc oxide forms a hard surface after drying, which cracks and peels off, particularly if applied to materials exposed to water or condensation of water from the atmosphere. Further, I have heard neither from architects, inspectors, building contractors, nor from practical painters that zinc oxide can be esteemed equal to white lead for outside painting. My final opinion, tested by the experience of practical men and my own knowledge of chemistry, can only be that, as yet, white lead cannot be replaced by zinc oxide.

18,439. At present no regulations for the use of white lead in paint are in existence in Holland, but it is understood that some may be issued as a result of the Commissioners' report.

18,440. On the health question, I would call attention to the fact that the Dutch statistics must be read in the light of the fact that the majority of house-painters in Holland are men who were not physically strong enough to follow a more exacting vocation. They are generally recruited from among the weakest of the workboys. Their illness is frequently not so much attributable to white lead, but to their general weakness. It certainly would be desirable to substitute white lead by a less injurious (zinc oxide) or, better still, by a fully harmless pigment; but experience has shown, however, that up to now this is not possible.

18,441. As a chemist I cannot believe that there is any danger from poisonous emanations from surfaces freshly painted with white-lead pigment, as white lead is not volatile at normal temperatures, and it does not form volatile alliances.

18,442. In regard to burning off lead paint there can be no noxious fumes, as the only effect of the blowing lamp is to burn up the oil. The temperature created is not high enough to volatilise the lead from the compounds which would require 1,200°-1,400° Celsius. The resulting dust from rubbing down is, however, dangerous, and regulations should be made that, after burning off, the paint should be rubbed down wet, as is done in Germany and Austria.

18,443. It is also my opinion that the supply of dry white lead to painters should be prohibited, as there is far less danger in the use of white lead ground wet in oil, i.e., in the white lead factories the paste is prepared in a special way by grinding the white lead in oil while still containing 25 per cent. of water, or a sufficient percentage of water to entirely prevent any danger from dust. The painters themselves are more and more convinced that this white lead in paste is much to be preferred above the white lead in powder which was formerly used, principally because now the mixing of dry white lead with oil need not be done any longer in the painter's workshops, and the danger of dust has been so far completely removed. It is regarded as quite probable that if the Government contemplate the establishment of regulations these will include a prohibition of the use of dry white lead for painting, as has been done in Belgium. The increase of the consumption of white lead ground in oil is shown by the quantities which were delivered by G. Greve, white lead makers, of Utrecht, since 1907, in which year the new method of preparation of white lead mixed with oil was adopted by them:—

|      |   |   |   |             |
|------|---|---|---|-------------|
| 1908 | - | - | - | 380,000 kg. |
| 1909 | - | - | - | 547,318 "   |
| 1910 | - | - | - | 800,441 "   |

18,444. I wish to point out, also, that the Marine Department workshops at Amsterdam required, for 1909, 10,000 kilos, of white lead; and in 1910 the three Marine Department workshops together required 19,000 kilos.

x 7790

18,445. I have also asked myself, in conclusion how it is possible that after a struggle of more than a century zinc oxide has not yet taken the place of white lead, though from a hygienical point of view the former undoubtedly is to be preferred. Because, according to my opinion, the technical part of the question also weighs heavily, and because the greater majority of practical men, not from a passing opinion or from custom, are convinced that paint of zinc oxide, as to durability, is very inferior to paint of white lead.

18,446. I have purposely left out of consideration two points: First, the cost, as this will be dependent on the quotations of the raw materials, which fluctuate very much and very often; secondly, the political side, which has been connected with the white lead question. I wish to judge the question only from a scientific point of view. I cannot imagine that any Government, judging independently and not wishing to oblige a certain section, will resolve to prohibit the use of white lead, and other paints containing lead, unless they have absolute proof that an efficient substitute is available. Should such a prohibition be made, I would point out that after some years it might be necessary to return to the use of white lead, in consequence of the greater cost which the maintenance of zinc-oxide paint involves, according to the opinion of the greater majority of experts. Especially the cost of the painting-work for Government and municipal buildings would increase in such a manner that it would be very disadvantageous for the public purse.

18,447. (Chairman.) I understand that you have investigated cases of lead poisoning, on behalf of the Dutch Government, for many years?—Yes; not only lead poisoning, but poisoning cases in general.

18,448. Can you tell us how many of these cases occurred among painters?—Yes. In the Wilholmina infirmary or hospital of Amsterdam there has been in ten years only one case of a painter who was taken ill with lead poisoning. In the Binnengasthuis, another infirmary, in six years there has only been one case of a painter who was taken ill by reason of lead poisoning, and in the Roman Catholic Hospital, in ten years, there were two cases. Therefore, in the whole of Amsterdam, with 600,000 inhabitants, we had in six years four cases in hospital. This is taken from an official report of the City Council of the 7th April 1912.

18,449. Are there official statistics kept with regard to lead poisoning in the city of Amsterdam?—No, there are none.

18,450. So that there may be a very much larger number of cases of lead poisoning than is suggested by the four cases in hospitals?—Yes, but the serious cases will go through the hospitals. Occasionally there might be a case of minor interest, but the serious cases all fall back to the hospital.

18,451. Can you tell us why the Dutch people should be so immune from the danger of lead poisoning, when the people of other countries suffer very severely from it?—There is no immunity, but a good many cases of illness are attributed to lead poisoning which are not lead poisoning at all.

18,452. Do you speak now for Holland, or do you speak for the whole world?—I speak only for Holland.

18,453. What deduction are we to draw from what you have stated?—Of course, people are not immune, but it is a difficult thing to compare those statistics of other countries, the correctness of which I am not absolutely convinced of. I have spoken to 20 master painters, and in 40 years only one case of lead poisoning had occurred.

18,454. They admitted only one case?—During 40 years' experience only one case had occurred. Of course, this is only with regard to house-painters, not men engaged in white-lead works.

18,455. But you have told us that there are no official statistics?—No, in Holland there are none.

18,456. You are simply quoting your own opinion as to the immunity of the Dutch house-painters from lead poisoning?—It is not only my opinion, but an opinion based upon the information which I got from house-painters, from foremen, from engineers, and

O o

9 May 1912.]

Professor WEFERS BETTINK.

[Continued.]

different people who have been in connection with white lead.

18,457. But in what form have you obtained these opinions from these people? What other people have told you in the trade is only hearsay evidence. I want to get facts?—I have here the book of Mr. Van Hoek, master painter, "Waarom Geen Loodwit-Verbod."

18,458. (Mr. Sutherland.) Was he one of the Dutch Commission?—No. He gave evidence. I am no doctor; I am a chemical man, and therefore it is not in my way to keep statistics of lead poisoning. I deal only with the chemical part and not the medical part.

18,459. (Chairman.) If we see you that the statistics compiled for the English Government show that the suffering amongst house-painters who are engaged specifically in painting houses and the like is lamentable, you will probably agree that it must be lamentable where the same conditions prevail in other countries?—The high figures of those statistics are in my opinion to be attributed to the fact that they include all cases taken together not only from the painting trade but from the different works and the factories where they use white lead and lead in other forms.

18,460. I did not ask you to give us a criticism of our official figures. I have asked a simple question, and you must not answer me by giving a hypothetical reply with regard to the inaccuracy of our figures, because you are quite wrong about that?—There are no statistics whatever compiled in Holland, and therefore I do not feel at liberty to attribute any value to other statistics, especially as those statistics are all from the medical side and not the chemical.

18,461. In other words, you know nothing of the incidence of lead poisoning in Holland with regard to house-painters. You do not know whether it is great or small?—After my experience, I say that the amount of lead poisoning is very small; but I would like to say something before you ask another question just to throw a better light on what I am going to say. My personal experience is based on the fact that I personally investigated the matter in regard to twenty master house-painters who employ altogether 300 hands. Amongst those people the uniform idea was that a case of poisoning was very rarely heard of, and was generally attributed to gross carelessness.

18,462. In this investigation did you have the assistance of workmen?—I started by asking the masters, and then afterwards I asked the workers and compared their opinions. The workpeople themselves also were quite convinced of the little danger. Only one case was told me personally by a painter, who, as a young man, was poisoned through mixing the powder into paint.

18,463. When did your inquiry take place?—September and October 1911.

18,464. Last year?—Yes.

18,465. Was this information collected so as to enable you to give evidence here?—It was a thing that I was interested in, because the Dutch Commission Report was wrong. There were several points which were not right. There were several points that I did not agree with. I felt interested, and for that reason I started a personal investigation.

18,466. Do you contend that your opinion is more worthy of the consideration of this Committee than the conclusions of the Dutch Commission?—Whether my opinion is better or not I am not going to judge, but it is a different one.

18,467. You would prefer that this Committee, having heard your views, should weigh the two sets of evidence, your evidence and the evidence produced before the Dutch Commission, and come to their own conclusions?—The conclusion which I have come to is that technically white zinc cannot replace white lead.

18,468. I did not ask you that. That is not an answer to the question. I understand that the Dutch Commission had the assistance of doctors in their inquiry. Did you have the assistance of doctors when you made your inquiry?—No; there were no medical men as far as my knowledge goes on the Dutch Commission.

18,469. Did you have any medical men to assist you when you made your own inquiry?—I did not ask any medical man to assist me, for the reason only that I wanted to go in for the technical and toxicological and political side and not for the medical side.

18,470-2. You deal in paragraphs 18415-18418 of your proof with certain criticisms of the provisional Reports of the Dutch White Lead Commission. These criticisms were earlier in date than the final Report issued by the Commission, I believe?—Yes. Mr. Van Hoek's original criticisms were on the provisional Reports. My criticisms are of the final Report and I could not possibly have made them before having it. The first thing that I wrote about white lead was my pamphlet in July 1910. The Report of the Commission was issued 5th October 1909, and Mr. Van Hoek's criticisms were of the Reports of 1907 and 1908.

18,473. Do you adhere to the evidence given in those paragraphs of your proof? May the Committee take that as being authentic?—Yes, it is.

18,474. The conclusions of the Dutch Commission point to zinc-white paints being unsatisfactory where they are exposed to vapours containing sulphurous acid?—Yes, that is quite true.

18,475. These vapours occur in the coal smoke of locomotives, as, for example, in railway stations?—Everywhere where they burn gas and coal there is sulphurous acid in the atmosphere. They occur in railway stations because the locomotives burn coal.

18,476. Have you had any experience of other leadless paints in such places. For example, bituminous paints, graphite paints, carbonising coating paints, and iron oxide paints?—I have had some experience.

18,477. Will you tell us what your experience is?—My experience is that no zinc paint can replace white lead. It has not been found so up to now. The reason is that only white lead and linseed oil give an elastic coat which expands with the temperature and prevents the paint falling off.

18,478. On what authority do you give such a very emphatic opinion? Have you had any practical experience of painting?—My authority is based upon my knowledge of chemistry, and the fact that for a long time people have tried to find a substitute which up to now cannot be found.

18,479. But have you had any practical experience?—I have had no practical experience, being no painter, and having no chance to investigate the materials. My opinion is based simply on chemical conclusions.

18,480. Have you any experience of bituminous paints or graphite paints, or carbonising coating paints, or iron oxide paints?—I have not; but it is a noted fact that iron-oxide paints are wasted within three or four months, and this is stated by the Marine Authorities. Ships painted with iron oxide lose their coats within three or four months. The Marine people came to ask the reason, and I answered that it was due not to the iron but to the paint. I would like to add that carbon paint (graphite paint) is no paint at all: therefore I would rather disregard that, because it is no paint.

18,481. We have been told here that the paints which I have just enumerated are suitable for iron structures, such as railway stations, roofs, and bridges?—These paints can be used for rough iron-work, but they cannot be substituted for white lead, as they have not a sufficient covering power.

18,482. That statement is based not on any practical experience but on your theoretical knowledge as a chemist?—Yes.

18,483. You stated that sulphurous acid is always present in rooms where coal-gas is burnt. Do you mean us to understand that in your opinion zinc paint is especially unsuitable for such rooms?—My answer is that for inside work zinc paints when properly mixed with oil can be used, but for indoor work only.

18,484. The further reservation you mention is that these paints must not be exposed to great moisture. Does not this refer to such places as greenhouses?—They cannot be used in a wet atmosphere. In damp places they cannot be used, and a greenhouse being a damp place, they cannot be used there.

9 May 1912.]

Professor WEFERS BETTINK.

[Continued.]

18,485. Evidence which has been given before this Committee shows that both lead and zinc paints are equally unsatisfactory in the presence of excessive humidity?—White lead is to be preferred because it is much better than white zinc. In the case of humidity white lead keeps longer.

18,486. Now, as regards paragraph 6, No. 18,433, you again quote the criticisms pronounced by Mr. Van Hoek and the Master Painters' Association?—Yes.

18,487. These criticisms, I believe, were pronounced before the final Report of 1909 was considered?—Yes, they were.

18,488. The Commission must, therefore, have considered that they had good grounds for brushing aside those criticisms, because, if they had not done so they would have accepted them?—I think it is quite probable that the Commission discarded them. My own opinions were expressed after the date of the final Report.

18,489. There were two master house-painters of great standing on the Dutch White Lead Commission which drew up the Report of 1909, I believe?—Yes.

18,490. You will understand that this Committee cannot attach much weight to the criticism of individual gentlemen, however eminent, when they are opposed to the considered conclusions of White Lead Commission appointed by the Government of their country?—I do not quite catch your meaning—that the Committee cannot attach much weight to the criticisms of individual gentlemen.

18,491. Your evidence, Mr. Van Hoek's evidence, and the evidence of any other gentleman before the Commission as individuals, could not weigh with us as a Committee in comparison with the definite conclusions to which the White Lead Commission of Holland came?—I repeat the answer above that whilst Mr. Van Hoek's opinion was expressed in reference to the interim Report, my own views were only expressed after the final Report was issued. Mr. Van Hoek also wrote further on the subject in 1911.

18,492. Now you agree that there are certain dangers which must be guarded against?—Absolutely.

18,493. For example, in paragraph 18,442, you advocate a regulation that paint-work should be rubbed down wet. Will you tell us how such a regulation could be enforced?—By law. It is done already in Amsterdam.

18,494. How would you suggest, with regard to various houses where painting is carried on, that we should see that the law was carried out?—First of all, we have in Holland special inspectors of labour and inspectors of buildings, and when a house is erected or repaired, they have a right to enter, and the inspector would see very easily if the regulation was not being carried out. They would not dare to do otherwise if it was the law.

18,495. Would the inspector be there all day to see that the law was complied with, or would he go there once a month?—He would go occasionally.

18,496. If this Committee are able to satisfy themselves that it is impossible to enforce such a regulation, would you agree that they must seek some other means of safeguarding the workers' health?—The only way is for the regulations to be enforced by government, as we are trying to do in Holland, and by seeing that sufficient care is taken when the law is carried through that it is obeyed. Of course, if it cannot be done by law, you have to look for something else.

18,497. In paragraph 18,443 you lay stress on the danger of supplying dry white lead to painters. Are you aware that in this country practically all white lead is supplied in paste form?—Yes.

18,498. The prohibition of the supply of dry white lead would therefore not help us to reduce the incidence of lead poisoning amongst painters in this country?—I cannot answer this by a single word, because contained in this question is a prohibition of the use of white lead. I still say that every care has to be taken as to washing of hands, &c. By answering it I am put into a corner. I am afraid that you will give a further meaning to my answer than I want to put into it.

18,499. (Dr. Collis.) How many house-painters are there in Holland?—I do not know exactly, but perhaps in Mr. Van Hoek's evidence you might find it.

18,500. How many house-painters are there in Amsterdam?—I do not know. I have not collected these figures. As I have said before, I do not compile statistics.

18,501. How many inspectors are there in Holland to look after the house-painters?—There are no special inspectors for house-painters. There are general inspectors of labour.

18,502. How many inspectors of labour are there in Holland?—There are, in Holland, 2 Head Inspectors, 7 Inspectors (First Class), 4 Inspectors (Second Class), 4 Lady Inspectors, 80 Assistant Inspectors, and 3 Assistant Lady Inspectors.

18,503. What other duties have these inspectors besides having to look after house-painters?—They have nothing to do with house-painters at present; they look after works to see to all requirements.

18,504. (Mr. Sutherland.) What was the purpose of the Dutch Commission? Why was it appointed?—Because from the Socialistic side there was a request to prohibit white lead, and to investigate the matter the Commission was appointed to make a thorough investigation.

18,505. But they do not seem to have inquired into white-lead paint as a poison. There is no evidence in their report that they considered it from a medical standpoint at all?—The poisonousness is generally known, and it was not necessary to investigate it again. It was a known fact that it was poisonous, and just because it was poisonous the Government thought that it was good to go into the matter.

18,506. But they do not seem to have gone into it at all from that standpoint?—In Holland it was a Socialistic question, because with using white zinc, which does not wear so long, more work would have to be done.

18,507. Then it was an economic question from the Socialist standpoint?—Yes, it was a Socialistic question. They wanted more work. The Government did not make that a political question, but said, "because it is poisonous, we will go into it from the standpoint of public health."

18,508. But there is no evidence of that at all in the Commission's Report?—Of course not; they are not going to mention that. If they said that in the Report, they would make it a political question. They took the technical side.

18,509. They simply inquired into the relative merits of white lead, zinc white, and lithopone?—Yes.

18,510. And they did not regard the question of lead poisoning at all?—The Commission tried to prove that white zinc was just as good as white lead. They could not say straightforwardly, "We prefer white zinc because it will mean more labour," but they said, "We prefer white zinc because it is less poisonous."

18,511. But they do not say anything in the Report about its being less poisonous. The basis of our Inquiry here is the evil effect of lead, and it runs right through the Inquiry, but in the case of the Dutch Commission they absolutely ignored it?—That is quite true.

18,512. May that be because there is very little lead poisoning with you?—I could not say, but on chemical grounds white lead is superior to white zinc.

18,513. To establish that point is really the burden of the Commission's Report?—Yes.

18,514. You will be interested to know that what you have stated about the rarity of lead poisoning is confirmed by the evidence which Mr. Nooijen of the Hague gave to this Committee?—Mr. Nooijen is the secretary of the master painters' association of the Netherlands outside Amsterdam. His association takes in all the master painters in Holland except Amsterdam. In the original White Lead Commission, poisoning was not spoken of at all. It simply is this, if I may read it to you: they had to consider how far in Holland white-lead paint could be replaced by

C O 2

9 May 1912.]

Professor WEFERS BETTING.

[Continued.]

white zinc, and what technical and financial difficulties would be associated with it.

18,515. (*Chairman.*) The inference from that is that they had a reason for it, and the reason was the danger connected with lead?—Yes. The White Lead Commission in Holland was simply appointed because the Government, from the Socialistic side, were requested to investigate the replacement of white lead by white zinc, and the Socialistic party always hammered at the standpoint of poisoning. But it was a question of labour, and not poison. I cannot prove it strictly, but that is the general opinion.

18,516. (*Mr. Sutherland.*) Then you are of opinion that there is very little lead poisoning in Holland?—Very little as far as I know, but I am not a medical man, as I have told you.

18,517. That evidence confirms what we have heard before from Holland. Do you know anything of the effect of oil, turpentine, and driers, and the emanations that are given off?—It is only the turpentine that is given off. The oil by itself is not volatile.

18,518. But I refer to the noxious effects produced when the paint is drying by the vapours of the oil, turpentine and driers mixed with it?—Yes. It is known that the fumes of turpentine are poisonous to a certain extent. Might I refer to a case of a paint called inertol which happened a fortnight ago. They thought that it was lead poisoning, but it was only the turpentine which caused the noxious effects, because inertol does not contain lead at all.

18,519. Do these noxious effects produce the symptoms of nausea, headache and that kind of thing, even when zinc is the paint that is used?—Yes, it is exactly the same.

18,520. So that even if white lead were abolished, we should still have some of these symptoms which have been attributed to lead poisoning, but which really belong to the effect of the oil, turpentine, and driers?—Yes, but it is not lead poisoning.

18,521. No, but still there would be these effects?—Yes.

18,522. In your opinion I understand there is no really satisfactory substitute for white lead for outside places or places where there is damp and moisture?—My answer is that we can use white zinc, but it lasts for a much shorter time. There is no substitute which will last as long as white lead, or which will equal it.

18,523. What alternative are there to white lead for white paint?—Lithopone and white zinc.

18,524. Zinc oxide?—Yes, zinc oxide.

18,525. So that we are really limited to those two things for white paint. There is nothing that we can deal with except these two things and white lead on a large scale?—Up to now nothing else has been found.

18,526. So, that if white lead were abolished, we should be limited to these two alternatives?—Yes. Science is making progress, but up to the present white zinc is the only substitute. Men of science for more than 100 years have been looking for something which can be used as a substitute for white lead, but up to now nothing satisfactory has been found.

18,527. (*Mr. Gardner.*) You say that there is no satisfactory substitute for white lead. Have you yourself made any practical experiments with regard to the durability of different paints?—No, because I am not a technical chemical man, but a toxicological chemical man.

18,528. Then you only give us a personal opinion?—Yes.

18,529. Based on no practical experience?—I am no inventor. I am a man of science, but no inventor.

18,530. Is there a great deal of ill-health among house-painters in Holland?—As far as my knowledge goes, no, but it really is not in my line. I have to mention one important thing, and that is that the house-painters are generally workmen who are not strong enough to perform the duties of another avocation. They are not physically strong enough to be smiths or carpenters, and therefore they become ill because they are not really strong men. It is frequently the case that a man says, "My son is not fit

" for a carpenter, let him be a painter, because it is " easy work."

18,531. If it is the case that all the weaklings go to house painting, would it not follow that there would be a great deal of sickness in that trade?—I have no statistics, so I cannot answer that.

18,532. But you make the assertion that it is all the weaklings in Holland who go to the painting trade. On what ground do you say that? It is rather a strange thing to say that the majority of house-painters in Holland are men who are not physically strong enough to follow a more exacting avocation. Why would that be? Does a house-painter in Holland not get as good a wage, comparatively speaking, as men in other trades?—He is worse paid. It is the worst-paid trade.

18,533. All the men in the trade appear to be Socialists according to your evidence?—I will not go as far as that.

18,534. The deduction to be drawn from your evidence is that the Inquiry of the Commission into the question of white lead in Holland was because it was a political question and the men wanted more work. Their representatives in Parliament would not raise the question unless the men had first put the question forward?—Certainly, the men put the question forward. I told you before that the men put the question forward, the Socialistic men first, and the Government appointed in 1903 the White Lead Commission to investigate it technically and financially (I speak of the technical investigation, and not the statistical) with regard to how far white lead could be replaced by other paint.

18,535. You can give us no definite ground for saying that it is only weaklings who enter the painting trade in Holland? You have no authority for stating that?—What I say is the result of my personal research, but I cannot give any official papers about it or any exact official statement.

18,536. (*Mr. Parsonage.*) Have you made any tests yourself of the vapours arising from white lead and oil and turpentine, and also from zinc white and oil and turpentine?—It does not make any difference. I personally did not carry out any special researches on the question, because it is among chemical men a known fact that neither lead nor white zinc is volatile. It is simply the fumes of the turpentine which cause the sickness.

18,537. You have not made any test yourself to find out whether there is any difference between the emanations from turpentine, oil and zinc white, and the emanations from turpentine, oil and white lead?—No; and as lead only gets volatile at 1,100 degrees Centigrade, and not less, it is quite impossible.

18,538. It is quite impossible to make any test?—I do not want to investigate what I know already. It is no use looking into it, because it is a known fact.

18,539. But I want to get at the difference between the emanations from zinc white and the emanations from white lead?—Zinc gets volatile at 900 degrees. Therefore it is the same as lead. It does not get volatile before that, and it is only the fumes of turpentine.

18,540. Then if the oil and turpentine were mixed with nothing at all, you would still get the fumes from them that would cause illness?—Yes, of course.

18,541. Then we may take it that it is not the pigment at all that causes the poisoning?—It is not in the pigment, it is not in the paint, but it is in the turpentine, and if you were to paint with pure oil and pure turpentine the effect would be just the same. The pigment or colour has nothing to do with fumes.

18,542. (*Mr. Kinggate.*) I understand that you made an investigation on your own account, in which you obtained evidence from the workmen. I would like to know how the workmen from whom the evidence which you have placed before us was obtained were selected, if you say there is no poisoning from the workers' point of view?—I did not have any special system. I asked, for instance, a man who was working with me. I went to different painters who occasionally did jobs in my house, and then I went to Haarlem and asked different people, and I chatted

9 May 1912.]

Professor WEFERS BETINK.

[Continued.]

with the men and with the foremen, and that is how I got my information. My son is in the building trade, and he gave addresses of different painters.

18,543. You did not get men selected by the employers?—No, not at all. I had no interest. I did it simply for the sake of science. I asked masters as well as men to compare evidence to be sure it was right.

(Mr. Kinggate.) It appears that you entirely disagree with the decision of the Commission. I wondered whether it was possible that the men were selected by the employers to give evidence to bear out your own views in contradistinction to the decision of the Dutch Commission. I think that the point with regard to Socialism is rather an important one. If the Socialists are strong enough to force the Government to have a Commission to deal with the matter, and it is merely a question of more labour, I should imagine, seeing that this is the worst paid industry in Holland, that the Socialists were strong enough to go for a higher rate of wages. Socialism here would mean more money and less work.

18,544. (Mr. Robins.) On this Dutch Commission there were two master house-painters. Were those master house-painters recommended by the master house-painters of Holland as their representatives?—No. They were appointed by the Government.

18,545. Were they qualified men?—One of them is a decorative painter in Amsterdam of little importance, and the other is Mr. Kippel.

18,546. Seeing that these are qualified painters, how comes it about that great stress is laid on the imperfect manner in which the zinc white was mixed up for their experiments and nothing is said about anything being imperfect with regard to the white lead in their experiments. I recognise myself that the two master house-painters were men who knew their business, or they would not have been there, or ought not to have been there at any rate. It would have been their duty, as members of the Commission, to see that the zinc white was mixed up in a proper manner so that fair tests were made with zinc white the same as with white lead. We find nothing about the imperfect method with regard to white lead, but we find great stress laid on the imperfect method which was employed with regard to zinc white in those experiments. I would like to know the reason. As there are two painters on the Commission, I want to know whether it is a fallacy or not?—I think you have a translation of the book of Mr. Van Hoek. I cannot give exact evidence as I was not on the Commission. I must give an answer as an opinion, and not as a fact.

18,547. And you are not a practical painter?—The proof is in the book of Mr. Van Hoek.

The witness withdrew.

Mr. JOHN HOLT SCHOOLING.

Evidence to 18,674 handed in and taken as read; witness then called and examined.

18,548. I am a consulting actuary, a Fellow of the Royal Statistical Society, an Associate of the Institute of Actuaries, an actuary authorised by the Treasury to prepare and certify annuity and pensions tables dependent upon death-rates under the Friendly Societies Act, and an actuary authorised by the Board of Trade regulations under the Life Assurance Companies Act, 1909, to value assurance companies; since the year 1880 I have been continually engaged in making many statistical and actuarial investigations relating to the computation of death-rates, sickness rates, &c. I am the author of the "British Trade Book."

*Occupational Mortality.*

18,549. The following portion of my evidence relates to occupational mortality in various occupations in England and Wales. It is based solely upon Blue Book Cd. 2619, a supplement to the 65th Annual Report of the Registrar-General of Births, Deaths, and Marriages in England and Wales, Part II., published in 1908.

18,550. The purpose of this investigation is to compare the mortality in occupational group (64) Plumber, Painter, Glazier, with the mortality in other occupations.

18,551. For this purpose I use mainly the facts contained in pages 3 to 159 of Cd. 2619. These pages show the death-rates per 1,000 living in a great number of different occupations, each set of death-rates being shown for seven periods of life from age 15 upwards.

18,552. In many cases these death-rates are shown in Cd. 2619 for "Occupied Males" and for "Occupied and Retired Males." I have used for this inquiry the death-rates of "Occupied Males."

18,553. In parts of Cd. 2619, other than pages 3-159, various "comparative mortality figures" are shown, these figures not being death-rates. In the remarks relating to these comparative mortality re-

sults the need for much caution in the use of them is strongly emphasised in the Blue Book. Some of the tables in Cd. 2619 which contain these comparative mortality figures have a note of warning as to drawing deductions from them, and a statement that these figures do not show the comparative mortality as between one occupation and another. Although, as is stated in the Blue Book, these comparative mortality figures do admit of comparison in each occupation of the death-rates in that occupation during different periods, such as 1880-1882, 1890-1892, 1900-1902. It is desirable to draw attention to the warning contained in Cd. 2619, because the neglect of this warning may lead to the forming of wholly erroneous ideas as to occupational mortality.

18,554. An essential feature of a comparison of occupational mortality is the age distribution of the years of life exposed to risk of death, the age distribution of the deaths that occurred, and the age distribution of the death-rates per 1,000 living, computed upon the two factors—exposures and deaths.

18,555. The objection to this process is, its much greater bulk in the presentation of the results than is necessary when a "comparative mortality figure" is used. The latter does not show age distinctions, while a comparison of death-rates must, to be sound, show the death-rate for each age-group throughout life.

18,556. But this disadvantage of greater bulk that attaches to the showing of occupational death-rates is, in my opinion, outweighed by the advantages of precision and of soundness of results that accompany the showing of death-rates in each age-group. It is my opinion that a comparison of occupational mortality based upon death-rates in each age-group is a superior mode of comparison to that which consists of the showing of a computed "comparative mortality figure" not distinguished as to age.

18,557. Thus, for the reason stated, this report is mainly based upon death-rates per 1,000 living in each age-group.

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued.]

TABLE A.—OCCUPIED MALES.

From Cd. 2619, pp. 3-159.

Mean Annual Death-Rates per 1,000 Living, 1900-1902, at Seven Age-Groups from Age 15 until Death.

The death-rates for occupation (64) Plumber, Painter, Glazier, are here compared with the death-rates in each age-group for each of 133 occupations in which the death-rate at any age-group is higher than the death-rate of occupation (64) Plumber, Painter, Glazier. Where the death-rate in any of the 133 occupations is lower than the death-rate in occupation (64) the space in the columns is left blank. Thus all the death-rates here recorded are higher than the death-rates in occupation (64) Plumber, Painter, Glazier.

| Occupied Males in various Occupations.<br>(The number in brackets at the left hand is the reference number of each occupation on pages 3-159 of Blue Book Cd. 2619. The page references are stated at the right hand.) | Mean Annual Death-Rates per 1,000 living. |        |        |        |        |        |               |

| (104) Brush, broom—maker; hair, bristle—worker, p. 158.   | 3·51                                      | 6·08   | 7·93   | 11·68  | 22·72  | 39·52  | 92·29         |
| (105) Other occupied males, p. 159  | 2·46                                      | 4·36   | 6·22   | —      | —      | —      | —             |

18,558. I have prepared Table A. from pages 3-159 of Cd. 2619. This table relates to 133 occupational groups of Occupied Males in England and Wales, and also to occupation (64) Plumber, Painter, Glazier. The period covered by the facts is 1900-1902. Occupied groups.

18,559. The mode of constructing Table A. is as follows:—

Every occupation on pages 3-159 of Cd. 2619 has been examined as regards its death-rate per 1,000 living in each age-group. In those few cases where the death-rates for "Occupied" Males are not shown, the facts have been excluded. For Table A. relates solely to "Occupied" Males, not to "Occupied and Retired" Males. Each occupational group was then compared, age by age, with occupational group (64) Plumber, Painter, Glazier, as regards the death-rate per 1,000 living at each age-group. In every case where the death-rate of each of these 133 occupations was higher than the death-rate, at the same age, of occupation (64), such higher death-rate has been entered in Table A. In every case where the death-rate of each of these 133 occupations was lower than the death-rate, at the same age, of occupation (64), such lower death-rate has been omitted from Table A. and a blank space left in the seven right-hand columns of Table A.

18,560. By this mode of construction, Table A. at once discloses all those occupations whose death-rates at any age were higher than the death-rates in occupation (64) Plumber, Painter, Glazier, because no death-rates that are not higher than the death-rates in occupation (64) are entered in Table A.

18,561. This full process of investigation supplies an interesting and instructive comparison between the death-rates of occupation (64) Plumber, Painter, Glazier, and the death-rates of 133 other occupations which are included in Table A. Moreover, this comparison is shown for each age-group throughout life. We are on solid ground, and we are free from the warning of danger in Cd. 2619 that attaches to the use of a "comparative mortality figure" lacking age distinction.

18,562. Inspection of Table A. at once shows the great number of occupations and the great variety of

occupations in which the death-rates are higher than the death-rates in occupation (64) Plumber, Painter, Glazier, at one or more of the seven age-groups.

18,563. In this connection I may point out that there are only six occupations in England and Wales, out of the great number examined in Cd. 2619, where the death-rate at all age-groups is lower than the death-rate in occupation (64). These six occupations are—

- (1) Clergyman, &c., page 9 of Cd. 2619.
- (22) Gardener, &c. " 36 " "
- (32) Fishmonger, &c. " 58 " "
- (34) Grocer, &c. " 60 " "
- (36) Coal merchant, &c., page 62 of Cd. 2619.
- (63) Paperhanger, &c. " 105 " "

18,564. In all other occupations in England and Wales the death-rate at one or more of the seven age-groups is higher than the death-rate in occupation (64) Plumber, Painter, Glazier.

18,565. Look, for instance, at Occupied Males, England and Wales, in Table A. In four of seven age groups the death-rates are higher than the death-rates in occupation (64). But the group Occupied Males, England and Wales, is a great group, including nearly 30 millions of years of life at risk (page 3, Cd. 2619); and containing many professional, commercial, and other occupations, not any of which are exposed to any "industrial" risk of death. Despite these facts, occupation (64) Plumber, Painter, Glazier, can be compared with All Occupied Males with the result that at four age-groups the comparison is in favour of occupation (64), and at three age-groups the comparison is in favour of All Occupied Males.

18,566. In Occupied Males, London, years at risk over four millions (page 5, Cd. 2619), the death-rates are higher than the death-rates in occupation (64), in no fewer than five of the seven age-groups in Table A. These higher death-rates extend from age 15 to age 54. Occupied Males in London include a large proportion of professional and commercial men, civil servants, and others who are not exposed to any "industrial" risk of death.

18,567. In the group Occupied Males, industrial districts of England and Wales, Table A., the death-

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued.]

rates are higher at every age-group than the death-rates in occupation (64). This group, relating to industrial districts, contains nearly eight millions of lives at risk (page 6 of Cd. 2619), and, of the big groups of lives, it is the one with which occupation (64) may most justly be compared.

18,568. Inspection of Table A. will disclose occupation after occupation where the advantage of comparison as regards death-rates per 1,000 living in each age-group is held by the occupation (64) Plumber, Painter, Glazier.

18,569. Here is a summary based upon Table A. and relating to the 127 occupational groups for which the death-rates at all age-groups are known. In six of the occupations in Table A. the letters N.K. are inserted in one or more of the death-rate columns. This means that the death-rates are not known. And 133 - 6 = 127.

18,570. Number of Occupations in Table A. with Death-rates Higher than the Death-rates of Occupation (64) Plumber, Painter, Glazier.

|   |   | No. of Occupations. |    |
|---|---|---------------------|----|
| Death-rates higher in 7 of the 7 age-groups |   | -                   | 14 |
| " " 6 " 7 "                                 | " | -                   | 16 |
| " " 5 " 7 "                                 | " | -                   | 9  |
| " " 4 " 7 "                                 | " | -                   | 23 |
| " " 3 " 7 "                                 | " | -                   | 30 |

|   |   | No. of Occupations. |
|---|---|---------------------|
| Death-rates higher in 2 of the 7 age-groups |   | - 15                |
| " " 1 " 7 "                                 | " | - 20                |
| Total                                       |   | - 127               |

18,571. The six other occupations in Table A., where at some ages the death-rates are not known, show that in one case the death-rate is higher than the death-rate of occupation (64) in six ages out of six ages, one case in five ages out of five ages, one case in five ages out of six ages, three cases in one age-group out of six age-groups. These six occupations, with the 127 already stated, make up the total of 133 occupations having death-rates higher than the death-rates in occupation (64) Plumber, Painter, Glazier, Table A.

18,572. It is impossible to examine Table A., noting that it is based upon the officially recorded death-rates at each age-group stated on pages 3-159 of Cd. 2619, without coming to the conclusion that the death-rates in occupation (64) Plumber, Painter, Glazier, do not compare unfavourably with the death-rates of most of the other occupations in England and Wales of a greatly varied nature. While as regards occupied males in England and Wales, occupied males in London, occupied males in industrial districts, the advantages of the comparison is held by occupation (64) Plumber, Painter, Glazier.

18,573. TABLE B.

This is a summary relating to Table A. It shows for 133 occupations, other than occupation (64) Plumber, Painter, Glazier, the number of such occupations where the death-rates are above or below the death-rates in occupation (64).

| Ages.        | 133 Occupations with Death-rates above or below the Death-rates in Occupation (64), Plumber, Painter, Glazier. |                                   |                  | Percentage Results of Columns (a), (b), (c). |                                   |                  |
|--------------|--|-----------------------------------|------------------|--|-----------------------------------|------------------|

| 15-19        | 98   | 30                                | *128             | Per cent. 77                                 | Per cent. 23                      | Per cent. 100    |
| 20-24        | 94   | 37                                | *131             | 72   | 28                                | 100              |
| 25-34        | 71   | 62                                | 133              | 53   | 47                                | 100              |
| 35-44        | 43   | 90                                | 133              | 32   | 68                                | 100              |
| 45-54        | 35   | 98                                | 133              | 26   | 74                                | 100              |
| 55-64        | 49   | 84                                | 133              | 37   | 63                                | 100              |
| 65 and older | 100  | 33                                | 133              | 75   | 25                                | 100              |
| All ages     | 400  | 434                               | 924              | 53   | 47                                | 100              |

\* The reason why these two totals are less than 133 is that there are seven instances where the death-rates at ages 15-19 and 20-24 are not known. See Table A.

NOTE.—Observe that in four of the seven age-groups, and also for "All ages," the death-rates of the 133 occupations, as a whole, are higher than the death-rates in occupation (64). And that in three of the seven age-groups, the death-rates of, the 133 occupations, as a whole, are lower than the death-rates in occupation (64) Plumber, Painter, Glazier.

18,574. Table B. is a summary relating to Table A. It shows for 133 occupations, other than occupation (64), and for each age-group, the number of occupations that have a death-rate higher or lower than the death-rate in occupation (64) Plumber, Painter, Glazier. At ages 15-19, 20-24, 25-34, 65 and older, and at all ages combined, the death-rates of a majority of these 133 occupations are higher than the death-rates of occupation (64). At ages 35-44, 45-54, 55-64, the death-rates of a majority of these 133 occupations are lower than the death-rates of occupation (64). Thus, on balance, and during the larger part of life, the death-rates in occupation (64) compare favourably rather than unfavourably with the death-rates of many other occupations.

18,575. It should be noted that the death-rates of occupation (64) in Table A. include the deaths caused by plumbism—lead poisoning. This is a disease to which occupation (64) is more exposed than are many other occupations which have their own special risks. But despite this fact, the death-rates in occupation (64) are by no means unduly high, as has been shown in Tables A. and B.

18,576. The death-rates from plumbism can be computed by means of the facts on page 106 of Cd. 2619, relating to occupation (64).

18,577. During 1900-02, the period to which the facts relate, there were 155 deaths from plumbism during the three years upon a total of 664,251 years of life exposed to risk of death. The average yearly

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued.]

results are 52 deaths from plumbism upon an exposure of 221,417 years of life.

18,578. The death-rates from plumbism for each age-group, as computed upon the facts stated on page 106 of Cd. 2619, are shown in Table C.

18,579. TABLE C.

Occupation (64) Plumber, Painter, Glazier, Occupied Group only. Period 1900-02. Death-rates per 1,000 living: Distinguishing deaths from plumbism, deaths from other causes, deaths from all causes.

| Ages.                  | Mean Annual Death-rates per 1,000 living. |                          |                  |
|------------------------|---|--------------------------|------------------|
|                        | From Plumbism.                            | From other Causes (c-a). | From all Causes. |
|                        | (a)                                       | (b)                      | (c)              |
| 15-19 . . . . .        | ·04                                       | 1·98                     | 2·02             |
| 20-24 . . . . .        | ·03                                       | 3·74                     | 3·77             |
| 25-34 . . . . .        | ·08                                       | 5·51                     | 5·59             |
| 35-44 . . . . .        | ·40                                       | 11·16                    | 11·56            |
| 45-54 . . . . .        | ·56                                       | 20·78                    | 21·34            |
| 55-64 . . . . .        | ·38                                       | 35·35                    | 35·73            |
| 65 and older . . . . . | ·38                                       | 80·37                    | 80·75            |
| All ages . . . . .     | ·23                                       | 12·08                    | 12·31            |

(From Cd. 2619, page 106.) The mean annual death-rate from plumbism =  $\frac{\text{Number of deaths from plumbism} \times 1,000}{\text{years of life at risk}}$ .

NOTE.—At "all ages" the death-rate from plumbism above is  $\frac{1}{4}$ th part of the death-rate from all causes. If only ages

18,580. Table C. shows that the highest death-rate from plumbism in occupation (64) is at ages 45-54, namely, 56 deaths per 1,000 men at risk for one year, or 5·6 deaths per 10,000 men at risk for one year. At all ages the death-rate from plumbism in occupation (64) is 23 deaths per 1,000 living, or 2·3 deaths per 10,000 men at risk for one year. This rate is much smaller than the special death-risks that attach to various other occupations, and it is relatively trivial.

18,581. Mean Annual Death-rate per 1,000 living Occupation (64), Plumber, Painter, Glazier. All Ages

|                             |              |
|-----------------------------|--------------|
| From plumbism . . . . .     | 23           |
| From other causes . . . . . | 12·08        |
| From all causes . . . . .   | <u>12·31</u> |

It is known that the death-rates of the population of England and Wales have been decreasing for many years. It is desirable to ascertain whether or not the decrease in the death-rates in occupation (64) has kept pace with the decrease in the death-rates of the whole population.

25-64 be taken, the death-rate from plumbism (computed from page 106 of Cd. 2619) is 31 in place of 23 above. And the death-rate from all causes is then 13·99 in place of 12·31 above. At ages 25-64 the death-rate from plumbism is therefore  $\frac{31}{12·31}$ th part of the death-rate from all causes. In Table G, using the "comparative mortality figure" from Cd. 2619, the mortality from plumbism is  $\frac{31}{12·31}$ th part of the mortality from all causes in occupation (64). Thus the result based upon death-rates brings out a slightly higher incidence of deaths from plumbism than is shown by the official "comparative mortality figure" in Table G.

18,582. TABLE D.

Death-rates of Males, per 1,000 living, at ages 25-45 and 45-65, Occupied Groups, Periods 1880-82, 1890-92, 1900-02, showing the large Decrease in the Death-rates in Occupation (64), Plumber, Painter, Glazier.

|   | 1880-82. | Decrease from (a) to (c). | 1890-92. | Decrease from (c) to (e). | 1900-02. | Decrease from (a) to (f). |
|---|----------|---------------------------|----------|---------------------------|----------|---------------------------|
|   | (a)      | (b)                       | (c)      | (d)                       | (e)      | (f)                       |
| (64) Plumber, painter, glazier (occupied):— |          |                           |          |                           |          |                           |
| Ages 25-45 . . . . .                        | 11·07    | 0·60                      | 10·47    | 2·19                      | 8·28     | 2·79                      |
| Ages 45-65 . . . . .                        | 32·49    | 0·79                      | 31·70    | 5·62                      | 26·08    | 6·41                      |
| All occupied males (England and Wales):—    |          |                           |          |                           |          |                           |
| Ages 25-45 . . . . .                        | 9·71     | 0·19                      | 9·52     | 1·68                      | 7·84     | 1·87                      |
| Ages 45-65 . . . . .                        | 24·63    | Increase 2·06             | 26·69    | 3·96                      | 22·73    | 1·90                      |

Excess of Death-rates in Occupation (64) over Death-rates of all Occupied Males in England and Wales.

|   |       |   |       |   |       |   |
|---|-------|---|-------|---|-------|---|
| Occupation (64) . . . . . 25-45           | 11·07 | — | 10·47 | — | 8·28  | — |
| All occupied males . . . . . 25-45        | 9·71  | — | 9·52  | — | 7·84  | — |
| Excess of occupation (64) . . . . . 25-45 | 1·36  | — | 0·95  | — | 0·44  | — |
| Occupation (64) . . . . . 45-65           | 32·49 | — | 31·70 | — | 26·08 | — |
| All occupied males . . . . . 45-65        | 24·63 | — | 26·69 | — | 22·73 | — |
| Excess of occupation (64) . . . . . 45-65 | 7·86  | — | 5·01  | — | 3·35  | — |

(From Cd. 2619, Table VII., pages cci and cciii.)

NOTE.—Observe that the death-rates in occupation (64) have been decreasing since 1880-82 at a much greater rate than the decrease in the death-rates of all occupied males.

18,583. This comparison may be made by means of facts are contained in Table D., appended, which Table VII. on pages cci and cciii of Cd. 2619. The compares the mean annual death-rates per 1,000 living

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued.]

of occupation (64) Plumber, Painter, Glazier, with the death-rates of All Occupied Males in England and Wales during 1880-82, 1890-92, 1900-02. In this connection only two age-groups are shown in Cd. 2619, and they are repeated in Table D. These groups are 25-45, 45-65. They cover the main working period of life.

18,584. Inspection of Table D. shows plainly that as regards decrease in death-rates the advantage is largely held by occupation (64) when compared with All Occupied Males in England and Wales. From 1880-82 to 1890-92, from 1890-92 to 1900-02, from 1880-82 to 1900-02, the decrease in the death-rates in occupation (64) was in every instance much larger than the decrease in the death-rates of All Occupied Males in England and Wales.

18,585. The lower part of Table D. shows the large decrease in the excess of death-rates in occupation (64) over the death-rates of All Occupied Males that has occurred since 1880-82. This is a severe test of the death-rates in occupation (64), because the group, All Occupied Males, includes a large number of men who are not exposed to any "industrial risk" of death. But the occupation (64) stands this test.

18,586. A much fairer test is to compare the death-rates of occupation (64) with the death-rates of All Occupied Males in industrial districts. This test can be applied for the periods 1890-92 and 1900-02, with the advantage of showing the results for seven age-groups. See Table E.

18,587. TABLE E.

Showing the Death-rates, and the Decrease in the Death-rates, during 1890-92 and 1900-02. For Occupation (64) Plumber, Painter, Glazier: and for All Occupied Males, Industrial Districts, England and Wales.

| Ages.        | Occupation (64), Plumber, Painter, Glazier, Occupied only. |          |                                |   |           |                                | All Occupied Males, Industrial Districts, England and Wales. |          |                                |   |           |                                |

| 65 and older | 107.10   | 80.75    | 26.35                          | 100   | 75        | 25                             | 120.44   | 98.05    | 22.39                          | 100   | 81        | 19                             |

(From Cd. 2619, pages cxxxiv and cxxxix.)

18,588. Inspecting Table E., we see in the first place that at every age-group during 1890-92 and during 1900-02 the death-rates of occupation (64) were lower than the death-rates of All Occupied Males, Industrial Districts.

18,589. The actual decrease in death-rates for the two groups is shown in columns (c) and (i) of Table E. The decrease in occupation (64) was not quite so large as the decrease in the death-rates of All Occupied Males, Industrial Districts. But as the latter death-rates are higher than those of occupation (64), it is necessary to look at the proportional decrease in the death-rates in columns (f) and (l) of Table E. We see that there is but slight difference between the two occupational groups compared in Table E. when the proportional decrease in their death-rates is observed. And, as stated, occupation (64) holds the advantage over All Occupied Males, Industrial Districts, as regards lower death-rates per 1,000 living at every period of life.

18,590. Hitherto I have exclusively used death-rates per 1,000 living, preserving the distinction of age. In my opinion, as already stated, death-rates are a sounder comparative test than is any "Comparative Mortality Figure." But I will show a table of comparative mortality figures based upon page clxxxii of Cd. 2619 See Table F.

18,591. TABLE F.

"Comparative Mortality Figures," all causes of death, period 1900-02, showing various Occupations, Occupied Groups only.

| Occupation.  | Comparative Mortality Figure. |
|--|-------------------------------|
| General labourer. Industrial districts                   | 2,471                         |
| Tin miner . . . . .                                      | 2,169                         |
| Inn, hotel—servant. London . . . . .                     | 2,121                         |
| General labourer . . . . .                               | 1,987                         |
| Innkeeper, &c. Industrial districts                      | 1,945                         |
| Innkeeper, servant, &c. Industrial districts             | 1,901                         |
| Innkeeper, servant, &c. London . . . . .                 | 1,814                         |
| General labourer. London . . . . .                       | 1,808                         |
| Costermonger, hawk, &c. . . . .                          | 1,778                         |
| Inn, hotel—servant . . . . .                             | 1,767                         |
| Innkeeper, servants, &c. . . . .                         | 1,697                         |
| Inn, hotel—servant. Industrial districts                 | 1,691                         |
| Innkeeper, publican; spirit, wine, beer dealer . . . . . | 1,669                         |
| Copper miner . . . . .                                   | 1,609                         |

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

| finisher, worker - - - - -                       | 1,074                         |  |                               |
| Hairdresser - - - - -                            | 1,070                         |  |                               |
| Textile dyer, bleacher, printer, finisher,       |                               |  |                               |
| &c. - - - - -                                    | 1,066                         |  |                               |

(From Cd. 2619, p. clxxxii.)

NOTE.—In addition to the 55 occupations included above, there are stated on p. clxxxii, 53 other occupations having a "Comparative Mortality Figure" lower than 925 (all occupied males). Also there are 47 other occupational groups, not stated on p. clxxxii. Of these 47 occupations the mortality in 20 of them was higher than 925, and in 27 of these occupations the mortality was lower than 925. The above "Comparative Mortality Figures" are stated to be applicable to compare one occupation with another.

18,592. Table F: shows the "Comparative Mortality Figure" without distinction of age for 55 occupations, including occupation (64). In 50 of these occupations the mortality is higher than the mortality in occupation (64), Plumber, Painter, Glazier. Among these 50 are All Occupied Males, Industrial Districts, and All Occupied Males, London. In both of these important groups the mortality is considerably higher than in occupation (64).

18,593. These results confirm those already shown for each age-group, and shown much more extensively, in Table A. They show that occupation (64) is not subjected to a heavy mortality, nor, indeed, to any excess of mortality. This group not only stands upon at least an average level of mortality, but as has been shown in Table D., the death-rates in occupation (64) have been decreasing largely since 1880-82.

## 18,594. TABLE G.

"Comparative Mortality Figure" for Males in England and Wales, 1900-02, in various Groups, and classified according to Deaths from various Causes. Ages 25-64.

| Cause of Death.                    | Occupation (64), Plumber, Painter, Glazier (Occupied Group). | Occupied Males, England and Wales. | Occupied Males, London. | Occupied Males, Industrial Districts. | Unoccupied Males, England and Wales. |

(From Cd. 2619, pages clviii and clxxiv.)

NOTE.—In occupation (64), column (a), the mortality from plumbism is equal to  $\frac{1}{4}$  part of the mortality from all causes. See the note to Table C., which shows a nearly identical result independently based upon death-rates, in place of upon a "Comparative Mortality Figure."

Observe that the mortality in column (a), occupation (64), compares favourably with three of the four other groups in columns (b), (c), (d), (e).

† On page clviii this figure is given as 1,129 in place of 1,122. This 1,129 seems to be a printer's error.

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued,

18,595. Table G. is another table based upon "Comparative Mortality Figures." The facts are taken from Cd. 2619, pages clviii and clxxiv. They show the mortality from various causes of death, without age distinction, for males aged 25-64 years. The period of observation is 1900-02. Occupation (64) is compared with some large groups of the population.

18,596. Table G. shows that although occupation (64) has a much larger mortality from plumbism than have other groups which are not exposed to the risk of plumbism—these groups having their own special risks to which occupation (64) is not exposed—yet the mortality from all causes in occupation (64) is not high. It is lower than Occupied Males, London; it is lower than Occupied Males, Industrial Districts; it is much lower than Unoccupied Males, England and Wales, and it is not greatly above the mortality for All Occupied Males in England and Wales, the latter group including all professional and commercial men and others not exposed to any "industrial risk" of death. I point out that Table G. relates only to ages 25-65, the period at which, as Table C. shows, the death-rate from plumbism is highest in occupation (64).

18,597. Table G. shows that deaths from plumbism are relatively insignificant. See also Table C. And Table G. shows that as regards causes of death much more important than plumbism, the occupation (64) compares favourably with other occupational groups in Table G. In such causes of death as phthisis, diseases of respiratory system, diseases of circulatory system, all potent causes of death, the occupation (64) compares favourably with the other groups in Table G. In cancer, accident, diseases of digestive system, occupation (64) comes out well. Similarly as regards influenza, suicide, alcoholism, diabetes, and other causes of death, occupation (64) Plumber, Painter, Glazier, easily stands the test applied in Table G.

18,598. TABLE H.

Mean Annual Death-rate per 1,000 living period 1900-1902, for various Occupied Groups of Males in England and Wales.

| Ages.            | Occupation (64)<br>Plumber,<br>Painter,<br>Glazier<br>(Occupied<br>Group).<br>(Page 106.) | Occupied<br>Males,<br>England<br>and Wales.<br>(Page 3.) | Occupied<br>Males,<br>London,<br>(Page 5.) | Occupied<br>Males,<br>Industrial<br>Districts,<br>(Page 6.) |
|------------------|---|--|--|---|
| 15-19            | 2.02  | 2.44   | 2.82                                       | 2.65  |
| 20-24            | 3.77  | 4.41   | 4.44                                       | 4.52  |
| 25-34            | 5.59  | 6.01   | 6.82                                       | 6.47  |
| 35-44            | 11.56   | 10.22  | 12.96                                      | 12.26   |
| 45-54            | 21.34   | 17.73  | 22.35                                      | 22.12   |
| 55-64            | 35.73   | 31.01  | 34.01                                      | 39.18   |
| 65 and<br>older. | 80.75   | 88.39  | 73.75                                      | 98.05   |
| All Ages         | 12.31   | 13.04  | 13.27                                      | 13.85   |

(From Cd. 2619, pages 3, 5, 6, 106.)

18,599. In Table H., I show the mean annual death-rate during 1900-02, at seven age-groups, for occupation (64) and for three other main groups of Occupied Males. This is a thoroughly comprehensive test of the mortality in occupation (64), and occupation (64) stands the test. This is made clear to the eye by the diagram relating to Table H. The mortality in occupation (64) is not at all ages lower than the mortality in All Occupied Males, England and Wales, but the mortality in occupation (64) is at all ages lower than the mortality in All Occupied Males, Industrial Districts.

18,600. TABLE J.

Showing the Actual and the "Expected" Number of Deaths during 1900-02 in Occupation (64), Plumber, Painter, Glazier. Page 106 of Cd. 2619. Occupied Group.

| 45-54 . .    | 97,206   | 22.12  | 2,150  | 2,074   | 76  | 96  | 100                                       |
| 55-64 . .    | 47,832   | 39.18  | 1,874  | 1,709   | 165   | 91  | 100                                       |
| 65 and older | 15,888   | 98.05  | 1,558  | 1,283   | 275   | 82  | 100                                       |
| All ages -   | 664,251  | —  | 9,079  | 8,181   | 898   | 90  | 100                                       |

Based upon Cd. 2619, pages 6 and 106.

NOTE.—The standard data used above, by which to compute the "expected" deaths during 1900-02 in occupation (64), are the death-rates on page 6 of Cd. 2619 relating to 7½ millions of lives in the group Occupied Males, Industrial Districts of England and Wales, 1900-02. The result is that the deaths occurring during 1900-02 in occupation (64) were, for "All Ages" 10 per cent. below the expected number of deaths by the standard data here used. In other words, 90 deaths actually occurred for every 100 deaths expected to occur, during 1900-02 in occupation (64), Plumber, Painter, Glazier.

18,600a. Finally, in Table J., I show the results relating to the actual and the "expected" number of deaths in occupation (64) during 1900-02. This table embodies a widely-used actuarial method of testing the mortality of any group of lives. A standard set of

death-rates is selected by which to test the mortality of any given group of lives, and the expected deaths are then computed by means of the standard set of death-rates. But Table J. is self-explanatory. The result is that when the mortality of occupation (64) is

9 May, 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued.]

tested by the large group, All Occupied Males, England and Wales, Industrial Districts, a suitable basis, it is found that whereas 8,181 deaths occurred during 1900-02 in occupation (64) there were 9,079 deaths expected to occur. There was a shortage of 898 actual deaths in occupation (64) during 1900-02; in other words, there were 90 actual deaths in occupation (64) for every 100 deaths expected to occur.

18,601. By the light of the facts shown in this Report, all of which are taken from or based upon Dr. John Tatham's letter to the Registrar-General, which constitutes Blue Book Cd. 2619, I am of opinion that the mortality in occupational group (64) Plumber, Painter, Glazier, is in no way excessive or abnormal, that it has been decreasing as rapidly or more rapidly than the mortality of England and Wales, and that there is a very large number of most varied occupations, many of which are believed to be ordinarily healthy, in which the mortality exceeds the mortality of occupational group (64) Plumber, Painter, Glazier. As regards mortality late in life, namely at ages 65 and older, occupation (64) compares most favourably with nearly all other occupations.

#### Occupational Sickness.

18,602. The following portion of my evidence relates to occupational sickness in various occupations in this country.

18,603. The purpose of this investigation is to compare, if possible, the sickness in occupations that are exposed to sickness arising from lead poisoning, with the sickness obtaining amongst the general population, with the object of ascertaining, if possible, whether or not the sickness from All Causes in occupations connected with risk of lead poisoning, exceeds the sickness from All Causes that occurs throughout the general population.

18,604. The first step is to obtain the necessary data for this investigation. But, although several important investigations have been made relating to sickness in various areas of this country, such as rural, town, and city areas, there has been only one important investigation relating to occupational sickness. This is the experience of the Manchester Unity Friendly Society observed during the five years 1893-97, the results of which were published in 1903. This is a most extensive investigation, covering nearly three million of years of life exposed to risk of sickness, and the following occupational groups were separately examined:-

- A. Agriculture.
- B. Outdoor building trades, &c.
- C. Railway service.
- D. Seafaring, fishing, &c.
- E. Quarry workers, &c.
- F. Iron and steel workers, &c.
- G. Mining occupations, &c.

18,605. These groups comprised nearly 1,400 separate divisions of occupation. Unfortunately, these big groups are too general in their classification of occupations to be of use in the present investigation. None of these groups can be regarded as applying specially to house painters, &c., nor to occupations exposed to the risk of sickness from lead poisoning.

18,606. Noting this lack of data, I lately applied for the loan of the cards upon which the Manchester Unity experience was tabulated. Nearly one million of these cards were prepared, each card relating to one life. It occurred to me that if I could get these cards, and sort out those that relate to house painters, &c., and then proceed to investigate the rates of sickness, &c., a most valid fact-base would then be obtained. But I was informed on 12th March 1912 that "the Manchester Unity cards were destroyed after the completion of the investigation." This destruction of data gathered at great cost seems to me a most unfortunate incident.

18,607. Thus, so far as I am aware, no adequate data exist by which to compare the rates of sickness among house painters, &c., or among those who are exposed to risk of sickness from lead poisoning, with the rates of sickness that occur in All Occupations. The records of friendly societies contain these data, but they are not available.

18,608. Sickness is so essentially a function of age that it is absolutely necessary to have the age distribution of the men exposed to risk of sickness, the age-distribution of the cases of sickness, the age-distribution of the weeks of sickness from whatever cause arising. Not any of these essential data exist as regards house painters, &c., or as regards sickness arising from lead poisoning.

18,609. The only data that I possess as regards lead poisoning are those contained in the Annual Report of the Chief Inspector of Factories and Workshops for the year 1910, page 170 of Cd. 5693.

18,610. But these data consist merely of a statement of the reported cases of sickness from lead poisoning, and the number of such cases that resulted in death, the period being 1900-10, and the facts relating to various occupations. These data are wholly inadequate. Not only is there no age-distribution, but also there is no statement even of the number of men exposed to risk of sickness. Nor is there any information as to the duration of the attack of sickness. Also, there is no information as to the sickness from causes other than lead poisoning occurring among these men who experienced some sickness from lead poisoning. Moreover, these reported cases are those occurring or contracted in a factory or workshop.

18,611. In actuarial investigations, it sometimes happens that a part of the data desired cannot be obtained. But if the main portion of the essential data be available it then sometimes becomes possible to make certain assumptions as to the nature of the missing data which do not greatly detract from the validity of the results brought out by such investigation.

18,612. But in this instance, not one of the essential sets of data is known. The number of lives exposed to risk of sickness is not known, the number of cases of sickness from all causes is not known, the duration of sickness is not known, no age-distribution is known and the only data we have are those just mentioned, namely, the number of reported cases of sickness from lead poisoning, with the deaths that occurred out of these cases.

18,613. I may say, at once, that no opinion of any validity can possibly be formed by means of these data on page 170 of Cd. 5693. No opinion, that is to say, which relates to the question whether or not the rates of sickness among house painters, &c. fall short of, or exceed, the rates of sickness in all occupations combined. We cannot even obtain a valid result relating to cases of sickness from lead poisoning that occur among house painters, &c. Because, to get even this result, we must know the age-distribution of the house-painters, &c., exposed to risk of sickness, the number and the age-distribution of the cases of sickness from lead poisoning that occur, the number and the age-distribution of the weeks of sickness from lead poisoning. The duration of an attack of sickness is an essential feature of any investigation of sickness rates. Duration of sickness is more important than the number of cases of sickness, because duration of sickness is more prominently a function of age than is the number of cases of sickness.

18,614. Thus, although I shall show some results based upon the reported cases of sickness from lead poisoning on page 170 of Cd. 5693, I state explicitly that these results do not throw any light upon the question that is the main purpose of this investigation, namely, the ascertaining whether or not the rates of sickness among men exposed to the risk of lead poisoning, such as house painters, &c., exceed, or fall short of, the rates of sickness among the general population.

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued.]

18,615. In my evidence as to occupational mortality it was shown that the mortality of the occupational group, Plumbers, Painters, Glaziers, is in no way excessive. For although in this occupation there is a higher death-rate from lead poisoning than in some other occupations not exposed to risk from lead poisoning—but which have their own specialised death risks—yet this death-rate from lead poisoning is relatively trivial, and as regards other and much more potent causes of death than lead poisoning, it was clearly shown that the occupation Plumber, Painter, Glazier has a lighter mortality than many other occupations. Thus the occupation Plumber, Painter, Glazier, is enabled successfully to stand the tests of occupational mortality that were applied in my evidence.

18,616. Now, although sickness does not follow the fluctuations of mortality, yet there is a connection between the two things, both of them being essentially functions of age. That is to say, both sickness and death are largely influenced by the age of a life exposed to the risk of sickness or of death.

18,617. Thus, if we find that in any occupation the death-rates from All Causes are not in excess of normal death-rates, there is at the least a fair presumption that the sickness rates from All Causes are not in excess of normal sickness rates. This is, as I say, only a presumption, and it may be applied to the occupation Plumber, Painter, Glazier. This occupation has a low death-rate as regards several potent causes of death, and presumably, therefore, this occupation escapes the sickness that comes before death from such diseases.

18,618. As regards the mortality of the occupation Plumber, Painter, Glazier, I may point out that the death-rates shown in my evidence on occupational

mortality were those of the Registrar-General, and that as regards deaths from lead poisoning no abatement was made on account of the possible excess error arising from the cause of death being mistakenly given as lead poisoning.

18,619. That such excess error is likely to exist may be gathered from the evidence of Dr. Goadby, on 21st December 1908, given before the Departmental Committee on the Dangers attendant upon the use of Lead, &c., in the manufacture of Earthenware, and China, Cd. 5385, page 483 *et seq.*

18,620. For instance, there is question 14,812:—

“Taking the cases all round, there might be very little difficulty in saying from the previous history *plus* post-mortem examination whether a person had died from lead poisoning or not?”  
Dr. Goadby replied, “It is presumptive evidence, but it is not conclusive.”

Further questions and answers point in the same direction, namely, that there is a quite appreciable chance of the number of deaths from lead poisoning having been over-stated.

18,621. However this may be, in my evidence as to occupational mortality no abatement was made on account of this possible error. And, as stated, the occupation Plumber, Painter, Glazier shows no excessive mortality from All Causes when compared with other occupations.

18,622. And thus I come back to the presumption already stated, namely, that as regards sickness there does exist some presumptive evidence that the sickness from All Causes in the occupation Plumber, Painter, Glazier, is not in excess of the sickness among the general population.

18,623. TABLE A.

*Illustrating the necessity to obtain the Age-Distribution of the Number of Years of Life exposed to Risk of Sickness, of the Number of Cases of Sickness, and of the Weeks of Sickness, in order to test the Incidence of Sickness from any Cause in any Occupational Group.*

| Ages.              | Number of Years of Life Exposed to Risk of Sickness. | Number of Members Sick. | Number of Weeks of Sickness. | Yearly Number of Members Sick per 100 exposed to Risk.<br>$\frac{b \times 100}{a}$ | Yearly Number of Weeks of Sickness per 100 exposed to Risk.<br>$\frac{c \times 100}{a}$ | Number of Weeks of Sickness per Member Sick.<br>$\frac{c}{b}$ |
|--------------------|--|-------------------------|------------------------------|--|---|---|
|                    | (a)  | (b)                     | (c)                          | (d)  | (e)   | (f)   |
| 16-19 . . .        | 101,912  | 29,203                  | 93,553                       | 29   | 92  | 3.2   |
| 20-24 . . .        | 434,117  | 106,152                 | 389,259                      | 24   | 90  | 3.7   |
| 25-34 . . .        | 901,760  | 212,382                 | 908,481                      | 24   | 101   | 4.3   |
| 35-44 . . .        | 678,958  | 167,646                 | 956,861                      | 25   | 141   | 5.7   |
| 45-54 . . .        | 470,828  | 132,656                 | 1,097,324                    | 28   | 233   | 8.3   |
| 55-64 . . .        | 274,261  | 99,176                  | 1,355,755                    | 36   | 404   | 13.7  |
| 65 and older . . . | 133,888  | 79,251                  | 2,221,205                    | 59   | 1,659   | 28.0  |
| All ages . . .     | 2,995,724  | 826,466                 | 7,022,438                    | 28   | 234   | 8.5   |

NOTE.—This illustrative table is based upon the Manchester Unity experience during the five years 1893-97, published 1903, pages 21-139. This is the basis of the National Insurance Act, 1911.

18,624. In Table A. I show the necessity to obtain the age-distribution of the lives exposed to risk of sickness, of the number sick, of the weeks of sickness, &c.

18,625. This Table A. is based upon the Manchester Unity experience which has been adopted as the basis of the National Insurance Act, 1911. It sets out the elementary essentials of any investigations of sickness in any occupation. Lacking these essential data, no valid opinion can be formed as to the sickness incidence in this or in that occupational group.

18,626. In column (d), we observe that at middle-age the number of members sick per 100 members exposed

to risk rapidly increases. But the number of weeks of sickness begins largely to increase much earlier in life than middle-age; *see* column (e). It increases from age 20-24 upwards. At the earlier ages this is due to the increased duration of attacks of sickness, and at the later ages to the increased duration of attacks of sickness plus the increased number of attacks of sickness. Column (f) of Table A. shows how the duration of sickness per member sick increases throughout life.

18,627. As soon as these elementary considerations relating to sickness rates become known, it is at once apparent that when these data are lacking no valid opinion can be formed as to the incidence of sickness from this or that cause in this or that occupational group.

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

| 1906                       | 122   | 230   | 402                        | 632                      | 97  | 48  | 70                 | 60               |
| 1907                       | 105   | 176   | 402                        | 578                      | 83  | 36  | 70                 | 55               |
| 1908                       | 95  | 174   | 472                        | 646                      | 75  | 36  | 82                 | 61               |
| 1909                       | 134   | 166   | 387                        | 553                      | 106   | 34  | 67                 | 52               |
| 1910                       | 87  | 121   | 384                        | 505                      | 69  | 25  | 67                 | 48               |
| Decrease from 1900 to 1910 | 39  | 363   | 190                        | 553                      | 31  | 75  | 33                 | 52               |

NOTE.—During 1900-10, the yearly number of cases of sickness from lead poisoning in All Occupations fell from 1,058 to 505. That is, from 100 per cent. to 48 per cent., a fall of 52 per cent. of the number of cases in 1900. As, presumably, the number of men engaged in the above occupations increased during 1900-10, the decrease in the incidence of sickness from lead poisoning, per 100 men at risk, was even greater than is shown in the above Table.

18,629. But we may make some use of the reported cases of lead poisoning on page 170 of Cd. 5693, by tabulating them as in Table B. for the purpose of ascertaining whether these cases have increased or decreased during 1900-10. Of course, this throws no light upon the question of sickness rates among persons in occupations exposed to the risk of lead poisoning, because there are no data as to sickness arising from causes other than lead poisoning.

18,630. Table B. groups the facts in various occupations, all of which are exposed to the risk of sickness from lead poisoning. In each of these groups, and in all the groups combined, there has been a large decrease in the reported cases of sickness from lead poisoning during 1900-10. Some house-painters are included in one or more of these groups, although it is not possible to state certainly in which group. Perhaps the occupation, Paints and Colours plus Coach-building plus White Lead, is the group most likely to include house-painters, &c. But, in any case, the house-painters included in Table B. are only a small proportion of all house-painters.

18,631. In my evidence as to occupational mortality, it was shown that mortality in the occupation Plumber, Painter, Glazier, has decreased more largely than the decrease in mortality for Occupied Males in England and Wales. And in Table B. we see that as regards the number of reported cases of sickness from lead poisoning, the decrease has also been great. Taking all occupations, there were only 48 cases in 1910 to every 100 cases in 1900, i.e., a decrease of 52 per cent., column (h) of Table B.

18,632. Presumably the number of men in these occupations has increased during 1900-10. If so, the large decrease in the number of cases of sickness from lead poisoning, shown in Table B., would be even

larger than it is, relatively to the years of life exposed to risk. This result is a partial confirmation of the large decrease in the death-rates of occupation Plumber, Painter, Glazier, already mentioned.

18,633. As regards sickness from all causes in all occupations, I give the following facts taken from each of the principal investigations of sickness in this country during 1871-97.

18,634. Rate of Sickness per 100 Members per Year in Friendly Societies. All Ages.

|                                       | Weeks. |
|---------------------------------------|--------|
| Ancient Order of Foresters - 1871-75  | 136    |
| Registered Friendly Societies 1876-80 | 190    |
| Manchester Unity - - 1893-97          | 234    |

18,635. It would not, of course, be permissible to state these results for all ages, as above, unless the results for each age had also been examined. They are given merely as a broad indication of the large rise in sickness rates that set in during the last quarter of the nineteenth century. And these results for all ages are confirmed by the results for each age-group. This rise in sickness is still going on, as I find when investigating the sickness rates of friendly societies during recent years of the twentieth century.

18,636. Thus the large fall in Table B. in the number of cases of sickness from lead poisoning is a much more satisfactory result than the increase in sickness from all causes in all occupations that has occurred in friendly societies, and which is still going on.

18,637. Another feature that admits of examination of the wholly inadequate data available is the number of deaths from lead poisoning per 100 cases of sickness from lead poisoning.

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

## 18,638. TABLE C.

Comparing the Number of Deaths from Lead Poisoning, All Occupations, per 100 Cases of Sickness from Lead Poisoning, All Occupations, with the Number of Deaths from All Causes per 100 Cases of Sickness from All Causes.

| Yearly Number of Cases of Sickness from Lead Poisoning, and Yearly Number of Deaths from Lead Poisoning, All Occupations. In Factories and Workshops. [Cd. 5693, page 170.] |                    |         |   | Yearly Number of Cases of Sickness and Yearly Number of Deaths from all Causes. In all Occupations. Manchester Unity Experience, 1893-1897. [Pages 21, 139 of Manchester Unity Report.] |                    |         |  |
|---|--------------------|---------|---|---|--------------------|---------|--|
| Year.   | Cases of Sickness. | Deaths. | No. of Deaths per 100 Cases. $\frac{b \times 100}{a}$ | Age.  | Cases of Sickness. | Deaths. | No. of Death per 100 Cases. $\frac{e \times 100}{f}$ |
|   | (a)                | (b)     | (c)   |   | (d)                | (e)     | (f)  |
| 1900  | 1,058              | 38      | 3.6   | 16-19   | 29,203             | 368     | 1.3  |
| 1901  | 863                | 34      | 3.9   | 20-24   | 106,152            | 1,815   | 1.7  |
| 1902  | 629                | 14      | 2.2   | 25-34   | 212,382            | 4,783   | 2.3  |
| 1903  | 614                | 19      | 3.1   | 35-44   | 167,646            | 5,659   | 3.4  |
| 1904  | 597                | 26      | 4.4   | 45-54   | 132,656            | 6,711   | 5.1  |
| 1905  | 592                | 23      | 3.9   | 55-64   | 99,176             | 8,036   | 8.1  |
| 1906  | 632                | 33      | 5.2   | 65 and older  | 79,251             | 11,689  | 14.8   |
| 1907  | 578                | 26      | 4.5   |   |                    |         |  |
| 1908  | 646                | 32      | 5.0   |   |                    |         |  |
| 1909  | 553                | 30      | 5.4   |   |                    |         |  |
| 1910  | 505                | 38      | 7.5   |   |                    |         |  |
| 1900 to 1910  | 7,267              | 313     | 4.3   | All ages  | 826,466            | 39,061  | 4.7  |

NOTE.—During 1900-10, the mortality from lead poisoning in All Occupations was 4.3 deaths per 100 cases of sickness from lead poisoning in All Occupations. Namely, one death out of 23 cases of sickness.

In the Manchester Unity experience, the mortality from All Causes in All Occupations, at All Ages, was 4.7 deaths per 100 cases of sickness. Namely, one death out of 21 cases of sickness.

Thus, assuming an equal age-distribution in both instances, cases of sickness from lead poisoning are not quite so fatal as cases of sickness from All Causes.

Incidentally, column (f) emphasises the necessity to consider the factor of age-distribution in any investigation of sickness rates or of death-rates.

18,639. In Table C., based in part upon page 170 of Cd. 5693, it is shown that at All Ages and in All Occupations exposed to the risk of lead poisoning, 4.3 deaths occurred per year during 1900-10 to every 100 cases of sickness from lead poisoning. Side by side with these facts, I show the experience of the Manchester Unity. In All Occupations, at All Ages, in the Manchester Unity, 4.7 deaths from All Causes occurred per 100 cases of sickness from All Causes. Thus, upon the

assumption of identical age-distribution in both sets of data, the mortality from lead poisoning per 100 cases of sickness from lead poisoning is slightly less than the mortality from All Causes per 100 cases of sickness from All Causes, in the proportion of 4.3 to 4.7.

18,640. Inspection of column (f) of Table C. again shows the necessity to distinguish the age at which sickness or death occurs, for the number of deaths per 100 men sick increases rapidly throughout life.

## 18,641. TABLE D.

Showing the Number of Cases of Sickness from Lead Poisoning, and the Number of Deaths from Lead Poisoning among these Cases, in Various Occupations and in All Occupations. In Factories and Workshops.

| Year.        | Yearly Number of Cases of Sickness from Lead Poisoning, and yearly Number of Deaths from Lead Poisoning among these Cases. In various Occupations, and in all Occupations. [Cd. 5693, page 170.] |                |   |   |                |   |                    |                |   |                  |                |   |
|--------------|--|----------------|---|---|----------------|---|--------------------|----------------|---|------------------|----------------|---|
|              | Paints and Colours plus Coach Building.  |                |   | Paints and Colours plus Coach Building plus White Lead. |                |   | Other Occupations. |                |   | All Occupations. |                |   |
|              | No. of Cases.  | No. of Deaths. | No. of Deaths per 100 Cases. $\frac{b \times 100}{a}$ | No. of Cases.   | No. of Deaths. | No. of Deaths per 100 Cases. $\frac{e \times 100}{d}$ | No. of Cases.      | No. of Deaths. | No. of Deaths per 100 Cases. $\frac{h \times 100}{g}$ | No. of Cases.    | No. of Deaths. | No. of Deaths per 100 Cases. $\frac{k \times 100}{j}$ |
| (a)          | (b)  | (c)            | (d)   | (e)   | (f)            | (g)   | (h)                | (i)            | (j)   | (k)              | (l)            |   |
| 1900         | 126  | 6              | 4.8   | 484   | 12             | 2.5   | 574                | 26             | 4.5   | 1,058            | 38             | 3.6   |
| 1901         | 121  | 4              | 3.3   | 310   | 11             | 3.5   | 553                | 23             | 4.2   | 863              | 34             | 3.9   |
| 1902         | 109  | 1              | 0.9   | 252   | 2              | 0.8   | 377                | 12             | 3.2   | 629              | 14             | 2.2   |
| 1903         | 113  | 6              | 5.3   | 222   | 8              | 3.6   | 392                | 11             | 2.8   | 614              | 19             | 3.1   |
| 1904         | 81   | 5              | 6.2   | 197   | 7              | 3.6   | 400                | 19             | 4.8   | 597              | 26             | 4.4   |
| 1905         | 113  | 4              | 3.5   | 203   | 4              | 2.0   | 389                | 19             | 4.9   | 592              | 23             | 3.9   |
| 1906         | 122  | 7              | 5.7   | 230   | 14             | 6.1   | 402                | 19             | 4.7   | 632              | 33             | 5.2   |
| 1907         | 105  | 4              | 3.8   | 176   | 4              | 2.3   | 402                | 22             | 5.5   | 578              | 26             | 4.5   |
| 1908         | 95   | 3              | 3.2   | 174   | 6              | 3.4   | 472                | 26             | 5.5   | 646              | 32             | 5.0   |
| 1909         | 134  | 8              | 6.0   | 166   | 10             | 6.0   | 387                | 20             | 5.2   | 553              | 30             | 5.4   |
| 1910         | 87   | 7              | 8.0   | 121   | 8              | 6.6   | 384                | 30             | 7.8   | 505              | 38             | 7.5   |
| 1900 to 1910 | 1,206  | 55             | 4.6   | 2,535   | 86             | 3.4   | 4,732              | 227            | 4.8   | 7,267            | 313            | 4.3   |

NOTE.—As Table C. shows, in the Manchester Unity experience, All Occupations, the yearly number of deaths from All Causes per 100 cases of sickness from All Causes, at All Ages, was 4.7. This is a test figure for those in columns c, f, i, l, above, during 1900-10. Namely, 4.6, 3.4, 4.3, 4.3, assuming a similar age-distribution in all instances. But it is probable that some of the large fluctuations in columns c, f, i, l are due to material differences in the age-distribution of the facts. Sickness and death are essentially functions of age.

Mr. JOHN HOLT SCHOOLING.

[Continued.]

18,642. Table D. states the cases of sickness from lead poisoning and the deaths from lead poisoning in various occupations, with also the number of deaths per 100 cases of sickness. This table is included in order to show precisely the facts and the mode employed.

18,643. TABLE E.

The Yearly Number of Deaths per 100 Cases of Sickness yearly. Distinguishing Cases of Lead Poisoning in Various Occupations; &c.

The Yearly Number of Deaths per 100 Cases of Sickness Yearly.

| Year.        | Lead Poisoning. In Factories and Workshops. Cd. 5693, page 170. |   |                    |                  | All Causes. Manchester Unity, 1893-97. |                  |
|--------------|---|---|--------------------|------------------|--|------------------|
|              | Paints and Colours plus Coach Building.                         | Paints and Colours plus Coach Building plus White Lead. | Other Occupations. | All Occupations. | Age.                                   | All Occupations. |
|              | (a)   | (b)   | (c)                | (d)              | (e)                                    | (f)              |
|              | Deaths.   | Deaths.   | Deaths.            | Deaths.          |  | Deaths.          |
| 1900         | 4.8   | 2.5   | 4.5                | 3.6              | 16-19                                  | 1.3              |
| 1901         | 3.3   | 3.5   | 4.2                | 3.9              | 20-24                                  | 1.7              |
| 1902         | 0.9   | 0.8   | 3.2                | 2.2              | 25-34                                  | 2.3              |
| 1903         | 5.3   | 3.6   | 2.8                | 3.1              | 35-44                                  | 3.4              |
| 1904         | 6.2   | 3.6   | 4.8                | 4.4              | 45-54                                  | 5.1              |
| 1905         | 3.5   | 2.0   | 4.9                | 3.9              | 55-64                                  | 8.1              |
| 1906         | 5.7   | 6.1   | 4.7                | 5.2              | 65 and older                           | 14.8             |
| 1907         | 3.8   | 2.3   | 5.5                | 4.5              |  |                  |
| 1908         | 3.2   | 3.4   | 5.5                | 5.0              |  |                  |
| 1909         | 6.0   | 6.0   | 5.2                | 5.4              |  |                  |
| 1910         | 8.0   | 6.6   | 7.8                | 7.5              |  |                  |
| 1900 to 1910 | 4.6   | 3.4   | 4.8                | 4.3              | All ages                               | 4.7              |

NOTE.—Assuming identity of age-distribution in the various groups compared, the deaths from lead poisoning per 100 cases of sickness from lead poisoning are, for All Occupations, slightly fewer than the deaths from All Causes per 100 cases of sickness for All Causes.

But column (f) suggests that the large fluctuations in columns (a), (b), (c), (d) are probably due to material differences in the age-distribution of the facts.

18,644. Table E. sums up the results of Table D. as regards the yearly number of deaths from lead poisoning per 100 cases of sickness from lead poisoning in various occupations. The results are then compared with the number of deaths from All Causes per

100 cases of sickness from All Causes in the experience of the Manchester Unity.

18,645. The importance of age-distribution of the facts is again emphasised by column (f) of Table E.

18,646. TABLE F.

The Yearly Number of Cases of Sickness to One Death Yearly. Distinguishing Cases of Lead Poisoning in Various Occupations; &c.

The Yearly Number of Cases of Sickness to One Death Yearly.

| Year.        | Lead Poisoning. In Factories and Workshops. Cd. 5693, page 170. |   |                    |                  | Manchester Unity, 1893-97. All Causes. |                  |
|--------------|---|---|--------------------|------------------|--|------------------|

|              | (a)   | (b)   | (c)                | (d)              | (e)                                    | (f)              |
| 1900         | 21  | 40  | 22                 | 28               | 16-19                                  | 79               |
| 1901         | 30  | 28  | 24                 | 25               | 20-24                                  | 59               |
| 1902         | 109   | 126   | 31                 | 45               | 25-34                                  | 44               |
| 1903         | 19  | 28  | 36                 | 32               | 35-44                                  | 30               |
| 1904         | 16  | 28  | 21                 | 23               | 45-54                                  | 20               |
| 1905         | 28  | 51  | 20                 | 26               | 55-64                                  | 12               |
| 1906         | 17  | 16  | 21                 | 19               | 65 and older                           | 7                |
| 1907         | 26  | 44  | 18                 | 22               |  |                  |
| 1908         | 32  | 29  | 18                 | 20               |  |                  |
| 1909         | 17  | 11  | 19                 | 18               |  |                  |
| 1910         | 12  | 15  | 13                 | 13               |  |                  |
| 1900 to 1910 | 22  | 29  | 21                 | 23               | All ages                               | 21               |

NOTE.—Assuming identity of age-distribution in the various groups compared, there are slightly more cases of sickness from lead poisoning to one death from lead poisoning for All Occupations, than there are cases of sickness from All Causes to one death from All Causes.

But column (f) suggests that the large fluctuations in columns (a), (b), (c), (d) are probably due to material differences in the age-distribution of the facts.

9. May 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued.]

18,647. Table F. shows the yearly number of cases of sickness from lead poisoning to one death yearly from lead poisoning in various occupations. The results are then compared with the yearly number of cases of sickness from All Causes to one death from All Causes in the Manchester Unity. At All Ages, and in All Occupations, the difference between the two groups is slight, in the proportion of 23 to 21.

18,648. The proportion between number of cases of sickness and number of deaths, as illustrated by the number of cases of sickness to one death, is not so comprehensive of the facts as is the proportion of weeks of sickness to one death. The latter ratio takes into the account the duration of sickness which is necessarily omitted when only cases of sickness are regarded. The results on page 170 of Cd. 5693 give no information as to duration or weeks of sickness from lead poisoning, and thus no comparison can be made.

18,649. TABLE G.

Showing the Yearly Number of Weeks of Sickness from All Causes to One Death Yearly from All Causes, according to the first and the last investigations of the Manchester Unity Experience, 1846-48 and 1893-97. All Occupations.

| Age.         | Manchester Unity Experience. |          |
|--------------|------------------------------|----------|
|              | 1846-48.                     | 1893-97. |
|              | (a)                          | (b)      |
|              | Weeks.                       | Weeks.   |
| 16-19        | 72                           | 254      |
| 20-24        | 92                           | 214      |
| 25-34        | 96                           | 190      |
| 35-44        | 102                          | 169      |
| 45-54        | 109                          | 164      |
| 55-64        | 116                          | 169      |
| 65 and older | 139                          | 190      |
| All ages     | 101                          | 180      |

NOTE.—The above results embody alterations in the death-rate, in the rates of cases of sickness, in the duration of sickness.

The main cause of the large increase in column (b) is the increase in sickness experienced in friendly societies, accompanied by a falling death-rate.

Column (b) emphasises the need to know the age-distribution of all the facts before an opinion can be formed as to the incidence of sickness in any occupational group.

18,650. But in Table G. I show the results relating to the yearly number of weeks of sickness from All Causes to one death from All Causes, now computed for the first and for the last investigation of the sickness and mortality of the Manchester Unity.

18,651. The highest results are those which relate to the most recent years, namely, the period 1893-97. These high results are mainly due to the increase of sickness experienced by the friendly societies of this country, accompanied by a falling death-rate.

Summarisation.

18,652. Although, as has been stated, no data are available by which to measure the incidence of sickness from lead poisoning, or the sickness from All Causes that occurs among house-painters or among occupations exposed to the risk of lead poisoning, as compared with the sickness that obtains among the general population, yet the data available do suffice to show a large reduction in the number of cases of

sickness from lead poisoning during 1900-10. Also, there is presumptive evidence connected with death rates that the sickness from All Causes among house-painters, &c., is not in excess of the sickness from All Causes among the general population. Further, it has been shown that the cases of sickness from lead poisoning are not quite so fatal as the cases of sickness from All Causes.

18,653. I may mention that during the whole of my experience, covering the years 1880-1912, I have never been requested to prepare special rates of premium for sickness assurance relating to house-painters, &c. Special rates are sometimes called for in other occupations, such as miners, agricultural workers, &c. The modern friendly society, of a good class, is quite an efficient institution, with most carefully-kept registers that are closely scrutinised.

18,654. If the occupation house-painter, &c. is exposed to any undue rate of sickness, I am of opinion that I should have been called upon at some time during 1880-1912 to prepare special rates of sickness premiums for this occupation.

18,655. Beyond these statements I am not able to go for lack of data.

18,656-7. If this question of sickness in occupations exposed to the risk of lead poisoning is to be examined upon a valid basis, I can suggest no better mode than to induce a large friendly society, or a number of small friendly societies, to fill up a large number of experience cards such as that shown here.

Specimen Card.

| PERIOD OF OBSERVATION, 1907-1911.            |                             |                             |                    |                  |

| 1908   | 40                          | —                           | 1 4                | 1 4              |
| 1909   | 41                          | —                           | —                  | —                |
| 1910   | 42                          | —                           | 31 0               | 31 0             |
| 1911   | 43                          | 37 2                        | —                  | 37 2             |
| Total sickness                               |                             | 37 2                        | 32 4               | 70 0             |

NOTE.—This is a specimen card, imaginary as to the facts stated upon it, that if filled up for a large number of house-painters, &c., would enable trustworthy knowledge to be obtained as to the rates of sickness, &c., occurring among house-painters, &c. The top right-hand corner is cut off to facilitate the subsequent processes of sorting the cards, &c.

18,658. Each of these cards, measuring about 6 by 3½ inches, relates to one life. By means of the data recorded upon these cards, if they can be obtained, I should be able to investigate the rates of sickness, &c., among house-painters, &c., upon a valid basis, see, for instance, Table H., which sets out some of the absolutely essential data.

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued.]

18,659. TABLE H.

SPECIMEN TABLE.—To be based upon the data obtained by the Cards shown above, relating to the Actual and the Expected Sickness among House-Painters, &c., during the five years 1907-11. The Expected Results are based upon the Standard Experience of the Manchester Unity, 1893-97.

| Age.         | No. of Years of Life exposed to Risk of Sickness. | Standard Rate of Sickness per Member per Year (Weeks). | Ex-pected No. of Weeks of Sick-ness. (a × b) | Actual No. of Weeks of Sick-ness. | Excess of Actual over Ex-pected Weeks of Sick-ness. (d - e) | Excess of Expected over Actual Weeks of Sick-ness. (e - d) | Percentage of Actual to Expected Weeks of Sickness. |            | Actual Weeks of Sickness. Distinguishing Sickness from Lead Poisoning. |               |                     |
|--------------|---|--|--|-----------------------------------|---|--|---|------------|--|---------------|---------------------|
|              |   |  |  |                                   |   |  | Expected.   | Actual.    | Lead Poisoning.  | Other Causes. | All Causes. (i + j) |
|              | (a)   | (b)  | (c)  | (d)                               | (e)   | (f)  | (g)   | (h)        | (i)  | (j)           | (k)                 |
| 16-19        |   | .92  |  |                                   |   |  | 100   |            |  |               |                     |
| 20-24        |   | .90  |  |                                   |   |  | 100   |            |  |               |                     |
| 25-34        |   | 1.01   |  |                                   |   |  | 100   |            |  |               |                     |
| 35-44        |   | 1.41   |  |                                   |   |  | 100   |            |  |               |                     |
| 45-54        |   | 2.33   |  |                                   |   |  | 100   |            |  |               |                     |
| 55-64        |   | 4.94   |  |                                   |   |  | 100   |            |  |               |                     |
| 65 and older | Not known.  | 16.59  | Not known.                                   | Not known.                        | Not known.  | Not known.   | 100   | Not known. | Not known.   | Not known.    | Not known.          |
| All ages     |   | —  |  |                                   |   |  | 100   |            |  |               |                     |

NOTE.—This is one of various Tables that would be based upon the data to be obtained by means of the Cards shown on page 595.

Inspection of this Table will show the impossibility of forming any valid opinion as to the incidence of sickness from lead poisoning, and from All Causes among house-painters, &c., in the absence of the kind of data here described.

18,660. In the Preliminary Tables (subject to correction) relating to lead poisoning, &c., in factories and workshops for the year 1911 (Cd. 6072), the cases of sickness from lead poisoning are stated at 669 (with 37 deaths occurring); as compared with 505 cases of sickness (with 38 deaths occurring), for the year 1910. This number of 669 cases in 1911 is the highest since 1901. (See Table D., page 593.) But as no age-distribution is stated, it is of course impossible to know to what extent the increase in 1911 is due to a difference in age-distribution of the facts as between 1910 and 1911. (See the note to Table D., page 593.)

18,661. These Preliminary Tables for 1911 also state that 263 cases of sickness from lead poisoning (with 48 deaths occurring) were reported among house-painters and plumbers not employed under the Act, in addition to the 669 cases above-mentioned. The corresponding figure for 1910 appears to be 232 cases (with 35 deaths occurring) among house-painters and plumbers. (See page 170 of Cd. 5693.)

18,662. But these scanty data, lacking all the essential qualities for sound investigation, are really useless.

18,663. It should be specially noted that the area of observation upon which Tables B., C., D., E., F., are based consists of the reported cases of lead poisoning "occurring or contracted in a factory or workshop." Thus, although this area of observation includes a considerable number of persons exposed to the risk of lead poisoning, it is probable that the conditions of their exposure to risk of lead poisoning are more severe than the conditions of exposure to risk of lead poisoning that attach to the work of a house-painter. Moreover, the number of house-painters engaged in factories and workshops within the meaning of the Act is, of course, much fewer than the number of house-painters engaged outside of factories and workshops. Thus, quite apart from the impossibility [for the reasons already stated] of using the data herein shown, or any other data in the Reports upon Factories and Workshops, as any guide to the incidence of sickness obtaining among persons exposed to the risk of lead poisoning, it is additionally obvious that these data, which relate to an area of observation limited to

factories and workshops, are not applicable to house-painters as a body. This objection would hold good even if the data herein shown were of a kind that admits of the investigation of rates of sickness from lead poisoning and from all causes obtaining among persons exposed to risk of lead poisoning in factories and workshops. But, as has been shown, the data available are wholly inadequate to enable any such investigation to be made.

18,664. At present no valid basis exists by which to form any sound opinion as to the incidence of sickness among house-painters, &c. Certainly, no sound opinion can be formed upon this matter by examining the facts contained in the Report of the Chief Inspector of Factories and Workshops. The latter facts merely admit of the minor and quite subsidiary elucidations herein contained, and which throw no light upon the incidence of sickness obtaining among persons exposed to the risk of lead poisoning.

#### Occupational Mortality.

(Addendum.)

18,665. In my evidence as regards occupational mortality, I show in Table J. the usual actuarial mode of testing the actual number of deaths in any body of facts, by means of comparing these actual deaths with the number of deaths to be expected upon the basis of this or that standard of mortality employed as a test. The test in Table J. is the mortality of all occupied males in the industrial districts of England and Wales. This standard is, in my opinion, a fair test of the mortality in Occupation (64), Painters, Plumbers, and Glaziers.

18,666. But as this matter of the standard test to be employed is, and must be, a matter of opinion, I now show four additional tests of the mortality in Occupation (64). These four additional tests are shown in Tables K., L., M., N., and the four standards for these tests are as follows:—

TABLE K.—All Occupied Males, England and Wales. This includes all the professional and

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued.]

commercial males who are not exposed to any "industrial risk" of death. And in my opinion this is not a suitable test for the industrial Occupation (64).

TABLE L.—All Occupied Males, London. This standard also includes all professional and commercial males in London who are not exposed to any "industrial risk" of death. In my opinion this is not a suitable test for the industrial Occupation (64).

TABLE M.—This relates to the standard "Paper-hanger, Plasterer, Whitewasher." It is one of the six occupations in England and Wales having an abnormally low death-rate, and, moreover, this standard includes only 132,000 years at risk. For these reasons this standard is not, in my opinion, a suitable test to apply to Occupation (64), the latter occupation having an exposure of 664,000 years at risk, and not being one of the six occupations with an abnormally low death-rate.

TABLE N.—This test, like Table M., relates merely to a relatively small group of lives in the building trade. This standard includes only 101,000 years of life at risk, and it has a rather high rate of mortality. For these reasons I do not consider that this standard is a suitable test of the mortality in Occupation (64).

18,667. As regards the death-rates in Occupation (64), Painter, Plumber, Glazier, it should be noted that a considerable proportion of the "years at risk" relates to plumbers.

18,668. Referencé to page 194 of Cd. 1523 and comparison with page 106 of Cd. 2619 will show that of the 664,251 "years at risk" in Occupation (64), no fewer than 189,585 relate to plumbers.

18,669. The 664,251 "years at risk" in Occupation (64) are made up as follows:—

|                        |         | Per cent. |
|------------------------|---------|-----------|
| Painters and glaziers  | 474,666 | 71        |
| Plumbers               | 189,585 | 29        |
| Total, Occupation (64) | 664,251 | 100       |

18,670. The deaths in Occupation (64) cannot be thus separated. It is probable that the death-rate of plumbers arising from lead poisoning is in excess of the death-rate of painters arising from lead poisoning. If this be the case, the death-rates herein shown for Occupation (64) are in excess of the death-rates of painters; although, as has been shown, the death-rates in Occupation (64) are in no way abnormally high. This consideration, namely, the fact that Occupation (64) includes a large proportion of plumbers, is further evidence that the death-rate of painters is not high.

## 18,671. TABLE K. (see Table J.).

Showing the Actual and the "Expected" Number of Deaths during 1900-02 in Occupation (64)  
(Plumber, Painter, Glazier, page 106 of Cd. 2619. Occupied Group).

Standard Data = All Occupied Males, England and Wales (page 3 of Cd. 2619). Relating to  
29½ millions of lives at risk.

| Ages.        | Years of Life exposed to Risk of Death, in Occupation (64). (Page 106.)<br>(a) | Mean Annual Death-rate per 1,000 at Risk all Occupied Males, England and Wales. (Page 3.)<br>(b) | Actual and Expected Number of Deaths in Occupation (64) during 1900-02. |  |   |   | Percentage of Actual to Expected Number of Deaths. |  |
|--------------|--|--|---|--|---|---|--|--|
|              |  |  | Expected Number of Deaths.<br>( $\frac{a \times b}{1,000}$ )<br>(c)     | Actual Number of Deaths.<br>(Page 106.)<br>(d) | Shortage of Actual Deaths in Occupation (64).<br>(c - d)<br>(e) | Excess of Actual Deaths in Occupation (64).<br>(d - c)<br>(f) | Actual.<br>( $\frac{d \times 100}{c}$ )<br>(g)     | Expected.<br>( $\frac{c \times 100}{e}$ )<br>(h) |
| 15-19        | 95,316   | 2.44   | 233   | 193  | 40  | —   | 83   | 100  |
| 20-24        | 101,193  | 4.41   | 446   | 381  | 65  | —   | 85   | 100  |
| 25-34        | 168,345  | 6.01   | 1,012   | 941  | 71  | —   | 93   | 100  |
| 35-44        | 138,471  | 10.22  | 1,415   | 1,600  | —   | 185   | 113  | 100  |
| 45-54        | 97,206   | 17.73  | 1,724   | 2,074  | —   | 350   | 120  | 100  |
| 55-64        | 47,832   | 31.01  | 1,483   | 1,709  | —   | 226   | 115  | 100  |
| 65 and older | 15,888   | 88.39  | 1,404   | 1,283  | 121   | —   | 91   | 100  |
| All ages     | 664,251  | —  | 7,717   | 8,181  | 297   | 761   | 106  | 100  |

Based upon Cd. 2619, pages 3 and 106.

NOTE.—Upon the basis of the above standard data, viz., All Occupied Males, England and Wales, the actual deaths in Occupation (64) were, for "All Ages," 6 per 100 above the standard. At four of the seven age-groups the number of deaths in Occupation (64) was below the standard number of deaths. It should be noted that the above standard "All Occupied Males, England and Wales," includes all the professional and commercial males who are not exposed to any industrial risk of death. Thus the above standard is probably not a suitable test for the industrial Occupation (64). It is a test that is too severe.

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

| 55-64        | 47,832   | 34.01   | 1,627   | 1,709                                | —   | 82  | 105  | 100   |
| 65 and older | 15,888   | 73.75   | 1,172   | 1,283                                | —   | 111   | 109  | 100   |
| All ages     | 664,251  | —   | 8,633   | 8,181                                | 645   | 193   | 95   | 100   |

Based upon Cd. 2619, pages 5 and 106.

NOTE.—Upon the basis of the above standard data, viz., "All Occupied Males, London," the actual deaths in Occupation (64) were, for "All Ages," 5 per 100 below the standard. At five of the seven age-groups, the number of deaths in Occupation (64) was below the standard number of deaths. It should be noted that the above standard, "All Occupied Males, London," includes all the professional and commercial males who are not exposed to any industrial risk of death. Thus the above standard is probably not a suitable test for the industrial Occupation (64). The fact that Occupation (64) is able to stand the above test supplies evidence that the mortality in Occupation (64) is not in any way excessive.

18,673. TABLE M. (see Table J.).

Showing the Actual and the "Expected" Number of Deaths during 1900-02 in Occupation (64) (Plumber, Painter, Glazier, page 106 of Cd. 2619. Occupied Group).

Standard Data = Paperhanger, Plasterer, Whitewasher (Occupied, England and Wales), page 105 of Cd. 2619. Relating to only 132,000 lives at risk.

| Ages.        | Years of Life exposed to Risk of Death in Occupation (64). (Page 106.) | Mean Annual Death-rate per 1,000 at Risk, Paperhanger, &c. (Page 105.) | Actual and Expected Number of Deaths in Occupation (64) during 00-1902. |                                      |   |   | Percentage of Actual to Expected Number of Deaths. |   |
|--------------|--|--|---|--------------------------------------|---|---|--|---|
|              |  |  | Expected Number of Deaths. $\left(\frac{a \times b}{1,000}\right)$      | Actual Number of Deaths. (Page 106.) | Shortage of Actual Deaths in Occupation (64). $(e-d)$ | Excess of Actual Deaths in Occupation (64). $(d-e)$ | Actual. $\left(\frac{d \times 100}{e}\right)$      | Expected. $\left(\frac{e \times 100}{e}\right)$ |
|              | (a)  | (b)  | (c)   | (d)                                  | (e)   | (f)   | (g)  | (h)   |
| 15-19        | 95,316   | 1.52   | 145   | 193                                  | —   | 48  | 133  | 100   |
| 20-24        | 101,193  | 3.44   | 348   | 381                                  | —   | 33  | 109  | 100   |
| 25-34        | 168,345  | 4.07   | 685   | 941                                  | —   | 256   | 137  | 100   |
| 35-44        | 138,471  | 11.52  | 1,595   | 1,600                                | —   | 5   | 100  | 100   |
| 45-54        | 97,206   | 19.18  | 1,864   | 2,074                                | —   | 210   | 111  | 100   |
| 55-64        | 47,832   | 32.53  | 1,550   | 1,709                                | —   | 153   | 110  | 100   |
| 65 and older | 15,888   | 72.18  | 1,147   | 1,283                                | —   | 136   | 112  | 100   |
| All ages     | 664,251  | —  | 7,340   | 8,181                                | —   | 841   | 111  | 100   |

Based upon Cd. 2619, pages 105 and 106.

NOTE.—Upon the basis of the above standard data, viz., Paperhanger, Plasterer, Whitewasher, the actual deaths in Occupation (64) were, for "All Ages," 11 per 100 above the standard. At all the seven age-groups the number of deaths in Occupation (64) was above the standard number of deaths. It should be noted that the above standard "Paperhanger, Plasterer, Whitewasher" is one of the six occupations in England and Wales having an abnormally low death-rate. See page 4 of my evidence on occupational mortality. The cause of this abnormally low death-rate is not known. It may be due to the relatively small number of years of life at risk, only 132,000. The above test is here included, although it is not satisfactory to use as a standard a body of facts that is much smaller than the body of facts to be tested.

| 55-64        | 47,832  | 34.70  | 1,660   | 1,709                                | —   | 49  | 103  | 100   |
| 65 and older | 15,888  | 92.82  | 1,475   | 1,283                                | 192   | —   | 87   | 100   |
| All ages     | 664,251   | —  | 8,867   | 8,181                                | 743   | 57  | 92   | 100   |

Based upon Cd. 2619, pages 106 and 110.

NOTE.—Upon the basis of the above standard data, viz., Wood Turner, Cooper, &c., the actual deaths in Occupation (64) were, for "All Ages," 8 per 100 below the standard. At five of the seven age-groups the number of deaths in Occupation (64) was below the standard number of deaths. It should be noted that the above standard "Wood Turner, Cooper, &c.," has a rather high death-rate, the cause of which is not known. It may be due to the relatively small number of years of life at risk, only 101,000. The above test is here included, although it is not satisfactory to use as a standard a body of facts that is much smaller than the body of facts to be tested.

18,675. (Chairman.) The first part of your proof deals with the mortality in the occupational group of plumbers, painters, and glaziers, as compared with the mortality in other occupations?—Yes.

18,676. Before going into any detail with regard to this, do I understand that you wish to draw the deduction that plumbers, painters, and glaziers, as a class, are not far removed from the average as regards their mortality from all diseases?—Well, I would not word it quite in that way, because I do not wish to draw any deduction. It is merely that an examination of the facts has caused me to form the opinion that it is not an abnormal rate of mortality, but I do not wish to draw the deduction. The deduction has come out of my examination.

18,677. You admit, of course, that there are a certain number of deaths from lead poisoning and diseases which are accelerated by exposure to lead?—Yes, certainly.

18,678. Then, if we could safeguard the painter against all risk of lead poisoning, do you suggest that his occupation might be more healthy than the average worker's occupation?—No, I do not think I would say that. So far as I can gather from the records of the Registrar-General, although the occupation (64) "plumber, painter, glazier" has a much higher mortality from lead poisoning than other occupations, so far as I know even then the mortality from lead poisoning is relatively trivial. It does not seem appreciably to affect the death-rate so far as I can judge. We must bear in mind that in all industrial occupations, or in most of them, there is an industrial risk, and lead poisoning appears to be the industrial risk of occupation (64). I do not think I would say that, if we could eliminate the lead-poisoning risk, therefore they would be much healthier. The influence of lead poisoning is too small as far as I can see.

18,679. But, small as it may be, they would benefit by the removal of it?—They would benefit, but I understood your question to be, would they be much more healthy if we could eliminate it. You rather emphasised that. I am qualifying my reply to your question, or being careful about it, because I do not consider the

risk of lead poisoning, as shown here in the Registrar-General's returns sufficient, taking the recorded deaths, to make any very large difference. I think I show what the difference is. It would make it better, certainly.

18,680. But, however small the difference may be, if that difference were eliminated it would be better for the painter?—I should think so. I do not really know the exact diseases that it affects because I am not a medical man, but I should say that it would be better. But they have to die from something if they do not die from lead poisoning.

18,681. Surely you do not put that forward as a reason why lead poisoning should be allowed to continue?—No; I am agreeing with your deduction—that if lead poisoning could be eliminated, it would to some extent reduce the mortality, but I do not wish to be interpreted as saying that it would greatly reduce it or bring it much below the average, or anything of the sort.

18,682. I note that you confine yourself largely to a consideration of death-rates per thousand living in each age-group?—Yes, as far as possible, so as to get the age distribution. That is very important.

18,683. The study of such figures must be combined with a careful consideration of the age distribution, must it not?—I think so. It is most important, so as to get the age distribution for lives exposed to the risk and the age distribution of the deaths that occur.

18,684. Would you say that the whole question is very much affected by a consideration of the average age at which workers enter upon employment in the occupation in question?—I do not know. I have not studied that. I do not think I would like to give an opinion off-hand about that. Some of these questions are exceedingly subtle; I do not mean that they are asked in a subtle way, but they have a very subtle result on the statistics.

18,685. I will put it in this way, then. If a painter enters his occupation at an earlier or later average age than the worker in some other occupation, a comparison of the death-rates per thousand living in each age-group would not give a true picture of the risks

P p 4

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued.]

attendant on the two occupations, would it?—There I should beg to differ, for this reason: as to a painter entering 10 or 15 years later on the average, or earlier, than a worker in some other occupation, I cannot say anything; but, taking your point, if they were correctly observed, and they are approximately observed in the Registrar-General's returns, so long as you get your years of life exposed to risk at any age (it does not matter what age) and your deaths at that age, you get your correct comparison of death-rate at that particular group of age with any other occupation at that particular group of age. The point you put, whether the age at which they enter on their occupation would affect the mortality, if I may say so, does not hold water, because it does not matter.

18,686. (*Dr. Collis.*) Yes, surely it matters?—No, not if the age distribution is taken, I think.

18,687. From the medical point of view, if a man starts being exposed to a certain poison at 15 and reaches the age of 30, it will have had 15 years' effect upon him; whereas if the exposure commenced at 29 he would only have had one year's exposure?—There might be something in that from a medical point of view, but I understood the question to be put not from the medical point of view. I do not know anything about that.

18,688. (*Chairman.*) I had in my mind the medical aspect?—I cannot answer from the medical point of view. I should say that there would be something in it, but I cannot possibly answer from a medical point of view.

18,689. Is there not something in it from an actuarial point of view?—There is nothing in it from the actuarial point of view. You would not possibly know actuarially, if he entered a friendly society, or an insurance company, whether he had been exposed to the risk of lead poisoning that you mention. I should say that from the medical point of view it might have some effect, but I do not know.

18,690. But it must have an effect?—If there is any danger in the inhalation of lead at all from the medical point of view, it must be so. The man's life might be affected injuriously before he came under actuarial risk of exposure. There I agree with you, but I did not interpret your question at first in that sense. What the nature or amount of it would be, I cannot say.

18,691. In paragraph 18,575 of your proof you state that the occupation of plumber, painter, and glazier is more exposed to plumbism than are many occupations which have their own special risks?—Yes.

18,692. You then proceed to say "But despite this fact the death-rates in this occupation are by no means unduly high"?—Yes.

18,693. I can only suggest again that, if you eliminated the lead poisoning, the death-rates in the occupation of plumber, painter, and glazier would not be as high as they are to-day?—No, I should say not. I would be certainly inclined to agree with that. It would not make much difference. You must bear in mind that whether they die from lead poisoning or whether they do not die from lead poisoning, they have to die. Do not forget that. I am inclined to agree with your point.

18,694. Therefore, to follow my point, the death-rates for painters are, in the ordinary sense, unduly high?—Yes, in that sense it would be correct to say that they are unduly high to the extent of the lead poisoning. This paragraph of mine which you quoted, which rather tends to contradict the last statement of mine, but not really, takes it that each of these industries has its own industrial risk. If you eliminate the industrial risk from all industries, including the industrial risk of plumbism, then I agree that it would be unduly high to the extent of the risk of lead poisoning.

18,695. I take it that you have used the expression "by no means unduly high" in a purely statistical sense, meaning that they are not much higher than the average?—Yes, quite so. That is precisely what I mean. I should be perfectly disposed to agree with your interpretation, but not to be understood to say

that I consider them unduly high in a statistical sense.

18,696. In your Table C, paragraph 18,579, you show that amongst plumbers, painters, and glaziers, the death-rates from plumbism, taking all these, is one fifty-fourth part of the death-rate from all causes?—Yes, according to the Registrar-General's figures.

18,697. To translate that into simpler language it means that of every 54 painters, plumbers, and glaziers who die, only 53 would die if there were no exposure to risk of lead poisoning?—I should think that that would be an accurate way of putting it, but one does not like quite to say certainly that it would, because one knows that there are so many pit-falls awaiting one. But, certainly, your last statement strikes me as a correct statement.

18,698. This takes no account of the increased mortality from Bright's disease and nervous and other diseases, due to exposure to lead, although it cannot be certified as lead poisoning, because of the normal liability of men to Bright's disease and nervous diseases?—It takes simply plumbism into account. If there is any mortality caused by lead poisoning which would not be certified as plumbism, then there should be other things included as plumbism. I do not know whether it is so or not.

18,699. Even if we take that one death of every 54 which you admit is directly due to plumbism, you would not, as a humane man, say that nothing should be done to save that one man in 54?—No, I suppose I should not. I was not looking at it actually from the humane point of view. I was only looking at it from a cold-blooded point of view, to get at the inside of the question.

18,700. But we here are looking at it from the humane point of view?—A very good way to look at it too. You must forgive me for not doing so. I am a little puzzled over this thing. I feel strongly disposed to agree with what you say that on the surface, according to the Registrar-General's returns, it looks as if one death in 54 is caused by plumbism. But I wish to be rather guarded about that, because I know from many years' experience of these things, especially when you have not the original data, that it is rather risky to say yes to a question like that. It looks perfectly safe, but when you come to investigate it afterwards you find that you have fallen into some pit-fall. There are so many pit-falls in this kind of work. That is why I qualify what I say.

18,701. You appreciate the standpoint of the Committee?—Yes, I quite appreciate that.

18,702. And that we must do something to save that one life?—Presumably. I do not say for a moment that plumbism saves a man from something else. But if you look at the table, you find that occupation 64 has a remarkably low death-rate, from some very pregnant causes of disease that kill people in other occupations. It is impossible for me to say that they are saved from other causes of death.

18,703. If it is true that one in 54 dies from plumbism, we ought to try to save that one?—Yes, being careful not to drive him to death from drink, or unemployment, or something else.

18,704. Now, in the second part of your proof entitled "Occupational sickness," you lay stress on the absence of reliable statistics?—Yes.

18,705. You are not in possession of any of the death statistics of the painters' societies, are you?—No, I am not.

18,706. As this Committee have been supplied with the certificates showing the cause of death in the case of every member who has died in the two leading societies of the United Kingdom for a number of years past, you will, of course, agree that statistics based on those returns must carry great weight?—Yes, I should say so, if they are properly collated in the first instance, and properly considered, and if they have age distribution in them, and the period of exposure to risk.

18,707. In paragraph 18,616 and elsewhere, you allude to the possibility that the number of deaths from lead poisoning have been over-stated?—There

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued.]

are some statements quoted there to the effect that they may be over-stated. I do not know myself; it is not my own opinion.

18,708. You are no doubt aware that in all industries, a number of cases of lead poisoning escape diagnosis and notification as such?—I do not know about the medical side of it. I do not dispute the statement, because I do not know anything about that part of it, one way or the other.

18,709. What reason have you for believing that the number of cases which ought to be regarded as lead poisoning and are wrongly ascribed to some other cause should be less than the number of cases which are certified as lead poisoning when they ought to be put down to some other cause?—I do not know that I do believe that, and I do not think I have any reason for believing it. I think that those last two questions are perhaps a little bit inclined to magnify the effect of what I say. I am simply quoting here, am I not, mainly from Dr. Goadby's evidence? I have no reason for making that statement on my own account.

18,710. In Table B., in the second part of your proof, you give figures showing the cases of lead poisoning in factories and workshops?—Yes, that is so.

18,711. In column (d) you take all occupations; in column (b) you take the occupations of paints and colours, coach-building and white lead?—Yes.

18,712. For what reason have you so divided the occupations?—It is some time since I did it. As far as I know I did it for the ordinary actuarial purpose of comparing the class that I was asked to look at, namely, painters, people using paint brushes and paints and so on with other occupations. I should say that the data is defective from what I remember from reading factory reports. All occupations could not be considered in the light that all occupations in the death report could be considered. Speaking from memory, this is a more restricted lot of data, and it is all that are available, but it is not certainly such a big group as in the death report which covers the whole population of England. I am merely speaking from memory, but to amplify my reply to your question, the reason was a perfectly obvious one—that I wanted a standard by which to compare the group I was asked to investigate, namely, painters.

18,713. Why did you mix up paints and colours, coach builders and white lead all in the same group?—I merely took out those because I thought that they would be the most likely to be the group coming in that occupation 64. I know that it is not correct, but then you see we are dealing with defective data.

18,714. Did you prepare this information specially for this Committee?—Yes, the whole of it.

18,715. At whose instigation?—Messrs. White and Leonard, solicitors.

18,716. The solicitors acting for the white lead corrodors?—Or for the London Chamber of Commerce—I do not know which. They asked me (without in any way asking me to say one thing or the other), "Will you investigate the matter?"

18,717. You quite understand that the fact of grouping together paints and colours, coach builders and white lead rather confuses the issue for the purposes of this Committee?—I am sorry that that should be so. It had not occurred to me that it does do so, but I might say, as I think I say somewhere else in regard to the sickness report, that all these "sickness" facts are practically worthless, in my opinion. I think it shows rather a low rate. I do not attach any importance to any of this sickness business because the data is so wholly lacking in all the essentials for proper investigation, so much so that I consider all this latter part useless.

18,718. Have you considered how the curve representing cases in all occupations compares with the sectional curves showing (1) cases of lead poisoning in all occupations for which special legislation has been introduced, and (2) those for which no special legislation has been introduced?—No, I have not. As far

as I know I had not the material for it. I was terribly short of material.

(A diagram was shown to the witness.)

(Witness.) These are cases of lead poisoning without any age distribution, I suppose?

18,719. Yes?—As I say in the report, I consider it perfectly useless to compare sickness or death without age distribution. It is so much a function of age in case of sickness.

18,720. If you compare those sectional curves, you will note that the marked reduction in total lead poisoning is almost entirely due to the much more rapid reduction of cases in what I may term the regulated trades, while the incidence of lead poisoning in the non-regulated trades has remained practically stationary?—I have not investigated this, and I am bound to say that I do not regard any investigation made of sickness that ignores age distribution as worth making. That is borne in upon me by a great deal of experience in this kind of thing.

18,721. Do you think that all the legislation in the last few years affecting lead workers has been useless?—Well, I do not know what the legislation has been, you see; but I do say this, speaking quite seriously about it—as I go on to say later—I think that unless you take age distribution into account in sickness, you really cannot arrive at sound actuarial results about it. I really do not think you can. If you would like me to illustrate that I could refer you to a table. I think that my point is very important. I do not want in the least to pooh-pooch this chart; no doubt it is very interesting. I can hardly be expected to deny or confirm anything about it, but it does not take age distribution into account. It is a very serious defect in the data, not in the method of working, of course.

18,722. The practical question to us would be, if the incidence of lead is dangerous to the workman, and everyone admits that, the removal of it must be beneficial to the workman?—I think that everyone must admit that. It is obviously so.

18,723. That is really the only question we have to consider?—We obviously must admit that. If it really is a thing that is seriously injurious then it should be removed, but as far as I have been able to gather from the mortality it has not borne itself into my mind that it is so, and as regards the exceedingly defective data which I have been able to get with regard to sickness I have nothing that throws any light upon it. That is my difficulty.

18,724. Have you the same material to work upon that the Home Office has in compiling their figures?—That I do not know. I have only the supplement to the 65th Annual Report and various reports of Inspectors of factories and workshops. In the latter part of the Sickness Report I sketched out the ideal kind of data that I would like to get. The card I show there is the kind of thing one would like. I have drafted out a specimen card to enable one to get at the bottom of this. I wrote to the Manchester Unity people.

18,725. In paragraph 18,630 you say: "Perhaps the occupation of paints and colours plus coach building plus white lead is the group most likely to include house-painters"?—Yes, I do say that.

18,726. Now house-painters are not included under the Factory Act; therefore, you would not expect any house-painters to be included in the figures that you give, would you?—No, I know; and I admit that it is not quite satisfactory. I was thoroughly dissatisfied with the whole of the sickness data when I went through it. I am inclined to agree with you that that should be revised. The data is entirely defective. The whole of this sickness data is defective.

18,727. I would like to ask you who suggested to you that group?—No one. I merely made it myself. It is really not of much use.

18,728. You are doubtless aware that statistics for lead poisoning amongst house-painters are published month by month in the Board of Trade Labour Gazette, and are summarised in the annual reports of H.M. Chief Inspector of Factories?—I have not those figures; they have not been supplied to me. I have asked for information that bears upon it, but I have

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued.]

not had those and I have not investigated them. Do they include any age distribution?

18,729. No, they do not. As there is no compulsory notification of non-fatal cases amongst house-painters, the only statistics of value are the records of actual deaths. We have the actual number of deaths from lead poisoning amongst house-painters?—You want the exposures. “The only statistics of value,” you say, but I do not know about that. There must be a lot of valuable data in the records of the friendly societies.

18,730. I will not say “of value” then, but the only statistics you can rely on are the records of the actual deaths?—Yes, I should think so.

18,731. If you turn to those figures you will note that there has been no reduction noticeable?—Is that so?

18,732. Yes?—I did not know that. According to the Registrar-General there is a big reduction in deaths in group 64.

18,733. (Dr. Collis.) We are dealing only with deaths from lead poisoning?—Then I do not know.

(Dr. Collis.) The Registrar-General makes a statement upon it himself.

18,734. (Chairman.) It is borne out by the statements in the Supplement to the Decennial Report of the Registrar-General at pages cxix to cxxi?—I show, I see here, taking it from the Registrar-General, that there has been a large decrease in the death-rate in occupation 64, not specially notifying plumbism.

18,735. (Dr. Collis.) You have not touched on the point in your proof that the Registrar-General touches upon?—I do not follow what is the point.

18,736. (Chairman.) If you turn to these figures published in the Board of Trade Labour Gazette every month you will find that the deaths amongst house-painters show no noticeable reduction?—As a matter of fact I have not seen them. Does that cover periods of years, because one does not want to take a month?

18,737. Ten years?—Is there any age distribution in them? I have not seen those figures, so really I cannot speak about that.

18,738. In paragraph 18,653 you state that you have not been asked to prepare special rates of premium for sickness assurance among house-painters. That statement relates to all sickness taken together, no doubt?—It does.

18,739. Lead poisoning is the only sickness painters are specially liable to which is the subject of compensation under the Workmen's Compensation Act?—Is that so?

18,740. Yes?—You are no doubt aware that special rates of premium for insurance under the Workmen's Compensation Act are payable in respect of painters?—No, I do not know that I am aware of it, but if you state it as the fact I will take it, of course.

18,741. These rates are higher, for example, than those for plasterers, who are exposed to similar occupational risks except that there is no risk of lead poisoning?—I have not investigated that, but I am not doubting that statement.

18,742. I am only quoting that to show that there must be a very marked risk. In paragraph 18,661, I note that you refer to the fact that there were 48 deaths from lead poisoning among house-painters and plumbers in 1911 as compared with 35 deaths in 1910?—A later report was sent to me showing that those curves that we have been looking at had jumped up a lot.

18,743. However strongly you may feel that this fact is an insufficient basis for any scientific deductions regarding occupational sickness and the like, you will no doubt admit that such a number of avoidable deaths is a deplorable fact in itself?—Certainly.

18,744. (Dr. Collis.) In your proof you draw attention to the fact that many occupations are associated with special risks?—Yes.

18,745. You would agree, I presume, that we should try, if possible, to eliminate such risks from industry?—Yes, if in eliminating them you can be sure that you are not introducing a worse risk, of course there is the possibility of that. You may be removing a relatively small injury and unwittingly introducing a greater. It is quite conceivable.

18,746. I said “if possible”?—Yes.

18,747. In Table F. (paragraph 18,591) you have given us a list of those occupations which stand, for comparative mortality, above that of plumber, painter and glazier?—That is so, taken from the Registrar-General's returns, and based, as I ought to call attention to, on the comparative mortality figure, which I do not like nearly so much as death-rate comparison from an actuarial point of view, or especially the comparison of actual and expected deaths which is dealt with later on, which is the real test of all.

18,748. We are here as a Departmental Committee appointed by the Home Office. Certain of the occupations there named are under the supervision of the Home Office which deals with mines and factories and workshops?—Yes, a good many of them.

18,749. Have you noted the fact that nearly every one of the industries which comes under the Home Office has already received attention as regards industrial risk, and has had established for it, either by Act of Parliament or special regulations, some methods of trying to reduce that risk, until we finally arrive at the plumber, painter, and glazier, who appear to be the next on the list?—I have not noticed that from personal observation. I accept your statement.

18,750. So that if that statement is true—and I think I may say that it is generally—it has now come to the turn of the plumber, painter, and glazier to have the industrial risk of their occupations considered?—Yes; accepting your former statement as accurate, I should say that that would be so. May I qualify that by pointing out that, even taking this comparative mortality figure in paragraph 18,594 (you are quite well aware that the standard of the comparative mortality figure is the figure 1,000) the occupation of plumber, painter, and glazier is only 4 per cent. above the average. It is not high above the average at all.

18,750a. No, but attention has been given to the other occupations?—Quite so; at least, I accept your statement.

18,751. Now, taking your large Table A (see paragraph 18,557) you have shown us in a very comprehensive way, by extracts from the Registrar-General's published figures, the relation at various age periods between the mortality of various occupations given by the Registrar-General?—All that he gives on the pages quoted (I have not made any selection) I have taken.

18,752. Then you have shown in Table B. (paragraph 18,573) for each age period, summarising them, the numbers of these occupations where the death-rates are above or below that of the plumber, painter, and glazier?—That is so.

18,753. Do you not think it a noticeable fact that between 15 and 19, there were 98 above; from 35 to 44, there were only 43; and from 45 to 54, 35?—Would it not be better to give the percentages? It brings out your point far better. It means that of 133 occupations that the Registrar-General compares (I have taken all of them) at age 15 to 19, 77 per 100 of those occupations have a death-rate that is above occupation 64 and, at the same age-group, 23 per cent. of those occupations have a death-rate which is below—77 and 23 make up 100 per cent. Your point is that at the early age there is a very large proportion of the other occupations whose death-rate is higher?

18,754. Yes. When we get to ages 35 to 44, the percentage is 32 against 68; and at ages 45 to 54 it is 26?—Yes, that is the lowest point.

18,755. At ages 55 to 64, it is 37?—Yes.

18,756. At age 65 and over, it rises again?—Yes. That tells in favour of occupation 64. We get 75 per cent. of older men who have a death-rate higher than occupation 64, and only 25 per cent. of all those occupations have a lower death-rate.

18,757. So that during the period of life when the occupation is having its effect, namely, between 35 and 64, you have some influence in this occupation which is placing it much less favourably than it would be placed at the commencement of the occupation. That is to say, that the class who form this occupational group are favourable from the health point of view up to 25?—I see your point—up to 34.

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued.]

18,758. Very well. When the occupational effect begins to show they take a poorer position, so there must be something in this occupation which is altering most profoundly their position in the mortality curve or column?—I do not feel sure about your deduction from the facts. The facts are perfectly clearly stated, but, if I may say so, I do not think one is quite justified in drawing your deduction, because we do not know by any means from the returns of the Registrar-General that men whose ages are from 35 to 64 have entered at that period of their life with this same occupation at the back of them. It is rather a big assumption to assume it. If this were taken exclusively with regard to men who had been observed (mark the emphasis I put on the word "observed") right away through from 15 to 64, then I think I should agree to your point without any qualification. Are we justified?

18,759. We are quite as justified as in considering that the other occupations with which you are comparing them are in the same position?—No.

18,760. You have to throw the whole lot over or accept the figures as stated?—I think not. I am comparing them here at each age. I do not say that your point is wrong. It is one of those rather complex points which I quite admit on the face of it appears to be borne out by the facts. I do not object to your statement merely for the sake of objecting but solely because I know that it is a kind of deduction that it is rather risky to base on the figures.

18,761. I see your point; but we have to accept that group as being representative of each age period of employment, or the whole of the table is of no value?—I do not think that.

18,762. If you cavil at the one, surely you must cavil at the other?—But must you? It is all split up into age-groups.

18,763. I take the age-groups?—But you want to assume that it is the same classes of individuals who have been observed. That is where I am not sure, and your deduction may be rather unsound and far-fetched, I am inclined to think. I do not say that it is, but it is quite likely to be. I do not say that you are wrong in any way.

18,764. You have to make the same allowance for the other 133 occupations. This seems to me, at any rate, to bear the interpretation that I put?—My point is that the interpretation which you put seems to me to be too weighty an interpretation to base on those facts, for the reason that I have given—that those lives have not been continuously observed.

18,765. But surely if those lives have not been continuously observed, the lives at each age period of the 133 occupations have also not been continuously observed. What holds good for the age-group of one occupation holds good for the age-group of another occupation?—Certainly, but I am not prepared to admit at present that the interpretation which you have applied to occupation 64 holds good for the others. I am merely comparing the death-rates of each age-group. I wish I could make the point quite clear.

18,766. The point is quite clear. Then I must ask you, will you please explain to me why the occupation group 64 has come to take such a poor position compared with those with which it started in the earlier ages?—I do not know. It may be that, as you say (I do not say that it is so), they have come into observation at age 35 with some injury from their occupation. This is going on your own lines. I do not know that it is so, nor could I actually take that and say that that is the explanation. I should not feel justified in saying that it is. That is my point. I am perfectly willing to admit that it may be so. On the other hand, it may be one of those more or less accidental things that happen when you are taking only groups and not dealing with a big class like "all occupied males." Over and over again, when I was younger at this sort of work (I speak with entire respect to you in this matter), I used to be rather inclined to base rather big assumptions (if I may call your statement an assumption) on not quite an adequate

fact basis. That makes me rather careful about replying to your question. You may be right, of course.

18,767. I should feel the strength of your remark more if the figures did not make a gradual descent and a gradual, steady descent?—Supposing that your contention is right, why, if these men have inherited a taint, should they suddenly at 65 years and over become so very much better than others. You would think that they would die out.

18,768. At 54 the figures begin to increase?—Are you referring to Table B.?

18,769. Column (d), Table B.?—Certainly.

18,770. This is no more than you would have expected when the risk that we know the occupation is exposed to produces diseases which have certain median ages of death. They show themselves during the occupation years, and, like lead poisoning, Bright's disease, and also phthisis, do not show themselves in the later years?—That I do not know. It may be so.

18,771. Taking those things into consideration, knowing that to be the reason, seeing the age at which they have become bad, and seeing that the move is not a chance move down but a steady move down, do you not think that it is somewhat reasonable to consider that that may be the cause of the alteration in position?—Do you mean that the risk of lead poisoning may be the cause?

18,772. Yes, and its accompanying troubles?—Yes, I think that that is a possible explanation, but at the same time I would not like to say it is, by any means a complete explanation. It seems to me a reasonable statement to make.

18,773. And worth considering?—Worth considering, and certainly worth investigation if it is possible to get more accurate data. It is certainly worth further investigation. This data is not accurate. This group of plumbers, painters, and glaziers contains about 30 per cent. of plumbers. I had a plumber in my house the other day. He actually handles the lead, and eats food, and perhaps smokes, without washing his hands. This group contains about 30 per cent. (or 29 per cent.) of plumbers. You can split up the years of life exposed to risk (I have done that), but you cannot split up the deaths. The question crops up: Is a part of this unfavourable effect that you have just referred to due to plumbers? I do not say that it is due to plumbers or painters.

18,774. (Chairman.) The registrar's figures are confirmed by independent testimony from the men's trades unions, which fully confirm the statistics?—I know nothing about that. Please understand that I am merely basing my statements on the things that I have examined. I cannot attempt to controvert any outside evidence, which I know nothing about.

18,775. (Dr. Collins.) With regard to plumbers, you suggest, in paragraph 18,670, "It is probable that the death-rate of plumbers is in excess of the death-rate of painters arising from lead poisoning"?—Yes.

18,776. Why do you make that statement?—Not from any definite knowledge.

18,777. I will clear the ground by telling you that the distribution of deaths among the two classes is exactly the same?—But is the distribution of death-rate the same? The deaths may be the same.

18,778. The death-rates are the same?—I wonder how it would affect the distribution. We ought to be able to split up the deaths amongst plumbers and amongst painters and glaziers just the same as with regard to the years of risk. It might be important.

18,779. The medium age at death for both is about 44?—But you cannot take that.

18,780. I only give that fact for the moment. It does not carry us far?—I do not want to be contentious or fractious, or anything of the sort, but I know that there is, perhaps, a little more in these points than appears, and you want to be a little cautious.

18,781. In paragraph 18,586, you state that you think that a fairer test is to compare the death-rates of occupation 64 with the death-rates of all occupied males in industrial districts. From your knowledge of the occupations of the kingdom, do you really consider that it is fair to compare all occupied males in

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued.]

industrial districts with occupation 64? This is not a matter of actuarial experience but a matter of knowledge of occupations?—I say, "a much fairer test." That does not say, does it, that it is necessarily a right test? If you take "all occupied males" as the words are here used, it means all occupied males in England and Wales.

18,782. That is 10,156,976?—You include there the whole of the professional and commercial classes and many men who are not exposed to any industrial risk of death.

18,783. The professional and commercial come to 842,000?—I have not gone into that. I think that it is a fairer test to compare the death-rate of occupation 64, which has its own industrial risk, as is freely admitted, with an industrial group rather than with a non-industrial group.

18,784. Surely not. If you compare a class with an industrial risk, to get a fair comparison you want to get a similar class without an industrial risk. If you have two or three industrial risks on either side how do you get a comparison?—I do not quite agree. When you compare the actual and expected deaths, as I do later on, on several different bases, the whole gist of making that actuarial comparison is to compare a relatively small group like 64, which is under observation, with a large mixed class. It is common practice to do so. You do it with a big friendly society. You would not compare a friendly society having 50,000 or 100,000 with another similar friendly society. You would compare it with the experience of some big organised body like the Manchester Unity or Foresters. The bigger you make the bulk of exposures to risk, the better the chance you get of an accurate result. The group is mixed up with all the professional and commercial classes. In that connection may I direct your attention to a table which is actually based on this comparison. You take exception to it.

18,785. I only speak for myself, I say that all occupied males is the best comparison?—I see your point. May I direct your attention to Table J. (paragraph 18,800), which carries it a bit further, because this bears on your point. Do you admit that this is a good way of testing? It is the common actuarial way.

18,786. Yes?—If you look at the actual and expected results in percentages in that table you will see on comparing occupation 64 with this group to which you object, namely, all males in industrial districts, that during the period of observation, that is to say, three years 1900 to 1902, the actual deaths among plumbers, painters, and glaziers was 90 to every 100 deaths expected had they been exposed to industrial risks. Now do you not see that you have a fairly good margin—a margin of 10 per cent. on the right side? That tends to justify me in the comparison I have taken. I do not say that these plumbers merely come neck and neck in their mortality with males in industrial districts. I point out on the other hand that this group—plumbers—leaves a margin of 10 per cent. They are 10 per cent. below the mortality of all males in industrial districts. Does not that rather tend to show that when you compare them with the males in industrial districts, and you have a margin on the safe side of 10 per cent., which is quite a nice margin, that one is not so very far out in the comparison? It gives 10 per cent. to meet your point.

18,787. No, I do not agree with you. It does not. I maintain that they appear as 10 per cent. better than the class with which you are comparing them?—No, 10 per cent. worse. It is just the reverse of what you say. The actual number is 90, and it would have been 100.

18,788. I quite agree, but had you taken the other class, it would have been different?—I have taken them all. Let us take your group—all males in England and Wales. I do not in any way want not to observe these effects. It is in Table K. (paragraph 18,671). You have there exactly the same thing. There they are compared with all occupied males in England and Wales. There you get the reverse result. Looking at columns (g) and (h) had occupation 64 had the death-rate of all males they would

have had 100 deaths, but they had 106 actual deaths. Therefore their death-rate was 6 per cent. more.

18,789. When compared with the other they were 10 per cent. less?—Yes, they come intermediate between the two.

18,790. One shows 6 per cent. more deaths and the other 10 per cent. less?—Yes, certainly. What it tends to show is that the proper test for them (we have not one given by the Registrar-General) would lie somewhere between all occupied males in industrial districts and all occupied males in England and Wales. I do not maintain that this test of occupied males in industrial districts is the best test, but I think that it is a fairer test. I may be wrong. I think that the point lies somewhere between.

18,791. I do not follow what you call a test?—The standard data.

18,792. Do you mean that the expected and the actual have to be precisely the same?—I mean the standard data that you use for making the comparison.

18,793. So I understood?—Using as the test all occupied males in industrial districts is not the best test, although I think that it is fairer than the other. One under-states it and the other over-states it.

18,794. Why do you make that statement—that one under-states it and the other over-states it? Is it merely because one is above and the other below?—No.

18,795. You cannot say that a thing is over-stated because it is above the standard which you fix?—Certainly not, but for reasons I have already given, it is not fair in my opinion to compare the death-rate of an occupation like that of plumbers, painters, and glaziers with death-rates of all occupied males in England and Wales, many of whom have no industrial risk.

18,796. No, but on the other hand the plumber, painter, and glazier working at houses, and going a considerable distance to his work, has apparently, one would expect, a very favourable opportunity of escaping disease and occupation risk, whereas if you compare him with the man who works alongside him, the paperhanger (a small class you have drawn attention to in your proof) he is placed in an unfavourable position?—It is admitted that the painter is exposed to the industrial risk of plumbism. We have been discussing it already. Therefore I say it seems to me that it is just to compare him with a group of males which also has industrial risk.

18,797. We want to find out how much we have to weight the whole class because of the risk as compared with a class which has not that risk. That is the whole point of our investigation, and I think that your figures help us considerably to understand it. That is the point that we want to get clear?—I see. In that case you would not want to compare the plumber with a group necessarily possessing any industrial risk whatever.

18,798. We want to get rid of other industrial risks. That is the whole point?—That is all right from your point of view, but from my point of view, the actuarial point of view, I say to myself, What is the best test that I can apply to these plumbers?—I say that neither of these two tests is right, and that the proper test lies somewhere between the two. Do you see the justice of my point of view?

18,799. I see the justice of your point of view. You approach it from the point of view of actuarial tables for insurance?—Supposing that instead of coming here to-day to talk the thing over, I had to prepare the monetary tables on it, I should take probably some mean of death-rates between these two.

18,800. I see your point, but our point is to try to ascertain the exact effect of the occupation risk compared with those who have no occupation risk?—There is no possible way of getting at that except by the card system, if it can be carried out. You could eliminate the death-rates from plumbism and take out the death-rate from other causes, and then you could compare the death-rate from causes other than plumbism separately from the death-rate from plumbism, and get a very sound comparison as compared with the mortality of other trades.

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued.]

18,801. Perhaps you would not agree that from my point of view, trying to get out what is the effect of this special occupation risk, occupied males in England and Wales is a little fairer standard than occupied males in industrial districts?—Might I suggest that if you want to get out the special risk from plumbism, have we not got it already in a table?

18,802. No, we have not got it?—I cannot actually say that it is a good comparison.

18,803. I only suggest that perhaps it is a better standard than occupied males in industrial districts, because there is less occupational risk with regard to the whole class?—It may be so, but from my point of view I consider it correct to compare it with an occupational risk group.

18,804. But I am considering it from my point of view?—It may be so from your point of view.

18,805. Then we should have to take into consideration the age distribution of the two classes?—Yes.

18,806. The age distribution for industrial group 64 is less favourable. From the ages of 55 upwards there are 96 in every thousand. In occupation group 64 "occupied males, England and Wales," there are from 55 and upwards 123; so that the mortality figure would be more unfavourable for occupation 64 if the age distribution was the same?—I do not quite follow that. I would not like to commit myself to any statement without having gone into it.

18,807. If there are more old people in the class, it is generally considered that the mortality in that class will be higher than if they are all young?—But I have not actually followed the figures. One would need just to go into it.

18,808. Allowing your point that paperhanger, plasterer and whitewasher, industrial group 63, is a small class, the age distribution of this class is nearly precisely the same as that of plumber, painter, and glazier, which is a help in comparison, is it not?—I do not think that it is.

18,809. I do not know. I only ask you. One is 97 and the other 96?—I have the figures split up into plumbers in one section and painters and glaziers in the other. The total agrees with the total on page 106.

18,810. (Mr. Sutherland.) What are the numbers?—You will find them in Cd. 1523, page 194, Cd. 2619, page 106. Although I have not taken them out in percentages, I have another table here that deals with it, and you would find if you took the figures out by percentage that you would get a much bigger proportion of plumbers at a younger age than at an older age. There is practically a constant decline in the years of risk. It is a noticeable point.

18,811. (Dr. Collins.) Yes, it is a very good point?—I lay no stress upon it. I merely said it in reply to your question.

18,812. Now, turning to the question of lead poisoning itself, look at Table G. (paragraph 18,594). You have the supplement to the 65th Annual Report of the Registrar-General before you, have you not?—Yes, I have it here.

18,813. You have doubtless read his special remark on the effect of lead on pages cxix to cxx. He there acquaints you with the effect of lead in producing illnesses other than lead poisoning. He draws attention to the fact that certain illnesses in addition to lead poisoning are present in those groups which are exposed to the risk of lead poisoning?—Yes.

18,814. On looking at your Table G. (paragraph 18,594), it is noticeable that, taking occupied males in England and Wales, with regard to these diseases the class we are dealing with is in excess—203 had phthisis against 175; 147 had diseases of the circulatory system against 135; 107 had diseases of the nervous system against 78; 89 had diseases of the urinary system (which I presume includes Bright's disease) against 48; 22 had plumbism against 1. And it is interesting to note a point which has appeared before the Committee several times with regard to the effect of alcohol—that the effect of alcohol is 12 only as compared with 16?—Yes.

18,815. So that this special class is in excess with regard to those special diseases, which the Registrar-General draws attention to, which are associated with chronic lead poisoning?—Yes, that appears to be so.

18,816. But with regard to other diseases, there does not appear to be any special occupation risk?—No; and in some other diseases, the death-rates are much lower than even in your test.

18,817. If we could eliminate this risk, we should have a very healthy class?—I do not know about their health, but it would of course effect a distinct improvement.

18,818. A bigger improvement than the 22 for plumbism would lead us to think?—The Registrar-General said that it is probable that at the present time practically all the deaths due to industrial lead poisoning are ascribed to that cause.

18,819. He means that the deaths of those who definitely die of lead poisoning are attributed to that cause?—I follow.

18,820. Then on page lxxix dealing with occupation group 64, he points out that occupation group 64 has shared in the general improvement of health during the last two decades, but that the high mortality from plumbism and Bright's disease which occurred ten years ago has been maintained since that date, the mortality from plumbism being 22 in both periods and from Bright's disease 72 in the first and 69 in the second of the periods. I draw attention to that because you said in your original evidence that you had no information at your disposal with regard to what had happened in this respect; but you had this information at your disposal?—I do not dispute that for a moment, but I forgot the exact point. May I refer you to Table M. Take a wood-turner and cooper as standard data. You can compare plumbers, painters and glaziers with that class. The death-rate amongst plumbers was no less than 8 per 100 lower than it would have been had they been exposed to the risk of wood-turners and coopers. Is that unhealthy?

18,821. You probably are not aware that they are exposed to an occupation risk?—I suppose they must be. I want to show the inapplicability of any one group. One paperhanger and plasterer supports your view, but one turner and cooper goes against your view.

18,822. But you do not know, perhaps, the occupation risk to which they are exposed, which I do know from examining them medically?—But you are taking a small class.

18,823. I agree with your criticism with regard to the size of the class, but they happen to be a class who are occupying the same kind of houses and working in the same premises?—Do you mean wood-turners?

18,824. No. Paperhangers and painters I am referring to?—Paperhangers is one of the six with an abnormally low mortality.

18,825. My point is that, small as the class is, it gives, as regards conditions, ventilation and the rooms they have to occupy and the hours of employment, a very close comparison?—Yes, I think so.

18,826. They are not exposed to the occupation risk of the painter—the tendency to lead poisoning?—For some reason which I do not profess to know, the paperhanger group happens to be one of the six occupations in the country with an abnormally low death-rate. I do not know the reason, but it occurs to me that it is not satisfactory, actuarially at any rate, to compare any occupation, whether plumbers or anything else, with an occupation with an abnormally low death-rate.

18,827. I agree; but I point out that their occupation is so similar that one would expect, if one knew nothing at all about the tendency of the painter to lead poisoning, to find the two running absolutely together?—Yes. There is no reason why the paperhanger should come out with a low death-rate as far as I can see.

18,828. I think there is. They get plenty of ventilation and work in fairly large rooms and where there are few people employed. There is everything to conduce to a low rate of mortality?—They are like the clergyman and the gardener then.

18,829. The wood-turner and cooper has exposure to dust of vegetable fibres which have a marked effect

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued.]

on the lungs?—Ought you not to take away the industrial risk from the wood-turner and cooper before you take it from the plumber?

18,830. We are doing so?—That is all right.

18,831. When you look at the supplement to the next Decennial Report, I think you will find that they occupy a more favourable position. I cannot say, but I shall be disappointed if they do not. Now you have suggested several times that the age distribution of the cases of lead poisoning which occur is not given?—The age distribution of the cases of lead poisoning?

18,832. Yes. It is quite true that it is not given, but may there not be a good reason underlying that?—I do not know.

18,833. I analysed over 2,000 cases with regard to the length of employment of the individual before he was attacked; 562 occurred in the first six months and 672 occurred during the first 12 months (in the 672, the 562 are included), and 226 in the second year, giving a total of 898 attacks in the first two years of employment, leaving only 1,297 attacks to occur in the remaining 48 years of employment. In other words, we know perfectly well that the length of employment, as regards this question of lead poisoning, medically, is of far greater importance than the age of the individual who is attacked, and to state the age of the individual attacked would be to give an entirely false impression and would be lending ourselves to details which people not understanding the medical aspect of the affair might be making use of for mistaken purposes?—Well, of course, I cannot say anything about the facts that you yourself have examined. I have not had the facts to examine, and cannot criticise one way or the other, but I do not think I can agree with your statement that it would be false to state the age. There may be something in your point, but I know nothing about it, because I have not any data; but I cannot see how it would be in any way false to state the age. It would be desirable, probably, to have the age sub-divided into employment if possible. It is so thoroughly well-established that sickness of all kinds is largely a function of age (and it has been established over and over again in big investigations) that I could not agree with you that it is false to state it.

18,834. Take scarlet fever as a function of age; it occurs in youth. Take tuberculosis as a function of age; it occurs at 40. If you take bronchitis, it occurs as a function of age at over 70. You cannot say that any special form of illness like lead poisoning, in its attack, is to be stated as a function of age?—No, you would not pick out any one of them. May I put it in this way: in this investigation we do not want merely to confine our knowledge to deaths and sickness from lead poisoning. It is an essential part of the investigation to find out, if it is possible, whether the deaths from all causes, and especially whether the sickness from all causes in this occupation are in excess of the normal, and, if so, to what extent. That is really important.

18,835. I quite agree, but you attack the method of tabulating our information by saying that something was not stated, and I felt that I was bound to point out to you that there were other matters to take into consideration?—I agree.

18,836. Length of employment is far more important?—I would like to see them both stated. Where you have two factors, both of which are important, you get the data so distributed that for each age you have a subsidiary qualification. I will not go into technical points; but we are actually engaged on cases where, instead of having one set of data stated for the age, you have each age group, and that age group is further subdivided. I do not know anything about what you tell me, but I should say that it should be looked into.

18,837. There is good reason for not stating the age?—While being perfectly free to admit that there is a good deal in that, I simply take exception to your words that it would be false to state the age. It would not be false to state the age, but it might be desirable to have both, and if you could only have one it might be more desirable to have the duration of

employment than the age. I do not say that it is so; I merely say that it may be so.

18,838. (Mr. Sutherland.) Do you think that the data available at the present time is adequate to form a sound opinion from on the question of lead poisoning?—The data available?

18,839. In the tables you have given various diseases. Some of these, we have reason to think from the evidence given before the Committee, would arise from the action of oil and turpentine, even if there were no lead in the paint, particularly urinary diseases, and possibly nervous diseases. If we had a card such as you suggest and we had four or five years' experience of such card tabulated, then the Government would have absolutely definite data to go upon?—I do not consider that the data at present available is of a high quality. I do not want to run it down in any way. I do not know whether you have looked at the composition of the tables in the book. The years of life and risk are picked out from the Census volume of 1901. They were then multiplied by three to give three years. That is an assumption. Then the deaths that were recorded in the country during the three years 1900 to 1902 were taken, and the deaths were divided by the years of risk, got in the way that I have stated, and these form a death rate. That is not the proper way of doing it.

18,840. It is not absolute?—It is not an actuarial way of getting at it, but it is the only thing you can do. As regards sickness, as far as my opinion goes, I say emphatically that there is no data worth having.

18,841. I am dealing with sickness only?—I have not got any data that I consider really worth investigating. I want information on cards similar to the cards referred to in paragraphs 18,656-8.

18,842. Is the Home Office method of calculating cases from tables a sound one?—I should say that it is most distinctly unsound. I do not want to be rude or anything of the sort, but I believe it to be useless. I do not say that the results are not what are brought out. I simply say I do not know. I frankly confess that I am ignorant on this matter of sickness amongst painters.

18,843. In sickness cases, all the returns to the Home Office are based on the mortality returns for the last ten years. They take a figure and they multiply it on the mortality returns. Is that accurate?—I rather wish you would not ask me those questions. I say I do not think it is accurate.

(Dr. Collis.) They are not represented as accurate.

18,844. (Mr. Sutherland.) But they are put forward in this inquiry as the number of cases?—I do not consider it sound myself.

18,845. I am asking whether in your opinion you think that is a sound basis of calculation, because the figure is stated as about 1,000 per annum on a mortality return of over ten years' experience. The cases are hypothetical?—It is the method I object to.

18,846. You think that the soundest way would be to have a period of probation, before taking any definite step, and tabulating on the basis of your card?—Yes, or a card similar to that. I would like to say something about drafting the card because we might be able to improve it. It might be possible to put in something else. That was simply drafted on my information.

18,847. The analyses and all the information before the Home Office after a period of five years, say, would be really perfect if those cards were insisted upon?—Yes, if you could get a consecutive period of observation.

18,848. Supposing that it were made compulsory by the Home Office to make these returns?—Yes.

18,849. (Dr. Collis.) You suggest rather that secretaries should be asked for information which they already possess of past sickness which has occurred amongst their members?—That is what I suggest here. Mr. Sutherland suggests that it should be made compulsory in future. It might be possible to get a good many thousands of these cards filled up, a small fee being paid to secretaries of friendly societies for giving the information. That occurs to me as the only way that I can suggest by which we can get the data.

9 May 1912.]

Mr. JOHN HOLT SCHOOLING.

[Continued.]

The method you suggest of the Home Office making it compulsory would apply to the future.

18,850. This information exists?—Yes, it exists in the registers of the big friendly societies. Look at the first page of my proof under the heading of Occupational Sickness. Dealing with the matter, I say here, "Noting this lack of data, I applied for the loan of the cards upon which the Manchester Unity experience was tabulated. Nearly one million of these cards were prepared, each card relating to one life. It occurred to me that if I could get these cards, and sort out those that relate to house-painters, &c., and then proceed to investigate the rates of sickness, &c., a most valid fact-base would then be obtained. But I was informed on 12th March 1912 that the Manchester Unity cards were destroyed after the completion of the investigation." My informant was the actuary who made the investigation. All those things costing something like 10,000*l.* were burned, although there was the most valuable information in them. Why the information was burned I cannot imagine.

18,851. (*Mr. Parsonage.*) I would like to ask a question, more for my information than for anything else. With regard to getting returns from the friendly societies to estimate the amount of sickness amongst painters, the certificate would simply state the illness. It would not state "plumbism." It may be put as a disease peculiar to painters, and that painters are more liable to it, such as Bright's disease?—I suppose no data that has ever been sought for or collected has ever been perfect in its classification, but by means of drafting a card in the most careful manner that one could devise, even if you could not get from friendly societies or anybody else your facts accurately distributed between lead poisoning and non-lead poisoning (and you probably would not and could not expect to), you would get an accurate basis for investigating true rates of mortality and true rates of sickness, and if the subdivision into lead poisoning were not sufficiently accurate you would have to throw that over. You would have to find out how painters stand with regard to sickness in relation to the rest of the population, which we do not know at present. That is interesting.

18,852. Supposing you had the medical certificates of a certain number of painters in my society, which is confined to painters, and took the same number of certificates from a friendly society and made a comparison between those two, then you would find the percentage of diseases peculiarly attributable to painting?—You might, but that would not be the way to do it. The way would be to adopt my suggestion or, as Mr. Sutherland says, make it compulsory. Results appear to be sound, but very often they are not. Something hidden comes in and traps you, and you find your result is a fallacy.

18,853. (*Dr. Collis.*) Would not Mr. Parsonage's society be fairly comparable with the Oddfellows?—I do not know what his society is.

18,854. (*Mr. Parsonage.*) The National Amalgamated Society of House Painters?—Would it not be possible for that society to fill in cards? If we could get cards filled in with age distribution and so on and

take out the rates, they would certainly be comparable with the rates in the book.

18,855. You would find a larger percentage of one kind of disease running through painters than you would get in the returns from other societies?—Quite likely; but whether you did or whether you did not, whatever you found would come out without being magnified one way or the other, if you had these cards. You would have a sound basis for observing the facts.

18,856. I do not think I could get any returns at the present time. They are destroyed?—Do not you keep your registers and records? I have investigated friendly societies for 30 years back.

18,857. We keep a record of the sickness benefits paid?—And the times of sickness.

18,858. The times of sickness are kept, but we do not keep the certificates showing the cause of sickness. In my society, where we pay sickness benefit, 75 per cent. of them are not in a friendly society at all; they are in a trade union, and they get all their benefits through the trade union?—In that case you might be up against a complication with regard to the length and times of sickness. You want to get the exposures to death or sickness accurately.

18,859. They have to join our society at a certain age?—You want 5,000 or 10,000 of the cards.

18,860. (*Dr. Collis.*) You have not the cause of the invalidity, but if you had a sufficient number showing the ages of the men who have been sick and the length of time they have been sick one could make a table from that. Leaving aside the absence of medical certificates, we could get the absolute amount of sickness?—You must have the age.

18,861. (*Mr. Kinggate.*) In paragraph 18,618, under the heading of Occupational Sickness, you make a point with regard to lead poisoning, that there is possibly an excess of deaths attributed to lead poisoning. What is your reason for stating that there are possibly many cases which are attributed to lead poisoning that are not lead poisoning?—I was asked about that by the Chairman earlier, and I replied that it is not based on any knowledge or information of my own, but on evidence given by Dr. Goadby.

18,862. It should be the other way about, because there is a large number of deaths from lead that are attributed to other causes?—That was dealt with.

18,863. It is a very important point. Now, with regard to cases of sickness (Table B., paragraph 18,628), these cases that you quote are reported to the Home Office?—Those occurring in factories and workshops.

18,864. We know that there is a large number of cases not reported at all—that a great number of men suffer from lead poisoning who are not reported?—It only shows how useless it is.

18,865. Very often what the man is suffering from is stated correctly, but what the cause is is not stated. The whole of the men in my branch of the trade periodically suffer from lead poisoning, especially from gout. I can assure you of that from working for a large West End establishment?—That I have no knowledge of. It is no doubt very valuable knowledge, but I have no right to state an opinion upon it, because I know nothing about it.

The witness withdrew.

Mr. F. PISART examined.

18,866. (*Chairman.*) You are the managing director of the Maastricht Zinc White Company?—Yes.

18,867. Do you consider that the use of white lead paint is very dangerous?—Not very, if proper care is used in its application.

18,868. So that you do not consider it necessary to restrict the use of lead paints in the interests of the workers?—Yes, because sufficient care is very difficult to be taken by the painters, I think.

18,869. Do you think that if the use of white lead is allowed to continue, precautionary measures should be taken?—They should be careful to wash themselves

before eating, and they should change their clothes, and do such things.

18,870. Have you thought out any plan by which the precautionary measures are to be introduced?—No.

18,871. Do you think that zinc can displace lead as a pigment purely on the ground of superiority?—Yes.

18,872. Can you instance any country in which this has taken place?—Yes, in Sweden especially, and in Norway, where the use of white lead is disappearing, and where for the present the quantity of lead used is less than one-eighth the quantity of zinc pigment used.

9 May 1912.]

Mr. F. PISART.

[Continued.]

18,873. By weight, eight of zinc to one of lead?—Yes.

18,874. How do you arrive at those figures?—I have statistics (handing in the following table).

| SWEDEN.                  |             |             |                                  |
|--------------------------|-------------|-------------|----------------------------------|
| Consumption of Pigments. |             |             |                                  |
| Nature.                  | 1904.       | 1910.       | Increase or Decrease in 6 Years. |
| Zinc pigments            | Tons. 3,032 | Tons. 4,274 | About 41 per cent. increase.     |
| White lead               | 511         | 501         | About 2 per cent. decrease.      |

In Sweden there are no laws against white lead, neither are there any duties on white lead, zinc oxides, or lithopone. There are no manufacturers of white lead, or of zinc pigments in Sweden. All these pigments are imported and none are exported. All the quantities named above are used in Sweden. The painters in Sweden are much more advanced and less conservative than those in England. These are the only respects in which Sweden differs from England in regard to the pigment question.

18,875. From the figures you have given us I take it that zinc pigments show an increased consumption from 1904 to 1910 of about 41 per cent., while there is a decrease of 0.2 per cent. in the consumption of white lead?—On the general quantity of pigment used, you will understand that the increase of use is always in the zinc pigment, and never in white lead. The climate of Sweden is very cold in winter, and wet; and hot in some parts of the summer. Then the colours are exposed to very great variation in regard to their elasticity. The importation of zinc oxide during last year in Norway (in Sweden we have not the figures at present for last year) was 1,352 tons. The importation of white lead was 114 tons. The importation of lithopone was 200 tons, but this last figure is only estimated. The exact quantity of lithopone imported cannot be ascertained as it is not classified separately, but is included under the general term "chemical products." There is a small works in Norway producing about 440 tons zinc oxide per annum, these works also manufactured in 1911 only about 30 tons white lead. There are no laws against white lead in Norway, but there are duties on both zinc and lead pigments. As in Sweden, the question as to which pigment is preferred rests with the painters, who, as is shown by the above figures, have adopted zinc pigments in preference to white lead, after having investigated the matter.

18,876. Have you any knowledge yourself of the methods of painting in Norway and Sweden? Do they differ?—No; they are quite the same.

18,877. Have you any knowledge yourself that the zinc pigments make paint that is as serviceable as lead?—Yes. If that were not the case, as there is no law prohibiting white lead in Sweden or in Norway, you would certainly have people using white lead.

18,878. Is the zinc paint used in Norway and Sweden cheaper than that made from lead?—The same difference would exist in Norway and Sweden as in England; it all depends on the market price of the lead and zinc, because, as in England, there is no duty there.

18,879. Are we to understand that the reason why zinc paint is so much in use in Norway and Sweden is because it is better?—Yes; the painters have tried it. Twenty years ago our import in Sweden was only a quarter of what it was in 1910. That is only because painters have interested themselves in new products and tried them. They find that the new products are good, and give good results.

18,880. Do you think that the durability of the paints made from zinc pigments is as great as that of

paint made from lead?—Evidently. If that were not the case, I do not see any reason why painters in Sweden and Norway will not use white lead; because, as I told you before, there is no law or anything at all forbidding or restricting the use of white lead, either for inside work or outside work.

18,881. You know that France has prohibited the use of white lead from January 1st, 1915?—Yes.

18,882. Is there a Commission sitting in France at the present time?—Yes. At the present time it is finishing. From December to the end of March there was a Commission sitting in France with regard to the enforcement of the new law at the end of 1914.

18,883. Has the report of that French Commission been issued?—The Commission have finished their work, and now they are endeavouring to legally and clearly define the words zinc white and lithopone so as to avoid fraud.

18,884. Has the report of the Commission been issued publicly?—Yes, in the French papers—"Le Matin," "Le Journal," and other papers.

18,885. Could you send us a copy?—I have here the articles which have been adopted by the Commission.

18,886. Could this Committee obtain an official copy of the report of that Commission?—Yes, any member of the Committee could.

18,887. It is available now for anyone to apply for?—Yes. For the present the Commission is finishing its work. The decision of the Commission is to come into force in a few months. It will be enforced before the white lead law comes into force.

18,888. Could you tell us the date when the report was signed?—Yes, I have the date and the wording adopted at the meeting of the 25th March 1912. It is the wording of the French Commission on the suppression of fraud in the sale of products used in painting: "Article 4. The description 'zinc white' (blanc de zinc) with or without qualification shall be applied exclusively to oxide of zinc used in painting and containing not more than five parts of impurities derived from the ore in 100 parts. Such impurities may consist of lead compounds provided they do not exceed 3 per cent. calculated as metallic lead (Pb)." For lithopone they say: "The description 'lithopone' with or without qualification shall be applied exclusively to the product containing in each 100 parts of mineral matter, 99 parts at least of compounds of zinc and barium sulphate. The latter shall be derived exclusively from the barium sulphide used in the process of manufacture. The products must not be sold unless the labels and invoices state the composition in terms of zinc sulphide."

18,889. Are we to understand that the substance of the new French report is that the restriction of lead is strictly limited to a content of not more than 3 per cent. calculated as metallic lead (Pb). This is a very new thing, and no doubt the French Commission was much impressed by the existing situation in Sweden and Norway, where they are using a very large quantity of zinc oxide with a small percentage of lead.

18,890. Do you think that pure zinc oxide paint can replace white lead paint for all purposes?—Yes.

18,891. But is there not any tendency for the pure zinc to crack with a changing temperature?—Yes. When we say "pure zinc" we must make some reservation because you can have pure zinc oxide which is not a pigment at all. It is not the chemical composition of a pigment that is important, but also, in a greater degree, its physical properties.

18,892. May I put it in this way: Do you think that pure zinc oxide without any addition is a suitable pigment for a climate such as that of England?—But it depends on the physical properties of the pure zinc. It is impossible to say yes or no without making experiments. You can have very pure zinc obtained by the wet process that is no pigment at all. On the contrary, you can have another zinc which is a very good pigment, although not chemically pure.

9 May 1912.]

Mr. F. FISART.

[Continued.]

18,893. Do you consider that the addition of, say, 4 per cent. of lead would check any tendency to crack?—Yes.

18,894. Do you consider that a zinc oxide containing less than 4 per cent. of lead oxide would be a suitable pigment for making paint for use in England?—Yes.

18,895. Do you state that quite positively?—Yes, absolutely; and I will tell you later the reason, if you wish.

18,896. Can you support that statement? For example, can you point to any important buildings, either in this country or abroad, which have been painted with zinc paints containing not more than 4 per cent. of lead?—Mentioning only public buildings, I might mention the Belgian Government buildings for the railway department. As you know, the railways belong to the State in Belgium, and the Belgian Government a long time ago decided to suppress white lead.

18,897. Was that in 1904 or 1903?—In 1903 they suppressed white lead in their building department, and the suppression of white lead was during only one year—1903. They came back to white lead for five years.

18,898. From 1903 to 1908?—Yes. They changed the specification to zinc oxide containing 4 per cent. of lead salts. From that time they never came back to white lead.

18,899. From 1908, when they adopted the formula containing up to 4 per cent. of lead, they have adhered to that up to the present time?—Yes.

18,900. Do the Belgian State Railways use lead paints on their rolling stock?—A long time ago they did.

18,901. How many years ago is it since they used lead for their rolling stock?—I cannot say exactly. The question of consumption by the rolling stock department is not, by far, so important as the consumption for the building department, and the conditions are very different.

18,902. Do you think that zinc paint containing not more than 4 per cent. of lead is as durable as white lead paint, both internally and externally?—Yes, I do.

18,903. Would such a paint have the same covering power as a lead paint?—I think it has greater covering power.

18,904. (*Mr. Sutherland.*) Do you mean, spreading power or covering power?—With three coats, the quantity of white paint to make a black surface white is less when you are using zinc oxide with 4 per cent. of lead than when you are using white lead. In Belgium the railways are always increasing, and the consumption of zinc by weight is smaller than the consumption of lead when they were using lead.

18,905. (*Chairman.*) If the use of lead in paints were restricted by law, do you think that the price of zinc would rise?—Yes, perhaps 2l. a ton.

18,906. Will you explain why?—It depends on whether there is a law which will suppress white lead in a short time or a long time. If you say it will be not for five years, I do not think that there will be a rise in the market, because makers will be prepared to furnish it.

18,907. Taking two years as the time, what would you say?—Perhaps you would have a small rise of about 1l. or 2l. per ton.

18,908. Would the increased demand for zinc necessitate the use of high-grade zinc?—I do not think that it will necessitate a great use of high-grade zinc, but perhaps at the beginning that will be necessary. I think that it would change in one or two years.

18,909. So that you do not think that the increase in price will be permanent?—No.

18,910. Do you think that the price would fall after a year or two?—Yes. The reason why I think so is this. In the statistics with regard to metallic zinc, the consumption of the world in 1901 was 507,000 tons; in 1910 it was 823,000 tons. The quantity of lead used in 1901 was 859,000 tons, and in 1910 it was 1,115,000 tons.

18,911. The increase is 62 per cent. in the case of zinc, and 29 per cent. in the case of lead?—Yes. From the above figures it will be seen the increase in

metallic zinc is 6·2 per cent. per annum during the 10 years 1901–1910.

18,912. Can you tell us anything about the quantity of white lead used in the United Kingdom?—I have two figures. I have 55,000 tons, and from another source 65,000, so I take the mean, 60,000. If this is replaced by 30,000 tons of zinc oxide—containing, with the loss by manufacture, 27,000 tons of zinc—and 25,000 tons of lithopone containing, with the loss by manufacture, 6,000 tons of zinc—an increase of 33,000 tons of zinc is equivalent to only 4 per cent. of the actual consumption of the world. I speak only of metallic zinc. In addition, many ores which cannot be used for making metallic zinc can be used for zinc oxide making or for lithopone making. There are many ores which cannot be used for metallic zinc making. There are ores containing lead or copper that can be used, but which are not used at present for zinc oxide and lithopone.

18,913. Do I understand you to mean that the price of zinc would fall because of the increased amount of zinc oxide which would be made from very low-grade ores by the direct process?—Yes, for direct process zinc oxide.

18,914. Would there be a tendency to re-open mines which are now useless because the ore in them is not good enough for making metallic zinc?—Certainly, a great number.

18,915. I suppose you would say that in the event of the prohibition of lead, sufficient zinc oxide could be made by the indirect process, that is from metallic zinc?—Yes. You can have a large quantity of zinc made by the indirect process, because the quantity of zinc turned into zinc oxide is not important, in comparison with the general output of metallic zinc of the world.

18,916. Supposing that lead up to 3 per cent. was permitted, could sufficient zinc be produced by the direct process to supply the full demand in this country in, say, a couple of years?—Yes, in two or three years.

18,917. But if the percentage of lead allowed was increased to, say, 4 or 5 per cent., would that make any difference?—It would be much easier for the direct process makers to find the ore.

18,918. You are quite sure that if these low-grade ores were brought into use, the supply of zinc would be ample, and the price would be reduced below what it is to-day?—Not below, but to about the same.

18,919. Do you think that lithopone can replace lead for interiors?—Yes, with advantage.

18,920. But does it retain its colour sufficiently well?—Yes, absolutely, in water paints and oil paints.

18,921. And outside too?—Not so well.

18,922. Is it as durable as lead for interiors?—Perhaps not. I do not think that lithopone paints can be washed so many times as lead paints.

18,923. Is lithopone paint as durable for interiors as zinc paint with the addition of 4 per cent. of lead?—I think that zinc paints with 4 per cent. of lead will be much more durable than any other paints.

18,924. (*Mr. Sutherland.*) Do you mean with 4 per cent. added lead?—Not at all. It is lead absolutely intimately mixed with the zinc. I mean lead obtained in the same sublimation as the zinc.

18,925. (*Chairman.*) Is lithopone largely used in France and Germany?—Yes; the import of lithopone in France has doubled in one year—last year.

18,926. Do you know the exact figures of importation?—Yes; there are more than 5,000,000 kilos, or 5,000 tons, used in France at present.

18,927. How does the consumption of lithopone compare with that of zinc oxide and lead carbonate?—In France only they are using 25,000 tons of white lead, 8,000 tons of zinc oxide, and 5,000 tons of lithopone.

18,928. Is there an ample sufficiency of lithopone available at a reasonable price?—Yes. Until this year the lithopone business was very poor, because there was too much lithopone on the market. This year, on account of the Lead Combine, which raised the price of white lead very high, lithopone is more in demand than it was before.

9 May 1912.]

Mr. F. PISART.

[Continued.]

18,929. (*Mr. Sutherland.*) You are convinced that zinc can replace lead?—Yes.

18,930. Have you any practical experience of it?—Personally, no. My convictions are based on experience of countries like Sweden, Norway, and France; and the Belgian Government, and the Dutch Government are using a good deal of zinc oxide. Especially has that been the case on the Belgian State Railways in the last five years.

18,931. There are large amounts of both zinc oxide and lithopone used in this country, are there not?—Yes. I cannot say the exact figures.

18,932. I do not want exact figures, but it is a large quantity, is it not?—Yes.

18,933. Can you tell the Committee how it is that no one has ever succeeded in manufacturing zinc oxide in this country on a large scale at all?—I should think it is because competent people have perhaps never tried it.

18,934. But if there is a market for a product and it is a profitable product, why should not they try it?—I do not know.

18,935. There have been very large experiments tried here, and they have failed?—I have not seen the work and I cannot say.

18,936. There have been very large experiments tried, and large sums of money lost in trying to establish zinc oxide works here, but they have failed. Now why is that? Is it because they have been making these experiments without the addition of 4 per cent. of lead?—In England I know they are making lithopone, and I do not see why—

18,937. Yes. I am not dealing with lithopone, but I am dealing with zinc oxide?—Having no knowledge of how these experiments were carried out I cannot express an opinion.

18,938. We have had witnesses here who have dealt with the question—gentlemen who are competent to speak on the point. I want to know, if it is a profitable article, what you think is the reason why we cannot succeed in making it?—I do not know. You have a good quality of coal in South Wales, soft coal, and I do not know why it is. We are making it; and from time to time we are using coal from the south of Wales.

18,939. The ——— people are making it, and making large fortunes out of it every year?—That is zinc oxide.

18,940. They are dealing with spelter?—The ——— are making 100,000 tons of metallic zinc and 8,000 to 10,000 tons of zinc oxide.

18,941. It is the finest zinc oxide in the world, is it not?—I cannot say that.

18,942. They are pre-eminent in the manufacture of zinc?—Yes.

18,943. And the ——— Company adopt the direct process?—I think it better for myself not to speak upon that as it is not my business.

18,944. But you come here to give us your opinion on zinc. Are there not many grades of zinc oxide?—Yes, there are.

18,945. They are of various grades, representing various qualities?—With regard to whiteness.

18,946. Would not that make a difficulty in standardising paint?—Not at all. London is a very important market for zinc oxide. There are various qualities. If the quantity is five times more, it will be quite the same.

18,947. In London, if we want to specify genuine white lead we specify genuine white lead, and we know what we get?—People will have it from one place and not from another.

18,948. Possibly, but if it is sold as pure white lead, it has by law to be pure white lead?—Yes, perhaps. You see what they have done in France. An absolutely pure zinc oxide does not exist. Absolutely pure zinc oxide is only something made for the pharmacist.

18,949. But you can get commercially pure oxide up to 99 point something?—Yes. The French Government has taken special steps on this question. It is very easy for a chemist to make pure zinc oxide, but often it has no value as a pigment.

18,950. Now, I understood you to tell the Chairman that zinc oxide would do all that was required of a paint for outside purposes in London?—Yes.

18,951. What knowledge did you speak from?—From the experience of the Belgian State railways. I do not think that there is much difference. Everybody who is using our zinc in London is very satisfied with its qualities when used for outside work. But I cannot speak of what I have no personal experience of.

18,952. But you come here to speak on paint, and you said that zinc was quite equal to lead for outside purposes, did you not?—I told you on what basis I have formed my opinion. If you want an opinion on the subject you should ask painters who are using it. I do not wish to be questioned from the manufacturer's point of view. I have no personal experience with regard to making paint. We see such a large public body as the Belgian State railway suppressing all white lead.

18,953. The Belgian State railway is the only one that you cite?—You have the building department in France.

18,954. In the case of lithopone, are there not very many grades of lithopone?—There is only one grade. It is obtained by the precipitation of zinc sulphide and barium sulphate. From this combination you have only one grade.

18,955. You have enormous variations in quality, have you not?—They are different with every different maker. It is the same with white lead.

18,956. If you specified lithopone, you would have no guarantee of its being up to a standard?—It is the same thing with white lead.

18,957. No. If you specify genuine white lead, the London Chamber of Commerce will insist on your getting it, or it will apply to the courts. Now, with regard to zinc oxide, when you said, in answer to the Chairman, that it depended on its physical property, what did you mean?—I meant that you can have pure zinc oxide which has not so good physical property, and is not so good for paint. The purity is not a standard.

18,958. It is a standard in one way. It is a standard of purity, but it is not necessarily a standard of paint excellence?—That is what I mean.

18,959. When you said that a certain weight of zinc oxide would go a greater distance than the same weight of lead, what did you mean? Did you mean that you could give three coats instead of two?—I meant, with the same number of coatings, the quantity of paint which is used to cover a black surface and make it white is less for zinc oxide than for white lead.

18,960. With the same number of coats?—Yes, with the same number of coats.

18,961. Your statement is contrary to that of many of the witnesses we have had before us?—My opinion is based, not on my personal experience, but on experience of painters and experts.

18,962. I have the testimony of an expert here. I asked, "Can zinc oxide be used in absolute purity, or is it improved by carrying another body with it?" He said, "You mean if you got approximately pure oxide of zinc, would it be the best pigment you could get?" I said "Yes," and he answered "No, it would not"?—I know that some people in America are using a small quantity of sulphate of barium.

18,963. With zinc oxide?—Yes.

18,964. You would not take America as a standard place for paints, would you?—I do not know.

18,965. You do a good business with Holland?—Yes.

18,966. Both zinc white and white lead are used by painters there?—Yes.

18,967. They are familiar with both?—We are selling to them. We do not know what they are using.

18,968. But you know that they are familiar with both?—Yes.

18,969. Have you seen anything of the Dutch report?—Yes.

9 May 1912.]

Mr. F. PISART.

[Continued.]

18,970. The Commission took seven years to examine into the point, and they came to the conclusion that in some instances zinc cannot be used with the same satisfaction as lead. Do you agree with that?—No. I have no personal experience.

18,971. That weakens your statement to the Chairman, and if you withdraw that statement, that ends the case. You stated that zinc oxide was good for any position in London?—I have heard that often.

18,972. But you have no experience?—I have no personal knowledge.

18,973. So we cannot attach much weight to that testimony?—No. I think that it is preferable for the Committee to have evidence from people who are experts on this question.

18,974. (Chairman.) I understand that you base the confidence with which you stated that zinc oxide, with the addition of 4 per cent. of lead would answer, on the fact that the State railways in Belgium use it, and Norway and Sweden almost exclusively?—Yes, absolutely. I do not see what will be the difference between Belgium and Sweden and Norway, and one part of London or another part.

18,975. I take it that with regard to the conclusion of the Dutch Commission, and the evidence that was produced before that Commission, you are not aware whether they had tried in their experiments the addition of 4 per cent. of lead?—I do not know exactly what they did.

18,976. (Dr. Collis.) Is the process by which you make zinc the direct method?—We are making it by both methods.

18,977. Can you make a satisfactory paint by the indirect method?—Certainly.

18,978. Which compares well with the ——— product?—Certainly.

18,979. You also make by the direct method?—Yes.

18,980. Is there any patent in either of the processes you are carrying on?—No.

18,981. So that it could be manufactured over here by another company easily?—Yes, absolutely. There is no patent at all. Each one of the processes is more than 50 years old.

18,982. You find no difficulty in producing by the indirect method and competing with the ———?—Not at all. German manufacturers also are making by the indirect process, and they have very good customers in England, I think they import to England, perhaps, eight times more than the ———.

18,983. The zinc white made by the indirect method imported to England, you think is eight times the amount to-day imported by ———?—I think so. I am not quite sure, but I think so. The total export of Germany of the product of the indirect process is, I think, about 18,000 tons, and the total production of

the ——— about 10,000 tons. In England Germany has very large customers. The ——— is selling more in France than in other countries.

18,984. Can you see any reason why it should not be manufactured here in England if the demand increases?—Not at all. I do not see any difficulty if the proper means are taken.

18,985. Are you likely to come here and make it yourself?—Yes, certainly; why not, if there is a large market?

18,986. There would be a large market possibly?—It depends on the restrictions that you decide on.

18,987. But you would yourselves consider the question of coming over?—Certainly.

18,988. (Mr. Sutherland.) Mr. Ricker-Devroede, in giving evidence a month ago, said: "What I say is so true that, although at the commencement of this law, which was passed in 1909, only white lead was used for the State railways of Belgium, within recent months we have had so much trouble with zinc white that an order for 60,000 kilogrammes of ground white lead has been placed by the works at Malines, the largest workshop of the State railways in Belgium, about 3,500 workmen being employed there"?—I will ask the Belgian Government.

18,989. (Chairman.) I wish you would. You have made the statement, and I would like you to verify it?—The last tender for pigment was placed last February, and it was for 100,000 kilos. of zinc oxide, and no white lead at all.

18,990. (Mr. Sutherland.) Mr. Ricker-Devroede said, "within the last few months"?—I do not know that the Belgian Government can place an order without asking for tenders. It is not the custom of that Government.

18,991. (Mr. Mason.) Can you suggest a reason for ——— exporting zinc to this country instead of manufacturing zinc oxide here?—I think the quantity that they export to England is not sufficient to have a separate-works; but I am not authorised to speak for them.

18,992. Did I understand you, in answer to the Chairman, to say that the price of zinc would rise for two years owing to the production being insufficient, but that at the end of that time the price would fall to the normal figure when the production rose?—Yes.

18,993. Is there no likelihood of there being a zinc ring, or combine, if your competitors, the lead ring, were abolished?—We have at present zinc combines.

18,994. If it has put up the price of lead, is it not likely that equally the price of zinc would be put up?—I do not think so, because there are so many makers; but it is impossible for me to reply to such a question.

18,995. Do you think that we shall not suffer—that zinc will not cost us more, so to speak?—I do not think so.

The witness withdrew.

Mr. GASTON DEPIERRES examined.

18,996. (Chairman.) Are you the managing director of the Indestructible Paint Company, Limited, Norway Wharf, Limehouse, E. P.—Yes.

18,997. And president of the Paint and Varnish Society?—I am a past president.

18,998. Have you had a long experience as a paint and varnish manufacturer?—Yes, nearly twenty years.

18,999. Have you studied the properties of both white lead and zinc paints from a scientific and technical point of view?—Yes.

19,000. Does your firm manufacture both lead and zinc paints?—Yes.

19,001. Have you any special interest in zinc paints as against lead paints?—I have no interest on either side.

19,002. Have both lead and zinc paints been in use for a long time?—Until the middle of last century white lead was practically the only pigment; but since then white zinc has come into vogue, and has been gradually more and more used.

19,003. Are there any defects in white lead?—Yes.

19,004. What are they?—First of all, its poisonous nature, and, secondly, the susceptibility of white lead to sulphur gases, and also its tendency to chalk and become powdery.

19,005. In regard to the susceptibility of white lead to sulphur gases, does that cause blackening of the paint?—Yes.

19,006. Can you tell us the cause of this chalking?—The cause of the chalking is mainly due to the carbonic acid contained in rain water, and also the action of sodium chloride contained in sea air. The principal chalking is due to the catalytic action of white lead, which is known as a magnificent catalizer, and induces continual oxidation of the linseed oil.

19,007. Is it, in your opinion, possible to do without white lead altogether for painting?—Undoubtedly it is possible.

Q 6 2

9 May 1912.]

Mr. GASTON DEPIERRES.

[Continued.]

19,008. Why do you say that?—I am firmly of opinion that it is quite possible to produce practically every class of paint, any kind of paint, without using white lead. I do not wish to say that white lead has not its place for some paint and for some purposes; I would not say that it is not a very excellent pigment; but if to-day white lead were suppressed I am sure that our houses would be painted equally as well as they are now painted, and that we should not suffer; and very probably in twenty years' time we should almost have forgotten the existence of white lead.

19,009. Are there any countries in Europe where the consumption of white lead is very small?—Yes. You have heard from Mr. Pisart his experience in Sweden. I need not repeat it. His evidence would hold good.

19,010. Then you hold strongly that white lead is unnecessary to-day as a pigment?—I think that you can undoubtedly do without white lead.

19,011. If you are forced to?—If you are forced to. If you are not forced to, naturally it will always be used. A lot depends on how you are putting the question to me.

19,012. I mean, could it be dispensed with without detriment to the stability of buildings?—Yes, I would say that it is possible to do without white lead without detriment to the stability of buildings.

19,013. What substitutes do you recommend to be used generally in place of white lead?—For the present we have only two substitutes, zinc oxide and lithopone.

19,014. Has zinc oxide been used widely as a substitute for white lead?—Yes, it has been used for many years as a substitute for white lead, and to-day it is more largely used than ever, I think.

19,015. How do you account for the fact that a large number of witnesses, particularly master house-painters have told us that they have made repeated experiments with zinc white, and have found it to fail, both with regard to durability and covering properties?—I think that it is entirely due to the lack of technical knowledge amongst house-painters.

19,016. How is zinc oxide manufactured?—It is manufactured by two processes, the direct process and the indirect process. In the direct process it is obtained straight from the ore without passing through the metal stage. I read a paper before the Paint and Varnish Society in 1910 fully explaining these two methods.

19,017. Will you please describe the direct process, briefly?—Oxide of zinc is obtained straight from the ore without passing through the metallic stage. In this process a low class ore is used, and generally the zinc manufactured by this process contains from 2 to 4 per cent. of lead salt.

19,018. Basic sulphate of lead?—Yes, basic sulphate of lead.

19,019. What is the indirect process?—The indirect process is starting from spelter and distilling the spelter in a retort to transform it into zinc oxide. That process is adopted by many—the Vieille Montagne, for instance.

19,020. How do the products of the two processes compare with each other in price?—You will readily imagine that direct zinc must be cheaper than indirect zinc; that stands to reason.

19,021. To what extent is it cheaper?—There might be a difference of about 2*l.* a ton.

19,022. What percentage would that be?—About 8 per cent. cheaper.

19,023. Which do you consider the better product for paint-making?—As far as I am concerned, I think that direct zinc is a long way better than indirect zinc.

19,024. What are the qualities which make it better?—It is a very much better pigment. Direct zinc possesses physical properties which indirect zinc does not possess. It is more opaque, and there is no doubt that its properties are due to intimate combination with lead salts which produces a special physical state, which it is impossible to obtain by the indirect process.

19,025. Does it cover better, and is it more durable?—Yes, and it covers better than white lead. I showed that in my lecture. I showed blackboards painted white. The opacity of the direct zinc oxide is greater.

19,026. You make that statement with great confidence?—Yes; I can substantiate it by proof.

19,027. You make it with confidence in the presence of Mr. Sutherland?—Yes.

19,028. Why is zinc oxide made by the direct process better in this respect than that made by the indirect process?—I have explained that it is on account of the special physical properties of the oxide.

19,029. What is the reason of the difference between the two varieties of zinc oxide?—Most probably the presence of a small amount of lead salt alters the physical properties.

19,030. (Mr. Sutherland.) The process is slightly different?—Yes.

19,031. That probably produces the physical difference?—Undoubtedly. In the case of zinc oxide produced by the direct process the oxide seems to be formed in an atmosphere containing a slight amount of lead, and on that account the physical property of the oxide is altered. Even a man who is not an expert can immediately detect the difference between a handful of oxide made by the direct process and oxide made by the indirect process. The oxide made by the direct process is soft, greasy and unctuous; whereas if it is made by the indirect process it is harsher. There is a different feel about it; it is not quite so soft.

19,032. (Chairman.) What proportion of lead compounds do you find in good zinc paints?—I do not think it ought to exceed 5 per cent., and that should not be added lead salts. It should be the lead present in the process of manufacture.

19,033. Would you tell us whether the presence of 4 per cent. of lead compound is objectionable and likely to cause injury to health?—Four per cent. is so small.

19,034. Is it the fact that the Belgian, Dutch, French, Swedish and Swiss Governments' specifications all admit of 4 per cent. of the lead compound?—I could not say anything about Switzerland, I am not quite sure about that; but the Dutch, Swedish, Norwegian and French Governments admit 4 per cent.

19,035. In specifications for zinc paints in this country, is it usual to allow a small proportion of lead compound?—It is not usual, and in my opinion that is a very great mistake. I must say that I have read the specifications of large public bodies—I cannot mention names, but I know of cases where many hundreds of tons of zinc oxide are ordered, and the stipulation is that the zinc oxide should be absolutely pure—99½ per cent. of pure zinc oxide. I know that it is mixed with white lead—half-and-half—that is a perfectly ridiculous thing. The paint manufacturer is not at all obstinate in this respect, and if we had not a stipulation of that description, which is perfectly ridiculous, we should then be able to use direct zinc oxide, which is a most excellent pigment, and the difference in price would undoubtedly be a very great advantage.

19,036. Would an allowance of 4 per cent. of lead compound be an improvement?—Yes.

19,037. Would you go so far as to say that the failure of master house-painters to succeed with zinc oxide paint is because they have not had the 4 per cent.?—I would not go so far as that, but if what I have indicated had been the practice, no doubt a good deal of the prejudice that has existed against zinc oxide would have been removed.

19,038. Can you tell us anything about lithopone?—Yes.

19,039. Has it been very severely criticised?—Yes, no pigment has been more so, and none has survived condemnation so well.

19,040. What kind of painting work is it specially suitable for?—It is principally used for interior work and water paints, and also for under-coating.

19,041. You do not consider it as good as zinc oxide?—No, not for outside work, but if it is properly

9 May 1912.]

Mr. GASTON DEPIERRES.

[Continued.]

mixed I think that lithopone has a very great future, and would be really quite as good as white lead.

19,042. You say in your proof that it is excellent for interior painting. Can it be used for exteriors?—It is more or less used now. An enormous improvement has been made in the manufacture of lithopone. You must remember that the lithopone of ten years ago and the lithopone of to-day are practically two different pigments. It is now used a little for outside work, and I have not heard many complaints. Its photogenic properties are to a great extent against it.

19,043. (*Mr. Sutherland.*) Do you mean by that, its liability to change?—Yes, to change from white to grey and return to whiteness again.

19,044. (*Chairman.*) Has lithopone pigment a good body?—A very good body indeed. It has excellent covering power.

19,045. What is lithopone principally used for in practice?—For interior paints and water paints.

19,046. You have told us that your firm manufacture both lead and zinc paints. Have you supplied zinc paints for any length of time?—Yes, we have supplied zinc paint for a great many years. My firm are contractors to the Admiralty, and we have supplied thousands of gallons of paint to the Admiralty; I am talking of zinc paint at the present moment. We have obtained contracts for supplying paint for the five super-dreadnoughts that are being built in this country at present by the Admiralty, at the Thames Ironworks, Beardmore's, and Armstrong Whitworth's. In all cases the paint that we have supplied is a zinc paint. Our last order from the Admiralty, a month ago, was an order for 7,000 gallons. That, of course, gives you an idea of the amount of zinc paint used. I may tell you that the paint supplied to the Admiralty is manufactured from direct zinc oxide. We have obtained absolutely the greatest number of points for excellency.

19,047. (*Mr. Sutherland.*) In competition?—In competition. It does not all depend on the quality of the zinc, and so on, but on the mixing. Many things are necessary for producing good paint.

19,048. (*Chairman.*) Can zinc paints be used in a similar manner to ordinary paints?—No, you require special knowledge—I do not say special chemical knowledge or technical knowledge, but you cannot use zinc paint exactly in the same way as you can use white lead.

19,049. (*Mr. Sutherland.*) Would you apply that to lithopone as well?—Certainly.

19,050. (*Chairman.*) Would it be difficult for a painter to apply zinc paint?—It is not difficult. He could be taught how to apply it, and he could get into the habit of doing it. I know that many painters have no trouble with zinc paint at all.

19,051. How does the cost of zinc oxide paint, prepared for use, compare with that of ordinary lead paints?—To-day it is cheaper, but I should say that there is very little difference in price, taking normal conditions.

19,052. Does the zinc paint deteriorate when stored for any length of time?—No, it does not at all. Do you refer to ready mixed paints?

19,053. Yes?—If it is properly made it can be kept for a long time.

19,054. For how long?—Two or three years. We have agreed with the Admiralty, that if any of such paint settles within two years we will take it back.

19,055. Can you say the same with regard to lead paint?—No, indeed you cannot. That is common knowledge.

19,056. To what extent do they differ?—Do you mean from the point of view of keeping?

19,057. Yes?—I am talking of ready mixed paint. With white lead paint the lead, naturally being heavy, falls; and there is also a hardening action.

19,058. For how long would you guarantee that lead paint would keep?—It all depends on its constitution.

19,059. You have told us that you give the Admiralty a guarantee of two years with regard to the keeping properties of zinc paint. What guarantee would you give with regard to the keeping properties of lead paint?—I would not give any guarantee at all.

19,060. What is the covering capacity of zinc paint as compared with that of lead paint?—Do you mean by that, spreading power or covering power?

19,061. Spreading power?—The spreading power of white zinc will be practically 20 per cent. more than that of white lead.

19,062. Does it retain its colour for a length of time unchanged?—Certainly. Oxide of zinc does not change on exposure.

19,063. Is it a suitable base for mixing with the pigment or colouring ingredients in common use by painters?—Certainly; most decidedly so. It is much better than white lead.

19,064. Can it be used with the same vehicle and thinners as the painter would use for ordinary lead paints?—Yes. It can be used, like white lead, with linseed oil and turpentine, and the necessary quantity of liquid driers, such as manganese, lead-manganese, cobalt, or nickel siccativ.

19,065. Do you generally send it out ready mixed?—Most of our business is done in ready mixed paints.

19,066. Will you please give us particulars of a few buildings where your paints have been used, first for internal decoration?—There are so many that I should have difficulty in making a selection, but I should be very pleased to send you a list.

19,067. Can you tell us whether your paints, which, as you have told us, have been successfully applied, were applied over former coats, or priming coats, of white lead or not?—In many cases they have been applied over coats of white lead. In some cases they have been applied on the top of under-coatings which we have prepared, these under-coatings sometimes containing white zinc and white lead, and sometimes only containing white zinc. In other cases the under-coating has been a composite paint.

19,068. Have you noticed any material difference when the paint has been applied over an under-coating of ordinary zinc paint?—No. Provided that an under-coating is properly made and is suited to the surface that it is intended to be applied to, as it would be in our case if we prepared it, we should not notice a difference.

19,069. Is there any great difficulty in preparing an under-coating from white zinc?—It is difficult, but an experienced manufacturer would have no difficulty in preparing an under-coating from lithopone or zinc oxide.

19,070. Will you give us the names of a few buildings where your paints have been used for exteriors?—Yes.

19,071. When you give us the names, will you make quite sure that the priming coats have been other than lead?—Yes.

19,072. Will you also give us the dates when the exteriors were painted?—Yes.

19,073. To sum up, then, so far as your experience goes, do you assert that you have found your zinc paints to be efficient substitutes for ordinary lead paints?—Yes.

19,074. If the use of white lead were prohibited by law, would this embarrass you in any sense?—Not in the slightest.

19,075. Or would it embarrass your customers?—No, it would not.

19,076. (*Dr. Collie.*) Would there be any difficulty, in specifying in your specifications for zinc paints, in getting a pure article, the specifications being on the same lines as you follow to-day? In the future, for instance, if the French principle was adopted, would there be any difficulty in obtaining a definite standard to follow for zinc paints?—I can hardly imagine a better method of securing pure zinc oxide than the formula adopted by the French Government.

19,077. You think that such a definition could be used by artists and decorators in specifying the product which they want when they want a zinc paint?—Yes.

19,078. Would there be any greater difficulty in obtaining a pure product than there is to-day in obtaining pure white lead?—No. You are never sure that you are going to get genuine white lead if it is specified to-day.

9 May 1912.]

MR. GASTON DEPIERRES,

[Continued.]

19,079. (*Mr. Sutherland.*) You could enforce it? You could not enforce it; how could you do it?

19,080. By taking people to court?—But you could not prove it.

19,081. If you sell a brand of lead as pure that is not pure, that can be proved?—The lead would be pure, but the pigment might be a miserable one.

19,082. I follow?—You would have the same difficulty with zinc oxide as you have with lead. You might specify genuine English white lead, or you might specify genuine English white zinc; but by that definition you would no more safeguard yourself than you are at the present moment guarded against fraud (as I may describe it) when you specify genuine English white lead.

19,083. (*Dr. Collis.*) If you were using zinc as a base, and you were limited with regard to the final product to 5 per cent. of lead, would there be any difficulty in obtaining the requisite colours for decoration, for instance, red colours?—I do not follow you.

19,084. If the final paint you were going to put on was not to contain more than 5 per cent. of lead, would there be any difficulty in obtaining, for instance, red colours in particular?—Do you mean, can you make any colour with zinc oxide manufactured by the direct process containing 4 or 5 per cent.?

19,085. I suggest that the final product must not contain more than 5 per cent. of lead?—You mean direct?

19,086. Would there be difficulty in preparing bright vermilion, for instance?—Bright vermilion does not contain lead.

19,087. I mean bright red colours?—White lead is constantly used for producing colours.

19,088. You use red lead and orange leads largely?—You are going from white lead to red lead and orange lead. If white lead and orange lead were prohibited, you mean?

19,089. Yes?—I understand you now. It would be more difficult, but not impossible.

19,090. Do you think that you could obtain the range of colours that is obtained to-day?—Yes, provided that you did not bar basic chromate of lead, that is to say, orange chrome.

19,091. That would probably be largely permitted?—It would be very much dearer, of course.

19,092. The red colours are a difficulty, I understand?—Some years ago the colour manufacturer had practically only at his disposal the scarlet and the azos. He had more or less fugitive dyes. The dyes were precipitated or mixed with barytes, orange lead or red lead. We have now entered on a different phase. In the old days the azos faded very rapidly and left the base, and became dark and blackened very soon on exposure. Since then enormous discoveries and improvements have been made by dye manufacturers, and we have now not dyes but actual pigments, and it is possible to produce permanent reds. It is possible to get a red equal in brilliancy and more permanent when exposed in a polluted atmosphere like that of London, without any red lead or orange lead at all. These azo-compounds, not being merely dyes but actual pigments, have a body and obscuring power, and they form excellent paints, without having to go back to the old red lead and orange lead.

19,093. Are they dearer?—No. You have at your command now a range of red without the use of red lead or orange lead.

19,094. (*Mr. Gardner.*) Without any lead salts?—Yes; without lead salts, except perhaps lead acetate or nitrate, used sometimes in the precipitation. I am talking of improvements which are not much more than two years old.

19,095. (*Dr. Collis.*) Would there be any difficulty with the blues?—No. White lead or white zinc are not used for blues. We use so-called "reduced" blues, celestial blues, Paris blue, and so on. All those are cheap pigments with a certain percentage of barytes. White lead and zinc do not enter into the composition.

19,096. For the chromes and yellows, if chromate of lead could be used to a reasonable extent, you

would be all right for all the colours?—Chromate of lead is used in such a small quantity. I do not think that the restrictions should go so far as forbidding the use of it. It is a very useful thing.

19,097. (*Chairman.*) Is chromate of lead very expensive?—No, it is not very expensive. It is a most excellent pigment.

19,098. (*Dr. Collis.*) If the use were not prohibited, would it not be likely to be used by some people indiscriminately?—No; that is quite impossible.

19,099. If you had the blues, the reds and the chromes, you could obtain all the other colours by combination?—Brunswick greens are composed of lead chromates. I do not think that the restriction ought to go so far.

19,100. (*Chairman.*) Would you say that there should be prohibition if you had permission to use lead chromate?—It would not disturb me in any way. As a manufacturer, even if you included chromate of lead, I should not find myself in any difficulty at all in producing a complete range of colour, but I would not go so far as to say that it would not disturb the economic conditions.

19,101. What do you mean by "disturb the economic conditions." Do you mean that it would increase the cost?—It must increase the price of greens, certainly, but not of blues.

19,102. What sort of increase would that entail?—I should think that it would increase the price of greens by certainly 15 to 20 per cent.

19,103. (*Dr. Collis.*) If the limitation took the form of prohibiting lead expressed in solubility in gastric juice (the Thorpe test), chromate of lead is very insoluble by that test, and you could have large amounts of chromate of lead?—I do not think that the prohibition should go so far as chromate of lead.

19,104. You would be able to keep well within 5 per cent.?—Yes.

19,105. What is the form in which lead occurs in the zinc made by the direct process?—It occurs as a basic sulphate.

19,106. Then it only reaches about 4 per cent.?—Yes.

19,107. You do not know what the solubility of basic sulphate is?—In the acids contained in the stomach, do you mean?

19,108. Yes?—I am not prepared to give evidence on that. I am not a medical man.

19,109. The Thorpe test is made in a chemical laboratory. What is taken is the solubility to 25 per cent. hydrochloric acid solution. The basic sulphate is not so soluble to that test as lead carbonate, which is 100 per cent. soluble to that test. The 4 per cent. of lead which you might have in the directly made zinc, would allow perhaps another 3 per cent. of lead to be added for staining purposes?—I see your point.

19,110. You would have scope for adding a stainer?—I take it, that if you ever came to draft out a specification, you would consult practical men, paint manufacturers, and it would be possible to arrive at a nicety. When you had settled the principle the adjusting of these things would be quite simple.

19,111. The lead compounds which are used for staining, themselves have a low solubility?—Yes.

19,112. The reds have not?—No.

19,113. (*Mr. Sutherland.*) Is there any topic in Heaven or on earth on which there is a greater diversity of opinion than on the matter of paint?—There is great diversity of opinion, I am quite sure.

19,114. You said that zinc paint had 20 per cent. more spreading power than white lead, but you did not tell us whether it had more obliterating power?—I also say more covering power.

19,115. More obliterating power?—Yes, more obliterating power.

19,116. Coat for coat?—Yes.

19,117. With less paint?—Yes.

19,118. Your opinion is contrary to that of a large number of people?—I am quite aware of that.

19,119. Mr. Mason, who left early, gave me a question to ask you. The Chairman asked you about the solidifying of lead paint and zinc paint?—Yes.

9 May 1912.]

Mr. GASTON DEPIERRES.

[Continued.]

19,120. If you had zinc paint ground in oil in paste form in a wooden tub, or if you had the same thing with lead, what would happen?—Any man who puts lead or zinc oxide ground in oil in paste form in a wooden tub is an ass.

19,121. It is a common practice?—It is common practice.

19,122. Do you say that if he put zinc in he would be an ass?—Why should he do it with white lead?

19,123. Because it is the custom of the trade?—But if it is ridiculous, why should he do it? Are you aware that if you put white lead ground in oil in a paste form in a wooden tub, the wood will absorb a certain quantity of the linseed oil.

19,124. A little bit?—It does not matter how much. To that extent you rob the white lead of a certain amount of linseed oil. The man who opens it says, "This is good stuff. Look how hard it is." It is ridiculous.

19,125. It is the practice, is it not, to send white lead out in that way?—Yes, but as we become more intelligent we are doing away with the old state of things. White zinc if properly ground will keep quite as well as white lead.

19,126. In a wooden cask?—I do not know.

19,127. If you put it in a drum it will?—Suppose you put it in a paper bag, for instance, it will not keep.

19,128. With regard to the Dreadnoughts, what do you say about the under-coating?—That is prepared by the Admiralty. Experiments are being made at the present moment by the Admiralty with under-coating prepared by various manufacturers, but no report has been published. The proportion approximately is half white lead and half white zinc.

19,129. Lithopone?—Zinc oxide and thinners, linseed oil and turpentine, and a certain proportion of driers.

19,130. Is that for the hull?—For the inside and part of the outside, the gun mountings and so on.

19,131. What you supply is in the nature of enamel?—Yes.

19,132. Your business, in substance, has lain in the direction of ready-mixed paints?—Yes; that is the tendency of the paint trade in general—to supply the prepared article to the painter or builder, who is quite incapable of mixing his own paint.

19,133. You would not like that to go out to the painters, would you?—I have said it in my lectures. Every man to his trade. Why should he not buy the paint ready mixed?

19,134. It has been the practice to buy the paint in paste form?—Yes, more so in past years, and less as we advance.

19,135. Lithopone is not sold to painters in paste form, is it?—Yes, very largely.

19,136. Do you mean mixed?—It is sold at 2*l.* a ton.

19,137. Stiff?—The demand for it is becoming so enormous that manufacturers are not able to cope with it. Painters are astonished at the results they are getting. I would not recommend them to use it for the purposes for which they are using it, but they are finding out that they have a pigment of great obscuring power. In the last four or five years we have made more progress with driers than we had made in the previous fifty years. Progressive paint manufacturers are to-day taking advantage of new discoveries to supply the painter and the decorator with liquid driers which can be mixed with every paint, and give the most excellent result. The old-fashioned paste drier is dying away.

19,138. We concede the value for inside work, but the value of lithopone paint for outside work has to be demonstrated?—I admit that; I am with you there—that it has not yet been demonstrated. But lithopone to-day is not what it was ten years ago. We used to call it in the olden days "Griffith's White." It is vastly superior to what it was, and there is no reason to suppose that lithopone manufacturers are not going on improving their product. If it is used outside, I would say use it for under-coats, and not indiscriminately.

19,139. Is there much made in this country outside the water-paint people?—There are three manufacturers at the present moment.

19,140. All the rest is imported?—Yes.

19,141. If prohibition of white lead occurred and three years' grace were given, do you think that the facilities for making zinc oxide and zinc white are such that the demands of the trade could be met?—I should say that there would be no difficulty in finding the capital in this country.

19,142. But that is not the solution of the problem?—Nor is there any difficulty in finding raw material. I know a great many people in the paint trade and the chemical industry, and I cannot say that I know anybody who could at once, to-day, start a white zinc factory; but I do not think that it is impossible. M. Pisart told you that he would be quite prepared to do it, and other people would be prepared to do it; I should think. The manufacture of zinc oxide is a simple process, and it is not secret.

19,143. How is it, then, that it has never been made in this country, where there is a big market for it?—The reason is probably this. Some years ago the quantities used were small and not what they are to-day. I should think that it would not pay a man to start a zinc factory unless he could make at least 10,000 tons. With the very keen competition from abroad, and with the possibility of excellent investments that capitalists have had, they thought very probably that the starting of a zinc oxide factory was, after all, a poor venture, and nobody thought of doing it. I should imagine that to be the reason.

19,144. That would not relieve the difficulty of the situation, if we could not get paint?—But that would never arise.

19,145. If white lead were prohibited, I mean?—If white lead were prohibited, I am sure that it would not disturb the economic conditions at all, except on the side of the white lead corrodors.

19,146. You know that the Admiralty are the largest users of white lead?—Yes, and they use less and less.

19,147. They have not abandoned it?—They have not abandoned it yet.

19,148. Do you think that they will?—I should not be at all surprised if they abandon it.

19,149. Are you conversant with the experiments that the National Association of Master House Painters made?—I am not personally conversant with them, but I have spoken with my friend Mr. Smith about them, and in various quarters. They are not taken very seriously.

19,150. In soft climates like Plymouth, where you would say the conditions are beautiful, the lithopone panels absolutely perished?—Very likely. For the seaside lithopone is not a good pigment.

19,151. Is zinc oxide better for that purpose?—Yes.

19,152. Fortified by varnish?—All pigments when fortified by varnish keep better, certainly.

19,153. I concede that. In all cases we found that the protective coat — ? I cannot discuss your experiments, but I have heard from practical men that they could not be taken as serious.

19,154. We did not disclose any names. We felt that the experiments might have been more scientific, but they had their value?—All experiments have their value. Did you experiment with zinc oxide?

19,155. One panel was zinc white?—Did not you experiment with zinc oxide?

19,156. No. We shall after the Report?—If you do experiment with zinc oxide, you should experiment with not only one zinc oxide but more than one; because as there is a difference in white lead, so there is a difference in zinc oxide.

19,157. Do you know Professor Baly's lecture?—No.

19,158. It was published in the society journals. His evidence here, and that of others, is that there is an emanation from paint that is not lead but is very noxious in its operation, and that it proceeds from the effects of oil and turpentine and drier?—Very likely.

Q q 4

9 May 1912.]

Mr. GASTON DEPIERRES.

[Continued.]

19,159. And he thinks that possibly a large number of cases of what is called lead poisoning, arise from this?—But it is not cumulative, is it? Take, for instance, the vertigo you get.

19,160. Two or three witnesses have stated that the same symptoms would arise from zinc paints; and in one case a gentleman said that if you mix sand with oil, turpentine, and drier, you get the same result?—At certain times I have known cases where men have suffered from the effects of varnish fumes or turpentine fumes, and at other times they have had no effect. It all depends on the physical state in which you find yourself at the time. No doubt the diagnosis of plumbism very often has been mistaken, but that does not destroy the argument that lead is poisonous.

19,161. As a man who knows the trade, do you think that the Committee has data enough upon which to make a recommendation for the prohibition of white lead?—I do not know what data you have. I do not know what evidence you have, or whom you have seen.

19,162. But taking your knowledge of the trade, do you think that there is sufficient data as to the noxiousness of white lead to justify a recommendation for its prohibition?—I am not prepared to say that I am for complete prohibition, as I have said; but I am certainly

for very very stringent regulation, not so much with regard to the manufacturer. I think you can regulate factories perfectly well with Government inspectors, and all that, and really bring the danger of plumbism in factories to a minimum. But even with strong restrictions, it will be difficult with painters. I certainly think that strong restriction should be imposed. I do not see how you are going to cope with rubbing down. It is an impossible problem to me.

19,163. (*Chairman.*) Supposing that the Committee find that any set of regulations will be ineffectual, or at any rate, will not be completely successful in removing the dangers, would you agree to prohibition?—I do not think that the country would suffer at all. No doubt in every big change someone has to suffer.

19,164. But speaking broadly?—Speaking broadly, I think that in ten years' time we should forget that white lead had ever been used.

19,165. (*Mr. Sutherland.*) Would you welcome its prohibition?—No. We are not interested in the grinding of white lead or white zinc.

19,166. (*Chairman.*) Prohibition would be the easiest solution for all concerned, would it not?—That is the easiest solution, and the most effective. You do away with it by a stroke of the pen.

The witness withdrew.

## THIRTY-SECOND DAY.

Friday, 10th May 1912.

PRESENT:

SIR ERNEST F. G. HATCH, BART. (*Chairman.*)

LORD HENRY BENTINCK, M.P.

Mr. E. L. COLLIS, M.B.

Mr. W. G. SUTHERLAND.

Mr. A. GARDNER.

Mr. J. PARSONAGE.

Mr. A. L. O. FELL.

Mr. O. KINGGATE.

Mr. W. ROBINS.

E. A. R. WERNER (*Acting Secretary.*)

Dr. COLLIS in the chair for a short time.

Mr. WILLIAM CAIL examined.

19,167. (*Chairman.*) Do you attend to-day to represent Cail's Bitmo Company, Ltd., of Newcastle-upon-Tyne?—Yes.

19,168. Do you manufacture leadless paints?—No, not paints.

19,169. Will you give us a list of the principal compositions which you manufacture and the purposes for which each is intended?—We manufacture practically two compositions of a bituminous nature. The first is a solution which is used as an ordinary paint. That is a sample to show its flexibility (*producing a specimen*). That is used either as ordinary paint or as a priming coat when the second composition which we manufacture is used.

19,170. Would you call this a paint?—We call it a solution.

19,171. I only ask because you said that you did not manufacture leadless paint?—Yes.

19,172. This would be a paint not containing lead?—Yes.

19,173. So that you do manufacture a leadless paint?—Yes, if you call that a paint.

19,174. The purpose for which it is used is as a paint?—Yes. The second composition is an enamel which is put on in nearly a boiling state. (*The witness handed another specimen to the Committee.*)

19,175. Is this one coat?—One coat.

19,176. It is a thick coat, is it not?—Yes.

19,177. What is the thickness of it?—One-sixteenth or a shade more. It depends on whether it is on a

vertical or on a flat surface. There is more on a flat than on a vertical surface because on a flat surface it does not run.

19,178. Is that paint on iron?—That is on a piece of iron. That is painted after the iron has had a first coat of the solution. The solution sinks into the pores of the iron and enables the hot enamel to get a hold of the iron, otherwise the hot enamel would not stay on.

19,179. These are the two compositions to which you now draw our attention?—Yes.

19,180. Do you make Bitmo enamel for ships' bunkers and floors under boilers, &c.?—Yes.

19,181. That is the last specimen you showed us?—Yes.

19,182. And Bitmo covering for tank tops under engines and boilers in ships?—Bitmo covering and Bitmo cement vary very little from the enamel. They have a higher melting point and a rather higher specific gravity. That has a smaller percentage of pure bitumen in it.

19,183. They are modifications of the enamel?—Yes, to meet the circumstances of each case.

19,184. The Bitmo cement for bilges flat of bottom, &c., is again a slight modification?—Yes.

19,185. We may take it that Bitmo enamel is made in three grades?—Yes.

19,186. And the other will be Bitmo solution for exposed deck holds, peaks, funnels and tanks?—Yes.

19,187. That is the first sample to which you drew our attention?—Yes.

10 May 1912.]

MR. WILLIAM GAIL.

[Continued.]

19,188. The paint. Are all these compositions intended especially for the use on ships, and iron and steel work generally?—When we first began to make them our intention was to use them entirely for ships, but since the use of them has so widely extended they are very largely used on land work now all over the world wherever there is metal to be protected from corrosion.

19,189. The compositions are essentially for applying on metal and on no other substance?—In a few cases they are applied on wood, but they are essentially for metal.

19,190. What is the effect of applying them on wood?—If the wood is dry, before you get a smooth surface you have to put about three coats on, it sinks in so much. The first two coats are comparatively dull. The first coat very nearly vanishes. The second gives a dull covering. You have to give a third coat. It is to preserve the wood and make it practically watertight.

19,191. Are these compositions applied in the same way as ordinary paints?—The solution is applied in exactly the same way as ordinary paint, but in applying the solution you have to be more careful in getting absolutely dry surfaces and absolutely free from rust. All the rust or scale must be chipped off so that you get down to the bare iron.

19,192. And the enamels?—The enamels are applied hot. They cool so rapidly that if you take a brush stroke six or eight inches in length, before you get down to the bottom the top is solid and cold.

19,193. When the customer receives your enamel he receives it in a hard block?—Yes.

19,194. Which he has to melt and then apply, and, as he applies it, it sets?—Yes. He has to melt it with a certain proportion of oil according to the purpose for which it is going to be used—that is a certain proportion of coal oil not linseed oil.

19,195. Is it shale oil?—It is not exactly a shale oil; it is a coal oil of a high specific gravity.

19,196. Is it a Scotch oil, or is it obtained elsewhere?—It is a product of the distillation of tar.

19,197. Obtained from ordinary coal-gas tar?—Yes.

19,198. Is Bitmo solution intended to be used with a first coating of red lead?—No.

19,199. Is it possible for anyone using Bitmo solution to dispense with the use of lead entirely for painting iron and steel work?—Certainly.

19,200. What is the composition of your non-poisonous paint so-called, to which you first draw our attention?—The composition is various kinds of bitumen. We at the present time have about four or five kinds of bitumen.

19,201. From Trinidad and elsewhere?—Trinidad and Mexico, and we get some very good from Germany and Manjak which has a very high melting point indeed. It depends on the purpose for which it is wanted and what part of the world it is going to a certain extent.

19,202. Are the supplies sufficient to meet all likely calls that may be made upon this material? Is there plenty of this bitumen?—I think there is plenty, but the price has been going up very much lately.

19,203. The paint is sent out fluid, is it not?—Yes.

19,204. It is mixed with something else to bring it into solution?—No, it is never mixed with anything else. It is applied exactly as it is sent out.

19,205. But the bitumen is otherwise solid?—It is sent out in solution. When I say it is in solution, part of it is in solution and part of it is in suspension.

19,206. Are volatile substances used for this purpose?—Yes, naphthas.

19,207. Do you recommend this paint to be used in closed places at all?—It is used in the peaks of steamers which are very difficult to do (they are very much enclosed) and in the tanks and underneath the boilers. Sometimes a tank is 30 or 40 feet long. It is a great deal sub-divided and it only has one man-hole at one end and another at the other. The ventilation is very bad. You can only get trained men accustomed to the fumes to work there. It irritates the throats of men not accustomed to the work and makes them cough.

19,208. Do you issue any warnings to the men?—We have had practically the same men for 17 years. They know more about it than I do.

19,209. Do I understand that this paint is not sent out to the public, but is only applied by your own men?—It is sent out to the public, but where it is sent out to the public it is generally used in the open air or where there is no danger. Nearly all ship work is done by our own men by contract. The construction of each ship varies so much, and the cost of applying it varies so much, according to the construction of the ship, that it is almost impossible to quote so much per 100 square yards or 100 square feet, the wages run so differently according to the construction of the ship. We always get a builder's plan sent to us, which we measure ourselves, and estimate.

19,210. Are there any lead compounds in your paints?—None.

19,211. Are leads driers added?—No.

19,212. Do you use turpentine for thinning?—No.

19,213. Is your composition substantially a carbon paint?—Yes.

19,214. Is your composition rust proof and damp proof?—That is a very crucial point that we have been trying to establish for many years. I can only answer that by referring to repeat orders. I think that repeat orders are the best answer to the question.

19,215. Yes; but is that your claim?—That is our claim.

19,216. (Mr. Gardner.) What happens when they want to examine the skin of a vessel after it has been painted with the enamel?—They chip some off.

19,217. As they do with ordinary paint. When it is chipped off do you find rust underneath?—They chip the enamel off to get at the skin.

19,218. Do you know if the skin underneath is rusted. Is it quite clean?—Yes, when there has been perfect adhesion. A great deal depends upon its being applied in the first instance on thoroughly dry and clean surfaces. If the contact is good the enamel lasts as long as the friction will allow it to last. In the coal shoots and so on, it wears off with friction.

19,219. What process is adopted to clean the steel plates before you apply your stuff?—Chipping and cleaning with steel brushes.

19,220. It is not red leaded first, and then the red lead cleaner off to take the scale off?—No. You could not put this on where there has been an oil paint unless every scrap of the oil paint was taken off.

19,221. How do you get the scale off a plate?—The mill scale?

19,222. Yes?—Leave it on.

19,223. What happens to it?—Nothing.

19,224. It seals it up?—Yes. We had a case the other day where bunkers were opened out after 11 years. The plate had just the mill scale on the same as the day it came out of the mill.

19,225. When you chipped off the bitumen, you would take the mill scale with it, and clean the plate then?—I do not think so.

19,226. When it gets a touch of oil behind it, the scale comes off?—There is a pitch oil, not a linseed oil, in the composition of the enamel; but you can hardly call it an oil. As it is put on, the heat is momentary. It becomes solid after that. The oil is not there as an oil. The oil is there in combination with the bitumen.

19,227. (Chairman.) How long does the paint composition take to dry?—It depends on the condition of the atmosphere, and the current of air—the ventilation.

19,228. Exactly, but take an ordinary room, or the hold of a vessel. It is not done in an ordinary room, of course?—Three or four hours probably.

19,229. It would take longer if it was in an enclosed place?—Yes.

19,230. What is the longest time it would take for the paint to dry?—I should think if it was in a small peak absolutely enclosed, and it was on a muggy winter's day when the air was loaded with moisture, it might take three or four days before it became hard.

19,231. Is either of the compositions affected by sulphur and acid fumes such as are present in the smoke of cities?—Our own works have been up 16 or 17 years. They face the river. They are corrugated

10 May 1912.]

MR. WILLIAM CAIL.

[Continued.]

iron, coated with the solution. They were painted when they were put up and they have never been touched until quite recently, when some of the roofs were done over again. The sides have never been done again at all.

19,232. Had they been done, do you remember, before I visited your factory?—I do not remember.

19,233. I remember being shown parts which they said had been done for many years?—The vertical parts have never been done a second time since the place was built.

19,234. I saw those?—The roof plates have gone to a certain extent. We have some very big lead gutters, and the plates came down inside the gutters rather low. The outside of the plate was protected with the solution, but the inside of the plate was not. The plate went according to the height of the water in the gutter. During those 17 years it had gone from the inside of the plate. It was an ordinary galvanized iron plate. That was the only place that we found where it had gone.

19,235. So you would say that the acid fumes and the sulphur in the atmosphere and the smoke of chimneys does not affect your paint?—Here is a testimonial from the Norddeutsche Textil-Werke Aktien Gesellschaft, Darmstadt, Germany. They get it regularly from us. This is an order. (Handing the same to the Committee.)

19,236. Do you wish to put other papers in at the same time?—Nos. 6, 7, 9, and 10 all bear upon that question. Perhaps if you read No. 10 that will be sufficient.

19,237. No. 10 is from A. G. Green, ironfounders and engineers, Rotherham: "We have used your Bitmo solution on the whole of our premises for the last three years, and found it the most serviceable material we have had. Previous to using it we tried several special paints and solutions, as the fumes from our casting shop acted on the galvanising of the sheeted roofs and caused the sheets to corrode very quickly. We put on a new roof three years ago, and painted the sheets before fixing, and they are now as good as when they were done. Using your solution has saved us a good deal and we can recommend it with confidence."—Those will go on to the notes. Do those shorthand notes become public?

19,238. Yes?—I do not suppose that any of the writers of those would object to having their testimonials made public, but, as a matter of right and wrong, I ought to ask.\*

19,239. We cannot accept them as evidence unless we have the opportunity of publishing them?—Would you object if we wrote to them and asked if they had any objection?

19,240. Certainly not?—I do not suppose that they would object, but some of these things have been given without any idea of testimonial.

19,241. Exactly?—Here is one. We did a ship a good many years ago, and they are going to alter the ship to carry motor spirit in some of the bunkers. They could not get our staff off. Here is a letter from the superintendent engineer to know if we could recommend anything to dissolve it in case they could not chip it off. I thought that the best testimonial we ever had, but it was not given as a testimonial.

19,242. Will the composition stand as well as lead paints in trying positions?—That, again, is a thing that we say it will do.

19,243. We want your opinion?—But I do not want to push our things to the detriment of anybody else's. I am chairman of a bridge company which has one of the high steel bridges over the River Tyne. The bridge was reconstructed about twelve years ago.

19,244. Is that down below the new King Edward VII. bridge?—No, the next bridge higher up.

19,245. On your left as you come across the King Edward Bridge?—On your left coming from the South and facing North. It has been painted twice. It has

never been properly chipped and cleaned when painted by ordinary painters. I determined to have it properly done this time. I lent my own men to the bridge company, and they painted it in the way in which it should be done. I did not get any profit out of it. Here are some pieces of rust that were chipped off the steel girders underneath. The paint remained on the top, but the rust had been going on underneath the whole time.

19,246. Was this your paint originally?—No.

19,247. Another party's paint?—Yes. This was on the top of the piers.

19,248. This shows rust underneath. Do you know whether the metal had been properly cleaned before the composition was applied?—My impression was that it had not.

19,249. Failure here may have been due to the wrong cleaning. Perhaps it was not necessary with the kind of thing that was used?—No. On part of the bridge now, I am going to have about five or six different paints put—the best lead paint, the best white lead paint, &c. Those are all linseed oil and turpentine paints. I am going to have some varnish paints and some of our solution. Personally I believe that our solution will be the best, but, being chairman of the company, I do not like to say too much. But I have told the other directors what I intend to do, and they thoroughly agree that the trials will be very useful in the future.

19,250. How long will these trials require?—I would say six years.

19,251. This Committee will not be able probably to acquaint themselves with the result of the test?—Not unless they sit so long.

19,252. How does your paint compare with lead paints in regard to its covering power? What do you say about your composition first?—One hundredweight will cover about 2,000 square feet of old iron or old steel. That is in the case of an old ship, going through her survey. It will cover about 2,500 feet of a new ship with new plate, or 3,500 feet of ordinary galvanized iron roofing.

19,253. How does that compare with lead paints?—It has a much greater covering power than that of lead paints.

19,254. Lead paints made up with linseed oil and turpentine would not cover to the extent that you are claiming here for your paint?—No.

19,255. Do you know what they would cover?—I should not think that they would cover half as much, roughly speaking.

19,256. (Mr. Gardner.) The two things are not comparable at all. You cannot compare a tar paint for covering power with a lead paint or a leadless paint. The tar will obliterate much more than the lead will?—But these are not tar paints, excuse me. They have absolutely no tar in them.

19,257. We call them tar paints?—You do, but it is an incorrect name. It is not fair to the paint.

19,258. You could not put paint on the top of your Bitmo solution?—If you put it on when it is fresh it gradually discolours the paint. If you allow it to be exposed to the weather for two or three months, then you can paint on the top without discolouring the paint.

19,259. (Chairman.) In your opinion its covering power is about twice that of an ordinary oil paint?—I should say at least twice.

19,260. How does the cost of your paint compare with that of lead paints?—That is a difficult thing to say. I can give you the exact cost of our paints, but lead paints vary very much according to their degree of purity or degree of adulteration, and also according to the linseed oil market. A few years ago it was 20l. a ton. Lately it has been up to 45l.

19,261. What is the price per hundredweight of your paint?—35s.

19,262. (Mr. Parsonage.) Ready for use?—Yes, ready for use.

19,263. (Chairman.) That is the paint, not the enamel? What is the price of one hundredweight of paint to-day?—About 32s. I should think; I do not know.

\* This witness wrote under date 28th May 1912, saying all the writers of testimonials referred to were willing for the matter to be published.

10 May 1912.]

Mr. WILLIAM CAIL.

[Continued.]

19,264. Do your customers tell you it is no more costly to paint with the leadless paint than to use lead paints?—They have never told us so.

19,265. Over what period have your compositions been in use?—17 years.

19,266. Do I understand that you have had no complaints from customers on the score of the durability of your paint?—No, I do not think that we have had any complaints. It is quite possible that somebody may have found it not to suit him, and may simply have dropped off sending us orders.

19,267. Can you name a few of your most important customers who have expressed their satisfaction with the compositions and have given repeat orders for them?—Here is one list of a few representative firms—Armstrong Whitworth & Co., Ltd.; John Brown & Co., Ltd.; The Consett Iron Company, Limited; Clayton Sons & Co., Ltd.; Coppee Co., Great Britain, Ltd.; Coke Ovens, Farnley Iron Company; Easton, Gibb and Son, Ltd.; H.M. Rosyth Dockyard; Hendon Paper Works; Robert Haggie & Son, Ltd. (Rope Manufacturers); Koppers Coke Oven Co.; Low Moor Company, Limited; Leeds Forge Company, Limited; Leeds Tramway Company, Limited; Manchester Corporation; Metropolitan District Railway; North Atlantic Steamship Company, Limited; Northern Counties Electric Supply Company; Otto Helginstock Coke Oven Company, Limited, Crigglestone, Wakefield; O. A. Parsons & Co., Ltd. (Turbine Works); Port of London Authority; Sharpe & Co., Ltd. (Engineers); South Kirkby, Featherstone and Hensworth Collieries, Limited; South Metropolitan Gas Company; Sheffield Coal Company, Limited; Stewart & Lloyds, Ltd. (Tube Manufacturers); Skipworth, Jones and Lomax Co. (Steel Works); Taylor Bros. & Co., Ltd. (Engineers); Werner, Pfeleiderer and Perkins, Ltd.; Washington Chemical Company; Cayzer, Irvine & Co., Ltd. (Shipowners). Those are a few representative firms.

19,268. Are your compositions used on gasometers at all?—Yes, I think they are, but I could not say for certain. The gasworks do get them. Here is a list of some names with the different purposes for which they are used. I do not propose to read the names but the purposes for which they are used.

19,269. The purposes for which they are used will interest us?—Roofs, ships, &c., contractors' work, tramway corporations, engineering, iron and steel works, collieries, quarries, potteries, &c., gasworks and sundry manufactories. Those are all inland.

19,270. Do you advertise your compositions largely?—No; we hardly advertise at all.

19,271. Do you find that unnecessary?—It may be foolish; it may be prejudice on my part; but I do not believe very much in advertising. I rather believe in

saving the money on advertising and putting it into good material and good work. I think in the long run you build up a more sound business.

19,272. As regards the size of your factory, are you well occupied with orders?—We are very busy indeed. During the last week we shipped two orders, one of about 90 tons to Germany, and another one of 70 tons to the United States.

19,273. Your factory at present is not a large one, is it?—No, it is not, but it is so arranged that we turn out a large amount of stuff.

19,274. (Mr. Fell.) I understand that you are using this in connection with some tramway work. What is it used for?—They use it for protecting the motors beneath the body of the car, I think.

19,275. Do they use it for the trucks?—For the trucks, and I think that it has also been used in the centre of some of the roofs between the double roof.

19,276. I take it that this paint is not used in the ordinary way for painting woodwork?—No, it is not used for painting woodwork except in rare instances. The only case where I know of it being used for woodwork, apart from rough work, was in a fish hatchery where they could not keep the tanks tight. It was a trout hatchery. They used our composition; it has given perfect satisfaction, and they have never had any trouble since.

19,277. Where the motors get hot, if you use the compound, does it stand the temperature all right?—At the Consett Ironworks we did a lot of their flues which take the hot air into the blast furnaces, which tubes had a dull red heat. The composition stood perfectly well at that temperature.

19,278. You have only one colour, namely, black? At the moment we have only black. We are busy experimenting to try to get others, but the difficulty is that all the bitumens contain more or less sulphur. We are trying now to find a bitumen free from sulphur. Sulphur disfigures most colours.

19,279. Has any of your paint compound been used for painting motor carriages; ordinary automobiles, for instance?—Not that I know of.

19,280. Not for steel bodies?—Not that I know of. With regard to a great deal of what we sell, we do not know where it goes to. It is used in connection with acid and in connection with heat. We are sending a very large quantity out to the Rand and have been for the last twelve or thirteen years. That is used for two purposes. On the Rand they have no brick chimneys, but all steel chimneys. It is used for protecting steel chimneys, and for protecting the cyanide works, where they crush the gold out. It is used in the acid process where they dissolve the gold out.

The witness withdrew.

Mr. ARCHIBALD VICKERS examined.

19,281. (Chairman.) Do you attend to-day as the representative of the firm of Archibald Vickers, Ltd., paint and varnish manufacturers?—Yes.

19,282. Do you manufacture leadless paints?—Yes.

19,283. Is your paint intended to be used as a substitute for white lead in paints?—Yes.

19,284. What is the composition of your non-poisonous paint?—Do you mean the pigment or the binder?

19,285. It is the pigment we specially desire to ask about?—It is a zinc base.

19,286. What vehicle is used?—Many; such as wood oil, linseed oil, sunflower seed oil, menhadyn oil and so on.

19,287. Are there any lead compounds in your paint?—None—well, not willingly put in. But there is a question of lead in zinc at times. You have had that question raised here before, I expect.

19,288. Certainly?—You may get 2 per cent. or 3 or 5 or  $\frac{1}{2}$  per cent. I am going to do away with lead if I can. When I get any lead salts I get into trouble generally, even with the lead drier.

19,289. Do you find zinc made by the direct method as satisfactory as zinc made by the indirect method?—I may be a little bit prejudiced on the question. I will

not say I am not. We have heard so much from the makers of the direct as against the other process that we are all wrong if we do not fall into line with them. I am a little inclined to take a free course and not be semi-frightened almost at times into using a zinc that they say is the only perfect one on the earth. There are other zines.

19,290. What is your experience as regards the respective values of zinc made by the direct and the indirect methods?—I am rather inclined to have the pure zinc, and I know where I am.

19,291. You prefer the indirect method?—Yes.

19,292. Do you use lead driers?—No. I have stopped it. I have had trouble with it.

19,293. Do you get satisfaction with the driers you at present use?—Yes.

19,294. Do you use turpentine for thinning?—Not much.

19,295. To a slight extent only?—Yes.

19,296. Do you get sufficient covering power without the use of either red or white lead?—Certainly.

19,297. How does the cost of your paint compare with that of lead paints?—Under ordinary conditions or under the conditions of to-day do you mean?

10 May 1912.]

Mr. ARCHIBALD VICKERS.

[Continued.]

19,298. I suppose that it is fairer to take the conditions of to-day?—I know that this investigation has been going on for months. If the same question had been asked twelve months before the white lead makers had this little convention, as they call it, the position would have been very different from what it is this morning.

19,299. Could you give the position twelve months ago and also the position to-day?—I was buying lead at about 18*s.* 10*s.* when I used it. The selling price of lead this morning is about 2*s.*

19,300. Twelve months ago what was the price of your paint as compared with lead paints?—There was not much in it then, I think.

19,301. And to-day?—I can beat them.

19,302. By how much?—It is rather difficult to know how much one can beat them by. They have a fixed price. I can beat them on their fixed price considerably.

19,303. It is fair to take their present price?—I can beat them, and I should be pleased to.

19,304. By how much?—I do not know what their present price is to-day. That is just it. Only this morning I went to buy a sample to bring here. I saw a piece of paper on a wall "Over 5 cwt. of lead" so much, "Under 5 cwt. of lead" so much and so on. What their cost of production is and what they are selling at are different things. I can beat their price on the market easily by 5*l.* or 6*l.* a ton.

19,305. Do your customers tell you that it is no more costly to paint with the leadless paint than to use lead paint?—Those that I have quite taught how to use zinc paints, yes. Those that will not listen to reason say that it costs a great deal more because they have never tried it. Many men to-day will not listen to argument.

19,306. Does it take long to show a painter who is accustomed to use lead paints, how to apply zinc paints?—No, certainly not. In a great many cases—hundred and hundreds—they use it, and do not know when they are using lead and when they are using zinc. They have no knowledge of it. If they once get an idea that a packet of stuff brought to them is zinc they are down on it. If they have a long name on a tin with a very pretty label they say, "This is the stuff." They are using zinc all the time and do not know it.

19,307. You suggest that some customers will not listen to your teaching with regard to the way in which it is to be applied?—Speaking bluntly on the matter, they are so extremely ignorant—a lot of them.

19,308. But if they did not know the difference between the two when they got them, it would not matter?—They are so used to buying their paint by weight and you cannot put the same amount of weight into a gallon package of zinc as into a gallon package of lead, and directly paint comes on a job or goes out to a contract they find that they are 8 lbs. or 10 lbs. gravity wrong on a gallon. They say, "It is costing us " 5*s.* a pound; we can mix lead paint for 3*s.*; we cannot afford to pay 2*s.* a pound more."

19,309. I understand your argument. Over what period have your paints been in use?—Seven years.

19,310. Have your paints been found to be durable?—Yes.

19,311. For outside purposes?—Yes, under certain conditions.

19,312. Under what conditions?—It is very difficult to answer. You can put the same paint out of the same kettle in three or four different positions and localities. Three will be right and one wrong.

19,313. Will the same thing happen with regard to lead paints?—Yes, I think so. I had a case last week at Brighton. I was sent for to the West Pier. At the end of the pier there was a concert hall that was painted with zinc. Right down the centre of the pier there was a sort of lean-to glass shelter with seats both sides. That had been painted with lead. The pier building had been washed with powdered monkey-brand. I should have thought that that was bad enough to break any paint up. The surface looked splendid, but it had lost its gloss. You could wipe off the white lead paint with your hands all down the centre. I was there with Mr. Gibson, the director. They were re-painting. I showed him where the concert

hall was perfect. They had always sworn by lead; but for their pier captain they had an old naval man who knew all about zinc, and he induced them to send to a certain firm, not my firm, for some zinc last season or the season before and it was an eye-opener to them. It stood splendidly, while the other had all gone to dust.

19,314. Were the two supplied for re-painting in the same season?—Yes.

19,315. (Mr. Parsonage.) Southsea pier is now being done with zinc paint?—One of my agents from Portsmouth has just told me so.

19,316. It will get a fair test there, I should think?—Yes.

19,317. (Chairman.) Have you had no complaints on the score of durability?—Yes, I have had complaints; we all have; so have the white lead makers. It is no good hiding that point at all.

19,318. Can you name a few of the most important customers who have expressed their satisfaction with your leadless paint, and have given repeat orders for them?—Yes. I will tell you what I am prepared to do. You can send anyone you like down to the ledger room and pick out any names you like and write to them; take them *holus bolus*. That is far better than my giving you a few picked names. You can go and pick out names for yourself. That is fair anyhow.

19,319. Yes, but we wanted to put them on the shorthand notes?—I deal with over a thousand buyers of paint. Jarvis's of Hackney Road did a very big job with my paint. I asked him about the big job that he did down at Devon.

19,320. Could you give us one or two in different positions. The one you mentioned was probably a private house?—A private house.

19,321. Can you tell us of a big factory where your paint has been used?—It is very difficult very often for me to know where my paint goes.

19,322. I quite follow that. Could you give us a good outside job, for instance, in one of the industrial towns. That is the sort of thing we like. You can look the point up?—If you will give me a few of the sorts of jobs you want I will pick them out.

19,323. Outside pieces of work in an industrial town, Sheffield, Manchester, Liverpool, or London, or somewhere like that. Then give us a piece of private work; then work in a factory where it is exposed to severe tests with regard to temperature and moisture?—Very well.

19,324. (Mr. Sutherland.) Give us a seaside place where it has been used for three years outside?—Yes.

19,325. (Chairman.) Then where it has been exposed to the fumes of railways?—Sulphuretted hydrogen?

19,326. Sulphurous acids (SO<sub>2</sub>)?—And ammonia?

19,327. Yes, at the gas works?—I have never tried white for gas works. Red oxide is used.

19,328. Metal work as well as woodwork?—Yes.

19,329. If you can send those in to the Secretary we will have them added to your answer on the notes. We will not trouble you with the names of the thousand people that you deal with?—My point was that there should be no collusion. You could pick your own names.

19,330. We do not suspect you of any collusion?—I want to be fair.

19,331. You were good enough to offer to give a demonstration to show the comparative behaviour of lead and zinc paints in actual use?—Yes.

19,332. Will you please, before actually proceeding with the demonstration, explain to the Committee what you propose to demonstrate?—The position is this, gentlemen. I do not believe personally that the decorator has any great objection to zinc at all; I think that a lot of it is ignorance. I have met several men who have been up here, and I have heard their views of things. I have also met men who are to come and I am going to tell you what I think about it now I am here.

19,333. (Mr. Sutherland.) Have you been coaching them?—No, but I have been listening. My experience of decorating is a pretty big one. One man very well known in London said yesterday that he had no time to teach his men, as he was too busy.

10 May 1912.]

Mr. ARCHIBALD VICKERS.

[Continued.]

Let me tell you an experience that I had. I brought out a paint called "Body White" which was made of lead, and then I brought out a zinc paint, and sent it out as "Under-coat White." I found that if I sent that paint out as "Under-coat White" they would not use it. If I sent it out as "Body White" they would use it. All a man thinks about is the weight. Thousands and thousands of people will tell you they never use zinc, and do not mean to, and that they have never done so, but you see dozens of gallons in their shops.

19,334. A painter does not regard enamel as an oil paint but as a finishing coat?—Where would you make the line of demarcation between an oil gloss paint and an enamel finishing paint?

19,335. There is a marked difference?—In the label.

19,336. And in the price?—And in the actual finish.

19,337. Yes; in the finish there is a very marked distinction?—Do you suggest that zinc paints are going to be made simply straight from linseed oil?

19,338. That I will ask you later on?—It all hinges on that point, does it not.

19,339. (Chairman.) Would you explain what you propose to demonstrate?—The only point I wish to show you is the point that decorators are always grumbling about enamel and saying that no matter how you manipulate zinc you cannot get oblitative power.

19,340. Zinc oxide?—Zinc oxide or sulphide of zinc and barium. I have not brought any lithopone because the more I play with lithopone the less I like it.

19,341 (Mr. Sutherland.) You are going to demonstrate with pure zinc oxide?—Yes.

19,342. Plus? Is it secret what else is in the paint?—There is no secrecy about the paint. Any decent chemist can find out what it is in a couple of days so it is no use trying to keep it secret. If you have zinc oxide for interior work or very fine barytes for exterior work and make a mixture rather stronger than lithopone mixture on the same lines, you have not all this bye-play of chemistry to deal with. These are actually wet (producing some boards). There can be no mistake.

19,343. (Chairman.) What is the difference in these two?—This is a finishing coat and under-coat on black. That is under-coat and body finishing coat. It is a little glossy. There is very little difference between those two really. One is a body and one is an under-coat. This is a finishing coat on under-coat on priming.

19,344. What sort of priming?—Zinc right through. This is under-coat on priming. That is the same thing only it has a black line.

19,345. (Mr. Sutherland.) This is a thicker coat?—It has not been put on by a professional man. I purposely did not have it done by a professional man. One of the men in the laboratory did that. That is the fairest way. Now that is 50 per cent. of zinc oxide and 50 per cent. of filler. A body paint was made up and a gloss paint was made up from a zinc, not a lithopone.

19,346. Was it barytes?—It might have been, or blanc fixing.

19,347. (Mr. Sutherland.) Blanc fixing is whitening, but it is very different from ordinary commercial whitening?—If we can produce a good result what does it matter? I have been at it now for years.

19,348. (Mr. Gardner.) Is that zinc?—Yes. This is under-coat on priming; I have not a scrap of lead in my works, not a half-pennyworth. But (here the witness produced several tins) feel the gravity. We have had to come down to what the painter wants.

19,349. (Chairman.) You have made it heavy because the painter wants it heavy?—Yes. He will not have it light.

19,350. (Mr. Parsonage.) How do you get the weight?—With filler.

19,351. (Mr. Sutherland.) What is the filler? Is it secret? Is barium heavier than lead?—No, but we have weighted it. What about straightforward barytes?

19,352. I do not understand?—What about a paint made from barytes; is there anything very awful?

19,353. I have no experience of a paint containing nothing but barytes?—I knew you can buy paint at 111. a ton—so-called paint.

19,354. (Mr. Parsonage.) Will this settle?—No. The whole trick in the making of paint is to make a medium that will suspend the pigment.

19,355. That is the greatest trouble?—Yes; it is the biggest trouble we have had, but we have overcome it.

A demonstration followed.

Sir ERNEST HATCH in the chair.

19,356. (Mr. Sutherland.) Do you think that zinc oxide alone (not zinc paint) can take the place of genuine white lead?—What medium?

19,357. As a paint, without particularising any medium?—For inside work there is absolutely no question; for outside work, yes, when it is mixed with proper and suitable mediums.

19,358. What do you mean by that?—It wants a preponderance of oil, and I think that there are better oils than linseed in that case.

19,359. Your paints are zinc oxide, not lithopone?—I have used a lot of lithopone, particularly for under-coatings, and I have come to the conclusion that I am going to say good-bye to it. I find lithopone a most uncertain mixture. You might get lithopone that you think is perfectly all right, but when you have had it in use some time you get, according to my idea, a sulphurous compound emanating from it. If you are clever enough to make a hard gloss film, my idea is that the sulphur gets behind, and discolours the whole thing. With body work you do not find it. You do not find it when you break down lithopone for under-coating for interior work. I believe that opening it out sets free the gas or the acid.

19,360. Does that destroy the photogenic action?—No. Last Saturday, a very nice sunny afternoon, I took nine samples of lithopone out, some thinned down with water, and some with oil, and tried them. Some of them went within twenty minutes.

19,361. The feature of lithopone is that you may paint your room and it may be beautifully white in the morning; in the afternoon it is grey; at night it may be white again. It is the action of the light on the lithopone. A customer of one of our past Presidents had a drawing room painted. The customer rang him up in great trepidation; it had gone grey. He could not go at once to see it. When he got there it was normal?—You get that outdoors.

19,362. This was on the windows where the sun struck the window-cases?—Yes. I have had that in 20 minutes.

19,363. You meet the defect of zinc oxide as a covering pigment by adding what you describe as a filler. What is that filler?—Inert base silica. I have tried all sorts—silica, barytes, asbestine. The molecules or atoms of zinc oxide have a certain shape. I want to find a filler that will adjust itself to them.

19,364. What is the action of this filler on the application of paint?—None.

19,365. Yes?—Do you mean that it makes it rather gritty?

19,366. No; it makes it easier to apply?—I see what you mean now. Are you talking about flat or gloss paints?

19,367. Both. Gloss paints particularly?—I agree that the filler eases it out. It takes that fluffiness out of it.

19,368. It gives it a body?—Yes, a key.

19,369. When you said that painters do not know when they are using zinc or lead, you meant such paints as yours and other makers?—Yes.

19,370. That is because of the filler you put in?—How many decorators' shops can you go into in England and find pure zinc oxide?

19,371. You probably would not find any pure zinc oxide at all in thousands of them?—No. You would find lithopone or mixtures of zinc.

19,372. If you get a pure zinc oxide paint and do not tell the painter what it is, will he not detect the difference?—Certainly he will.

19,373. That qualifies your answer tremendously, does it not, when you said that if you did not tell the painter he would not know?—Zinc base paint was the first remark I started with. Do not get away from

10 May 1912.]

Mr. ARCHIBALD VICKERS.

[Continued.]

that point. My paint is made from a zinc base; you have just said yourself that you cannot find a pure zinc paint.

19,374. Practically here they do not use it?—No, but you find zinc mixtures.

19,375. In Holland they use pure zinc oxide. They mix it for themselves, and they use zinc paints and lead paints in common, and are masters of both. But a witness told us that on wet grounds and under like conditions lead paint was the best. He had no bias towards lead paint except his experience. He was a man with very large experience?—Lead paint was the test, he thought?

19,376. Yes, under any circumstances?—I do not agree with that at all.

19,377. I was quoting from Mr. Nooijen's experience?—Did he say that under equal conditions it was the best?

19,378. Yes, that under equal conditions it was the best?—I do not agree.

19,379. Then you said that painters were "extremely ignorant." Do you wish to qualify that?—I am not talking about the masters. I am talking about the men.

19,380. But a good master controls his own business, does he not?—Perhaps my experience of painters is unfortunate.

19,381. Mr. Gardner and Mr. Parsonage will deal with the men. I will deal with the masters?—That is a different thing altogether. My great experience of paint work has been amongst practical decorators, not the West End type of people, but the smaller class of men.

19,382. (Mr. Parsonage.) Many of them are not painters?—Many of them are not painters.

19,383. (Chairman.) You say, I understand, that a great many men who use paint are not qualified painters?—Yes, they are not painters.

19,384. (Mr. Sutherland.) Whatever they may be in the West End of London, or whatever they may be in London, does not exhaust this country. There are plenty of master painters throughout the country, and in Scotland, who are perfectly competent to conduct their business?—Can you contrast the class of men you meet in the suburbs of London with the class of men you meet in Scotland?

19,385. I am not dealing with the suburbs of London, but with the whole of the trade. These men are thoroughly competent, and control the business, and do a fine decorating business. They have come here, and one and all of them have told us that they have had experience with zinc, that it has failed them, and that they are perfectly satisfied that there is no pigment equal to white lead?—I quite expect to hear that.

19,386. You would not put that down to ignorance, would you—that preference for white lead?—Let us try to get at it in another way, as you are very strong on this point. Take 100,000 brush hands. After all, it is the brush hand who settles the case.

19,387. No, the master painter does not allow the brush hand to settle the case for him?—Yes, he does.

19,388. (Chairman.) What do you wish to establish by your reference to brush hands?—We have great trouble in selling zinc paints because the brush hand or the foreman comes to the master and says, "This thing is no use," and the thing is thrown out, without the slightest chance of being fairly and squarely tried.

19,389. (Mr. Sutherland.) The master painter who knows his business does not allow his workmen to determine what they are to use. You make a claim that the men are ignorant. My point is that the master controls his business, and his experience leads him to the conclusion which I have put to you?—I do not differ altogether from you, but I maintain this: you go into a town and find excellent master decorators and excellent master painters, but if you were to analyse the amount of paint the men use, and take a percentage of the practical men on the one hand and of the unpractical, or botchers, on the other (call them what you like), you will find that there is a far greater percentage of botcher hands than practical men amongst them. Go to Brighton, Southampton, or

London, or any part you like at this time of the year—

19,390. (Mr. Parsonage.) Or Glasgow or Edinburgh?—I do not know about Edinburgh and Glasgow. Take the men painting park railings and so on. How many practical men would you put on to do that sort of work. Take marbling, for instance.

19,391. Mr. (Sutherland.) You said that painters are accustomed to regard paint by weight?—Yes.

19,392. Is not the prepared paint trade relatively quite a modern introduction?—Yes, it is not old. It is five or six years old.

19,393. For the last few years at all events painters have not bought by the gallon, except enamel paints?—Yes.

19,394. The painter bought his paint and lead and oil and turps in bulk previously?—Do you think that he has bought all the articles you have mentioned by weight?

19,395. Up to within the last eight or nine years prepared paints were rather for amateurs?—Yes, quite right.

19,396. Up to then a master painter stocked his pigments and his thinners in bulk?—Yes, and put them together himself.

19,397. So that his attitude towards zinc and lead paints was not at all influenced by weight per gallon, because he never regarded it from that standpoint?—No, he did not; but the trouble is that when men send their paints out to a job they book up so many pounds of paint to a job.

19,398. Yes, and so with thinners, and with stainers?—Yes; and how many men know the gravity of linseed oil?

19,399. How does your answer bear on the question?—A good deal.

19,400. I am not talking now of the relative merits of prepared paints and paints mixed by the master painter?—I make up at my works at 3½d. a pound.

19,401. (Mr. Parsonage.) You mean that when a man takes up a kettle of paint and it is light, he thinks it is not good enough, and he wants the weight in it. I do not see how that affects the question in any way?—Except as one of the prejudices of the painter.

19,402. Yes, we know it is a prejudice?—Yes.

19,403. (Mr. Sutherland.) Do you think that zinc oxide paint is better for sea atmosphere than lead paint?—Yes, I do.

19,404. Do you know that the Office of Works, which is a great advocate of leadless paints, painted the Menni Bridge, which is exposed to the sea air, with five tons of lead last year?—I should not doubt that if they have painted the bridge with lead. They may have painted hundreds of things with lead paint where zinc would have been better. That does not alter it.

19,405. It shows that they had not confidence in it?—Was it white?

19,406. Yes?—I think to paint ironwork with white lead is not a good idea.

19,407. It is red lead underneath. It has almost inches of paint on it?—Is Sir Henry Tanner at the Office of Works?

19,408. Yes?—I painted the Duke of York's Schools for him with zinc.

19,409. I am talking about the seaside?—I mean the schools at the seaside, right on the coast near the Convict Prison at Dover Castle.

19,410. Who painted the structures you mentioned on the Brighton Pier?—I do not know.

19,411. Was it a contractor?—I fancy they do their own painting.

19,412. Do you think that zinc paints would lead to the suppression of the operative painter and the introduction of the amateur?—No, I do not think so for a moment.

19,413. (Chairman.) You said just now that zinc paints could be used for exteriors provided that there was an increase of oil in the mixing?—Yes.

19,414. Would that entail any extra cost?—Yes, by weight, but not per yard super.

19,415. With regard to the intrinsic worth of the paint, would the additional oil make it more expensive?—It would depend on whether a man brought by

10 May 1912.]

Mr. ARCHIBALD VICKERS.

[Continued.]

measure or bought by weight. If it is per yard super, no.

19,416. Have you had any special experience in zinc paints applied to exteriors?—I have been selling paints now for seven years in London, and making them. Lately they have all been zinc.

19,417. Do your customers use an increased amount of oil?—I send mine all out ready for use.

19,418. You use an abundance of oil?—Yes.

19,419. Is that the reason of the success of your paint?—Yes. Everything depends on the medium.

19,420. (Mr. Parsonage.) Speaking of increased cost, would not the cheapness of the pigment, the filler and the zinc, balance the extra cost of the medium?—I do not think that it will cost any more money than lead paint.

19,421. One would balance the other?—Yes.

19,422. And it would not cost any more?—The zinc itself, up to the last Trust, was more money than the same amount of lead; perhaps 10*l.* more. With linseed oil down at a normal price 16*l.*, 18*l.*, 20*l.*, or 22*l.*, you could make paint as cheaply from zinc as from lead, by measure.

19,423. But not by weight?—Not by weight, and the decorator will have it by weight. I find lithopone a most treacherous thing to deal with. It is a splendid white, and a splendid coverer, and for interior work it may be all right, but certainly not for outside. There may be some people who have found out some trick we do not know.

19,424. It is a question of medium?—It is a question of medium every time. I believe that road

sweepings with a proper medium would stand. If you can get a varnish that will hold them, I believe that road sweepings or dust out of the corridors would be all right. I am not at all sure if barytes is not one of the best things we have to deal with, tinted properly. I see in some of the American tests the barytes came up certainly a good deal better than some of the others.

19,425. It all depends on the medium?—It all depends on the medium. That is the point. There are other mediums besides linseed oil.

19,426. Take, not the men who are fetched in casually, but a proper painter, he would have no difficulty in using your paint?—Not a bit.

19,427. He could apply it just as if it was lead?—Yes. There is nothing very tricky about the tins I brought up.

19,428. Nothing whatever?—Nothing whatever. If I did not show you which was the lead and which was the zinc you would not know.

19,429. You could tell by the colour, but not by the difference in working?—No.

19,430. There are many towns in Lancashire where a man is not allowed to work unless he has served an apprenticeship?—That is what they told me.

19,431. The men know the business entirely right the way through, and they are the best men in the shop in many cases, because they go to the technical schools?—Yes.

19,432. London is not a fair criterion?—That is the criterion I am working on. I was not taking the country generally.

### At the London County Council Tramways' Central Repair Depot, Charlton, S.E.

Mr. W. READMAN examined.

*Car No. 807 painted with zinc.*

*Car No. 815 painted with lead.*

19,433. (Chairman.) What is your opinion with regard to these two cars?—The colour is as good, in fact better, in the zinc, but the paint shows slight cracking in all cases in the zinc.

19,434. If lead were prohibited, would you consider that painting a car with zinc would, generally speaking, be as good as painting a car with lead?—In general appearance zinc is as good, but there is a slight cracking. That is the drawback.

19,435. Have you any lead in the paint?—None whatever.

19,436. Do you consider that the cracking might be obviated by having four or five per cent. of lead added?—I cannot say whether it would be any better.

19,437. For how long have these cars been painted?—They were painted on 29th April 1911.

19,438. Can you give us the formula for the zinc paint?—Yes. Pure zinc and thinners were used, viz., zinc oxide ground in oil thinned with equal parts of elastic carriage varnish and turps.

*Car No. 955 painted with zinc oxide.*

*Car No. 957 painted with white lead.*

19,439. When were these cars painted?—No. 955, on 29th April 1911, and the other about the same time.

19,440. What was the formula of the zinc paint used?—The same as in the other case.

19,441. Have both cars had the same sort of wear and tear?—Exactly the same sort of wear and tear.

19,442. Which is in the better condition?—There is not a lot of difference in the general appearance, but there is slight cracking in the zinc oxide.

19,443. Will that slight cracking increase as time goes on?—It will not get any better. It is difficult to say what will happen.

19,444. Were they painted on a lead base?—Yes.

19,445. That applies to all the cars you are showing us at this depot?—Yes.

*Car No. 401 painted with white lead.*

*Car No. 415 painted with zinc.*

19,446. Have these cars had the same wear and tear?—The same wear and tear for twelve months.

19,447. Which do you consider is in the better condition?—Of the two, the lead is actually in the better condition.

19,448. What is the objection to the zinc paint?—A slight cracking.

19,449. But, in general appearance, are they about the same?—Yes, the general appearance is very much the same.

19,450. What is *this* paint on the panels of No. 415?—Crimson lake.

19,451. Is there any lead in this. This is more cracked?—The lake is a very bad drying colour, and is of rather a soft nature. When the varnish comes on the varnish is quicker drying.

19,452. (Mr. Kinggate.) What condition was the car in when you placed it on? The crack might come from the filling. It might not be the outside coats that are cracking at all?—There were no cracks. I can confidently say that.

19,453. (Chairman.) One car has been painted with lead paint, and the other with zinc. The car painted with lead paint has not cracked so much as the car painted with zinc. Would you consider it a better test if the colours were painted on absolutely plain wood?—A much better test.

19,454. (Mr. Sutherland.) In both cases the cars were in an equal condition?—Yes, about equal condition.

10 May 1912.]

Mr. W. E. IRELAND.

[Continued.]

### At the London County Council Tramways' Bow Shed, E.

Mr. W. E. IRELAND (Rolling Stock Superintendent, London County Council Tramways) examined.

*Cars Nos. 1620, 1621, 1622, 1623, 1624, 1625.*

19,455. (*Chairman.*) For how long have these cars been in use?—About six months.

19,456. Were they all painted at about the same time?—Yes.

19,457. Were all these painted with zinc white throughout?—Yes.

*Cars Nos. 1254 and 1255.*

19,458. Were Nos. 1254 and 1255 painted with lead

about the same time?—Yes; No. 1254 was painted in the first instance by Hurst Nelson, and Co.

19,459. What is your opinion about the condition of these cars?—Personally, I see very little difference from a wearing standpoint between the zinc and the lead paints.

19,460. Could you say positively that the zinc white ones are as good as the ones painted with lead?—Yes, that is so, after six months' wear.

## THIRTY-THIRD DAY.

Tuesday, 21st May 1912.

PRESENT:

SIR ERNEST F. G. HATCH, BART. (*Chairman.*)

Sir GODFREY BARING, BART., M.P.  
Mr. E. L. COLLIS, M.B.  
Mr. W. G. SUTHERLAND.  
Mr. F. C. RICE.

Mr. A. GARDNER.  
Mr. J. PARSONAGE.  
E. A. R. WERNER (*Acting Secretary.*)

Mr. JOHN ANDERSON examined.

19,461. (*Chairman.*) Do you attend to-day as the representative of the London Association of Master Decorators?—Yes.

19,462. You are the president of that association, are you not?—Yes, I am the president for this year.

19,463. You are aware that we have already heard a very large number of master house-painters?—Yes, I have heard of it.

19,464. What is the nature of your business, and where is it carried on?—It is carried on at 4, Clarendon Grove, South Kensington. The nature of the business is the usual London builder's and decorator's business.

19,465. What is the average yearly number of painters employed by your firm?—The average number last year was about 110.\*

19,466. Have you been in the painting trade a good many years?—Yes, ever since I was 11 or 12 years old—nearly 43 years.

19,467. Have you known any cases of lead poisoning or painter's colic?—Yes.

19,468. Have your men had occasional days of sickness, possibly due to lead?—Very seldom and very slight.

19,469. Do you have periodical medical examinations of your men?—No.

19,470. Then how do you know that they have not had occasional days of sickness due to lead?—The only reason is that when a man is away ill he generally reports what is the matter with him. I want to know, and he would let me know if he was away with colic or whatever it was.

19,471. I suppose you have from time to time a certain number of men who are away off duty through illness?—Yes.

19,472. And that might be owing to the lead?—No, I should certainly know if it was owing to the lead.

\* The witness has subsequently corrected this to 51. See also Questions 19,827-9.

19,473. Why?—I know the majority of my men more or less intimately.

19,474. Would the men be quite sure whether they were suffering from lead poisoning or not?—They generally know. I do not ask for a doctor's certificate. I certainly think that I should know if they were away from lead poisoning.

19,475. Have they ever reported to you that they were suffering from anything approaching lead poisoning?—Yes.

19,476. They have?—Yes. I have had claims. When I say that I have had claims, I have had probably three or four in the last 10 years, speaking roughly.

19,477. Do you mean to say that you have only had three or four cases where the men have come to you and told you that they were suffering from lead poisoning?—Yes.

19,478. Do you think in your own mind that that is the whole of the number who have been so suffering?—I think so. I think that I am not far out. I had a man the other day who was told that he was suffering from lead poisoning. He was attending the hospital for another complaint, and he did not know as a matter of fact that he had lead poisoning.

19,479. That is the sort of thing I mean. Has that sort of case recurred time after time?—I do not know—not very frequently. This man has worked for me for 25 years. He is a very good man.

19,480. Why should there be only one such case? Might there not be many other cases?—There might, but I should know pretty well immediately a man is away. I should want to know why he is away.

19,481. You are not a doctor?—No.

19,482. How do you know, then, whether it is a case of lead poisoning or not?—I interview a man who is away for any little time to know why he should be away. I am interested in the men.

19,483. Would you ask him his symptoms and all the rest of it?—I would ask why he was away.

21 May 1912.]

Mr. JOHN ANDERSON.

[Continued.]

19,484. Why do you take such a kindly interest in your men?—I have about 63 men who have worked for me on an average 11 years. My business is an unusual one.

19,485. Is it not unusual for employers to take such a minute and careful interest in the people whom they employ?—When you have men working for you for many years, I think it is not unusual.

19,486. I am glad to hear it?—My business is one that makes it most important that I should know all about my men.

19,487. Do you think that that feeling prevails generally in your trade?—I am afraid not. It would be better if it did.

19,488. I suppose you will admit that the risk of lead poisoning among house-painters constitutes a very real danger, and one that should be removed?—No, I do not.

19,489. You do not admit it?—No, I do not admit it a bit. It is very seldom, as far as I know, that they suffer from it. It is very rare, seeing the number of men employed.

19,490. Have you noted that 284 deaths of painters were definitely certified as due to lead poisoning in the 10 years ending 1910?—No, I have not.

19,491. When you say that you do not think it serious, you do not know how serious it is?—I am only speaking of my own experience. You said 284 in 10 years?

19,492. Yes, in the years 1901 to 1910, and 36 deaths in 1911. So when you tell the Committee that you do not think that there is very much danger of lead poisoning amongst house-painters, you speak only from your own experience?—Yes, and my own knowledge of the trade generally.

19,493. But how far does your own knowledge go?—I have obtained it from a large number of decorators whom I am associated with. We naturally talk together about that sort of thing.

19,494. But do not you think that the number of deaths from lead poisoning is rather serious?—No, I do not. In my lifetime I have only known of one case.

19,495. But the figures I have given to you show a serious state of things, do they not?—I do not know how they are obtained, or under what circumstances.

19,496. If they are quite accurate, are they not very serious?—I would take them as accurate; I would not like to say that they were not, but so much depends on how many men that covers. The chances are that some of the men who have died would have died if they had been in some other trade, probably. That is my opinion.

19,497. But the point is that we have this large number of deaths certified as due directly to lead poisoning, and I ask you whether you do not think it a very alarming and lamentable situation?—No, I do not, I must say. I do not think that it is so dreadfully serious, and I think it is more likely to be on the decrease.

19,498. But that is not the point. I am not speaking about what you think. I am asking you about these particular figures. I thought that, as president of your association, you would have gone into all these figures. Do you not take any interest, as an association, in the general health of the painter?—I am afraid that we have not done so. I may say that our association is rather a young one, only four years in existence, or hardly four years, and I must say that we have not gone very closely into the health of the men up to now.

19,499. Then, in your view, things might remain practically as they are?—I do not think that there is any very great need for any drastic alteration, because I think that even the men themselves are improving in their habits compared with what they used to be years ago.

19,500. Then, how do you account for the number of deaths in 1911 exceeding the number of deaths in any other year that they have been recorded?—It is very difficult to account for, unless they have been more accurately noted in that particular year.

19,501. That is not the case?—Insurance has brought the thing more to the front probably.

19,502. You are only speaking of generalities?—I am only speaking of generalities.

19,503. You are not speaking from any definite knowledge?—No.

19,504. So that, in that respect, your opinion is not worth much?—Perhaps it is not in that respect, but my experience in connection with the trade has been all my life, you see. I could not give evidence on absolute figures.

19,505. Yet you say, without having any knowledge of definite and accurate figures, that in your view it is not serious?—I do say so.

19,506. From your own experience?—From my own experience.

19,507. But, as president of your association, do you not think that you ought to have had sufficient knowledge to form an opinion?—It would be very difficult for me to get an opinion unless I circularised the whole of the association.

19,508. Take the Board of Trade returns. They are serious enough?—I am afraid that not many of us read those, or know anything about them as a matter of fact.

19,509. (Mr. Sutherland.) Or see them?—I see them, I think.

19,510. (Chairman.) You are not sure whether you read them, I think you said?—I read them sometimes. I do not go through all of them.

19,511. When I pointed out the number of deaths, you did not know it?—I did not know it definitely.

19,512. If you read them, you do not read them very carefully?—No; I have no occasion. The thing is not brought to my notice particularly. I cannot quite see the very dreadful importance that you apparently attach to it.

19,513. You do not?—No.

19,514. You say that without having any real knowledge of the actual state of things?—Only knowledge as far as my own men are concerned, whom I have known for many years, and the fair number that I employ.

19,515. Do you know that there were about 2,000 cases of lead poisoning in your trade reported to the Home Office voluntarily without any legal compulsion whatever during the same 10 years?—No, I do not.

19,516. Is not that a very alarming situation?—It seems rather a large number, certainly, but how many does that cover? What is the proportion? If that was out of 5,000, it would be a very large number; but if it is out of 200,000, it is another matter.

19,517. Do not you think these 2,000 people's health worth saving?—Yes, undoubtedly.

19,518. Do you not think that something should be done by the Home Office to alleviate this terrible number of cases of illness?—If anything could be done to save those lives, I would certainly agree.

19,519. (Mr. Sutherland.) Not 2,000 lives, 2,000 cases?—All masters would endeavour to save their men from any illness. They would not treat it recklessly.

19,520. (Chairman.) You agree that something might be done?—I agree that something might be done, but I do not see the very great necessity.

19,521. What am I to take from that? You agree that something should be done to alleviate the seriousness of these 2,000 cases of lead poisoning, yet you tell me in the next breath that you do not think it very important. What do you mean?—You mentioned figures to me which have not been brought to my knowledge, to begin with. Then, again, I am only speaking from my own experience, and in connection with the trade as to the number of cases that occur.

19,522. When you read that answer to my question, you will see how extraordinarily involved it is?—Yes.

19,523. It is not a direct answer. I have got you to admit, after a little trouble, that this lead poisoning evil amongst painters is rather serious. You have also agreed that something should be done to alleviate it?—Yes, if it can be done.

21 *May* 1912.]

Mr. JOHN ANDERSON.

[Continued.]

19,524. Do you mean that?—Yes. I do not wish to disregard it.

19,525. Something should be done to alleviate the suffering which is incidental to house-painters?—Yes, if it can be done, I agree, undoubtedly.

19,526. We have got to it at last. Now, there are two alternatives; one is prohibition of lead, and the other is drastic rules to prevent suffering?—Yes.

19,527. Have you thought which of those alternatives would be the better?—No, I am afraid that I have not for this reason. To begin with, I think that it would be very difficult indeed to prohibit lead altogether. The general public would suffer considerably.

19,528. But do you think that the general public would suffer as much as the men do now?—Possibly not.

19,529. Do you not think that the men should be considered before the general public? I quite agree.

19,530. And if prohibition was the only alternative, this Committee ought to advocate it?—If that was the only alternative, it would have to be adopted, of course.

19,531. Would you like me to go through in detail the precautionary measures which would have to be introduced, if lead is allowed to be used in the industry as hitherto? I am quite willing to listen, and to answer any questions, certainly.

19,532. First of all, there is the provision of overalls by the employer, who would be responsible for seeing that they were regularly washed? Yes. That would be a very difficult matter, and of course that is done by the men now to a very great extent.

19,533. I wish you to understand that, in other industries where lead is permitted to be used, the employers provide the overalls for the men, and see that they are properly washed?—In a different kind of trade, I expect.

19,534. Would you find it very difficult in the house-painting trade to enforce that rule?—Yes, on account of the way in which the men are distributed about all over the country pretty well. I do not say that it is impossible, but I do not see how you could do it.

19,535. You could not do it yourself?—It would be very, very difficult. At busy times we have 40 or 50 jobs on, and men scattered about in all directions. They are taken on this week and off the next.

19,536. Now we come to the provision of a meal room. Care would have to be taken that in no case whatever would the men be allowed to take their meals in a room where lead is used, where painting is being done, for instance. Do you think that that would be very difficult to enforce?—Very difficult in many instances.

19,537. Would it not be impossible in some cases?—It would be impossible in some cases. We paint outside, and we are not allowed inside the house. The lead is in a cellar, or goodness knows where the lead may be used, but not in a room.

19,538. You agree, I suppose, that, at the present moment, a large number of men are obliged to have their meals in a room where they are working?—That does prevail probably to a certain extent, but I should say a very small extent. More often there are other rooms that they could have. It occurs sometimes, but the majority of the men do not do it if they can get meals elsewhere. My men do not.

19,539. But it occurs in some places where there is no other room for them to use?—Yes. But I would like to qualify that. It does happen on jobs, but the large majority of the men do not have their meals on the job at all.

19,540. I am speaking of the men who do?—In London there are so many facilities for having meals in coffee shops or somewhere near, which they use frequently.

19,541. In the country districts it would be much more difficult, I suppose?—It would be much more difficult.

19,542. Next you would have to make provision for a proper place to keep the overalls where they would

not contaminate food or outdoor clothing? While the work is in progress?

19,543. And where they will not collect unnecessary dust when not being worn. Could such a provision as that be enforced?—Again that would be very difficult.

19,544. Would it not be almost impossible in some cases?—In most cases it would be possible.

19,545. But would it not be impossible in some cases?—In a few cases it would be impossible.

19,546. Tell us the few cases in which it would be impossible? Where outside painting is proceeding. We go to a house to do a drawing-room only some times. We gain admittance by going up a ladder outside into the drawing-room, and do not go into the other parts of the house at all. It would be difficult in a case of that kind for the men to have their things hung up somewhere else, and they are hung up in the room.

19,547. Then there is the provision of cloak-room facilities, so that clothing put off during working hours, the ordinary outdoor clothing, shall not under any circumstances remain in a room where lead is being used. Would that be possible to enforce?—The same answer applies.

19,548. Now, I suppose, you will agree that it is very important for the men to have proper washing accommodation?—Certainly.

19,549. Could that always be provided?—I think there is not much difficulty about that. It all depends on what you call "proper washing accommodation." They would not have a lavatory basin fitted up, and that sort of thing.

19,550. I would say at least one basin or other utensil for every two or three men, and a regular supply of clean hot water, soap, and towels, and above all nail-brushes?—To begin with, they do not have nail-brushes and they do not have towels, and there are some occasions when it is even difficult to get hot water, but there is a plentiful supply of cold water in the ordinary way, and soap, and if they do not have towels they usually use wash leathers, which are generally supplied.

19,551. Have you ever known them use their pocket handkerchiefs?—They might sometimes do that even, but they generally wipe on the leather or on their aprons and that sort of thing.

19,552. It is a highly dangerous process if they wipe their hands on their pocket handkerchiefs?—Highly dangerous, provided they happen to have been doing any dry rubbing down.

19,553. Provided that they have any paint on their hands. It is not a question of dry rubbing down?—I daresay that you have been told before that we have plenty of painting work where there is no painting going on as a matter of fact. That is rather paradoxical, I know. No paint is used at certain times of the year.

19,554. I am speaking of the ordinary painter with hands smeared with paint. It is very important that he should remove that paint. Can you assure the Committee that in every case provision could be made for that?—You are touching on a tender point. A decent ordinary good painter does not smear his hands over with paint. I should be terribly annoyed if I saw a man with hands smeared with paint. I should go to him at once and complain to him and say: "Why are you so careless? I will not have it."

19,555. I am not speaking of ideal men, but the ordinary run of painters, who necessarily get daubs of paint on their hands and fingers. Take the ordinary run of painters in London painting bridges and other work?—They get smothered sometimes. They are hardly painters.

19,556. To go back to my original question, can you be quite sure if the Home Office allow the use of lead, that provision shall be made for supplying the men with hot water? They cannot rub off paint with cold water. Do you think that they can?—To a very great extent—the small portion that is there.

19,557. But do you think that they could wash off paint in the winter with cold water?—Yes, they could.

19,558. In winter?—Yes, I have done it, and it can be done. If a man is smothered with paint and

21 May 1912.]

Mr. JOHN ANDERSON.

[Continued.]

it is hard on his hands and dried on, it is difficult to get it off with cold water, I admit. Most painters carry a piece of rag in their pocket. If they happen to touch their hands with paint they wipe their hands at once, and there is not much to come off when they wash.

19,559. What do they do with the rag?—Carry it about during the day and then throw it away.

19,560. They carry it about the whole day?—Yes.

19,561. Do you think it possible to provide nail-brushes, clean towels and soap, in every case?—Undoubtedly it would be possible, but I think it would be rather difficult, and that sort of thing would considerably increase the cost of the work. That is one of the points, of course.

19,562. I am taking your point by point, because I want you to say when I come to the end of this which you prefer, and which you think would be the better and cheaper—these rules and regulations or prohibition. Now another point is, that provision would have to be made for the avoidance of dust?—Yes.

19,563. Some means would have to be devised for getting rid of any dust which the men might breathe?—Yes.

19,564. Do you think it is possible, in every case, by means of exhaust draught or anything like it, to remove the dust from the men while they are at work?—There again it would be very difficult. I am sorry to keep on saying "difficult" to these things.

19,565. I appreciate the position. I know myself that it is difficult?—It is the solid truth. You could have fans, but look what it means.

19,566. You say it is difficult, but would you go so far as to say that it is absolutely impossible?—I would not say that it is impossible.

19,567. I am speaking of the dust generated from lead paints. When you say that it is not impossible, what would you do to remove the dust from a room that you rubbed down, for instance?—To begin with, we have but very little dust.

19,568. I am speaking of the dust that is there. You said just now that it was very difficult, but not impossible. I want to know how you would go about to do it?—In the present days of electricity and so forth, it is possible to have a fan in the room, and drive the dust out of the room, of course, the same as you have a fan in hot weather anywhere. I have a fan in my room that I live in, when it is very hot. You can extract the warm air, and you can extract the dust.

19,569. Where would the dust go to? Do you think that a fan like that would remove the dust?—It would carry it out of the room.

19,570. Where would it go to?—It would carry it out of the room, away into the air and distribute it. You would not put it in a waste-paper basket.

19,571. Supposing that there was dust in this room, and we were anxious not to breathe it, would it help matters to have a revolving fan?—If you caused a current of air it would help matters, undoubtedly.

19,572. Would the dust go out of the window, or out of the door, or up the chimney?—Up the chimney probably; but the dust is very small after all.

19,573. But it is the dust that does the harm. You may think it small; other people may think it large?—I agree.

19,574. We have got it all mixed up or churned up by draughts in the air. Now, where does the dust go?—Out of the window, or up the chimney, or out of the door or other parts of the place where the men are not working.

19,575. And a good deal down the men's throats?—While it is being extracted?

19,576. (*Sir Godfrey Baring*.) It is all churned up, and it may settle again in the room?—There is so little. I will qualify that. With good work there is very little, but with rough work a lot. To qualify that again, rough work is not rubbed down. That is the point. It is only first-class work that you have to rub down.

19,577. (*Chairman*.) You have not satisfied me that the dust which has been churned up by the draught will be removed?—If it is in a draught it will

be carried out of the room. You think that it might be churned up and still stop in the room.

19,578. You see the dust is all in the air of the room?—Yes.

19,579. If you open the door, will it go out there?—If you had a fan put in the window and opened the door, the bulk of the dust would go out at the window, if you had a draught.

19,580. Would you have a portable fan?—Yes. You ask if it is possible, and that is what I say.

19,581. How would you drive it?—By electricity.

19,582. Where would you get the motive power?—From a plug in the room.

19,583. But supposing you have no electricity?—I am talking of houses that have, and the bulk of our houses have.

19,584. I am talking of houses that have not?—That is another matter. If you have not got it you cannot have it; that is a certainty. But there are very few houses in good property in London which do not have electricity. If you made it a regulation, it would be possible to have the electric wire carried to any part of the house, and you could put it on to a fan if you wanted. It would be quite possible.

19,585. (*Dr. Collis*.) Would you keep a special motor for every district in which you were painting, to drive your fan?—The fan would be driven by the electric current that is supplied to the house.

19,586. But every electric light supply supplies its current at a different voltage and alternation, and you would fuse your motor and everything else, if you put it on to a system to which it was not adapted?—No, excuse me.

19,587. Excuse me, yes?—If you wanted a fan for that purpose, you could put it on to the ordinary lamp. The process of dry rubbing is only an hour or two in a week.

19,588. But the same motor will not drive on the different systems?—Yes. I admit that you would have to pay the extra cost for the current above what you would have to pay if you had a separate cable. In Kensington it is 6d. for ordinary supply and 2d. for heating purposes.

19,589. You would have to have special wiring and resistances?—Wherever there is a plug in a room that would light an ordinary lamp that would drive a fan.

19,590. But surely you know that, when you have electric light put through your house, you have to tell the individual who is supplying the light, the alternation and the voltage of the current?—Certainly.

19,591. Then he supplies you with lamps for that voltage and for that alternation?—Yes.

19,592. You cannot put your electric motor on to any supply casually and expect your fan to go?—Yes, it will at certain voltages.

19,593. But you have to know the voltage for every district, and you will have to have a special motor and fan for every district you go to?—That would probably occur.

19,594. I only wish to put that point. You would have to have a different fan for each district?—Certainly.

19,595. That is what I put to you?—Yes. It would be very widely distributed.

19,596. (*Chairman*.) That would be a very expensive matter?—Undoubtedly.

19,597. That is your only suggestion for removing the dust?—Yes.

19,598. Now with regard to the fumes in burning off. Is burning off absolutely essential?—In many cases, yes. There are processes where we do not burn off a great deal. As it is now, there is material for stripping off paint.

19,599. Burning off is obligatory in some cases, is it not?—No.

19,600. Can you do without burning off altogether?—You can do without burning off, undoubtedly. There are plenty of materials supplied for stripping paint from woodwork or any material without burning off.

19,601. Would that be as cheap as the ordinary burning off?—There is not a great deal of difference.

R r 2

21 May 1912.]

Mr. JOHN ANDERSON.

[Continued.]

19,602. Would it be more expensive?—A little more expensive.

19,603. It is another little amount to add to the cost?—Yes, that is it.

19,604. Now I will take you to another point. In addition to these regulations that I have suggested, there would have to be periodical medical examination of the workpeople, say once a month?—Yes.

19,605. Which would have to be paid for by the employers?—Yes.

19,606. Would there be any objection to that?—That again means a question of cost, the cost of getting the men together for the medical officer to see them. Who is to pay for their time in going to a given point?

19,607. The employer would have to pay for that?—Then the customer would have to pay it.

19,608. That would be left to you?—Well, there is no doubt about it that the customer would have to pay.

19,609. Then with regard to this same point, in the pottery industry, regulations have recently been issued to protect the workers from the dangers of lead. In addition to having periodical medical examination, the employers have agreed to give compensation to any worker who is withdrawn from work by the doctor's orders on account of doubtful health. Let me give you an illustration of what I mean. Supposing that a doctor examines a workman, and says, "Look here, you have not got lead poisoning, but you will very soon have it; I must suspend you for a month"; the employers in the potteries have agreed to give that man compensation for that month. Do you think, as the president of your association, that your colleagues would agree to a similar regulation?—I am afraid that they would not be so generous.

19,610. (Mr. Sutherland.) They would have to, if it were the law?—It would want a lot of fathoming. It is very difficult.

19,611. (Chairman.) Taking all these points into consideration—and there are many more—would you say that you prefer that the industry should be regulated by special rules such as I have foreshadowed, or, as an alternative, that the use of lead should be prohibited, or very closely restricted?—In the interest of my clients, I should say regulations.

19,612. Notwithstanding the cost?—Notwithstanding the cost.

19,613. In the interest of your clients, do you say?—In the interest of my clients. I qualify that by saying that I am of opinion that any other material would not be so durable or so satisfactory and want so seldom renewing as lead does.

19,614. Give me your answer in regard to the interest of your colleagues?—I think that their opinion would be much the same.

19,615. It must be one way or the other?—Yes.

19,616. Would you prefer the Home Office to say, "Now, these men are suffering very greatly from the use of lead in paint; we will prohibit the use of lead, or rather we will let you have as much as 4 or 5 per cent. of soluble lead in general use," or "these rules must be enforced, and you must guarantee, as employers, that they will be carried out." Which would you prefer?—I think, personally, that that is a difficult question in a way. For one reason I would rather that lead be abolished, because if it were abolished every employer would be treated the same without any looking after. I am afraid, personally, that a great many might say they would prefer regulations, but then they would dodge them all the time, and the man who tried to abide by them would be handicapped by the man who was not doing it. That is a point that I am rather keen about.

19,617. You say that very seriously?—I do say that very seriously.

19,618. It points, does it not, to the Home Office introducing prohibition?—Yes, it points to abolition of lead, because I see the difficulty of enforcing regulations. When I say "regulations," reasonable regulations might be enforced, but I cannot see for the life of me how you are going to look after every man to see that

he is fulfilling the conditions. That is the difficulty I find about it.

19,619. (Sir Godfrey Baring.) I understand that when you came here you were not impressed with the serious character of lead poisoning?—No.

19,620. It did not occur to you that it was a serious matter?—Not so serious as the Chairman has led me to believe in a way, but even now I do not see the seriousness of it.

19,621. Even now?—Because, as far as it comes within my own supervision or cognisance, the cases are so few and far between. Sometimes it will affect one man much more quickly than it will another.

19,622. Have not the figures which the Chairman has quoted to you rather modified your views—2,000 cases in ten years, 36 deaths in 1911?—I do not think that it has altered my opinion very much.

19,623. You do not think that any special effort is necessary to grapple with this evil?—I certainly think that it would be advisable not to let it go on. I should not agree to shutting our eyes to the thing, and not troubling at all about it. That would not be wise, and I would not go so far as that. But I think that there are other methods than even the Chairman has suggested by which the state of things might be improved.

19,624. What sort of methods?—For instance, the education of the workman to a very great extent, which our association is endeavouring to do.

19,625. That would be a gradual improvement?—It would be a gradual improvement. They are educating themselves in that respect. I was talking to my foreman last week, knowing that I was coming here. He has been with me for many years. I asked him about his experience of lead poisoning and that sort of thing. He said at once that as far as his knowledge went, he considered that it was decreasing considerably from what it was years ago. The cases are more notified than they were years ago.

19,626. The figures do not bear that out?—Figures were not taken years ago.

19,627. They have been taken for a considerable time now, and there have never been so many deaths as last year?—20 or 25 years ago my foreman, who is an experienced man, heard of more cases of lead poisoning happening then than he hears of now. It is owing to the better conditions of living and better conditions all round. Men have become more educated, more thoughtful, and more sensible than they used to be in that respect.

19,628. You suggest that the only requisite to secure improvement is the education of the working man?—That is one, not the only thing. If the Home Office were to circularise firms more than they do, and allow the men to know what is going on, and how they could preserve their health better, and avoid this and avoid that, it would be better. Unfortunately, the painting trade is a very fluctuating trade. The men are out of work for a large portion of the year, and some of them are badly fed. In Scotland I understand the deaths are not so many. There better conditions prevail, I understand. For instance, the men there have an hour for breakfast, instead of, as our men, half an hour, and they have more time to be more cleanly, and more tidy over their things generally than if they have to scamper off and scamper back.

19,629. The masters give a longer time for meals?—It is not a case of the masters giving a longer time. The men are paid by the hour, and they would not be paid for breakfast.

19,630. They prefer a short meal time, you think, in this country?—I do not know that, but it is the custom of the trade. Even with drastic regulations, if the men will not follow them and difficulties are put in the way, they will not get on so well. I think that the men should be educated.

19,631. You would look rather seriously on these precautions being enacted by Home Office Order, because of the increased cost?—Increased cost and the difficulty of carrying them out thoroughly. I have to compete with a man who might not do it, and if I did it I should be at a disadvantage.

21 May 1912.]

Mr. JOHN ANDERSON.

[Continued.]

19,632. Many of these precautions could not be carried out in country districts?—Many of them could not be carried out in country districts.

19,633. For instance, electric fans. A large number of the houses in country towns are lit by gas only at present?—Yes, I believe so.

19,634. (*Dr. Collis.*) There is one point that a little astonishes me. You say that your impression is that lead poisoning in the painting trade has been getting less in recent years?—That is the experience that I have myself, and also the experience of my foreman, who is more intimately connected with the men than I am, and mixes up much more with them. Only last week I was asking him the question, and he was distinctly of opinion that there were not so many cases prevailing now as there used to be. Another thing is that many kinds of paints are used now that are not lead paints more than there used to be.

19,635. The Registrar-General states in his last supplement that there has been no alteration whatever in the house-painters' and plumbers' occupations?—In how long?

19,636. Between 1891 and 1901? Ten years.

19,637. You speak of being yourself not much acquainted with the occurrence of lead poisoning among the men. What illnesses are you acquainted with among the men?—Colds, or an attack of rheumatism, and all sorts of different complaints of that kind.

19,638. What do they die of?—I am happy to say that not many die. One or two have died of old age more than anything else.

19,639. We are not contending here that men die more from lead poisoning than from anything else, but they do die?—Undoubtedly.

19,640. And yet you have no particular information of their dying at all. So I am not astonished that you have no information of death from lead poisoning?—I had a man die the other day who had been working for me for 23 years. He died because he was getting very old; and he had been a painter all the time.

19,641. But men do not all die over 70, unfortunately. You say that the amount of dust which comes off is very slight?—Yes, with good work.

19,642. I mean that. If you were getting up a front door in the West End, would there be very little dust?—Yes, and with a front door there is very seldom much lead about it at all. There are not often white doors.

19,643. I am thinking, not of a white door, but of a coloured door. A dark green door would probably contain lead, would it not?—There is very little lead in that.

19,644. And yet we are told that non-lead paints will not stand outside?—Unless it was a white or light colour there would be very little lead in it at all. It would be painted with other ingredients, vegetable stainings, and so forth, which do not contain lead at all. That would be the case with dark greens and that sort of colour.

19,645. Then what is the difficulty in not using lead for the outside for high-class work?—It is not required. In some circumstances it is required, where it is done with light paint.

19,646. Supposing that you are getting up a front door with light colour?—That is very rarely done, not one in a hundred would be done with light colour. If you walk round the streets you will not see many doors with light colour.

19,647. There are a good many in Wimpole Street and Harley Street?—I do not think that you would come across many white doors.

19,648. Light ones?—It depends on what you call light; but there is very little lead. I do not say that there is none.

19,649. The door I am thinking of particularly has no lead, but I was interested in watching the man at work. There would be no particular difference in the amount of dust given off, I presume, whether there was lead in the paint or no lead in the paint?—There would be much less dust.

19,650. Why should that be so?—Detrimental dust, I mean.

19,651. But there would be dust, would there not? If it is not lead dust, it is not detrimental particularly.

19,652. But the point, now, is the amount of dust that comes off in rubbing down? I saw a man rubbing down a stucco column. He was smothered in white like a miller, but it was only whitening and size. He was putting it on and rubbing it off again.

19,653. The amount of dust that was given off in the case of the door I watched seemed a very fair sample of the amount of dust given off in dry rubbing down?—A front door requires rather more rubbing down than inside-work. It gets more blistered and wants more filling up, and so forth. Inside rooms and doors do not get blistered with the sun like the front door does. It is getting rid of the imperfections that occur through blistering and heat that necessitates the rubbing down that you mention.

19,654. What would a man use for filling up the woodwork, in a case of that sort?—All sorts of concoctions, some of which would be white lead.

19,655. How about the rubbing down?—There again, it is very slight, there is so little of it.

19,656. There were a good many patches on the door that I had under my observation?—The filling up would not be all white lead.

19,657. But they would use some?—They would use a little, no doubt. If they use a great deal it makes it very, very hard, and much more difficult to rub down.

19,658. If that was a fair sample of the dust that is coming off in high class work (and you have referred to high-class work) it is very considerable, it seems to me?—Then I say it does not prevail inside to the same extent, or anything like.

19,659. I was not speaking of that. The dust was all coming towards the man, as he rubbed with glass-paper; whatever his position, he was constantly inhaling it. Now in starting to educate a man, what line would you take? Would you teach him not to breathe?—Many men, when they are at work, work with their mouths open. If they would shut their mouths that would stop a good deal of the trouble. They are eating it. If they did not do that, you might say they would breathe it up their nostrils.

19,660. Yes, because the air has to go into their chests?—A man should take precautions not to stand so that it blows over him. It does not always blow straight on to him.

19,661. I was watching to see how I could tell him to keep out of it, but I could not see how he could keep out of it?—Was there no draught?

19,662. None at all. It was a quiet day with the usual conditions that prevail in a London street?—If the men knew that they had to use certain precautions in doing certain work, they would have better health perhaps than if they did not use them.

19,663. But what line has the education to take? It has to take practically the line that they are not to breathe?—I do not agree with that.

19,664. That is the inevitable conclusion. Lead poisoning occurs more from dust than in any other way, and I do not see how the men are to get out of the way of the dust. Therefore, what line is the education to take?—You would have to try to educate them to be very careful. You say you do not see how they could keep out of it.

19,665. The man said that for that coat he might have used wet pumice. I said, "What would you use later?" He said, "I am obliged to use dry glass-paper for the other coats. If you watch other men doing it, you will not see very much difference?"—The rubbing down process is not a lengthy one comparatively. The number of hours a man is working at rubbing down in a week are not very considerable. It all depends, of course, on the work a man is doing.

19,666. If there was more, we should hear undoubtedly of a great deal more trouble; but it is probably sufficient to account for what we do hear. I understand that you can talk to men about washing and care, but I cannot quite see how you can educate

21 May 1912.]

Mr. JOHN ANDERSON.

[Continued.]

men not to breathe? A man might be educated as to the best kind of food he should have food more suitable for his complaint.

19,667. (*Mr. Sutherland.*) With regard to the front door that Dr. Collis spoke of, the first process would be a wet process, unless you were burning off?—Or stripping off by other processes.

19,668. With reference to the other point that the doctor was speaking about, the protection of the door does not so much depend on the paint you put on it as the subsequent coats of varnish taking front doors that are well got up?—I should say so.

19,669. The comparison does not exist between a front door well got up and ordinary white lead painting? Such as sashes and frames, which are not varnished.

19,670. You could not establish any conclusion from that?—No.

19,671. Now, could you tell me how the Home Office could enforce prohibition with regard to painters unless they stopped the source of supply to manufacturers?—I am afraid that I could not. It would be very difficult to carry out and very drastic.

19,672. It would mean a large staff of inspectors to look after it?—Undoubtedly.

19,673. (*Chairman.*) You are talking now without any knowledge of what the Home Office procedure would be; so that it is not much good giving your opinion on a matter of that sort, although you may if you wish. You are not qualified to speak about what the Home Office can do about that. The Home Office have not made up their minds?—I can see some difficulties; that is the only thing.

19,674. (*Mr. Sutherland.*) You can see the point that I see—that there would be very considerable difficulty. You would prefer regulations in the interests of your clients, but not in the interest of yourself as a master painter. I understand you feel that the use of lead gives you a better job, and a more durable job?—Undoubtedly.

19,675. And therefore it is in the interest of the public that lead should be retained?—Yes, that lead should continue to be used. I think that they would suffer if lead was abolished. The work would have to be done much more frequently, and would be much more costly. It would be better for me in a way, because it would mean more work.

19,676. But it would not enhance your reputation?—It would not.

19,677. Ultimately it would recoil on the master painter as well?—Yes.

19,678. (*Chairman.*) If all the master painters were in the same position it would not recoil on any one of them?—No.

19,679. (*Mr. Sutherland.*) Now, with reference to the periodical medical examination which the Chairman indicated, on the question of cost and convenience, the position would be met, in many cases at all events, by transferring the men to work that did not involve the use of paint, such as stripping, staining, and distemping?—If the man was in a delicate condition, you mean?

19,680. If he was showing symptoms of lead poisoning, and the doctor said, "Now this man is threatened with lead poisoning," it would not be necessary for him to be sent off on holiday; but it would be possible to comply with the conditions by putting him on to some work that did not involve the use of paint. There is no difficulty in that?—Not at all. It may be interesting for me to say that at the present moment I am doing eight large new houses at the corner of Brook Street, and Gilbert Street, Grosvenor Square. Some of the men are not very strong. If they were working where new painting was going on, priming and so on, for six weeks on end, they would feel the effects. The other day a man was not very well. My foreman, Mr. Protheroe, said: "I think the rubbing down has had some little effect. I am taking him away from Brook Street where he has been two or three weeks." We take that into consideration.

19,681. (*Sir Godfrey Baring.*) What would he do then?—Go to a job where there was not so much rubbing down to be done.

19,682. (*Mr. Sutherland.*) Not necessarily painting?—Not necessarily painting.

19,683. (*Chairman.*) You have told us that you are a kindly humane employer, but you rather suggested that your sympathetic feelings did not prevail throughout the whole of the trade?—I said I am afraid not.

19,684. I am sure what you told us is correct; but that does not help us very much?—Very well.

19,685. (*Mr. Sutherland.*) Scientific and medical witnesses have satisfied this Committee that there are no lead fumes from burning off?—I have heard that.

19,686. There is no volatilisation of lead until you get to a temperature of 700 or 800 degrees; so that there cannot possibly be any lead fumes from the burning off?—I should think not, according to that.

19,687. According to these same authorities, who, I think, have proved their case, if the use of lead is abolished there would be paint poisoning which is very hurtful to the system?—In consequence of using oil, turps, and other concoctions?

19,688. Yes, because of the emanations given off from them. They are not lead poisoning?—They would create illness or unpleasantness, you mean?

19,689. Nausea, headache, colic, stomach, and urinary troubles, and kidney troubles?—Yes.

19,690. And so if the Government abolished the use of lead, they would be up against trouble?—Yes.

19,691. If white lead were abolished, you would be up against these troubles which may in the past have been classified as lead poisoning?—I cannot speak as to that. I cannot differentiate between them.

19,692. In July next, according to all portents, the new Insurance Act comes into operation, and every case has to be recorded, to ensure benefits under the Act?—Yes.

19,693. Two thousand cases have been voluntarily reported. The estimate is that during the ten years 1900 to 1909 there were something like 10,000 cases, but these cases are not actually reported cases. They are cases that are estimated on the basis of fatals, taking the ratio which is known in other trades where compulsory reporting is necessary. Do you not think that it would be better for the Home Office to be absolutely sure of their data, and defer any decision on this point, except regulations, for a term, and get the returns which we shall get through the Insurance Act, definitely disclosing the painter's risk in a tabulated form?—I should think that we should get much more authentic evidence then, probably.

19,694. We should get absolute evidence, undoubtedly?—I should think so.

19,695. At present, except with regard to fatals, we have calculated on an estimate only?—Yes.

19,696. (*Chairman.*) Would you advocate regulations in the interim?—Yes.

19,697. You have said that they cannot be enforced?—I have said that it would be very difficult to enforce them.

19,698. That is the same thing, is it not?—I did not say that they ought not to be enforced, or that I would not enforce them, but there would be difficulty.

19,699. The difficulty with regard to getting rid of dust from a room, for instance?—It would be difficult to enforce a thing like that, undoubtedly, if you could not do it.

19,700. (*Mr. Sutherland.*) Except for the effect on the health, is there, in your opinion, any possible competitor that could replace white lead?—Not that I know of.

19,701. Is it your opinion that zinc paint could replace white lead for interior work, without serious inconvenience?—It could replace it, but it would be more costly for the client.

19,702. For inside work?—For inside work.

19,703. For outside work you are quite convinced that there is no efficient substitute?—I feel quite convinced of that.

19,704. You are familiar with large Scotch painters?—Yes.

21 May 1912.]

Mr. JOHN ANDERSON.

[Continued.]

19,705. Many of them have appeared before this Committee, and they have substantially told us that they use nothing but white lead, and substantially they have no experience of lead poisoning?—Yes.

19,706. The statistics for Scotland sustain that, outside the Glasgow area. Dr. Legge himself said that, except for Glasgow, there was very little lead poisoning?—There was only one death last year, or the year before—I cannot remember. I was at the Conference and talked with them, and they said that the small death-rate was extraordinary.

19,707. Can you give any reason to the Committee why lead should be so hurtful in parts of England and why it should be so innocent in Scotland?—My only idea about it is that I should say that the Scotchman is much more careful. To begin with, the Scotch painter would be a better mechanic.

19,708. A better trained man?—A better trained man than the English painter. I do not know, as a matter of fact, but I think it is more or less the fact that their employment is more regular in Scotland than it is in London, for instance. I am speaking more or less of London. They are not out of work, I think, in different parts of Scotland so long as they are in London. The physique of the men and the kind of living to a great extent render them liable to this sort of thing.

19,709. Lancashire, London, and Birmingham are the three deadly areas in our whole country?—Yes.

19,710. Outside that the risk is a very slight one?—Yes.

19,711. (Chairman.) Do you know that?—No.

19,712. You keep on saying, "Yes"?—I only say "Yes" because of the form of the question.

19,713. (Mr. Sutherland.) Do you think it possible that painters could dispense with dry rubbing down? Supposing that the Home Office prohibited dry rubbing down, which Dr. Legge tells us is the source of 90 per cent. of the trouble, and the Home Office said, "We will make it penal to rub down by the dry process," do you think that the trade could meet the case by some other process?—To a very great extent, if not wholly, I daresay it could, but there again it would be difficult.

19,714. I know that there are difficulties?—If you paint a door to-day or to-morrow you cannot rub that down wet the day after.

19,715. (Mr. Parsonage.) How long would you take?—Cannot you do it the day after?—I have never tried it.

19,716. (Mr. Sutherland.) That is just it; you have not tried it?—I have not.

19,717. (Mr. Parsonage.) Many of the employers here have stated that they could?—What have they said about regulations?

19,718. (Mr. Sutherland.) Every change of custom is bound to cause some inconvenience and some recasting of methods?—Naturally.

19,719. If the Home Office made it a penal thing to do, do you not think that the trade would meet the case in some way?—It might be possible.

19,720. Rubbing down dry is a fertile source of poisoning?—If the Home Office issued an order that no dry rubbing down was to be done, it would be up to the men to report it if it were done. It would be perhaps easier to carry that out than some other things.

19,721. (Chairman.) Do you think that the men would make such a report?—I should think that they would.

19,722. Would not they be liable to be cautioned, or something?—I think that it could be done without even the master knowing who had reported, if it were necessary.

19,723. (Mr. Sutherland.) If it were the law, the men themselves in their organisations would see that they were not penalised for reporting?—Naturally.

19,724. Every decent master painter would endeavour to carry it out as far as he could?—Every decent master painter would carry it out as far as he could. Some would not trouble, and would take the chance.

19,725. Now with regard to the provision of overalls by the employer, to which you objected, do you not think it unnecessary?—Yes.

19,726. Most decent painters provide overalls?—Yes.

19,727. Why should the Government go out of its way to force employers to provide for men who are careless?—I do not think that they should.

19,728. (Chairman.) I only told you that the Government had enforced in other industries, with the consent of the employers, the provision of overalls?—I suppose that the regulations in the house-painting trade would be abreast of other new regulations. In some industries it would be quite easy for employers to provide overalls, and have them properly washed and so on, but in the painting trade it would be difficult.

19,729. (Mr. Sutherland.) You attach great importance to education?—I attach more importance to it than I do to any regulations or anything else that you have.

19,730. In that case, you would have the labelling of all lead compounds as dangerous?—Yes; there are various ways. We have not gone into the matter very, very carefully in that respect, but I think education a very great point. Unfortunately, the idea prevails to a very great extent with the public generally, and in fact with masters who do not understand the trade at all, that anybody can paint, and therefore uneducated men come in who do not understand the trade at all. If trade societies were more stringent about their men and were more amalgamated, and did not let anybody come in who did not know anything about painting, it would be better for the men.

19,731. Would it be a hardship on the men to make it obligatory to provide themselves with overalls or jackets?—I do not think so.

19,732. The decent men do it now?—The decent men do it now.

19,733. It would be soreing up the trade at that end of it?—It would be an advantage to the trade.

19,734. Would not you make it compulsory on clients to provide facilities for the men washing and having a separate room for a mess-room and cloak-room when painting was being done?—Would not that meet the difficulty?—That would help, no doubt.

19,735. (Chairman.) Is it reasonable to suggest that you are going to make a law, making it obligatory, with penalties, on the part of the householder to provide rooms for men to wash and keep their clothes in?—Do you think it reasonable to suggest such a thing?—I think it is.

19,736. Would you like to have a provision made that, if a plumber came to your house, he should have a room set aside to have his meals and put his clothes in, and all the rest of it?—So much depends on what he has to do. Why should the client get off scot-free? Why should he have the work done at his pleasure and convenience without any inconvenience, and the men suffer in consequence?

19,737. But does he not pay for it?—It is one way or the other.

19,738. You do not think that they would object?—I do not think that they ought. When you speak about washing and provision of washing accommodation, I do not know whether you are aware that the Water Board have been much more stringent lately in compelling masters to pay a water rate for the use of water in cleaning down fronts of houses, putting a penalty on it really. That is official procedure.

19,739. Such a procedure as Mr. Sutherland put to you would involve inspection from house to house?—While work was in progress.

19,740. Yes. Do you think that the British public for one moment would accept such a state of affairs?—You would have to have very close inspection to see that it was carried out. That is what regulations would mean.

19,741. (Mr. Sutherland.) Should not the British public bear part of the burden?—I think so.

19,742. Why should the master painters bear it all?—The master painters should not.

R 4

21 May 1912.]

Mr. JOHN ANDERSON.

[Continued.]

19,743. (*Sir Godfrey Baring.*) Could it not be done with a little adjustment of the charges?—(No answer reported.)

19,744. (*Mr. Sutherland.*) There are situations where it could not be done unless facilities were given in the house. Supposing that a householder refused to give facilities, what would be the position? The provision of nail-brushes and towels would not be a difficulty, would it?—No; but there again, who is going to collect the towels, and keep them clean? I am afraid that I am more against regulations the further I go.

19,745. The foreman could see to it, could he not?—If you are going to have so many dozen towels scattered all over the jobs and collected every week, what does it mean?

19,746. You have the same difficulty with brushes?—No. The brushes go to a job for five or six weeks, but the towels would have to be collected and cleaned weekly. That is an additional cost against the clients.

19,747. In many cases, you do not experience difficulty in getting facilities for washing?—No.

19,748. Only in a few cases?—Only in a few cases.

19,749. That is all the more reason why, if regulations are insisted on, these obstinate people should be compelled to give you facilities?—I have known instances where a customer would forbid a man to put his coat inside the door. They will not have them in the place. I think that that is very arbitrary.

19,750. (*Chairman.*) You would have to put a clause in your contract providing for that when you accept the job?—Then they would go to the man who did not put it in.

19,751. (*Mr. Sutherland.*) But if it were made compulsory, it could be on every contract form?—Yes, it could be if it were made compulsory.

19,752. From your long experience, you know that white lead is a material which you can absolutely depend on as a paint base, I suppose?—Undoubtedly.

19,753. Is there anything else that you know of, if white lead were prohibited, that could take its place?—Not to take its place generally.

19,754. If it were prohibited, would not the painting trade be thrown on to proprietary paints?—Undoubtedly.

19,755. Unless the abolition of white lead occurred, what is to prevent proprietary paint manufacturers putting white lead into paint in large quantities?—If it is prohibited, that would not be allowed, I take it.

19,756. Unless it was prohibited at the source, it might occur?—Yes.

19,757. A witness told us that that was commonly done—that people bought zinc paint, and 50 per cent. of it was lead?—One of my objections to using made-up paint is that you do not know what there is in it. Some of it may be lead all the time.

19,758. Do you know that the Admiralty and the War Office are the largest consumers of white lead in this country?—I do not know that they are. I will take it from you.

19,759. (*Mr. Rice.*) You do a very high-class trade in painting?—Yes.

19,760. In fact you are rather a swell among painters, are you not?—I think I am. At least, I do not think I am; I am sure I am.

19,761. Therefore it is a tender point with you to see a man with paint on his hands?—Yes.

19,762. But you have seen men with paint on their hands?—Yes.

19,763. Therefore you admit that there is a certain danger amongst painters—not necessarily your painters—by reason of getting paint on their hands?—Yes.

19,764. How do you propose to deal with that danger?—In the way of making the men cleaner, do you mean, or to prevent it?

19,765. How do you propose to deal with that danger in any way?—I do not quite see the point of the question exactly.

19,766. The point of the question is that the man who gets paint on his hands is in danger from that paint. That you have admitted. How do you

propose to deal with that danger?—When it does arise?

19,767. Yes?—You mean, when he gets ill by having the paint on his hands?

19,768. I mean, when he has the paint on his hands?—I do not quite follow what you want me to answer, really.

19,769. I only want an answer to the question?—The only point is to educate the man so that he does not get paint on his hands. I maintain that a good painter does not get paint on his hands. He might get a little, but nothing to speak of.

19,770. You admit that we have to take things as we find them, do you not?—Yes.

19,771. You admit that there are men who get a lot of paint on their hands; you have admitted that that is a source of danger, and I want to know how you propose to deal with that danger?—I only say, by educating them not to get the paint on their hands.

19,772. So that the way of getting rid of the danger is by educating the men not to get the paint on their hands?—Yes. A painter who is not a painter slobbers the paint all over the place. If you saw a proper painter you would see that he used his tools in a proper way, and differently from the so-called painter, who slobbers the paint all round the pot, and so on.

19,773. We have to take things as we find them. There are men who get paint on their hands?—So-called painters.

19,774. You think that they should be educated not to do it?—Yes. They might eat it, for instance. You would educate them not to do it. Some do not appreciate the danger, I believe. You would teach them that it is unwise.

19,775. You said that one of the difficulties of prohibition is the suffering of the general public. How would they suffer?—Because the work would cost more to do, and it would have to be done more frequently, and it would not be so durable as if done with white lead.

19,776. Assuming that regulations were enforced, you admit that there would be extra cost of the work by reason of these regulations?—Yes, naturally.

19,777. Can you give us any comparison between the extra cost of complying with the regulations and the extra cost of painting the work more frequently?—It would be very difficult, I am afraid, off-hand.

19,778. Do you think that there is anything in it?—To begin with, I do not know what the regulations are going to be, and even if I did it would be very difficult to estimate the cost.

19,779. Taking the regulations foreshadowed by the Chairman: the overalls, with regard to which you see such great difficulties, the supply of hot water in all cases, the provision of meal rooms, &c., &c., exhaust fans driven by electricity, and so on, you admit that that would be a very costly proceeding?—Undoubtedly.

19,780. Have you ever tried to buy poison?—Not to my knowledge.

19,781. If you had, you would probably have found difficulty in getting it?—I suppose I should.

19,782. Do you not think that there would be as great difficulty in getting white lead, if it were prohibited, as there is in getting poison?—I suppose that there would.

19,783. Really, you had not considered your reply to Mr. Sutherland when you said that you could not see how a regulation could be made to prohibit white lead?—I did not say that, I think.

(*Mr. Sutherland.*) That was not my question.

19,784. (*Mr. Rice.*) That was the purport of the question?—I do not remember it. I do not see what the difficulties would be in prohibiting white lead.

(*Mr. Rice.*) The point was that it would be difficult to make restrictions for the prohibition of white lead.

(*Mr. Sutherland.*) Unless you cut it off at its source.

19,785. (*Sir Godfrey Baring.*) The difficulty was with regard to zinc paint containing lead?—If lead were prohibited, zinc paints from abroad, for instance, which had lead in them would not be allowed, I take it.

19,786. (*Mr. Rice.*) You said that first-class work only was rubbed down, and that rough work was not

21 May 1912.]

Mr. JOHN ANDERSON.

[Continued.]

rubbed down. Can you give the proportion of work that is not rubbed down?—I meant that some work would be scarcely rubbed down at all and hardly ever see glass-paper.

19,787. But what proportion?—I could not give you the proportion.

19,788. Have you no idea?—So much depends on the class of work. Some work would scarcely ever be rubbed down at all.

19,789. I am speaking of the proportion to the whole of the painting work. Have you any idea as to whether half the work is rubbed down and half not rubbed down?—In poor neighbourhoods, and so forth, there is very little rubbing down done at all; that is with the poorer class of work. Good class work is almost all rubbed down; but so much is not necessary, because a good painter spreads the colour in such a way that very little rubbing down is needed. An indifferent painter puts it on so roughly that more rubbing down is required.

19,790. You admit the difficulty of using the fan in many cases?—Yes.

19,791. Where only gas is provided, an electric fan could not be used?—I admit that.

19,792. In many houses where there is electric light, there is not a plug on the skirting or somewhere else?—There are very few but what have a plug.

19,793. Bedrooms?—Some of the bedrooms would not have; but there are very few good class houses that do not have plugs somewhere. They would not be in the servants' bedrooms or in the basement, but in the reception rooms. It is possible to have a long length of wire to attach to the fan.

19,794. Which would mean additional expense?—Yes.

19,795. That would have to be added to the more frequent work that was required?—Yes.

19,796. Now periodical medical examination would be a very costly item?—Undoubtedly.

19,797. Do you see any difficulty in getting the men together to be examined?—Who is going to pay their wages while they are going to be examined? Unless the doctor is going to walk round to every job it would be very difficult.

19,798. Even if the doctor went to every job, the cost of examination would be something?—The men would have to be collected together, and wait to see the doctor, and then go back to their work, and so on.

19,799. You are quite prepared to say that anyhow it would be a very costly item?—Yes.

19,800. Now in speaking about the interest of your clients, you suggest that there should be regulation?—Yes.

19,801. Why?—Because I say that the work done with lead is much more durable than the work done with the so-called ready-made paints or zinc paints.

19,802. That is only a question of expense?—Yes.

19,803. You admitted that these regulations would materially add to the cost of painting, and you can form no opinion as to which is the dearer, whether more frequent painting or painting with regulations?—It is rather difficult to give an opinion off-hand; so much depends on the kind of regulations which would be enforced. If they were very drastic they would be more costly.

19,804. More costly than more frequent painting?—Yes.

19,805. Have you conducted any comparative tests of white lead and zinc white?—Not recently. I used to use zinc white years ago; but that does not cover so well, and does not last so well. I discontinued it on account of the cost, some years ago.

19,806. You have not conducted tests recently?—No reliable tests.

19,807. So you cannot say absolutely that zinc white is not so durable as white lead?—No. I know of tests.

19,808. Not personal tests?—I have not used zinc white recently.

19,809. Then it is only from hearsay that you say that white lead is more durable than zinc white?—Not exactly hearsay. I have had more or less proof submitted to me in reference to it.

19,810. But you have made no tests yourself?—I am referring to the National Master House Painters' Association tests. Tests were made with zinc white paints and other kinds of paints against white lead. The result was distinctly in favour of white lead.

19,811. Not necessarily in your own case, but in many cases, a rush of work demands the employment of anyone you can get, pretty well?—Yes.

19,812. You realise that, having a large number of men at one time and a smaller number at another, the regulations if imposed would be extremely difficult and costly at those times?—Yes.

19,813. It would really prevent the rapidity with which the work would otherwise be done?—It would, I think, to a very great extent.

19,814. The men would have to be called up for medical examination, and that would prevent the work being finished so rapidly and quickly as if they were allowed to go on without interference?—It would make a little difference, but not a great deal.

19,815. But it would make some difference?—It would make a difference.

19,816. (*Mr. Parsonage.*) Who takes on your men and discharges them?—The painters, do you mean?

19,817. Yes?—To a very great extent my head foreman. I take on some and the managers take on some. It all depends.

19,818. And the foreman and managers also discharge them?—They also discharge them.

19,819. You may have a good many men in your employ that you would have no knowledge of whatever?—I would hardly say that. We keep a record of all the men working for us.

19,820. Time sheets?—Not only time sheets. We have recently established record cards. We refer back and give preference to men who have worked for us before over men who have not. We always try to do that.

19,821. For how many years have you had the record cards established?—The last two years.

19,822. In the spring time you get a great rush of men taken on for a job and discharged?—Yes.

19,823. You have no means of knowing anything about the personal health of these men at all?—Probably not, if they come on for a short time.

19,824. That would apply to the majority of the men that you employ, would it not?—No, I do not think that it would apply to the majority.

19,825. About what percentage of the men would you employ constantly?—The average number of men that I employ during the busy time, something like six months of the year, is 75, and in the slacker six months about 38.

19,826. The average?—Yes.

19,827. You gave us the average number of men that you employ as 110 in answer to one of the early questions. Now you say 38 to 75?—Did I say 110 altogether, or painters?

19,828. You said that the average number of painters you employed was 110?—Not painters, I think.

19,829. (*Chairman.*) The question I put was the average yearly number of painters?—If I said an average of 110, it was a mistake. I am sorry if I did. It should be 51.

19,830. (*Mr. Parsonage.*) I have a little knowledge of your firm, and it struck me at the time that it could not be right?—I misunderstood the question, or I answered too quickly.

19,831. There are times in the winter when you have not half a dozen men on?—That has never happened.

19,832. Not so low as that?—Not so low as that.

19,833. Seventy-five per cent. of the men you employ in the spring time are taken on by your foreman, and discharged by him, and you would have no knowledge of them whatever?—I would know more about them than that.

19,834. You would not know them if you saw them again?—I might not know 75 per cent. of them, but I should know many. Speaking off-hand, the men I know very little about would be about 25 per cent. In our neighbourhood, as you know, the men come regularly in the spring and the autumn. They come

21 May 1912.]

Mr. JOHN ANDERSON.

[Continued.]

on in the busy time and go off in the slack time. We have them repeatedly; therefore, we get to know them.

19,835. You do not know whether they have suffered from lead poisoning in the intervals, or what has happened?—No.

19,836. So really you could not say anything about their average health?—Not in the interval.

19,837. Now with regard to the education of the worker, we will assume that the employer is educated to the dangers of lead, and requires no education to instruct him to allow time for washing hands or providing washing accommodation and all that?—No.

19,838. And yet he does not do it?—I doubt that.

19,839. You would not allow your men to leave off five minutes before breakfast or dinner to wash their hands?—But they do, whether I allow them or not.

19,840. I know they do, but they are not supposed to?—It is not a printed rule, but a general rule nevertheless. I should not be surprised if I saw a man doing it.

19,841. (*Sir Godfrey Baring.*) Would your foreman object if he found a man washing in his work time?—I do not think that he would; if it was a few minutes before his dinner hour.

19,842. (*Chairman.*) Some employers might object?—Some employers might. Some must not leave off until the whistle blows. They come off the job and wash somewhere else.

19,843. (*Mr. Parsonage.*) In your opinion the man who gets lead poisoning most frequently is the man who has not had experience or knowledge of the trade, but simply comes into it, as in London, in the spring, without serving any apprenticeship or anything of the kind—just a rough painter?—Yes, to a very great extent. Some men might be very good mechanics, but they are delicate and would be more susceptible.

19,844. Would you make it a condition of employment that men should belong to a trade union and show some qualification?—If I saw any advantage in it, I would.

19,845. You have admitted that men who learn the trade and follow it regularly are better men?—Yes.

19,846. But would they be less liable to lead poisoning?—I think so, if they knew the trade thoroughly.

19,847. Mr. Sutherland mentioned Lancashire, London, and Birmingham as the three places where lead poisoning is most frequent. In no place in England is apprenticeship carried out more than in Lancashire. In many towns in Lancashire a man must prove that he has served five years in the trade before reaching the age of 21, and must be a member of a trade union, and yet we have more cases in Lancashire even than in London?—I am surprised to hear that.

19,848. So that the education of the worker has not much to do with it. Mr. Sutherland, I think, will agree that there is really as much lead poisoning in Lancashire as anywhere?—Although they are more qualified men in Lancashire?

19,849. Yes?—Than in any other part of the country?

19,850. Yes, Lancashire and Yorkshire. They will not admit a man into the trade unless he proves that he has served an apprenticeship; and in many of the towns there are technical schools where they go to receive instruction; but yet they suffer from lead poisoning more than they do in the country places?—More than in London, where you do not know of an apprentice scarcely?

19,851. As much as in London, at any rate, and far more than in a country town where they get fresh air. So that the education of the worker does not prevent lead poisoning?—I would qualify it by saying, education that would teach them to avoid running needless risks in the way of stopping paint all over them, as they do, I am sorry to say, sometimes. They are educated in the wrong way. They may learn how to do the work, but not how to do it while taking care of their own health.

19,852. You want them to get over the work as quickly as possible?—Naturally; every man does; but not to the detriment of their health, I hope.

19,853. You spoke of dry rubbing down and a good painter putting the paint on so that it required very little rubbing down. How about when he has to put two coats on in one?—That sort of thing does not come within my province.

19,854. There is a good deal of it?—You mean putting on a very round coat, and trying to make it cover as good as two coats?

19,855. Yes?—That is not a proper way of doing it.

19,856. Taking lead poisoning and what is termed "paint poisoning," paint poisoning would not cause paralysis or dropped hands?—I could not tell you about that.

19,857. So you would agree that lead is really the cause of the poisoning?—I do not know. I presume it is, but I do not know.

19,858. The wash-leathers that the men use for washing their hands are the same leathers as are used for washing the paint?—Yes.

19,859. A man has been rubbing a door down with pumice-stone; he has been washing the door, and a certain amount of lead off the door is moistened and on the leather. You see it, white, on the leather sometimes, and he uses the same leather for washing his hands?—That is very far-fetched, I think. I do not think that you get much lead on the leather. After the door has been washed down he uses the leather for the purpose of drying the work. Is there any dust on it? In old work there is not much dust to come off, but in new work you may get a certain amount of lead. No dust arises in rubbing down with pumice-stone and water. It is all moist and wet. The dust arises when you use the dry rubbing down process.

19,860. There is no dust, but you soften the surface of the paint by rubbing down with pumice-stone, and you finish off with a leather, and the man uses the same leather for washing his hands?—If a man got dust on the leather, I would say that he had not properly done the work. The dust would come off in the rinsing down, before he used the leather.

19,861. Not dust, but particles of paint?—That would come off before he used the leather, I should say.

19,862. (*Mr. Gardner.*) I take it that you are a practical painter, and have served your time to the trade?—I am a practical painter, but in the last few years I have not done any painting. I could paint with the majority.

19,863. As a young man you went through the mill?—Yes, I was born in it.

19,864. You are one of the highest class of painters in London?—I think so.

19,865. And yet in your shop, where you have the best conditions prevailing, you have had three or four claims for compensation, since lead poisoning has been put under the Workmen's Compensation Act?—Yes, in the last three or four years.

19,866. You said 10 years in your examination-in-chief; but it is only five years since the Act came into force?—Yes.

19,867. So that, even with the best conditions, you still have had claims?—We still have claims, but very few and far between.

19,868. You do not keep apprentices?—No; there is no opportunity. When I say "no opportunity," it is not customary in London. I am sorry, but it has dropped out very considerably. We are trying to introduce it now at the present moment. We are doing all we can by our association to get apprentices.

19,869. I suppose it is only since this inquiry into the dangers of lead poisoning has taken place, that your association has taken up the question of educating the workmen as to the dangers?—They have not taken up the question of educating boys or improvers from that point of view, as a matter of fact. It has not been taken up on account of lead poisoning, but principally on account of their trying to create better workmen generally.

19,870. If you do not get them as apprentices, do you wish to train them after they are journeymen?—Yes, to improve their workmanship.

21 May 1912.]

Mr. JOHN ANDERSON.

[Continued.]

19,871. You spoke about Scotland. You seem to have an admiration for the painter in Scotland. You said that he had better conditions. What better conditions have the painters in Scotland than the painters in London in the better class shops?—Better conditions inasmuch as the hour for breakfast is of great importance.

19,872. Could not that be introduced in London?—Yes.

19,873. How many hours per day do the men work in London?—Nine hours is the regulation day. Painters work rather long—10 or 11.

19,874. Supposing that they have two breaks for meals in Scotland of an hour each, could not that be arranged here, if it would help to benefit their health?—Yes, no doubt.

19,875. You also expressed the opinion that the men who come into the trade late in life are most subject to lead poisoning. Would you have a restriction that nobody should be allowed in the trade without an apprenticeship?—That would be rather difficult to start off-hand, would it not?

19,876. But you said the union ought to be more strict?—I wish they were.

19,877. If they were, would not we hear a good deal about trade-union tyranny?—Who hears about trade-union tyranny?

19,878. We do?—I have not complained about that.

19,879. Now, how many oil paints are there in the trade that have a vegetable basis and no lead at all?—Most of the dark colours have no lead in them.

19,880. Have they not?—Black, green, and blue, and some of the dark colours.

19,881. What are green and blue composed of?—They are mostly vegetable colours.

19,882. Are they?—Yes, green and blue would be. It all depends on what kind of blue. A light blue may have lead in it, of course.

19,883. I am not speaking about carbonate of lead or white lead, but there are salts of lead in it?—You might have oxide of lead.

19,884. Brunswick green, for instance. The only colour I know of, if you can call it a colour, which has a vegetable basis is black—as far as my knowledge

goes of what is used in the trade?—And lead in greens?

19,885. Yes, lead in greens and lead in yellows?—I have something to learn yet.

19,886. (Dr. Collins.) How about Brunswick green and all the chromates?—I should have thought that there was very little lead, if any at all, but I am not a chemist.

19,887. (Chairman.) Have you recently found that the insurance companies have increased the premium for painters?—Yes, I have.

19,888. Can you tell us to what extent?—Here is a letter that answers the question (*handing a letter to the Committee*).

19,889. This letter says: "For general building work the rate is 30s. per cent., and, for painters, 35s. per cent."? Perhaps 2s. 6d. might be put down as representing the risk of lead poisoning?—Yes.

19,890. That is from the Sun Insurance Company?

—Yes. I have been told that it is in consequence of lead poisoning that the rates have been increased so considerably. Two years ago the rate was 20s.; then it was increased to 30s. This year it was increased to 35s. They say there that it is not in consequence of lead poisoning so much as it is in consequence of the number of small accidents that occur to painters that do not occur to men in other trades, owing to the way in which painters go about. They do not get the same security and facility with regard to scaffolding as other trades do.

19,891. It says here, with regard to painters, that the chief elements of risk are, the use of ladders, cradles, and the nature of the structures used in connection with the work, as compared with those employed in ordinary building?—That is what I mean.

19,892. And also, to some slight extent, the risk of lead poisoning?—Yes; it says "to some slight extent."

19,893. (Mr. Gardner.) It may be information to you to know that in our society in Scotland we pay 13 weeks' sick benefit for accident, and the cost has been something like 6½d. per member per year. So that that is not a heavy liability?—No.

The witness withdrew.

Mr. C. E. WILKINSON examined.

19,894. (Chairman.) Do you attend here to-day as a representative of the London Association of Master Decorators?—Yes, I believe that that is my position.

19,895. We have just had the president of your association here. Do you come to supplement his evidence?—I have not the least idea what it is, I am sure. I take it that I come with my own individual evidence, as far as that is concerned. I have no knowledge of his experience or his ability to answer questions.

19,896. You are possibly aware that we have already heard a very large number of master house-painters and decorators?—No, I am not aware of it.

19,897. Have you satisfied yourself that the danger of lead poisoning amongst house-painters constitutes a very real danger; and one that should be removed?—No, I am not satisfied at all in that direction.

19,898. What is your business and where is it carried on?—My business is that of a decorator chiefly. I am what is known as an ordinary London jobbing builder, which comprises more than one trade. I was apprenticed as a decorator, served as a journeyman, became foreman, then manager, and finally an employer. I have had 31 years' experience, 16 years as an employer.

19,899. Have you known any cases of lead poisoning or painter's colic?—No.

19,900. What is the average yearly number of painters employed by your firm?—About 20.

19,901. It is very small?—Twenty per week. It varies from 15 to 50, probably. It may be a little more. That is painters. Then I employ other trades.

19,902. Have you known no cases of lead poisoning?—Never in my experience, and I have had many hundreds of men—never a single instance of it.

19,903. Have your men had occasional days of sickness possibly due to lead?—No; I have at least ten men in my employ who have been 25 or 26 years employed who have never had a day's illness. I can produce them.

19,904. Do you have periodical medical examination of your men?—No, I never consider it necessary.

19,905. How do you know that they have not had occasional days of sickness?—By the fact that they are always at work. I am speaking of ten or twelve of my men who have never lost a day's work.

19,906. What about the rest of them?—Those I cannot speak about. They are discharged in accordance with the pressure of business and the variations of business.

19,907. They might possibly have been ill from lead poisoning?—They might, but I have no knowledge of it. I think I should have heard of it.

19,908. You know, I presume, that lead poisoning frequently undermines the health without immediate violent symptoms arising?—I believe that lead poisoning is a serious matter.

19,909. Do you know that the incidence of lead poisoning is published month by month by the Board of Trade?—No; I know that there are some reports, but I have not any personal knowledge of them.

19,910. You said just now that you did not think that the incidence of lead poisoning was very serious?—Personally I do not think that it is serious.

21 May 1912.]

Mr. C. E. WILKINSON.

[Continued.]

19,911. Have you read the reports of the Board of Trade on lead poisoning?—No.

19,912. Then you do not know how serious it is? No, but I may judge from my own personal experience, which I consider to be fairly large, and I am not going further than that. I must say that I have not a great deal of faith in statistics.

19,913. Would you have faith in the death certificates of doctors?—Knowing instances where certain cases have been said to be lead poisoning, and also knowing that those particular cases have been proved not to be lead poisoning, I am afraid that I am somewhat sceptical.

19,914. Do you know that, during the last ten years, 284 deaths of painters have been definitely certified as due to lead poisoning? No, I am not aware of it. The point is, what is the percentage.

19,915. And in 1911 there were 36 deaths?—No, I was not aware of that.

19,916. Do you know that about 2,000 cases of lead poisoning in your trade were reported to the Home Office, voluntarily without any legal compulsion whatever, in the same 10 years?—No.

19,917. I am sure you will agree with me that all this sickness and death is very deplorable?—Certainly. I would like to know the proportion.

19,918. It is not a question of proportion?—You mean that the fact alone is deplorable.

19,919. Yes?—Is that amongst house-painters?

19,920. That is amongst house-painters?—I should say that it was deplorable, certainly.

19,921. I suppose you would agree that the Home Office must do something to remove the danger?—Yes; on that statement it is sufficiently obvious, I think, that something should be done.

19,922. There are two alternatives which the Home Office can adopt: one is to prohibit the use of lead or restrict it to a very small percentage; and the other is to issue regulations similar to those which obtain in all other industries where lead is used. I suppose you agree to that?—Well, with my experience I think that regulations, which of course the workmen have to share the responsibility of as well as the employer, are all that is necessary. It is a question of the cleanliness of the individual workman.

19,923. I want you to answer my question. I said there are two alternatives. I gave them, and I suppose you agree that one or the other must be adopted to remove the danger?—I should be inclined to agree to the latter proposition; but I am not aware at the moment what those regulations are. I am speaking advisedly.

19,924. I will tell you. First of all there is the provision of overalls by the employer, who is responsible for seeing that they are regularly washed?—That is not practicable, and it is not necessary. The workmen themselves do it.

19,925. It is no good your stating that it is not necessary. I am only putting to you regulations such as are enforced in other trades?—In the painting trade it is not practicable.

19,926. I want you to get quite clearly in your mind that I am telling you now what regulations obtain in other industries where lead is permitted to be used, and as the amount of lead poisoning is greater in the house-painting trade than in these other industries, the regulations will not be less stringent, and they may be made more so. I am going through them one by one, and shall be very much obliged if you will give me your opinion about each one. We, secondly, come to the provision of a meal room, care being taken that in no case whatever are any of the men allowed to take their meals in a room where lead is used. What do you say to that?—That would be done where it is possible, as it is done now; but there are cases where it is not possible. The responsibility does not rest on the employer, but a good deal on the employer's customer.

19,927. I want to know whether such a regulation could be generally enforced?—I do not see why it should not be enforced, but there may be difficulties. I am sure there would be difficulties.

19,928. I suppose you agree that at the present moment a large number of men are obliged to take their meals in the room where they are working?—Yes. Frequently there are objections to their doing otherwise.

19,929. That is, of course, a highly dangerous thing to do?—Well, I rather differ.

19,930. I will put it in this way: in the opinion of the Home Office, who have disallowed that practice in other industries where lead is used, it is highly dangerous?—Yes, but the conditions in which lead is used in other industries may be entirely different from those existing in the painting trade.

19,931. It is a question of dust generated in the rooms, which the men breathe?—There again I might disagree with you as to the amount of dust generated.

19,932. The third provision is a proper place to keep the overalls where they will not contaminate food or outdoor clothing, and where they will not collect unnecessary dust when not being worn. Do you think that that is practicable?—No, not in the painting trade; it may be in others; but you see the painting trade is not carried on in a factory. That must not be lost sight of.

19,933. Then there is the provision of cloak-room facilities, so that clothing put off during working hours shall not under any circumstances remain in a room where lead is used?—I give the same reply to that as in the other matters, the impracticability of carrying it out.

19,934. I suppose you agree that it is most important to provide proper washing accommodation for the men?—It is always done. They always find means for washing themselves.

19,935. Would you say quite positively that it would be always possible to provide hot water?—No, not hot water, but every self-respecting painter carries a towel and soap in his bag, and he is always using water in his business, and good soap with cold water I have always found in my own practice sufficient.

19,936. Would you agree, as an employer, to take care to ensure for each of your workmen proper washing appliances, clean towels, nail brushes, and soap?—Well, if it was a regulation I daresay it could be done; but the painter is not a dirty man by any means. He is obviously a clean man if he is really a painter. I think that there are difficulties in the way of making regulations, and I think it unnecessary. A painter who is a painter carries these. I was taught as a boy to carry my towel and soap with my tools.

19,937. Do you mean to say that any considerable number of painters carry soap, towels, and nail brushes in their bags?—The majority of my men do, I guarantee. I do not say all. It is very much easier to make the regulation for the men to do it than for the employer.

19,938. The employer is responsible?—The employer could go to the bag and see that it is done.

19,939. (*Mr. Parsonage.*) In this bag they carry some of their tools and the overalls that they use in their work, with the towel?—Yes.

19,940. And their food?—No. Their kit bag is on the job. They do not carry the kit bag to and from home.

19,941. (*Chairman.*) But if the case is as put to you, the overall would contaminate the towel and the clothing?—A man only puts the overall into his bag when he is travelling from job to job. A job lasts for weeks. He hangs it up where he has been working.

19,942. How does he get the overall cleaned?—He takes it home weekly, or at the most fortnightly.

19,943. Provision would have to be made for the avoidance of dust: some means would have to be devised for getting rid of any dust which the men might breathe. Do you think it is possible in every case, by means of an exhaust draught or the like, to remove the dust from the men while they are at work?—No; it is impossible. I think that the question of dust, if I may say so, is quite exaggerated.

19,944. You are entitled to give your opinion, but it is not the opinion of a very large number of witnesses who have come from your trade?—Good painters' work requires very little rubbing down, which generates dust.

21 May 1912.]

Mr. C. E. WILKINSON.

[Continued.]

19,945. You think it impossible to provide any means of removing the dust?—Not by exhaust.

19,946. Can you suggest any other way?—Only by eliminating the necessity for rubbing down, which causes the dust.

19,947. Could you dispense with rubbing down?—To a large extent, according to the quality of the painting.

19,948. Could you dispense altogether with dry rubbing down?—You can moisten the glass-paper with turpentine. That is frequently done. Lead dust does not float about.

19,949. Certainly it floats about?—It will come right straight on the floor.

19,950. If the men are doing a ceiling, for instance?—They do not rub down a ceiling.

19,951. You have paint on ceilings?—But there is no dust from a ceiling. That is my practical experience, and I am a painter.

19,952. Do you say that there is no dirt on the men's hands, and no dust?—I have seen it myself?—Dust from the painting of a ceiling?

19,953. I have seen a man stippling?—But that is not dust; that is splashes.

19,954. But he gets the stuff on his face, and that dries and generates dust? [No answer reported.]

19,955. (Dr. Collis.) Do you say that, because dust is composed of lead, it necessarily falls to the floor?—Yes.

19,956. Explain how in file-cutting, when they are working on a solid lead bed of nothing but lead, you can find lead in the dust on the top of the beams 6 feet above the man's head. Such an extraordinary statement as you make forces me to ask you to think again. Just because a particle happens to contain lead do you think it will not float in the air?—If it is small, it will float about the room. Just because lead is heavy, that does not show that a particle of lead would not float about in the air?—But it would fall very rapidly.

19,957. I gave a simple case of the lead beds and the lead on the beams?—Is there no other reason for it. Are there no draughts? Are there vacuums, for instance?

19,958. No more draught than there is in this room?—Is an experience of 31 years of practically no value?

19,959. I could take you into some of the potteries where they have had no cases of lead poisoning for many, many years; and to others, much better works, much better equipped, and everything up to date, where they have a crop of cases every year?—It is very extraordinary.

19,960. (Chairman.) Now, in addition to what I have told you, periodical medical examination would have to take place, say, once a month, and that would be insisted upon at the expense of the employer. Would you agree to that?—It seems another tax on the trade. I think it might be a good thing.

19,961. You think that it might be a good thing?—Yes, I think it might be a good thing.

19,962. Now in the pottery industry, in addition to medical examination, the employers have agreed to give compensation to any worker who is withdrawn from work by the doctor's orders on account of doubtful health. Let me give you an illustration of what I mean:—Supposing the doctor examines a workman and says, "Look here, you have not lead poisoning, but you are very near it; I must suspend you for a month"; the employers have agreed to give that man compensation for that month. Would you agree to give similar compensation under similar circumstances?—Well, I suppose that it would be a question of insurance. I do not see that one could take that risk in ordinary business.

19,963. But you would not mind the cost?—Not if it became a regulation; I suppose not.

19,964. Taking all these points into consideration, would you say that you would prefer that the industry should be regulated by special rules such as I have foreshadowed, or, as an alternative, that the use of lead should be prohibited or very closely restricted?—I think that I should prefer regulation to prohibition.

19,965. You have told me that you cannot enforce these regulations?—Many of these regulations, I think, are impracticable. I mean a regulation.

19,966. I will put it to you again. Would you prefer regulations such as I have foreshadowed—the whole of them—or prohibition?—I do not think that prohibition is possible. I think that the regulation should be modified. I must give you a qualified answer.

19,967. Will you please answer the question?—I cannot give a yes or no answer to a thing like that.

19,968. Why cannot you?—Because I do not agree with some of the regulations.

19,969. I will put it in this way:—do you think the regulations could be enforced?—Not those that you have foreshadowed. They could not all be enforced. I think that some of them are impracticable.

19,970. If the Home Office felt that, unless the whole of the regulations were enforced, the health of the workpeople would still be in danger, you would not be surprised if they, under the circumstances, said, "We must have prohibition"?—I should not be surprised.

19,971. You would not?—I should not; because I do not think that the regulations are workable as you lay them down.

19,972. (Dr. Collis.) What regulations would you suggest, if you do not agree with the experience of the Home Office over something like 20 years now, in the way of protecting workers in lead from the danger of lead poisoning?—I could suggest no table of regulations. I did not anticipate the question. They should be modified to suit the requirements of the working of the particular trade.

19,973. In what way?—Some of the regulations appeal to me as being quite impracticable in working, and could not be followed. How would you enforce them?—Your system of inspectorship would have to be so detailed that I do not think they could be carried out.

19,974. You appreciate the idea that these are not regulations produced by sitting down at a table and agreeing as to what you think is likely to be of value, but they are the accumulation of our efforts of over 20 years, since the first regulations for the manufacture of white lead were brought into existence?—They may be quite reasonably carried out in some particular industries.

19,975. That is not my point, if you will kindly follow. These regulations are the accumulation of experience gathered over 20 years of the incidence of lead in producing lead poisoning. Whether they are applicable to this trade is another question, but they are what the Home Office has found necessary to protect the worker from the danger of his occupation. Your contention is that, when you leave the trades within the factory walls for which regulations have been introduced, and come to the house-painter, they become impracticable?—Yes, to some extent.

19,976. You have no other suggestion to offer by which the worker may be protected equally well. You see the dilemma?—I quite see and appreciate the difficulty.

19,977. Here are our long experience and the regulations which the Chairman suggested to you. We know the protection that they will give. You say that they are impracticable?—Yes.

19,978. There is the dilemma?—Quite.

19,979. Have you any way out of the dilemma?—Understand that I am speaking from my own experience. I cannot speak from the experience of anyone else.

19,980. Exactly?—My experience is that the properly trained painter is a very decent man, and he is not influenced in his health by the use of white lead. Consequently, a lot of these regulations are not necessary.

19,981. We have definite evidence from societies contrary to that, and in other ways?—But have you gone into the status of the man who is ill; is he a trained painter, and does he rank properly as a painter.

19,982. You are asking questions, instead of me, at the present moment. The incidence of lead poisoning in the definite unions and societies of painters is high?

21 May 1912.]

Mr. C. E. WILKINSON.

[Continued.]

We have it in the Registrar-General's statistics distinctly?—I should not accept that.

19,983. You ask me, and I give the figures as far as I know them?—I should not accept that altogether as an opinion to be followed, for the reason that I am not sure that all the best painters are in the trade unions.

19,984. Have you any other figures to give us; I shall be only too pleased?—I have only experience of my own employees.

19,985. An experience of 25 employers, even over 30 years, cannot be set against the experience of societies and the Registrar-General's figures dealing with thousands of men?—One has had hundreds of men through one's hands in the time.

19,986. But this is thousands of men in the same time?—Yes, I allow that.

19,987. Here is our dilemma. In other trades means are taken for protecting the workpeople. You say that those are impracticable in your trade. What is your solution?—My solution is proper training and education of the painter in cleanliness and things of that nature.

19,988. What would you educate them in?—Chiefly in cleanliness and in the material they are using, and taking precautions—which a decent painter would.

19,989. Have you yourself studied the question of lead poisoning and the method by which it is contracted?—If it is contracted at all it is contracted from the dust.

19,990. Would you educate the painter not to breathe?—Oh no, no, no.

19,991. How then would you educate him not to get the dust into his mouth?—The question of rubbing down is of vital importance; and there is not so much as is generally thought.

19,992. Whenever I see a man painting, I find more than the witnesses have generally told us in the Committee room?—Then the man is not a proper painter.

19,993. I give a good deal of my time to the study of dust. How much is 3 milligrammes? Can you see 3 milligrammes in the air? Would you know that it was there? It is a question really of what you consider much. Dr. Legge, after many years' work, told us that 3 to 4 milligrammes of lead is the utmost amount that may pass into the human system with safety, but it is practically unappreciable *quæ* dust. That is where you are making a mistake—in neglecting what is a most important point; and, consequently, I must bring you back again to our dilemma, and how you are going to help us out of it. If these regulations are impracticable for your trade, to protect these men from the breathing of 3 to 4 milligrammes of lead per diem, what are we to do? Education is not going to do it. It would help, of course?—A properly painted door or wall, or whatever it may be that is painted, if painted by a thoroughly trained painter, requires but little rubbing down. As I said just now, I think that the question of rubbing down is very much exaggerated, and there is not the amount of dust generated that you suppose.

19,994. Do you think that there is less than 3 to 4 milligrammes?—I am not prepared to say that.

19,995. You have come to give evidence. We presume that you have come to give evidence on important points to help us?—Yes.

19,996. (Mr. Parsonage.) In one part of your evidence you say that the painter who is a painter is a very decent man?—Yes.

19,997. Clean?—Yes.

19,998. Then, again, you speak of educating them in cleanliness in order to avoid lead poisoning?—Yes, still further educating them. There are a great number of so-called painters whom I should not consider painters from the point of view of ability in the trade.

The witness withdrew.

Mr. J. J. HONEYMICHON examined.

20,017. (Chairman.) Do you attend here to-day as a representative of the London Association of Master Decorators?—Yes.

19,999. You consider that they require educating?—Yes.

20,000. In your own business do you wish to know, when you take a man on, if he has served apprenticeship to the trade?—Not now, because it is so seldom that they have done so. You judge from their work.

20,001. You take on any man who comes along?—In most cases we judge by appearance, and so on; and by their work, when they commence work.

20,002. What is the standard rate of wages that they are paid?—8½d. or 9d.

20,003. Do you employ men at 8½d.?—Yes, and 9d.

20,004. According to the abilities of the workman?—Yes, chiefly.

20,005. I know places where they pay 9d., and one price only. You will agree that a good workman can get a higher rate of wages?—Yes.

20,006. And he can get a longer run of work?—Yes.

20,007. Yet, even in the case of these good workmen, who get the higher rate of pay, there is lead poisoning?—Is that so?

20,008. Yes?—It is not my experience. I have been particularly fortunate.

20,009. There are three places in the country where lead poisoning is more frequent than anywhere else. I agree that in London far too many men are called painters who are not painters. In Lancashire the apprenticeship system is in vogue to-day, and in many towns in Lancashire and Yorkshire a man cannot get a job in a decent shop unless he has served his apprenticeship to the trade, and he must be a member of the trade union; but yet in Lancashire we have more cases of lead poisoning than in any other part of the country except London. These men are technically trained men; trained in technical schools, and they are qualified men?—That surprises me.

20,010. (Mr. Gardner.) You agree that overalls are necessary for the men, although you do not agree that the employer should provide them. Can you tell us why it is that we see so many painters in the London streets without overalls painting outside?—Those are men whom you should not class as painters. That is the unfortunate position. They are only more or less painters' labourers. It is an extraordinary term for a painter, but they are not what I should call painters, and I probably should not employ them.

20,011. In going along the street, if you saw a man on a ladder or working at a shop front without overalls, you would say he is not a painter?—It is customary in most shops for the men to wear overalls.

20,012. (Mr. Parsonage.) What do you term overalls—the long blouse and the apron?—Yes. That is what I take it is being referred to.

20,013. (Mr. Gardner.) Yes. You also told us that the painter is really a clean man. Would it astonish you to be told that we have been informed repeatedly here that he is very dirty, and that the lead poisoning is due to his dirty habits?—I cannot call them painters. There are a number of men in the painting trade who are not painters. We must draw the line in that respect. I do not consider them as painters.

20,014. Does that mean that you think that if a man suffers from lead poisoning he is not a painter but an importation into the trade?—I should expect to find that the chief sufferers from lead poisoning are this class of man rather than the properly qualified painter.

20,015. Would you agree to a restriction that no man should be allowed to enter the trade after he became an adult without previous training in his youth?—I think it is a very good suggestion.

20,016. As a master painter, you would agree to that?—I think that it is an excellent suggestion, particularly as I have the education of the painter at heart.

21 May 1912.]

Mr. J. J. HONEYCROFT.

[Continued.]

20,019. Have you satisfied yourself that the danger of lead poisoning amongst house-painters constitutes a very real danger; and one that should be removed?—Well, not altogether a real danger.

20,020. Then I must tell you what the dangers are. But, first, will you tell us what is the nature of your business, and where is it carried on?—In various parts of the country, as regards general building and painting.

20,021. What is the average yearly number of painters employed by your firm?—I should say 40.

20,022. How long have you been in the painting trade?—Twenty-three years.

20,023. Have you known any cases of lead poisoning or painter's colic?—Not in connection with our own firm, but we have known cases.

20,024. Have your men had occasional days of sickness possibly due to lead?—No.

20,025. Do you have a periodical medical examination of your men?—No.

20,026. Then how do you know that they have not had occasional days of sickness from lead?—We have had no complaints from them.

20,027. They might have had them without your knowledge?—Certainly.

20,028. Do you know that lead poisoning frequently undermines the health without immediate violent symptoms arising?—No, I do not know that.

20,029. The incidence of lead poisoning is published month by month by the Board of Trade; do you see the Labour Gazette issued by them?—No.

20,030. Has your association, to your knowledge, taken any action in regard to the incidence of lead poisoning with a view to its diminution?—The association is so young that we have not done very much as regards it. We have simply had this matter brought up recently, but nothing has been done yet.

20,031. When did you have the matter drawn up?—It was first brought up about six years ago.

20,032. (Mr. Parsonsage.) Where is your business?—Queensdale Road, Holland Park.

20,033. (Chairman.) How many firms are there in your association?—At the present time about 90.

20,034. Do you know how many painters they employ?—No. Application was made with regard to that some time ago; but I am not the secretary and I do not know.

20,035. Do you know that in the Labour Gazette issued by the Board of Trade there have been 284 deaths of painters noted, whose deaths have been definitely certified as due to lead poisoning?—In what period would that be.

20,036. In the ten years ending 1910?—That is not very large.

20,037. But I ask you the question; do you know that?—No.

20,038. And that there were 36 deaths from lead poisoning in 1911. You did not know that?—No.

20,039. Do you know that about 2,000 cases of lead poisoning in your trade were reported to the Home Office voluntarily, without any legal compulsion whatever, in the same ten years?—No.

20,040. And that probably there is a much larger number of cases than those reported?—Undoubtedly.

20,041. I am sure you will agree with me that all this sickness and death is very deplorable?—It is not a very large percentage of the number engaged in the painting trade.

20,042. But the actual fact of this sickness and death, you must agree, is lamentable?—It is, of course.

20,043. Now the steps which can be taken to remedy this seem to be, either to do without lead compounds altogether or limit them, say, to 4 or 5 per cent. of soluble lead; or very strictly regulate the trade. You agree, I suppose, that those are the only alternatives?—Well, I suppose so, if there is no other remedy. Something would have to be done.

20,044. In the one case lead poisoning would disappear from your occupation altogether—under prohibition?—Yes.

20,045. In the other the remedy could only be partial, and would further depend on the stringency of the regulations and the thoroughness of their enforcement. Do you agree to that?—Yes.

20,046. Now I will tell you exactly what these regulations would be, based on the regulations which have been recently issued for a trade in which lead is used: First of all there is the provision of overalls by the employer, who is responsible for seeing that they are regularly washed. Would you agree to that?—That would be rather impossible.

20,047. Secondly, there is the provision of a meal room, care being taken that in no case whatever are any of the men allowed to take their meals in a room where lead is used?—That could not be applied in the ordinary painting trade.

20,048. I suppose you agree that at the present moment a large number of men are obliged to have their meals in the room where they are working?—No, I do not, not in any case.

20,049. What do you mean by not in any case?—They are not obliged to have their meals in the room where they are working; in fact, they do not now.

20,050. But where would they have their meals if they are working on a job where there is no other room at their disposal?—It is very seldom that there is any part of a house that they can get to to have their meals, and they usually go out to their meals.

20,051. But supposing that they do not go out?—Then there is always some place other than the place where they are working.

20,052. But is that always the case? A great many witnesses who have been here told us that there are occasions when there is no other room available?—Well, I have not found it so.

20,053. Then there is the provision of a proper place to keep the overalls where they will not contaminate food or outdoor clothing, and where they will not collect unnecessary dust when not being worn. Would you agree to making a provision of that sort? Is that a possible provision?—Yes.

20,054. Then there is provision for cloak-room facilities, so that clothing put off during working hours shall not under any circumstances remain in a room where lead is used?—That would only apply to a paint shop where there are usually only one or two men employed.

20,055. No. It would mean that a workman would not be allowed to hang his coat up in the room where he is painting?—But you see at this time of the year, for instance, when it is nearly all outside painting, perhaps there are only three or four men on each particular job.

20,056. I am speaking now of indoor painting?—You may be only doing one or two rooms in a certain house, and that is the part where the men are engaged. Such a regulation as you put to me is impossible.

20,057. I suppose you agree that washing accommodation is very necessary?—Yes.

20,058. Would it be always possible to have a supply of hot water?—No, not on each individual job.

20,059. Would it be possible for the employers to supply clean towels, nail brushes, and soap for the workmen?—That would not be a very great trouble.

20,060. Then it would be possible, would it?—Yes, that would be possible.

20,061. Now let me take you to another point. Provision would have to be made for the avoidance of dust. Some means would have to be devised for getting rid of any dust which the men might breathe. Do you think it possible in every case, by means of an exhaust draught or the like, to remove the dust from the men while they are at work?—No.

20,062. In addition, periodical medical examination of the workpeople, say once a month, would be insisted on at the expense of the employer?—Well, that, I daresay, would be possible. It would not want so many men, because work would be so expensive that there would not be so much of it done.

20,063. In the pottery industry, in addition to medical examination, the employers have agreed to give compensation to any worker who is withdrawn from work by the doctor's orders on account of doubtful health. Let me give you an illustration of what I mean. Supposing the doctor examines a workman, and says, "Look here, you have not lead poisoning, but you are very near it; I must suspend

21 May 1912.]

Mr. J. J. HONEYCHURCH.

[Continued.]

"you for a month"; would you agree in the painting industry to give compensation for that month?—No I do not see how that could be done.

20,064. I must ask you to be kind enough to remember what I have suggested to you would be the regulations or something approaching them. You have told us that in a great many cases it would be absolutely impracticable to carry out these regulations. Then I would ask you, would you agree to regulations such as I have foreshadowed, being perfectly sure that they will be carried out in every instance, or if not, would you rather have prohibition?—Well, it would not be possible to carry them all out.

20,065. Then if the Home Office felt that the danger could not be removed without such regulations, there would be no alternative for them but to recommend prohibition?—That would be all right, provided that we had a suitable substitute.

20,066. No; it is not a question of a suitable substitute. We are here to make suggestions for the removal of the danger to the workpeople which it is admitted is lamentable?—Yes.

20,067. I have told you that there are two alternatives—you may suggest a third—I do not know; one is prohibition, and the other is regulations. You have told us that regulations such as I have foreshadowed are impracticable, so that there is no alternative but to prohibit?—The regulations could be modified.

20,068. I wish to inform you that the number of cases of lead poisoning in the painting trade is greater than in any other trade in which lead is allowed to be used. I can scarcely conceive that this Committee or the Home Office would be likely to introduce regulations of a modified type, or less effectual than those which obtain in other industries. So that I ask you again which of those alternatives you would take, bearing in mind that the cost of these regulations would, I imagine, come to practically the same as the cost of the extra painting which I am told would be necessary if lead were prohibited. So that your clients would have to pay the extra cost one way or another, I take it?—Yes. Well, it certainly would mean, either way, very much less business.

20,069. That is a question which you cannot speak about yet. You do not know whether people would pay the extra cost or not. You do not know whether they would have their houses painted less frequently or not. But that is not the point. I want to know which of the two alternatives you prefer?—I certainly should not favour prohibition.

20,070. Then the corollary of that is that the men must go on suffering?—Well, I do not think that, taking the great number of painters, the suffering is very great.

20,071. But you have admitted that the cases which I have presented to you are lamentable?—Of course they are, but in the painting trade as far as house-painting is concerned I do not see that the percentage is very great.

20,072. You do not think that the rules which I have suggested are practicable?—Not all of them.

20,073. And you will not agree to prohibition. What have we to do to remedy this evil? Have you anything else to suggest?—The only thing, of course, is, as I say, if a suitable substitute can be found, to do away with the poisonous qualities of lead, or modify the regulations.

20,074. But do not you think that the question of finding a substitute devolves on the employers?—That is a thing that is being tried now. There are several.

20,075. Have your association taken this up collectively to try to find a substitute?—I believe that each individual member is trying different things.

20,076. But you do not know?—No.

20,077. You had better not say, then?—I know two or three individuals have.

20,078. The chairman of your association, who has been here to-day, says that he has not tried them personally?—That I gathered from him the other day.

20,079. But other members have?—It is a question of time.

20,080. This question of lead poisoning has been going on for a great many years, and you apparently have not made any great efforts?—The question has not been taken up, as it has not directly affected us.

20,081. I suppose that the advent of this Committee has quickened you a bit?—It certainly has wakened things up, more especially the manufacturers.

20,082. (Dr. Collis.) What experience have you yourself of paints which do not contain lead?—Principally zinc paints.

20,083. Have you used them much?—Only just recently, except for the finest white work, in which we have used zinc for years.

20,084. What is the proportion of your work which is the finest white work?—A very small percentage.

20,085. And it is only for that that you have employed zinc?—Yes.

20,086. I presume you mean enamels?—No, for flat work.

20,087. How does it stand?—It stands well. It keeps its colour better than lead.

20,088. Has not that experience induced you to try it on other work?—No, for the simple reason that it has not such good covering power as lead.

20,089. You say it stands well, and keeps its colour better?—Yes. It is more expensive to use. You have to give more coatings with zinc than with lead.

20,090. What kind of zinc have you used?—Zinc-white oxide.

20,091. You do not know whether it is the direct or indirect method of manufacture?—No.

20,092. So that you have not gone much into the question of seeking after it?—No, not very much.

20,093. Therefore you are hardly in a position to say that there is no substitute for lead?—No.

20,094. Yet you have made that statement to the Chairman?—As regards the present conditions of painting, I mean.

20,095. But apparently you have not given them any trial at all personally?—The only thing I say is that zinc is too expensive to work.

20,096. Is it too expensive at the present price of white lead?—Yes.

20,097. (Chairman.) Is that your only objection to a substitute for lead—the expense of it?—The expense of it, because it requires more coats.

20,098. Is that the only objection you have to it?—That is the principal objection.

20,099. (Dr. Collis.) White lead has risen very considerably in price during the last twelve months, has it not?—Yes.

20,100. What are the comparative prices to-day, gallon of paint per gallon of paint, ready for use?—That is a thing I have not gone into.

20,101. (Chairman.) But you must know that when you say it is more expensive? [No answer recorded.]

20,102. (Mr. Sutherland.) You do not buy the paint except by weight?—No. The present price of lead is 28*l.*, I know.

20,103. (Dr. Collis.) To get any information on the point as to whether it is more expensive, you must know the cost of a gallon of each of the two paints?—You can hardly get at it by the cost per gallon.

20,104. How else can you get at it?—You take the quantity of lead, oil, and turps used on any particular job. That is how the comparison is got at with regard to zinc. In outside work, for instance, where it has been tried, it was tried under a certain architect, and in place of two coats we had to give four, which meant a very large increased cost of labour apart from materials. I am speaking of zinc.

20,105. You do not know what zinc you were using?—Zinc-white oxide, supplied by the manufacturers.

20,106. Zinc white varies as much as white lead varies. Some white leads are good, and some are bad. Your evidence is rather vague. You have stated that there is no real substitute for lead, but you have no really scientific evidence on the point?—I have not said that there is no substitute for lead.

20,107. I thought you said it to the Chairman?—There are substitutes; but I said a substitute equal to lead, or I meant that.

21 May 1912.]

Mr. J. J. HONEYHURCH.

[Continued.]

20,108. But you have no personal experience on the point. We all know what everybody talks about, but you have no personal experience of an experiment scientifically carried out to compare the various brands of zinc to-day on the market with the various brands of lead on the market, as regards their value?—That is a thing I cannot tell you anything about.

20,109. You understand that that is of very vital importance?—Quite so.

20,110. But you, as a man having been in the trade for a considerable period, have no information upon it?—We do not have time to test qualities like that. We know from experience the quality of material that we have before us when we open lead or zinc.

20,111. You must forgive us if we think that painters and decorators have not studied the question, it is rather difficult for us, therefore, to take the general impression of the trade that nothing can be used except lead, if such experience as you and others give us is all that we have to go upon. We naturally look to you, as being users of the material, to know what materials there are for use in your own special trade, in which you surely should be specialists, and not we. If you have never tried any scientific experiments, you will see the obvious conclusions that we must draw?—Quite so.

20,112. It is rather putting up, if I may say so, a bogey than a thing which you know is absolutely a scientific fact. We cannot very well consider a bogey. We want scientific facts. You have no experience of lead poisoning occurring in the trade?—Not in our own business.

20,113. How does your insurance stand to-day, taking what you pay to cover yourself under the Workmen's Compensation Act?—We are paying 20s. per cent. in the London and Lancashire.

20,114. (Mr. Parsonage.) Is there any difference made with regard to painters?—No; that is covering the whole trade.

20,115. (Dr. Collis.) A general rate?—Yes. It covers plumbers, and painters, and all.

20,116. What is the proportion of men that you employ altogether who are painters?—Two-thirds would be painters.

20,117. What illnesses do your men have?—We have a pretty healthy lot. At the present time we have one complaining of rheumatism and lumbago, and that is all.

20,118. (Mr. Parsonage.) A painter?—No; he is a bricklayer.

20,119. But we are only referring to painters?—I was speaking generally.

20,120. (Dr. Collis.) Do not they have anything the matter with them?—We have very little illness amongst them.

20,121. But I want to know what illnesses occur. You have said that you have no acquaintance with lead poisoning. What experience have you of other sickness and illness?—I do not know of any. A man is away sometimes for two or three days with a cold, or something like that, but we have no illness.

20,122. You do not suggest that human beings employed by you are different from all other human beings in the nation, and never have any sickness or illness?—I cannot recall a man being away for more than two or three days, and then only with a cold, or something of that description. I remember a man some time ago who went to have a tooth drawn at the hospital, but I know of no illness at all. Some of our men, painters especially, have been in the shop for over 30 years.

20,123. You have not studied the question of illness among your men?—There is no necessity to do so.

20,124. But illness must occur with regard to every class?—We are not in touch with the whole of them the whole year round. Amongst the regular staff I do not know of any illness at all.

20,125. We are not suggesting that the influence of lead is the only influence in your trade, but you have observed no other illness. Therefore, it is quite obvious that illness due to lead was not observed. You have given a definite opinion, but you have not made any scientific observation on the point on which you are

giving evidence?—Painters may be at the shop perhaps three months in the early part of the year, and we may not see them again until the latter part of the season, when they may be here perhaps another two months.

20,126. As regards illness in general among your men you have no information, so it naturally follows that you have no information on the question of lead poisoning?—No.

20,127. (Mr. Sutherland.) Master house-painters do not buy their paint by the gallon, except in the way of varnish and proprietary paints?—Varnish is the only thing that we buy in that way.

20,128. And enamels?—Yes.

20,129. And proprietary paints like Gay's and others?—Yes.

20,130. So that you cannot institute a comparison?—No.

20,131. You buy your base in bulk, you buy your turpentine and oil in bulk, and mix your own paint?—Yes.

20,132. If painters were forced to buy by the gallon it would mean a complete change in the custom of the trade, would it not?—Yes.

20,133. A recasting of values and estimates?—Yes.

20,134. You have told us that you painted a house which required four coats of zinc paint to do what had previously been done with two?—Yes.

20,135. So that in addition to the additional cost of the paint, you had a very serious additional cost of labour?—Yes.

20,136. Your contention is that this increased cost of paint would act in the way of reducing the amount of painting done?—Yes.

20,137. Now, if regulations were drawn up, a very eminent medical scientific witness who has been before us says it might be possible to devise regulations for practically cutting down the poisoning to nil. They should be reasonable regulations, such as would not hamper the trade and bring it to a standstill?—If they were reasonable regulations, it would be different.

20,138. You do not think it reasonable that the masters should provide overalls for the men, for instance?—No, that is a thing that the men do themselves now.

20,139. It is the general custom for the men to provide overalls?—Yes.

20,140. You have never heard any objections to it on the part of the men?—No. We are very particular with regard to the men's overalls, and if a man has got them dirty or appears on a job with them dirty, he is very soon told of it.

20,141. Most decent shops insist on the men having overalls and coming with them clean on Monday morning?—Yes.

20,142. That is the universal practice, is it not, throughout the country?—Yes; a man's business is known by the appearance of his men as much as his work.

20,143. So that any regulations could safely embody the present practice without hurting the men, whilst still guarding them on that point?—Quite so.

20,144. So that that would not be an obstacle?—No.

20,145. The difference is very marked where the trade is confined, as in the pottery district, to factories or works, and where the same overalls are kept in one place?—Yes.

20,146. You would have difficulty in tracing your overalls, would you not?—We should not find half of them.

20,147. Some men would resent wearing overalls that were used by other men?—I do not know that the ordinary type of painter would object.

20,148. A lot of men would that I have met?—Provided that you supplied the painter with them, I think he would consent.

20,149. On the ground of not having to buy them or wash them himself?—Yes.

20,150. Could you tell us what danger would arise if the clothes were kept in the paint shop? Nothing is given off from the lead in bulk, and the turpentine and the oil you keep sealed in bottles, so that if the paint

21 May 1912.]

Mr. J. J. HONEYCHURCH.

[Continued.]

shop was used also as a place for hanging the private clothes in; nothing could get on to those in the way of dust because there is no dust there; is there?—No.

20,151. So that that would meet the case?—Yes.

20,152. If regulations were enforced, do not you think it would be reasonable to make it compulsory upon the householder, when you are doing work, to give facilities for washing and a separate room for meals?—Yes, quite so. It is a thing that is often done now. In many cases they provide a proper place for the men to have their meals and also to hang their clothes, but there are some houses where they almost object to the men going near a sink to wash, and in those cases they have to use a pail of water in the room where they have been painting before they go out.

20,153. But if the question is so important to the health of the painter, do not you think that the general public should be brought in to do their share in giving facilities?—Certainly.

20,154. Is there not a big assumption in favour of white lead, because almost every master-painter of experience who has come before us has expressed himself strongly in favour of it as against any other substitute?—Yes.

20,155. If white lead were prohibited, we should be thrown on to all kinds of compounds which manufacturers wished to put forward?—Yes.

20,156. In your opinion, is it good for the preservation of outside work and properties which are painted that this should be the case and that the trade should be forced to use an inferior paint?—No, more especially for outside painting.

20,157. Now zinc has had a free market in this country, and pretty well in the world, as a competitor with lead. If it has the qualities that are claimed for it, how is it that it has not replaced lead?—Because it has not the same body.

20,158. Exactly. It has not the qualities that are claimed for it?—It has not the qualities of lead.

20,159. Do you think that lead could be abolished for inside work without any serious loss?—I think that for inside work it could. Zinc could take the place there, but for outside work I fail to see that zinc would answer that purpose.

20,160. (Chairman.) You have already told us that it requires double the amount of zinc paint compared with that would be required of lead paint. Does that apply only to outside painting?—Yes, only to outside painting. For inside painting it would not make a serious difference.

20,161. (Mr. Sutherland.) There are a lot of zinc sulphide paints, lithopone paints, which could be used for inside work which are admittedly not useful for outside work, and it is on that basis that you answer?—Yes.

20,162. You referred to the finishing of work with zinc paint. That was for inside work?—That was for inside work.

20,163. And it was on the top of a lead grounding?—No; it was all zinc.

20,164. Right through?—Yes. That was where the least part of the work had about nine coats of paint. It was very fine finished work.

20,165. Do you draw a distinction between zinc-oxide paints and lithopone paints?—No.

20,166. Do you know the distinction?—No.

20,167. Lithopone paints cover very much better than zinc-oxide paints. They are not pure zinc?—I follow.

20,168. (Mr. Parsonage.) What is the average number of painters that you employ?—I should take the average as about 40.

20,169. Throughout the year?—Throughout the year.

20,170. Are there any large firms in the London Association of Decorators like Whiteley's or Waring's or any of those?—No.

20,171. It is a local association, mainly in Kensington?—No. It is founded to try to get together the whole of the trade in London, representing nearly 3,000 firms.

20,172. (Mr. Gardner.) They are not drapers?—No.

20,173. They are all practical painters in the association?—Yes. One of the principal objects of the association was to fight against the drapers.

20,174. (Mr. Parsonage.) Was the work which took four coats to cover it instead of two coats of lead outside work?—Yes.

20,175. What class of men were employed on it?—Painters.

20,176. Did you pay the standard rate of wages?—Yes.

20,177. *9d.* an hour?— $8\frac{1}{2}d.$

20,178. That is not the standard rate?—The recognised rate.

20,179. Do you think that a man who can use lead paint can use zinc paint equally well?—Yes.

20,180. I take it that it was zinc oxide that you referred to?—Yes.

20,181. These men that you paid  $8\frac{1}{2}d.$  an hour to could use the zinc oxide just as well as they could lead?—The four men in charge of each job are all paid *9d.*, but our ordinary rate is  $8\frac{1}{2}d.$

20,182. The standard rate in the West End of London is *9d.* an hour?—We are outside the West End, you see. We are in the districts which are not affected; at least, we are not termed "in the West End."

20,183. Are many of the firms in your association in the West End?—Yes.

20,184. A good many of them would pay *9d.* an hour?—Some of them. For instance, our late president, Mr. Campbell, paid *9d.* to all his men.

20,185. That is the firm of Campbell and Smith?—Yes.

20,186. A man who can get *9d.* an hour does not work for  $8\frac{1}{2}d.$  You do not get the best class of men for  $8\frac{1}{2}d.$  That is why I asked you about some of the leading firms. The class of men that you were employing may have had something to do with the fact that you did not make a satisfactory job with zinc, and that you had to give four coats instead of two. You cannot possibly get a man to work for a less rate of wages if he is a good man. If a man can get two or three shillings a week more, he will not work for  $8\frac{1}{2}d.$  There is a stigma on men who take less than the standard rate?—With regard to some of the men we get who come from the West End who have been getting *9d.*, we could put painter's labourers on who would do better work.

20,187. It is astonishing then that they can get the money they do?—You see, they have to pay *9d.* in the West End.

20,188. That shows that the master painters do not know their business?—Well, it is left to a foreman. He has in many cases a few who work for him, and it does not matter what class of work they do. You do not get all first-class work done in the West End, you know.

20,189-90. Surely if the men who are working for  $8\frac{1}{2}d.$  could get the standard rate, *9d.*, they would insist upon it?—Not always.

(Mr. Rice.) Mr. Chairman, I object to the words "standard rate of *9d.*" There is not a standard rate of *9d.*

(Mr. Parsonage.) Buffers pay  $8\frac{1}{2}d.$ , but the standard rate for decorators is *9d.* That is what I meant.

The witness withdrew.

21 May 1912.]

MR. JOHN MILTON.

[Continued.]

Dr. COLLIS (*in the Chair*).

Mr. JOHN MILTON, 136, Maida Vale, examined.

20,191. (*Dr. Collis.*) Do you attend here to-day as a representative of the London Association of Master Decorators?—Yes, I do.

20,192. You are possibly aware we have already heard a large number of house painters and decorators?—Yes, I believe so.

20,193. And you have, I presume, some special information that you wish to draw our attention to?—No, no special information. I believed that I was going to be rather led instead of being examined in any other way. I believed that you were going to ask my own experience as a practical man. I have had no information from anyone who has been here, if that is what you mean.

20,194. No, I do not, but I thought that perhaps you had some special information which you would give to us that others have not given, as you have come here after we have heard so many already?—No. I will answer questions to the best of my ability.

20,195. Have you satisfied yourself whether the danger of lead poisoning amongst house painters constitutes a very real danger, and one that should be removed?—It constitutes a danger, but the danger is so remote that I have hardly met it in my experience.

20,196. What is the nature of your business, and where is it carried on?—I am a house decorator at 136, Maida Vale.

20,197. What is the average yearly number of painters employed by your firm?—I have now about a dozen.

20,198. How many would you have in the slack season?—About a dozen in the slack season, and about 30 in the busy season.

20,199. Then you average somewhere about 22?—Yes, about that.

20,200. How long have you yourself been in the painting trade?—About 35 years.

20,201. Have you known any cases of lead poisoning or painter's colic?—I have seen two or three cases of colic.

20,202. Among your own men?—Not among my own men, amongst men whom I have been over. I was a foreman in a large way before I was in business for myself, but since I have been in business for myself it has not been in a very large way.

20,203. (*Mr. Parsonage.*) For whom have you been foreman?—Aldin Brothers and Davis, the same firm as Leslie & Co., as it is now, and for Rawlings Brothers, Kensington.

20,204. (*Dr. Collis.*) In past years, have you seen cases of lead poisoning?—I have seen them in a way, but they have not been very pronounced at all. They have been there. They have been existent.

20,205. How many cases have you seen?—About two.

20,206. Among your own men you have no knowledge of any such cases?—Among my own men I have had none whatever.

20,207. How long have you been working on your own account?—About five years.

20,208. During that time have you had any claim made against you at all by any of your men?—Not for lead poisoning; I had one slight claim for about a week. A fellow fell through a skylight and hurt his head, but he was not a painter.

20,209. Have your men had occasional days of sickness?—I have never seen sickness in men working for me.

20,210. Have your men had no occasional days of sickness at all?—None whatever.

20,211. Then they are a very healthy lot?—Yes; they use plenty of soap and water.

20,212. When you were a foreman, did the men never have occasional days of sickness?—I never knew of it.

20,213. Do not painters ever have any illness?—They may, but I have not experienced any of them being so through lead poisoning, or anything of the kind.

20,214. I did not say lead poisoning, but any illness?—I have known them, I suppose, to stop away with a touch of Monday-morning headache, or something of the sort.

20,215. Have you ever known a man die of consumption in the painting trade?—Yes.

20,216. (*Mr. Sutherland.*) One of your own men?—No, I have never had any illness amongst my own men at all.

20,217. (*Dr. Collis.*) Not while you were foreman either?—No, not while I was foreman.

20,218. Do you know that in the ordinary population one man in ten dies of consumption?—I had no idea that the proportion was as big as that.

20,219. You see placarded all over London, on every hoarding: "Come and help the consumptives. One man in every ten dies of consumption." It is so publicly known that I should not have thought anyone could miss it?—I think that your figures are a little exaggerated.

20,220. They are from the Registrar-General's figures. If you have no information of an illness which is as prevalent as that, it is quite possible that you also have no information about an illness which is admittedly not so prevalent as that, and yet may exist—that is to say, lead poisoning?—There is no doubt that lead poisoning exists, but I think it does not exist to such a great extent.

20,221. (*Mr. Sutherland.*) It does not come your way?—It does not come my way.

20,222. (*Dr. Collis.*) Nor does consumption, apparently. Do you have periodical medical examination of your men?—No.

20,223. Then how would you be able to know that these occasional days of sickness, which you admit they do have, may not have been due to the influence of lead?—I do not think that I have said that my men have occasional days of sickness, have I?

20,224. I thought you did?—I said that I have known men stay away on Monday mornings, but I would not say that it was through sickness. In our line they are as healthy as in any other line, if they are at all clean in their habits.

20,225. Take it all round, you have not made a close study of the health of your men as regards the question of illness. You are not alone in that?—I do not think I have made a study of it at all, really.

20,226. You know, I presume, that lead poisoning frequently undermines the health without immediate violent symptoms arising?—Yes, I have heard so.

20,227. Do you know that the incidence of lead poisoning is published month by month by the Board of Trade in the "Labour Gazette"?—Yes, I have heard that, but I have not seen any figures of it.

20,228. You have not looked it up?—I have not studied it at all. The only time that I studied the lead poisoning question at all was when I went in for hygiene, when I was passing through the sanitary institute. It was drawn to our attention a good bit then, more so than ever it has been through contact with the men.

20,229. You have not noted, then, that 284 deaths occurred among painters during the ten years which ended in 1910, and that there have been 36 further deaths in the year that closed last—1911?—All due to lead poisoning?

20,230. Definitely certified cases of lead poisoning, in which inquests were held?—That would be about one in 2,000, would it not—or not so much?

20,231. I was drawing attention to the total amount rather than the case incidence?—Would that include makers of paints as well as workmen?

20,232. No—workmen; house painters only. The plumbers are taken out of that?—It seems a lot, when in the course of about 30 years' experience no actual friend has ever died of it.

20,233. You have no information, perhaps, of an actual friend of yours dying from consumption, either?—Yes, I have.

21 May 1912.]

Mr. JOHN MILTON.

[Continued.]

20,234. You told us that you had not—I mean in the trade?—No, not in the trade.

20,235. Although you have not information, the thing may be going on; however, I am not surprised that you have had no cases amongst your employees because in some of the potteries, in fact a large number of the potteries of North Staffordshire and Scotland, they have had no cases at all, and then quite unexpectedly, without any warning, a firm which has been immune has had quite a crop of cases. In addition to these cases of deaths which I have given you details of, do you know that about 2,000 cases of lead poisoning in your trade were reported in the Home Office voluntarily without any legal compulsion whatever in the same ten years?—That is about 200 a year.

20,236. You understand that in factories and workshops the cases which occur have by law to be notified to the Home Office?—Yes, I believe so.

20,237. This compulsion does not exist with regard to house painters who are outside the Factory and Workshop Act, but the practitioners of the country have of their own free will voluntarily notified to us some 2,000 cases?—I take it that you are not including coach painters with house painters.

20,238. I am only taking house painters. Coach painters' shops are under the Factory Act. Now, having regard to what I have told you, it is fair to assume, is it not, that a larger number of cases would be reported if it was legally necessary to notify them?—I have not the slightest doubt that there are cases of lead poisoning; we all know that.

20,239. I draw your attention to the point, because I think you will agree that all this sickness and death is very deplorable. Now there are only two possible means of dealing with the evil, or we can only think of two possible means: One is by establishing a code of regulations, and the second is by the prohibition of the use of lead in paint, or rather the restriction of its use within narrow limits. Can you suggest any third alternative?—Not a third alternative. I do not see how we are going to do without white lead. Up to now we have nothing that will take its place for outside work. For inside work there is nothing to hinder it.

20,240. If you have no third alternative, which of these two that I have put to you would you prefer?—I would rather have its restriction within narrow limits. I do not think that a code of regulations would be suitable at all in our trade.

20,241. The restriction which has been suggested, you should of course know this when you are answering the question, is the prohibition of the use of lead to the extent of more than 5 per cent. of solubility in the paints used. That is the narrow limit that I meant. As a matter of fact, the 5 per cent. gives you larger play than 5 per cent. for colour purposes; but as regards white lead it is 5 per cent.?—You would only be allowed to use 5 per cent. of white lead in the colour. Is that what I understand?

20,242. (Mr. Sutherland.) Greens, browns, blues, and that sort of thing?—We do not want it at all for colours.

20,243. (Dr. Collis.) It would give you larger scope for using lead salts for colour purposes, but in using white lead it would restrict you to 5 per cent. in zinc or anything?—I am sorry to hear that, because I do not see what will take the place of white lead for outside work, although I am not a lover of white lead exactly. We can do quite well without it for inside work, and I would not mind seeing it abolished altogether for inside work.

20,244. If the whole trade was in the same position, the public only would suffer?—Yes.

20,245. You as an individual would not be affected any more than the others?—There is one thing I would like to mention just now that I mentioned the other night at a Paint and Varnish Society's meeting. I believe that if a better medium than we have at present in the way of oil and turpentine was found, we could do without white lead for outside work. Oil and turpentine are not the best medium to be found by any means. I use at present whites which are not white lead. I find by using white boiled oil and a good lot of varnish, and the like of that, that I can

get a better paint for standing purposes than with white lead.

20,246. For outside purposes?—I have not risked my reputation with regard to outside work yet, except in my own place, where I used it two years ago, and so far it is all right.

20,247. For window sashes, for instance?—Yes, sashes and all the lot—outside.

20,248. The experiment has not disappointed you, so far as you have been able to judge?—It has not disappointed me. I have tried it on the gates of our workshop facing the sun, so far with good result.

20,249. Had the paint which you used some special preparation as regards the vehicle?—Yes.

20,250. Had you to put more coats on than if you had been using a white lead compound?—No. It covered just as well. The medium is a little more expensive. There is a great deal of prejudice in our trade with regard to trying anything new, but I am rather keen on trying anything new, and I experimented with this by myself, and through a lot of these little experiments by myself I have found out things that other people are right dead against.

20,251. (Mr. Sutherland.) What was the paint?—Line's white.

20,252. It is not zinc oxide?—Not pure zinc oxide. There is zinc oxide in it. I am trying to find out if I can circumvent some of the white lead beauties. They have put up the price of white lead about 30 per cent. against us.

20,253. (Dr. Collis.) If you can succeed, we as a Committee shall find ourselves out of work, and we shall not be sorry?—Many men, many minds, of course. There is something to be said for and against white lead. There is certainly a danger, but the danger in my opinion is very very small, and I think it is mostly with the man himself, if he is not clean.

20,254. (Mr. Sutherland.) You mean the danger of poisoning?—The danger of poisoning.

20,255. (Dr. Collis.) You have been dealing with it quite apart from the health point of view?—Yes.

20,256. Just to see if you can find something that will do as well, or possibly better, at a lower price?—Yes. If you believe all the makers of these whites, they are all better than white lead, but you cannot believe them without trying them. None of the whites up to now will stand like white lead.

20,257. Was your house covered with two coats?—Yes.

20,258. Just as if it had been painted with lead?—Yes. I did not even use turpentine; that was six shillings a gallon at the time, and I would not use it at all. I did not use it for twelve months.

20,259. (Mr. Gardner.) You used a substitute?—Yes.

20,260. (Dr. Collis.) How long, in the ordinary way, would you let your house stand without being painted?—About two years. It would go three years, but I do the front when I am slack once a year. It was not done last year. I am letting the back stand now as an experiment. It has stood quite as well as white lead.

20,261. It has run for the usual time that you would allow your house to run?—Yes.

20,262. If you had not been trying an experiment you would have painted it this year?—Yes.

20,263. So that with regard to your own house the paint really has stood the full length of time that you would allow for paint in the ordinary way?—Yes; but not with the same medium.

20,264. It required different treatment?—Yes.

20,265. It seems that zinc does call for different treatment?—It wants different treatment. It wants a different medium.

20,266. One of the reasons why it perhaps has received a good deal of obloquy is because it is treated the same as white lead?—Yes. It does not give it a fair chance at all if you do that.

20,267. (Mr. Sutherland.) Do you think that, apart from this particular experiment, white lead cannot be abolished with safety for outside work?—Yes.

21 May 1912.]

Mr. JOHN MILTON.

[Continued.

20,268. But inside it can be dispensed with?—Yes. I would not like to risk my reputation without it for outside work at present.

20,269. I understand that you put special oil and varnish to your paint?—Yes.

20,270. Would it not add very considerably to the cost if all the painting in London had to be prepared with special boiled oil and more varnish?—This particular white will cover half as many yards again as white lead.

20,271. Do you know if what you used was zinc oxide?—What I used was not pure zinc oxide.

20,272. For inside work have you bought pure zinc oxide?—Yes. The covering power is not so good.

20,273. Had you to give additional coats?—I was not using zinc oxide by itself, but as a finishing coat.

20,274. Inside?—Inside.

20,275. Do you know that a great number of these whites with different names all come from the same source?—Yes, I believe so.

20,276. The bulk of these proprietary whites have lithopone as a base?—Yes.

20,277. The general opinion expressed by men who know, who have been before this Committee, is that for inside work lithopone is very convenient and very effective?—I have just finished a job with it now, and it is all right.

20,278. But for outside work it is not as good as pure zinc oxide?—What I am trying the experiment with is with a proper vehicle; you can manage quite as well.

20,279. Plus varnish?—Yes.

20,280. That adds very much more to the cost of the job? The pigment is cheaper than white lead is at present, and it will cover half as many yards again as white lead will. I would take a job on at the same price as for white lead.

20,281. You are not prepared to risk it for outside work?—No, not yet. I must try it a bit longer.

20,282. It needs further experiment?—Yes, it needs further experiment.

20,283. (Mr. Rice.) When you speak of the prejudice with regard to using made-up paints, do you refer to the prejudice of the employer or to the prejudice of the workman?—I do not think that I said prejudice with regard to using made-up paints, though I have a great prejudice against them myself. I said that there was a prejudice in our trade against introducing anything fresh.

20,284. What do you mean by "anything fresh"?—I will give you an instance about a bit of a squabble with a very eminent architect in London once over red lead in priming. I would not use it. He said that he was going to condemn my work if it was not used. I called it an abomination. He said: "Everybody uses it. What is the matter with it?" I said: "It is a relic of the past." When I went into the trade first of all they used red lead and glue for knotting to cover up the knots. That was before the days of white enamel. In another case I sent an order to the shop that the work was not to be primed with red lead. It came on the job primed with red lead, and it had rather a jarring effect on my nerves. The red lead was eating its way through four coats of white lead and two coats of enamel. We had to do it twice. When I called attention to it the man said: "It is the correct thing to do. Architects specify it."

20,285. (Mr. Sutherland.) How long ago?—About eight years ago.

20,286. Was that red lead?—It was sent out as red lead.

20,287. (Mr. Rice.) Would there be any prejudice on the part of workmen with regard to painting a house with white lead and using zinc as a base?—Not a bit.

20,288. Would there be prejudice on the part of the employer?—I think so. It is one of the things that die hard, but the prejudice would have to be got rid of.

20,289. You would not feel the prejudice?—No; I would not mind seeing the last of white lead to-morrow if I could get a good medium to stand as well, but I do not know what will stand as well.

20,290. Speaking of the house which you have painted with what I may call the "Milton paint." I

presume that it was put on white lead?—Yes, on the top of the other paint.

20,291. You paint your house every two years I take it?—Yes.

20,292. Not as a matter of necessity?—To make it look smart.

20,293. For smartness, as I thought. The last time you painted it, did you paint it with a white-lead body?—Yes.

20,294. Do you think that the result which you have obtained is a fair result to expect from "Milton paint," seeing that it had a good white-lead body?—Yes, I think so. I will give you an idea of how it would be. Last summer was a very severe summer for paint exposed to a southern aspect. There is a job I have had to do this year over again, that I generally do once in two years for a regular customer. The paint is actually eaten away through the heat of the summer. The doors of my workshop are the same. I am leaving them till I am slack.

20,295. Was the white-lead eaten right away before you applied the "Milton paint"?—It was not so much the white-lead as the medium—the oil. If there is a great deal of sun on any particular work the oil vanishes first, and sometimes the white-lead will dust off. I have known, even in the case of an ordinary wall, after a severe summer of sun, that the next year you could dust the white-lead off—genuine white-lead.

20,296. I take it that you have a rather high-class trade?—All classes.

20,297. You have very capable painters, I take it?—Yes.

20,298. You pick out the best men and employ them?—The best I can find.

20,299. Are they of cleanly habits?—I always insist on that.

20,300. Do they wear overalls?—Yes.

20,301. How often are the overalls washed?—Once a week.

20,302. Who pays for the washing?—The workmen themselves.

20,303. Would you object to paying for the washing if you had to?—If it was general I do not suppose that I would object, but the men rather pride themselves on seeing themselves in clean overalls on Monday mornings.

20,304. If everyone had to do it you would not object to pay for washing the overalls?—I would not object, but it is rather hard with double insurance.

20,305. (Mr. Rice.) Would you be prepared to find overalls for the workmen as well as paying for the overalls to be washed?—That would simply be equal to giving a rise of wages, would it not?

20,306. It would mean finding overalls for them?—I would not have anything to do with that.

20,307. You would object to that?—Yes.

20,308. Do you provide any facilities for the washing of hands?—Yes, always plenty of soap and plenty of water, and if they use plenty of those there is no fear of lead poisoning.

20,309. Do you give them hot water?—They can have it if they like.

20,310. But do you provide facilities for hot water?—Yes; if there is no gas-ring I give them a little oil lamp, one of those little things that you stand a pot on.

20,311. That is for general use?—For size and so on. They always require a fire.

20,312. It is not specifically for heating the water and washing the hands, is it?—No. I do not know that it is so very essential to have hot water if a man washes four or five times a day, and keeps his nails close cut and trimmed.

20,313. Do your workmen wash their hands three or four times a day?—They wash before they go to breakfast, before they go to dinner, and before they go to tea. That is three times, and I dare say they wash when they get home at night.

20,314. But I mean how many times a day do they wash when they are at work?—Three times.

20,315. Do you supply towels?—No.

21 May 1912.]

Mr. JOHN MILTON.

[Continued.]

20,316. What do they wipe their hands on?—Leathers.

20,317. Do they use them for the sole purpose of wiping their hands?—They use them for general work.

20,318. The same leathers?—Yes, if they are not too dirty.

20,319. They wipe their hands on the leathers that they wash the paint-work with?—Yes.

20,320. Who supplies the leathers?—I do.

20,321. Let me tell you what the regulations would include. The regulations would include the provision in every case of hot water, nail brushes, clean towels, the supply and weekly washing of overalls, and periodical medical examination of the workmen?—I would not mind the periodical medical examination of the workmen, but I would object to the provision of towels and all that on a job. It would be all right in a workshop, but I do not see how you could do it otherwise.

20,322. You are quite clear that regulations such as I have suggested would be very onerous?—Yes, in regard to house painters.

20,323. And such as you could not adopt?—Yes. I will tell you how you could not adopt them. I am very sorry to say it—

20,324. Bearing that in mind, would you prefer regulations to the prohibition of white lead?—I would rather have the prohibition of white lead.

20,325. (Mr. Gardner.) Is this the first that you have experimented with pale boiled oil?—No, I have used it for years.

20,326. It is the first time that you have tried it with zinc or lithopone?—Yes. I would not like to try the stuff without it.

20,327. It is not much more costly, you think?—No.

20,328. It is quite customary to put in varnish when you are doing an outside job and want a good finish?—I very often do.

20,329. Where you are using lead?—Where I am using lead.

20,330. (Dr. Collis.) So if it was used with zinc it would not be altogether a new thing?—No, it would not.

20,331. Would using it with zinc paint add to the cost of outside painting?—It would not add much.

20,332. (Mr. Parsonage.) You are more progressive than the majority of the employers?—Well, I have been an actual worker myself, and I know pretty well every wrinkle in the painting trade.

20,333. (Mr. Gardner.) Where did you come from?—Aberdeen.

The witness withdrew.

## THIRTY-FOURTH DAY.

Wednesday, 22nd May 1912.

PRESENT:

SIR ERNEST F. G. HATCH, BART. (Chairman).

Lord HENRY BENTINCK, M.P.

Mr. E. L. COLLIS, M.B.

Mr. W. G. SUTHERLAND.

Mr. F. O. RICE.

Mr. A. GARDNER.

Mr. J. PARSONAGE.

E. A. R. WERNER (Acting Secretary).

Mr. JOSEPH DEVINE (75, Framfield Road, Hanwell) examined.

20,334. (Chairman.) What practical experience have you had in the house-painting trade?—I went to the trade when I was about 12½ years old, and have worked at it, with the exception of a month occasionally, all my life since.

20,335. How many years is that?—Roughly speaking, about 30 years.

20,336. What branch of the National Society of Operative House and Ship Painters are you connected with?—No. 1 London Branch.

20,337. Have you any personal knowledge of lead-poisoning?—Yes. I have been affected several times myself, and I know others who have also been affected.

20,338. Can you tell the Committee anything about your symptoms when you get an attack of lead-poisoning?—Yes. It starts with an acute pain (perhaps not so acute at first—it seems to grow) in the stomach, accompanied by vomiting, and one loses appetite. The first time, I remember, I did not know what it was, and I thought that it was a cold, or a chill or something. I took brandy, and the brandy eased it for a little while, but it kept returning. I tried salts, which did not seem to have much effect at first, and they made me vomit. I saw a chemist on one occasion, and he advised me to go to a doctor. The doctor ordered me to go to bed, and have hot fomentations put on and an injection, and they gradually soothed the pain in that manner. A complete description of the first symptoms of lead-poisoning and its treatment ought to be distributed amongst all lead-workers. With regard to that, I would like to say this: If I had at the time known the symptoms of lead-poisoning, I could have saved

myself a very great deal of pain; I believe so now. I would have taken doses of salts more frequently. Afterwards I had an attack once when I was away in the country, and I took 12 ounces of salts in one week, and that, I believe, kept me from being laid up in bed. I kept taking a strong dose of salts every time I felt the least indication of it. I knew instantly when the lead-poisoning was coming. The complaint may be cured, but its effects are permanently weakening to the internal organs.

20,339. Has it been so in your case?—Yes; I am sure of it. I am not well now. I am suffering now from lead-poisoning. In fact I have been compensated for lead-poisoning.

20,340. Are you a very careful and clean worker?—Always particularly clean.

20,341. Did you always wash your hands regularly?—Yes, before each meal.

20,342. Did you use a nail brush?—Yes.

20,343. Have you had any experience of lead-poisoning among members of your branch?—Yes; I know that several of them have had lead-poisoning.

20,344. Can you give us the number of members in your branch, and details of the lead-poisoning cases which have come to your knowledge, in connection with those members?—I can tell you in a vague way. I did not visit them when they were sick, but I know of three cases of lead-poisoning. One died of lead-poisoning, and his widow was compensated. It affected his heart. It generally weakened his heart, so that he gradually wasted and died. The other man gets periodical attacks of something in his legs, so that he

22 May 1912.]

Mr. JOSEPH DEVINE.

[Continued.]

cannot walk properly—in his legs and hands. One hand swells, and he seems to lose all power in that hand.

20,345. And the other case?—The other is an elderly man. He is very bad, and he gets sickness and general weakness.

20,346. Have you only known of three cases of lead-poisoning?—Those three I know intimately; there are others, but they live at such great distances from the branch that I do not see them often.

20,347. What period do these three cases cover?—I should say during the past three or four years.

20,348. How many members are there in your branch?—Between 150 and 200, I think; I am not sure.

20,349. (Mr. Parsonage.) About 170 in your branch?—Yes; in the one branch; but there are 30 branches in London.

20,349a. (Chairman.) I am speaking of your own branch?—I know members of other branches which meet not far from us.

20,350. Will you name the principal causes which, in your opinion, contribute mainly to the prevalence of lead-poisoning among house-painters. Before you answer that question I want to ask you this: You have told us of three cases of acute lead-poisoning. In your opinion, were any other members of your branch suffering in a less acute form?—Yes. On one job where I was there were twelve of us, and all those were members of my branch. Two of them had to come home. One has died since. I was forgetting those men. With regard to the others, all the men had lead-poisoning, not in an aggravated form, because a doctor was brought, and he took immediate steps to stop it. They themselves did as I did; they took salts.

20,351. Have you known of other cases where men have had slight seizures from lead-poisoning?—Yes; there are many cases like that where men have had slight seizures, and they have stayed away for a few days without going on the sick club. They have stayed away for a few days and taken purgatives.

20,352. Will you name the principal causes which, in your opinion, contribute mainly to the prevalence of lead-poisoning among house-painters?—Lead gets into the stomach through the mouth or the nostrils, in consequence of flitting work over-head.

20,353. Please explain what you mean by "flitting" work?—Using paint which is made of white lead broken up in turpentine, and a little varnish or gold size put in just to bind it, otherwise it would rub off in a powder. It would practically fall off in a short time if it were not for the gold size or varnish. Being made up with turpentine makes the work very light, and it splashes about and falls down in a fine spray in doing over-head work; when looking up at ceilings it falls down on the face.

20,354. Do you mean that you inhale the spray when you are flitting?—Yes.

20,355. Do you think there is any danger in the wet paint itself, from the smell or fumes, or from fine particles which may form spray when the lead paint is applied?—Yes, from the fine particles. I do not know about fumes. Possibly there is danger there. I believe that it brings on a kind of headache and sickness. I have frequently felt that.

20,356. But you do not necessarily attribute that to lead?—No; it may be the fumes.

20,357. Of the turpentine?—Yes.

20,358. What other processes do you consider very dangerous?—Rubbing down, with glass-paper, work which is filled with lead—rubbing down white-lead filling and inhaling the dust; and the same may be said about rubbing down flat work with glass-paper.

20,359. Do you think there are other causes of lead-poisoning?—Through small particles of lead remaining on the tips of the finger even after washing, if one is not extremely careful, and then being dissolved by butter or other grease on the bread, and then conveyed to the mouth. It is impossible to do certain kinds of work without getting some of the material on the finger tips.

20,360. Is sand-papery the only process in which there is dust? Does the making up of stoppings and

mixing of paints give rise to dust?—Yes, it does, because it sometimes falls about and gradually gets into powder, and then of course the dust rises.

20,361. Do you consider lead paint on the clothing to be another cause of poisoning?—Yes, I believe it is, because it breaks up and forms dust afterwards; and you never know where it is going to.

20,362. Do you consider the process of stippling an unhealthy one? Is there much spraying of paint when this is done?—Yes; it is impossible to avoid spray when you stipple. You batter it; you knock it.

20,363. Do you knock it? Do you not simply push the brush?—Yes, you knock it like that (*describing*). You make a row.

20,364. (Mr. Gardner.) You hammer the paint on to the work?—Yes; it is practically hammered to make it even.

20,365. (Chairman.) Are you quite sure there is a good deal of dropping from this process?—Yes; it is impossible to avoid it. It spreads out in a very fine spray—very tiny particles.

20,366. Have you anything to say regarding burning-off? Do you think there is any risk to health involved in this operation?—Yes. On one occasion I was one of twelve victims of lead-poisoning contracted through rubbing down work which had been scorched with a burning-off lamp. The men doing the work were enveloped in a cloud of finely powdered lead; which, although it had been on the work for many years, and then thoroughly burned by lamp, still contained as much poison and produced the same effects on the victim as newly made white lead. I would like to add that the danger would have been minimised if each man had used a lamp and taken off the work while it was hot. In that case one man went round the work and applied the burning-off lamp and scorched it all and raised it off the work, and then other men were sent to scrape the paint off and leave the wood bare—to scrape it and rub it down with glass-paper. If the man who scorched it had taken it off while it was in a soft state, there possibly might not have been so much powder; but there would have been a certain amount of powder after it had fallen to the ground, because it powders even then.

20,367. (Mr. Gardner.) You mean that there would not have been as much dust as there was if it had been taken off while it was hot?—That is right.

20,368. (Chairman.) To sum up this part of your evidence, you attribute lead-poisoning to various causes, mainly to inhalation of the dust produced in sand-papery, and in mixing materials and such operations?—Yes.

20,369. Partly also to inhaling the spray of lead paint. And, further, to contamination of hands and food and clothing?—Yes.

20,370. I will now ask you to what extent these causes of poisoning can be obviated?—I do not know how they can be obviated.

20,371. As regards the dangerous process of sand-papery between the application of one coat of paint and the next, is it quite impossible to dispense with this and replace it by a wet smoothing process?—Yes, it is impossible, I think; because if you rub it down wet you tear the paint away again. You cannot get paint hard enough to rub down wet under perhaps about twelve months. You can get the paint dry, but you cannot get it dry enough.

20,372. We have had a good deal of evidence from master house-painters in which they have expressed a contrary opinion to that which you have just given to the Committee?—Well, that is my view. If you start rubbing down new paint with pumice stone and water you tear it away again.

20,373. How are mouldings and curved surfaces rubbed down?—With glass-paper.

20,374. Stopping and also old hard paint-work are sometimes rubbed down wet, I believe?—Yes.

20,375. Why cannot this method be applied to newly painted work between the coats?—Because of what I said just now—owing to the softness of the work.

20,376. (Mr. Gardner.) If you took powdered pumice stone and water and felt, how would that affect

22 May 1912.]

Mr. JOSEPH DEVINE.

[Continued.]

new work between coats?—I think it would rub it off much about the same as the other.

20,377. (Mr. Parsonage.) Not so badly as pumice stone not powdered?—No, not so badly as pumice stone not powdered. It is sometimes used on enamel, but you have to wait for a week or two before the enamel is sufficiently hard to apply it.

20,378. (Chairman.) You mean to tell us that pumice stone and water would, in your opinion, tear and damage newly dried paint which has not had time enough to harden completely?—Yes.

20,379. Is dry sand-papering cheaper than wet rubbing down, do you think?—Yes, I think it is. This process is elastic. You can do as much or as little as the price and the value warrants. They frequently tell a man: "Do not spend much time on this." The cheapness depends on the amount of time that is spent on it.

20,380. (Mr. Gardner.) Generally speaking, dry rubbing down is much cheaper than wet rubbing down?—Yes, I think it is.

20,381. (Chairman.) Next, as to spray from the brush; for example, when you are painting ceilings having moulded or relief work upon them, and when you are doing stippling, how could you protect the painter from such spray?—I do not know that it is possible or practicable to give any protection. Some people advocate the use of respirators; but in that case the thing would get clogged, and probably be more dangerous than doing without it. It would have to be handled in order to be placed there. I do not know of any protection.

20,382. And a respirator, I take it, would not prevent the spray falling on to other parts of the man's face. Can you tell us how and where colours are usually mixed?—Lead is broken up in a pail first of all, with turpentine generally—it depends upon what the work is—and then it is strained in order to get all the grit out of it and make it cleaner. It is then poured out in pots, when they get the colour decided on, for each man to use. In the evening it is brought back and the things are kept clean by pouring it back into the pail.

20,383. Is there any way of safeguarding the worker against breathing dust in this operation?—No, not that I know of.

20,384. Then you hold that there are some necessary operations in which the worker cannot be fully safeguarded?—Yes.

20,385. That no regulations whatever will remove the danger?—I think that is so.

20,386. Are there many processes in which the painter cannot avoid getting his hands soiled with the paint or stopping materials?—I do not know how many processes. In stopping he cannot very well avoid getting it on his fingers, and even when he is using the brush he cannot very well avoid it always. We always carry a bit of rag to keep our hands clean even while we are working, and generally a clean man scrapes his tools to get them clean. But there is not any time generally allowed for that sort of thing.

20,387. Do you think that the provision of washing conveniences, and the regular cleansing of the hands, is important?—It is extremely important. I think that things are better now than they were. Employers are making a little better provision now. It may be probably through the knowledge that this Committee is sitting. It may be that, I do not know; but it is quite noticeable that, instead of one pail for twenty men to wash their hands in, you will probably find two now, or it may be three in some cases where they are extra scrupulous.

20,388. Should hot water always be available?—It is not always possible. It is not always available.

20,389. I ask you should hot water always be available?—It is certainly better to use hot water for washing. It brings the dirt off better.

20,390. From your own knowledge, can you get paint stains off your fingers without using hot water?—Not very well. With a little oil you can.

20,391. You have told us that you are a very careful man, although you have had several attacks of lead poisoning?—Yes.

20,392. Have you always been quite sure of removing the paint stains from your fingers when you have not been able to obtain hot water?—No, I cannot say that I have been quite sure, because sometimes you get fine particles of white lead on your fingers, which are so small that they are practically invisible. I am of opinion that if I get the finest particle of white lead in my system I will be laid up now, even if it is so small that it were impossible to see it with the naked eye.

20,393. Are you a very susceptible subject?—I think so now. I believe that a person once having had lead-poisoning is more likely to get it again than a person who is sound in health.

20,394. If you are painting the outside only of a house, and are not allowed to go inside to wash, it might be impracticable to get hot water in those circumstances?—Yes. They do not always like us to go inside when we are doing the outside; in fact we are very often forbidden.

20,395. Is food often kept in the pocket of a working coat and eaten in a place where paints are being used?—Yes, simply because there is, frequently, nowhere else to put it. There is no other provision.

20,396. Is it frequently impracticable to have the use of a separate place as a meal room?—Yes, it is.

20,397. Can you tell us how frequently such a case has come before your notice?—There is always, when painters are about a house, a scarcity of room—or practically always—because we want one room, at least, or one place under cover to keep our colours in—to keep the material. And then, again, in the house itself, they have made some provision for us by doing with a room less themselves in the household, in order to have the room done that we are working on. If we are outside, they do not like us to come inside at all. There is always a scarcity of room.

20,398. You mean that you may be obliged, owing to climatic conditions, and the fact that there is no inn available, to have your meals inside the house. I want to know how frequently, when that is the case, you are obliged to have your meals in the room where painting is being done?—It is an everyday occurrence.

20,399. Do painters usually wear overalls while at work?—Yes; it is a common practice.

20,400. What kind of overalls do they wear generally?—Always a long blouse and an apron, or, in the absence of an apron, a pair of overalls to cover the trousers.

20,401. Is that generally the case?—Yes, generally. A man who came on a job without a blouse would not be considered a decent workman.

20,402. But are there a number of men who come on a job without blouses?—No; it is a very rare occurrence. A man might in the spring-time, when he is hard up and had had a bad winter, be minus a blouse for a day, but somebody would lend him one, or he would get one.

20,403. I have watched painters lately. I have seen a good many painters who have not had a full blouse on, only a short jacket and no overalls to the trousers. In your opinion that is not general?—No, it is not general. Labourers sometimes wear short jackets.

20,404. How are these overalls kept clean?—As a rule they are washed once a week.

20,405. Are they washed at the painters' homes?—Yes; generally a man takes them home with him once a week.

20,406. How are the overalls taken home?—Sometimes in a bag and sometimes in a piece of brown paper.

20,407. Is the bag kept specially for carrying the overalls to and fro?—For carrying tools.

20,408. He puts the overalls in the same bag as his tools, does he?—Yes.

20,409. So that the overalls may receive some dust from the tools?—If the man is a good workman he keeps his tools pretty clean. As a rule men are more particular about their tools than they are about most other things. You do not see a working-man put tools in his bag which have lead or paint on them.

20,410. What becomes of the overall when the man has ceased work for the day?—He just hangs it up in the colour shop. There is nowhere else generally

22 May 1912.]

Mr. JOSEPH DEVINE.

[Continued.]

20,411. Does he ever hang it up in the room where he has been painting?—Yes; he hangs it up on a trestle, or a pair of steps sometimes.

20,412. I suppose that there is some lead dust on an overall when it has only been worn one day?—Yes.

20,413. Is that dust likely to be disseminated when he puts the overall on the next day, and is he likely to breathe any of it?—Yes, it is quite possible.

20,414. Do you, however, consider that the greatest danger arises from the dust and spray made in the course of the man's actual work?—Yes; I attribute the greatest danger to the dust.

20,415. How can the evils arising from such dust and spray be removed?—I do not know, I am sure. So long as you are using white lead, the white lead is bound to get into fine particles. The only way I know is to leave off using lead. I cannot think of any other way.

20,416. You have told us that there is no way, that you know of, of removing the danger of dust and spray?—Yes.

20,417. Could the painting processes which chiefly give rise to spray, such as stippling work, be prohibited, or at least so restricted as to remove the danger?—You could prohibit stippling, but there would be some danger from laying the work on without stippling it, so long as you use white lead.

20,418. (Mr. Sutherland.) Do you mean for ordinary painting?—Yes.

20,419. Laying off?—Laying the work on with ordinary brush.

20,420. (Mr. Parsonage.) It would be a difficult matter to do a large ceiling without stippling?—Yes.

20,421. (Mr. Sutherland.) You are dealing with a ceiling?—Yes, or stippling walls. You could not very well do a wall without stippling it.

20,422. The walls of this room are not stippled?—Are they not?

20,423. (Chairman.) Would it be a good thing to have periodical medical examination by a surgeon having power to suspend men who are afflicted by lead-poisoning in its early stages?—No, I would not be in favour of that myself, because you could not very well examine a man every day. If you had the doctor round every fortnight you might have men dead in the interval. Lead-poisoning does not wait until the doctor is coming round.

20,424. Would it be practicable to make a medical examination of the men, say, once a month, taking into account that they are spread all over the country at different jobs?—It would be a big undertaking, and a costly one, too, because there are so many little jobs going on and some people would think it a nuisance to have a doctor coming to the house because they were just having a few days' work done by a couple of painters.

20,425. The doctor would not necessarily come to the house. The painter would probably have to go to the doctor, or some arrangement would have to be made to mass the men together for the doctor to examine them?—I see.

20,426. What is your main objection to a system of medical examination?—I do not know. I have never thought of that part of the subject really.

20,427. Is much compensation for lead-poisoning claimed under the Workmen's Compensation Act?—Yes.

20,428. (Mr. Sutherland.) Do you know that of your own knowledge?—Yes. I have been in receipt of compensation myself.

20,429. (Chairman.) Can you tell the Committee what amount of compensation has been paid in your own branch?—I am not sure. In my case I received 100l. not very long ago.

20,430. Are there many other members of your branch who have had compensation?—One man I know received 90l.; and in the case of another man, who died, his widow received, I think, 240l. I forget the details of two other cases now.

20,431. Do you find that the men are quite willing and anxious to claim compensation?—I do not know about that, I am sure. I have never discussed that with them.

20,432. I will put it the other way; do you find men reluctant to claim compensation?—I have known one or two men who have been reluctant to claim compensation when they have thought that the complaint would soon pass off, or that they would soon get better.

20,433. Why should they be reluctant to claim compensation which must obviously be to their advantage?—Well, it is difficult to say, unless there might be a thought behind the man that it would militate against his getting work afterwards. There may be some thought like that.

20,434. Have you ever heard of such a case?—I never had any hesitation myself, speaking from my own experience and my own thought about the matter, in claiming compensation. The doctor said that I was suffering from white-lead poisoning, so I sent the claim in.

20,435. Has it acted adversely to your getting work?—Well, you see, I am not properly better though I have started work. I am doing a little, but I have not been to shops where I usually work to apply for work. The insurance people might raise the premium against people who have been afflicted; but I do not know from my own experience that they do that, or that it would have any effect.

20,436. To sum up, so far as the methods of painting in vogue to-day are concerned, do you assert that it is impossible to stamp out the evil of lead poisoning without replacing the lead by some non-poisonous substance?—Yes, I think it is impossible.

20,437. Have you yourself had any experience in the use of non-poisonous substitutes for white lead?—Yes. There are many patent painting materials on the market, but a workman has very little opportunity of ascertaining what proportion of lead, if any, they contain, as most of them have been introduced chiefly from the point of view of cheapness. Some of the materials I have used are much more economical than lead, being more easy to use, and consequently more work can be accomplished in a given time; but whether such work is more durable than lead I am at present unable to say, without going into some special investigations.

20,438. Have you formed any opinion as to their practicability for general use?—Yes. I think it is quite practicable to use substitutes for lead, even for outside work. I used to think that there was nothing like white lead for outside work, but I believe that outside work can be protected, and is protected now, by enamels and varnishes.

20,439. Would it be always practicable to have enamels and varnish for outside painting?—Yes, I think so. You can get varnish made with any gloss.

20,440. Do you know whether it would be more costly to enamel any varnish outside painting?—It would not be any more costly.

20,441. Do you know that?—I am certain it would be more economical.

20,442. But with regard to its initial cost?—Perhaps the initial cost would be more—a coat of varnish extra; but it would be more durable, more lasting.

20,443. Would it retain its colour longer?—That is another point altogether. Colour has nothing to do with durability.

20,444. But surely the appearance of the house has a good deal to do with the subject?—Yes.

20,445. If you say that enamelling lasts longer but gets a dirty colour, it would not satisfy the owner of the house, would it?—With regard to colours, I would not like to say anything.

20,446. You have told us that, when you are working with lead paints, you feel ill effects upon yourself?—Yes.

20,447. Have you noticed any difference when you are working with substitutes?—Yes. I do not know whether it is general amongst other men, but lead affects me; but when I am working, say, with distemper I do not have that sort of feeling.

20,448. My question had reference to a substitute for lead—zinc, say?—It does not have the same effect on me. Using zinc white, for instance, does not have the same bad effect as white lead.

22 May 1912.]

Mr. JOSEPH DEVINE.

[Continued.]

- 20,449. We have been told that a painter who is used to lead paints may, at first, find some difficulty in applying zinc and other leadless paints. Do you find any difficulty in using zinc and other leadless paints?—No.
- 20,450. Do you think that any such difficulty should occur, either with zinc oxide or lithopone paint?—No.
- 20,451. (*Dr. Collis.*) When you had the illnesses to which you referred, how were the bowels? Were they opened easily or not?—No, they were not.
- 20,452. What was the longest period that you can recall during which you had constipation?—Do you mean the longest period between the motions of the bowels?
- 20,453. Yes?—Three or four days.
- 20,454. Was it the effect of medicines which you had taken?—It was the effect of hot water poultices and hot water fomentations and an injection.
- 20,455. You had to have injections?—Yes.
- 20,456. Into the lower bowel?—Yes.
- 20,457. To get action of the bowels?—Yes.
- 20,458. Have you often had to have such injection?—No, not since.
- 20,459. You have always since been careful?—Yes. I take medicine when I feel the least indication. I take medicine quickly. My liver is all wrong now. That is the effect on my system.
- 20,460. What induced you to have those injections? Was it the doctor's orders?—Yes, the doctor sent a nurse in the first place.
- 20,461. To give the injection?—Yes.
- 20,462. Have you ever heard of any of your fellow-workmen being similarly troubled?—Yes, I have.
- 20,463. And having had to have injections?—Yes.
- 20,464. I lay stress on that, because it quite fixes the diagnosis of lead poisoning. You never get obstinate constipation from turpentine. Was the piece of work to which you referred where the doctor came to see twelve men, in London?—No, in a place called Bedule in the North Riding of Yorkshire. The house was called Thorpe Peril.
- 20,465. Was it the employer who sent for the doctor because the men were getting ill, or how was it that the doctor was called in to see you all?—I could not say as to that: I forgot.
- 20,466. It was some years ago?—Yes; it was in 1892.
- 20,467. (*Mr. Sutherland.*) Was it a London employer?—Yes.
- 20,468. (*Dr. Collis.*) I understood you to say that the doctor was called in to see all the twelve men. Did you send for him yourself, or the foreman, or how did the doctor come to see you all?—I forget now.
- 20,469. Referring to another point, is varnish used to any extent in lead paints which are used for outside purposes now?—Yes; the work is often varnished after it is painted; a little varnish is often put in the paint.
- 20,470. Often put in paint used for outside purposes to-day?—Yes.
- 20,471. When you are using substitutes for lead, is more varnish or about the same amount put in?—I could not say whether it is more or the same amount. It is varnished afterwards.
- 20,472. But is the varnish incorporated at all with the paint itself?—I think it is in the case of some of these patent paints.
- 20,473. (*Mr. Sutherland.*) But you do not know?—No.
- 20,474. (*Dr. Collis.*) I only want what you know. You know of your own experience that varnish is used to-day to a certain extent in some lead paints which are used for exterior purposes?—Yes.
- 20,475. But you are unable to say whether more varnish is wanted for the other paints except as regards the last coat?—I could not say whether more varnish is wanted to mix up with paint, but I should say that any substitute wants varnishing afterwards—or, I do not know about any others.
- 20,476. (*Mr. Sutherland.*) For outside work?—Yes.
- 20,477. (*Dr. Collis.*) You think that those paints generally require a coat of varnish to finish?—Yes.
- 20,478. And lead paints do not always require that coat of varnish?—Yes.
- 20,479. (*Chairman.*) You are not an expert paint mixer, are you?—No; I do not know anything about substitutes.
- 20,480. (*Mr. Sutherland.*) There is not much broad work varnished outside, is there; I mean walls. Stucco is not varnished, is it?—No.
- 20,481. It is generally done with oil paint, and left at that?—Yes.
- 20,482. What substitutes have you had experience with?—Zinc.
- 20,483. What sort of zinc; because "zinc" is a very wide term. Do you mean zinc oxide or lithopone?—Zinc oxide. There are a lot of substitutes for lead which I really do not know the names of. I know they are substitutes for lead.
- 20,484. But your evidence is not of value on that point?—Perhaps not.
- 20,485. Generally speaking the wall surfaces of London which are painted, are painted with oil paint, and are not varnished afterwards?—Yes, that is right.
- 20,486. Varnish is an exceptional thing for special situations, is it not, like front doors and sashes?—Yes, woodwork, shop fronts and sashes.
- 20,487. It does not apply to general painting. Now have you ever heard men complain of having to provide overalls? They have never regarded the necessity to provide overalls as a hardship, have they?—It is the general custom to provide and wear overalls.
- 20,488. There is no complaint amongst decent men that they have to provide them. Have you ever heard a complaint about the accepted custom? Has it ever in your experience appeared to the men to be a hardship that they should provide their overalls?—No, I do not think so.
- 20,489. Or washing?—No, I do not think that it is considered a hardship. It is quite the custom for the men to provide overalls.
- 20,490. So that in any recommendations, if we retained the custom of the men providing their own overalls, we should not be introducing any hardship to the workmen?—No, I do not think so.
- 20,491. And the workmen generally have the overalls washed every week, do they not?—Yes.
- 20,492. They come with clean overalls every Monday morning?—Yes; there is no obligation.
- 20,493. But it is the practice?—The man who does not do it is not regarded as being quite a decent fellow.
- 20,494. He is a marked man. You have never experienced, and I understand that you do not know of, any case where a man has suffered from lead poisoning and has been penalised by employers refusing to take him on?—Well, you see I have not followed closely every case of lead poisoning that I know, because of the distances apart.
- 20,495. You do not know of any such case?—Honestly I do not know of any such case. There may be cases that I am not acquainted with for that simple reason. I live about 10 miles away; we live so far apart. Whether I shall be able to get a job as easily as before, I do not know. I live at a place called Hanwell.
- 20,496. Are you still under the doctor?—No. I still owe the doctor for some treatment.
- 20,497. That is quite another question. A good many people besides painters owe doctors money?—I would not hesitate for a moment if I felt any of the old trouble. I should go to him without any hesitation.
- 20,498. Do you think that if you had regarded the first symptoms of lead poisoning when you had them, and had sought to meet them in the early stages, you would have avoided the serious consequences?—Yes. If I had known exactly that it was lead poisoning, and had known exactly what to do, I should have saved myself a good deal of trouble.
- 20,499. So that any regulations and literature circulated amongst the trade and any provision for informing the men and guarding them against the dangers attaching to the use of lead, would really help the men?

22 May 1912.]

Mr. JOSEPH DEVINE,

[Continued.]

—Yes, I daresay they would. You are not always sure that it is lead.

20,500. What do you mean by that?—I did not know, and did not believe, that I had lead poisoning at first. I drank brandy. I kept drinking a shilling's worth of brandy. It soothed my pain for a little time. I did not dream for a moment that it was lead poisoning till the doctor told me. It would be difficult for a man himself to know that it was lead poisoning; but generally speaking I should think you could not do any harm by circulating precise knowledge.

20,501. It would put the men on their guard, would it not?—Yes.

20,502. (*Mr. Rice.*) Is this the first illness you have had?—No; I have had three attacks from white lead.

20,503. Three bad attacks?—Yes.

20,504. Is this the first illness that you have claimed compensation for?—Apart from an accident. I had an accident.

20,505. But I mean from white lead poisoning?—Yes; it is the first time I have claimed for lead poisoning.

20,506. Was there any reason why you did not claim in the previous cases?—I do not think that the Act was in force then.

20,507. I see; it was before the Act came into force? Do you think that if painters had literature sent to them by any of the authorities, they would be able to intelligently understand it and take measures against lead poisoning to prevent it?—I do not think that painters are less intelligent than the rest of the community. I think they would be able to understand anything that was written properly.

20,508. And understanding it, do you think that they would be willing to take precautions?—Yes, I think so. I think that painters as a rule are reasonable.

20,509. Do you think that they are different from other workmen?—No, I do not think so.

20,510. You have worked on buildings?—Yes.

20,511. You have seen scaffolders and other men working on scaffolds?—Yes.

20,512. You have seen them take risks, as they do by reason of familiarity with the constant danger which they are in. In other words, they become used to the danger and do not take the usual precautions which the employers wish they should. Have you ever noticed that?—Well, yes. There is a good deal of variation amongst workmen.

20,513. Do you think that painters would be different from other men employed on buildings?—I do not say that they would be different, but I say that they are much the same as other workmen. Painters have to take risks, from the nature of their work.

20,514. But my point is that you often see men taking risks because they are familiar with them. Rather than go up one ladder and down another they will sometimes jump across?—I have seen men take foolhardy risks at times.

20,515. Do you think that painters would be the same as other men in that respect?—I do not wish to set up painters on a pedestal as being better than other men. They are normal human beings. Some would take more risks and some would be more careful.

20,516. With regard to an answer you gave the Chairman, you said that it was possible for men to die between the periodical inspections—in a fortnight's interval?—Yes.

20,517. Have you ever known men to die in a fortnight? Is the disease so malignant that on one Monday it cannot be seen that a man has the complaint, and yet the following Monday fortnight he may be dead?—Yes.

20,518. It is as malignant as that?—Yes.

20,519. (*Mr. Parsonage.*) With regard to dry rubbing down between coats, have you ever seen turpentine used with glass-paper to moisten the glass-paper?—No, that is not a usual process.

20,520. It is not a usual custom at all. You possibly may have seen it done?—Yes; I have done it myself; but it is no good.

20,521. It would not answer in a general way at all?—No. I have done it for a little special job, when I could not afford to wait for the stuff to harden.

20,522. You have been asked questions with regard to cases you have known in your own branch. You belong to other branches in London just as much as to your own branch?—Yes.

20,523. Taking it generally, you would come across many men who suffer from lead poisoning apart from men who are members of your own branch?—Yes.

20,524. If literature was circulated amongst painters and they took notice of it and were ever so careful, that would not prevent lead poisoning, would it?—No, it would not.

20,525. It might make the men more careful. The main thing would be to tell them the symptoms, so that they could provide against getting dangerously ill?—Yes.

20,526. But it would not be any preventive of the disease itself?—No.

20,527. You do not think that there are any regulations possible that would prevent lead poisoning, except the prohibition of the use of lead?—No, I do not.

20,528. With regard to circulating literature, that would be mainly instructions to the painter with regard to cleanliness?—Yes, I suppose so—telling him to take a dose of salts occasionally when he found that he had pains.

20,529. (*Mr. Sutherland.*) And the labelling of all materials that contained lead as poisonous would be part of the procedure?—I see.

20,530. (*Mr. Parsonage.*) You generally work in the West End of London, and mainly in large decorators' shops?—Yes.

20,531. Not so much on building work; so you would not come in contact with building work generally?—No, I have never been on building in the West End.

20,532. Have you found it a general practice for the employer to allow time for washing hands, and to provide proper facilities?—No, they do not do that properly. The men sometimes sneak the time, but it is not given willingly, nor are there facilities for washing. The facilities for washing are better now, but they are not quite first class even now. They do not get enough clean pails and water, and the men who have to bring the water sometimes have to carry it long distances, and they do not like doing it in their own time.

20,533. Do you remember Warnings doing the Waldorf Hotel?—Yes.

20,534. Do you remember the case of a man named Smith who was taken ill at that work. You probably would not know, as he belonged to the Central Branch?—No.

20,535. He died in three days from lead poisoning. He was a fine healthy-looking man. They were working night and day at the Waldorf Hotel. An inquest was held and a *post-mortem* examination, and the verdict was "Death from lead poisoning." I saw the man six days before, and he was a fine healthy-looking man then.

20,536. (*Mr. Gardner. (To the witness.)*) When an operative painter is working on a job and gets a substitute for white lead to use, he does not always know what that substitute is, does he?—He very rarely knows.

20,537. For instance, if I, as an employer, send you down to a job, I do not tell you whether it is Griffith's white, Dixon's white, zinc oxide by direct process, or indirect, or anything else?—No.

20,538. I just say, "There is some stuff; you put it on" ?—That is right. If a painter inquired he would be considered impertinent.

20,539. He does not know what he is putting on?—That is right.

20,540. When you mix your paint you do not always use the same quantities of the different mediums on every job. In some jobs you may have more oil, and in some jobs more turpentine?—Yes.

20,541. You vary the quantity according to the job?—Yes, according to the work.

20,542. The same thing applies to making up with varnish or not. You vary the quantity of varnish in the paint according to the job?—Yes.

22 May 1912.]

Mr. JOSEPH DEVINE.

[Continued.]

20,543. You might on one job put as much varnish into a lead paint as on another job into a zinc paint, and vice-versa?—Yes.

20,544. With regard to the washing of overalls, where are the overalls washed when they are taken home? They are generally boiled with soft soap, are they not?—Yes, generally with the other clothes.

20,545. Where are they boiled?—Generally in a copper in the back kitchen of the house.

20,546. Have all the painters in your own district got back kitchens with coppers attached to them?—That is another question altogether. I would not like to say.

20,547. I want to know where they are washed?—I know where mine are washed. We have a copper in our back kitchen at home; but in London there are many apartments where they have not washing accommodation and the overalls would be taken to the baths and washhouses.

20,548. They would not wash them at home, you think?—They could not, very well. There are plenty of workmen's houses in London where they have not the slightest accommodation for washing.

The witness withdrew.

Mr WILLIAM F. WALLIS (Brommend Works, Maidstone), examined.

20,557. (Chairman.) Do you attend to-day as a representative of the National Federation of Building Trades?—Yes.

20,558. You are possibly aware that we have already had a very large number of master house-painters and decorators as witnesses?—Yes, I have heard that you have.

20,559. Have you satisfied yourself that the danger of lead poisoning amongst house-painters constitutes a very real danger, and one that should be removed?—As far as my observation goes, I have not satisfied myself that it is of very great importance.

20,560. What is the nature of your business?—We are builders and contractors.

20,561. Where is your business carried on?—At Maidstone.

20,562. What is the average yearly number of painters employed by your firm?—It varies very much. At the present time we have between 60 and 70. I think you might take it that our average would not be very much more than 25. It depends on how you take the average.

20,563. How long have you been in the painting trade?—We have been painting since 1889. That is 23 years.

20,564. Have you known any cases of lead poisoning or painter's colic?—Yes. I have made inquiries. I find, in 23 years, only four cases of lead poisoning.

20,565. When did you begin to make enquiries?—When I heard that I was to be called as a witness.

20,566. Did you ever make any enquiry into the condition of health of your workpeople?—No. As far as I know there was nothing of any importance to attract my attention to the matter. Cases are few and far between.

20,567. How do you know that they are few and far between if you did not enquire?—We should have known of them in the ordinary course if they had been frequent. We should have known of the serious cases, I take it.

20,568. Would you know of any slight cases?—I do not know of any slight cases.

20,569. They have not come to your notice?—They have not come to my notice. They have not been reported.

20,570. Have your men had occasional days of sickness possibly due to lead?—That I cannot tell you; they are casual men. Our painting jobs very rarely last more than a few weeks. The fact of a man staying away for a day would not be reported to me, and there has been no sufficient number stay away to make it of sufficient importance to be regarded.

20,571. You know, I presume, that lead poisoning frequently undermines the health without immediate

20,549. (Mr. Parsonage.) They boil them in the saucepan sometimes?—They may do that.

20,550. (Mr. Gardner.) Do you know of cases of overalls being boiled in the same pot that people may use for cooking food in afterwards?—No, I have no knowledge of that.

20,551. It is quite a common practice. You roll up your overalls, and take them home; you have a good deal of lead dust on them, and are you not carrying danger into the home?—Undoubtedly.

20,552. When you unroll them, the dust is shaken all over the place?—Yes.

20,553. And you give the family a share of the trouble?—Yes.

20,554. (Mr. Parsonage.) When you have carried your food, as men generally do in London to their work, have you ever noticed the food taste of the paint?—Yes; it is never the same. You never enjoy food that is carried out—or I never do.

20,555. The food is carried sometimes in the bag that you keep your blouse in as well?—Yes.

20,556. And it might easily become contaminated with the dust in that way?—Yes.

violent symptoms arising?—Yes; I have understood that that is a general thing.

20,572. Do I understand you to say that your labour is casual labour?—We keep very few permanent hands.

20,573. So that you would not know whether, after they had been on a job with you and a job for someone else, they suffered from lead poisoning or not?—I have painters who have been with me the whole time. They are only few in number. They are leading hands. They have never suffered from lead poisoning.

20,574. The incidence of lead poisoning is published month by month by the Board of Trade; do you see the Labour Gazette issued by them?—No. It never occurred to me to look there for the statistics. I have been trying to find statistics on the matter.

20,575. When you say that you do not think lead poisoning is a serious question, it means that you have not studied it. You do not know?—I know that there is an average of 25 to 30 deaths per annum, but that is something less than one in 1,000, and it did not occur to me that that was a dangerous or alarming proportion.

20,576. Did it not occur to you that it was worth while trying to prevent that one death in a thousand?—I cannot say that it did. We have to take risks.

20,577. But not unnecessary risks?—We do not think the risk, when we take it, is unnecessary; but we do not go through life without them.

20,578. Have you noted that 284 deaths of painters have been definitely certified as due to lead poisoning in the ten years ending 1910; and 96 deaths in 1911?—I was not aware of it before this morning.

20,579. Are you also aware that about 2,000 cases of lead poisoning in your trade were reported to the Home Office voluntarily without any legal compulsion whatever in the same ten years?—I know there was an average of about 150 to 200 a year, but that seemed a small number.

20,580. How did you obtain that information?—From reading an article somewhere; I forget now where. It was an extract somewhere which I made a note of. It was probably in a newspaper in answer to a question. Mr. Gladstone said in answer to a question that there were 557 cases in four years. That is about 140 a year.

20,581. (Mr. Sutherland.) Is that house-painters?—Yes, house-painters and decorators.

20,582. (Chairman.) Now I am sure you will agree with me that all this sickness and death is very deplorable?—Yes. We do not wish at all to increase the ordinary risks of life in any shape or form.

20,583. There seem to be only two possible means of dealing with this evil of lead poisoning: one is to

22 May 1912.]

MR. WILLIAM F. WALLIS,

[Continued.]

issue a code of regulations; and the other is to prohibit the use of lead, or rather restrict its use within narrow limits, as for example by forbidding the use of paints containing more than 5 per cent of soluble lead compounds. Do you agree that those are the only two alternatives?—I can see no other.

20,584. Which of the two alternatives would you suggest we should adopt?—The only efficacious one, or that is likely to be efficacious, is the prohibition of white lead.

20,585. Do you think it practicable to issue a code of regulations which could be adopted by master house-painters and their men?—It entirely depends on the regulations. It is quite practicable to issue a code; it is another thing to get the regulations carried out.

20,586. But taking into consideration the kind of work that is done in remote corners of the country and the fact that workmen have to do painting in single rooms, houses where there is no proper accommodation for washing and the rest of it, do you think that it would be practicable for the Home Office to issue rules expecting them to be carried out?—It depends entirely on whether the rules are reasonable. As far as my observation goes, I have never seen one of our jobs where there was not washing accommodation or separate messing accommodation for the men. But I am not an ordinary house-painter or decorator. I do not have that class of work.

20,587. Shall I tell you what the rules are, say, in the pottery industry?—I understand roughly that they have to provide accommodation for washing, which is always done now since people have begun to study the question.

20,588. I think you may take it that the rules which obtain in the pottery industry are somewhat similar to the rules which may be introduced in the painting industry. First of all, there is the provision of overalls by the employer, who is responsible for seeing that they are regularly washed. Would you agree to that?—That does not present any difficulty. Ninety-nine out of 100 of our painters use their own overalls.

20,589. But they will have to be provided by the employer?—That would not present any difficulty.

20,590. And the overalls would have to be washed by the employer; the point being that it has been decided by expert witnesses that it is highly dangerous for these men to be allowed to take their overalls home to be washed?—I quite understand that.

20,591. Would that present any difficulty?—No. It is a matter of expense, which would have to be allowed for in our estimates.

20,592. Then, secondly, provision would have to be made for a meal room, care being taken that in no case whatever are any of the men allowed to take their meals in a room where lead is being used or where painting is being done. Would that be practical?—I should not see any very great reason against it myself. It is invariably done on our jobs, I may say. What would happen in the case of a small house being painted I do not know. I should assume that there would be one room to which they could go.

20,593. You must not assume?—This is all hypothetical. You must assume, surely.

20,594. No, you must not assume. I want to know whether you think that such a rule could be enforced?—Yes, I should think that was a rule which could be enforced, because the men themselves would fall in with it.

20,595. That is not the question. Could you in every instance be quite sure that a separate room could be provided for the men to take their meals in?—Possibly not in every instance, but in by far the great majority of instances I should think you could.

20,596. What would you suggest we could do in those instances where they could not provide a room?—The rule would probably be ignored if it were found to be impossible.

20,597. So that the rule would break down in some cases?—Yes, in some cases.

20,598. Then the next is this: provision would have to be made for a proper place to keep the overalls after working hours, where they would not contaminate food

or the men's outdoor clothing and where they would not collect unnecessary dust when not being worn. Do you think that such a provision could be enforced?—Yes, I should think that that could reasonably be enforced.

20,599. Could you tell us what you would do in cases where there is no room for the workmen to take their meals in?—There would be one room, surely, for them to hang up their overalls, would there not? I can hardly conceive of a case, even in a small house, where they could not hang up their overalls. The smaller the house, the fewer the painters. They could hang up their overalls in the kitchen or scullery or one of the out-buildings.

20,600. You are going to transfer the danger from the painters to the other occupiers of the house?—That is so.

20,601. That would not be very good for the occupiers of the house?—You could arrange that the overalls should be kept away from the food. I should imagine that there would be no difficulty in getting an out-house or bicycle-house to hang them up in the dry. Provision of a special place means providing a shanty.

20,602. It would present great difficulty?—Yes.

20,603. Then there is provision for cloak-room accommodation, so that clothing put off during working hours shall not under any circumstances remain in a room where lead is used?—That presents greater difficulty even than the overalls, which would already be tainted. It would not be necessary to keep them apart. These might be hung up in the same room as the overalls.

20,604. That would be objectionable?—Yes.

20,605. You consider proper washing accommodation to be very important?—Yes.

20,606. The provision in the pottery trade—and as, I have told you, I do not suppose that the Home Office would issue regulations that would be any less drastic—enacts that one basin or other utensil shall be supplied to every five men?—That is ample, one would think.

20,607. Do you think that that would be possible?—I think it would er on the side of amplitude.

20,608. I did not ask that; but do you think that it is possible?—Everything is possible.

20,609. You can hardly say that, can you?—You cannot say that it is impossible.

20,610. I want to know whether you think it would be possible to adopt that throughout the trade?—I doubt whether it would be adopted strictly. There would be washing accommodation provided, but I doubt whether you would get one utensil to every five men.

20,611. Would it be possible to provide hot water?—Yes, I think so.

20,612. In every case?—Yes; in all the cases with which I am more specially connected it is quite possible to provide hot water, and it is provided.

20,613. I do not want you to speak for other places, but from your own knowledge of the trade, do you think it is possible to provide hot water in every case?—Hot water is always available at meal time. I have never known a case where it would not be possible to do it.

20,614. Would the employers allow certain time for workmen to wash their hands?—Yes; that is quite the custom.

20,615. Out of the time of the employers?—Yes, three or four minutes before knocking off time.

20,616.—They would not mind having that enacted by law?—No. We should have to put up with it if it was enacted by law.

20,617. Ten minutes?—Five minutes is ample if proper washing accommodation is provided.

20,618. Would the employers agree to provide nail brushes, soap, and towels?—I have never had nail brushes asked for.

20,619. Nail brushes are most important, because lead paint gets under the nails and remains there?—I quite see the importance of it.

20,620. Do you think it would be possible to be quite sure that all these towels and soap would be regularly supplied clean to the men?—All that the employer could undertake to do would be to supply them.

22 May 1912.]

Mr. WILLIAM F. WALLIS.

[Continued.]

20,621. He would have to put them in the hands of somebody who would see that they were distributed at the right time, and so on?—I take it that they would be with the water and the towels.

20,622. You think it quite possible?—Yes.

20,623. To whom would you give such a task?—The foreman painter would see that he had the necessary accommodation. He would ask for it and get it.

20,624. If you had a country job, would the foreman painter take so many towels down?—Yes.

20,625. He would take so many nail-brushes and so much soap down with him?—If it were in the regulations he would have to do it.

20,626. But would it be always done?—That I cannot say.

20,627. As you said just now, it is quite easy to make regulations but the difficulty is to enforce them?—Yes.

20,628. Now I will take you to another point: provision would have to be made for the avoidance of dust. Some means would have to be devised for getting rid of any dust which the men might breathe. Do you think it is possible in every case, by means of an exhaust draught or the like, to remove the dust from the men while they are at work?—I think it is quite impossible.

20,629. Now with regard to the fumes in burning off and the spray which may be breathed in certain operations, what would you suggest as a remedy for that?—I can suggest nothing for that. If you have anything in the shape of a draught they cannot use the burning off apparatus.

20,630. In addition to these regulations, periodical medical examination of the work people, say once a month, would be insisted on at the expense of the employer?—That would be very onerous.

20,631. Then in the pottery industry, in addition to medical examination, the employers have agreed to give compensation to any worker who is withdrawn from work by the doctor's orders on account of doubtful health. Let me give you an illustration of what I mean: Supposing the doctor examines a workman and says, "Look here, you have not lead poisoning yet, but you are very near it; I must suspend you for a month"; in such a case the employers have agreed to give that man compensation for that month. Would you agree to give similar compensation under similar circumstances?—Well, not willingly; but if it were a regulation we should have to conform to it.

20,632. Now taking all these points into consideration, would you say that you prefer that the industry should be regulated by special rules such as I have foreshadowed, or, as an alternative, that the use of lead should be prohibited or very closely restricted?—I am decidedly in favour of prohibition. We are quite over-pestered, one may say, with rules and regulations in factories now, and the more they accumulate the more increasingly difficult it becomes to see that they are carried out.

20,633. (Dr. Collie.) Have you used, to any extent, paints which do not contain lead?—Practically not at all.

20,634. So you have no experience of their value?—No.

20,635. (Mr. Sutherland.) The medical examination would probably work out at about 6d. a man per term, whatever it was, say a month. That would not be very onerous, would it?—No, not if it worked out at that sum; but I do not know that it would.

20,636. The provision of overalls is already made by the men?—Yes, by the best men.

20,637. And there is no reason why they should not continue to be made responsible, in any reasonable regulation, for doing what they have always done?—Yes.

20,638. There would be no hardship?—No, there would be no great hardship there.

20,639. With regard to country jobs and the provision of washing accommodation, on all your country jobs you send the foreman. He represents you and has complete charge?—Yes.

20,640. He would take the towels and nail brushes and distribute them?—Yes. I do not see any great hardship in that.

20,641. You have to guarantee that the men would have the facilities?—Yes, we would have to guarantee that the men would have the facilities. I could not guarantee that they would avail themselves of them.

20,642. Not even with the best regulations?—No.

20,643. If you give the men the facilities, your obligation to the law is met, if it is the law?—Yes.

20,644. In most houses you get an empty room for the men to dine in, and so on?—Yes. I have never known a case where it was not available; but I do not do small work.

20,645. If a regulation was made, would it not be reasonable to compel the householder to give the master painter facilities for rooms?—Yes.

20,646. Should not they bear part of the burden as well as the master painter?—I should think that that was quite reasonable.

20,647. You have no knowledge of substitutes?—No.

20,648. So you do not know what you would be going on to if white lead were abolished?—No. We have used zinc white, but in very very small quantities. All our work is done to specification, and I have not seen a specification where anything but white lead and oxides were specified.

20,649. That is the architect's specification?—That is the architect's specification.

20,650. Do you think that it would be a serious thing to the trade to be compelled to abandon the use of lead?—Well, painters generally are very much averse to giving up the use of white lead.

20,651. (Mr. Parsonage.) Do you mean employers?—The painters themselves. If you ask them as to a painting medium, they say there is nothing like white lead. I have asked several lately. They all say the same.

20,652. (Mr. Sutherland.) They know from long experience that it is good?—They know that as a practical material for getting good results there is at present nothing on the market, so I understand, which can approach it.

20,653. (Mr. Rice.) You are in a large way of business?—Yes.

20,654. And your knowledge would be really of large buildings where mess rooms are provided not only for painters but for other tradesmen?—Yes.

20,655. The hot water that is provided, is not provided especially for the painters to wash their hands, but is available for meals, or any other purpose?—Yes.

20,656. You have no knowledge of the methods of small employers, I take it?—No, I have no knowledge beyond what one sees in going round; but I cannot speak of that.

20,657. You agree that regulations, if enforced, would increase the cost of work?—Undoubtedly.

20,658. (Mr. Parsonage.) You say that painters say that they prefer white lead to any substitute?—Yes, from the point of view of good work.

20,659. And yet you say that you have practically tried no substitute?—I get my opinion from having asked painters.

20,660. You have asked men in your employ?—Yes, since I knew that this Committee was sitting I have asked my foreman painters what their opinion is of substitutes for white lead, and they one and all have made the same reply—that nothing gives such satisfactory results from a decorative point of view as white lead.

20,661. Have these foremen been in constant employ for you?—Yes. Not one of them has been at work for us for less than ten years.

20,662. How can they possibly have any knowledge of substitutes when you say that you do not use them, and they only work for you?—That is a point, certainly.

20,663. That is what I want to know?—They have the general knowledge of the trade.

20,664. They are just as ignorant as yourself, if they have never used the things?—Do you mean that there have been recent substitutes?

22 May 1912.]

Mr. WILLIAM F. WALLIS.

[Continued.]

20,665. I am speaking of zinc oxide?—They all know zinc oxide and they all condemn it.

20,666. You have used very little of it?—We have used very little. Our oldest man is 72 years of age. He must have had a good deal of experience before he joined us.

20,667. There have been great improvements in that in the last few years. It is different from ten years ago?—Of that I am ignorant.

20,668. These men would not have more knowledge than yourself, so that evidence would not be very valuable?—No.

20,669. Now did you say that you provided towels for the painters?—Yes.

20,670. That is the first time I ever knew it?—They are provided, and they are provided, I assume, by our firm. They are there, I know.

20,671. Do you send towels out to the jobs?—That is a detail, but I know that the towels are there. I have seen them being used; in fact I have used them myself.

20,672. On a job?—On a job.

20,673. I am very glad to hear it. It is the first painting firm I have ever known who sent out towels to a job. If we have had evidence that others do it, I may have forgotten it?—The foreman is allowed the discretion to provide soap, towels, and water.

The witness withdrew.

Mr. T. McHUGH (99, Merton Road, Bootle), examined:

20,681. (Chairman.) Do you attend to-day as a representative of the National Association of Master House-Painters and Decorators?—Yes. I am on the Council of that Association.

20,682. You are probably aware that we have already heard a great number of master house-painters and decorators?—Yes.

20,683. Have you satisfied yourself that the danger of lead poisoning amongst house-painters constitutes a real danger and one that should be removed?—Yes. I have been of that opinion for a very long time.

20,684. There seems to be only two alternatives for dealing with the evil: one is to issue a code of regulations somewhat similar to that which has been introduced in the pottery trade?—Yes.

20,685. And the second is to prohibit the use of lead, or rather to restrict its use within narrow limits, as, for example, forbidding the use of paints containing more than 5 per cent. of soluble lead compounds. Which of these two alternatives do you think we ought to adopt?—I would go in for the total prohibition of white lead; or, next to that, I would let it be limited to using no more than 5 per cent., as you have just suggested.

20,686. (Dr. Collins.) Have you had any experience of the use of paints which do not contain lead in your own work?—Yes, zinc oxide, which everybody knows does not contain lead; and there are greens, ochres, and browns and other paints which can be made without using white lead.

20,687. What is your experience of the value of such paints for outside work?—It is pretty well understood amongst the trade that it is not absolutely necessary for interiors, but for outside work there is a feeling that there is nothing better than white lead as a body.

20,688. What is your feeling?—I have tried zinc white where white is required, and if it is well mixed with varnish I think it is almost equal to white lead. I look upon it in this way: in years gone by large buildings were mostly coated with stucco or cement and such buildings with cement fronts had half a dozen coats of paint. Plenty of white lead was used in those days. Those buildings are now getting obsolete. In modern buildings the outside is mainly constructed of stone, Carrara, composition marble, terra cotta, and that sort of thing. Very little white paint is now required outside—principally on window sashes and such like.

20,674. You have never heard a workman objecting to provide overalls, have you?—They do not all, but by far the great majority provide them.

20,675. And they are always quite willing to provide them?—Yes.

20,676. The reason for the employers providing the overalls is to eliminate the danger that arises from the workman taking them home to be washed, and so taking the danger of lead poisoning into his home when the overalls are washed along with other clothes?—Yes, I understand that.

20,677. It is not a question of any objection on the part of the workman at all?—No. They frequently wear their overalls much too long. I have told them of that occasionally.

20,678. I wanted you to understand that it is not a question of the workmen objecting to it, but it is to prevent the danger from their taking them home. When you spoke of it being easy to provide a separate room, and so on, you have not had experience of London work?—No.

20,679. You know that sometimes, when doing a drawing-room, you are not allowed to go into the house but you have to go up a ladder and through a window?—Yes.

20,680. You cannot even go through a door in the area. In such cases it would be difficult or impossible to get a room?—Yes. If you are doing only one room in a house it would seem to be impossible.

If there is good pure zinc oxide with plenty of varnish, in my opinion it is quite as good as white lead paint.

20,689. Would that cost much more to apply than painting with lead with less varnish?—I do not think so. Zinc paint costs a little more in market value, but there is more bulk. Even with white lead paint we use varnish to get a nice glossy effect. If you put a little varnish with zinc white paint, to my mind it has almost as good a body.

20,690. To get the same effect from zinc paint as from lead paint, is there much difference in the amount of varnish that requires to be added?—Not much.

20,691. So the question of difference of cost is not very great between the two?—In my opinion it is not.

20,692. As prices rule to-day probably zinc would be cheaper?—Taking the present prices of lead, yes. There is no doubt that if white lead was totally prohibited the price of zinc would go up unless a substitute was found. If prohibition was announced the manufacturers would concentrate their minds on getting a good substitute. Many manufacturers are trying that now. They are continually sending you samples of goods which they claim are equal to white lead.

20,693. You do not consider that there would be any very great upheaval in the house-painting trade if such a prohibition came in with a certain time allowance?—No, quite so—not with a reasonable time. I am a member of the Liverpool Master Builders Association; and President for this year. The Association has about 400 members and comprises all branches of the Building Trade, including the painting trade of the City. You have already had evidence from two of our representatives who were sent here. We resolved that we would rather vote for total prohibition of white lead than be hedged in with any onerous regulations or restrictions. In a factory you can carry out restrictions.

20,694. (Chairman.) There is a great difference in that respect between house-painting and factory work?—Take my case for instance. Our jobs may lie within an area of ten miles. There may be a job here, another a mile away, and another two miles away, and so on, three or four men working on one job, and three or four working on another. It would be absolutely impossible to carry out any Government regulations. You would have to leave it to the workmen to carry

22 May 1912.]

Mr. T. McHUGH.

[Continued.]

them out, and they might not be carried out; or you would have to have an inspector to go round. I have read, as a citizen of Liverpool, of lead poisoning, and I have known two or three inquests held on men who have died of lead poisoning. I am supplied every month with the Government Labour Gazette, and I see from that the number of cases throughout the country is simply appalling. The study of long life and good health should be placed on a higher plane than the exigencies of commercial requirements, especially if a substitute can be found.

20,695. (*Mr. Parsonage.*) Zinc oxide is being more largely used in Liverpool, is it not?—Decidedly.

20,696. During this last year or two especially?—Yes. I might mention in support of that, with regard to enamel work, that nearly every paint manufacturer has a special form of enamel that has a basis mostly composed of zinc. To get good results, it is necessary to use zinc as a body before using the enamel. In the old days you would put a gloss coat of white lead, and have flatted white lead, and so on. Nowadays it is nearly all zinc with enamel on top of it. In nearly all new buildings coming on now, water paint is used on the walls, say in a building like this, with ornamented relief plaster decorations. So to my mind there is less necessity year by year than in the past to use white lead. Twenty years ago I would have said it was impossible for a painter to do without it, but we are gradually drifting away from that.

20,697. A good workman finds no more difficulty in using zinc paint than in using lead?—None whatever. I should be astonished for any painter to say that he did not understand how to use zinc paint or apply it. If he did not do good work, I would say that he was an incompetent man, and I would have no room for him.

20,698. If a man is a painter he can apply both?—Yes. In every well-regulated shop zinc oxide is there daily. We have the two things lying side by side.

20,699. I believe that in Liverpool you insist on having painters?—I hope so.

20,700. Have you any understanding with the Painters' Union to employ trade unionists?—Yes. We have just entered into a new agreement for four years, that the Master Builders' Association, which, as I said before, comprises the painting trade, will employ none but trade unionists. On the other hand, the union painters have pledged themselves to work for none but members of the Master Builders' Association. The object of that is to try to lift the trade from the rotten state it has got into. Take Corporation contracts, schools, and public buildings of that kind; we have evidence at different times of an employer employing one man and 15 apprentices, or something like that, or taking on apprentices and improvers wholesale, and discharging when slack. We have tried to stop that. We have agreed to employ only one apprentice for every four operatives. That is for the general uplifting of the trade, and I think that the public will gain by the arrangement in the long run. I do not want anyone to imagine that we are trying to fleece the public in any way. We know that the public is fleeced when it gets shoddy work, and thinks that it is getting work done cheaply. If the public will accept the lowest standards, it is not really getting work done cheaply. There will be more scope under our arrangement for an elderly man. A man who is a little on in years, over forty years of age, is practically crushed out at present.

20,701. There have been a good many lead poisoning cases in Liverpool?—Yes, there have from time to time, especially among ship painters. The danger lies not so much in outside work, but in confined places where doors, windows, and everything must be closed to get a good result—with no dust flying about.

20,702. (*Mr. Rice.*) Did I understand you to say that you were President of the Association of Master Builders in Liverpool?—Yes.

20,703. As well as a representative of the Master Painters' Association?—Yes. I am on the Council of the National Association of Master Painters. That is the question the Chairman asked me at first. I am also the President of the Liverpool Master Builders Association, which comprises the painting trade of the city as well as all the Branches in the building trade. The building trade, I need hardly tell you, comprises a number of trades. In Liverpool we have them all grouped into one Association.

20,704. Did you have a meeting to discuss this question?—Yes, we did.

20,705. Was it the unanimous wish of the builders to have prohibition instead of regulation?—Yes, it was. Our two representatives, Mr. Frank Griffiths and Mr. Morton, two large employers in Liverpool, were elected to give you gentlemen evidence accordingly. I was asked to go at the time but I could not manage it.

20,706. Why did the Liverpool Association of Master Builders discuss this question?—It came in the first place from the National Association. We are federated in different parts of the country to what are called "County federations," and then with the National Association of Building Trades Employers of Great Britain and Ireland, the offices of which are here in London. Mr. White is the Secretary. I am also on the Council of that Association. The question was discussed in London, and then the result was sent out to all the federations and the local associations. It was unanimously, I think, agreed throughout the country, or it was fairly well agreed, that rather than have any further restrictions on the trade they would have total prohibition. That conveys to my mind that it is not absolutely necessary to use white lead. We can have substitutes if the law declares that lead must not be used. With regard to employing trade unionists, we have agreed with the painters, and now we are negotiating with the plumbers, and we have every hope that the same arrangement may be carried out.

20,707-12. (*Mr. Parsonage.*) The men have breakfast now before they start?—Yes. We have a full run from eight o'clock, and go right through for four hours, and from one to half past five; and we consider that there would be quite as much work done in the four hours as before. Our starting time was seven o'clock in the summer. In the winter we had two or three starting times, according to the daylight, half-past seven and eight. The breakfast time was always getting changed. We found that worked very badly. It was fixed with the best of intentions at the time, but it did not work well, and customers were continually complaining, and some employers, especially those not associated, made rules of their own to start at any time they liked. Now we let the men have breakfast before they come and start at eight and go on. That has given every satisfaction. It came in on the 1st May. Every employer seems to be well satisfied, and the workpeople too whom I have asked. There is no dissatisfaction.

The witness withdrew.

## THIRTY-FIFTH DAY.

Wednesday, 5th June 1912.

PRESENT:

|  |   |
|--|---|
| <p>Mr. W. G. SUTHERLAND.<br/>Mr. A. GARDNER.</p> | <p>Mr. E. L. COLLIS, M.B. (<i>in the Chair</i>).<br/>Mr. J. PARSONAGE.<br/>E. A. R. WERNER (<i>Acting Secretary</i>).</p> |
|--|---|

Mr. DAVID MCKILLOP examined.

20,713. (*Dr. Collis*.) What practical experience have you had in connection with the house-painting trade?—Twenty-two years.

20,714. Is that as a house-painter?—Yes.

20,715. Are you connected with the Edinburgh branch of the Scottish Painters' Society?—Yes.

20,716. How many members are there in your branch?—At the present time 549.

20,717. Are you prepared to give particulars of a number of cases of lead poisoning which have occurred among these men?—As far as I know from my own knowledge.

20,718. Will you give first the details with regard to Hugh Blyth?—He was a member of the branch for a while. He was laid up badly, but he was not certified at the time to be suffering from lead poisoning. He was confined in Bangour Asylum with general paralysis.

20,719. In whose employment had Hugh Blyth been?—He was for many years with Messrs. Dobie. He was a decorator and sign-writer there.

20,720. Did he have an attack of lead poisoning some years ago?—Yes; his wife told me that he had been off badly through lead a number of years ago; she did not state how long.

20,721. (*Mr. Sutherland*.) You do not know how long?—No, I do not know how long.

20,722. (*Dr. Collis*.) He was taken to Bangour Asylum, and certified to be suffering from general paralysis?—Yes; he is now dead.

20,723. Did the doctor of the asylum mention to Mrs. Blyth that her husband was suffering from the effects of lead poisoning?—Yes.

20,724. When he had his previous attack, before he went to the asylum, was he certified as having lead poisoning?—He was not a member of our branch then. I only know what Mrs. Blyth told me.

20,725. You do not know whether he had compensation; or was it before the Compensation Act was passed?—Before the Compensation Act was passed.

20,726. How long is it since he died?—October 1909.

20,727. Did he have any compensation at all, do you know?—No.

20,728. Have you anything to say regarding the shopman at your own place of employment?—He is not there now, but he had two or three definite slight attacks, three weeks, a fortnight, and so on, occasionally.

20,729. (*Mr. Sutherland*.) What was his name?—William Crawford.

20,730. Employed with whom?—Thomson, 66, Newington road.

20,731. Leith?—Edinburgh. He was at that time employed there.

20,732. (*Dr. Collis*.) Was his case notified?—No; he was treated at the infirmary.

20,733. Do you know whether he made any claim for compensation?—No, he made no claim.

20,734. Are these names to go down in the printed evidence, or do you want them left out?—It is immaterial to me.

20,735. Very well. Can you refer to other cases among members of your branch?—There is one of

them here, James Watson. Two years ago, in March, he was affected with lead poisoning in the left arm.

20,736. Did the doctor see him and say that it was lead poisoning?—He was certified for that, and got compensation. He was off for eight weeks.

20,737. Have you known any other cases?—Another one was treated for nephritis, a member of the branch.

20,738. That is Bright's disease?—He only worked five weeks during the year before last. He had no compensation, although the doctor said that there was lead in his system.

20,739. Had he been employed for many years as a house-painter?—Yes. I think he had been a good few years employed.

20,740. (*Mr. Sutherland*.) Was he a regular painter?—Yes.

20,741. (*Dr. Collis*.) Have you met with a case while you were temporarily employed at the Science and Art Museum?—Yes. He has had several attacks, and last winter he had a very severe attack.

20,742. Did he make any claim for compensation?—No.

20,743. (*Mr. Sutherland*.) Who was this?—The permanent painter at the Science and Art Museum at Edinburgh.

20,744. What was his name?—William Walsh. They got the sick allowance. It is a Government institute. He was allowed sick pay for so many weeks.

20,745. (*Dr. Collis*.) What Government institute is it?—It is the Royal Scottish Museum of Science and Art. He got sick pay.

20,746. Therefore, he would get his sick pay and not bother to claim for lead poisoning?—No, there was no need for compensation.

20,747. That was not so with the other man you mentioned just now who was ill for three weeks?—The one with nephritis was off for nearly twelve months.

20,748. But he made no claim?—No.

20,749. (*Mr. Sutherland*.) Was that the man with Thomsons'?—No, the one previous.

20,750. Hugh Blyth?—No, the one after Hugh Blyth, the shop man.

20,751. What was his name?—William Crawford.

20,752. (*Dr. Collis*.) Can you account in any way for the fact that the people in the North do not claim compensation always?—Yes; some of them are afraid that if they do they will lose their job. They have, perhaps, been for some time in the shop. The insurance companies press employers to get rid of men. That is only a suspicion.

20,753. (*Mr. Sutherland*.) You have no knowledge of that?—No.

20,754. (*Mr. Gardner*.) Your knowledge is that these men find difficulty in getting employment afterwards?—Yes. They would rather try to keep it quiet.

20,755. (*Dr. Collis*.) The men do definitely find difficulty in getting employment afterwards if they claim, and consequently they do not claim?—They do not claim.

x 7790

T t

5 June 1912.]

Mr. DAVID MCKILLOP.

[Continued.]

20,756. Do you think that this might in any way account for the fact that we do not hear much of lead poisoning in Scotland?—Yes; that is my opinion.

20,757. Can you also give us particulars regarding a chronic case of which you have knowledge?—Yes. That refers to a man working alongside me for many years.

20,758. Will you tell us about it?—He was off badly for 13 weeks in 1899, and confined in the infirmary for a while.

20,759. (Mr. Sutherland.) What was his name?—Robert Johnson.

20,760. Of where?—The same employment—Thomson, Newington Road, Edinburgh. In 1901 he had 15 weeks off. He seemed to take it every alternate year. And then he had 11 weeks off in 1903, with slight attacks betwixt times for perhaps a day or two. Two years ago he claimed compensation from his employer at that time, who was Hall, in George's Street. Then Hall's insurance people went to Thomson's insurance people, and the two of them had to divide at the finish. It never went to the court, although it was going there. He got somewhere about 16 or 18 weeks' compensation between the two firms.

20,761. (Mr. Sutherland.) Is he still alive?—No, he died a fortnight ago.

20,762. (Dr. Collis.) Do you know what he was certified to have died of?—Yes, an ulcer; nothing to do with lead. I made inquiries.

20,763. Lead does not appear on the death certificate?—No, it does not appear on the death certificate. It was hemorrhage and an ulcer. There was a peculiar name attached to it, which I cannot remember.

20,764. Duodenal ulcer?—Yes, something like that, I dare say.

20,765. Do you consider that there is great danger from inhaling dust containing lead?—Yes. In the case that I referred to of Johnson it was always after sandpapering work that he seemed to be affected. He seemed to inhale the dust after sandpapering work.

20,766. Is it possible to avoid breathing particles of lead when you are rubbing down with sandpaper?—No; unless there is some invention for protecting the mouth and nostrils.

20,767. How could that be done?—They could have muslin, gauze, or something of the sort put over the mouth and nose.

20,768. Do you think that if such an apparatus was supplied it would be possible to get the men to wear it?—Some men would; I do not say they all would unless you made it compulsory.

20,769. But if it were made compulsory, how would you compel the men?—The chargineman would have to be responsible to the employer to see that it was carried out.

20,770. If it was not carried out, what could happen?—I do not know what the result would be.

20,771. You speak of the chargineman. On a piece of work which is being carried out in a private house, the chargineman is not always present, is he?—He must always be on the job.

20,772. But sometimes from one's own acquaintance with painting, certainly in the South, where the piece of work is, to use a colloquial expression, kept warm by a single man only, perhaps four or five men start the first day and look as if they were going to do the work fast, and they all disappear, and one man only comes. There is no chargineman on the spot at all?—He will be the chargineman himself.

20,773. How is he going to compel himself? In these cases you could not bring any influence to bear on the man?—No.

20,774. And that is not an unusual condition, is it?—It is very frequent at this time of the year.

20,775. Have you ever seen a respirator which you would regard as comfortable, and which you would have been pleased to wear yourself?—No, I never did.

20,776. How long do you do dry rubbing down for? What is the percentage of the whole work which is dry-rubbed down?—It depends on the quality of the job. Some jobs are never rubbed down at all.

20,777. But take the average piece of work?—I could not give any stated time. Sometimes it is about half the time of putting on the paint, and sometimes more.

20,778. (Mr. Gardner.) And other times just a few minutes?—Yes.

20,779. (Dr. Collis.) Do you think it possible to dispense with dry rubbing down?—It is a difficult question. It could not always be done away with.

20,780. It could not?—Owing to the way in which the work is done, it could not be done with water and felt, because it does not get time to stand long enough. It has to stand a few days before you start using felt and pumice.

20,781. How long?—When in a hurry you can give it a scuff with sandpaper and go on.

20,782. (Mr. Sutherland.) A scuff with sandpaper does not do it any harm, does it?—It does not break very far into the skin.

20,783. (Dr. Collis.) Do you think that that gives off dust?—Yes, especially if it is sharp colour flat.

20,784. Rubbing down with pumice stone and water is not so much used now, is it, as dry sandpapering work?—It is almost all sandpapering.

20,785. Does there appear to be any tendency to introduce pumice stone and water?—No; it is a thing of the past.

20,786. It is going out rather than coming in?—Yes.

20,787. Do you consider that the wet process is suitable for rubbing down old paint?—That is preparation work. You use hard pumice and water. But between the coats of paint you use sandpaper, and that is where the dust comes from. Very seldom, in preparing a job thoroughly, do they use sandpaper. It is after it gets a coat of paint on that you start sandpapering.

20,788. Not till after you put on a first coat?—No.

20,789. (Mr. Gardner.) Cheap work you sometimes rub down with sandpaper before painting, as a preparation?—If it comes so cheap as that, you do not do anything at all.

20,790. (Dr. Collis.) The wet process of hard pumice and water is used, is it not, for rubbing down old paint?—Yes.

20,791. Why can it be used for that purpose?—To cut the surface, because the old paint is hard; sometimes it is enamelled and varnished, as the case might be.

20,792. In your opinion the wet process cannot be applied to new paint-work between successive coats of paint?—It does not get the chance, unless there are many days between each coat.

20,793. How many days would you have to let the paint stand?—A week at the very least.

20,794. In Scotland do you usually apply three coats of paint?—Yes.

20,795. That is a matter of three weeks, then?—Yes, between coats.

20,796. That is prohibitive from the length of time?—Yes.

20,797. Does the rubbing down of the successive coats of new paint cause much dust in the air?—Yes, especially when it is a sharp colour flat.

20,798. Is a quantity of dust visible on surrounding objects?—Yes; you can see it on a polished table in the middle of a floor.

20,799. (Mr. Sutherland.) You cover those with the dust sheets?—I mean, if there is a little polished table you can see the dust on it.

20,800. (Mr. Gardner.) Can you see it on the floor?—If it was heavy sandpapering you would see it lying on the floor at the margin underneath wherever you were working.

20,801. (Dr. Collis.) Do you hold that in the case of new paint work this dusty process cannot be generally replaced by a wet process?—Yes.

20,802. Would you be prepared to adhere to that answer even if you knew that several witnesses had stated that dry rubbing down could be dispensed with entirely?—They must give the time stated between.

20,803. How is the filling made which is used in preparing rough work for painting?—The usual thing

5 June 1912.]

Mr. DAVID McKILLOP.

[Continued.]

is to use a dry powder. Alabastine is most commonly used now.

20,804. That is plaster-of-Paris, practically?—Yes.

20,805. You use that for filling?—Yes.

20,806. How is this filling applied?—It is made into a paste with water, and applied with a knife, and sometimes put on with a brush and sandpapered off.

20,807. Is there any danger connected with the use of this filling?—I do not think there is any with that.

20,808. Have you noticed much splashing when ceilings with moulded or raised designs are being painted?—Yes. It depends on the man and the brush he is using.

20,809. Is there any fine spray generated?—Yes, especially with rubbing down cornice and ornamental work. You cannot see it at first, but you feel it on your hands, and afterwards you will see it.

20,810. Can you suggest any way of removing the risk attendant on such splashing?—No.

20,811. Do you consider that stippling gives rise to similar dangers?—Yes, quite the same.

20,812. Could a man possibly wear a respirator when he was doing such work?—I think so, unless it was too warm for him.

20,813. It might get too warm for him?—It might get too warm for him.

20,814. We have been told by witnesses that it would be impossible to apply exhaust fans to remove the dust or the spray. Do you agree with this?—Yes, I think it is impossible.

20,815. Do you consider that there is danger in connection with the burning off of paint?—No, I think there is not.

20,816. Have you anything to say as to turpentine substitutes?—The smell is the worst. It will give you a headache, perhaps, and sore eyes, if closely confined.

20,817. (Mr. Sutherland.) That is turpentine substitutes?—Yes. Turpentine affects you too, but you soon get rid of it, I think. The others seem to hang about you much longer.

20,818. That is with the substitutes?—Yes.

20,819. (Dr. Collis.) How and where are the colours usually mixed?—We get them in a pulp. We do not know much about the manufacture.

20,820. Then what do you do?—They are beaten up with turps, and so on.

20,821. Where?—In a pot.

20,822. But where?—In the shop or on the job. There is no fixed rule. If it is a big job, it is done on the job. Some firms supply the lead made up ready as paint; others send the lead, oil, and turps to be made up into paint.

20,823. Do you ever get any of the materials dry?—No.

20,824. So that you do not think there is much danger of dust being inhaled at this operation?—No.

20,825. Can you name any other processes in which there is great danger of the painter inhaling dust or fumes?—No, I cannot think of any just now.

20,826. Have you any experience of painting with paints which do not contain lead?—Very little. There was a substitute in a shop a few years ago called Laroline.

20,827. Did you notice any difference in the use of that preparation?—The more thinners you put into it, the thicker it got; that is the fact. It seemed to curdle the more thinners you put into it. Whether it was a substitute for turps, or not, I do not know, but it did not agree with the thinner that was in the shop at the time.

20,828. Have you applied zinc paints?—Dry.

20,829. What do you mean by dry?—Made up into size colours and used as water paints.

20,830. (Mr. Sutherland.) As zinc distemper?—Yes.

20,831. (Dr. Collis.) You have not used zinc paints with oil?—Not in oil.

20,832. There are, no doubt, many processes in which the painter cannot avoid getting his hands soiled with the paint or stopping material?—He does not require to handle the stopper. He has putty boards for the white-lead putty.

20,833. Will it not get on to his knife?—Yes, but not on his hands.

20,834. Will the handle of the knife always be quite clean?—Yes.

20,835. When he is painting, is there any probability of his getting his hands soiled with paint?—Yes, every probability, especially in painting cornices or ornamental work.

20,836. Do you think that the provision and use of washing conveniences is important?—Yes, very important.

20,837. Do you consider that time should be allowed for washing before each meal and before leaving work?—Yes.

20,838. And that there should be a proper supply of soap, towels, nail brushes, and clean water?—Yes, there ought to be.

20,839. Including hot water?—No.

20,840. But do you not think that there should be hot water?—I do not believe in the hot water.

20,841. You do not believe in it?—No.

20,842. Do you find that you can wash equally well in cold?—It is my belief that hot water opens the pores of the skin, and it is dangerous because of that.

20,843. But which can you keep your hands clean with the easier?—By rubbing with oil before you use water and soap.

20,844. What oil do you mean—turpentine?—Linseed oil.

20,845. Is that always available?—It should be on all jobs where there is paint.

20,846. But frequently paint is sent out ready mixed?—You have the thinners—oil and turpentine.

20,847. Is it always practicable to have a supply of soap, towels, nail brushes, and water?—Sometimes you cannot get water, but you should be able to.

20,848. How is it you cannot get it sometimes?—It may be a new house, where there is no water.

20,849. Is that fairly frequent?—Yes, tenement work and new property.

20,850. (Mr. Sutherland.) No water at all?—Yes, on new property before the water is laid on.

20,851. (Dr. Collis.) Then you cannot get water at all?—Not unless you go a distance for it. It is not on the premises.

20,852. When it is on the premises can you always get soap, towels, and nail brushes?—No.

20,853. How is that?—Sometimes the work is in a house where you are confined to the one room. Some people restrict you to going to that room and doing your work and going out again. You are not allowed to travel through the house.

20,854. You cannot always get water even there?—No, unless it is for washing the woodwork—preparing—and you cannot do without it. You are allowed to go to the kitchen then sometimes.

20,855. You cannot get it for washing purposes?—Some people are very strict. You are confined to that room. You must not go travelling about the house. You may have the water, but not the soap.

20,856. Do you take soap and towels and nail brushes with you to the work?—No, not at present.

20,857. Is not that the custom in Scotland?—No.

20,858. Do painters usually wear overalls whilst at work?—Yes.

20,859. What do these overalls consist of?—A jacket and an apron, and some wear overall trousers. The general thing in Edinburgh is a jacket and apron.

20,860. How often are the overalls washed?—The general rule is every fortnight. Some do it every week, but it is every fortnight mostly.

20,861. Where do you keep the overalls?—Generally in the paint shop, or wherever we can. If we are only working in one room, they must lie in the same place, but in a big job a small room will be set aside as a paint shop, and the overalls will hang there usually.

20,862. When you are going to a new place to work, what do you do with your overalls on leaving the piece of work you have been doing? You take them with you, I suppose?—When you leave one job to go to another you take them with you.

T t 2

5 June 1912.]

Mr. DAVID McKILLOP.

[Continued.]

- 20,863. How do you take them?—Roll them up in paper or put them in a bag. Most of the men have small bags.
- 20,864. How do you take your meals to the work?—In various ways. As I said before, you are sometimes confined to one room.
- 20,865. What do you carry your food in?—In paper, usually in the pocket.
- 20,866. Do you put it in the bag?—No.
- 20,867. Where are the overalls washed?—Generally at the usual washtub at home.
- 20,868. Are they ever washed in anything else besides the washtub?—I do not know of anything else.
- 20,869. Who does the washing; the wife, I suppose?—Yes, the wife in the case of a married man, and perhaps the washerwoman in the case of a single man—or a laundry woman.
- 20,870. (Mr. Gardner.) Where are they boiled?—In the usual washing pot.
- 20,871. (Dr. Collis.) Do they never boil them in the kyle pot?—No. Most people have a washing pot, and a kyle pot separate.
- 20,872. (Mr. Gardner.) In all cases?—It should be so.
- 20,873. (Mr. Sutherland.) All decent cases?—Yes.
- 20,874. (Dr. Collis.) Have you ever known the kyle pot used?—No, I cannot say that I have.
- 20,875. Is there any danger of dust arising from a dry overall that has been worn on the previous day?—Yes.
- 20,876. Would you advocate a periodical medical examination by a doctor, with power to suspend those whom he found to be affected by lead?—Yes. I believe that all apprentices ought to be examined before they become indentured; that is, before they go into the trade.
- 20,877. It would be more frequent than that. It would be continued during the work: every month, say, a man would have to be examined by a doctor to see if he was affected by lead?—I do not know what the results may be.
- 20,877a. If they got compensation when they were suspended, would you welcome it any more?—I would not object to being examined, but I do not know how other men might take it.
- 20,878. Do you know of much compensation for lead poisoning being claimed under the Workmen's Compensation Act?—No, not any further than I have said.
- 20,879. Have you known men to be affected with other diseases intensified by the fact of lead in their system, even if they could not actually claim to be affected by lead poisoning, which diseases might be thought by the doctor to have originated with lead poisoning?—The one that suffered from nephritis is one case.
- 20,880. Do any others occur to you?—Not at the moment.
- 20,881. To sum up, then, do you consider that it is impossible to stamp out the evil of lead poisoning in your trade without replacing the lead by some non-poisonous substance?—That is the only way to stamp it out. I do not want to abolish the use of lead myself. I do not like the idea of other things; zincs, for instance.
- 20,882. Why do not you like them?—Experience shows that these substitutes are not good.
- 20,883. You have only had one very short experience of something which is very little known?—Without lead they do not stand so long.
- 20,884. That would not matter to you, would it?—It would make more work, you think?
- 20,885. (Mr. Sutherland.) Perhaps less?—I am not accustomed to the use of these other things.
- 20,886. (Dr. Collis.) You have no practical experience of them?—No.
- 20,887. But apart from that natural prejudice against being called upon to use something which you have never used before; do you see any other way of stamping out the evil of lead poisoning?—No.
- 20,888. (Mr. Gardner.) You spoke about respirators—that the only way of keeping dust away was by the use of respirators. Have you ever known men wear respirators?—No.
- 20,889. You have never known them in your trade?—No.
- 20,890. Do you think that the men would take kindly to them at all?—It depends on how the men take it themselves. It was only an idea.
- 20,891. You know that a respirator has been used for keeping people from breathing dust, but you have no experience of using them?—No.
- 20,892. Do firms in Edinburgh use white-lead filling for filling up?—Not now; they have done in the past.
- 20,893. But have they all given it up for the use of alabastine?—Yes, they have all given it up for the use of alabastine. There may be cases now and again, but very few.
- 20,894. You do not like hot water for washing purposes?—No.
- 20,895. Why? Do you think that you can absorb paint through the skin?—Yes, I think so.
- 20,896. You have a definite opinion that you can absorb paint through the skin?—Hot water makes it liable to get through the skin.
- 20,897. But, quite apart from hot water, you think it possible that paint can be absorbed through the pores of the skin? Your objection to hot water is that you think it open the pores and drives it in?—Yes.
- 20,898. You do not like turpentine substitutes, because they are more volatile?—I object to substitutes.
- 20,899. But although they are more volatile, would that tend to lead poisoning?—I could not say whether it would tend to it or not.
- 20,900. It is a case to a certain extent of prejudice?—That is all. The smell is most objectionable, and some of these substitutes alter the colour.
- 20,901. The same thing applies to your prejudice with regard to zinc?—Yes.
- 20,902. The ordinary painter's prejudice?—Yes, I have never used it.
- 20,903. He has never used it, and he has never made any attempt to use it?—He has never had the opportunity.
- 20,904. The painter in the past has never tried to find an effective substitute for white lead. Both the operative and the master. The operative has not much chance. The employer has more. Do many shops provide washing facilities on the jobs now?—No. It depends on the men on the job themselves, and the circumstances of the house in which they are working.
- 20,905. The employer makes no provision?—No, the employer makes no provision.
- 20,906. With regard to working at a small house, you could never get your overalls and your clothes hung up anywhere else than in the paint shop?—They must just be in the room in which you are working. In an empty house, for instance, you may take the lavatory or elsewhere.
- 20,907. You never carry your food in your bass?—No.
- 20,908. Do you know men who do that?—I have seen it sometimes.
- 20,909. The first time they go to a job, when they take the bag with them?—No. They would put a piece in during the day.
- 20,910. The food is kept in the bag now and again, if not always. With regard to inspection, do you think if white lead was allowed to be retained in use that the trade is a trade which could be subject to inspection?—You would have to get every man to a certain place, say in the shop.
- 20,911. I am not dealing with medical inspection just now; but if white lead were to be allowed and regulations were made for the use of that poisonous substance, there would have to be some system of inspection to see that the regulations were carried out. Do you think that the trade is a trade which would lend itself to that inspection?—No.
- 20,912. It could not, you think?—I do not think so. You would have to have an inspector for every job.

5 June 1912.]

Mr. DAVID MCKILLIP.

[Continued

20,913. (Mr. Parsonage.) You do not see any danger in burning off?—No.

20,914. You do not think that there is any danger from the fumes?—I do not think it. It depends on what they use for burning off.

20,915. I mean ordinary burning off with a spirit lamp?—I do not think that there is any danger with a spirit lamp.

20,916. Is there no danger when you have to rub it down after you have burnt off?—No.

20,917. You rub down the old stuff to smooth it down?—Yes.

20,918. Do you think that there is no danger in the stuff that comes off then?—No; it is wet.

20,919. Not always?—Yes. In most cases you polish it down with pumice stone and water.

20,920. Even then you get the stuff into the water?—Yes.

20,921. You get it on your hands; it gets on the floor, and it dries. Do you think that there is no danger in that?—Well, I have never thought that there was any danger in that.

20,922. What are the usual hours of work in Edinburgh?—The general hours are from 6 in the morning to 5 at night during the summer, with an hour off for breakfast and an hour for dinner.

20,923. Divided into three periods of three hours each?—Yes.

20,924. Do you work three hours before breakfast?—Yes. Some shops only work 2½ hours before breakfast; some firms start at 6, have 1½ hours for breakfast and half hour for dinner.

20,925. (Mr. Sutherland.) Where is that?—Dobie's; that is the only shop, to my knowledge.

20,926. (Mr. Parsonage.) That is breakfast, not dinner. Why do they allow 1½ hours?—For men who come from a distance.

20,927. Sometimes men take food with them for the week in Scotland, when they are going away for a week?—Yes, I have heard of it.

20,928. How do they carry it; they cannot carry it in their pockets?—In hampers; but I have never experienced that.

20,929. (Mr. Parsonage.) You have not had experience of zinc white, or any of the substitutes for lead that are on the market at the present time?—None, except Lumlino.

20,930. I have never heard of the material which you mention. You could not say from practical knowledge that there is no substitute that can take the place of lead?—No.

20,931. You have only used lead and nothing else?—Yes.

20,932. (Mr. Sutherland.) Was Hugh Blyth certified as suffering from lead poisoning?—No, general paralysis.

20,933. Was that brought on by lead poisoning?—Mrs. Blyth said that the doctor at the Bangour Asylum informed her that Mr. Blyth had lead in his system.

20,934. It was not certified as such?—No.

20,935. When did he break down and have to go to the asylum?—He had about 26 weeks' sick benefit a twelve-month before he went into the asylum.

20,936. What year?—It would be 1907 or 1908; I am not quite sure. He was in the asylum for close on a twelve-month.

20,937. And he died when?—In 1909.

20,938. (Mr. Gardner.) What was his age?—About 50.

20,939. (Mr. Sutherland.) He really would come within the scope of the Act of 1907?—Yes, but he was not certified.

20,940. So there was every ground for them to make a claim for lead poisoning upon if they had thought that they could have succeeded?—They did not know at that time. He was not being treated for lead poisoning.

20,941. But does not your society take an interest in its members in that way?—Yes; but then, if the medical certificate does not state anything about lead and there are no signs of lead, we do not take any action.

20,942. But the doctor at the asylum told the wife that it was lead poisoning?—But we only deal with the certificate.

20,943. Are you the secretary for the Edinburgh Society?—Yes.

20,944. It would come through you?—Yes.

20,945. Do you not inquire if a case is a case of lead poisoning?—We did not trouble.

20,946. Do you pay the benefit without making inquiry?—We get a medical certificate, and have to pay the benefit under the rule.

20,947. We may take it that this was not lead poisoning?—You may take that, if you like; but the doctor told Mrs. Blyth that there was lead in his system, but he would not certify it on the death certificate.

20,948. That the death was due to lead poisoning?—He would not certify that.

20,949. If general paralysis had been brought about by lead poisoning, he would have had a substantial claim against the insurance company?—That was not stated in the certificate.

20,950. The doctor could not certify that?—He would not state it.

20,951. He would have stated it if he had felt justified in doing so, would he not?—He only remarked to Mrs. Blyth that there was lead in his system.

20,952. We may take it that that was not a case of lead poisoning?—He had suffered from lead a number of years previously before I was acquainted with him in any way.

20,953. We have had Mr. Dobie here, and he disclaimed any knowledge of lead poisoning?—There is one in his shop at the present time who treats himself occasionally with sulphuric acid because of the lead.

20,954. Are you in Mr. Thomson's employ?—Yes.

20,955. Did not this shopman of whom you spoke get compensation for lead poisoning last year?—No.

20,956. Why?—He never claimed it, I think.

20,957. You are not as keen on claims in Scotland?—But the shopman is not a painter; he is only a labourer; he has nothing to do with our society.

20,958. It does not matter?—We do not recognise them.

20,959. But the shopman has a claim. The law does not discriminate between a man being a labourer or not?—But we do not recognise him.

20,960. Why do you think that men refrain from claiming compensation? The insurance companies, you say, press the employers. Have you ever known of your own knowledge any insurance company pressing employers not to take on a man in such a case?—You cannot get it definitely proved.

20,961. It is only an idea of yours; it is not a fact?—A lot of men do not know that they are entitled to compensation for lead poisoning.

20,962. Then they have not so much intelligence in Scotland as we have been giving them credit for. We have been looking upon the Scotch working painter as the model of all that is sound in his trade, and everything, and now you come and tell us that they do not know that they can claim?—They have been a while with an employer and do not want to be removed.

20,963. Really, I cannot take seriously what you say. It is only hearsay evidence of your own, is it not?—Only just general conversation.

20,964. Your members get sick pay when off work?—Yes.

20,965. Is the cause of the sickness generally stated?—Yes, it must always be.

20,966. Have you had any claims under the head of lead sickness?—James Watson was lead-poisoned.

20,967. Did he make any claim?—I do not mean on your society, but on his employer?—For compensation?

20,968. Yes?—Yes; he had eight weeks' compensation.

20,969. In any case, if there was lead poisoning it would be reported in your returns for sick payment, would it not?—Yes.

5 June 1912.]

Mr. DAVID McKILLOP.

[Continued.]

- 20,970. Is James Watson the only man that you know as suffering from lead poisoning?—The only man to my knowledge during my time.
- 20,971. For what period have you been secretary?—Ten years.
- 20,972. Is that the only one case in ten years?—Yes. The other cases were not members of the society.
- 20,973. In your society, 549 or 550, you have only had one case of lead poisoning in ten years?—They have not always all been in the society.
- 20,974. (Mr. Gardner.) Only a section of these men get sick benefit. They do not all get sick benefit?—No.
- 20,975. (Mr. Sutherland.) Still, you have only had one case before you in ten years?—Yes.
- 20,976. With regard to dry rubbing down, there is a tremendous lot of work that is quite innocent of dry rubbing down, is there not?—You do not do dry rubbing down in cheap work?—No.
- 20,977. And in moderate work you do not do much of it?—It depends on the quality of the job.
- 20,978. But in moderate work?—You sandpaper up to the level of the eye. In good work you are more particular.
- 20,979. Do they do that in Scotland?—I thought that they only did that in England?—In some places.
- 20,980. It is only in really good work that there is what you would call a lot of sandpapering?—A good class of work has good sandpapering applied to it.
- 20,981. I understand that you fill up with alabastine?—The most popular way of filling up is with alabastine.
- 20,982. And that is not lead?—No.
- 20,983. If you got a mouthful of that it would not poison you with lead?—No. You could spit it out easily.
- 20,984. Do you rub that down with sandpaper?—Yes.
- 20,985. And then what do you do—coat it?—Prime it and just paint it.
- 20,986. Coat it?—Yes.
- 20,987. What do you do after that?—Paint it with three or four coats till you stop the suction.
- 20,988. With regard to the coats on the top of alabastine, you do not cut down the first coat much, do you?—Not much.
- 20,989. The first coat is to stop the suction?—Yes.
- 20,990. The second coat would not have a great deal of rubbing down, would it?—No; you cannot rub very much.
- 20,991. You rub the alabastine down smooth, and the subsequent rubbing down is to take the fine nibs off the paint?—Yes.
- 20,992. And the better the quality of the painting, the less rubbing down of that kind you have to do?—Yes.
- 20,993. When you speak of sharp colour, what do you mean by that?—Flat colour.
- 20,994. Yes, but at what stage does that come—just before you enamel, or is it only a filler up?—Some firms believe in sharp colours.
- 20,995. For filling?—No, for painting purposes.
- 20,996. (Mr. Gardner.) For bringing up?—Yes. They have sharp colours as a preventive of blistering. There is very little oil in it.
- 20,997. (Mr. Sutherland.) I am speaking of inside work now?—Yes, for inside work.
- 20,998. It is not every firm that uses sharp colour, is it?—No.
- 20,999. Most of the Scottish masters who have come here—I do not know whether it is your experience—have said that they use a great deal more oil and less turpentine in their paint?—For bringing up purposes?
- 21,000. Generally—more than we do in England. Is that confirmed by your experience?—I have never had any experience in England; but most firms believe in oil for the first coat, and sharper colour for the next coat. Some firms use very little oil. Every coat is sharp colour.
- 21,001. But they do not cut down every coat?—Yes.
- 21,002. There comes a time when the coat is practically the finish, before you varnish?—You use sandpaper.
- 21,003. You would spoil your surface with sandpaper?—You make a surface for enamel or varnish.
- 21,004. You said it would take three weeks to get three coats of paint on and rub down by the wet process?—Yes.
- 21,005. Suppose you put a coat on to-day, would it take a week before you could touch it with the wet process?—It would require that, I fancy, to do it justice.
- 21,006. If you did it well with the wet process, ground pumice and felt and water, you would not want to cut down much after that, would you?—Between each coat?
- 21,007. If you really made the first coat the basis with good rubbing down, you would not want to cut down very much after that?—No.
- 21,008. So that at the end of the week you could put another coat on, and that could be very lightly done in two or three days with water?—You cannot rub it down and paint it at the same time.
- 21,009. But you do not want to rub it down much when you have rubbed the first coat down well?—You have to do the same again. The brush marks are there—the reeds.
- 21,010. It should not be so with proper painting?—It may be rougher in some places than in others. It depends on the work.
- 21,011. Taking your own time, a fortnight would do, allowing an interval between the first and the second, and finishing the third?—Yes.
- 21,012. So that that takes off 33 per cent. of your time?—But if you started rubbing down on a Saturday, you could not paint it the same day.
- 21,013. Yes, you could. For ceiling work the old flattening is being superseded by Duresco and water paints?—Yes.
- 21,014. There is not as much flattening as there was 12 years ago for ceiling work?—Water paints are taking its place.
- 21,015. There is no dust from mixing paint?—No.
- 21,016. And there is no dust in what is called the paint shop, if it is outside the room where you are working—no lead dust?—No.
- 21,017. You do not think that the Scotch housewife boils her clothes in the pan she makes the family soup in?—No.
- 21,018. If that is stated, it is a libel on Scots-women?—Yes.
- 21,019. You say that water is not always available, but you always get water for your distemper work on a job; you are bound to, are you not?—You have to go for it.
- 21,020. But if it is available for one thing, it is available for the other, is it not?—For washing hands, do you mean?
- 21,021. Yes. If you can get it for your distemper, you can get it also for your washing?—Suppose you do not use distemper?
- 21,022. There are not many houses you go in where you use all paint?—No.
- 21,023. There are very few jobs where there is not some distemping done?—That is true.
- 21,024. So if you can get the water for distemper, you can get it also for washing?—Yes.
- 21,025. Do not the masters supply towels?—No.
- 21,026. But there is usually soap sent on a job?—Not always.
- 21,027. Do you speak for other shops besides your own, or only for your own?—Just what I have been in.
- 21,028. Shops you have been in in Edinburgh?—I have been for 14 years in the present shop. I have been with Messrs. Dobie and Messrs. Hall and Moxon.
- 21,029. Do not Messrs. Hall and Moxon and Messrs. Dobie supply soap on a job?—I do not think there is always soap. There may be soap if it is a washing job.
- 21,030. (Mr. Parsonage.) Soap is not sent out specially for painters to wash their hands?—No.

5 June 1912.]

Mr. DAVID MCKILLOP.

[Continued.]

21,031. (*Mr. Sutherland.*) I did not say that it was sent out specially for painters to wash their hands, but there is soap on most jobs for stipplers, for washing brushes?—There ought to be.

21,032. And there is, as a rule, is there not?—If it is a day job there will not be any soap, because it is returned to the shop.

21,033. You do not think it a hardship on the men that they should provide their own overalls, do you?—No, they are used to doing that.

21,034. They do it without any grumbling?—Yes.

21,035. They do not regard it as a hardship to keep them clean, do they?—No.

21,036. So that in any regulations that are passed, it would not be cruel to the men to ask them to do

what they have done from time immemorial, would it?—No.

21,037. (*Mr. Parsonage.*) Do you say that there is no lead dust in the paint shop?—I am not aware of it.

21,038. Does the man at the bench never scrape out his pots when he is going to put colour in, occasionally?—That is done away from the paint shop.

21,039. Sometimes he scrapes a pot. I do not mean burns it out, but just scrapes it round when he wants to put colour in?—Even then there is no dust. It would be a skin that he would scrape off.

21,040. The dust comes from that. It is not always a skin that comes off when you scrape a kettle. There is not sufficient on to be a skin. In sweeping up the paint shop I do not see how you can avoid lead dust.

The witness withdrew.

Mr. ARTHUR SMITH (Aberdeen) examined.

21,041. (*Dr. Collis.*) What practical experience have you had in connection with the house-painting trade?—I have had 18 years' practical experience now as a house-painter.

21,042. Are you connected with the Aberdeen branch of the Scottish Painters' Society?—Yes; I am an official of that branch.

21,043. What is your official position?—In the meantime I am auditor.

21,044. How many members are there in your branch?—They average about 350.

21,045. Have you practical acquaintance with all branches of the painting trade?—Yes, every branch of the trade in Scotland, and especially in the north of Scotland. There is no speciality; it is general work, including all branches of the trade.

21,046. Have you yourself known cases of lead poisoning?—Yes; I have experienced the preliminary symptoms myself in the shape of colic.

21,047. Let us take them in order. I think you wish to mention six cases?—Six cases.

21,048. Will you give us details of the case of James Murray, senior?—James Murray, senior, is a very old man now, and it is several years, I believe, since he contracted lead poisoning. He was an inmate of the hospital in Aberdeen for some considerable time.

21,049. Was his illness attributed to lead poisoning?—His illness was attributed to lead poisoning.

21,050. Was it notified as such, and did he claim compensation for it?—No, I do not believe that he did claim compensation for it.

21,051. How about James Thomson?—James Thomson was in America, and while preparing some work which had been filled with a white-lead filler, he rather disagreed with the dust that he was inhaling, and the following day he felt rather badly. He immediately, or within a day or two, was taken badly and was confined to bed, and was very ill for a few days.

21,052. That sickness occurred in America?—That sickness occurred in America.

21,053. Is he now at home?—He is now in Aberdeen. He was only in America for 12 months.

21,054. Has he suffered at all while he has been in Aberdeen with lead symptoms?—Subsequently to that?

21,055. Or before?—Not subsequently, I understand; and up to that time he had never suffered from lead poisoning.

21,056. How about Lynas Peacock?—He is an Englishman working now in Aberdeen. He belongs to Hartlepool. He was working as a bench man. He was taking charge of the paint shop, mixing up the paints.

21,057. Dry, or paste?—I should think it would be paste. It is only on very rare occasions that it is mixed dry.

21,058. (*Mr. Sutherland.*) Was this when he was in Aberdeen?—This occurred in Hartlepool. He is in Aberdeen now.

21,059. (*Dr. Collis.*) Where was the paint mixed?—The shop wherein the paint was mixed had a corrugated

iron roof, which was very warm, owing to the sun striking on the roof, and the smell was very disagreeable. The doctor stated decidedly that it was a case of lead poisoning. The fact of the matter is that he has not yet recovered from it. He still feels the effect. At that time the doctor attributed the disease to inhalation of the fumes.

21,060. Is he one of the members of the Aberdeen branch?—He is one of the members of the Aberdeen branch.

21,061. Is he on your sick club?—No.

21,062. Did he make any claim for compensation?—The disease was contracted in Hartlepool, not in Aberdeen. I am not aware whether he made any claim for compensation.

21,063. You do not know whether the doctor gave a certificate saying that it was lead poisoning?—I am not aware of it.

21,064. With regard to James Smith, have you anything to say?—James Smith was in London. He suffered from Bright's disease. His doctor stated that it was due to the presence of lead. He attributed it to the dry polishing down which is so prevalent in London on many jobs, and the inhalation of the dust.

21,065. Did he make any claim at all for compensation for lead poisoning?—I am not aware that he made any claim.

21,066. How about John Tennant, senior?—John Tennant suffered from wrist drop a good number of years ago. The details of the case I got from his son. He suffered from wrist drop as the result of lead poisoning. He was ill for a number of months, in fact, from it.

21,067. Had he any other symptoms—pain, colic, or anything of the sort?—Yes, he was very ill for some time.

21,068. Was this before the Compensation Act came in?—Yes.

21,069. So that he would not be making any claim?—No, that was not a case of a claim.

21,070. Then, as regards yourself, what is your experience as to illness from lead poisoning?—I never experienced colic until I came to London.

21,071. (*Mr. Sutherland.*) Are you working in London now?—No; I only worked in London for two years.

21,072. How were you affected?—With spasmodic pains, and they occurred two or three times. I went to a medical man here, and he told me that it was lead colic, and he treated me. It never really went any further, although I had some slight symptoms of colic. When I left London it disappeared entirely. I have never suffered since from it.

21,073. Did you make any claim for compensation?—No, I never made any claim for compensation.

21,074. How long were you on the sick list?—It was only a matter of two or three days.

21,075. Did you have any constipation?—Yes.

21,076. Did you have difficulty in getting the bowels open?—Yes.

T t 4

5 June 1912.]

MR. ARTHUR SMITH,

[Continued.]

- 21,077. What measures did you have to take for that purpose?—I received some aperient from the doctor.
- 21,078. That was sufficient?—That was sufficient at the time. The doctor told me at the time that he was quite able to treat it then, but I ought not to let it go any further.
- 21,079. I notice in regard to these cases that you have mentioned that most of them appear to have contracted their illness while out of Scotland?—Yes, mostly.
- 21,080. Can you in any way account for that?—The one point which is striking, I think, is the fact that, in London especially, there is an immensity of white work which does not occur at all in Scotland.
- 21,081. There is not much white work in Scotland?—No. not a fraction of what there is in England, and London especially. And the work in London is done with sharp colour, whereas in Scotland it is done more with oil or varnish colour, the result being that in applying glass paper to the surface of London paint or London-painted work the dust is more easily detached than it is with the oil or varnish paint. In polishing down the surface, dust is more readily thrown off with the London colour than with the oil or varnish colour, which is more prevalent in the provinces, and in Scotland in particular.
- 21,082. Your experience from working in London and working in Aberdeen is that when working in London you are more exposed to dust than when carrying out work in Aberdeen?—Very much more. The preparatory work in London is very much more elaborate than it is in Scotland or even in the provinces of England.
- 21,083. Have you known men in Scotland complaining, perhaps, of colic and pain, even although they have not been off for any length of time from sickness or illness?—Yes, it is not at all uncommon.
- 21,084. Contracted in Scotland?—Contracted in Scotland.
- 21,085. Do you know Mr. Robert Miller, of Seton Place, Old Aberdeen, a coach-painter?—No, we have nothing to do with coach-painters in Aberdeen. They are entirely different. We deal with general house and ship work.
- 21,086. He is blind as a result of lead absorption?—I am not aware of the case. Was he a master-painter?
- 21,087. No, an ordinary painter. He lives in a cottage down there. I corresponded with him, and went to see him. Have you anything you wish to add?—There is one point with reference to the question of colic; when any of the painters experience these spasmodic pains, they resort, of course, to spirits, whisky or brandy, in very many cases. The spasmodic pains cease in a short time. They never go any further, because they consider that the cause is removed, and they never go in for any further treatment. They are absolutely in ignorance of the real cause.
- 21,088. In your opinion, is it possible to dispense with dry rubbing down?—Quite possible.
- 21,089. Could you do without it entirely?—Entirely without it.
- 21,090. Which is most commonly done to-day, dry rubbing down with sandpaper or wet rubbing down with pumice stone and water?—Dry rubbing down is more prevalent in London and the provinces of England by a very long way.
- 21,091. Have you worked in the provinces of England as well as London?—I have worked in Newcastle.
- 21,092. What percentage of the whole work is rubbed down dry on an average?—In Scotland I should say at least 90 per cent. was rubbed down dry.
- 21,093. To come to a job, how much time, while at work on that job, is occupied in rubbing down? That is what I want to know?—It is a rather a difficult question to answer, because many of the jobs are done almost entirely without any rubbing down at all, without any preparatory work.
- 21,094. But you dry-rub down between the coats, do you not?—With decent work; but much of the work does not receive polishing down between coats. I should say that on an ordinary job a matter of possibly 5 per cent of the time would be absorbed; I should not think it would be any more.
- 21,095. When you have been working in London and in the provinces, has that percentage been higher?—Very much higher.
- 21,096. How much would it rise to?—Nearer 50 per cent. It is very much more elaborate in London than it is in any other part that I know of.
- 21,097. The work is more elaborate?—More elaborate; the preparatory work especially.
- 21,098. Is that to produce a finer effect?—To produce a finer effect.
- 21,099. And it costs more?—Undoubtedly it costs more.
- 21,100. Is rubbing down with hard pumice stone and water suitable for rubbing down old paint?—It is entirely suitable.
- 21,101. Why is it suitable for old paint?—It produces a more level surface.
- 21,102. Is the old paint harder, and easier to rub down?—Yes.
- 21,103. That is the reason why it is suitable?—Yes, it cuts down better.
- 21,104. What would you say with regard to new paint?—It is too soft.
- 21,105. Can the wet process with hard pumice and water be applied to new paint-work?—Yes, provided the under surface is hardened. It depends entirely on the length of time that the work has stood. A matter of three or four days possibly would harden the under surface in most cases.
- 21,106. If you were rubbing down with pumice powder and a cloth and water, that would be more suitable, I presume, for new paint?—It would be more suitable because it would not disturb the under surface so much.
- 21,107. How long would it take a coat to harden after you had put on the first coat before you could rub down with the pumice powder and water?—It depends entirely on the nature of the material that is applied. If it is a flat colour, the surface will harden very much more rapidly than if it is oil colour.
- 21,108. How quickly would flat colour dry quite hard underneath?—In 24 hours.
- 21,109. So that you could rub down after that?—It would be quite ready for rubbing down after that.
- 21,110. And the other process?—The other process is determined by the amount of oil or driers incorporated in the material.
- 21,111. (Mr. Sutherland.) You are speaking of the wet process now?—I am speaking now of the distinction between the rapidity of the flat and the oil paint in regard to hardening.
- 21,112. (Dr. Collis.) Take a good piece of sharp work; what length of time would that take? What is the longest length of time with an oil coat before you could rub down with pumice powder and water?—If it is not thickly coated, but coated in a practical manner, a matter of four or five days would be quite sufficient.
- 21,113. Does this rubbing down of the successive coats of new paint, by the dry method, cause much dust in the air?—It causes a good deal of dust in most cases.
- 21,114. Is there a quantity of this dust visible on the surrounding objects?—It is mostly visible on the floor; but on a job where there is much dry rubbing down, the whole of the furniture in the room; if there be any, window ledges, mantelpieces and so on, usually show traces of the dust.
- 21,115. If you were dry rubbing down a door, would there be enough to leave the impress of your foot on the floor if you moved away?—Yes. If you left an article on the mantelpiece during the time the rubbing down was going on, and then removed the article, you would see traces of rubbing down all round.
- 21,116. Do you think that in the case of new paint-work this dusty process can be generally replaced by a wet process?—Yes, generally it can.
- 21,117. If you wait for the coat to set?—Four or five days at the outside is all that is necessary, even for oil paint, before the wet process is used.

5 June 1912.]

Mr. ARTHUR SMITH.

[Continued.]

21,118. If you were using the wet process on an oil paint, would you put on three coats of paint altogether?—That must be determined by the state of the woodwork or the wall where it is applied.

21,119. What is usual—two or three coats?—On an old wall, if the wall is broken or dirty, it is necessary to give at least two coats. If the wall is in very good condition, one coat is sometimes sufficient.

21,120. Have you ever had to give three?—If it was very bad, three would be necessary.

21,121. If you are giving it one coat, is any rubbing down necessary at all?—It certainly would be slightly necessary. It depends a great deal on the condition of the wall.

21,122. But if you are going to put on one coat, and finish with that one coat, the condition of the wall must be pretty good?—Yes, quite so.

21,123. Would you have to do much rubbing down?—Much rubbing down would not be required on a one-coat job.

21,124. You do not rub down unless you are going to put another coat on?—No.

21,125. (Mr. Gardner.) You would prepare the wall by rubbing down with pumice stone and water before putting on the coat?—Yes.

21,126. (Dr. Collis.) For single-coat work dry rubbing down could be dispensed with?—Yes.

21,127. For two-coat work you have to dry-rub down the first coat at present?—Yes, between the coats at present you would dry-rub down.

21,128. If you put the paint on to-day, and you were going to dry-rub down the coat, how soon could you dry-rub down?—If it was an oil colour it would dry-rub down in two days without disturbing the under surface at all.

21,129. If you had to wait and do it by the wet rubbing process you would have to give four or five days?—Not necessarily four or five; three days would do. It depends almost entirely on the application of the material.

21,130. But how much extra time on a certain definite job would be required if dry rubbing down was abolished?—I should say that three-days would be sufficient for rubbing down by the wet process.

21,131. You would require to wait three days till it was dry?—Two or three days. The shortest time with the dry process would be one day.

21,132. But take the same piece of work. You have said that in some cases it would take four or five days for the oil paint to dry?—Yes.

21,133. In such a case as that how soon would it be sufficiently dry or hard for you to dry-rub down? Would it be as long?—It would be quite ready to rub down dry on the second day.

21,134. But with wet rubbing down four to five days?—Four to five days would be a reasonable time.

21,135. Now take a piece of work which you could dry-rub down the next day. There are some pieces like that?—Yes.

21,136. How soon would the paint be sufficiently set for you to wet-rub down?—Possibly two days longer.

21,137. That is three days?—Yes.

21,138. So that if you are applying two coats of paint, it would take two days longer to finish your work, because the last coat is not rubbed down?—Not necessarily. It may be rubbed down between coats.

21,139. Take two coats; you dry-rub down coat No. 1 and you put on the last coat, and you do not rub that down?—No.

21,140. The wet process has taken you two days longer?—Yes.

21,141. Now let us take three coats. You put on a coat, and then you wait two days extra before putting on a second coat. Is that right?—Yes.

21,142. Would you have to wait an extra two days before you could put on your third coat?—I should say that a matter of two days further would allow it to be rubbed down.

21,143. If you are putting on three coats of paint, one, two, and three, it would be four days longer before you could finish your work?—A matter of three or four days longer.

21,144. Putting on one coat, no extra time; two coats, two days; three coats, four days?—Yes.

21,145. Roughly, that is right?—Yes, roughly.

21,146. How is the filling made which is used in preparing rough work for painting?—Generally white-lead filling is mixed by the painter with japanners' gold size, varnish, and turpentine.

21,147. Do you ever use any filling which is not made of white lead?—The other fillings that are used, as far as I am aware from personal experience, are distempers, which are coming into use now in the north of Scotland.

21,148. Do you ever use alabastine?—Yes.

21,149. Have you ever used any other fillings of that character which do not contain white lead?—Hall's distemper.

21,150. As a filling?—Yes.

21,151. How is the filling applied?—With the brush or knife, according to the depth of filling required.

21,152. Do you ever rub down the surface?—Yes.

21,153. Dry or wet?—Necessarily dry.

21,154. It must be dry?—It must be dry.

21,155. Does that process give off dust?—It creates a great amount of dust.

21,156. Could you get rid entirely of white lead for filling?—Yes. I think there is no doubt but what a substitute can be found for white-lead filling.

21,157. What is your experience, for instance, of alabastine? Is it as good a filling as the white lead filling?—As a filling it seems to be quite as good.

21,158. Have you noticed much splashing when ceilings with moulded or raised designs are being painted?—It is inevitable; there must be splashing.

21,159. Do you use lead paint much for that purpose in Scotland?—Yes. It is certainly being replaced with washable distempers now.

21,160. You use it still?—Yes.

21,161. Which is used more? In the north of Scotland embossed relief ceilings are first painted with white lead, and then finished with Duresco or Hall's distemper.

21,162. (Mr. Sutherland.) Painted with a coat of oil paint first?—Yes.

21,163. Not much lead. It is thin just to make a surface?—Yes.

21,164. (Dr. Collis.) But it is lead paint?—It is lead paint.

21,165. There is splashing?—That is inevitable from the nature of the colour itself.

21,166. Can you suggest any way of removing the risk attendant on such splashing?—It is really impossible to remove the risk of splashing.

21,167. Do you consider that stippling gives rise to a similar danger?—It must do. The very nature of the material itself causes spots of paint to be thrown off.

21,168. Could a man possibly wear a respirator in doing such work?—I do not think it at all practicable. In any case there would be great difficulty in acclimatizing the men to wear them.

21,169. Witnesses have told us that it would be impossible to apply exhaust fans to remove dust and spray generated in the processes we have just mentioned. Do you agree with this?—I should certainly think it is impracticable.

21,170. Do you consider that there is danger in connection with the fumes generated in burning off paint?—Personally I do not think that there is very much danger in the fumes from burning off paint. I believe that the danger arises not from fumes, but from the dust that arises, after the burning off is completed, in polishing down the door.

21,171. How do you polish down the door after burning off the paint?—As a general rule pumice stone is used on the work which is burnt off.

21,172. The wet process?—The wet process.

21,173. Is there any dust from that?—Very little. There is practically no dust unless the debris is allowed to dry.

21,174. It falls on the floor and dries?—Yes.

21,175. And generates dust?—Yes.

5 June 1912.]

MR. ARTHUR SMITH.

[Continued.]

21,176. Have you anything to say with regard to turpentine substitutes for removing paint instead of burning off?—Not turpentine, but solvents.

21,177. What is your experience of solvents?—There are some very fine solvents in the market. There are two or three which I personally use, and they are superior in many cases to the burning off process.

21,178. Do they give off any disagreeable odours or smell or fumes?—Some of them do, but there is really nothing very disagreeable with the new solvents. They smell mostly of petrol.

21,179. Have you ever suffered yourself from headache or anything when using them?—No.

21,180. How and where are paints and colours generally mixed?—As a general rule, in the provinces in Scotland, they are mixed in the shop, and sent out to the job when in large quantities. Small quantities are mixed on the job.

21,181. Do you ever have to mix dry colour?—Red lead; never white lead dry.

21,182. White lead always comes as paste?—White lead always comes as paste.

21,183. To what extent do you use red lead?—Only to a very slight extent, in the case of priming ironwork, and it has to be mixed dry.

21,184. Is ironwork always treated with red lead paint?—Not always, but usually.

21,185. What do you use for putting on the ironwork besides red lead?—In many cases they do not coat the ironwork with lead preparation at all, but with some oxide.

21,186. Have you yourself painted any special ironwork with non-poisonous oxide?—Yes; on many occasions I have used oxide on the ironwork.

21,187. Is there much danger of dust being inhaled in mixing paints?—Not if the paint is in paste.

21,188. We have been over several processes. Can you name any other process in which you think that there is danger to the painter of inhaling dust or fumes?—I do not think so.

21,189. There are many processes apparently in which the painter cannot avoid getting his hands soiled with paint or stopping material. Is that so?—That is quite correct.

21,190. Do you think that the provision and use of washing conveniences is important?—It is most important.

21,191. Do you consider that time should be allowed for washing before each meal and before leaving work?—If it is to be done, time must necessarily be allowed.

21,192. Is it allowed to-day?—It is not, so far as I am aware.

21,193. In no place where you have worked, either in England or Scotland?—In no place, and as a general rule the men are afraid to take the time.

21,194. Why?—In case of victimisation. If one man suggested to the others that they ought to stop prior to the meal hour if they are working on dirty work, there is the danger that his employer might turn him out. That is the feeling amongst some of the men.

21,195. Should there be a proper supply of soap, nail brushes, and clean water?—Yes, I should say so.

21,196. Are soap, towels, and nail brushes supplied to-day?—Not so far as I am aware.

21,197. Not at any of the shops at which you have worked?—At none of the shops at which I have worked other than the shop I am at present engaged in. That is merely for the warehouse staff.

21,198. Do you think that hot water is necessary?—It is certainly better. Paint can be removed very much more easily with hot water than with cold.

21,199. Is it always practicable to obtain hot water on the premises?—It is very difficult sometimes to get either hot or cold water in some new houses, where the buildings are isolated.

21,200. But you require water, do you not, in certain of the processes, for instance, if you are using water paint?—Yes.

21,201. How do you manage to get it?—There is some difficulty in getting it. It must be got.

21,202. But if you have to get it for water paint, you get it?—Yes, but with difficulty.

21,203. When it comes to the question of washing, which is not necessary to the process, it is a bother to get it, and so you do not get it. Is that what you mean?—Yes, in some cases. In new properties, where the water is not turned on, you may have to go some distance for water.

21,204. You go some distance for the water if you want it for the paint; but if you want it to wash in, you do not?—You would not be so willing to go then.

21,205. Do painters usually wear overalls whilst at work?—Yes, but in Scotland mainly—or I will not say mainly, but in very many cases—it is the apron that is worn, and no overall trousers.

21,206. How about the coat?—They wear the short jackets and aprons, but no overall trousers.

21,207. How often are these overall garments washed?—In some cases it is almost necessary to wash them at the expiration of one week, and in other cases they will probably ruin a month before they are cleaned.

21,208. (Mr. Gardner.) The painter here wears a long blouse. In Scotland he wears a short white jacket?—Yes.

21,209. I wanted to note that point of difference?—Exactly.

21,210. (Dr. Collis.) How do they take them to the work and from the work?—They are just thrown into a basket amongst the tools, as a general rule.

21,211. How do they take their food to the work?—Usually in their pockets.

21,212. Do they ever take it in the basket?—No, I should not think so. It is not customary at any rate.

21,213. Do the men have their own overalls washed?—They have them washed.

21,214. Where are they washed?—In many cases they are sent to the laundry by the man's wife, and the laundry cleans them.

21,215. They go to a general laundry?—Not a general laundry; any private laundry.

21,216. My things might go to the same laundry?—Yes.

21,217. My handkerchiefs might be boiled in the same cauldron as your overalls?—Exactly.

21,218. And the next time I go to blow my nose, I may have the advantage of getting some of your lead dust?—It is quite probable.

21,219. (Mr. Gardner.) Is it customary for painters in Aberdeen to send their overalls to a laundry?—Quite customary.

21,220. (Mr. Parsonage.) Does not his wife wash them?—In many cases they are so dirty that the wife will not wash them, and they are sent to a laundry.

21,221. (Dr. Collis.) Really, then, they are too dirty to treat at home?—In very many cases.

21,222. The public laundry has to take them?—Yes, the public laundry has to take them, and they use strong caustic soda. They make them white.

21,223. When they are washed at home, as I suppose they are sometimes, where are they boiled?—As a general rule in Aberdeen they are just put in the wash-house boiler—in the general wash-house.

21,224. Are they ever boiled anywhere else than in the wash-house boiler?—They may boil them in an iron pot in their own kitchen.

21,225. When they have finished boiling them in the iron pot, what will go into the iron pot the next day?—That is problematical.

21,226. Is there any possibility of what is boiled out of the overalls getting into the iron pot?—I should not say that it is altogether out of the question. They may use it to boil the clothes without any knowledge of the danger, and think nothing about it.

21,227. And put the cabbage in the next day?—It is commonly termed a broth pot. They will sometimes use that.

21,228. There is, I suppose, some danger of dust arising from the dry overall which has been worn on a previous day, which might rise and be breathed?—There is a danger, no doubt.

21,229. Would you advocate periodical medical examination by a doctor, with power to suspend from

5 June 1912.]

Mr. ARTHUR SMITH.

[Continued.]

work those whom he found to be affected by lead?—I should think it would be a necessary precaution.

21,230. Do you think that the men would object?—There is no doubt that at first they might resent what they might think was an interference; but if they were educated up to the point of knowing the danger which they incurred by neglecting it, I have no doubt that they would accept it.

21,231. Do you think that it would be easy to get the men together for such medical examinations if they were a distance away in the country?—I do not know that it would be possible to get them all together at one time; in fact it never would be possible to get them all together at one time.

21,232. They would have to be examined as they could be?—Just as they came back to the town.

21,233. Do you know whether much compensation for lead poisoning is claimed under the Workmen's Compensation Act in Scotland by painters?—I have really no information on the subject.

21,234. Have you found the men in any way reluctant to claim compensation?—I know that in the case of accident there is a reluctance on the part of some of the men to claim compensation.

21,235. But you do not know whether that is so as regards lead illness?—I do not know the position with regard to lead illness.

21,236. Have you ever known men affected with other diseases than those definitely called lead poisoning, which have been intensified by the fact of lead being in their systems?—No such cases have come to my notice.

21,237. Do you consider that it is impossible to stamp out the evil of lead poisoning entirely, without replacing the lead by some non-poisonous substance?—I do not know that it is possible absolutely to stamp it out without abolishing the use of lead, but the dangers can be minimised greatly by statutory regulations.

21,238. What is your opinion concerning care and cleanliness of individual men in guarding them against lead poisoning?—The question of cleanliness is one which, in many cases, never appeals to the painter. He is absolutely ignorant of the danger of the lead, and, therefore, he does not have any due regard to the cleansing of his hands.

21,239. Do not you think that attention to the question of cleanliness and care is sufficient to enable him to escape any possible danger?—No; I do not think that personal cleanliness would ever remove the causes.

21,240. Why do you think that?—Because personally I contend that it is the inhalation that is the main source of contraction.

21,241. You think that some men have some idiosyncrasy, possibly, which renders them more liable to the influence of lead?—They do not really understand the danger of it.

21,242. No; but one man will get lead poisoning and another will not, though both are subjected to the same exposure?—Yes.

21,243. Whether he is careful, or whether he is not?—Yes. It has been a matter of note to myself that on many occasions I have seen men who have had their hands and their faces spotted with paint, sit down and take their food out of a paper, which has been lying exposed to paint fumes all the time, and take their lunch in the room where they were working.

21,244. They have escaped?—They have escaped.

21,245. Others more careful and cleanly have not escaped?—In four of the cases which I have quoted the men were very careful, and scrupulously clean men.

21,246. And yet they went down?—And yet they all contracted the disease.

21,247. Have you had any experience of the use of paint which did not contain lead, zinc oxide for instance?—I have experience but it is a limited experience, owing to the fact that there is not much of it done.

21,248. Do you think that zinc oxide could be used as a substitute for white lead?—I believe that it is quite possible.

21,249. On what grounds—as regard colour, for instance?—The colour is very much superior to that of white lead.

21,250. How about durability?—The durability, so far as I am aware, except under very exceptional circumstances, is quite equal to that of lead.

21,251. In what circumstances do you consider that that zinc has greater durability than white lead?—In cases of sulphuretted atmosphere.

21,252. Does it keep its colour better?—It keeps its colour better.

21,253. Does it last better?—The question of durability under these conditions is one which I cannot exactly speak upon.

21,254. What is the chief objection put forward to the use of zinc oxide in paint?—The common fallacy, and it is a fallacy, is that it does not cover as well, and that possibly you would require about four or five coats of oxide of zinc to equal two coats of white lead.

21,255. Do you yourself consider that zinc oxide is wanting in the capacity of masking or hiding the surface to which it is applied?—In the case of one or two-coat work it is inferior, possibly, to lead. It is inferior, undoubtedly, in the case of one coat. In the case of two-coat work it is only very slightly inferior. In the case of three-coat work I should say that it is quite equal in masking capacity.

21,256. Can you quote any authority on this point?—Yes, the records of practical experiments published in Cassell's House Decoration, edited by Paul Hasluck, 1911.

21,257. What were the experiments?—Two wooden panels of known size were prepared in exactly the same manner. On these panels were applied a definite sample of white lead paint and a definite sample of oxide of zinc paint, and the weight of paint required to cover the panels for each coat was carefully determined.

21,258. Can you give the weight of paint per square foot in each coat?—The quantities are as follows:—

| Weight of Paint per Square Foot. | First Coat. | Second Coat. | Third Coat. | Total.    |
|----------------------------------|-------------|--------------|-------------|-----------|
| White lead paint                 | Lb. .0452   | Lb. .0309    | Lb. .0300   | Lb. .1061 |
| Oxide of zinc paint              | .0265       | .0221        | .0220       | .0706     |

21,259. What was the comparison as regards opacities?—As regards the opacities of the two materials after each coat, the following results were found: After the first coat the white lead was distinctly the better; after the second coat the white lead slightly better; after the third coat there was no difference, but the important point to note is that, whereas the three coats of white lead paint had absorbed .1061 lb. of paint per square foot, the three coats of oxide of zinc paint had only absorbed .0706 lb. per square foot.

21,260. What conclusions may be drawn from these experiments?—The obvious deduction is that under the actual conditions of painters' use, it is possible to produce an oxide of zinc paint whose opacity is equal to that of white lead paint, without prejudice to the saving of more than 25 per cent. of material by reason of the superior spreading power of the oxide of zinc paint.

21,261. (Mr. Sutherland.) This is from Hasluck?—From Hasluck.

21,262. We are really getting Hasluck's opinion?—Yes.

21,263. There are other factors to be taken into account besides spreading power in estimating the relative costs, are there not?—The other factors are the numbers of renewals necessary and the prime cost of material.

21,264. Is this still Hasluck?—I am not exactly sure but what it is Hurst.

21,265. They are very different?—I am not sure but what Hasluck quotes from Hurst.

5 June 1912.]

Mr. ARTHUR SMITH.

[Continued.]

21,266. (Dr. Collis.) You put in a table in which all these factors are taken into account?—Yes.

|   | White Lead. | Oxide of Zinc. |
|---|-------------|----------------|
| Covering capacity in square yards per cwt.          | 806         | 1,411          |
| Price per cwt. in shillings - -                     | 32          | 36             |
| Cost (in shillings) per 100 sq. feet                | 0.44        | 0.28           |
| Times painted in 20 years - -                       | 5           | 5              |
| Cost in shillings per 100 sq. feet for 20 years.    | 2.20        | 1.40           |
| Relative economic value—highest represented by 100. | 64          | 100            |

21,267. These latter figures that you put in are not from your own personal experience, but are quotations from the book that you named?—Yes.

21,268. (Mr. Parsonage.) With regard to the wet rubbing process, when you say that work can be rubbed down by the wet rubbing process in two days, what wet rubbing process do you mean?—Ground pumice and felt.

21,269. You do not mean pumice stone and water?—No, not the hard pumice and water.

21,270. You mean nothing else but ground pumice stone and felt?—Yes.

21,271. That would take a considerably longer time than dry rubbing?—The paint would not be sufficiently hard in two or three days. The lump pumice stone could only be used on old work.

21,272. A witness here at the last meeting said that it would take twelve months before it was hard enough to rub down with pumice stone and water. The process of rubbing down, or felting down with ground pumice and felt, would take a longer time than the dry rubbing?—It would take a longer time.

21,273. A great deal longer time. Would it be practicable to introduce that to take the place of dry rubbing between coats, looking at the time it would take?—I think that it would be quite practicable.

21,274. It would add very considerably to the cost of the work?—It would undoubtedly add very considerably to the cost of the work, but only in certain cases. There are cases where it would be quite as economical to do it with the pumice and felt as it would by dry rubbing.

21,275. Why?—On certain classes of work where the work does not require any real levelling down, but merely wants surfacing.

21,276. You said that there was much more preparation of the work in London than elsewhere?—Very much more.

21,277. You mean that work is done better in London?—It is much more elaborate.

21,278. (Mr. Sutherland.) Not better necessarily?—Much better. The preparatory work is far more elaborate. And necessarily the finished work reflects the preparatory work.

21,279. (Mr. Parsonage.) You would not waste a lot of time on preparatory work if you did not want a good finish?—No.

21,280. Did you work in the West End of London?—Yes.

21,281. Would you say what firm?—I was mostly with a small firm in Portsea Place. It has now gone from there. It is 11 years ago.

21,282. (Mr. Gardner.) What do you consider the chief causes of lead poisoning amongst painters?—Inhalation of dust, I suggest, is the most prolific cause.

21,283. If we are not doing so much rubbing down, which causes the dust, what is the reason of the increase of lead poisoning? How do you account for it?—I have really no definite opinion on the question of fumes, as to whether the fumes really cause lead poisoning or otherwise, but I certainly know that the smell of white lead paint is distinctive, and I would suggest that the smell, even in itself, very often does harm.

21,284. That is, you think that white lead paint has a distinctive smell which zinc paint has not?—Undoubtedly.

21,285. You said that you thought that dry rubbing down could be done away with. Did you mean between coats, or for preparatory work?—For all preparatory work.

21,286. But not between coats?—Between coats too. The difference would be that on newly painted work, between coats, it would only be done with pumice powder—felted down.

21,287. But you replied to Dr. Collis that dry rubbing down could be done away with entirely?—It could be done away with almost entirely. I would not say absolutely entirely.

21,288. Would it not be at the expense of the finished work?—No, I should not say so. Polishing with pumice gives a far superior finish compared to the glasspapering—the dry rubbing process.

21,289. When you say that dry rubbing down could be done away with, you mean that wet rubbing down should be substituted?—Yes, I would suggest that.

21,290. I think you agree that so far as burning off paint is concerned, solvents could be quite well substituted for the lamp?—In most cases they are quite efficient.

21,291. Without doing any harm to the woodwork?—Absolutely without doing any harm.

21,292. You have had no great personal experience of the use of zinc?—Very little, not on any large jobs.

21,293. Is it much used in the North?—To a very small extent.

21,294. Can you give any reason why the master painters in Aberdeen have not taken up the use of zinc?—Well, they are just going on in the same old rut. They have used lead for a number of years, and they possibly think that they can manage better with the lead than they can with zinc. They have greater experience of lead, and therefore they have greater faith in it.

21,295. If this Committee, recognising that white lead was the cause of a good deal of trouble among the men, were to institute a set of regulations for using white lead, it would require inspection to see that they were carried out. Do you think that any system of inspection could be carried out in the trade?—I think it quite impracticable for any real system covering the whole area to be introduced. I do not think that it is possible to cover the whole area with any system of inspection.

21,296. The trade does not lend itself to inspection?—No; that is certainly the case. Some of the jobs are of so short duration that before notification could be sent the job would be finished and the men out of the way.

21,297. (Mr. Sutherland.) The master painters of Aberdeen are most of them very practical men, are they not?—I would not like to commit myself.

21,298. They are, most of them, men who have gone through the trade?—They all are, I believe, with one exception.

21,299. So we may say that they are practical men?—They are really practical men.

21,300. And their use of white lead covers a life experience of the trade?—Yes.

21,301. So that there is a sound reason for their preference for it against zinc oxide. They know the value of white lead?—Yes; but on the other hand, they have never thoroughly tested oxide of zinc.

21,302. I do not know about that?—The necessity has never arisen.

21,303. There is a large amount of water paint used?—Yes, an increasing amount.

21,304. For ceiling work and that kind of thing?—Yes.

21,305. The process of flattening ceilings and stippling, which is an objectionable one perhaps, is reduced very considerably thereby, is it not?—Yes.

21,306. You quoted James Murray, senior, as a case of lead poisoning. Is he still alive?—He is still alive.

5 June 1912.]

Mr. ARTHUR SMITH.

[Continued.]

- 21,307. Is he working?—Very seldom.
- 21,308. What age is he?—I should say that he is about 73. He is certainly over 70.
- 21,309. Did you know him when he contracted lead poisoning?—I did not know him at that time. I became acquainted with him after.
- 21,310. James Thomson, when he contracted lead poisoning, was in America?—He was in America.
- 21,311. Was it lead poisoning?—It was undoubtedly lead poisoning.
- 21,312. Did he get a doctor's certificate?—I understand so. I was personally acquainted with the painter in question prior to his going to America, and subsequent to his return. I am still acquainted with him.
- 21,313. Is he working at the trade to-day?—Yes.
- 21,314. How long has he been back from America?—I should think about 6 years.
- 21,315. Has he had any recurrence of lead poisoning?—I do not think that he has had any recurrence. He has never left off working.
- 21,316. And Lynas Peacock—do you know for whom he worked at West Hartlepool? Was he in one of the shipyards?—I understand that he was in one of the shipyards, and in an outhouse used as a paint shop.
- 21,317. For one of the shipbuilders?—I understand that it was for one of the shipping firms.
- 21,318. Did the doctor give a certificate of lead poisoning?—Yes, I understand so, and he advised him at that time to frequently take a little beer.
- 21,319. I have known painters take it without doctor's advice?—Yes; but the point that I mention that for is that he was a teetotaler up to the time when the doctor advised him to resort to beer on certain occasions.
- 21,320. Has he had any recurrence since?—He has never been really fit since, although he has never been invalided altogether. He has always been working, but his health has never returned to normal.
- 21,321. I understand that the doctor attributed it to the heat of the shed?—Yes. It was in the summer time. The outhouse where he was working had a corrugated iron roof. Peacock himself stated that the heat was very great while the sun was striking on the roof, and the smell became really obnoxious.
- 21,322. Is James Smith still at work?—He is still at work in Aberdeen.
- 21,323. Was it in Aberdeen that he had this attack of Bright's disease?—It was in London, or subsequent to his return from London.
- 21,324. Did you know him personally at the time?—Yes. I know him now.
- 21,325. Were you with him?—I was not working with him.
- 21,326. No, but you were in contact with him during the time?—Yes.
- 21,327. John Tennant—is he working at the business still?—Yes. He is in much the same category as Murray. He is a very old man now—over 70, but he is quite able to do a little job now and again.
- 21,328. How long is it since he had wrist drop?—About 20 years ago. I would not be positive as to the time.
- 21,329. Is his wrist normal now?—Yes. He is not robust by any means, but he is quite able to do small jobs.
- 21,330. You yourself have experienced colic?—I experienced colic in London.
- 21,331. Did the doctor certify that it was lead poisoning?—He told me that it was due to lead poisoning.
- 21,332. From the use of lead?—Yes.
- 21,333. That was an ordinary doctor?—Yes.
- 21,334. Not a Home Office doctor?—No.
- 21,335. How long did it last with you?—So far as I can remember I had about three days' illness at that time.
- 21,336. Is that the only illness you have had?—That is the only illness I have had through lead.
- 21,337. You know that you can have colic from paint which is not lead?—The constipation in my case was very marked.
- (Dr. Collis.) Colic from a non-lead paint would not be associated with constipation. That is why I asked the question in my examination-in-chief. The colic produced by the oil, turpentine, and driers would be associated with diarrhoea rather than constipation.
- 21,338. (Mr. Sutherland.) (To the witness.) You suggested in your reply to a question that 50 per cent. of the time of the painter in London was taken up with dry rubbing down?—Not necessarily—preparatory work.
- 21,339. I understood that, in reply to Dr. Collis, you said 5 per cent. in normal work in Scotland, and 50 per cent. in London?—Yes, but that is preparatory work. The 50 per cent. that I suggest is absorbed in London work is on preparatory work.
- 21,340. Washing off ceilings, stripping walls, and rubbing down?—No, more on woodwork, or painted work.
- 21,341. Fifty per cent. of the time spent on painted work would be taken up with preparatory work?—Yes.
- 21,342. Rubbing down, stopping, and sandpapering?—Yes.
- 21,343. A painter's time is not all spent in painting, is it?—Not by any means.
- 21,344. So that 50 per cent. would probably be 50 per cent. of 50 per cent. of his time, or 25 per cent. of all his time?—I should say that on a really good job—
- 21,345. We are speaking of average employment and average work, and average jobs?—25 per cent. of the job would no doubt be a reasonable average for preparatory work.
- 21,346. A little of that would be dry rubbing down?—There would be a little, but very little dry rubbing down.
- 21,347. So that even in London the time actually devoted to dry rubbing down would be very small in proportion to the whole of the time the man is at work?—Very small.
- 21,348. So that your 50 per cent. might mislead if people read it that in London 50 per cent. of the painter's time was given to dry rubbing down?—Yes. It was not my intention to suggest that.
- 21,349. Sandpapering is not used for levelling, is it? You do not use dry rubbing down for levelling, except when you are filling up with fillers, either distemper fillers or leadless fillers?—It is used for levelling where the brush marks are showing. Sandpaper is used for levelling—really polishing.
- 21,350. If you have levelled up a door with alabastine, or any of those fillings, or lead filling, which can be cut down with pumice stone and water, you do not do very much levelling after that?—There is practically no levelling after the filling up.
- 21,351. The other is to take off the nibs?—Yes, and any other marks that may be occasioned.
- 21,352. You are of opinion that dry rubbing down could be dispensed with by the use of felt and ground pumice?—On practically all jobs.
- 21,353. Mr. Parsonage asked you if it would not add much to the cost of the work. If it is slightly rubbing down, it should be no more expensive than sandpapering; should it?—Quite so, not for work that is in really good condition.
- 21,354. For work which you have previously filled up with distemper fillings?—It would add very little, if any, to the cost.
- 21,355. What hours do you work in Aberdeen?—The hours range from nine hours for six months in the spring and summer time to seven hours during the winter.
- 21,356. About 50 hours. You take an hour for dinner and an hour for breakfast?—Yes, an hour for

5 June 1912.]

MR. ARTHUR SMITH.

[Continued.]

breakfast and an hour for dinner during the summer time, when working nine hours; and only one break during the winter time.

21,357. You have had very little experience of zinc oxide paint?—Practically very little experience.

21,358. So that we cannot attach much weight to your opinion that it could replace white lead?—No. The experiments that I have conducted personally have been such that I would not submit them as really authoritative.

The witness withdrew.

## THIRTY-SIXTH DAY.

Thursday, 6th June 1912.

PRESENT:

SIR ERNEST F. G. HATCH, BART. (*Chairman*).

Sir GODFREY BARING, BART., M.P.

Mr. E. L. COLLIS, M.B.

Mr. W. G. SUTHERLAND.

Mr. A. GARDNER.

Mr. J. PARSONAGE.

E. A. R. WERNER (*Acting Secretary*).

Dr. COLLIS in the Chair.

Mr. H. G. CHANCELLOR, M.P., and Mr. S. P. PENWARDEN examined.

21,359. (*Dr. Collis*.) Do you attend to-day as the representatives of Messrs. C. Chancellor & Co., paint merchants?—(*Mr. Chancellor*.) Yes.

21,360. Do you manufacture leadless paints?—Yes.

21,361. Is your paint intended to be used as a substitute for white lead in paints?—It can be used for any purpose for which white lead paint is used.

21,362. What is the composition of your non-poisonous paints?—They vary with the colour. All the colours have their own pigments, but the bulk of the trade is in white—tinted white, ivory white, and cream and so on—and the pigment in that case is zinc oxide. That is the main pigment.

21,363. Do you obtain your zinc oxide at home or from abroad?—Partly at home, and partly from abroad.

21,364. Do you make any special stipulation as to the method of manufacture of your zinc oxide—whether it is the direct or the indirect method?—No; we generally buy it on the market.

21,365. Are there any lead compounds in your paints?—Not in the article that you are asking about. We do supply ordinary white-lead paints as well, but the article you ask about, "Velure," has no lead whatsoever, except in the case of lead chromes. Some of the colour pigments and vermilion would contain poison.

21,366. Would they contain red lead?—No.

21,367. Would the vermilion contain a mercury salt?—Yes. What I am saying applies to white, and those that are made mainly of white. Where you have to use colour pigments you have to use colours which may or may not be poisonous.

21,368. (*Mr. Gardner*.) The tinting pigments are chromates?—Yes, some of them.

21,369. (*Dr. Collis*.) And, in the case of vermilion, it contains a mercury salt?—Yes.

21,370. What vehicle do you use?—We use a special medium.

21,371. Are lead driers added?—No.

21,372. Do you use turpentine for thinning the paint?—No; we use a special thinner, which is practically the medium slightly modified.

21,373. Do you get a sufficient covering power without the use of either red or white lead?—Yes. We claim that a coat of Velure will cover quite as well as two coats of white-lead paint.

21,374. How does the cost of your paint compare with that of lead paints?—Compared with common paint and varnish, one, and often two coats, less are required, so that the saving in quantity of material used and in labour more than equalises the cost per gallon of material. Three-coat work, ordinary house decoration,

with a coat of varnish on it, is charged by ordinary painters 1s. 2d. a yard on an average in London, whereas three-coat work, two under-coats, and finishing coat of Velure, which gives a better result and requires no varnish, is charged quite commonly by painters at a shilling a yard. With Velure you get a better finish and better cover with one coat less at the prices at which I am willing to supply the Government. I supply the Admiralty at that price in some of their departments. A few Government departments buy, but not very many. I find very great difficulty in doing business with the Government. The cost of the material would work out at about 2d. per yard. That is the cost of white for material without labour. Black is 1½d. Then I can also give the cost of colours. In the one case I am giving the comparison with ordinary work carried out with common paint and varnish.

21,375. That is 1s. 2d. per yard?—Yes.

21,376. (*Mr. Sutherland*.) That includes labour?—That includes labour. It is 1s. as against 1s. 2d. The other quotations are for the material without the labour. It covers 90 yards to the gallon. At that it will work out for material 2d. a yard for the finishing coat, 1½d. a yard for the black, 2½d. for most colours. The under-coats may be got up in common paint, if you like. We supply under-coats, but we do not make that a condition. You use this as a finish.

21,377. As a finishing coat?—This can be used from a motor car down to a common piece of decoration.

21,378. (*Dr. Collis*.) Are the prices which you quote here on the basis of the Government quotations rather than quotations to the trade?—No. The prices which I have given you are charged by ordinary painters buying at 20s. a gallon, buying the ordinary materials at the ordinary prices on the market.

21,379. And on that it works out at 1s. against 1s. 2d.?—For the ordinary common work of any small decorator, not for the Government carrying out large contracts. Would you look at exhibit A? You will see that the experience of many large contractors is that they can get a great deal more than I claim for the paint.

21,380. Do you put this in?—Yes. I thought it would be interesting.

21,381. I will read it: "Dears Sirs, We have yours of the 6th inst., for which we are much obliged. In 1904 we obtained from your agents in Liverpool, Messrs. Brown, Kay & Co., 44 gallons of poppy red, and 26 gallons of white Velure paint to be put on some steel work for the North Eastern Railway Company at Hull. We have 13½ gallons of poppy red left in tins and bottles, none of which have had the seals broken. We shall be glad to know if you

6 June 1912.]

Mr. H. G. CHANCELLOR, M.P., and Mr. S. P. PENWARDEN.

[Continued.]

" will take this back, carriage paid, at the price we paid for it. It appears that we have had the same experience as other people, viz., that it has gone much further than we anticipated. At present we have nothing on which we can use Velure, but we will bear you in mind when there is any work on which it can be used. Can you supply small quantities, say about a quart each, of black, green and yellow?—Yours faithfully, for the Cleveland Bridge and Engineering Company, Limited, James E. Reed, Secretary." I put that in to show you that when I claim 90 square yards per gallon I am not claiming anything excessive.

21,382. (Mr. Sutherland.) Who is the contractor?—The Cleveland Bridge and Engineering Company. Others of the biggest engineers in the country have had precisely the same experience. One is Head, Wrightson, and Company; Sir Thomas Wrightson was in the House. Then Rudd and Son, Grantham. Also F. and H. F. Higgs, a large firm of London contractors, and Andrew Handyside and Company. That is simply a statement of fact. Head, Wrightson and Company are amongst the largest in the trade.

21,383. Do your customers tell you that it is no more costly to paint with your leadless paint than to use lead paints?—Some of them say that they can get the same result at a cheaper rate. There is a great amount of prejudice against special articles. Ordinary decorators like to make up their own stuff, and they will not adopt specialities if they can help it, but our experience is that where contractors have carried out a contract with our materials they not only find that they can get the work through as cheaply or more cheaply, but they recommend them elsewhere. The best evidence of that is this: Here is a circular showing what architects said in 1911, and what was said in 1911 by decorators and others. I get out one of these every year, and I could easily multiply the examples ten times over. I differ a good deal from a great many business people in that I absolutely refuse to publish any testimonial which has behind it even the suggestion of a request. They are absolutely spontaneous, written when remitting cheques or when giving orders and so forth. You will find evidence of that kind repeated over and over again, and especially on the question of durability.

21,384. Over what period have your paints been used?—Since 1899.

21,385. Has your paint been found durable? You say "since 1899"; that gives us 13 years?—I put in a list including several cases of paints not requiring renewal for seven or eight years. There is a paragraph under "Buildings, &c. where used." May I put that in as evidence? Velure was used first on the Royal yacht "Victoria and Albert" in 1902. Since then they have tested a lot of other similar things, but have rejected them all and come back to Velure. I believe it is exclusively used for finish.

21,386. (Dr. Collis.) Was it used to decorate the yacht for the Coronation review last year?—I do not know. I have had an order within the last week. I get orders about twice a year.

21,387. (Mr. Sutherland.) Is that through the Office of Works?—There is a special department, I think. My firm is on the Admiralty list for special purposes only. I cannot get adopted for general purposes: therefore, I am restricted to certain special things—the Royal yachts, and the buildings of the Admiralty, but not ships.

21,388. You said "the 'Victoria and Albert.'" I was thinking of the museum?—No, the yacht; they buy the paint and apply it themselves.

21,389. (Dr. Collis.) We inspected the Royal yacht "Victoria and Albert" when it was decorated before the Coronation review. That is why I asked about it?—The finish has always been done with Velure since 1902, and I believe that they paint it much less frequently than they used to.

21,390. Is it used at Windsor Castle?—We do not get the orders direct, but the estate agent there purchases through one of our customers. It was used at Sandringham in 1902. On sending round circulars to architects in 1903, I got a postcard from the architect, Mr. Beck, who specified it for Sandringham. I did not

know of his connection with Sandringham at the time. He has ceased to be the architect since then, so I do not know whether it is being used there or not. That was quite unsolicited. I did not know Mr. Beck. I did not know anything about him. With regard to durability, if you have occasion to visit Osborne House you will see the condition. When it was first transferred to the nation by the King, it was decorated throughout the inside with Velure matt. I am not sure whether it was outside or not. I do not believe that it has been re-painted since. I believe that that paint is still on the walls.

21,391. That is a matter of six years at least, is it not?—More than that. It was 1903—eight or nine years. Since then Velure has been used in the Victoria Hall, which is an addition. I have not been down myself, but there is a hall in connection with the Cadet College.

21,392. (Sir Godfrey Baring.) I live close by, and I know all about it?—Yes, you know all about it. It was put on by Watts, of Cowes. They used large quantities.

21,393. (Dr. Collis.) Will you name some other places where your leadless paints are used?—The Home Office keep on buying small quantities, nearly the whole of which, I believe, are used on baths in prisons. We are asked to send down half a gallon, or something of the sort, to these various prisons. It has been repeated again and again. There is Mountjoy, Dublin, for instance. I cannot remember all. I only know of it having been used for other than baths in prisons at Maidstone and at Lewes. It is only occasionally that we get to know what it is used for.

21,394. There it was used for external doors, was it not?—It was for external doors in the one case and brick walls in the other.

21,395. How long ago was it put on to the external doors?—(Mr. Penwarden.) Four years, I saw the surveyor here about it.

21,396. Was that the doors or the walls?—The doors at Maidstone. (Mr. Chancellor.) That is a very severe test.

21,397. How have the doors stood?—I do not know. At Lewes it was used on brick walls. If you want to see places close at hand which you can visit by a short walk, you will find a very good example in the Infants' Hospital at Vincent Square. That has been painted twice. I forget when it was painted originally. They have expressed very great satisfaction with it.

21,398. (Mr. Sutherland.) When was it painted last?—Last year. Plaistow Fever Hospital is a kind of show-place to which medical officers come from all over the world. It is a poor law institution. It is a kind of model. They use nothing but our stuff.

21,399. (Dr. Collis.) Is it used there for both outside and inside?—Yes. (Mr. Penwarden.) On a zinc-oxide undercoat. That may interest you. (Mr. Chancellor.) We recommend that lead paint should not be used immediately under this.

21,400. Particularly we want examples of its use for external purposes and its durability?—The best example would be ironwork at a seaside place.

21,401. I think that what would stand on ironwork would probably stand on woodwork?—Velure has been used exclusively on the Soudan Government Railways for about nine years. They tested a variety of paints and found that ours was the only thing that would stand the combined effect of the equatorial sun and the sand. For about 150 miles, I understand, the railway runs through sandy desert. Nothing would stand there until they adopted Velure. We made some special shades to harmonise with the sand. Since then the external parts of the carriages have been painted exclusively with our material. We had to send the stuff down to Loughborough. The Gloucester Wagon Works are making 100 carriages for them now. We send whenever they have new carriages made. In the Nigeria Coast Protectorate it has been used exclusively on the "Ivy," which is the Governor's official yacht, and on the Nigerian Railway as well. Where the test is especially severe, a test of exposure to sun or to cold, we claim, and I am interested

6 June 1912.]

Mr. H. G. CHANCELLOR, M.P., and Mr. S. P. PENWARDEN.

[Continued.]

in claiming, as you quite realise, that this will last very much longer than anything else.

21,402. You quote the Nigerian Railway and the Soudan Railways as particularly severe tests of your paints being applied for external purposes. Could you give examples from India as well?—On the South Indian Railway, and on the tramcars in Rio de Janeiro, and on the Buenos Aires and Pacific Railway, they have used it and sent us testimonials. We have supplied some to the Royal Indian Marine—for ships, I suppose—I do not know.

21,403. Have you examples of a similar kind on home railways?—In England it is very difficult to get business from railways unless you are prepared to adopt the same methods as your competitors, and those are methods which I will not adopt. Only here and there can I get it used by the larger railway companies, but the smaller companies have used it for many years, especially the Belfast and Northern Counties Railway, who now buy through the Midland Railway Company.

21,404. Do you supply the Midland Company? Have they been bought by the Midland lately?—They have for years used our paint, and continue to use it. The Midland Company have used it on their Heysham boats.

21,405. They do not use lead paints for carriage-work generally?—They have not bought them for carriage-work. They buy them in small quantities and for special purposes. Questions of price and other things have prevented our getting their business up to the present. The Great Eastern Railway have painted their Hook of Holland to Harwich boats—or Earle's Shipbuilding Yards have painted them for them—for many years with our paints. If you are ever crossing that way you will see. Lots of yachtsmen who used to have their yachts painted in the spring, and again in the autumn, now only have them painted once a year since using Velure.

21,406. Have you ever had any complaints at all on the score of durability?—Only very occasionally, and then, when I am able to investigate, I generally find that something has been added to the paint. It works a little stiff, something like varnish with pigment in it; consequently, it is a very strong temptation to the workmen to put linseed oil in, or something of the sort. Where we have been able to investigate and get the facts, in a number of cases of complaint we have found that something of the kind is at the bottom of it. We have not had many complaints.

21,407. (Mr. Sutherland.) That is the experience with regard to most proprietary paints, is it not?—Yes, that is the experience with regard to most proprietary paints. May I say one other thing, that all these garden suburbs and cities which are run on the co-partnership principle have adopted Velure from the very start. Ealing began in 1901; Hampstead and all the others one after the other have done it. If you make inquiry from the Co-partnership Tenants, who are a kind of wholesale society supplying them, you will find that that is so. The manager, who has had probably as big a building experience as any living man, will tell you what he thinks of it. He is Mr. Ramsbottom, of 6, Bloomsbury Square.

21,408. (Dr. Collis.) Do they use it for external purposes as well as for internal purposes?—Yes, Mr. Raymond Unwin experimented with it when Letchworth began. He is very well known in the Garden City Movement especially. Generally the houses on the Co-partnership Estates are finished in two coats, instead of three or four. After the priming they put one coat, and finish with a coat of Velure. You will find that all over Letchworth and Hampstead.

21,409. (Mr. Parsonage.) Is the second coat lead?—We have asked them not to use lead, because zinc is so much better.

21,410. (Mr. Sutherland.) Does that affect its durability?—Lead is against the durability, because of the chemical action that is set up. Then Whiteley's new premises were finished in Velure—the enamel work. There is very little enamel work about it. Wills' Tobacco Factory buy regularly. Huntley and Palmers have been regular buyers for years. Then there are flour

mills (I attach importance to them because they are up to date), Hovis, and Vernon's, and so on. They have adopted them. I put in a list with a cross against those who constantly send orders. They appear to be specially well satisfied with it. Then Smedley's Hydro have done their decorations for years with Velure. The Express Dairy Company and Williamson's tea shops use it for outside as well as inside.

21,411. We are specially interested in the question of its use for outside purposes?—Then schools of all kinds, including such well-known schools as Rugby and the Royal Naval College at Osborne, and Balliol College, Oxford. I have an unsolicited testimonial from Mr. Nagel, of the Chemical Laboratory there. I do not know him. The Chertsey Union Workhouse painted their exteriors eight years ago with it, and the Post office pillar-boxes in a number of towns, where the local postmaster has the right to do it, are being painted with our paint. In London only the General Post Office has a right to do it. They have used it for bicycles for some considerable time, but not on the pillar-boxes. One postmaster tells another about it, and it is spread from one to the other. They find that they do not have to paint so often. It has been put on no end of public buildings such as libraries, baths, and places of that kind. Then there is the Office of Woods and Forests, next to the War Office; that was painted with it.

21,412. (Mr. Sutherland.) Inside and out?—External painting on the wood sashes, for instance. Nearly all the internal painting was done with it, and I believe the external. Mowlem's did the work.

21,413. (Dr. Collis.) Was that at the time that it was built?—Yes.

21,414. It has not had long to stand?—Three years.

21,415. (Mr. Sutherland.) The sashes are coloured; they are not white, are they?—(Mr. Penwarden.) They would be stone colour, speaking from memory.

21,416. (Mr. Gardner.) Velure can be supplied in any colour?—(Mr. Chancellor.) We stock about 150 colours and make fresh ones every day.

21,417. You have colour for pillar-boxes?—We have a colour, vermilion, which we number 167.

21,418. (Dr. Collis.) Am I right in considering that you would suggest that the garden cities would be a good example to take of the standing power of your paint for exterior work, because it has had years of test and there has been time for re-painting?—Yes. If you went to Ealing, Mr. Ramsbottom would tell you anything about it. I have not seen them myself. He has had the organising, under Mr. Vivian, of practically all of the Co-partnership estates. There is a kind of co-operative society, which helps to finance and which buys on a big scale, and supplies at cheap rates all the subsidiary companies.

21,419. You do not advise that your paints should be put on former coats or priming coats of white lead?—We advise that the coat immediately under Velure should be zinc-oxide paint, because there is no chemical action set up then. In the case of white lead our experience is that after some time the white lead has the effect of creaming the Velure, and it is best to prevent that, if possible, if you want it to remain white.

21,420. To sum up, then; so far as your experience goes you have found your paints to be efficient substitutes for ordinary lead paints?—Yes, and far more durable because less liable to atmospheric and chemical action.

21,421. Have you any difficulty in obtaining your supply of zinc oxide?—No. There is difficulty just now with strikes and so forth.

21,422. But apart from that?—There is no difficulty.

21,423. Do you anticipate that, if there was a largely increased demand for zinc-oxide paints, there would be any difficulty in the future?—Probably the price would go up and a corner would be formed, as they are trying to form a corner in white lead just now.

21,424. (Mr. Sutherland.) They have formed a corner?—Yes. I do not know if it is going to last.

6 June 1912.]

Mr. H. G. CHANCELLOR, M.P., and Mr. S. P. PENWARDEN.

[Continued.]

Ordinary economic forces are set in operation directly you create a demand, especially an unexpected demand, for an article.

21,425. (*Dr. Collis.*) If this Committee made a recommendation limiting the use of lead in paints, it would probably increase the demand for zinc?—It would no doubt increase the demand for zinc, but under conditions of free trade, where you can draw your supplies from anywhere, the difficulty is minimised.

21,426. (*Mr. Sutherland.*) But can you do that with regard to zinc oxide?—Yes. It is produced here and it is produced in Belgium. It is produced in large quantities.

21,427. Zinc oxide is already in a ring?—There is a ring, but its operations are not very severe at present.

21,428. It controls prices, I think?—There may be other pigments which can be used unless you insisted on zinc being used. If you rule white lead out, probably other pigments may be found.

21,429. (*Dr. Collis.*) Have you any idea what others?—I cannot say. Lithopone would keep down the price. As an outside finish it is not good, because sun makes it grey.

21,430. We want to know whether you think that such a limitation, if made, would detrimentally affect the public purse in having their property protected?—If it were merely a prohibition of white lead, I do not think it would materially. If it were a question of something special, I do think that the effect would be material.

Sir ERNEST HATCH in the Chair.

21,431. (*Sir Godfrey Baring.*) You have not found any special difficulty in very smoky towns with your paint; I mean places like Manchester, for instance, and Sheffield?—It is rather the other way. It is not chemically affected so easily as the ordinary paint. It is not destroyed so quickly.

21,432. (*Mr. Sutherland.*) The colour is not?—No. People have washed it down for re-painting, and found it in such a condition that they have said, "We shall not paint until next year." We have had that experience again and again.

21,433. (*Sir Godfrey Baring.*) You think it specially suitable for smoky towns?—Yes. This is rather important. It has been used inside the acid chambers, I think they are called, in electrical works in generating chambers, where the fumes settle and run down the wall.

21,434. (*Mr. Sutherland.*) Sulphuric acid?—Yes. If you put strong sulphuric acid on it it will eat it away, but the condensation of the sulphuric acid on the wall appears not to affect it much. Brewers have adopted it repeatedly in their yeast rooms because they find that they can flush them down and remove the settlement of the yeast germs.

21,435. (*Mr. Sutherland.*) Do you suggest that Velure and articles like Velure (not as good, but of the same character) could replace white lead for all the purposes for which white lead is used?—I do not know of any purpose for which they cannot.

21,436. I mean for general painting. I am thinking of the question of cost?—You quite understand that it would become costly if used other than as a finish—if you painted wood from the bottom with it without any under-coat at all. If you use a zinc under-coat and finish in Velure there is no decorative or protective purpose that I know of for which it is not suitable. Indeed, as a protection against the oxidation of metal in seaside places or places of that kind it is very much better than white lead. There is no purpose for which white lead can be used for which a thing of this kind in conjunction with a cheaper material as an under-coat cannot be used with greater economy and with more durable results. I am absolutely certain of that, and I have had plenty of experience to go upon.

21,437. There are many, many hundreds and thousands of properties where two coats of paint are sufficient and will last for three or four years?—Yes, put on over old paint, but, put on *de novo*, you very seldom find two coats sufficient except on metal work.

21,438. But there is an enormous amount of such property all over the country, so if we abolished white

lead and were confined to things of this nature it would enormously add to the cost of the work, would it not?—Where you are covering an old coat of paint with the same colour you need never use more than one coat of this. You can dispense with the intervening coat, and numbers of people do.

21,439. Your material is slow-drying, is it not?—It is slower-drying than common paints.

21,440. And slower than most of the enamels?—Rather slower. It can be quickened, but we do not recommend that for outdoor use.

21,441. You claim that slow-drying contributes to its durability and lustre and body?—Yes, the slower the more durable. In frosty weather, of course, it takes twice or three times as long.

21,442. That applies to all paints, more or less?—Under ordinary conditions it is slightly tacky the next morning.

21,443. A friend of mine painted a place outside at Newcastle with Velure; he was perfectly satisfied with the Velure, but the weather was not happy for it, and a dust got up, and the last state was worse than the first?—Yes, I know.

21,444. (*Chairman.*) Would that have applied to ordinary lead paint?—No, not to the same extent. White lead is in itself a drier.

21,445. So to that extent white lead would be preferable in such an instance?—Yes; but may I say that, where you are using two or three coats of paint, the under-coats would be quicker drying. It only applies to the very last coat.

21,446. (*Mr. Sutherland.*) You do not use lithopone for your under-coat, do you?—Sometimes a little, but I use more zinc oxide. The medium is cheaper and it is a quicker drying thing. It dries flat and quickly.

21,447. You use no lead drier?—No. We use a special liquid drier.

21,448. Is there no lead in that?—None whatever.

21,449. (*Sir Godfrey Baring.*) You are sure that there is no lead in it?—Yes, I am practically certain.

21,450. (*Chairman.*) I do not like the word "practically"?—I feel absolutely certain that there is no lead in it.

21,451. (*Mr. Sutherland.*) Most driers have a measure of lead in them, even liquid driers?—I do not know much about driers. I buy of the manufacturer. I am quite certain that there is no lead in ours. If there is doubt about that, I will find out.

21,452. Medical evidence shows that there is very great danger from manganese driers, and turpentine and oil, not of lead poisoning, but discomfort to the workers?—I think that our preparation is oxide of manganese. I will ask if there is any lead in it.

21,453. The proportion of the proprietary paints, like your own and Ripolin, put together, would be a very small proportion compared with the bulk of white-lead paint, would it not?—Yes. All these paints are used as a finish. The bulk is an undercoating.

21,454. There would be difficulty if the Government substituted proprietary paints for white lead, would they not?—Yes, if they were substituted for all white lead purposes there would be difficulty, but you would substitute a coat of this paint for the last coat and the coat of varnish on it.

21,455. We all recognise that inside we could dispense with lead, but outside the great bulk of the work is done just with the lead, oil, and turps, and driers?—If you want to protect it you varnish it.

21,456. Not necessarily to protect it, but if you want an extra finish?—In cottage painting and ordinary house decoration you put on a coat of varnish.

21,457. No?—Not on doors.

21,458. If the doors are grained, yes, but the ordinary house door in 80 per cent. of cases is not varnished?—(*Mr. Penwarden.*) That would only apply to cottage property, would it not? (*Mr. Chancellor.*) I personally do not get about very much, so I cannot say, but I think that I am correct.

21,459. The front door might be varnished?—You would never see a front door not varnished, I should think.

21,460. (*Chairman.*) I was detained on another Committee, and did not hear the whole of your evidence.

6 June 1912.]

Mr. H. G. CHANCELLOR, M.P., and Mr. S. P. PENWARDEN,

[Continued.]

Did you come here to speak as an expert?—I am the principal of a firm of paint manufacturers.

21,461. I did not know whether you were chairman or were actively engaged in the business?—I founded the business.

21,462. Then we may take it that you are an expert?—Yes.

21,463. The whole of the inquiry by this Committee is centered on one point, and that is whether any harm would ensue to the trade generally if the Committee decided to prohibit the use of white lead. In your opinion no harm would ensue in any direction, I understand?—Not to anybody except the white lead manufacturers.

21,464. Do you think that the public would suffer in any sense first in regard to extra cost, or secondly in regard to want of durability, if white lead was prohibited?—I believe that other materials are more durable than white lead. I have given reasons for that in the evidence which I have given already. With regard to cost, any fresh rule disarranges matters for a time, but I do not believe that it would make any material difference after things had settled down.

21,465. I suppose we may take it that, in a sense, you are prejudiced in favour of your own paint?—Not at all. We supply lead paint as well. Of course, naturally, if you have a speciality on which you pledge your credit, you are prejudiced in a sense.

Mr. CHANCELLOR withdrew.

21,466. (Chairman.) (To Mr. Penwarden.) What is your position?—I am a director of Messrs. Chancellor's Company.

21,467. (Mr. Parsonage.) Has the sale of Velure materially increased each year?—Yes.

21,468. Among house decorators?—I cannot quote you figures, but the tendency is a distinctly upward one over the whole bulk of our trade.

21,469. A gradually upward tendency?—A gradually upward tendency. I do not know that offhand I could tell you where the output goes.

21,470. This is enamel?—We do not call it enamel.

21,471. But it is always glossy?—Yes.

21,472. (Mr. Sutherland.) It is an enamel in essence?—It is a question of trade terms. It may be supplied to give a dull finish or glossy.

21,473. (Mr. Parsonage.) I want to know whether it is supplied to finish flat work?—Yes.

21,474. I have never seen that. It is difficult to use, is it not?—I do not think so.

21,475. There is rather hard work for the wrist in using it?—No, I should say not.

21,476. I want to know the effect of using it for outside work?—It is very similar to using varnish.

21,477. Does it work stiffly relatively to ordinary lead paint?—Relatively to ordinary flatting.

21,478. Would the ordinary painter, working in the ordinary way on ordinary painting work, be able to use Velure?—Certainly.

21,479. (Mr. Gardner.) No special training is required?—No.

21,480. (Chairman.) Would there be any inducement to the master house-decorators to use your paint in preference to lead paint?—There would be several inducements. He would turn out, I should say, better work at a lower cost. That is a material inducement, I should think.

The witness withdrew.

Mr. PETER JOHNSTONE HUNTER examined.

21,497. (Chairman.) You are employed by the Forth Bridge Railway Company as inspector, are you not?—Yes.

21,498. Are you in charge of the painting operations on the Forth Bridge?—Yes.

21,499. Have you been instructed to attend before the Committee for the purpose of giving evidence re-

21,481. But taking it that he has a fixed idea that lead paint is the best, is there any specific reason why he should give your paint a trial?—It would be very difficult to deal with a man who has already a fixed prejudice in his mind. You cannot convince a man like that.

21,482. What kind of customers are they who buy your paint?—The decorators are our largest customers.

21,483. People who have an open mind on the question?—Certainly.

21,484. Is it because they have an open mind on the question, or because they think yours a better paint?—I think that it often begins in this way: in many cases an architect specifies it, and the decorator has to use it against his prejudice. He finds his prejudice mistaken, and goes on using it because he likes it.

21,485. Does the cost differ much from that of lead paint?—The cost per bulk would be more. The cost per bulk plus labour would be very little more proportionately.

21,486. Is the covering power greater?—We consider so.

21,487. Supposing that I was a master house-painter and I did work for my customer very satisfactorily with lead paint, would there be any special reason, owing to the particular merits of your paint, why I should change?—I should suggest to you, if I were a traveller and I approached you, that if you used Velure instead of lead paint in the ordinary way you would get one of two results: either an equally good result at a lower cost, or a better result at the same cost.

21,488. Is not that the gospel as it is preached by a large number of other firms?—I am not responsible for other people.

21,489. Mr. Chancellor has handed in a list of a large number of places where this paint has been used satisfactorily?—Yes.

21,490. Do you know from your own knowledge that this paint has had a pretty good trial, say four or five years?—Yes.

21,491. With quite satisfactory results?—Quite.

21,492. Do you know if your customers have ever returned to lead after using this paint?—Yes, I have found that, but I should certainly not consider that as a reversal to lead, implying that they had dropped Velure, but that it was a reversal to type because we have not created a sufficiently deep impression upon them. A man is using a great many different things, and he loses the impression caused by our particular stuff.

21,493. Have you ever had a case where a master house-painter or decorator has told you or your firm that he proposed to abandon the use of your paint because he had not found it as efficacious as he had found lead?—Yes.

21,494. He has told you that?—Not when lead has been used as a comparison, but on general grounds he has not been satisfied. I have had cases of that kind.

21,495. Many?—Not many; a very small proportion.

21,496. Would that be a very small percentage in comparison with those who have greatly approved of your paint?—It would be a negligible percentage.

(Mr. Sutherland.) It is only fair to say that Velure is recognised as a valuable article in the trade, but it is used mostly for finishing, and used as you would use a high-class varnish.

(Mr. Parsonage.) I think that it has more covering power than any other enamel that I have seen, if I may call it an enamel.

garding the materials that are used for painting that bridge?—Yes, I have.

21,500. Are non-lead materials principally used in the painting of the Forth Bridge?—Yes, non-lead materials principally.

21,501. What paints do you use?—Oxide of iron.

21,502. Oxide of iron is what you principally use?—Oxide of iron principally.

6 June 1912.]

Mr. PETER JOHNSTONE HUNTER.

[Continued.]

21,503. Do you use any red lead or white lead?—Both red and white.

21,504. How much do you use of each on the Forth Bridge?—The quantity of red lead last year was 1 ton 16 cwt., and white lead 18 cwt.

21,505. And oxide of iron?—9 tons of paste. That is not mixed paint.

21,506. Were the other two mixed paint or paste?—The white lead is paste. The red lead is powder.

21,507. What proportion of non-lead paint do you use in comparison with paints containing lead?—75 per cent.

21,508. Why do you use 25 per cent. of lead paint?—The lead makes the better priming coat on bare steel work.

21,509. (Mr. Gardner.) Red lead?—We use a mixture of red and white lead as a priming coat on the naked steel where we have to chip and scrape. We give it two coats of lead before we put the oxide on.

21,510. (Chairman.) How often is it necessary to repaint the parts which are painted with oxide of iron?—It varies. We paint the bridge every three years, but last year I commenced painting the lower parts every year, because they are subject to the action of the sea spray. The paint does not last so long on the lower parts of the bridge. It is really only absolutely necessary to paint it every two years, but I have commenced to do it every year.

21,511. When did you decide to use oxide of iron instead of lead paint?—That was decided during the building of the bridge.

21,512. You have always used oxide of iron?—I have always used oxide of iron with lead always as a priming coat.

21,513. You have no comparison between oxide of iron and lead paint?—Do you mean with regard to the time it would stand without repainting?

21,514. Yes?—Only with regard to inside work.

21,515. Are the directors of the Forth Bridge Railway quite positive that oxide of iron produces as good a covering as lead paint?—Lead paint is not so good unless you put some covering paint over it. It absorbs the oxygen from the atmosphere, and there is a tendency then for corrosion to begin.

21,516. Then oxide of iron was used because it was preferable to lead paint?—You had better state it in this way: The whole of the steelwork was primed with red lead, with a proportion of white in it. If you mix red lead powder and oil, the lead settles to the bottom of the pot, and you have to continually stir it. By putting in a proportion of white lead you float the red. You get a better mixture. The whole of the steel work received a coat of this red and white mixture first. We do not use red lead alone. It is always covered with oxide.

21,517. Why did you cover the priming coats of lead paint with oxide of iron paint instead of lead paint?—The priming coats are lead paint. Lead absorbs the oxygen from the atmosphere, and it is necessary to cover it with some other paint to prevent that.

21,518. (Mr. Sutherland.) You think that oxide of iron resists the weather better?—Yes.

21,519. I expect you find that it is necessary to protect the lead paint from the weather?—Yes.

21,520. (Chairman.) Do you consider the oxide of iron better than lead as a paint as a last or covering coat?—Yes.

21,521. Can you say anything as to the relative costs of non-lead and lead paints?—Lead paint is more expensive than oxide of iron. Our contract prices for oxide paste last year was 12s. per cwt., red lead 16s., and white lead 19s. 9d.

21,522. Have you ever tried to find a substitute for lead as a priming coat?—No, we have never tried to find a substitute.

21,523. Supposing that this Committee were to prohibit the use of lead for all outside work, do you think it would be possible to find a substitute for the lead priming coat that is used now?—I do not know of any at present, but I know from experience that, if it is prohibited, a substitute will be found. That is always so.

21,524. But otherwise, you tell us that the non-lead paints used on the Forth Bridge have proved satisfactory in every respect?—Yes.

21,525. (Dr. Collis.) Have you ever had any illness among the men who put on the paint?—No, there has been no illness amongst them that you could trace to the use of paint. From 20 to 22 years ago, when painting the inside of the tubes first of all, there were a number of cases of what was called painter's colic. There was a large quantity of dust in the tubes. I think that the dust had as much to do with it as anything. Since then there have been no complaints.

21,525a. They were inside the tubes?—They were inside the tubes.

21,526. Were they cleaning lead paint off the tubes, or applying the first priming coat?—In some cases they would have some lead paint to clean off.

21,527. Would that be the paint that was put on before the steel was delivered to you?—No; that would be put on after erection.

21,528. They would be cleaning off the primary coat you yourself had put on, and which you know contained lead?—Yes.

21,529. On that occasion there was a certain amount of sickness?—Yes.

21,530. Do you now have to chip the inside of the tubes at all to apply fresh priming coats?—Generally speaking, no. We may have a very small surface to chip once a year, but, generally speaking, there is no chipping to do. It means a scrape, and a rub with the wire brush.

21,531. And re-application of the oxide?—We only use lead inside.

21,532. Do you use the wire brush much?—Yes. After the steel is scraped it is always brushed with a wire brush.

21,533. Does not that create dust?—Yes, it creates dust.

21,534. Do not the men have any sickness at all?—No.

21,535. All the inside of the tube is painted with lead?—Yes.

21,536. The men have no sickness?—No. We only touch up a little corner here and there where there might be a leakage. There is no general painting in the inside of the tubes.

21,537. So that they would be only dealing with an inch or two?—Yes; it might not exceed a square foot.

21,538. Then the men would move away to another part?—Yes.

21,539. That makes a difference?—Yes.

21,540. Is there a good current of air through the tubes?—Yes, there is a good current of air through the tubes.

21,541. An up or down current as the case might be?—Yes.

21,542. That would carry the dust away?—Yes. The air in the tubes is quite pure. There is a current going through the tubes all the time.

21,543. In outside work, do you often have to scrape down to the surface?—Yes, on the lower part of the bridge.

21,544. Do you scrape down to the surface over large areas?—On the lowest points we practically scrape bare.

21,545. For how far up would that be?—To the level of about 90 feet above high water. We do the steel work nearest the water.

21,546. Do you have any of the paint under the water mark?—No; the lowest point is about 30 feet above high water.

21,547. For 30 feet you bare the steel entirely every year?—We do not bare the steel work for a distance of 30 feet every year; it is the steel work at the level of 30 feet above the high water, i.e., the steel work nearest the water, that is bared every year. (See Question 21545.)

21,548. And you have to chip all the old paint off, and you get dust?—Yes.

21,549. My experience of that part of the world is that there is usually some air blowing about?—Yes, it is generally blowing there.

U n 2

6 June 1912.]

Mr. PETER JOHNSTONE HUNTER.

[Continued.]

- 21,550. That probably carries away the dust as it is made?—It carries it away. It does not hang around in the air.
- 21,551. The men employed on that work have never complained?—We have had no complaint at all from them.
- 21,552. The only complaints of illness that you have had have been when employed on the inside of the tubes?—On the general painting of the inside of the tubes over twenty years ago.
- 21,553. (Mr. Sutherland.) You do not think that you could dispense with the lead for priming on your present knowledge?—At the present moment I am experimenting with a paint, and applying it to the bare metal. It is not a lead paint; it is a bituminous paint. It was tried four years ago on a small section, and last year I repainted that section with the same paint, and it appears to be satisfactory.
- 21,554. Is it a black?—Yes, it is a black.
- 21,555. (Mr. Gardner.) Have you never tried any portion of the outside work finished entirely with red lead paint?—Yes; I tried it just with the red alone, but it deteriorates very soon.
- 21,556. How many coats did you give it?—Two coats.
- 21,557. It did not stand?—It did not stand.
- 21,558. On what ground do you say that you must have red or white lead as a priming coat on the bare steel?—That is the result of general experience—that it is better to prime the steel with red lead before applying any other paint.
- 21,559. Have you ever tried any portion of your priming from the beginning with oxide?—I tried a portion last year with a mixed oxide paint. That was done in August last and it has failed.
- 21,560. You put oxide direct on the steel?—Yes, three coats of oxide direct on the steel. We had to chip and scrape into the bare metal.
- 21,561. The water does not get at that?—It is from 30 feet to nearly 40 feet above the water. The sea spray does get up to it.
- 21,562. (Chairman.) You would not mind very much if white lead were prohibited altogether, would you?—No, provided I find an efficient substitute.
- 21,563. And that you expect you would do fairly easily if you had to?—Oh, yes, if I had to.
- 21,564. (Mr. Gardner.) You use red lead on the bridge? There is only sufficient white lead put in to carry the red?—Yes. Some of the tubes were painted red at the beginning and we finished with white because of the lightness.
- 21,565. You have not tried zinc paint inside, because it is not exposed to the weather?—I do not see why zinc should not do equally well.
- 21,566. You might try a section just for experimental purposes?—Yes, I will.
- 21,567. Use a good oxide zinc?—Yes.

The witness withdrew.

Mr. WALTER SIMPSON examined.

- 21,568. (Chairman.) Are you at present foreman painter at Messrs. Brown & Co.'s Engineering and Shipbuilding Works, Clydebank?—I am.
- 21,569. What practical experience have you had in connection with the painting trade?—I have been all my days at the painting trade, and have been 30 years a foreman.
- 21,570. How many painters are employed at these works under you?—In the month of November about 410.
- 21,571. Have you yourself known cases of lead-poisoning among painters?—Very few; and in all my experience I do not think that I have had half-a-dozen cases altogether. I would attribute those to pure carelessness.
- 21,572. How do you know that there were only half-a-dozen cases amongst all these men you employed during all these years?—As far as we know, these cases are always reported to the firm.
- 21,573. Do they always come to you if they are ill, and tell you what is the matter with them?—If it is lead-poisoning they will do that.
- 21,574. How do they know that it is lead-poisoning?—They go to the doctor, and he pronounces it to be lead-poisoning.
- 21,575. Supposing they do not go to the doctor, but go away ill, how do you know then?—I am speaking of cases reported to us.
- 21,576. You have only had these few cases reported, but there have been a great many more?—There may have been unknown to me.
- 21,577. Do you regard the breathing of dust arising from dry rubbing down as one of the most serious dangers involved in the use of lead paints?—To a certain extent, but there is not the same amount of rubbing down now as there used to be.
- 21,578. I am not speaking about that, but when it does take place?—You may inhale a little of the dust in rubbing down.
- 21,579. Do you come here to tell us that there is no danger in using lead paint?—There is a certain amount of danger.
- 21,580. But you seem to minimise what the Committee have had in evidence as one of the most serious sources of danger—the rubbing down?—I do not see that there is a great deal of danger in the rubbing down.
- 21,581. You do not know?—Really I do not.
- 21,582. With all your experience, you do not think there is much danger in rubbing down?—Not a great deal.
- 21,583. Then you have come here to minimise the danger of contracting lead-poisoning from paints with lead in them, during dry rubbing down for instance?—The cases I know of are purely carelessness on the men's own part.
- 21,584. (Dr. Collis.) Have you had any experience at all of the use of paints other than those containing lead?—Oil paints?
- 21,585. Yes?—Yes, I use oil paints all the time.
- 21,586. Which do not contain lead?—All kinds of paints.
- 21,587. What is your experience as regards the lasting properties of paints which do not contain lead?—I think that it would be a hard thing to substitute white lead by anything else.
- 21,588. That is not what I asked you. I asked you what experience you had had as regards the durability of paints which do not contain lead; zinc oxide, for instance, or oxide of iron paint and graphite paints?—I do not think that anything stands better than white lead. That is my opinion.
- 21,589. I did not ask you that. I said: "What experience have you had of the lasting properties of paints which do not contain lead?" What you keep on telling me is that you think that nothing will stand like lead. I want to know your experience?—As far as my experience goes I have found that other paints such as zinc oxide and so on stand very well.
- 21,590. Have you used them much? That is what I want to get at?—Yes, I have used them very largely.
- 21,591. For what purposes?—For inside work.
- 21,592. On what?—Confined places, with oxide paint, in Admiralty work.
- 21,593. Are you doing much Admiralty work?—We have four vessels in hand just now.
- 21,594. And the inside confined places are done with oxide of iron?—Entirely.
- 21,595. Do you use non-lead paints for any other parts of the vessels for the Admiralty besides the confined places?—No.
- 21,596. What do you do the top decks with?—First with red lead, and finish them off with zinc and white lead mixed.

6 June 1912.]

Mr. WALTER SIMPSON.

[Continued.]

21,597. How much white lead do you put into the zinc?—The Admiralty mixture of white paint is two-thirds zinc white and one-third of white lead. We must use that.

21,598. You use those for decks and for cabins?—For all finished work.

21,599. Then with regard to confined places, you have some experience of oxide of iron. What is your experience of the use of zinc oxide paint alone?—Do you mean in any particular colour?

21,600. White, or colour if you like, as long as you do not put lead into the colour?—I find that zinc works very well.

21,601. What knowledge have you of its use? For what parts of vessels, and in your work generally, have you experience of its use?—As a rule, I finish most with zinc white. The finishing coat, such as flattening, is always done with zinc.

21,602. Have you had any experience of the use of zinc brought up from the base?—It is very seldom that we do that, but I have done it. I prefer white lead as a base.

21,603. I do not want your preference, but what your experience is based on?—I have put it on bare iron and bare wood.

21,604. For what purposes—what part of the vessel?—All over—the whole of the inside entirely with zinc white, the first coat.

21,605. And the hull, too?—Yes, entirely.

21,606. Right on to the bare metal?—Right on to the bare iron or bare steel.

21,607. And brought the whole thing up with that?—Yes, brought the whole thing up with that.

21,608. Could you name a vessel that has been so treated?—Yes, I believe I could. I cannot remember the name at the moment.

21,609. You have a vessel in mind?—Yes.

21,610. Was the vessel when it was finished good in appearance?—It looked perfectly well.

21,611. Has that vessel come back into your hands for repainting?—No.

21,612. Do you know how the paint stood?—I have had no report back of any fault being found with anything.

21,613. That experience seems to be good?—Yes.

21,614. Do you get vessels sent back to you for repainting ordinarily?—No. As a rule when we finish a vessel we are done with it.

21,615. You have no knowledge then of the durability of the paint you put on?—We have had several of the Cunard vessels back for repair.

21,616. Have any of those been brought up with zinc from the base?—No.

21,617. Then you have had no experience in regard to durability?—No.

21,618. The only test of paint is time?—Yes. I have not seen a vessel back that has been coated throughout with zinc.

21,619. You say that you can make a vessel look perfectly nice with zinc, but we want to know how it will last. On that point you have no experience?—Not with regard to a vessel coming back. I have seen many jobs finished with zinc.

21,620. We all understand about the finish, but how will the zinc last?—It is not as durable as white lead.

21,621. But on what do you base that? Can you give us a single case?—I have so many through my hands that I cannot remember any single case at the moment.

21,622. You mentioned the Cunard?—I finished some 250 ton cranes with zinc, and it did not stand as well with zinc. I am painting them at the present time with white lead.

21,623. (Mr. Parsonage.) How long have they stood?—Five years. They had a coat of oxide of iron. Sir William Arrol built the cranes. They came in under a coat of brown or red oxide. I finished a couple of coats with zinc white. They are pretty bare now.

21,624. (Dr. Collis.) Can you tell us of any similar crane painted in a similar way with lead?—Those are all the big cranes we have in the yard.

21,625. We must have a comparison to see whether, if the paint had been lead, it would have lasted better?—I have some jobs in the yard which have been done with white lead. They are perfectly good although they are dirty.

21,626. How long ago?—About the same time.

21,627. What are they?—One a crane, or big machine, which is there was done entirely with that.

21,628. What kind of machine was it?—A machine for rolling plates. That was done ten years ago, and it is good.

21,629. The wear and tear on that is as much?—The wear and tear on that is as much as on the cranes. It is used every day of the week.

21,630. (Mr. Gardner.) From the first time you paint a hull inside till the ship leaves the yard, what is about the average time that would elapse?—Five or six months.

21,631. If you give one vessel a coat of red lead and another a coat of zinc, a long time elapses between the two coats?—Yes.

21,632. What sort of appearance has a vessel painted with zinc as compared with an ordinary vessel coated with lead during that time? You know how the first coat acts on the steel?—The zinc or even the white lead will turn quite yellow; the red lead will not. The rust will come right through.

21,633. Did the rust come through the zinc just as much as through the lead?—More so. It does not come through the red at all. It will show through the white lead a little. There is not the same body in the zinc.

21,634. That would go to show that even the zinc is as good a protection against corrosion as white lead?—I would not say that.

21,635. The rust was there?—The rust was there, but there is not the same body in the zinc, and it came through sooner.

21,636. Sooner than with the white lead?—Yes.

21,637. That is what I wanted to know. And how about the red lead?—You will scarcely get it to come through the red lead.

21,638. It is an effective protection against corrosion?—It is as near perfection as we can get it.

21,639. What is the best protection for the outside of a hull? Which paint is going to stand subject to the action of the water? Have you had experience of that?—Do you mean red or white?

21,639a. Take them all?—The best thing I get for a ship's bottom is red and white lead mixed. Nothing stands better.

21,640. Have you ever tried zinc for outside in the water?—Yes.

21,641. How did it stand?—It got quite soft and fuzzy in the water.

21,642. You would take the vessels to the graving dock, and that is how you would find it?—Yes, that is how you would find it. That is where you would see it.

21,643. Why did you use the oxide of iron in the confined places instead of red lead, if red lead is so much better as a protector?—The Admiralty Orders specify it. We are obliged to do it.

21,644. Then they will have some reason for specifying it?—The reason is that a ship which was done with red lead was being cleaned up some years ago, and the sailor men complained of lead poisoning. It was supposed to be that. They got it into their heads that it was that. A good many knocked off through it, and so the Admiralty said: "Do away with red lead entirely in all confined places."

21,645. The men would be scraping off red lead and creating dust?—Yes.

21,646. You think that the Admiralty have stopped it because of the danger of lead poisoning, and have specified oxide of iron?—Yes; that is the reason.

21,647. Have you tried bituminous paints in these confined places?—Bituminous paints in double bottoms.

21,648. Do men work in the double bottoms with red lead as they did for many years? You do not know of any evil effects on the men?—No.

21,649. Except through the fumes?—If you wait in too long it will affect you.

6 June 1912.]

MR. WALTER SIMPSON.

[Continued.]

21,650. You put that down to the fumes from the medium—the oil and turpentine?—Yes.

21,651. Has it any different effect on the men now that they are coating with oxide of iron?—The smell of the paint is there at all times. You cannot wait in a confined place too long. You must get fresh air. With double bottoms I have an electric fan, and a hose leading into them.

21,652. Is there any difference between the period of time that a man can wait in with lead paint, and the period of time with oxide of iron?—As far as the smell is concerned it is about the same.

21,653. And with bituminous paints?—It is much worse. I have taken men out of the double bottoms in all states, shouting and fairly stupid. I have had to put them below ventilators to bring them round.

21,654. Then, in your opinion, bituminous paint has a very much worse effect on the men than other paints?—I hope that I shall never be required to do double bottoms with them again.

21,655. I suppose that you have had to lift men out?—Yes, lift them through the manhole.

21,656. They could not come out themselves?—They could not come out themselves.

21,657. (Mr. Parsonage.) Does it stupefy them?—I have been down myself for a time, and after a little time I felt that my head was swimming.

21,658. (Mr. Gardner.) You only remember starting one vessel from the foundation with zinc in all the work that you have done?—I believe that I have done more. It is a long while to look back at all the vessels I have done; I have done so many.

21,659. At the time she left the yard she would be just as good as any other vessel?—Yes, at the time she left the yard.

21,660. If anything had gone wrong with the vessel the owners would have complained?—In a case like that the owners specify that it shall be done with zinc; otherwise it would not be done.

21,661. So that they could not make a complaint if anything went wrong?—No.

21,662. The first vessel was done for these owners on that specification. Do you know whether they repeated the specification?—Really, I could not say. If you had let me know the questions you were going to ask I should have been prepared with an answer, but I cannot answer from memory.

21,663. So far as the durability of paint goes, you think that there is nothing to replace white and red lead for painting on board ship for preparatory coats?—I prefer it myself for preparatory coats.

21,664. It is the case that we have a good deal of lead poisoning in the trade, although it may not have been your experience. If rubbing down and the inhalation of dust does not cause that poisoning, what do you think causes it?—I think that there is a good deal of carelessness on the part of the workmen themselves. They are not clean, and they are careless as well. I have seen them sitting down for meals with their hands covered with paint, and although I have hot and cold water, a nail brush and everything else and every accommodation in my shop, they will not take advantage of the accommodation. They really are eating paint.

21,665. What accommodation have you for washing purposes?—I have two large sinks 4 feet 6 inches, hot and cold water, soft soap, a nail brush and a towel.

21,666. Two taps?—Yes.

21,667. For 400 men?—We have not always 400 men.

21,668. Supposing that you had only 100, would that be adequate provision?—I have 200 now.

21,669. (Chairman.) How many towels have you for 200 men?—Most of them are local men.

21,670. Have you one towel for 200 men?—Yes, one big towel.

21,671. I call it disgraceful for you to come here and tell this Home Office Committee that the men are careless, when you supply them with one towel to wash these dirty hands which you have described to us?—You may not understand the towel I mean. It is a large one.

21,672. I do not care how large it is?—It is several yards of canvas.

21,673. (Dr. Collis.) How long would it take these 200 men to get washed? It would take three-quarters of an hour at least if they were even to wipe their hands on the towel?—Two-thirds of the men live locally.

21,674. That does not matter. They ought to wash before they leave the premises?—They are not allowed to leave the ship to go into the shop before the time.

21,675. There is no time allowed for washing?—They should do it in their meal time.

21,676. (Mr. Parsonage.) If they were caught a minute before, they would have to go out?—Yes.

21,677. (Dr. Collis.) Are you helping to make them clean?—Ours is the finest shop in the river.

21,678. It does not say much for the others. The standard is one washing basin for every five men; you have one for 200, and you say that the men are dirty?—So they are.

21,679. (Mr. Gardner.) When the horn blows there is not much chance for a man to wash. If he had to wait for a turn at the tap, he would have no time to take his food?—I see that.

21,680. So that that points to the necessity of more washing facilities being provided in the yard?—That is what is wanted.

21,681. (Mr. Parsonage.) Is there anything to prevent you from providing them, and allowing five minutes for washing?—That is not in my power. Our order is that no man shall leave the ship before the horn blows.

21,682. (Chairman.) My point is that you complain of the men being dirty, and yet you tell us that they have no opportunity of making themselves clean. That is the point. I may tell you this: that if lead were allowed to be used in the future, one of the first conditions would be that you provided proper washing arrangements, and a towel for every five people. Instead of having one or two taps for 200 men, you would have to have 40?—But as soon as the horn blows the men are on the way home.

21,683. Before they left the factory you would have to provide one towel for every five people, and soap, and proper washing accommodation?—What I have spoken of is there if the men want it, but they do not come into the shop.

21,684. But my point is that you have come here and made a complaint against the men of being dirty, but, by your answer to Mr. Gardner, we find that you provide no accommodation?—I have seen them coming in and not even taking advantage of the water that is there.

21,685. Of the ample supply you give?—Yes.

21,686. (Mr. Parsonage.) Do your firm give you instructions to put the towel there?—I do the whole thing myself.

21,687. Have you no instructions to provide washing accommodation for the men?—None whatever.

21,688. So that what you have you have provided entirely on your own account?—Yes.

21,689. You give them canvas to wipe their hands on?—Yes.

21,690. You know that they cannot wipe their hands on canvas?—It is not hard canvas.

21,691. Supposing it is ordinary scrim canvas, you cannot wipe your hands properly on it?—I have done so many times.

21,692. (Chairman.) When you go back you might see if you cannot give them a little more accommodation, and help them to be clean?—That is all very good, but if a man is not allowed to leave a ship before time, what are you to do?

(Chairman.) You might tell them what you have heard here.

21,693. (Mr. Parsonage.) You say that it is the best shop on the Clyde? It does not say much for the others?—Mr. Gardner can tell you what the other shops on the Clyde are like.

The witness withdrew

## THIRTY-SEVENTH DAY.

Tuesday, 9th July 1912.

PRESENT:

SIR ERNEST, F. G. HATCH, BART. (*Chairman*).

Mr. E. L. COLLIS, M.B.

Mr. W. G. SUTHERLAND.

Mr. A. GARDNER.

Mr. J. PARSONAGE.

E. A. R. WERNER (*Acting-Secretary*).

M. GIRAUD and M. PETIT examined.

21,694. (*Chairman*). Do you, M. Petit, attend to-day as representing the French firm of Carlier Frères, manufacturers of hydrated zinc oxide?—Yes.

21,695. And do you attend to-day as the English representative of the same firm trading as Giraud & Co., London?—(*M. Giraud*.) Yes.

21,696. Do you manufacture leadless paints?—We are not paint manufacturers. We manufacture Zinox, which is a stiff paste composed of pure zinc oxide (hydrated) ground in pure linseed oil. The painter prepares paint from this paste by the addition, according to need, of oil, turpentine, driers, and colour. We guarantee Zinox free from white lead.

21,697. Is your paint intended to be used as a substitute for white lead in paints?—Yes.

21,698. What is the composition of your non-poisonous paint?—The composition of the Zinox is hydrated zinc oxide and pure linseed oil. The chemical analysis of this product gives zinc oxide (ZnO), water (H<sub>2</sub>O), and linseed oil only.

21,699. What vehicle is used?—Pure linseed oil.

21,700. Are there any lead compounds in your paint?—No.

21,701. Are lead driers added?—No.

21,702. Do you use turpentine for thinning?—Zinox contains no turpentine. The painter can thin with turpentine or any substitute.

21,703. What substitutes are used if turpentine is not used?—They use white spirit. They can use any kind of turpentine substitute.

21,704. Do you get sufficient covering power without the use of lead?—Paints made from Zinox have greater covering power than those made from white lead.

21,705. Will you give us exact particulars of the comparative covering power of Zinox and white lead?—If one makes two normal paints, one with white lead and the other with Zinox, their covering power will be identical, that is to say, that the obliteration will be exactly the same. For instance, the usual formula for paints with white lead and Zinox are: white lead 2½ lbs., oil 4½ ozs., turpentine 2 ozs.; Zinox 2½ lbs., oil 1 lb., turpentine 2 ozs. For the drier, the usual proportion for the above amount of oil. These two paints will obliterate quite equally, but white lead paint, according to the above formula, will only cover 11 square metres, when Zinox will cover 15 square metres. Therefore, Zinox goes further, because it covers 15 square metres with the same obliteration as white lead for 11 square metres.

21,706. What do you mean precisely by "the same obliteration"?—By "obliteration" I mean that if you take a board with a black line drawn on it, and put one layer of white lead and one layer of Zinox on the board, you will get exactly the same obliteration with the white lead as with the Zinox.

21,707. How does the cost of your paint compare with that of lead paints?—Paints made from Zinox are cheaper than those made from white lead.

21,708. Can you tell us how much cheaper?—Well, it comes to about 1s. 10d. per cwt. It is cheaper in use—not by weight.

21,709. Do you sell much of this Zinox in France?—We have sold for this year already between 700 and 800 tons.

21,710. Do your customers tell you that it is no more costly to paint with the leadless paint than to use lead paints?—All our customers say that paints made from Zinox are cheaper to use than paints made from white lead.

21,711. Over what period have your paints been in use?—Zinox has been in use in France for seven years.

21,712. Has the Zinox paint been found to be durable?—Yes.

21,713. Do I understand that you have had no complaints in that respect?—None of our customers have complained of the durability of paint made from Zinox for exterior work, or interior work. They have not complained at all.

21,714. (*Mr. Sutherland*.) For neither?—For neither.

21,715. (*Chairman*.) Can you give us particulars of a test of the durability of this zinc paint?—At St. Denis, near Paris, 22, Avenue de la Plaine, stands a five-storey corner house. The first and second storeys have been painted with Zinox, and the third, fourth, and fifth storeys with white lead. To-day, the Zinox is in a better condition than the white lead. This house, which was painted in October or November 1906, is still to be seen. We saw it two weeks ago, and it had not been repainted. But if a member of the Committee was desirous to see it, we should like to know beforehand so as to preserve it as it is. On this subject I have a letter from the proprietor of the house, and he says himself how the house stands now.

21,716. Will you please read it?—"With regard to your asking about your Zinox which has been employed six years ago for the exterior painting of our house, situated at 22, Avenue de la Plaine, St. Denis, we are happy to say that the results obtained have been far superior to those obtained with the white lead, because the two storeys painted with the Zinox are still in a very good state, while the three storeys painted with white lead have a very black aspect. The paint of the white lead is falling into dust, and" (they put a French expression, which I must translate literally into English) "'swears with the Zinox.' That is to say, that it looks very bad beside the Zinox, which is still in a very good state. We do not regret to have made the trial, and we recommend your Zinox as being superior to white lead."

21,717. Is the gentleman who wrote that the proprietor of the house?—Yes, he is the proprietor of the house.

21,718. Is he a quite disinterested person?—Yes. He is himself a manufacturer of paints. He is a manufacturer of English varnish. He is not the painter. The house belongs to him.

21,719. Would you give his name?—Certainly

21,720. Will you put the letter in?—Yes.

21,721. You tell us that this house has been exposed to atmospheric conditions for six years?—For six years. There are no other houses round it, and the house I must say is situated in a very bad place in St. Denis. Therefore, the rain or sun or any bad weather is going against it all the time.

U u 4

9 July 1912.]

M. GIRAUD and M. PETIT.

[Continued.]

21,722. I suppose that in Paris the atmosphere is purer than in some of our manufacturing towns?—I dare say that it would be, but we have tried Zinox in Lille, which is a manufacturing town with a lot of smoke all over, and the buildings are very black. We found that Zinox will stand much better in Lille than white lead.

21,723. Have you any evidence similar to that which you have given us with regard to Paris, from which the Committee could see quite clearly that the trials of Zinox in manufacturing towns have been satisfactory?—We have some letters. The only evidence that we have of that kind are the houses which have been painted with Zinox in Lille.

21,724. How many houses did you paint with Zinox in Lille?—M. Petit says between 200 and 300, but he does not know very well, because they supply the wholesale paint merchants, and are not in direct contact with the builders. But we have some letters from people in Lille who have been using it and who say that they have had no complaints whatever about the Zinox.

21,725. Can you name a few of the most important customers who have expressed their satisfaction with your Zinox paint, and have given repeat orders for it?—Among our buyers are Messrs. Boyer Frères, Rue St. Honoré, No. 392, Paris; Messrs. Durand, Giroux, Froment & Co., Rue St. Meri, No. 5, Paris; Messrs. Cadot Frères, Quai de la Guillotière, No. 9, Lyons; Messrs. Les Fils de V. Faur, Rue St. Remi, 32, Bordeaux; Messrs. de Kouninck et de Decken, Antwerp, Belgium. These firms use between them 500 tons of Zinox a year.

21,726. (Mr. Sutherland.) Are they paint manufacturers or dealers?—They are wholesale people like a paint merchant would be here.

21,726a. Not decorators?—Not decorators. Wholesale paint merchants.

21,727. (Chairman.) Have you any English customers?—No, we have no English customers. I have submitted it to different firms. So far the firms to whom I have submitted it have said that it is a very suitable product.

21,728. I want to know whether the paint has been tried in England in any way?—No, it has not been tried in England.

21,729. Has Zinox been used on ships?—Zinox has been used to paint yachts, and the result has been very good, as one owner has recommended the use of Zinox to all his friends possessing yachts. On this subject I have some letters, if you would like to see them, from people possessing yachts; and there is a letter from a boat builder in France who is using Zinox for all his work.

21,730. Would you give a little explanation of each letter, and then put the letters in?—Certainly. I have a letter here from a gentleman of the name of Monchablon, a yacht owner, and he says that he is very pleased with the Zinox. His yacht, of which the name is "Yvonne," is 40 tons. He says, "My boat has been painted with Zinox." Only the top parts are painted with Zinox; that is to say, the parts which are above the water. The keel and bottom of his boat are copper, and he could not paint them with Zinox. He said that in a small boat like this the sea water is going over practically all the time, and Zinox has never been affected by it. He says that last summer he was in a place in the Riviera, and he remarked about another yacht much larger than his which had been painted with white lead just at the time, and it looked much worse than the paint on his yacht.

21,731. Was it painted at the same time?—That he does not say. He said that in the other boat the paint was yellow in places.

21,732. Then the comparison is not worth very much, is it?—No. He says that he thinks it was done quite recently; because the boat was a very elegant one (if I may put it that way), and the owner of the boat generally had it repainted every year. It is one of the smartest yachts in the Riviera.

21,733. Just quote the other letters?—Here is a letter from Messrs. Abel, Le Marchand, Vincent & Cie. They say: "Dear Sir—I have used Zinox for seven years on all the boats I am speaking of, and

" which I have navigated. I have always been very satisfied with this paint, which adheres to the wood and preserves it perfectly. The paint also remains white, and is very economical in use, which is the reason why I am continuing to employ it with great satisfaction to my customers. I shall always be very pleased to recommend the qualities of Zinox because I have always been satisfied that it is a good product." Here is a letter from a gentleman who possesses a yacht also, and he is ordering only 10 kilos to repaint it. He says: "I have been very satisfied last year with the Zinox you have supplied me with. Will you kindly send me as quickly as possible two barrels of 5 kilos each to the following address," which is given. That is from M. Bar. Those are all the letters I have about yachts.

21,734. Can Zinox be used on iron?—Zinox has been used with the same success on iron, steel, and wood.

21,735. Can you give us any particulars of where it has been used on iron?—M. Petit says that in Lille there are some works of spinners where they make thread. They are obliged to use vapour of water; and the top of their works is covered with iron. Until lately they have been using all sorts of paints, which could not stand the moisture. Last year they used Zinox and it has stood it very well. We have a letter from that firm.

21,736. Are the works that you speak of large ones?—Yes, very large works.

21,737. For how long have they used Zinox with such success?—For four years. There is another firm of the name of D'Alciel which used it six years ago.

21,738. Have they repeated the order?—M. Petit does not know. He says they will use Zinox, but the orders would not be put through to them direct, because they are buying from someone else.

21,739. Do they still use Zinox?—They still use Zinox. They do not use anything else.

21,740. How often do they paint these iron roofs?—Not more than once a year.

21,741. (Mr. Sutherland.) Have they only just started with your stuff?—No. Some was started six years ago, and one started four years ago.

21,742. (Chairman.) Supposing that the demand for zinc paints were to be greatly increased, would there be any difficulty in getting sufficient zinc ore at present prices?—As far as we are aware, we will always have sufficient zinc oxide to meet even a very strong demand.

21,743. What is your knowledge with respect to this?—The knowledge of my firm—what my firm have told me. M. Petit says they have no fear of being short of zinc oxide, because they are engaged with such large firms, who will be only too pleased to make contracts with them, and they already have contracts with them, because they can make it as well from the metal as from the ore.

21,744. Do you know anything about the capacity of the world for producing zinc ore?—M. Petit says that he cannot give a very definite answer.

21,745. Now, will you kindly translate the letter about the cotton mill?—The name of the firm is Delannoy et Fils: "In answer to your letter of the 21st June we must say that we are very satisfied with the Zinox. For a great number of years we have tried a great number of different colours in paints in our spinning room, where we do work thread with artificial humidity, and we have never before been able to obtain a result to be compared with the one obtained with Zinox. We are happy to assure you of this."

21,746. Does moisture not affect Zinox paints?—Salt and water does not affect Zinox. Re the complaints made about ordinary zinc oxide being affected by water remaining in the sashes, such complaint has never been made about Zinox. Moisture would not affect it, as it has been used in that spinning factory.

21,747. Can Zinox be used on glass?—Zinox can be used on glass like any other paint.

21,748. Do you know if your Zinox paints are used by the railway companies?—We know that the French Northern Railway and the French Eastern Railway

9 July 1912.]

M. GRAUD and M. PETIT.

[Continued.]

use Zinox, but we do not know for what purposes exactly.

21,749. Have you tried to ascertain for what purposes it is used?—No, we have not tried to ascertain, but we think it is for all their buildings and stations. We have a letter from the contractor of the Northern Railway, who is contracting for the supply of all the paints of the Northern Railway.

21,750. Please read it?—The name of the contractor is Mr. F. Grandi. They wrote on the 15th June 1912 to Messrs. Carlier, and they said: "Following your demand, I have pleasure to inform you that all the zinc oxide hydrated, which you call 'Zinox,' has given me full satisfaction in the many applications I have made with it." This firm are contractors to the Great Northern Railway Company, and I must say that the Great Northern Railway Company made a trial of Zinox six years ago. They painted a board partly with Zinox, partly with white lead, and partly with other kinds of paint, and they put it against their works, so that the smoke or any kind of bad weather could go against it. At the end of six years they looked at it, and found that Zinox was the best of the lot, and it was after that result that they forced their contractor to only use Zinox for all the works.

21,751. When did you first bring Zinox under the notice of the railway companies?—Six years ago.

21,752. What quantity of Zinox have they used since that time?—I could not tell you. It goes direct to the contractor, so we do not know.

21,753. Have you any idea whether it has been used continuously?—M. Petit says that he knows that for one special work they took 6 tons, and the French Eastern at one time, for one work only, took 7 tons. But as it goes through the contractor it is difficult to answer.

21,754. Could you tell us how many tons of paint they use in the whole of their system in the year? I want to know what percentage this bears to the paint that is used generally?—M. Petit says that it is rather difficult to answer, because of the difference from year to year and the difference of the structures to be painted.

21,755. Could you apply to any of the railway companies to ascertain exactly what use is made of Zinox paint in any of their departments?—I could apply to those two companies to know the quantity of paint they use in a year.

21,756. It would be very satisfactory to this Committee if they could hear authoritatively that one of the great railway companies in France used this paint for a variety of different purposes, and that it had been satisfactory in all respects. That would be very good evidence. Could you find out, for instance, whether it is used for railway carriages, whether it is used for iron bridges, whether it is used for railway stations, where smoke plays such a serious part?—I think that that is where they generally use it at the present moment—on the stations. M. Petit asked me to tell you about the President of the *Chambre Syndicale* of the Master Painters in Paris. If you would write to the president (M. Manché) officially he would tell you anything you would require about Zinox.

21,757. (Mr. Sutherland.) I know him. He visited us at Leeds?—We asked him for a letter. He said: "I cannot give a letter, but if I have an official letter from the Home Office I will reply."

21,758. (Chairman.) That is very satisfactory. Now, do you supply users direct or only through paint merchants?—Only through paint merchants.

21,759. Then you do not always know for what purpose Zinox is used?—No.

21,760. But you judge of its efficiency as a paint by the fact that the demand for it has increased considerably since it was put on the market?—Yes. The demand has practically doubled each year. If it might interest you I have a letter here from the vice-president of the same *Chambre Syndicale*.

21,761. Will you translate it?—This gentleman is also a builder and contractor and master painter. He says: "You know that I have followed Zinox very attentively since its appearance on the market, and that from last year I have adopted Zinox exclusively for all my works, as well for the interior as for the

exterior. I estimate that it is the best of the products which we possess actually to replace white lead as to the point of view of covering power, and the facility of having it employed by our workmen. I must add that of the numerous works which I have executed with Zinox it gives the greatest satisfaction to all my customers and also to their architects."

21,762. (Dr. Collis.) In 1915 in France the use of lead in paints for buildings will be prohibited, will it not?—Yes, it will be, if there is no other law coming on the top of it which might alter it.

21,763. As the law stands at present, that is so?—Yes.

21,764. Are the building contractors and decorators taking steps in France to find out what they will use when that law becomes operative?—M. Petit says that in France the contractors are looking for a substitute for white lead, because of the law.

21,765. Does that, do you think, in any way account for the prosperity of the Zinox firm just at present?—M. Petit says he does not think that that is what makes the good sale of Zinox at present, because there are many substitutes for white lead on the market, which have been tried by many firms, and in none of them have they found the qualities which they find in Zinox. They have found also that Zinox is better than white lead, and even if there was not a law in France the people would prefer to use Zinox instead of white lead.

21,766. And even without the law which is to come into force in 1915, do you consider that the sales of Zinox would be equal to what they are now?—It is not the fear of the law which makes people buy Zinox. It will be bought because people see that it is better than white lead, and they will certainly use it in place of white lead.

21,767. Yes, but you understand the point that I am upon?—I know quite well what you mean.

21,768. Is there really here a true comparison with white lead, or is it because white lead has got to go in 1914 that they are picking out the best of what remains?—I quite follow your question. He says that that does not make any difference. It does not affect it in any way.

21,769. I wanted to get that point clear?—If there was no law, people seeing the Zinox would buy it just the same.

21,770. (Mr. Sutherland.) On its merits?—On its merits.

21,771. (Dr. Collis.) With regard to hydrated oxide of zinc, which is sold under the name of Zinox, is the method of preparation a secret in any way? I do not want to ask the method if it is secret?—Yes.

21,772. Might I go so far as to ask whether it is made from the ore by the direct process at all?—M. Petit says that he can use zinc oxide made by the direct process or the indirect process. It does not matter to him.

21,773. Does he buy the zinc oxide made or does he make the zinc oxide?—No, he does not make the zinc oxide.

21,774. He buys it and then hydrates it?—He buys it and then hydrates it by special process, which is a secret.

21,775. So that his process of manufacture depends, not on the amount of zinc ore which there is in the world but on the amount of zinc oxide produced from the ore?—Yes, that is right. He can make his stuff from zinc oxide coming from the ore or coming from the metal.

21,776. Yes, but he has to get the zinc oxide first. He does not produce it straight from the ore?—No; he buys the zinc oxide to make this.

21,777. He is in fact a paint manufacturer, the same as in England a person is who buys white lead from the lead corroder and makes white lead paint?—Yes, exactly the same.

21,778. So that the supply of zinc oxide which he can get affects his output; in the same way that, if the lead corroders could not get enough lead to make white lead, the paint manufacturer could not make his white lead paint?—Yes, that is right. That is why we put the answer as we did. We know that the firms would

9 July 1912.]

M. GIRAUD and M. PETIT.

[Continued.]

be only too pleased to supply us with large quantities, and my firm already have large contracts placed with different firms.

21,779. Is the zinc oxide that he uses chiefly made in France?—He has many firms who are supplying him with samples of zinc oxide, and he takes the one that he likes best for his purpose. He is not bound to anybody.

21,780. No, but as a matter of fact does he buy usually in France or from Belgium or Germany?—He buys practically everywhere. France, Belgium, Holland, and America. He takes those which are found best for his purpose.

21,781. Does it affect his product if the zinc oxide contains any appreciable amount of lead?—He does not use any zinc oxide with lead in it. He always analyses it and tests it, and if there is any lead in it he does not use the zinc oxide.

21,782. What amount of lead does he allow in the zinc oxide? Does he allow himself a limit of one per cent. or what?—No percentage at all. I know the French Code would give three per cent. of lead.

21,783. But he works with none?—He works with none.

21,784. To the best of your knowledge, does it stand sulphur fumes?—M. Petit says that they have no effect upon it at all.

21,785. (Mr. Sutherland.) They do not affect it?—They do not affect it.

21,786. Not sulphurous gases?—No.

21,787. (Dr. Collis.) Has it been used at all in gas works?—He says that it has been used in places where people have sulphurous baths. They always use Zinox there.

21,788. Has it been used at all in gas works?—No. That is the only answer he can give to your question.

21,789. (Mr. Sutherland.) Is M. Petit the gentleman who published a book on zinc oxide?—Yes.

21,790. Published by Scott, Greenwood, & Co.?—I do not know.

21,791. It was translated?—Yes.

21,792. There is an English edition. Is Zinox nothing but pure zinc oxide?—Yes; pure zinc oxide guaranteed.

21,793. How does it differ from the ordinary zinc oxide paint?—He says that the difference between the ordinary zinc oxide and Zinox is that the Zinox is much thinner and the Zinox forms a combination.

21,794. Thinner?—The molecules are much thinner.

21,795. Finer?—Finer. By his process there is a true chemical compound which does not exist with ordinary zinc oxide.

21,796. But what constitutes the difference in application between Zinox and zinc oxide?—Do you mean in the working?

21,797. Yes, in the working?—It is exactly the same.

21,798. M. Petit in his little book speaks of a thin coat of white lead paint as one of the great advantages in painting, and as a means of getting good work. He admits in his book that a thin coat is very much better than a thick coat for the life of the paint. He also admits in the book that zinc cannot strain as thin and give the same covering or obliterating capacity that lead can. Now, how does Zinox get that covering capacity?—Zinox gets that covering capacity by the method of making it. That is the only answer I can give. It does obliterate as well as white lead; and it will therefore obliterate better than ordinary zinc oxide will.

21,799. Will it spread thin like white lead?—It will, because the thinner you use it the better it is.

21,800. And still keep the covering power?—And still keep the covering power.

21,801. (Chairman.) I do not think that you have answered Mr. Sutherland's point quite. What is the difference between this paint of yours and ordinary zinc oxide?—If you use ordinary zinc oxide for outside work, for instance, after a certain time the molecules of the zinc will go down in the oil. It will be only zinc oxide in transparent oil if I may say so. With Zinox it will be a true chemical compound, and therefore the zinc oxide cannot be separated either from the

oil or from the water. They do not separate; they form a homogeneous film exactly like white lead does.

21,802. (Mr. Sutherland.) Does Zinox saponify like white lead?—It does.

21,803. Is it a secret thing?—It is a secret thing.

21,804. Is it covered by the process of hydration?—Yes; it is covered by the process of hydration and operation of the oil.

21,805. I understand that there is nothing added in the way of thinner to the zinc oxide?—No; there is only pure hydrated zinc oxide and pure linseed oil.

21,806. The best linseed oil?—The best linseed oil.

21,807. You do not require any special preparation for the linseed oil?—That I do not know. I think that he makes special preparations, too. He says that they always buy the best, the purest linseed oil, analyse it and see that it is very pure, and then he makes his own preparation after.

21,808. But he does not change the nature of the oil, does he?—That I cannot say.

21,809. And when you supply it to a painter, does he just mix it with ordinary linseed oil and turpentine?—Yes.

21,810. And does it require as much oil as zinc oxide does?—Yes, he says that we use more oil with Zinox than we do with ordinary zinc oxide. This paper will show you perhaps:—

#### Directions for Use.

All the paints in current use can be made with Zinox M or B.

The best results are obtained in using Zinox M or B in the form of very liquid paints.

#### ZINOX "M" (Flat).

The following is, for example, an excellent liquid paint for application on plaster:—

For outdoor work—

By Weight. By Measure.

|            |   |                     |
|------------|---|---------------------|
| Zinox M    | : 100 lbs.                                      | 4 gallons.          |
| Oil        | - 50 "  | 5½ "                |
| Turpentine | 5 "   | ½ " (slightly over) |
| Drier      | : Usual proportion for the above amount of oil. |                     |

This liquid paint, though very fluid, covers perfectly, is very durable, and highly economical.

For indoor work, decrease the amount of oil and increase that of the turps, viz.:—

By Weight. By Measure.

|            |   |            |
|------------|---|------------|
| Zinox M    | - 100 lbs.                                      | 4 gallons. |
| Oil        | - 35 "  | 3¾ "       |
| Turpentine | 15 "  | 1¾ "       |
| Drier      | - Usual proportion for the above amount of oil. |            |

For dead flat:—

|            |                     |
|------------|---------------------|
| Zinox M    | - - - 100 lbs.      |
| Oil        | - - - 5 "           |
| Turpentine | - - - 30 to 35 lbs. |

or better with turpentine alone, viz., 30 to 35 lbs.

#### ZINOX "B" (Glossy).

Contains and requires no varnish.

Same formula as for Zinox M.

Zinox B yields liquid paints which dry to a highly elastic film with a brilliant enamel lustre.

The method already given for dead flat with Zinox M, if applied to Zinox B, will give a waxy polish.

These paints smooth themselves, and can be washed repeatedly without losing their brilliancy.

#### Important Notice.

Zinox M or B applied on hard wood (oak) out of doors ought always to be used in the form of oily paints, i.e., liquid paints in which oil predominates, even when used on places exposed to the sun.

It neither wrinkles nor cracks; its elasticity is remarkable.

9 July 1912.]

M. GIRAUD and M. PETIT.

[Continued.]

To preserve Zinox M or B, cover it with a layer of water.

21,811. But you do not give here the proportion that is used for zinc oxide?—No, but he says that they use more with Zinox than they do with the ordinary zinc oxide.

21,812. Could you send the Committee a specimen of Zinox to test?—Yes.

21,813. What quantity?—A 7-lb. tin. I have two small samples here.

21,814. (Chairman.) A 7-lb. tin is something that can be used practically. Mr. Sutherland might like to use it?—There are two qualities, one which is flat and one which is glossy. Both of them contain only pure linseed oil and pure hydrated zinc oxide.

21,815. Can you make this Zinox paint in any colour?—We always make it white ourselves, but the painters can tint it any colour.

(Mr. Sutherland.) If the material is good it can easily be tinted. You could not get dark colours like greens and so on with this, but you could get light shades.

21,816. (Chairman.) Then this Zinox paint could not be used for dark colours?—No, not for very dark ones. It can be used exactly in the same way as you would use white lead. For the colours which you can do with lead you can use Zinox.

21,817. (Mr. Parsonage.) Is this the consistency that it is always supplied in?—Yes.

21,818. (Mr. Sutherland.) Does it deteriorate by being kept?—No, it does not. To keep it you have only to cover it with a layer of water, and you can keep it indefinitely, exactly like white lead.

21,819. (Mr. Gardner.) It does not cake?—No, it does not cake. It covers itself with a skin exactly like white lead, which the ordinary zinc oxide will not do.

The witnesses withdrew.

## THIRTY-EIGHTH DAY.

Thursday, 17th October 1912.

PRESENT:

SIR ERNEST, F. G. HATCH, BART. (Chairman).

Lord HENRY BENTINCK, M.P.

Mr. E. L. COLLIS, M.B.

Mr. W. G. SUTHERLAND.

Mr. F. C. RICE.

Mr. A. GARDNER.

Mr. J. PARSONAGE.

Mr. A. L. O. FELL.

Mr. C. L. MASON.

Mr. W. ROBINS.

E. A. R. WEINER (Acting Secretary).

Mr. F. PISART re-called and further examined.

21,820. (Chairman.) Do you attend to-day principally in order to give us further information regarding the Belgian State Railway?—Yes.

21,821. A question was put to you when you attended in May last which implied that the Belgian State Railways were at present using lead paints. Have you taken steps to ascertain whether this is so?—Yes, I have.

21,822. What steps have you taken?—I applied through Monsieur Beernaert to the Minister for Railways, who is also Prime Minister of Belgium.

21,823. What was the result of your inquiries?—Monsieur Beernaert received an official letter. I produce here a letter of Monsieur de Broqueville stating that white lead has been prohibited since 1908.

The letter was handed in and is as follows:—  
(Translation.)

“Brussels, 21st July 1912.

“I have the honour to transmit to you the enclosed note setting forth the particulars asked for by Mr. F. Pisart, Mining Engineer of Liege, concerning the use of white lead and zinc white in the works carried out by the State Railway Department.

“(Signed) de Broqueville,  
Minister of Railways.”

“To Monsieur Beernaert,  
Minister of State at Brussels.”

“Note.

“The Belgian State Railway Department no longer uses white lead, this material having been prohibited alike for works of maintenance as for those of construction, by a Ministerial Decree passed in the course of the year 1908.

“From the close of that year no further purchases of white lead have been made.

“The quantities of zinc white supplied to the services using it are as follows:—

|      | Locomotives and Rolling Stock. | Permanent Way and Works. |
|------|--------------------------------|--------------------------|
| 1909 | 38,400 kilos.                  | 118,150 kilos.           |
| 1910 | 59,500 „                       | 75,000 „                 |
| 1911 | 61,000 „                       | 75,006 „                 |
| 1912 | 60,000 „                       | 96,000 „                 |

“The figures given for the Permanent Way and Works Service are those of the quantities of zinc white supplied for requirements of maintenance by public tenders; they do not include the supplies used by the contractors for constructional works which are carried out by way of contract.”

21,824-34. Does that prohibition apply to all painting work done for the State Railway?—Yes, both for work done by the railway administration and that done by contractors.

21,835. Does it apply to locomotives and rolling stock as well as to buildings?—It applies to everything—locomotives, carriages, waggons, station buildings, bridges, signals. I must add something to that reply: The Belgian Government has only two departments, and in no department have they used white lead since 1908.

21,836. What paint is being used at present instead of white lead?—Zinc white.

21,837. Is it absolutely pure zinc white?—No. I will not say that pure zinc white is not good, but the Government contracts in Belgium allow zinc oxide containing not more than 4 per cent. of lead salts.

21,838. In what way is pure zinc oxide not satisfactory?—Absolutely pure zinc oxide hardens and peels off. In the same way, absolutely pure white lead chalks off; for outside work only I mean.

21,839. What do you consider the best proportion for a white paint?—Where absolutely pure white is

17 October 1912.]

Mr. F. FISART.

[Continued.]

required zinc oxide with 4 per cent. of basic sulphate of lead, combined in the course of manufacture—not added—is sufficient for good results. Where a pure white colour is not so important and the greatest possible covering power is required for external work, a little more lead should be allowed.

21,840. How much P—I should say 8 per cent. of combined lead in the form of lead sulphate as the maximum.

21,841. How much soluble lead calculated as lead monoxide would that represent?—That depends on the nature of the basic sulphate of lead. You have many basic sulphates of lead. You have mono-basic, di-basic; tri-basic. I have made experiments on this subject, and I must say that when you have a small percentage of basic sulphate of lead in zinc oxide, all the basic sulphate of lead is soluble in a solution of hydrochloric acid of  $\frac{1}{4}$  per cent. strength. When you have 2, 3; or 4 per cent. of basic sulphate of lead it is soluble in hydrochloric acid, but when you have more than that, i.e., 7 or 8, you arrive progressively at basic sulphate of lead which is not dissolved.

21,842. When you say "is not dissolved," you mean cannot be dissolved by hydrochloric acid?—Yes, by acid. When you have 8 per cent. of lead, 60 per cent. of the lead only is dissolved in the acid solution.

21,843. Would you say that there would not be more than 5 per cent. of soluble lead P—I have a note: If you have a zinc oxide containing 8 per cent. of lead, 63 per cent. of this lead is soluble in a solution of hydrochloric acid  $\frac{1}{4}$  per cent. strength. That is what we have found.

21,844. (Mr. Sutherland.) That is roughly 5 per cent. P—Yes. I have had only one or two days to make these experiments.

21,845. (Chairman.) Then you maintain that perfect paints for all purposes can be produced under a restriction of not more than 5 per cent. of soluble lead P—Till the day before yesterday we did not pay very much attention to the quantity of lead which was soluble, because generally we make zinc containing 3, 4, or 5 per cent. maximum, and as we have never had any trouble with lead poisoning with this proportion, we did not pay attention to this question. We are making both pure and leaded zinc; we saw a difference, a sensible difference in the way in which they are standing, for outside paint, so far as we have tried.

21,846. When you made inquiries regarding the Belgian State Railways, did you ascertain whether the use of red lead had been discontinued?—Yes, but not formally, because the question was not put to me when I was before the Commission. But I know that red oxide of iron is being used now in place of red lead.

21,847. How do you know that?—From a member of the Belgian State Railways, the General Manager of the Malines Works, and he told me that red lead had been suppressed at the same time as white lead.

21,848. With regard to your statement that the State Railways have ceased to use white lead, I understand you produce a letter from the Prime Minister of Belgium to that effect, but with regard to your statement that red oxide of iron is being now used instead of red lead, you have no such letter?—No official information.

21,849. You have very large works for making zinc oxide have you not?—Yes. We make about 10,000 tons annually.

21,850. How long have the works been in operation?—Since 1870.

21,851. How many men are employed at your works?—We are making also lithopone. We have several works, and we are employing on the whole 500 men.

21,852. Have you had any cases of lead poisoning among your workers?—None since the beginning of the works, that is in the last 42 years.

21,853. Do you take any precautions to prevent them from breathing the dust of the material you manufacture P—No; we have no special ventilation.

21,854. Are a number of the men considerably exposed to dust?—Yes. There are 20 or 30 men who do the packing. They get covered with zinc white

dust just like a miller. They have to hammer down the material into the casks.

21,855. If they do not suffer from lead poisoning, do they suffer from phthisis or bronchitis?—No. In lithopone we had a man suffer from a chest complaint on account of the mechanical effect of the dust. Lithopone does not contain lead at all.

21,856. Do you then pack the zinc oxide absolutely dry?—Yes. We guarantee that it shall not contain more than a quarter per cent. of water.

21,857. Does all your zinc oxide contain a small percentage of lead?—Most. We are also making the purest zinc oxide in the world.

21,858. Notwithstanding that much of it contains lead, you have had no cases of lead poisoning from the breathing of dust by the packers?—Never.

21,859. Do the men have to exercise care in handling this zinc oxide with a small percentage of lead if they have cuts or scratches on their hands?—In fact it is a regular practice to rub the material into any scratch or cut for the purpose of healing.

21,860. (Dr. Collis.) Do you have any medical examination of your men at all?—Yes. We have physicians who are attending for everything in the works, and, as you know, in the Netherlands the medical inspection of factories is very careful.

21,861. Do you mean that you have a doctor at the works who sees any man who is ill?—He sees only men who complain of anything.

21,862. Have you ever known that doctor or any of the doctors say that the men suffer from any effect of inhaling zinc dust, except the mechanical effect?—No.

21,863. You have never heard of any illness ascribed to zinc?—No. A doctor of the Dutch Government, an official doctor, asked us last year to have some ventilators, only on account of the dust, in the lithopone department, where there is no lead at all, because the ceilings were too low. It is an old building, and the ceiling of the packing room is too low. We are considering how best to deal with the matter.

21,864. But as a matter of fact your own medical man, your own doctor, has never suggested to you that zinc ever causes any illness among the men?—No.

21,865. Not during the whole 42 years that you have been engaged in this?—No. We can show you statistics of our works showing that the number of days of illness of our workmen are less than in the towns. During 40 years the amount of illness per year has been less than the amount of illness in the district. The books are open to anyone and we can show the attendance of the men. There are many workers who have been employed by us for more than 20 or 30 years as packers, and in every department.

21,866. Concerning the chest trouble in the manufacture of lithopone, could you tell me what form that chest trouble took?—The man was not very strong in the chest. It was only one case. He suffered from inflammation.

21,867. Pneumonia or bronchitis?—No, irritation. We had to put him in another department.

21,868. He used to get irritation?—Irritation.

21,868a. He could not continue the work and went to another department?—We put him in another department where there was no dust.

21,869. Did the doctor say that he had bronchitis or consumption or anything definite, or did he only say that it was irritation?—Merely that.

21,870. (Mr. Sutherland.) Is there any law in Belgium corresponding to our Workmen's Compensation Act?—I am afraid that I do not know the Workmen's Compensation Act. I do not know if it is the case in Belgium, because we have only very small works in Belgium, but in Holland there is a Compensation Act.

21,871. Your works are in Holland?—Yes.

21,872. Now with regard to the evidence that you gave us last time. I asked you this question (18,892), "May I put it in this way? Do you think that pure zinc oxide without any addition is a suitable pigment for a climate such as that of England." You answer "But it depends on the physical properties of the pure

17 October 1912.]

Mr. F. PISART.

[Continued.]

"zinc. It is impossible to say 'Yes' or 'No' without making experiments." Then you go on to say, "You can have very pure zinc obtained by the wet process—that is no pigment at all." Is that the process that is called the hydrated process?—No, not at all. It is zinc oxide obtained by precipitation and this zinc oxide is in a crystalline form. The hydrating as it is done by one or two French firms is a mixing of ordinary zinc oxide with an emulsion of oil and water, but it has no relation to this process.

21,873. Does that hydrating process confer on the zinc any special qualities of stability or ease of working?—Ease of working perhaps, but at present I must say that personally I have no special experience of it, because the quantity of such material sold up to the present is a few hundred tons, and we do not pay much attention to it.

21,874. The experience to be gathered from that is not very important, because the quantity made is so small?—The quantity is only a thing of a few hundred tons a year.

21,875. So that it is what might be called in the experimental stage?—No. I think that people are using it regularly, but we are not using it, and we have not made experiments ourselves with it.

21,876. (Mr. Rice.) This letter from the Minister of Railways says that the Belgian State Railways Department no longer uses white lead, and it gives figures as to the amount used by the Department?—Yes.

21,877. Do they prohibit the use of white lead by contractors?—Yes. In the beginning of the note they say that white lead is prohibited for all maintenance works and for new construction.

21,878. I want to know if white lead is prohibited in connection with the work done by contractors?—Yes, it is.

21,879. At the Brussels Exhibition I noticed several carriages and locomotives that had a label on them, "Purchased by the Belgian State Railways." Would the State Railway Department ascertain if those engines and carriages were painted with white lead or zinc white before they purchased them?—I do not know—not when the Belgian Railway buys an engine after it is painted.

21,880. (Chairman.) Do they prohibit the use of lead even on purchases they make in other countries?—I cannot say.

21,881. (Mr. Sutherland.) Do you know whether the Railway Department had a heavy stock of lead before they prohibited it?—No.

21,882. They might have had?—The Belgian Railway Department is always short of money, and I do not believe that they have a big stock. Perhaps they have stocks for three months or something like that. As they are making several tenders a year, I do not see the interest they would have in having more than that amount of stock.

21,883. (Mr. Fell.) The fact that they have now ceased to purchase does not prove that they have yet had any experience with zinc white?—They have had only zinc oxide since 1908, and it was after experiment that they took up zinc oxide. They did not suppress white lead at once. At first they suppressed

white lead in 1902, and they used zinc oxide solely in 1902, but they came back to white lead in 1903, and then they made new experiments in 1908, and they suppressed white lead entirely from that time till the present in 1912. Everybody thought that white lead was suppressed for ever, but they came back to white lead a year later, and they used white lead during the five years from 1903 to 1908. Then they came back to zinc oxide, but admitting 4 per cent. of lead compounds in it, and never came back to white lead again.

21,884. (Mr. Fell.) Would it be possible to get a statement as to why they changed?—I do not think that they will give any information of that kind. It is an internal matter. They will not say anything about the reason why they abandoned white lead or why they came back, and then abandoned it.

21,885. (Chairman.) Would you say from the fact of their having used zinc white during the last four years that that is in itself proof that it is satisfactory?—It is our opinion. I am absolutely sure that for the next years it will be zinc oxide that they will use.

21,886. (Mr. Mason.) I notice that the figure for permanent way and works for 1909 is quite a large one. It dropped suddenly in 1910, which looks as if they found that zinc white was not so successful as they thought, and used something else in place of it. Can you suggest any reason?—No. It was exactly the contrary. They found that they had got too much zinc oxide. They purchase their zinc oxide on the basis of the quantity of lead used. They found that zinc oxide was more economical to use, and so they had a surplus stock.

21,887. How do you suggest that they made a mistake in that way with regard to permanent way and works when, on the other hand, the locomotive and rolling stock department made an under-estimate by roughly 50 per cent. of their requirements in 1909. Did not they order in the same manner?—There was a shortage of carriages and waggons, and the rolling stock was very much increased in 1907, and they were obliged to buy many cars, and I presume that they had come up for repainting in 1910. Before 1909 they were always buying about 30 tons a year of zinc oxide for the Rolling Stock Department. It would vary to the extent of a few tons. For the last few years it was always something like 30 tons. In 1909 they increased their purchases on account of the increase of the rolling stock.

21,888. (Mr. Mason.) What is the comparison between a kilo. of zinc and a kilo. of lead?—You will find it in the book of Monsieur Souris, Chief of the painting department in the Belgian State Railways. Up to the year before 1908, they always bought about 150 tons of white lead. It varied between 120 and 150, and at present they have a larger system. It is always increasing, but the quantity is not.

21,889. Would you say that if they had 120,000 kilos. of white lead, they would only want 75,000 kilos. of zinc?—You will find in the book of Monsieur Souris the relation between one kilo. of white lead and one kilo. of zinc oxide, and you will find that one kilo. of zinc oxide in the Belgian State Railways is doing much more work than one kilo. of white lead. That is the reason why the quantities are smaller.

The witness withdrew.

Mr. A. CONNELL examined.

21,890. (Chairman.) Do you attend to-day to give evidence as the representative of Messrs. Meister, Lucius, and Bruning?—Yes.

21,891. What materials do this firm manufacture?—Aniline and alizarin dyes.

21,892. Do you manufacture pigments and paint materials?—No, just the dye stuff merely for colouring the paints.

21,893. Do any of the materials which you supply contain lead?—None of them, and they are absolutely non-poisonous.

21,894. What colours do you manufacture?—All colours sold under various technical names—"Hansa" yellows, "Hansa" greens, and various other names.

21,895. Do you manufacture reds and greens?—Yes, practically every colour.

21,896. Are they intended as substitutes for colouring materials which have a lead base?—They can be used for that purpose, and they are used for that purpose. Much of the lead colouring material at present used is in the form of chrome.

21,897. Why is so much lead used in the form of chrome?—Because for many years nothing was known except chrome which was fast to light.

21,898. Please explain what you mean by "fast to light"?—I mean a colouring material which does not fade or change its tint when exposed to bright light.

17 October 1912.]

Mr. A. CONNELL.

[Continued.]

21,899. Has your firm succeeded in producing aniline colours which are fast to light?—Yes; the "Hansa" yellow is faster to light than lead chrome.

21,900. Is it fast when used direct on woodwork, metal work, plaster and the like?—Yes. Chromes are not fast when applied directly on lime, but "Hansa" yellow is always fast to lime.

21,901. Can the "Hansa" yellow be used for all purposes for which chrome yellow is used to-day?—Yes, and with advantage.

21,902. What is the special advantage?—Fastness to light and fastness to lime and its non-poisonous properties.

21,903. You have told us that the materials you manufacture are dyes?—Yes.

21,904. Does that mean that another material must be used with them to give the requisite body of paint?—Yes, and we recommend generally its use with heavy spar lithopone and other basic materials as a body. The "Hansa" yellow is merely a dye.

21,905. Is your firm directly interested in the manufacture or sale of lithopone?—We are not, but we recommend it because we have never heard any complaint regarding its use.

21,906. Can the "Hansa" colours be used also with zinc white?—Yes, and they are even better with zinc white than with lithopone.

21,907. In what respect do you mean they are better with zinc white?—"Hansa" yellow is slightly less fast when used with lithopone. This is not the case when it is used with zinc white. But even with lithopone, "Hansa" yellow is faster to light than lead chrome.

21,908. How does the price of leadless yellow or green paint made with "Hansa" yellow compare with a similar lead paint made with chrome?—The "Hansa" yellow paint is somewhat more expensive at present.

21,909. What would the additional cost of using "Hansa" yellow mean?—The actual colouring material, of which of course a very small proportion is used, has been variously estimated as from 10 per cent. to 50 per cent. more expensive than lead chrome. The resulting paint when mixed ready for use would therefore be, in the case of a paint containing 10 per cent. of yellow colouring material, from 1 to 5 per cent. more expensive.

21,910. How long have these new colours been on the market?—Since May 1910.

21,911. Is two years a sufficiently long trial to enable you to judge of the quality of your colours?—Yes; if the colouring material were not fast it would fade in much less than two years.

21,912. But we have been told by many witnesses that a longer time than that is needed to test the durability of a paint?—Yes, but our material is not a paint; it is a colouring material which can be added to any paint base, and the durability of the paint would depend on the basic material used. A lead paint coloured with "Hansa" yellow would last the same time as a lead paint coloured with any other dye. A zinc paint coloured with "Hansa" yellow would last as long as a zinc paint coloured with any other dye. But in both cases the "Hansa" paint would be faster.

21,913. (Mr. Sutherland.) The colour?—Yes.

21,914. (Chairman.) Has your sale of these colouring materials been considerable since the middle of 1910?—Yes.

21,915. Is the demand for them increasing?—Yes, it is.

21,916. To what extent has there been an increase?—It has been a continual increase. It was in 1910 when we first put them on the market, and the increase has been continual since then.

21,917. Can you give us any idea what that increase means?—In May 1910 the sale was nothing.

21,918. What was the quantity in 1911?—I am afraid I cannot tell you.

21,919. You say that the demand is increasing. Can you give us any indication as to who use them?—The majority of the large distemper and paint manufacturers.

21,920. (Mr. Sutherland.) Do you mean water paint manufacturers?—Not necessarily.

21,921. (Chairman.) Do you find that these paint manufacturers and decorators are using them in ever increasing quantities?—Yes.

21,922. Are they suitable both for interiors and exteriors?—Yes. The advantage of "Hansa" yellow is particularly marked when used on exteriors in cities, because, in addition to being faster to light, it is unaffected by sulphuretted hydrogen, whereas chrome colours have a tendency to turn black.

21,923. You sell your colours to large manufacturers of distempers and paints?—Yes.

21,924. You have told us that for these purposes the demand is increasing, notwithstanding the fact that "Hansa" yellow is more expensive than chrome?—Yes; for the best class of work a large amount of "Hansa" yellow is now being used.

21,925. You have dealt mainly with the "Hansa" yellows; are we to take it that your remarks apply equally to the greens which are derived from those yellows in the same way as chrome greens are derived from chrome yellow by mixture with blues?—Yes.

21,926. So far you have told us regarding leadless substitutes for lead chrome colours. Do you also supply leadless reds which will take the place of all those colours which are commonly made with orange lead?—Yes; we can supply dyes for any tint of red which can be struck on a barium base alone.

21,927. You have sample cards showing various red tints produced without the use of lead?—Yes.

(Some cards were handed to the Committee.)

21,928. Would these be more expensive than those made with an orange lead base?—I am afraid I am unable to say; it is doubtful.

21,929. Why are you doubtful about that?—Because I do not know the cost of manufacturing paints exactly as paints.

21,930. Would you say that if lead materials were to be prohibited the additional cost of these leadless yellows, greens, and reds would be sufficient to increase very materially the cost of painting operations?—No; the increase in cost would be a very slight one owing to the relatively small quantities of actual colouring matter used in any painting job.

21,931. (Mr. Rice.) You said that you recommended the use of lithopone with your paints because you had had no complaints of lithopone. Do you recommend also the use of white lead with your paints?—No, we do not recommend it. What I intended to indicate was that we have been asked by a good many people for a substitute for white lead, and in that case we have recommended lithopone.

21,932. When you have been asked for a substitute for white lead you have recommended lithopone?—Yes.

21,933. But you have not ceased to recommend white lead for any reason?—It is no interest to us to either recommend it or the opposite. We simply sell the dyes.

21,934. (Mr. Mason.) When you speak of aniline or alizarin colours being in use since May 1910, I take it that you mean your particular brand of aniline colours?—I was referring particularly to that one colour, "Hansa" yellow, not aniline colours generally.

17 October 1912.]

Mr. A. CONNELL.

[Continued.]

21,935. Can you tell me why the Midland Railway Company gave up using alizarin?—I am afraid I must hesitate to enter into any discussion as to the reasons for that sort of thing, because the people who have supplied them are very big customers of ours, and what you tell me is absolutely news to me. I was not aware of it, and I can hardly credit it.

21,936. (*Mr. Sutherland.*) With regard to your colours, are they bleeding colours? Do you know what I mean by bleeding colours?—Bleeding in oil.

21,937. Yes?—Some of them are, and some are not.

21,938. (*Mr. Mason.*) I take it that most of these colours are not substitutes for lead paints, but substitutes for such things as cochineal?—Yes, substitutes for colouring matter; that is so.

21,939. They only take the place of lead in the case of the yellows and greens, perhaps?—No; do not misunderstand me. "Hansa" yellow does not take the place of lead chrome. It takes the place of chrome. It is the colouring matter. What we say is, that we have a colour by which a substitute for lead chrome can be made. We provide the colouring matter.

The witness withdrew.

Mr. KENNETH W. GOADBY, D.P.H., M.R.C.S.

Evidence to 21,981 handed in and taken as read; witness then called in and examined.

21,947. In the course of evidence given before the Committee in December last, certain questions as to the effect of both lead and zinc compounds on bacteria were asked, and as at that time I had made no special experiments in this direction I was unable to answer such queries from first-hand knowledge.

21,948. It appears that both M. Trillat and M. Marie had made certain observations on the effect of zinc and lead salts on bacteria. Various cultures, in the one case of two of the higher fungi, *aspergillus niger* and *penicillium glaucum*, were used, and in the other case the typhoid bacillus.

21,949. M. Trillat, in experimenting with *penicillium glaucum* and *aspergillus niger*, found that there was very little effect on the *penicillium glaucum*, but a definite effect on the *aspergillus niger*. In these experiments cultures which were to be tested were placed in petri dishes, and the whole series of cultures placed under a bell-jar of 10-litre capacity. The dishes were placed at different heights in the bell-jar, and both at the bottom and the top were placed open dishes of the compound which was to be tested.

21,950. Inhibition was only noticed in the case of white lead and oil and not with zinc oxide. Development was not entirely inhibited, and the observer only speaks of a "retardation" of the growth, and not of a "direct" inhibition.

21,951. These experiments were all performed with fluid media.

21,952. M. Marie's experiments were made by taking various portions of oil, &c., white lead and white zinc, and placing these materials over the surface of gelatin plates upon which the bacillus typhoid had been previously inoculated. As, however, the observer states that at the end of five days these plates were covered with a number of colonies of bacillus prodigiosus, staphylococci, and a large number of other organisms, the experiments can hardly be regarded as coming within the denomination of a bacteriological test, interesting though they may be.

21,953. It is suggested, however, on reviewing the experiments, that there may be inhibition produced by the action of vapours given off by compounds of lead with oil, or zinc with oil, and I have accordingly proceeded to experiment with certain bacteria.

21,954. Two varieties of experiments were undertaken:—

(1) To test if any action could be produced by the vapours given off from white lead paste and

21,940. (*Mr. Gardner.*) Your firm provides stains which are entirely free from lead and lead salts?—Yes.

21,941. (*Mr. Sutherland.*) Do those yellows bleed?—No.

21,942. Only the reds?—Not all reds. Very few of the reds do. It is the fault of the manufacturer; wrong precipitation or wrong methods of working. It may not be entirely the precipitation. What I mean is that if asked for non-bleeding paints, a manufacturer can supply them. For some purposes, bleeding in oil is no disadvantage.

21,943. (*Mr. Mason.*) Your colours are non-poisonous paints, and can be used as substitutes for poisonous paints?—All our colours are non-poisonous. Our dyes can be used as a preparation. We are not supplying paints in any form. We are not even supplying dry lakes. I want that to be clear.

21,944. They are stains?—Yes.

21,945. (*Mr. Sutherland.*) Do they use your stains to produce what is called lead chrome, or a substitute for it?—A substitute for it.

21,946. On a lead base?—No.

zinc oxide paste and oil when these compounds were heated in the manner described in my previous evidence.

(2) To determine whether any inhibitory action on bacterial growth could be determined at room temperature.

#### First Series of Experiments.

21,955. I pointed out in my previous evidence that if white lead paste be exposed to a temperature of 50° C. in an electrically-heated tube, and air drawn over, certain compounds, amongst which aldehyde and formic acid were recognisable, came over, but no lead, and no trace of that metal could be discovered. Formic aldehyde is a well-known bactericidal agent, and I thought, therefore, that if any inhibition was produced in the cultures, such an action might be easily attributable to the formic aldehyde, and not to any recondite volatile action of the metal lead.

21,956. An apparatus was set up consisting of—

(a) A tube, round which was wound a resistance in asbestos, through which a measured electric current could be passed, and so maintained that it would give a steady heat of any desired degree.

(b) A long glass tube, which fitted tightly inside the heating tube, and which contained the white lead and oil or zinc white and oil to experiment with.

(c) An exhaust pump, connected up with a series of wash bottles in such a way that a constant stream of air could be drawn through the heated tube and over the surface of the contained compound at a steady rate.

(d) Interposed between the tube containing the lead or other compound to be tested, and the series of wash bottles, was placed Bulloch's anaerobic apparatus, connected up in such a manner that the air drawn over the surface of the warmed compound passed first of all through this glass vessel, which was hermetically sealed, then through a series of wash bottles, so that the air passing over could be examined for the content of lead, aldehyde, carbonic acid, &c. In the Bulloch's apparatus were placed a series of petri dishes containing the cultures to be tested.

17 October 1912.]

Mr. KENNETH W. GOADBY, D.P.H., &amp;c,

[Continued.]

## 21,957. TESTS FOR INHIBITION OF BACTERIAL GROWTH.—A.

21,958. The cultures used were:—

*Bacillus Gärtner*, an organism of the typhoid group, and the common cause of ptomaine poisoning. It is closely allied to the bacillus tyhous, differing from it only in certain carbohydrate fermentations.

*Bacillus coli communis*, an organism commonly found in the intestine of man and animals.

*Staphylococcus pyogenes aureus*, one of the organisms commonly causing boils, blood poisoning, &c.

21,959. The lids of the petri dishes were raised, so that the whole of the surface was open to the action of the vapours. The cultures used were grown for twenty-four hours previously on agar at blood heat, an emulsion was then made in sterile normal saline, and sufficient of the culture added by means of a platinum loop to 10 c.c. of melted gelatine or agar, the melted medium being then poured into the petri dishes under aseptic precautions, allowed to cool, and placed in the glass container of the apparatus.

21,960. The whole of the apparatus having been set up, the electric current was turned on, and the heat, as indicated by a delicately-reading thermo-couple attached to a galvanometer, maintained at 50° C., from which point it did not vary more than 2° during the whole of the experiment. Air was drawn over at a slow rate for three days continuously, at the end of which time the experiment was stopped, the plates removed, and inspected.

21,961. Three plates in every respect similar to those used in the apparatus were placed in a glass jar alongside the apparatus under exactly similar conditions, with the exception that no vapour was drawn over, to act as controls.

21,962. Distinct inhibition of growth was produced in all the plates in the apparatus, when white lead paste free from acetate, or containing 0.1 per cent. of acetate, was used. Slight growth took place in the depths, but no surface growth was obtained, showing that the gases given off from the heated white lead and oil were a vapour inimical to the growth of the three organisms tested.

21,963. This experiment was performed with lead containing 0.1 per cent. of free acetate. A similar experiment was performed with lead when washed free from all traces of acetate, with an exactly similar result.

21,964. With zinc oxide in oil slight inhibition also took place.

21,965. Heavy growth took place on all three control plates.

21,966. Examination of the contents of the condensing flasks through which the air passed after passing through the bacterial chamber showed that both aldehyde and formic acid were present, but in the case of white lead no trace of lead could be discovered.

21,967. There is, therefore, little doubt that the inhibition of the growth was to be referred to the presence of the aldehyde and formic acid.

## Second Series of Experiments.

21,968. The method of experiment was as follows:—

Gelatin plates were poured, as previously described, and the plates placed in bell-jars, as in the method described by M. Trillat, the jar being cemented to a glass plate by means of resin ointment.

A series of controls inoculated were placed in a similar bell jar in the same position, and under the same conditions.

In the experimental jars, in addition to the petri dishes containing the cultures, a large dish was placed containing:—

- White lead paste, free of lead acetate.
- White lead paste, containing 0.1 per cent. lead acetate.
- Dry white lead, powder.
- Zinc oxide paste in oil.
- Pure linseed oil.
- Pure lead acetate.
- Zinc oxide, powder.

21,969. The plates were exposed for three days, at the end of which time the covers were removed, and the plates inspected for the purpose of comparison. Wherever possible the colonies on the plates were enumerated. In the case, however, of both the staphylococcus aureus and the bacillus coli communis, the colonies were so numerous as to be innumerable. In the bacillus Gärtner plates, the colonies varied between 300 and 350 per plate, the lowest number being present on the control, the highest number on the dry white lead plate. (See Table A.)

21,970. The amount of culture added to each of the petri dishes for the purpose of the experiments was the same, a standard loop containing 1 milligramme being used in each case for inoculation.

17 October 1912.]

Mr. KENNETH W. GOADBY, D.P.H., &amp;c

[Continued.]

21,971. TESTS FOR INHIBITION OF BACTERIAL GROWTH—A.  
AT ORDINARY TEMPERATURE, 18-20° C.

CULTURES—24 hours agar emulsified in normal saline, 2 standard 1 mg. loopsfuls added to gelatin plates and poured into petri dishes. Petri dishes placed in bell-jars with compound to be tested.

| <i>Bacillus<br/>Gärtner.</i>            |                                   |                                 |  |                                 |                             |                                 |                             |                                 |                             |                                 |                             |                                 |                             |                                 |                                      |                                 |
| <i>Bacillus coli communis</i>           |                                   |                                 |  |                                 |                             |                                 |                             |                                 |                             |                                 |                             |                                 |                             |                                 |                                      |                                 |

21,972. There was therefore no evidence that any vapour was given off from the surface of the above compounds that produces inhibition of bacterial growth at the ordinary room temperature, which varied from 18° to 20° C.

## Third Series of Experiments.

21,973. A third series of experiments was undertaken, and in this case the conditions were made much more rigorous.

21,974. Instead of exposing 50 grammes of the substance in a bell-jar\* containing 10 litres of air, as in M. Trillat's experiments, that is, 5 grammes per litre, a dish containing 20 grammes of the substance to be tested was placed inside the petri dish of 50 c.c. capacity, which was inverted (see sketch).

Outer cover of petri dish.

A—Outer cover of petri dish.

B—Inner cover.

C—Capsule with substance tested.

D—Layer of gelatin containing bacteria.

21,975. The organisms tested were as before:—

- Bacillus Gärtner.*
- Bacillus coli communis.*
- Staphylococcus pyogenes aureus.*

21,976. The cultures were poured in a similar way, using a standard loop, the emulsion having been made on 24 hours culture grown at 22° C., and the plates placed in the cold incubator. In each case the experiment was so arranged that the substance tested in no way touched the surface of the media upon which the organisms were grown, and in no case, either in these experiments or those previously described, did any air-borne contamination, nor any other organisms than those actually placed in the media, show upon the cultures after prolonged incubation. The experiments therefore satisfy ordinary routine bacteriological conditions, in that no organisms other than those tested were found at the conclusion of the experiment. These inhibition experiments were performed with the following substances:—

1. Zinc oxide.
2. Zinc oxide and oil.
3. Basic lead sulphate.
4. Basic lead sulphate and oil.
5. Lithopone.
6. Lithopone and oil.
7. Manganese borate.
8. Manganese borate and oil.
9. Linseed oil.
10. White lead, acetate free.
11. White lead, acetate free, plus linseed oil.
12. White lead, with 0.1 per cent. acetate.
13. White lead, with 0.1 per cent. acetate, plus oil.
14. Zinc oxide, plus oil, plus manganese borate.
15. Basic lead sulphate, plus oil, plus manganese borate.
16. Lithopone, plus oil, plus manganese borate.
17. White lead (acetate free), plus oil, plus manganese borate.
18. White lead (containing 0.1 per cent. acetate) plus manganese borate, plus oil.
19. And the usual controls.

21,977. It will be seen from the annexed table that the basic lead sulphate (purex), the zinc oxide, linseed oil and manganese borate, the acetate free white lead, manganese borate and oil, showed a clear ring in the

\* 20 grammes in a jar of 50 c.c. capacity is equal to 4,000 grammes in a 10-litre jar.

17 October 1912.]

Mr. KENNETH W. GOADBY, D.P.H., &amp;c.

[Continued.]

centre exactly opposite to the dish containing the substance. Very little growth took place on these plates, whereas on all the other plates the colonies were so numerous as to defy enumeration. With the bacillus

coli communis, the colonies were enumerated. It will be seen that a slight amount of difference exists in the number of colonies present, but that this difference is well within experimental error. (See Table B.)

## 21,978. TESTS FOR INHIBITION OF BACTERIAL GROWTH.—B.

METHOD.—24 hours cultivation of B. Coli. Communis, B. Gärtner, Staphylococcus Pyogenes Aureus, emulsified with normal saline—2 standard 1 mg. loops to 10 c.c. melted gelatin at 39° C., poured into petri dishes. Inverted when cold and capsule of substance placed in lower half.

| Organism.                          | Substance.  | Quantities.    | Capacity Dish. | Result, 48 hours.                                      | Result, 4 days.            | Notes.                 |
|------------------------------------|---|----------------|----------------|--|----------------------------|------------------------|
| 1. Staphylococcus pyogenes aureus. | Zinc oxide and linseed oil.                                       | 20 grammes     | 50 c.c.        | Colonies innumerable.                                  | Liquefied.                 |                        |
| 2. Ditto                           | Zinc oxide powder.  | Ditto          | Ditto          | Ditto  | Ditto.                     |                        |
| 3. Ditto                           | Zinc oxide, linseed oil, manganese borate.                        | Ditto          | Ditto          | Centre of plate opposite the dish clear, few colonies. | Outer ring only liquefied. | Retardation of growth. |
| 4. Ditto                           | White lead, acetate free.   | Ditto          | Ditto          | Innumerable colonies.                                  | Liquefied.                 |                        |
| 5. Ditto                           | White lead, 0.1 per cent. acetate.                                | Ditto          | Ditto          | Colonies innumerable.                                  | Ditto.                     |                        |
| 6. Ditto                           | White lead, 0.1 per cent. acetate, linseed oil.                   | Ditto          | Ditto          | Colonies innumerable.                                  |                            |                        |
| 7. Ditto                           | White lead, 0.1 per cent. acetate, linseed oil, manganese borate. | Ditto          | Ditto          | Clear ring in centre of media.                         | Outer edge liquefied.      | Retardation of growth. |
| 8. Ditto                           | White lead, acetate free, linseed oil.                            | Ditto          | Ditto          | Innumerable  | Liquefied.                 |                        |
| 9. Ditto                           | White lead, acetate free, linseed oil, manganese borate.          | Ditto          | Ditto          | Clear ring in centre.                                  | Outer ring liquefied.      | Retardation of growth. |
| 10. Ditto                          | Basic lead sulphate (purex)                                       | Ditto          | Ditto          | Clear central ring, edge growth.                       | Not liquefied              |                        |
| 11. Ditto                          | Basic lead sulphate (purex), linseed oil.                         | Ditto          | Ditto          | Innumerable colonies.                                  | Liquefied.                 |                        |
| 12. Ditto                          | Basic lead sulphate (purex), linseed oil, manganese borate.       | Ditto          | Ditto          | Clear central ring, colonies at edge.                  | Edge only liquefied.       | Retardation of growth. |
| 13. Ditto                          | Lithopone   | Ditto          | Ditto          | Colonies innumerable.                                  | Liquefied.                 |                        |
| 14. Ditto                          | Lithopone and linseed oil.  | Ditto          | Ditto          | Colonies innumerable.                                  | Ditto.                     |                        |
| 15. Ditto                          | Lithopone, oil, manganese borate.                                 | 20 grammes     | 50 c.c.        | Innumerable colonies.                                  | No liquefaction.           | Retardation of growth. |
| 16. Ditto                          | Linseed oil   | Ditto          | Ditto          | Innumerable colonies.                                  | Liquefaction.              |                        |
| 17. Ditto                          | Manganese borate.   | Ditto          | Ditto          | Innumerable colonies.                                  | Liquefied.                 |                        |
| 18. Ditto                          | Manganese borate and oil.   | Ditto          | Ditto          | Clear ring   | Not liquefied              | Retardation of growth. |
| 19. Ditto                          | Control   | Nothing added. | Ditto          | Innumerable colonies.                                  | Liquefied.                 |                        |

NOTE.—The chief factor in the production of inhibition appears to be the manganese borate, which apparently combines with the oil.

| 19. Ditto  | Control   | Ditto      | Ditto          | 1,920             |  |

21,980. It will be seen, therefore, that whatever evidence exists for inhibition of bacteria from paint, must be referred to some substance other than the lead itself, and that this substance is one of the aldehydes, probably formic aldehyde, is rendered highly probable.

21,981. It may be pointed out that this formation of an aldehyde or other substance inhibiting bacterial growth is of undoubted importance with regard to painting. The hygienic effect and disinfecting action of freshly painting rooms has been recognised by hygienists for many years; a room is always freshly papered and painted after an infectious disease has been present therein. There is no doubt that the most efficacious paint in such circumstances is one which produces some form of vapour inhibiting bacterial growth.

21,982. (Chairman.) Have you come to-day to lay before the Committee some additional investigations you have carried out on the effect of lead and zinc compounds on bacteria?—Yes.

21,983. Generally speaking, you found a distinct inhibition of growth due to the gases given off from heated white lead and oil and a slight inhibition from the gases given off by heated zinc oxide and oil?—Yes.

21,984. You satisfied yourself that this is due in each case to aldehyde and formic acid?—Yes. As far as one could say from the experiments, those were the substances passed through, and knowing that these bodies have a distinct inhibitory action on bacteria, there is nothing else to ascribe the action to. On this point, I might show these dishes, because they actually illustrate the things that were used. That is a petri-dish, and you see they are illustrated roughly in my

printed statement. The method of experimenting is as follows: The medium containing a certain number of microbes is poured into this part of the dish. The whole is previously sterilized and the cover put on. In the case of vapours, these dishes were placed in this way, and the covers raised so (*describing*), so that the vapour could pass directly into the chamber and so diffuse over here, covering the surface. When they were used in the second series of experiments, the substance to be tested was placed in a small watch glass in *this* way; the medium was poured into *this* part of the dish in the same way, forming a thickish layer. *This* dish contained a substance to be tested. It was placed in, under antiseptic precautions, and the top put on like that. When I refer in one place to a clear ring, it applies to the portion of the dish exactly opposite to where this little watch glass of the tested substance was, showing that the action was more intense exactly over the watch glass, but radiating, and less intense round the sides. There was no direct contact with the substance tested and the medium containing the bacteria, but it is quite close, and any vapours given off would easily get to the substance containing the bacteria. When inhibition of bacterial growth took place, a clear ring remained in the centre of the mass of small bacterial colonies covering the rest of the surface, there were some colonies round the edge, but none in the centre.

21,985. Why was the inhibition of growth much less with zinc oxide and oil than with white lead and oil?—Well, I suppose there would be more formic acid and aldehyde given off from a substance like white lead which has a strong affinity for oil than there would be from zinc white which does not chemically combine with oil.

X x 2

17 October 1912.]

MR. KENNETH W. GOADBY, D.P.H., &amp;c.

[Continued.]

21,986. Your general conclusion from the whole series of experiments is that all pigments when mixed with oil and driers give off a vapour which kills bacteria?—All those pigments I have tested at ordinary temperatures have done so, with certain exceptions.

21,987. What are the exceptions?—They are in this Table. It is largely a question of the driers as far as I can make out. With regard to all these pigments, it did not appear to have anything to do with the pigment at all. If you compare the two series of experiments, paragraphs 21,978 and 21,979, when I used manganese borate and oil, which you could scarcely call a pigment, because it is only a drier that is put in the paint to accelerate its drying, it produced retardation of growth. The oil did not. May I explain these Tables a little more fully?

21,988. In my question I asked for your general conclusion, you will notice?—But then you say pigment; that is difficult. The pigment does not seem to make any difference. If the pigment was varied it would make no difference, but if the drier was it would. I have not considered other driers. I can only speak with regard to this particular class of drier. It did not make any difference with regard to what is dealt with in paragraph 21,978.

21,989. I will put the question in that form. Your general conclusion from the whole series of experiments in paragraph 21,978 is that pigments when mixed with oil and driers give off a vapour which kills bacteria?—Yes, certainly; that I agree with. That is the point. It seemed to be the action of the drier with those pigments that was responsible for the bacterial inhibition rather than the pigment's action on the oil. It is a compounded pigment.

21,990. (Mr. Sutherland.) Would not white lead have a greater action owing to the absorption of oil and saponification?—No; that I did not find. You see here white lead and linseed oil acetate free. The colonies were innumerable, and in other cases no action had taken place at all.

21,991. Would not that account for the difference between the white lead and the zinc oxide that you referred to earlier?—That is an absolutely negative result. There was no inhibition in those two cases.

21,992. "With zinc oxide in oil slight inhibition also took place"—paragraph 21,964?—That is heat. That is a different type of experiment entirely. This is at normal temperature (15°-20° C.), as you will see. The others were with the vapour passed over from the heated substance. It is quite a different type of experiment, one in which vapour given off from mixed paint at room temperature, the other from zinc or lead mixed with oil and heated to 50° C. in an electrically heated tube.

21,993. (Chairman.) Do you say that this vapour which kills bacteria would have a hygienic effect and a disinfecting action?—Yes, evidently.

21,994. It would not produce ill-effects?—Possibly not. It would be in very small quantities, and the amount given off would be local. Where you have a large quantity of it (and in the experiments I have tested with animals), particularly where you have turpentine, then, as I said before in my previous evidence, the animal definitely suffers from turpentine poisoning. There is no question of that, but on the question of the deleterious effects of these bacterial inhibitory substances, aldehyde, formaldehyde, and formic acid and substances of this description, would have to be in fairly large quantities to do any harm to man. I do not know what the concentration is necessary to produce effect on man; that is a point on which I could not offer an opinion.

21,995. Lead poisoning which occurs amongst painters must be due to the absorption of lead in some other form than vapour?—Yes, I think that is definitely so. That is the conclusion I come to.

21,996. This means, then, that we get back to the breathing of lead dust as the most serious cause of lead poisoning?—Yes.

21,997. This Committee then must concentrate their attention on the removal of the danger of lead poisoning arising from the breathing of dust containing lead?—Yes, I am quite in accord with that.

21,998. (Dr. Collins.) One minor point: in paragraph 21,978 the results obtained from experiments numbers 10 and 11 seem a little bit unexpected. When you were using basic lead sulphate alone, at the end of 48 hours there was a clear central ring, while when you had basic lead sulphate and linseed oil on the other hand there were innumerable colonies, as if there was retardation with the sulphate alone?—I do not understand that at all.

21,999. It seems to be slightly supported by the second series of experiments in paragraphs 21,978-9: There again you have rather fewer colonies, with lead sulphate alone than with lead sulphate and linseed oil?—Yes.

22,000. They seem to support one another as far as they go?—As far as they go they do, certainly.

22,001. You have no explanation to offer?—No. In looking through the results I noticed what you point out. I could not see any particular reason. I have not carried out any further experiments. One naturally puts the result of the experiment as it is. I am not engaged in any partisan investigation.

22,002. Would you consider that I am right in saying that all paints containing driers and oil have some definite hygienic beneficial effect?—I think so. I should imagine that that is one of the great reasons for painting out a room which has housed an infectious case. I have stated that, I think.

22,003. You have stated it in paragraph 21, 81 of your printed evidence?—One always paints a room out after infectious disease if one can, and the inhibition of bacterial growth cited above is probably an explanation of the advantage of so doing.

22,004. The two elements in paint which conduce to sickness and illness are turpentine and lead dust?—I think so, undoubtedly.

22,005. So that the less lead dust you get, having regard to the special reference to our Committee, the better. And the second consideration, not actually referred to us, is less turpentine?—Yes. As you know, I have always been interested in lead dust, and one felt that if there was anything important in the vapour question, it was necessary to settle it, and I have been over the ground exceedingly carefully and I cannot satisfy myself that there is the least trace of lead vapour.

22,006. (Mr. Sutherland.) If you eliminated the lead dust in the painting trade by the prohibition of dry rubbing down, would not that be a solution of the question, because that is the main source of lead dust?—Personally, I think it is the main source of lead dust. From my own experience, and experience in dusty atmospheres, experiments and so forth, I think that you have there got the kernel of the whole question—the question of dry rubbing down.

22,007. The prohibition of that would be a very simple administrative thing to do, would it not?—That is for you to say, not for me. I only express an opinion on the scientific aspect of the case.

22,008. Perhaps you would not care to answer this question: Do you think that the medical information on the subject is sufficiently precise to determine the prohibition of white lead?—As it exists, no; I do not think so. My personal view from what I have seen is that there is not sufficient evidence. I have not been able to satisfy myself by what I have been doing. That is all; if you ask me a direct question, whether there is or is not sufficient evidence to warrant the total prohibition of white lead, I consider there is not sufficient evidence.

22,009. (Chairman.) On what evidence do you base that statement?—I am alluding to my own experimental work. The point is this; I hold that lead poisoning as taking place amongst painters exactly as amongst white lead workers is a dust question rather than anything else, and therefore, if it is a dust question it seems to be a matter of removing that dust rather than of stopping the material that is used.

22,010. But supposing you cannot remove the dust?—The question was "if you could remove the dust," and I say, yes.

22,011. But if you cannot remove the dust?—If you cannot remove the dust, then you still have operating the cause of the poisoning. That is obvious,

17 October 1912.]

Mr. KENNETH W. GOADBY, D.P.H., &amp;c.

[Continued.]

22,012. (*Mr. Sutherland.*) If that could be easily attained, it would be a big step towards solution?—Yes; I think it would be the biggest step of all.

22,013. Are you of opinion that even with the prohibition of the use of lead there would remain a large incidence of paint sickness?—Unless some regulations are brought into force. If you only touch the question of dry rubbing down and leave every other condition operating as it is, you will get all sorts of queer symptoms and disease, like nephritis and so on, due to the paint itself.

22,014. (*Mr. Rice.*) To the turpentine in the paint?—To the turpentine. You cannot, I suppose, eliminate turpentine. If you could cut out turpentine and cut out dust—

22,015. Then you could leave lead?—I think you could leave lead.

22,016. (*Mr. Parsonage.*) Then you would get these cases certified as being lead poisoning by the certifying surgeon?—That depends on the way in which you go to work. If somebody says a thing is black when it is white, do you think that that is an argument—if I may be allowed so far to contradict on that point. If you have a definite disease of which we are beginning to recognise definite symptoms, and you get those symptoms from another cause and say it is lead colic, you are making a wrong diagnosis.

22,017. I am dealing with a peculiar case at the present time, the case of a man who has been working at painting for five years. He was working with a company dealing with the lining of boxes inside with lead. He finished up with his painting and worked as a labourer with the joiners in the shop for two years. He was put on to painting, and he was only at it two days, and he was ill with lead poisoning. There was no question of any dust arising from the paint at all. There was no rubbing down of any kind. He had been certified by the certifying surgeon as suffering from lead poisoning. The firm have appealed to the medical referee, and his decision is that the man is suffering from lead poisoning?—But I am going to ask a question. You say he was engaged in lining boxes with lead?

22,018. This is the work, I understand, of the company he was employed by. He was painting the boxes?—Did he never line the boxes afterwards?

22,019. No. He had finished that work for two years?—That does not matter. You can have lead remaining in the body for two years. He might have stored up in his body an amount of lead dust from the lining of boxes in painting, turning them over and so on, and shaking them, and then, when he began the painting, he would inhale a large amount of turpentine vapour, and that would act as a liberating cause, and he would develop an acute attack of lead poisoning. I have seen a case of lead poisoning come on acutely four years after the man had left the painting trade; due to a long period of alcoholic excess. There was no doubt he had lead poisoning, but he had had no exposure to lead in the meantime. One finds that in animals and in men large quantities of lead are stored up and remain latent in the body, and if some sudden intercurrent disease occurs the lead is liberated. I have seen a case of a man who had left lead works for some time—five or six years. He suffered from lead poisoning to some extent during the time he was working. He had a bad attack of bronchitis with influenza, and he got definite wrist drop. The poison of the influenza bacillus is known to attack the nerves. Various heart symptoms and so on are common—what we call toxic neuritis following from the action of poisons on nerves which are somewhat damaged and in which hæmorrhage had taken place before, and where the recovery had been only slight, and the nervous mechanism was working perhaps at only half its normal rate. The poisoning took place immediately, and he developed wrist drop. You may call it wrist drop or secondary toxic influenza poisoning.

22,020. I understand the doctors to say that the lead material works out of the system?—I wish it did.

22,021. (*Mr. Parsonage.*) Is not that so?—I think Dr. Collis will support me in that.

(*Dr. Collis.*) I entirely agree with what Mr. Goadby says.

22,022. (*Mr. Sutherland, to the witness.*) When you were here last, you pointed out to us important results obtained in recognising lead poisoning by basophilic bodies in blood. Have there not been experiments made in Germany on these lines?—Yes. The Leipzig experiments are most interesting, and most convincing. I have not the absolute details at my fingers' ends at the moment. You will find them in the book by Goadby and Legge on Lead Poisoning; when it comes out in about a month's time. There we have quoted the experiments that have been carried on at Leipzig. They have examined the blood; they have established a routine examination once a month for painters, and they claim to have absolutely stopped lead poisoning. The early appearance of basophilic granules allows time to prevent a man becoming any further infected, and the process there adopted, I believe, is this; when a man is found to have more than 100 basophilic corpuscles per million (it is an easy estimation), he is certified, not as suffering from lead poisoning, but as being in a pre-saturine condition, and his work is altered. The men are going voluntarily for blood examination.

22,023. (*Chairman.*) You say that the work is altered. What do you mean?—If a man was engaged in lead work, and was affected by dry rubbing down, or if he had been in white lead work where he was working in removing the corrosions from the beds, he would be given other work. Many persons can absorb lead dust and not suffer appreciably.

22,024. Applying that to the painting trade, you mean that painters if they had these symptoms would have to be given other work?—I believe that what is done in Leipzig is that they are put on their club, or that there is some special arrangement. They are certified as sick. There is some arrangement by which they are either paid or have some other sort of work quite different.

22,025. Do you mean that they have compensation?—I think so. I believe it is worked through the Guilds. I did not anticipate the question, and have not the exact details here.

22,026. The long and short of it is that they must abandon their work for a certain time, or be given other work in which they do not come into contact with lead?—In the worst cases. The ordinary medicinal treatment might be quite enough in other cases.

22,027. You said that the system in Leipzig was that they were given other work?—Given other work without exposure to lead dust. I am quoting from memory; I have not the exact figures. You must not pin me down to that as a fact please, otherwise I must withdraw it altogether. I can give you the exact facts later.

22,028. As you are not quite certain as to the facts in respect of the evidence you have given about the Leipzig experiments, you suggest to us that you will send in a paper dealing with the whole question?—Yes. The medical side of the question I can give you fully, but you asked me about the administrative side, which I am not so familiar with.

22,029. In giving these further particulars you will bear in mind the remark you made in connection with men being given other work, because I want that cleared up?—Yes, certainly I will clear that up. I will give you the particulars of the method of dealing with lead poisoning in Leipzig. The method of estimating whether a man is or is not suffering from lead poisoning is by the basophilic granules. It has been found successful. What is done with that man between the time he shows basophilic granules in his red blood cells and is certified free of them and goes back to his original work, I cannot say at the present moment.

22,030. (*Mr. Sutherland.*) Do you think that the advent of the new Insurance Act does not give an opportunity to the Government to collate a very valuable mass of evidence before they eventually decide to adopt any prohibitive course through the insurance records of the sickness claims?—I do not understand the question.

17 October 1912.]

Mr. KENNETH W. GOADBY, D.P.H., &amp;c.

[Continued.]

22,031. After a course of three or four years, if all the cases of sickness amongst painters were recorded, as they will be for the purposes of benefit, and collated and tabulated, and the sickness analysed, we shall get at definite data?—Certainly, and I think you will get very different data from that which you have now, but unfortunately sickness from lead poisoning does not come under this category. It is dealt with under the Workmen's Compensation Act.

22,032. (*Chairman.*) So that those cases will not be recorded?—Not more than at present. I had forgotten that for the moment.

22,033. But even supposing that all the cases were recorded, it would mean a prolongation of the present state of affairs for three or four years?—Yes, unless you made some definite recommendation for the present; for instance, with the evidence you have before you, you could not postpone dealing with dry rubbing down. That, I think, is obvious.

22,034. (*Mr. Mason.*) Do I understand that there is no danger in a freshly painted room?—No, I did not say that.

22,035. Your answer to Mr. Sutherland was that provided there was no dry rubbing down, or provided there was no dust, there would be no danger from lead poisoning?—Yes, if you put lead poisoning in. Then I think all the other factors may be considered negligible.

22,036. (*Chairman.*) What other factors?—The splashing from painting and so on that were discussed in my last evidence. I think the sprays negligible, as compared with the dust produced.

22,037. (*Mr. Mason.*) May we consider that what we know as lead colic is due to these aldehydes?—I am afraid I must ask you what you mean by lead colic, to see whether we agree upon what is lead colic.

22,038. I am asking you. I have known men who suffered from lead colic, and I cannot find out how they get it. I want to find out from you how they get it?—We must start with meaning the same thing when we discuss colic. If you mean pain in the stomach and leave out the word "lead," I think it is exceedingly probable. That you get lead colic now with painters I do not deny, but you get other colic. You get colic with turpentine. That is my position. I hope you have understood it.

22,039. Put in an Irish way, many of the lead colics are not lead colics at all?—Absolutely.

22,040. (*Mr. Rice.*) Do I understand you to say that the only danger of lead poisoning arises from the dust from dry rubbing down?—Yes, as far as I can see.

22,041. And if regulations were enacted preventing the use of dry rubbing down and thus having no lead dust, the whole danger that is suggested is obviated?—As far as I can see from my own experience and from my experimental work, that is my feeling.

22,042. (*Chairman.*) But what is your experience about this particular thing?—My experience has been with regard to white lead industries, generally.

22,043. But have you had any experience in house painting and general work?—Only in the fact that in consultation I have seen a number of cases of house painters who have suffered from lead poisoning and who were suffering from lead poisoning, and in every case which I have seen I have undoubtedly found that the cause of their illness was concerned with dust.

22,044. Yes, dust, but not necessarily rubbing down dust?—In every case it has been associated with that. I may be unfortunate in my experience.

22,045. Might not that be a coincidence?—It might. I have not seen all the painters that have suffered from colic.

22,046. But have you seen painters at work, and have you noticed specifically the amount of dust that might arise from other operations?—Yes, certainly. You put in dry rubbing down. It would be only fair in answer to your question to say dust of which dry rubbing down is the chief cause. Would that meet with your approval?

22,047. Yes?—That is what I mean.

22,048. Have you any knowledge of the amount of dust that is on an overall of an ordinary painter?—Yes,

there is an enormous amount when they are not washed, and the same in white lead works.

22,049. Would you attribute that mainly to dry rubbing down dust?—No. I suppose that the painters' overalls get a certain amount of splashing, as in the white lead works, and the overalls have to be dealt with. It would not get on to the overall as dust. It might get on as a splash, and then dry and create dust. It would not be dust that was made at the time.

22,050. It is not then a question of only dry rubbing down?—Mainly.

22,051. (*Mr. Rice.*) In your opinion, should there be a regulation dealing with dust?—Yes, dealing with any possible source of dust.

22,052. Dust only? What do you say with regard to emanations?—I do not regard emanations. There is no evidence whatever of emanations except with regard to turpentine.

22,053. (*Dr. Collis.*) Or absorption through the skin?—Or absorption through the skin.

22,054. (*Mr. Rice.*) You place very little importance on the washing of the hands?—Very little. It would be a small extra dose. That is a subsidiary cause. One wants to put one's finger on the main cause. There are contributory causes.

22,055. Would you attach importance to washing hands in warm water?—I should attach distinct importance for general hygienic reasons to a man washing his hands.

22,056. Apart from the hygienic question of cleanliness to prevent the danger from the use of lead, would you attach importance to the washing of hands?—Very little trouble is brought about by not washing hands.

22,057. Overalls. What do you say with regard to those?—I have seen washerwomen get lead poisoning from overalls because they were not damped when they came to them. I consider it is one of my duties as appointed surgeon to several large lead works to occasionally examine overalls when they come down to be washed, to see that they are properly damped. No absorption takes place through the skin unless you rub in a soluble lead salt or ointment on delicate skin such, for instance, as inside the thigh or the axilla. You can in this way produce lead poisoning from inunction; it is possible. Men handling lead as in lead rolling mills, whose hands are covered with a lead oleate all day long, and who are very careless at the washing, do not suffer appreciably from colic or from other forms of lead poisoning. A few susceptible ones may ultimately show wrist drop, just as the file cutters do, but this is probably due to fine metallic dust inhaled, but they do not suffer to the same extent as the white lead workers do, who wash their hands every meal time, and also wash their mouths, but inhale lead dust during their work. The persons engaged in washing the corrosion off the plates, and whose hands are all day long in a solution of lead acetate very rarely develop lead poisoning. There is often much splashing; and although precautions are taken to prevent this, splashing a good deal is occasioned when throwing the grids about and beating them with a fork to remove the adhering white lead. The workman who is not shovelling and making splashes, but attending the rollers and the man who lifts the corrosion from the bed and so distributes dust are always the most probable persons to develop lead poisoning. It is therefore the inhalation of dust rather than contact and absorption by the hands that determine the incidence of poisoning. One would not be so foolish as to say it does not matter about your hands, but there is not a risk of absorption through the skin of the hands. Operators should not eat their meals without washing their hands, of course, otherwise there would be a subsidiary cause of lead poisoning. Workmen, painters or white lead workers, ought to wash their hands most decidedly, but they are not liable to absorption of lead through the skin.

22,058. (*Mr. Rice.*) But they would be when eating food, unless the hands are properly cleansed?—Yes.

22,059. So in that respect you do attach great importance to washing the hands before meals?—Certainly, in regulations, in white lead regulations, I

17 October 1912.]

Mr. KENNETH W. GOADBY, D.P.H., &amp;c.

[Continued.]

should say that no meals should be taken without washing.

22,060. And the same with regard to smoking?—Yes.

22,061. Does it matter whether it is hot or cold water?—No.

22,062. But in cold weather?—Probably they would not wash their hands if they had cold water. Absorption *via* the alimentary canal is very small indeed compared with the dust danger.

22,063. Many witnesses have regarded it as highly important that there should be always hot water for washing the hands before meals?—Personally I should not attach any importance to that.

22,064. In cold or hot weather it is immaterial?—Yes. As I told this Committee, and I think the Potteries Committee, I fed animals for three years with as much as a gramme of white lead a day, but they exhibited no symptoms of lead poisoning. The same class of animal exposed to white lead dust go down in six weeks when exposed to from one-tenth to one-hundredth of the above quantity, as fine dust in the air breathed.

22,065. (*Chairman.*) Is that because it is through the lungs?—Yes. In the other case it goes through the alimentary canal. I have given details of artificial digestions. It is difficult to find the lead. It becomes precipitated as an almost insoluble compound by the ordinary digestive processes.

22,066. (*Mr. Robins.*) You lay great stress on the fact that the chief cause of lead poisoning amongst painters is from the dust?—I do.

22,067. As a practical painter for nearly 40 years I can tell you that in my own craft where we use lead you cannot escape from dust. With your personal experience and mine and that of the generality of our trade, would you not consider it better to abolish it altogether, knowing as we do that other things can be used with equal advantage?—You are making two statements together and asking me to agree. You say as a practical painter, that there are plenty of other things.

22,068. I am a coach painter?—I am not a practical painter, but I have always understood that it is most difficult to find any efficient substitute, and I am not prepared to express any opinion on that point. All I can say is that I regard dust for practical purposes as the only source of lead poisoning. I have been fighting that question now for the last ten years, and by fighting it in that way I have succeeded in reducing lead poisoning in certain big factories from an incidence of something like 50 cases a year down to one occasionally, and that very mild—solely by the methods of dust elimination.

22,069. Would it be your opinion that dust can be done away with altogether where lead is used?—That again is a practical question. It is not one to ask me. It is a practical question how you have dust produced, and what are your processes. It is very difficult. If you are going to eliminate the dust, then you can eliminate the poisoning. I can answer that.

22,070. From my point of view it never can be done away with?—You perhaps possess special knowledge that I am not prepared to express an opinion upon. I would if I were acquainted with the exact conditions.

22,071. (*Dr. Collie.*) You have been quoted, I believe, on the strength of the experiment you made of injecting zinc oxide, I think it was, under the skin of a cat?—Yes.

22,072. Zinc has certain toxic properties?—Yes, I have found that.

22,073. Do you consider the toxic property of zinc in any way comparable with the toxic property of lead, if zinc or lead is absorbed in the form of dust?—You mean as to the relative poisonousness of the two substances?

22,074. Yes?—I have come to the conclusion that all heavy metals of every sort, of which zinc is one and lead another, affect the kidneys.

22,075. If there is sufficient of it, whatever the metal?—If there is sufficient of it, whatever the metal.

22,076. Do you consider that there is any reasonable comparison from the health point of view between the

dust of zinc and the dust of lead?—I can give you details of experiments dealing with that point if I may. I have been giving animals zinc by inhalation. Going back to the inoculation, one animal was done with zinc oxide, another one was done with Purex, another was done with white lead, all at the same time, and another one was done with lithopone. They all died. They all had the same amount, 0.5 grammes of lead, 0.5 grammes of zinc oxide, 0.5 grammes of lithopone, and 0.5 grammes of white lead. As to the relative rates of death, two months for the Purex. That animal died with encephalopathy; the zinc oxide cat six weeks, encephalopathy; the lithopone cat two months. That died in the night. I do not know what happened. It had no loss of its jumping muscles, but it died. In the case of the white lead cat it was a month—call it three weeks and a half.

22,077. That is subcutaneous injection?—Subcutaneous injection.

22,078. The inhalation is an important point for us to consider?—Zinc and white lead dust inhalation—

22,079. The two together?—The two together—zinc and red lead dust and zinc alone.

22,080. What were the proportions of zinc and lead—half and half?—Half and half. The date is 5th December 1911. This is zinc and white lead. That is the date of the commencement of the experiment. The red lead is the same, and the same with the zinc. They were equal parts, and 54 grammes were used in four days. It was blown over.

22,081. (*Chairman.*) Blown over the cage?—Blown into the cage. This is the cage that I explained to you when I gave evidence last time. The amount in the cage is very small blown in with the apparatus that we used. The next date is 14th March 1912. There were symptoms of poisoning there. Zinc and red lead, 10th March 1912. I have not the finish in this book. The cat did not die. It is alive now.

22,082. Did you find symptoms?—Very slight symptoms just before I went for my holidays.

22,083. When did you go for your holidays?—About the last week in July. That animal I have not killed and examined at present, so there is no post-mortem of it, and there is in the others.

22,084. As far as the experiments go they do not show much toxicity with regard to zinc?—Not with the same doses—with that blast. Taking the amount of dust in the three experiments, if anything rather more zinc dust goes over. It is a little lighter.

22,085. What do you say to this?—"But in view of Dr. Goadby's experiments, one may assume that zinc is a poisonous metal, even if it contains little or no lead capable of producing pathological changes and in particular inflammation of the kidneys"?—I have found that in inoculation experiments, undoubtedly. You could do it with iron. A good deal depends on the dust. I do not know absolutely what quantity of the zinc dust inhaled will produce toxic symptoms. The difficulty of dealing with zinc is this—that although paralysis, and hamorrhage do not occur to the same extent that they do with lead, a chronic condition of inanition is set up. The zinc cat whose record unfortunately I have not got here, lost weight like the lead cat. It got emaciation and metallic poisoning, but it did not develop anything like the acute symptoms that the lead animals developed.

22,086. You will get a poisonous effect also with iron?—Yes.

22,087. Is the poisonous effect of zinc closer to the poisonous effect of iron than it is to lead?—I do not know what the definite amount is, but putting them in relation I should put lead, zinc, iron, and I should not bracket zinc and iron together.

22,088. Would you put a greater space between zinc and lead, than between zinc and iron, if you were arranging a series?—Zinc and lead undoubtedly are closer.

22,089. Whereabouts would you put copper in the series?—I have not tested copper. I could not say.

22,090. Do you think it is probable that in the house painter's occupation the dust from zinc that the painter is exposed to would ever be sufficient to cause sickness, unless a person was specially predisposed?—

17 October 1912.]

Mr. KENNETH W. GOADBY, D.P.H., &amp;c.

[Continued.]

I have no statistics, but I should think that on a surface being rubbed down dry with clouds of dust, the zinc would be present in toxic doses. Zinc does not produce the same definite symptoms, that is to say, the gross hæmorrhage, that lead does, so that paralysis is unlikely to occur, but I should think there would be sufficient zinc to cause some effect on the health, especially when associated with turpentine.

22,091. The point rather is that among house painters, with their present exposure to lead dust, the incidence of sickness is lower than it is with people exposed to dust in white lead works. If you reduce the toxicity of the dust by a quarter, is the probability of ever reaching a very toxic dose in the trade in using zinc serious?—It is very difficult to say. I have not made sufficient experiments with zinc to answer the question; but I know that it is possible to increase the toxic effects of both lead and zinc, by exposure first of all to turpentine. Emaciation follows. I have been trying to immunise animals to turpentine vapour, and I cannot do it. An animal exposed to zinc dust decreases in weight at a much greater rate if it is exposed to turpentine vapour before it is allowed to inhale zinc dust, than if it be exposed to the inhalation of zinc dust alone.

22,092. We have to-day the house painter exposed to turpentine and lead, and taking into consideration the lower toxicity of zinc, is it not possible that we should get below the toxic dose?—It is probable, but I could not answer that without further experiment.

22,093. It is because you are quoted here that I have asked the question?—It is reading more into my experiments than I should care myself to read into them. One point that did not arise just now, and which I did not mention, is this: in regard to the investigation by certain French observers, there was a question raised when I gave evidence previously whether guinea-pigs might not give a better answer to the question, Does paint give off deleterious vapours? It was said that the French observers had got effects on animals exposed to paint fumes. I have made experiments on that which might interest the Committee.

22,094. (Mr. Sutherland.) In what way do your experiments on guinea-pigs differ in results from the French experiments?—It was difficult at first to understand why they did. You are familiar with the experiments of M. Breton. As I had found the bacteriological experiments cited previously gave entirely different results when repeated in my laboratory with proper controls, I determined to repeat the guinea-pig experiments. I found that the method in which M. Breton had ventilated the chamber in which the guinea-pig was exposed was insufficient, and that animals exposed in a similar manner died of CO<sub>2</sub> poisoning from expired air, when exposed to either zinc or lead paints. I therefore repeated the experiment, giving the animal sufficient fresh air, and using a white lead paint acetate free, and a white lead paint with acetate, and a sample of zinc paint that Mr. Werner kindly got for me, and the latter is the only one that killed the guinea-pig. Apparently there was more turpentine in the zinc paint, and, although the animals showed signs of poisoning (it was definite turpentine poisoning, although M. Breton says that

he took great care to eliminate turpentine), I found that where animals were exposed in his way, it made no difference at all what the compound was, but that, when the animal died of asphyxia, sufficient air was allowed to enter, the zinc paint—which obviously had more turpentine than the white-lead paint—caused death. I will describe the experiments.

22,095. (Chairman.) What was the amount?—I put 150 to 200 c.c. of paint in a dish, and over the dish I placed a wire gauze and a bell-jar round (describing). M. Breton had a chamber, and had air passed over very slowly. The animal was living in a pond of CO<sub>2</sub>.

22,096. What happened to the others?—They were very ill. When you took them out of the cage they were all right for the first 15 to 30 minutes, and then developed definite signs of poisoning. The guinea-pigs exposed were all the same weight. The one exposed to zinc oxide died. The others recovered.

22,097. What deduction did you make?—Simply that there was more turpentine in the zinc paint.

22,098. Do you attribute the death of the guinea-pig to the additional turpentine?—Yes.

22,099. Not to the zinc?—No; please do not think I am suggesting that it is due to the zinc. It is a well-known fact that you want more turpentine in zinc paint than in others.

22,100. Is that so?—I believe it is so, especially in flitting paints.

22,101. We want to know what deduction you draw?—My deduction is that there was more toxic vapour in the sample of ready-made zinc paint than there was in the sample of ready-made lead paint, or in the lead paint made up with a compound.

22,102. I want to know why there was more vapour in the one case than the other?—I have asked one or two painters, and they have said: "If you want to use zinc you have to put in extra turpentine."

22,103. Could you tell that from your experiments?—Not without careful analysis of the paints themselves.

22,104. Do you not think that that is rather important?—Breton's experiments are quoted as showing that zinc has no toxic effect, or rather, he attributed the toxic effect to lead emanations. It was obviously not the emanation of the lead; it was the turpentine vapour that was given off, and in this particular instance it was the zinc paint that contained more. If one had mixed a larger quantity of turpentine with the lead paint, then that animal would have suffered. The point is that the variation is not due to the pigment itself.

22,105. It seems to me that you are rather speculating on the fact of the turpentine being there in abundance?—Nothing is further from my intention than to speculate.

22,106. Are you sure that turpentine was present?—The animal showed signs of turpentine poisoning when I dissected it, and it smelt of turpentine.

22,107. Then you are sure that it was turpentine?—I am sure it was turpentine that killed it. The others did not die, so the deduction that I make, I think, is the obvious deduction, and fair.

The witness withdrew.\*

Professor H. E. ARMSTRONG, F.R.S.

Evidence to 22,150 handed in and taken as read; witness then called in and examined.

22,108. As requested by the Committee, I have conducted further experiments with a view of controlling those described in M. Breton's Report to the French Chamber of Deputies, and beg to submit the result as follows:—

22,109. First, with reference to M. Trillat's experiments, page 344, I may be allowed again to point out that no evidence whatever is afforded by Trillat's experiments that vapours containing lead are ever given off from paint materials.

22,110. The effects produced upon micro-organisms, studied by Trillat, are such as would be produced

necessarily if any volatile organic vapour were given off when oil is oxidised by air in presence of lead oxide.

22,111. It is doubtful whether the slight retardation of growth noticed by Trillat in presence of white lead alone was more than accidental. I believe Dr. Goadby has not been able to verify Trillat's observation. In any case, if real, the difference he observed was slight and the effect transient, and there is nothing to show that it was due to lead.

22,112. The experiment referred to at page 336 of M. Breton's report, to which Dr. Collis attached special importance (Q. 15,045 in my evidence given before the

\* For further details of experimental work by Mr. K. W. Goadby, see Appendix XXI.

17 October 1912.]

Professor H. E. ARMSTRONG, F.R.S.

[Continued.]

Departmental Committee on 14th December, 1911), is the only one that I can discover in the Report which deserves attention as an indication that lead may be volatilised by passing air through lead paint. But the experiment does not necessarily afford proof of volatilisation. In such an experiment the lead may easily have been carried forward in the form of spray.

22,113. I have, therefore, specially directed my attention to this experiment and have repeated it in various ways. It is not quite easy to pass air through a thick mixture such as lead paint. Bubbles tend to form, and these often burst suddenly, giving rise to fine spray. I have found that, when precautions are taken to avoid any spray being carried forward, no evidence whatever can be obtained by means of sulphuretted hydrogen that lead has been carried forward.

22,114. In my opinion there is not a shred of real evidence in M. Breton's report that lead is ever volatilised in appreciable quantity under the conditions which obtain in practice.

22,115. The same may be said of the reports of MM. Heim and Hébert. It is noteworthy that these observers admit that they were unable to detect lead by means of sulphuretted hydrogen—the recognised distinctive test; they relied on Trillat's agent, which is not a distinctive test for lead.

22,116. It is also noteworthy that the amounts of lead which they supposed they had detected were very minute and practically the smallest quantities that can be indicated by the test.

22,117. Further, it is noteworthy that the amount that the test appeared to show was volatilised when lead was heated to fusion in a current of air was very much the same as they inferred was volatilised when the air current was passed over lead at the air temperature.

22,118. I have altogether failed in obtaining evidence of volatilisation under the conditions they describe—using sulphuretted hydrogen as the test.

22,119. Trillat's agent, in my experience, not only suffers from the disadvantage that it is not a specific test for lead; but it is also uncertain and not more delicate, when lead is present, than the sulphuretted hydrogen test. It is very difficult to avoid the production of a blue colour, owing to the readiness with which the agent undergoes oxidation.

22,120. The following is a detailed criticism of the French experiments:—

#### OPINION ON THE FRENCH EXPERIMENTS REFERRED TO IN M. JULES-LOUIS BRETON'S REPORT.

M. Trillat's experiments, page 344. These experiments involved watching the development of certain micro-organisms (*Penicillium glaucum* and *Aspergillus niger*) in presence of dry white lead powder and of a paste of white lead and oil.

22,121. Dishes containing an appropriate culture fluid infected with the organism were placed under bell jars containing—

- (a) Nothing else;
- (b) Dry white lead powder;
- (c) White lead made into a paste with oil.

22,122. Using *penicillium*, contrasting the development of the organism in jar (a) with that in jar (b), a slight retardation was obvious in jar (b). In jar (c) the growth was manifestly retarded. In the case of the more sensitive organism, *aspergillus*, it is stated that after five days, colonies were a little less numerous and less compact in jar (b) than in jar (a). Even after 15 days, no growth had set in in jar (c), though the cultures in jar (a) and in jar (c) were then fully developed.

22,123. It is implied in the Report that the results afford proof that plumbiferous emanations which affect the growth of the organism were given off.

22,124. Taking into account my previous observations, I am satisfied that this was not the case, and that the explanation I have already put forward may be equally applied to Trillat's experiments.

22,125. The retardation of the growth of *penicillium* and the prevention of growth in the case of *aspergillus* by exposure to the mixture of white lead and oil is without question to be ascribed to the organic but not plumbiferous vapours which our earlier observations have shown to be given off from such a mixture, as proved by the effects produced on certain leaves, such vapours being formed in consequence of the oil undergoing oxidation.

22,126. As reference is made to the fact that exposure in presence of oil alone had no effect on the organisms and it is implied that the white lead is contributory to the effect, it should be pointed out that oil alone undergoes oxidation very slowly and that the oxidation process is much hastened by mixing it with white lead. In fact, it is on this account, that a mixture of white lead and oil is so specially valuable as paint. The result that Trillat obtained is that which was to be expected therefore.

22,127. The very slight retardation of growth observed by Trillat in presence of white lead alone may well have been a mere coincidence. It is necessary that such experiments should be repeated many times to carry conviction, and no weight can be attached to the result of one or two. If white lead alone could produce a specific lead effect, it is to be expected that the effect would be cumulative, whereas M. Trillat states that after 15 days the *aspergillus* cultures were "*en plein développement*" both in jar (a) where nothing else was present, and in jar (b) containing the white lead powder.

22,128. It is noticeable that moist white lead was without effect according to Trillat. Many micro-organisms are very sensitive to acid, and it is conceivable that the effect observed by Trillat may have been due to traces of acetic acid liberated from acetate present in the white lead by the action of atmospheric carbonic acid; such escape of acetic acid would be less likely to take place in presence of water.

#### M. ARMAND GAUTIER'S OPINION—P. 334.

22,129. An opinion given by M. Gautier in the following terms is cited at p. 334:—

"Une autre pratique fort dangereuse, aussi par ses poussières, etc. . . . Il est presque impossible de faire disparaître les vieilles peintures à l'huile par simple raclage; pour les enlever, on les fait fondre au moyen de ces lampes à gros chalumeau que vous avez certainement vu employer quelquefois à Paris. A une température de 200 à 250 degrés, la peinture plombique se ramollit et on peut dès lors la gratter avec des raclettes spéciales. Les ouvriers chargés de ce travail sont bien plus exposés que les peintres eux-mêmes à l'empoisonnement saturnin, parce qu'ils ne peuvent pas se soustraire aux poussières plombées ainsi produites. Elles sont absorbées par les pores de leur peau et par leurs poumons et produisent rapidement de dangereuses intoxications."

22,130. I have given most careful attention to the burning process, and in my opinion there is far less likelihood of dust arising in the operation of burning off paint than in dry rubbing down.

22,131. There is absolutely no reason to suppose that volatile lead compounds are produced in the operation of burning. It is conceivable, however, that the volatile organic products given off from the burnt oil may in some cases have produced effects which have been wrongfully attributed to lead poisoning.

22,132. M. Marie's observations (Report p. 346) are subject to the same criticism as M. Trillat's. They prove nothing more than that vapours are given off from a mixture of white lead and linseed oil, but not from this oil alone or from a mixture of the oil and zinc white, which inhibit the growth of organisms. No one knowing anything of the subject will wish to dispute the point. But as organic vapours generally—at all events all those of the *Hormone* class—have this effect, such results are valueless as proof that lead was in any direct way the cause of the effects observed.

22,133. The same argument applies to the experiments referred to on page 348 with a guinea pig which was exposed to the vapour of ordinary lead paint, i.e.,

17 October 1912.]

Professor H. E. ARMSTRONG, F.R.S.

[Continued.]

a mixture of white lead, linseed oil, and turpentine. The implication that the lethal effects of the mixture were due to emanations containing lead is absolutely unjustifiable, and it is difficult to understand how serious scientific workers can have been led to put forward such a view, and to leave out of account other possible explanations.

#### TRILLAT'S AGENT.

22,134. Great importance is attached in M. Breton's report to experiments in which lead is said to have been detected by means of Trillat's agent.

22,135. I have therefore paid special attention to this test. In the first place, it is not a specific test for lead and it is not justifiable to base the conclusion that lead is present on the evidence afforded by this test alone.

22,136. Trillat's agent is affected by almost any, if not by every oxidising agent. Lead peroxide being an oxidised agent, if lead be present and be converted into peroxide, the agent indirectly affords proof of the presence of lead—provided always that every trace of any other oxidising agent be got rid of.

22,137. In applying the test, it is necessary to convert the lead presumed to be present into peroxide by means of an oxidising agent and unless every trace of this be removed before the test is applied the test is useless.

22,138. My observations go to show that it is doubtful whether Trillat's test is in reality superior to the recognised specific test for lead. In any case, I hold that it is not legitimate to assert that lead is present unless the specific test for lead be successfully applied.

22,139. M. Breton quotes an experiment (p. 336) in which lead was detected by means of sulphuretted hydrogen, but this is one in which a current of air was passed through lead paint. I do not doubt that lead was detected, but I have no doubt whatever that the lead was not volatilised but carried over mechanically as spray. I find that, just as in my previous experiments on distillation, unless care be taken, minute particles are carried forward in the form of spray.

#### MM. HEIM AND HÉBERT'S EXPERIMENTS.

22,140. The experiments made by MM. Heim and Hébert are also subject to the above criticisms. Their conclusions are based largely on the use of Trillat's agent.

22,141. In passing large volumes of air through tubes containing finely divided solid matter it is difficult to prevent particles from being carried forward mechanically, and these are not held back even by cotton wool unless the plugs of this material are packed very closely in the tubes.

22,142. In all cases, hitherto, I have failed in obtaining evidence that lead is ever volatilised from white lead under conditions such as obtain in practice. I have little doubt that in the cases in which volatilisation is supposed to have been observed the lead was really carried forward in the form of dust, and that in the case of paint the deleterious effects attributed to lead when not due to dust were those arising from organic vapours.

22,143. In the paper he communicated to the Liverpool section of the Society of Chemical Industry on March 13th, 1912, on the *Toxicity of Paints*, Professor Baly makes no reference to his previous paper in which he had implied that a *volatile lead compound* was formed; but he now speaks of a poisonous volatile organic substance—unsaturated aldehydes—as a product of the action of white or red lead on oil. He further states the opinion that, "the causes of poisoning which have been noted amongst people inhabiting rooms freshly painted with white lead would seem therefore to be due to these unsaturated aldehydes and not to be true lead poisoning."

22,144. Professor Baly should have withdrawn in specific terms the statement he made in his previous communication that volatile lead compounds were formed.

22,145. It is satisfactory, however, that he has himself shown that he was in error in speaking of

volatile lead compounds, and that he has adopted the explanation put forward by me at a much earlier date; but in giving this explanation he overlooks the possible influence of turpentine.

22,146. He also exaggerates the properties of the volatile organic compounds speaking of the vapours as singularly nauseating. But this was in the case of experiments in which he had heated the oil and white lead mixtures. The familiar smell of lead paint (without turpentine) is scarcely to be termed nauseating.

22,147. Apart from his tendency to exaggerate the "toxicity" of the products of the oxidation of oil we may claim Professor Baly's statement as entirely corroborative of mine. He even shows that basic lead sulphate acts on oil though more slowly than white lead.

22,148. In fine, I am of opinion that all the evidence we have obtained shows that the dangers attending the use of lead compounds are only the well-known mechanical dangers—that dust or incautious handling are the causes of poisoning whenever it arises. Our inquiry appears also to show that in many cases effects have been regarded as due to lead poisoning which are attributable to other causes.

22,149. The protective effect of paint is due to the production of a tough skin formed by oxidation of the paint. Whatever substance be incorporated with the oil sooner or later the oil must undergo oxidation. White lead is the most effective toughening agent; other metallic compounds are less effective and are therefore often used together with driers. Whatever objection may apply to lead paint, applies to other paints in greater or less degree—the oil is the primary cause of difficulty and there will be little difference presumably in the "toxic" effect of the vapour of two paints which dry equally rapid whether or no lead be present in both.

22,150. I believe Dr. Goadby has expressed the opinion that the vapour given off by paint in drying may be of distinct hygienic value in bringing about disinfection of rooms, &c. I am in entire agreement with him on this point.

22,151. (*Chairman*.) Do you attend to-day to give further evidence on the question of emanation of vapours containing lead?—Yes; more particularly in reference to the questions that were put to me at the end of my previous examination.

22,152. I notice in your fresh proof you criticise very carefully the experiments referred to in the report of the French Chamber of Deputies?—Yes.

22,153. You do not refer to any experiments which you have yourself made as a check on the French experimental work?—I have made experiments, particularly with reference to the point that was raised in connection with M. Breton's experiments, I think it was.

22,154. Have you made any repeat experiments yourself?—Yes; I have repeated the experiments which he describes.

22,155. You do not say so in your proof of evidence?—I intended to imply that.

22,156. What experiments did you make?—I took exception to the test that was used—Trillat's test—as not being a test for lead. Then my attention was called to an experiment by M. Breton, in which he passed air through lead paint, and found lead in the receiver. I have repeated that experiment, and I have come to the conclusion that, as in other cases, the lead was merely carried over mechanically. Lead paint is a thick material, and it is necessary, so to speak, push the air rather hard to get it through, and you are very liable, if you are not particularly careful, to get spray produced, and in that way lead has been carried forward. I have made a number of experiments in which I took care, and in which I introduced plugs of cotton wool to prevent solids being carried forward, and in those cases I got no lead. That is the only case in the French report in which the specific test for lead was used. I cannot find, when I repeat the experiment, any indication that lead really is volatilised.

22,157. Could you give us any particulars of the experiment you made?—The experiment is simple. It involves merely having a flask with paint in it, and a

17 October 1912.]

Professor H. E. ARMSTRONG, F.R.S.

[Continued.]

tube dipping into that paint. The flask is closed in the well-known way with cork and clips; then you pass the air on into a receiver into water so as to scrub it.

22,158. You also criticise the use of M. Trillat's reagent. Have you made an exhaustive series of tests with that reagent?—I have made a great many tests with Trillat's reagent, and I have come to the conclusion, as I said before, that it is not a test for lead; it is only a test for oxygen in lead peroxide. Many other oxides produce the same effect. That is point No. 1. My second point with regard to that test is that it is very uncertain. You can never be sure that it is working properly. Since that report was sent in, I have been working on it from another point of view, and I am more and more convinced of the uncertainty of the test, especially when it is carried out in the way that is described, I think, by MM. Heim and Hébert.

22,159. In the last paragraph of your proof you state that you are in entire accord with Mr. Goadby with regard to the hygienic value of the vapour given off by paint in drying?—The vapour given off might have effect in killing organisms and so on attached to the wall.

22,160. Have you made any experiments on this subject?—Not direct experiments, but I know a great deal about the influence of that type of vapour.

22,161. Have you made any experiments yourself?—Yes, with leaves, and so on. I brought those under your notice before, and I am arguing from that kind of evidence.

22,162. You say that you are in entire agreement with Mr. Goadby with regard to the hygienic value of the vapour given off by paint in drying. Those are your own words?—Yes.

22,163. I want to know whether you made any experiments yourself, or whether you are quoting from other experiments?—I made experiments with living things, leaves for instance.

22,164. If the vapour given off is hygienic it could not produce ill effects, and therefore the excessive illness amongst painters must be due to the use of lead?—But you have to bear in mind the sense in which that expression is used. That expression is used with reference to the killing of organisms, not as showing that it is health-giving. It is hygienic in the sense that it acts against something which is harmful.

22,165. But it would not produce anything tantamount to lead poisoning?—It might produce headache effects, and effects of that kind, certainly. I think that it does produce many of the effects that painters complain of, and more particularly that people complain of who go into freshly-painted rooms.

22,166. (Dr. Collis.) Do I understand that you consider the oil is a primary cause of anything of this sort which arises?—Oil and turpentine.

22,167. The oil primarily?—No, not primarily.

22,168. I am reading from your proof. I may have mistaken your meaning?—When I am speaking there I am speaking of the effect of whatever solid material you have plus oil. The oil is the primary cause, and not the solid material. It is the medium.

22,169. You mean it is the medium rather than the oil?—The oil is the medium.

22,170. What do you say upon the question of turpentine?—That is put into the paint to thin it. The original mixture is a mixture of oil plus lead. The assertion was that you get volatile vapours from lead. We say that you get volatile vapours not from

the lead, but from the inter-action of the lead and the oil, and the vapour arises not from the lead.

22,171. I was wondering whether you were eliminating turpentine?—No, the amount of vapour given off in the early stages is mainly turpentine. As the drying sets in, the drying of the oil proper, you get the vapour given from the oil, but that is a slower gradual process. It takes days, and the other takes hours probably.

22,172. I suppose you look on turpentine as the more toxic of the two?—If it were diminished to the same quantity, I do not think weight for weight, it would be. If you condensed the vapours from the oil and contrasted those with the others, I think probably you would find that the vapours from the oil were more toxic.

22,173. (Mr. Sutherland.) There is nothing in this last statement of yours, where you quote Dr. Goadby as to disinfection of rooms, etc., that conflicts with the known fact that newly-painted rooms give off emanations of those working in them which are not lead emanations?—It is in accordance with that. If the vapours act as disinfectants, as I have said, then they will have their influence also on people exposed to them.

22,174. You are of opinion that lead cannot volatilise under the conditions of painting?—I have studied the matter very carefully, and cannot see a scrap or particle of evidence anywhere to prove that lead is ever volatilised from paint under any conditions which occur in painting.

22,175. And dust produced by dry rubbing is the great source of danger?—I think that dust is the source of danger. Temporary effects may be produced by turpentine which have been thought to be lead poisoning effects in the past, but those are not effects that matter.

22,176. If we could eliminate the dry rubbing down which is the great source of dust, we could go a long way to reduce the evils of lead poisoning, could we not?—I think you would reduce practically all the evils that come. May I make one remark with reference to what has been said in the course of this Inquiry with regard to oils. I think that Mr. Baly, in his paper read in Liverpool, has given an altogether wrong impression with regard to the effects produced from the oil. He speaks always of poisonous effects. There is no evidence of any poisonous effects being produced. We ought to be very careful in using the word; for instance, smelling salts are poisonous, but you do not speak of their poisonous effects.

22,177. (Mr. Fell.) Do you say that the volatile products given off from turpentine in paint in some cases produce effects which have been wrongly attributed to lead poisoning?—Yes, I do not think the Committee ought to go away with the idea that these are really poisonous. You may get temporary effects. It is not right to speak of turpentine which is used by painters as a poisonous substance. However you use oil, if you use it in paint you will produce this effect, whether you associate it with lead or anything else.

22,178. (Chairman.) In your opinion is turpentine innocuous?—No, it is not innocuous. If it were used as a beverage it would be poisonous, but not in paint.

22,179. Do you consider that it has ill effects if mixed with paint?—It has an effect just as smelling salts have an effect.

22,180. Would it be injurious to a workman in his daily occupation?—No, I think not. He would soon get accustomed to it. Smelling salts, of course, would be dangerous if taken in quantity.

The witness withdrew.

Mr. EDWARD M. JOHNSON.

Evidence to 22,272 handed in and taken as read; witness then called in and examined.

22,181. I am a director of Locke, Lancaster, and W. W. and R. Johnson, Ltd., lead de-silverisers and white lead corrodors, and I have been acting as chairman of the committee of the white lead corrodors' section of the Chamber of Commerce, which has had

the preparation of the evidence placed before the Committee by the Chamber, and, so far as possible, I have carefully followed all the available evidence, although the rule which precludes any other than the witness being present has made it difficult for me to do so. On

17 October 1912.]

Mr. EDWARD M. JOHNSON.

[Continued.]

behalf of the corrodors, I wish to assure the Committee that, if there is any point on which further evidence is required which we may be favourably placed to obtain, we shall be pleased to assist.

22,182. I am personally of opinion that a public inquiry; as, I believe, was held in the case of phosphorus poisoning, would have been the proper method of getting at the root of the matter. I am not here to plead specially for the continuance of the white lead industry, if it can be proved to be contrary to public policy. I have little doubt that the corrodors are as public spirited as other manufacturers, and are prepared to suffer for the public good. But any interference with the use of lead in paint is more than an interference with the trade of the white and red lead makers, it involves the interference with the use of 20 or 25 per cent. of the output of the raw material, pig lead, the substitution of a mainly foreign product like zinc white, for a mainly British product like white lead, and a change that may be described as a costly revolution affecting the amenities of every home. The *onus probandi* is emphatically imposed on those who propose a drastic change, and it is, I submit, for your Committee to be satisfied of the necessity and justice of prohibition before recommending that step. I am grateful that I have been allowed an opportunity, not indeed to place before you anything particularly new, but to indicate some of the deductions to be drawn from the evidence placed before you.

22,183. My submissions are briefly:—

- (i) *That there is no statistical or other evidence that prohibition is more necessary in the case of red and white lead than in the case of other articles.*
- (ii) *That prohibition has not been possible elsewhere, and is not possible in the United Kingdom.*
- (iii) *That education and regulations have been successful elsewhere, and if tried here would be successful.*

22,184. I.—*That there is no statistical or other evidence that prohibition is more necessary in the case of red and white lead than in the case of other articles.*

A. So far as I know, there are no public statistics other than the Blue Book figures reproduced in Mr. Holt Schooling's Table A.

22,185. I would like to call particular attention to this table. Your Committee are no doubt aware that for a considerable period an energetic press campaign has been inspired by the manufacturers of one at least of the suggested substitutes. I am sure, however, the average reader of these *ex parte* and interested statements in the press as to the prevalence of lead poisoning and deaths from the same, will be astonished to learn that the mean annual death-rate per 1,000 living of occupied plumbers, painters, and glaziers is less at every age than the mean annual death-rate of all occupied males in industrial districts, and that there are only six occupations in England and Wales out of the great number examined where the death-rate in all age-groups is lower than the death rate in occupation G4.

22,186. Table O shows that the death-rate from plumbism in occupation G4 (painters, plumbers, and glaziers) is much smaller than the special death risks that attach to various other occupations.

22,187. Tables D and E show that the decrease in death-rates in occupation G4 has kept pace with the decrease in the death-rates of the whole population. These tables are particularly encouraging to those who, like the lead manufacturers, have by the help of the Home Office Regulations and their own unstinted efforts improved the hygienic conditions in the factories, and who, through me, ask that the users of their products should have the same advantages.

22,188. Tables F and G, again, show conclusively that there is no excessive mortality in occupation G4; and table H shows that that mortality is at all ages lower than the mortality in all occupied males (industrial districts).

22,189. Table J is equally interesting and shows that during 1900-2 there were only 20 actual deaths in occupation G4 for every 100 deaths statistically expected to occur.

22,190. Any unprejudiced person must agree with Mr. Schooling that the mortality in occupational group G4 is in no way excessive or abnormal, on the contrary there are a very large number of most varied occupations in which the mortality exceeds that of the plumber, painter, and glazier.

22,191. It must be admitted that the statistics of mortality are not such as offer a *prima facie* reason for so extreme a measure as "prohibition."

22,192. As to occupational sickness, it is admitted that the statistics are of the slenderest character, but there is no reason why the Home Office should not set on foot the machinery to ascertain the rates of sickness among house painters, with the rates of sickness that occur in all occupations, with the age distribution of the men exposed to risk of sickness, the age distribution of the cases, and the age distribution of the weeks of sickness.

22,193. It is impolitic and unjust to recommend prohibition until these data are received, as indeed has been emphasised by several of the foreign witnesses. Dr. Kaup has said that "no industrial disease can be properly studied and checked unless there be sufficient material in the way of statistics."

22,194. In the absence of data—perhaps on that ground alone—there is no reason for prohibition. The data available do, however, show a large reduction in the number of cases of lead poisoning, 1900-10, and there is presumptive evidence to be deduced from the mortality statistics that the sickness from all causes among house painters is not in excess of the sickness from all causes among the general population.

22,195. However, I gather that you asked Mr. Schooling to prepare other tables similar to his Table J, and this he did, and I have studied also Tables K, L, M, N. I still consider Table J the fair standard, referring as it does to 7½ millions of males in the Occupied Males Groups, Industrial districts of England and Wales.

22,196. Table K relates to 29½ millions of lives of occupied males in England and Wales, including the professional and commercial classes that are exposed to no industrial risk. It certainly indicates excessive mortality in occupation G4. But if the test of Table K is considered fair and suitable, then Table L must not be ignored; which permits of exactly the opposite conclusion.

22,197. Table M in the same way indicates an excessive mortality in occupation G4, as compared with the abnormally healthy occupation of a paper-hanger. It would be interesting to know why this industry is so healthy in view of the fact that the paper-hanger is not infrequently exposed to paint emanations. The conditions might be secured in other branches of the building trade.

22,198. Table N is equally conclusive in the opposite direction.

22,199. I know of no reason why the wood turner and cooper should have a higher death-rate than the painter. It would be unfair and statistically unsound to use only Tables K and M without due regard to the other table, including Tables L and N.

22,200. Mr. Schooling's summarisation stands unshaken, and no reliable statistics have been adduced to show that prohibition is more necessary in the case of red and white lead than in the case of other articles.

22,201. B. But is there any other evidence? Medical or scientific, for instance?

22,202. I cannot find that any one of the English or foreign scientific witnesses whose evidence I have been able to read has admitted the necessity for prohibition.

22,203. If after perusal of the statistics available it is still held that the occupation of painter is

17 October 1912.]

Mr. EDWARD M. JOHNSON.

[Continued.]

abnormally dangerous, would it not be well to consider why—whether it is quite certain—that lead is the sole cause, and if satisfied that it is, after most careful and exhaustive examination, then whether it cannot be rendered harmless by regulation of its use, education of the user, extension of the principle of medical inspection, and possibly a more general diffusion of knowledge of the preventive and curative remedies among the medical profession—the members of which have not all the complete knowledge of this industrial disease that several have. As regards education of the user and extension of principle of medical inspection I have just heard that much has been done in this direction in Leipsic in Germany, where the routine examination of the blood is carried on systematically with all painters, with the result that a great diminution in repeated cases of lead poisoning has taken place.

22,204. I understand that evidence has been placed before you that the sallow and unhealthy appearance of the faces of some painters is attributable to the inhalation of turpentine vapour. This effect is just as marked where pigments other than lead are used. Turpentine at least temporarily lowers the vitality of the user, and may well be an important factor affecting the ill-health of painters which is frequently attributed solely to lead.

22,205. The substitution of zinc white for white lead would increase the percentage of turpentine used in the paint when mixed for use.

22,206. Dr. Goadby's interesting experiments on animals, which showed similar symptoms whether exposed to emanations of zinc oxide, lithopone, or white lead paint, prove that the turpentine is the chief, if not the sole, cause of the malaise, nausea, and ill-defined colic felt by him and the animals experimented upon. The turpentine vapour clearly caused the presence of basophil granules in the blood and also kidney disease. By the use of white lead the use of turpentine is decreased as compared with zinc white, as also is the use of driers.

22,207. One of the reasons advanced for the prohibition of the use of lead is that the emanations given off a freshly lead-painted surface contain a volatile lead compound. I am aware that Professor Baly has withdrawn his lecture as to its conclusions, and now agrees that at ordinary temperatures aldehydes and not volatile lead compounds were the cause of the ill effects he experienced.

22,208. Professor Armstrong's interesting experiments show clearly that the volatile substances are free from lead, and are nothing more than the products of oil and turpentine in the drying process. He and, I understand, Dr. Goadby have proved, once and for all, that this idea of volatile lead compound emanation is based on a complete misconception, that the French experiments of Trillat, Breton, Heim, and Hébert, largely relied upon by the French Government, were not only unreliable, but would not bear any scientific examination. The later experiments of Dr. Goadby prove in particular that retardation of bacterial growth only occurred when manganese borate was present, whether the paint be lead or zinc or lithopone. Mr. Klein has arrived at the same result as Professor Armstrong by different means.

22,209. I submit that there is no scientific evidence here in favour of prohibition.

22,210. But if there were, would it not be our duty, before prohibiting the use of white lead, to be quite certain that the substituted pigment was itself harmless? Supposing it were possible to eliminate the harmful action of turpentine and driers, has it been proved that the only two serious substitutes for white lead are above suspicion—namely, sulphate of lead and oxide of zinc?

22,211-21. Dr. Goadby has conclusively proved before a previous Committee (Potteries Committee Report, page 483) that sulphate of lead is soluble in gastric juice, and the ridiculous claims of non-toxicity made for this pigment have been sufficiently dissipated by the Home Office in recent prosecutions.

22,222. He has also proved that zinc oxide is soluble in gastric juice, and I understand the result of inoculation of an animal with zinc oxide was exceptional inflammation and hemorrhage of the kidney. Zinc oxide, even pure, cannot be described as completely innocuous. Zinc oxide containing from 2 to 7 per cent. of lead is largely on the market, and would combine what disadvantages there may be in lead and zinc. I believe Dr. Goadby demonstrated before the Royal Physiological Society some of the toxic effects of turpentine, and I presume they have been brought to the notice of your Committee.

22,223. No doubt zinc white (pure) is less poisonous than white lead, but Dr. Delbastée, the deputy who initiated a prohibition movement in Belgium, never claimed it as harmless. It is doubtful if any of the heavy metals are quite harmless.

22,224. A fact of importance when it is remembered that lead effects are more severe in the presence of alcohol is to be found in the fact that zinc also produces considerably more effect under the same circumstances. Belgian official regulations (1901)\* forbid the employment of zinc, galvanised iron, lead, antimony, and arsenic in the manufacture of beer engines and other appliances for alcoholic liquors. A small quantity of lead is nearly always to be found in zinc white and the newer "direct" process of manufacture contains up to 5 or 6 per cent. of lead. A pure zinc oxide is too costly for ordinary use. The Belgian Government has recently raised the limit of lead permissible in zinc white from 1 to 5 per cent. But in view of Dr. Goadby's experiments, one may assume that zinc is a poisonous metal even if it contains little or no lead, capable of producing pathological changes and in particular inflammation of the kidneys. I note that the French "Moniteur Officiel du Commerce" for July 4th, 1912, contains new regulations under the law of 1905 (which deals with the sale, &c., of foodstuffs), and Article 2 of the "Arrêté," referring to packing, states expressly (with one or two special and unimportant exceptions) that "it is forbidden to place any beverages or foodstuffs in direct contact with copper, zinc, or galvanized iron." Article 3 restricts the lead in any receptacles, &c., used for beverages and foodstuffs to 10 per cent.

22,225. The presence of lead in zinc white is important, in that the mass of house painters, if the use of lead were prohibited, would certainly never suspect poisonous qualities in the pigment approved by the Government. Prohibition, then, would lead to a lack of precaution with zinc white and other harmful compounds, the results of which might be severe. In a publication of the French Ministry of Commerce† the author calls attention to the "purely mechanical action" of zinc dust and its frequent contamination "with antimony, lead, &c." The same publication cites cases of poisoning in a zinc white factory near Marseilles, ultimately proved to be due to arsenic present in the zinc. In fact, I submit that the evidence of Professor Armstrong, Dr. Goadby, and others, points strongly to the desirability of regulations being introduced for

\* The reference to Belgian Official Regulations emanates from Mr. Van Ierberghe (Courtrai) who states that the regulations forbidding the employment of zinc, &c., for certain purposes appear in the Ministerial Circulars of April 3rd, June 16th, September 17th, and December 12th, 1891.

† The publication of the French Ministry of Commerce referred to is entitled "Poisons Industriels." It was issued in 1901. The words quoted occur on page 70.

17 October, 1912.]

MR. EDWARD M. JOHNSON.

[Continued.]

all painting—not because of the lead which is present in most good paints, but because of the dust and turpentine, which is common to all, good and bad alike.

22,226. My submission is that there is no statistical or scientific evidence that would justify you in recommending prohibition of lead, and the substitution of any other known metallic pigment.

22,227. II.—But I go further and say that the evidence points to the fact that prohibition has not been possible elsewhere and will not be possible here, on two grounds, though there may be others:

- A. The absolute necessity of the use of red and white lead, and absence of an efficient substitute.
- B. The failure of the repressive legislation.

22,228. *Austria*.—An examination of the evidence shows how one or both of these causes continually crop up, notably in the evidence of Dr. Ignaz Kaup and Dr. Josef Rambousek, who recounts the failure of all the substitutes and the non-observance of the prohibition of the use of lead in inside painting in Austria, and indicates how the prevention of lead poisoning can best be secured by regulations. From Austria, too, you have had the evidence of a very large master painter, Herr Meissl, that white lead is indispensable for outside use and for damp places inside, and that red lead is indispensable for painting ironwork. All agree that the greatest source of danger is the dry rubbing down and that its prohibition is the chief obvious remedy.

22,229. *Belgium*.—Again, M. Ricker-Devigne from Belgium in his interesting historical account of the Belgian Prohibition Movement, which only ended in regulation, points out that there is no efficient substitute for white lead for outside painting, and even for inside painting in the vicinity of water.

22,230. *Germany*.—Again, from the German evidence of Herr Leyendecker. "No satisfactory substitute for white lead can be found in non-poisonous pigments." The railway department, after two years' practical test, found that white lead gave the only satisfactory results. Herr Dullen's: "Regulations are amply sufficient, and there is no necessity to prohibit the use of white lead." Herr Niederhauser: "There is no efficient substitute for white lead where durability is important." Again, I note the principal danger is shown to be the use of dry white lead and the practice of dry rubbing down.

22,231. *Holland*.—Again, Professor H. Wefers-Bettink, of Holland, gives exhaustive reasons for his opinion that "white lead cannot be replaced by zinc oxide," and "that experience has shown it is not possible to substitute white lead by a less injurious (zinc oxide) or better still by a purely harmless pigment." Again, that "the great majority of practical men are convinced that paint of zinc oxide as to durability is very inferior to paint of white lead." All this was confirmed by Mr. Nooijen, a practical master painter from the same country. I note again that these witnesses limit the serious danger to dry rubbing down.

22,232. *Switzerland*.—Again, M. de Morsier, of Geneva, has given you the whole history of the prohibition movement there, and how it was finally abandoned because *inter alia* "for outside work white lead is indispensable, for railway stock and iron work leadless materials give unsatisfactory results—red lead, especially cannot be prohibited—and there is no effective substitute for lead."

22,233. Dr. Roch instances the case of the Belgian Government, who reversed the decision to cease using carbonate of lead for the railways, as white lead was found to be indispensable, and recommends, before all else, the prohibition of dry rubbing down.\*

22,234. *France*.—It is a striking fact that in only one country (France) is prohibition contemplated; and, concerning France, you have already had the evidence of M. Expert-Bezançon that the proposed prohibition does not come into force until 1st January, 1915, and that, as was the case on the previous nine occasions mentioned in Mr. Miller's evidence there is little probability of any permanent effect being given to any such prohibition.

22,235. I read as lately as August, 1912, in the report of the British Consul at Lille\*.—

"White Lead.—There was no sensible modification in the white lead industry. The law prohibiting its use for outdoor painting purposes, which comes into operation three years hence, does not appear to be in favour with the public. For the use thereof has not been decreased, whereas substitutes such as lithopone, &c., are being gradually left aside as consumers begin to discover their inferiority to white lead, and it is doubtful whether the law will ever come into force. Prices of white lead and colouring matters rose with those of lead and oils."

22,236. When one reads the significant evidence of Dr. Roch and M. de Morsier of how this prohibition was secured, and how preposterous will be the effect of attempting to enforce it, one can only conclude that they have made a mistake in France—and there is no reason for England to do likewise.

22,237. While, therefore, it is evident that prohibition is by no means certain in France, there does not appear to be any known instance of white lead being successfully abolished in any other European country where the experiment has been tried—in Prussia and Belgium,† on the State railways; in Switzerland, for all Government work (after a four years' trial); in Holland, the Marine Department and Justice Department; everywhere the reintroduction of white lead has resulted, owing to the failure of the proposed substitute.

22,238. *Great Britain and Ireland*.—I cannot unduly emphasise the evidence of our English and Irish witnesses.

22,239. Out of 123 leading decorators in the country selected impartially by disinterested public bodies and personally unknown to me or any white lead maker, 111 said there was no substitute for white lead, and of the 110 who had used white zinc for inside work, no less than 93 recommended the use of undercoats of white lead. The vast majority recommend the issue of regulations to prevent lead poisoning.

22,240. The onus is upon your Committee to disprove in no uncertain way the conclusion of the Report of the Home Office Departmental Committee of 1893, that "there is at present no substitute than can take the place of carbonate of lead." You have had scientific witnesses like Messrs. Klein and Armstrong to explain wherein lies the superiority of white lead over other pigments; these explanations were corroborated by disinterested and impartial grinders of all pigments, whether lead, zinc, or lithopone, like Mr. Rivet, of Messrs. Farmiloe, and were confirmed by practical painters and users like Messrs. Sibthorpe and Plumb. We could have produced hundreds of witnesses to assert and re-assert this, but we attached more importance to the evidence of the foreign disinterested experts, most of whom have been long engaged, and are still engaged, in trying to find a really effective substitute for white lead.

22,241. The experience, limited to a few years, of one Government department not engaged in competitive work cannot be set against that of practically the whole of the painters and paint manufacturers in this and every other country,

\* The extract quoted in the proof from the report of the British Consul at Lille occurs on page 44 of Cd. 6005-02.

† See \* note to previous column.

17 October 1912.]

Mr. EDWARD M. JOHNSON.

[Continued.]

to shy nothing of the fact that an increasing quantity of white lead is purchased annually by the Admiralty and the War Office.

22,242. III.—Education and regulations have been successful elsewhere, and if tried here would be successful.

I firmly believe that by regulations you can devise a protection for the user of lead and other pigments without injustice to the makers of lead and its pigments, and at less cost to the community or consumer than if you prohibited the use of leads.

22,243. So far as coachbuilders are concerned, since the workmen work under the eye of their employers, the enforcement of regulations which would obviate all danger is a relatively simple matter, seeing that in lead works, where the conditions are more severe such good results have followed the special rules. The special rules could be extended to carriage works in the same way as they have been applied to colour grinding works.

22,244. Investigations in this and other countries have conclusively demonstrated which lead processes are the most dangerous. On reviewing the foreign inquiries it is clear that the most thorough investigation which has ever been given to this question is that of the recent Austrian Commission. That Commission was composed of the most representative elements, the official element predominating. They considered exhaustively the whole subject of lead, from the mining and smelting of it to its commercial uses, and their report comprises seven volumes full of the most painstaking statistics. You have had the advantage of hearing the evidence of two of those who took a leading part in connection with that Commission, Dr. Kaup and Dr. Rambousek, men of European reputation as hygienists, who spend their lives in dealing with precisely this class of problem, one of them the author of the Report of the Austrian Commission on this branch of their enquiry. They have told you that the conclusive finding of the Austrian Commission, which they emphasised with their own opinion, was that the cause of lead paint poisoning, which is overwhelmingly the most important, is the process of dry rubbing down. It cannot be reasonably contended that Austrian conditions of painting are fundamentally different from ours. Nor, indeed, does this Austrian view stand alone. In every country where the use of lead paints has been the subject of official or semi-official inquiry it is agreed that lead dust gives rise to the most harmful effect, and that dry rubbing down is the most fruitful sort of dust.

22,245. You have been told not only by men of the vast experience of Herr Meissl, but also by men so entirely acquainted with our own circumstances as Mr. Plumb and Mr. Sibthorpe, that there is no practical difficulty in dispensing with dry rubbing down.

22,246. To a plain man of business the common-sense line of action would appear to be to follow the Austrian and German example and abolish dry rubbing down, striking at the root of the danger, rather than adopt the drastic principle of prohibition.

22,247. There is also practical unanimity as to the ignorance of the majority of those employed in painting of the poisonous qualities of the materials in use. This, of course, is by no means confined to white lead. The percentage of painters actually attacked by lead being small, the workmen rarely come into direct contact with it, and not unnaturally, therefore, are disinclined to attach much credence to the so-called dangers of paint, particularly as obvious exaggeration characterises most of what they do hear on the subject. This phase of the question is perhaps the most difficult with which to deal, but I have not such a poor opinion of my countrymen generally, and of British painters in particular, as to suppose that they are less capable than foreigners of profiting by a little education in the hygiene of industry.

22,248. In the light of experience abroad, there can be no question that the abolition of dry rubbing down and the publication of information whereby workmen are made aware of the dangers of lead and the first symptoms of lead poisoning, by routine blood examination, for instance, together with the best

methods of counteracting the same, would very considerably diminish the number of cases, and these precautions would probably be more effective still if all receptacles containing lead or other dangerous compound were clearly marked with the percentage of that compound.

22,249. Looking to the fact that almost every Continental country has recently considered this question and that no single country has yet established a system of prohibition, but that wherever regulations have been enforced with any degree of thoroughness they have caused a speedy decrease of lead poisoning, it does appear the merest commonsense that a system of regulations should be first tried rather than prohibition, with its obvious economic advantages, and, as I submit, its doubtful possibility and effectiveness. That governmental interference with an industry is to be avoided if possible is a truism which needs no argument. The rationale of this has been put before you very pointedly by Dr. Rambousek. Other things being equal you will avoid crushing out an industry which, with its ancillary occupations and ramifications, occupies a not inconsiderable position in the economic framework of the country.

22,250. I may be met with the objection that any system of regulation to be effective would be so vexatious to the painting trade, and would require so expensive a machinery of inspection and administration, as to counterbalance the disadvantage to the community of the use of a more costly and less efficient substitute for white lead which would be necessitated by prohibition.

22,251. The answer to this is threefold. In the first place, the regulations need not be vexatious to the painting trade. For the most part they would only enforce upon the trade, as a whole, ordinary rules of cleanliness which are already observed by all the better class of painters, and the extra cost of any particular rules would be common to the trade. In any case the painter has a way of escape from the irksomeness of regulation of white lead by having recourse to other less regulated paints to which he would be forced by prohibition. Further (though I confess my present knowledge of all details is a negligible quantity), I am assured by Dr. Goadby, whom I regard as one of the highest living authorities, that there should be little difficulty in arranging a satisfactory extension of the principle of self-inspection to the painting industry, as such would entail little or no departmental expense and might be devised in a manner applicable to all branches of the trade.

22,252. Secondly, there is no necessity for an effective system of regulation to be costly. There is obviously no need to visit every painting job once a day. Surprise visits and a few punishments would effect a speedy knowledge and general observance of the law. It is possible also that the workmen themselves might assist through the trade unions in the enforcement of the regulations, as happens in Germany and Austria. Again, the work of inspection is not of great technical difficulty, and could be performed by men of far less education and standing than His Majesty's factory inspectors, always provided that the inspectors were under the direct supervision and control of the factory inspectors, and were not subject to the disadvantages of local appointment. I have further considered this point and should like to put in a more extended statement of my views.

22,253. Thirdly, it must be pointed out that prohibition, just as much as regulation, would necessitate a machinery of inspection, so long as there continues to be no substitute of the same all-round efficiency and cheapness as white lead; and the cost of the two systems of inspection would be the same. As a case in point, I may state that in the course of the last few days one of our staff was handed a so-called substitute for white lead, which, on analysis, proved to contain 11 per cent. of white lead.

22,254. I would point out that no prohibition of the use of white lead can have any beneficial effect for, say, 10 to 20 years of the continuance of the practice of dry rubbing down is to be permitted.

17 October 1912.]

Mr. EDWARD M. JOHNSON.

[Continued.]

22,255. I would further point out that it is not reasonable to prohibit the use of the lead compounds and allow the unrestricted use of the far more deadly arsenate of copper, oxide of mercury, ferro-cyanide of potassium, and the various mercurial colours, zinc greens, &c.

22,256. I have made a careful study of the regulations in force in various countries, and have consulted some of the leading house painters and experts in this country. I desire to suggest for the consideration of this Committee the formation of a joint committee to draft and consider regulations which would, if enforced in this country, materially decrease the risk to which the house and coach painter is exposed. This Committee should consist primarily and necessarily of Home Office experts who are accustomed to the work; secondly, of master painters and users of white lead paints; and, lastly, of a white lead corroder and/or a white lead grinder. I may repeat that, in my judgment, which is founded upon long experience of the conditions in white lead factories, the principal danger to be feared is that of lead dust, and provided that that danger can be eliminated by the enforcement of regulations among the actual users of paint similar to those which are in operation in white lead factories, I feel sure that if the figures are extracted after five years' working under these regulations a very considerable improvement will be shown. I appeal to the Committee not to recommend so childish simple a remedy as prohibition, which would involve an enormous loss of capital to those engaged in the white lead and kindred industries as well as materially add to the problem of unemployment among the working classes, until after a full trial has been given to all other reasonable remedies which are proposed, and in particular until some more definite knowledge is obtained as to the real source of danger to which the painter is exposed.

22,257. I do not put forward a set of regulations, because I feel that the drafting of such should be left to a Committee, but I have tabulated the points which I think should be dealt with by the Committee.

22,258-64. I.—APPLICABLE GENERALLY, *i.e.*, IN CARRIAGE PAINTING IN WORKSHOPS AND INSIDE AND OUTSIDE HOUSE PAINTING.

(a) Employers must affix in some prominent position in their workplaces and pay offices the text of these regulations, and the attention of each workman must be drawn to the dangers of dust, zinc, lead, and turpentine poisoning, to which carelessness may expose him, and to the rules of hygiene which should be followed to avoid the absorption of poisonous matter and dust by the respiratory and digestive organs (in particular the danger of smoking and eating during and after work without having first ensured cleanliness, and the danger of sweeping up the remains of paint without having first moistened them), and especially the danger of inebriety.

Each employer to be responsible that every workman has a copy of such regulations and instructions before engaging.

(b) Prohibit mixing and use of colours dry except in existing white lead or grinding works, where, of course, the special Home Office Rules for dangerous trades are in force.

(c) Prohibit dry pumice stoning and dry scraping off of all paints.

(d) All ingredients containing lead must be in vessels upon which the lead contents are clearly stated.

(e) Aprons and/or overalls and headgear to be provided and washed weekly. Washing facilities to be offered in all cases. Hot water, if convenient, but not necessary when special soap provided for use with cold water and nail brushes. Ten minutes to be allowed for washing before meals and on leaving work.

(f) Quarterly or half-yearly inspection by a doctor. Proper register. System of self blood examination.

(g) Workmen are to submit themselves to the prescribed medical examinations, and whenever called upon by the employer or inspector produce their card showing the date of their last medical inspection.

(h) Doctor to have power to suspend for prophylactic reasons.

(i) Master to have power to dismiss and not re-engage for the same reasons.

(j) If medical inspector certifies a man to be alcoholic, he is not to be employed where he comes into contact with lead or other metallic poisons.

(k) No workman shall be engaged or continued in employment of any employer unless he shall have received a certificate of good health from an approved doctor, within three months from the date of such engagement or continuance of employment. Substantial penalty for any breach of this rule.

(l) Workmen engaged in the handling of white lead, ground and mixed in paste, shall work in such a way as to avoid the contact of the substance with the hands, as also the producing of splashes.

(m) Workmen so engaged shall wear clothing and headgear exclusively reserved for the work. They shall keep them in a good state of cleanliness and shall take them off before leaving the workshops or workplaces.

(n) Before taking food or drink, and before leaving the workshops or workplaces, workmen shall rinse their mouths, and shall also wash their hands and faces with special soap. Food brought into the workshops or carried to the workplaces shall be enclosed in boxes or coverings kept well shut until the mealtime.

(o) Workmen shall keep the material and the tools under their charge in a good state of cleanliness.

(p) Workmen are forbidden to bring spirits or tobacco, or consume tobacco or spirits, in the workshops or workplaces.

(q) Breaches of any of these regulations shall be punished by a fine.

(r) In case of a repeated offence within twelve months after a conviction under these regulations the fine to be increased.

22,265. II.—FOR INSIDE HOUSE-PAINTING ONLY.

(a) Rubbing off and pumice-stoning off old paint—whether supposed to be leadless or not—must only be done after previous and complete moistening. Everything rubbed off must be removed before it becomes dry, or must be kept moistened until removed.

(b) Foremen to be responsible for above; also for seeing that a copy of the regulations and instructions is displayed on every job.

22,266. III.—APPLICABLE FOR CARRIAGE-PAINTING ONLY.

Regulations similar to those in white lead factories could easily be framed, *i.e.*, fans, floor moistening—in fact, any good anti-dust regulations—quite irrespective of the dust being leadless or leady.

22,267. In addition to regulations I hope that your committee will follow the German, Belgian, Austrian, and Swiss examples in issuing full and simple instructions and warnings to painters. It is a matter of great regret to me and others that the old guild and apprentice system has no vogue in England—that there are no painter guilds with whom to communicate and co-operate, as mentioned by Herr Leyendecker, and suggested by Mr. Sibthorpe, who also raised the interesting points of registration and licensing of painters. I would welcome a revival of such, by which we should get a well trained and intelligent class of men, keen on using the best material and turning out good work. A guild or union could exercise a wise selection in admitting to its guild, and should have the sense to see that it was not to the interest of its members to admit all or any, temperate or intemperate,

17 October 1912.]

Mr. EDWARD M. JOHNSON.

[Continued.]

clean or dirty, into such a skilled trade as that of painting. The Home Office and/or the Insurance Act Commissioners should assist and encourage the formation of such guilds, and I should have thought master-painters would have welcomed them also. In particular, they should be warned of the dangers of alcoholic excess, and the masters warned to engage only abstemious or temperate men. You have been told by Herr Leyendecker that the most effective protection is cleanliness and temperance—brandy and spirits to be particularly avoided—and have doubtless considered the striking testimony of Dr. Roch, of the Cantonal Hospital of Geneva, of the relative insignificance of lead poisoning as compared with alcohol poisoning. Similar evidence was given before the Pottery Commission. The predisposing or aggravating influence of alcoholism might be pointed out to the moderate and immoderate drinker alike, and the thirsty man be encouraged to drink milk. You will have noticed, too, Dr. Roch's allusion to insanitary dwellings as a predisposing cause of lead poisoning. Everything they have said has for years been accepted by English lead manufacturers as a truism, founded on actual experience. Is it too much to hope that your Committee can do much to educate the men as well as their masters on these essentials?

22,268. I have serious hopes that the provision of unemployment benefit by the recent Insurance Act will reduce the liability of the painter to occupational sickness.

22,269. In conclusion, I must explain that I have ventured to draw your attention to what appears to me to be the outstanding points of the evidence called before you, because it was quite impossible for the witnesses to come before you in logical sequence. All the foreign witnesses but one were unknown to me, and it was difficult to make their convenience and yours coincide. We insisted, as indeed they themselves insisted, that all our technical witnesses, whether statistical or scientific, should get at the facts, whatever they might prove to be, to the best of their ability. With regard to the foreign witnesses in particular, they will bear us out that we acted simply as collecting evidence on behalf of the Committee. All alike, whether British or foreign, have acted as if your Committee had called them. Though a corroder I have endeavoured to make an impartial survey.

22,270. As an industry we have been abused and prejudiced by outside criticism for years. We have hitherto been content, if only we could satisfy the Home Office of our *bona fides* and solicitude for the safety of the workpeople. There has not been a word of complaint from the Home Office. The letter and spirit of the regulations have been loyally kept. We do not believe that the Home Office will further any crippling of an industry without, at any rate, very careful consideration of what we have placed before you.

22,271. I do feel that we have a distinct grievance, that we are kept in ignorance of evidence that may have been tendered to you in favour of the prohibition of lead—and I can understand the sulphate, zinc, and lithopone makers may feel the same of us. I venture to ask even now that a transcript of all the evidence should be handed to us at once so that we can have a chance of bringing rebutting evidence, and I have no objection to a transcript of all our evidence being handed to anyone who wants it.

22,272. I can well understand the attractive simplicity of prohibition at first sight. Here is an article the use (or the careless use) of which, it is admitted, causes a large amount of human suffering and a certain number of deaths in a particular trade, whether above or below the average. There are other articles which can more or less take its place. What is wealth compared with human suffering? What is the cost to the community beside the annual loss of life? Let us strike out white lead and all will be well! It is surely unnecessary for me to point out such methods defeat their own ends. If, upon such arguments, the use of articles infinitely more dangerous than white lead were prohibited, the whole national well-being would be brought to an end. It is not by such slap-dash

x 7790

methods that the improvement of the State is effected. The method of a scientific age is not to throw aside a useful material but patiently to seek out and eliminate the true causes of the evil.

22,273. (Chairman.) You are Chairman of the Committee of the White Lead Corroders' Section of the London Chamber of Commerce?—Yes.

22,274. In paragraph 22,182 of your proof you refer to the public inquiry in regard to the prohibition of yellow phosphorus?—Yes.

22,275. In this you are mistaken?—Am I?

22,276. There was no public inquiry, but the prohibition law was passed by Parliament just as any house painting law would have to be.—I said "I believe"; I was not sure.

22,277. Such a long and patient hearing on all sides, extending in the case of this Committee over more than two years, is only possible under the system of Departmental Committees and Royal Commissions whose procedure can hardly be discussed here?—I understand that.

22,278. You have prepared a somewhat lengthy proof in support of the arguments which have been put forward against any prohibition of the use of lead in paints?—Yes.

22,279. You desire no doubt to have this proof put in and taken as read?—Yes, with any corrections that I may be allowed to make.

22,280. In paragraph 22,182 of your proof you refer to pig lead as a mainly British product?—No, I mean that "white lead" is mainly a British product.

22,281. Are you aware that 92 per cent. of the metallic lead used in this country is imported?—Yes. I thought there would be some misunderstanding about that. In addition to lead imported in the form of ore, about half of the metallic lead imported into this country is in the form of argentiferous and auriferous lead. It is not pig lead at all in that state. We get out the copper from it, the gold and the silver, and all that sort of thing. It does not follow that it does not come from a British possession. It comes in in an absolutely unusable form. The remaining half is pig lead, *i.e.*, the finished article.

22,282. The metallic lead produced from British ore is 17,990 tons, and the metallic lead imported is 213,707?—But a lot of the lead imported is in the raw material state, and we make it into pig lead in England. It is imported largely from British Colonies.

22,283. Are you aware that 92 per cent. of the metallic lead used in this country is imported?—It is not imported in a form in which it can be used. There is a large de-silverising interest in the country. I am a de-silveriser. What we make is pig lead. Some of the bullion and the ore comes from foreign countries, and some from the British Empire. What we make is used by white lead manufacturers very largely because we make it in a specially pure form. The ore imported is full of gold and silver. But with regard to the Welsh mines there is hardly any silver at all. They have a rather precarious existence, depending on the price of lead.

22,284. I find in the official figures of the Board of Trade that metallic lead from British ore is, 17,990 tons, and the metallic lead imported from abroad is 213,707 tons. Approximately, a third of that 213,707 comes from British possessions. Now, do you still maintain that the raw material used for white lead making is mainly a British product?—I state that white lead is mainly a British product, but I think that the pig lead that is used in this country for white lead making is mainly, if not entirely, a British product. Whether it is foreign or English, you are going to interfere with the consumption in this country of some 25 per cent. The point is quite good with regard to what is consumed in this country.

22,285. You admit that my figures are correct?—Yes, I think they agree with the figures that I have.

22,286. In Part 1 of your detailed proof, you deal with the statistical evidence regarding lead poisoning?—Yes.

22,287. You do not dispute the official figures showing a deplorable number of deaths from lead poisoning among painters, do you?—I do not dispute

Y y

17 October 1912.]

Mr. EDWARD M. JOHNSON.

[Continued.]

Table A. of the Registrar-General's report, nor the figures published by the Board of Trade last night. That one reads every month. I have been reading the figures this afternoon in Mr. Werner's room, as a matter of fact, in the *Labour Gazette*.

22,288. Table C. of Mr. Schooling's report, which you refer to, shows that the death rate from plumbism among plumbers, painters and glaziers, is one fifty fourth part of the death rate from all causes? Yes, at all ages.

22,289. This means, does it not, that of every 54 plumbers, painters and glaziers who die, only 53 would die if there were no exposure to risk of lead poisoning?—I think you had better ask him that.

22,290. But it means that, does it not? Is not that the deduction you make from it?—I am not an expert on these matters.

22,291. Would you not as a humane man say that everything should be done to save that one man in 54?—If the deduction is correct, I should say by all means give him a good chance under regulations.

22,292. I did not ask about regulations, but ought he not to be saved?—A very good effort should be made.

22,293. Not a very good effort; but ought he not to be saved?—Certainly. I am a humane human being. Everything possible and reasonable should be done.

22,294. These figures refer to deaths from lead poisoning alone, and take no account of the increased mortality from Bright's disease, and nervous and other diseases due to exposure to lead?—You beg the question. How can you say that it is due to exposure to lead entirely after all this evidence? I might have said so if I had not gone into it, but I think it is possible that other things, besides lead, cause kidney disease, for instance.

22,295. I say these figures refer to deaths from lead poisoning alone, and take no account of the increased mortality from Bright's disease and nervous and other diseases due to exposure to lead?—I do not like the words "due to exposure to lead." It seems to me to beg the question. I cannot admit it. We will agree to differ upon that point. My point is that other things besides lead predispose one to Bright's disease and kidney disease, obviously turpentine does.

22,296. Do you tell us that the mortality figures showing an increase of Bright's disease, and nervous diseases, and other diseases, are not correct?—I would not like to say that they are not correct, but it was that little addition with regard to lead that I did not like.

22,297. (*Dr. Collis.*) Among plumbers, painters and glaziers, the mortality from diseases of the urinary system, which include Bright's disease, is 94. Among file makers, who have no exposure to turpentine or any oil vapours, it is 160. In white lead manufacture and among those engaged in lead goods making, with whom you are particularly associated (and you know there is no exposure to vapour of turpentine, or of oil), it is 160; so I think we are justified in considering that the 94 among the plumbers and painters has relation to the lead to which they are exposed?—It is a fair argument. As a matter of fact, our workpeople are largely exposed to turpentine and oil.

22,298. The point is that urinary diseases are always found associated with exposure to lead, and we therefore feel ourselves justified in considering that the urinary diseases of the painter are due to the same cause. When we do not find the urinary diseases of the painter in excess of other people exposed to lead, we find that they have a liability to gout which the others have not, and we are perfectly prepared to place the gout to the credit of the turpentine?—This seems to be worth following up. We shall have another go at it.

22,299. (*Chairman.*) Now there seem to be only two possible means of dealing with the evil: (1) to issue a code of regulations; (2) to prohibit the use of lead, or rather to restrict its use within narrow limits, as for example, by forbidding the use of paints containing more than 5 per cent of soluble lead compounds. Do you agree that these are the only two alternatives, regulation or prohibition?—I do not agree

that you are any better off with prohibition. You may prohibit. Is it strictly logical to say that there are only two alternatives to anything? A thing is either black or not black. It does not follow that it is black or white. But I admit that those are the only two alternatives that I have heard seriously discussed.

22,300. I may say that practically all the witnesses whom we have examined have admitted that something must be done to remove the evil of lead poisoning?—Yes; we should like it very much.

22,301. The question which confronts this Committee is not whether anything should be done, but how it can best be done?—I quite agree.

22,302. You next go on to quote authorities for attributing much of the painter's ill-health to turpentine and oil?—Yes. There seems to be very grave ground of suspicion against turpentine. I do not know so much about oil. Professor Armstrong, who was here this afternoon, uses the word "oil," but it rather looks as if it was a mixture of the two.

22,303. Do you suggest that a mixture of turpentine and oil produces lead poisoning?—No, but it predisposes. A great many things have been put on to lead that are not lead. It is like hanging a dog with a bad name. I do not know that anybody is quite satisfied yet that the diagnosis of lead poisoning is quite complete. If Dr. Collis, for instance, were to diagnose a case as lead poisoning, I would not be so foolish as to say that he was wrong, but there is evidence from these scientific gentlemen—so they have told us, and I imagine they have told you—that turpentine is under grave suspicion. It was raised at the Geneva Inquiry. It is not a new point.

22,304. You do not suggest that it causes lead poisoning?—No. I would not suggest such a thing as that.

22,305. You next say, in paragraph 22,205 of your proof, that the substitution of zinc white for white lead would increase the percentage of turpentine used in paints?—Yes.

22,306. What proof do you offer of this statement?—Take genuine ground white zinc. I have put it into percentages. I think that is the proper way to do it. We sell white zinc in considerable quantities. When mixed for use it would consist of 61½ parts of dry zinc oxide, 14 parts of refined linseed oil, 14 parts of boiled oil, 8 of turpentine, and 2½ of some manganese borate driers. That is 100 per cent. White lead mixed for use would be 78 parts of dry carbonate of lead, about 15·5 of fine linseed oil, 3·5 of turpentine, and 3 of driers. That is 100 per cent. Those are working mixtures, gentlemen, I think. I will put it in this way: 72½ parts of genuine ground white zinc, 3 added parts of refined linseed oil, 14 of boiled oil, which contains a lot of driers, 8 parts of turpentine, and 2½ of manganese borate driers; the lead to consist of 85 parts of ground white lead, 8·5 per cent. of refined linseed oil, 3·5 per cent. of turpentine, and 3 per cent. of driers, which would be regular patent driers. If you went into a room and painted it, you would find that your zinc would start to dry, but would not dry so quickly as the other. It would get sticky. Possibly the smell would not be much worse, but you could not put on the other coat so soon as you could with white lead. Consequently your painters would have to keep about on the job very much longer. In the second place they would certainly, from all the evidence, have to put on three coats of zinc mixture as against two of the other. Thirdly, from all the evidence we have had, you would have all these gentlemen in again with their zinc paints putting it on again sooner than would be the case with lead, whereas lead would be standing all right. My point is that I do not want to have too much turpentine in the house. It is a very big question whether zinc will stand outside.

22,307. Supposing it were proved that the substitution of zinc for lead would lead to an increased use of turpentine, have you any proof that even that increased amount of turpentine would be sufficient to produce serious ill effects in human beings?—No, but I think that the Home Office authorities might well inquire further into this matter.

17 October 1912.]

Mr. EDWARD M. JOHNSON.

[Continued.]

22,308. But you do not know yourself?—No. I am not a bacteriologist, and I would not presume to express an opinion after Dr. Goadby has been here.

22,309. You refer to the evidence offered by a number of witnesses who have been heard by us?—Yes.

22,310. We examined all those witnesses at considerable length, and as you have not listened to their evidence it would be useless to go into all their points again?—I do not want you to.

22,311. In paragraph 22,206 of your proof you refer to the possible poisonousness of zinc oxide. Have you ever heard of a case of poisoning arising from exposure to zinc oxide?—There are several mentioned in the foreign evidence.

22,312. But do you know of any case yourself; have any come to your notice?—No. There was no factory until about six months ago in England manufacturing zinc oxide.

22,313. (Dr. Collis.) But it has been used?—Yes.

22,314. (Chairman.) May we take it that the only evidence you have is the foreign evidence which has been given to this Committee and which you have read?—Yes.

22,315. Would you be surprised to hear that this Committee has had evidence that men who are covered with zinc oxide dust in the course of their work in a zinc oxide manufactory show no signs of poisoning, even when they have worked 20, 30, or 40 years at such a dusty process as packing dry zinc oxide?—Yes; I am very surprised.

22,316. You refer in great detail to the evidence-in-chief of foreign witnesses. Are you aware that it was generally admitted by them to be impracticable to enforce prohibition of dry rubbing down where such a regulation has been introduced?—No; that is not my impression.

22,317. In paragraph 22,233 of your proof you repeat a statement made regarding the Belgian Government and their return to the use of white lead as indispensable?—Yes.\*

22,318. Have you taken any steps to ascertain the truth of that statement?—There was something in a trade paper last week implying that that was not the case. A wire has been sent to-day to Brussels to have it verified.\*

22,319. Would you be surprised to know that documentary evidence of the highest authority has been produced to this Committee showing that no white lead has been used by the Belgian State Railways for the last four years?—Yes. I shall have my answer to-morrow and I may withdraw that. We may have been misinformed.

22,320. In paragraph 22,239, when you come to Great Britain and Ireland, you quote a large proportion of decorators as saying that there was no substitute for white lead. Have you satisfied yourself that each of these gentlemen had made exhaustive and scientific tests of other paints?—No, and I do not think that anybody could have satisfied himself personally upon such a point.

22,321. If they have not made such experiments their statement is not of much value as against the evidence of large users who have tried and succeeded with leadless paints?—If you like to put it in that way I should like to see them called. If I have been foolish enough as chairman of a committee not to take every precaution, and I have half a chance of putting it right, I should like to call them.

22,322. Now, in the third portion of your proof, beginning at paragraph 22,242 you state that education and regulations have been successful elsewhere?—Yes.

22,323. Can you quote any country where statistics have shown that lead poisoning has been stamped out by regulations?—Not stamped out. There has not been time yet. I believe if we honestly tried to do it in this country, in a very short time we should be able to show something almost like that, but we could never stamp out any disease.

\* The result of my inquiry in Brussels is that white lead was not in fact used by the State Railway Department at the date of my evidence, although there was not any official or formal arrêté or decree of prohibition.

22,324. I need not go into great detail with regard to your statements regarding inspection, because they merely repeat the statements of other witnesses called on behalf of the white lead corroders, and those witnesses have already been very fully cross-examined?—Yes; I would like to put in my addition.

22,325. In paragraph 22,256, however, you suggest the formation of a joint committee to draft and consider regulations?—Yes; I thought it would be rather presumptuous on our part to frame them.

22,326. You suggest the composition of this committee, namely, Home Office experts, master painters, workmen and users of white lead paints, and lastly a white lead corroder, and/or a white lead grinder. Do you seriously suggest that a committee representing only one side should be set up. If a white lead corroder, why not a zinc manufacturer? If a white lead grinder, why not a manufacturer of leadless paints?—Quite so (anything you like), but I want it to be absolutely impartial.

22,327. In paragraphs 22,258 to 22,266 of your proof you set forth the points which you think should be dealt with in framing regulations?—Yes.

22,328. This, however, only brings us back to the question of how such regulations can be enforced in the case of painting operations which are scattered all over the country?—Yes.

22,329. In paragraph 22,271 you speak of a grievance of not being allowed to see the evidence tendered in favour of the prohibition of lead, and suggest that all evidence should be published with a view to the calling of rebutting evidence?—I do not make any great point of that. You told me at the beginning the position with regard to phosphorus, but I had an idea that it was a public inquiry. We heard a great deal about phosphorus.

22,330. You do not appear to realise that this is an impartial Committee, containing as it does an equal number of employers' and workers' representatives, together with four members who have absolutely no pecuniary interest whatever in the question, on either one side or the other?—Yes, I realise that it is impartial. If you have read anything else into my evidence, I beg to withdraw it. I certainly did not mean that.

22,331. Do you not think, under these circumstances, that you can rely on our sifting every particle of evidence which is presented to us, and weighing it all fairly?—Yes. It has been going on a long while, and everybody wants to know what is going on.

22,332. You are, of course, aware that all the evidence will be published eventually, and you or any other person interested will then be in a position to approach the Home Office or Parliament if you feel that you are in possession of new and material evidence which this Committee has not heard?—Thank you.

22,333. (Dr. Collis.) There are one or two points in your proof that I would like to ask you a question or two about. In paragraph 22,194 you state, "The data available do, however, show a large reduction in the number of cases of lead poisoning in 1900-1910." Can you tell me where those data are got from?—I understood that the statistics referred to lead poisoning in factories.

22,334. But we are not talking about factories. Your phrase, in the paragraph that we are now speaking of, is dealing entirely apparently with house painting, and it states that "the data available show a large reduction in the number of cases of lead poisoning, 1900-1910." With regard to notifications received by the Home Office, there were in 1901, 169 cases; in 1902, 179; in 1903, 201; in 1904, 227; in 1905, 163; in 1906, 181; in 1907, 174; in 1908, 239; in 1909, 241; in 1910, 232; and in 1911, 263. These are cases, not deaths, so there is no reduction of case incidence; these are voluntarily reported and imperfectly represent the total. With regard to deaths amongst house painters, in 1901 there were 41; in 1902, 32; in 1903, 39; in 1904, 39; in 1905, 28; in 1906, 36; in 1907, 39; in 1908, 44; in 1909, 47; in 1910, 35; and in 1911, 48; so that your statement is hardly correct?—It is very difficult to keep strictly to the terms of

Y y 2

17 October 1912.]

Mr. EDWARD M. JOHNSON.

[Continued.]

reference. I would like to know when the Workmen's Compensation Act and other Acts came in.

22,335. The Workmen's Compensation Act came into force on July 1st, 1907? Probably there were more cases in the olden days which were not reported.

22,336. There have been 44, 47, 35, and 48 deaths since?—I quite see myself what has happened. You give your statistics in two forms. Factories and house painters are given separately. I withdraw by all means what I have said. On the other hand, I would like to say that I think that some of the increase is due to the new legislation.

22,337. That may possibly be?—The state of trade varies very much. I suppose when times improve there is a tremendous run, and a great many odd men are taken on who are not regular, and do not quite understand all the tricks of the trade.

22,338. That must always have happened?—I do not want to say that there has been a reduction of lead poisoning. I hope you will not take it in that light, but I think it has been exaggerated. I want to stop what there is.

22,339. In paragraph 22,197 you make an allusion to paint emanation not affecting paper hangers. We have had a great deal of evidence to show that there are no emanations, and therefore the paper hanger cannot be exposed to them?—I do not attach any importance to emanations myself, but I understand that some people do. It is a little sarcasm.

22,340. The paper hanger seems to be particularly happily placed as a workman, compared with a painter, since he carries on his work in the same room, and yet we find him better off?—It is a little curious. One ought to know what the good influence is which makes him so exceptionally healthy. There may be something in the size, or whatever it is he uses on the wall. We might introduce that good influence elsewhere.

22,341. Do you know an old classical quotation: "Art is long and life is brief"?—Yes.

22,342. We cannot sit for ever. We are inquiring as far as we can. Now, do you know of any reason why the wood turner and cooper should have a higher death rate than the painter?—No.

22,343. Ought we not to make a thorough inquiry into the wood turner and cooper too?—It would be very much more interesting perhaps.

22,344. Personally, I have made inquiries, but our inquiry is only into the use of lead in paint?—My point is that ours may be a dangerous trade, but not the most dangerous trade, apparently, judging from statistics alone.

22,345. That is hardly the point?—It is my point.

22,346. The Secretary of State's point of view is that here is a trade with exposure to lead, and that lead is possibly a preventible cause of sickness and illness. Some of these others are not preventible?—Possibly they are.

22,347. Or possibly we do not know anything about the causation to alter it. But here we do know. With regard to other trades, for instance, with regard to accidents in mines, we are constantly making regulations. It seems no argument whatever to say that others are more dangerous, and that therefore this should be left alone?—Please do not think I come here to say that it should be left alone. I say, do you know the definite causation of lead poisoning, and can you prevent it? Do not talk about prohibition until you are quite sure that you have got to the bottom of the cause and are not attributing the cause to the wrong article.

22,348. You have not had the advantage of reading all the evidence which has been placed before us?—No, that is what I wanted to do. You will not let me.

22,349. After all, we are here to consider it and sum it up. The Secretary of State has appointed us for that purpose?—I should have thought that perhaps he would have allowed one to see some of it. We can but ask.

22,350. You mention Dr. Goadby's evidence in paragraph 22,211. While Dr. Goadby was here, I took the opportunity of reading these words to him, without telling him from where I took them: "In view of Dr. Goadby's experiments one may assume that zinc is a

"poisonous metal, even if it contains little or no lead, "capable of producing pathological changes, and in "particular inflammation of the kidneys." I asked him whether that represented fairly his experiments in comparing zinc and lead, and his reply was, as I took it down: "This is reading more into my evidence "than I wished to say"?—I must explain that I have never seen any of Dr. Goadby's evidence. All that we have had to do with Dr. Goadby is that he has been before our Committee, and if he has altered his mind since he spoke to a meeting of the Chamber of Commerce, I withdraw that.

22,351. In paragraph 22,227 you speak of the failure of repressive legislation?—Yes. I have not much evidence on that, but I particularly refer to inside painting. That you have been told about. The fact is that there has been repressive legislation in Holland which has been cancelled. I have the words "Minister of Marine," but I think it is the "Minister "of Justice." This is what he writes to Messrs. White and Leonard: "One of the members of the Commission "appointed some years ago by the Dutch Government "to inform about the white lead question was a certain "Mr. W. C. Metzelaar, Chief Engineer of the Justice "Department (construction and repairs of prisons, " &c.), who proved himself to be a great opponent of "the use of white lead; in the practice he showed this "by modifying in 1910 the general conditions for the "public tenders so that the use of white lead and red "lead was completely prohibited and only the use of "zinc white and oxide of iron was allowed. Now a "short time ago a new tender was given out by "Mr. Metzelaar, and this contains the condition that "the painting work must be done with white lead and "red lead. Not even there is a prescription that the "white lead must be ordered from a manufactory "where it has been prepared as a paste. By the same "mail we send you a copy of the above-mentioned two "tenders, so that, if you think it proper, you can "have a translation made of those parts which interest "you."

22,352. We understood that in Austria they had withdrawn the prohibition on internal painting and regulations with regard to outside painting, and we understood that they could not possibly enforce the regulations?—They could not enforce the prohibition of the use of white lead inside. I know of no evidence that the prohibition of dry rubbing down was unworkable. Did they not find that the painters put a white lead foundation and a coat of zinc white on the top and a very good practice too?

22,353. The evidence was very emphatic on the point of withdrawal. We had a master painter from Austria. It would be difficult to do it here, would it not?—Quite so; it would be difficult, but I have a great opinion of the British nation, and where there is a will there is a way. If the country wishes it, it will be done.

22,354. It is a matter of pounds, shillings, and pence?—Yes, but it is quite another thing to substitute zinc for white lead.

22,355. Monsieur Ricker Dovrède, in a letter put in after discussing the question of regulations, says: "The Corporation of Painters would prefer the "total suppression of white lead in their work"?—That is interesting, but there is other evidence on that point. What does it mean exactly—"Corporation of Painters"? We must do better in England; that is all.

22,356. (Chairman.) Have you, as a body of lead corrodors, considered a set of rules which could be applicable to the evils of this particular trade?—We did set to work, but we thought it was rather presumptuous on our part. After all, we do not paint, and we know that you have a lot of expert gentlemen here. After all, whom can you have better than Dr. Collis and Dr. Legge on the drafting of regulations?

22,357. It would be very interesting if you could send us up a list of rules which you think would combat the whole of the evils and also say how they are to be enforced?—I can show one simple rule, and

17 October 1912.]

Mr. EDWARD M. JOHNSON.

[Continued.]

comprehensive of all others—the “prohibition of dry rubbing off.”

22,358. But you come up here to represent the lead corroders, and you say that that regulation will meet the whole case. If you can suggest to us regulations and how they are to be enforced, we will consider them?—I have a suggestion for enforcing them, but I shall be in a much better position three months hence to enlarge on that for a certain reason.

22,359. (*Dr. Collis.*) I hardly followed you in paragraph 22,251. You say, “The regulations need not be vexatious to the painting trade,” and then immediately afterwards you say that the painter can escape from the irksomeness of regulations?—I mean that he can use the other stuff.

22,360. If they are not vexatious, why should he find them irksome?—He may think them so, that is all. We say that there is nothing to take the place of white lead. If there was there would be no necessity for you gentlemen to be sitting here over a year inquiring into all this. If there were something to take its place we should have all shut up long ago in the ordinary course of events. There has always been zinc used: One of my greatest friends, commercially, is the man who sells probably more zinc in England than anybody else. We talk over these things together, and he says, “Let everybody live.” The sales of the two have been going on side by side for years. Zinc is going up. Lead at the present moment is very high in price. It is a most unfortunate time for us, and most unfortunate for the purposes of this inquiry. We are coming before you at a time when we have never had pig lead or other products so high since the Crimean War. I do not consider that we are having a very good year with regard to the painting trade. The cold summer has not been conducive to an inordinate amount of painting, but I find that the imports of foreign white lead at the end of September have increased 9.31 per cent. compared with last year, and the zinc oxide imports have only increased 7.06. Lithopone has gone up 4l. or 5l. a ton while you gentlemen have been sitting here. The increase is not caused by its being used so much in paints. No man on this committee or anywhere else can estimate what the substitute is going to cost.

22,361. With regard to regulations, you base your ideas on the regulations necessary for factories?—Yes, and on the foreign regulations.

22,362. They have broken down in Austria. You have considered probably the difficulty, if not impossibility of carrying out some of these regulations in the house-painting trade?—Yes, some but not all.

22,363. (*Chairman.*) I asked you just now if you could submit to us a list of regulations which you consider would meet the evil with which we have to deal, and also can you tell us how those rules can be enforced?—I put forward these suggestions which I think would form the data for a joint committee. I am a great deal too modest and diffident to come here and dictate to you gentlemen under this roof a list of regulations. I think it would be presumptuous. I want the masters, the makers, the users, and the grinders, Dr. Collis and Dr. Legge, and Mr. Werner to keep them in their minds in dealing with the subject. I think it would be a very good thing.

22,364. This Committee is formed to deal with the question, and when you talk of rules to meet the difficulty I want to know what they are?—Here are two pages, and then I want to put this paper in to explain how they can be carried out. Carrying them out is a difficult matter, and I am an amateur in these matters.

22,365. (*Mr. Rice.*) You have put forward here a suggested list of regulations. Have you any evidence that these regulations would be acceptable to the trade. Have you taken steps to find out whether, if these regulations were in force, the actual users would accept them?—No, but I should be perfectly pleased to ascertain the position with regard to that. I thought it would be presumptuous on my part to come along with a set of regulations. I did not think that the Home Office people would like it.

22,366. But you have put these in without asking whether they would be acceptable to the trade?—I

have put them in without asking whether they would be acceptable to the trade, but I might ask you or Mr. Sutherland whether you think they would be acceptable. Mr. Sibthorpe undoubtedly would say that these are acceptable from his point of view, but I have not ascertained the view of others.

22,367. (*Lord Henry Bentinck.*) The point is what we think of them?—Quite so; everything, of course, depends on that.

22,368. (*Mr. Rice.*) As a corroder of lead, have you taken any steps to find out whether the actual users would support you?—No, not specifically as to these two pages of draft regulations.

22,369. (*Mr. Parsonage.*) In paragraph 22,239, in referring to this matter you state that there have been 123 witnesses called—employers—and the vast majority recommend regulation. I am under the impression that the vast majority have said the contrary?—I do not think I say that. What I mean is that the Chamber of Commerce issued inquiries to the different chambers of commerce throughout the country to 123 different people, and I have their answers.

22,370. (*Mr. Rice.*) In paragraph 22,182 I take it the point is that you wish to make clear that the prohibition of white lead would be the extinguishment of a British industry—converting lead ore into pig lead. What you make into pig lead is from lead ore, I understand—the auriferous and argentiferous ore?—Call it bullion mixed up in an unusable form.

22,371. If white lead was prohibited, would it mean the extinguishment of that particular industry?—If the lead ore or the bullion is rich enough to be worth importing it would not mean the extinction, nor is the sentence meant to mean that, *vide* my answer to the Chairman's 22,280. I say that the smelting and desilverizing industry would be very severely hit by doing away with the use and consumption of 20 to 25 per cent. of pig lead. The lead itself would not be worth dealing with so much. Many poor ores would be affected.

22,372. What trade would suffer?—The people most hardly hit would be the small lead miners in England and Wales. Their lead is found in the ground in such a pure form that it is taken to Newcastle and turned into white lead or electrical lead. We take complex ores from different parts of the world, and we have to do a great deal with them. It is entirely a British industry.

22,373. To what extent will that particular portion of the industry be affected?—The Wales industry will be very largely affected.

22,374. But not the industry of converting the ore?—I hope not.

22,375. Is it possible to adapt the machinery that you now use for making white lead for producing zinc white?—No, and I think that Mr. Lancaster, my partner, has told you that there are very great drawbacks with regard to doing it in this country. We shall always remain a conduit pipe.

22,376. (*Chairman.*) The small mineowners would suffer first, I understand?—Yes.

22,377. What proportion of lead do they produce in comparison with what is used in the whole trade?—I cannot separate the Welshmen yet from the Englishmen.

22,378. On what do you base your statement that they would suffer?—I base my statement of the fact that they would suffer on this—that their stuff is mined for the value of the lead alone. The stuff that we get from Mexico is mined for the value of the gold and silver.

22,379. Why should not the mineowners' ore, as it is so pure, be used?—The price would go down so much that they would have to close.

22,380. (*Lord Henry Bentinck.*) There would be a big demand for lead pipe?—I am afraid that many lead pipes are made from old lead.

22,381. (*Chairman.*) The amount of metallic lead produced from the Welsh mines is 4,500 tons, compared with nearly 18,000 produced in the United Kingdom, so I ask you again, how do you justify your statement that these people who produce so small a

17 October 1912.]

Mr. EDWARD M. JOHNSON.

[Continued.]

quantity will be ruined? Do you still maintain that statement?—I am sorry that I cannot make myself clear. What I say is that the Welsh and English lead mines now open (and they are rather more open than usual just now, owing to the high price) produce a form of lead so pure and so free from gold and silver that if you did anything, or the world did anything (because I assume that the world will follow what England does) by which the consumption of pig lead is reduced 20 or 25 per cent., you will infallibly knock down the price of raw material so enormously that the very first people who will have to shut up will be the mines in England and Wales, where only lead is got. That is the point.

22,382. That applies particularly to the Welsh mines? —Yes—to the particular gentlemen who have appeared before you, such as Captain Francis. An impartial witness has been put in by the Chamber of Commerce, who has given chapter and verse for all these things. He has collected information from individuals and given it all to you.

22,383. (Lord Henry Bentinck.) Your convention has a fairly good control over the price of white lead? —I wish we had better control over the price of pig lead, but this is going off the point.

22,384. I do not think it is?—We are talking about pig lead, and now you say that in regard to white lead there is a convention of which I have some control.

22,385. (Chairman.) Now will you read your suggestions?—“As regards the insufficiency of statistical data, I would urge that every National Insurance card should have a space provided for the insertion (compulsory) of the insured person's occupation.”

22,386. (Dr. Collis.) The insured persons' occupations are being, I believe, duly recorded?—I am glad of that. “Secondly, with reference to the suggested difficulty as to the enforcement of any regulations which might be made owing to the very large number of buildings in which the work of painting proceeds simultaneously, in my view there would be no necessity to have a very large number of inspectors, nor need they be men of the mental calibre of H.M. Inspectors of Factories. It appears to me that it would be sufficient if flying visits were paid from time to time to places where painting work was being carried out, as the employer would always be on the *qui vive* for the visit of the inspector, which would, of course, be made without previous notice to him. I should have thought in the ordinary course of events that the sanitary inspectors and surveyors of the various local authorities would have been the officers best fitted to undertake these duties under the supervision of the district medical officer of health, part of whose duties it would be to make the quarterly examination of the men and keep the records. The officers of the local authority are constantly about in each district carrying out various duties of inspection, including the supervision of the erection of new buildings, and under the Housing and Town Planning Act every house in the district has to be surveyed, and I am told that some 108 particulars of

“the size of the rooms and condition and construction have to be taken of each house and filed by the local authority, duplicates being transmitted by the medical officer of health to the Local Government Board. This Act is now being carried into operation in most districts, and the officers delegated by the local authority are becoming more and more familiar with the condition of each house, large or small, in their area. It has occurred to me that, as the Old Age Pension work was delegated to the Excise officials, the Home Office might like to delegate this inspection work to the officials of the local authorities. I understand, however, that the Home Office have an objection to this system on the ground that the sanitary inspectors are appointed by the local authorities, and that it would be impossible for them to exercise an independent judgment. Seeing, however, that these officers hold their appointments subject to the general control of the Local Government, I should have thought this objection not insuperable. Having regard, however, to the fact that it exists, I have caused inquiries to be made as to how far the machinery, which is being set up to carry into effect the provisions of the National Insurance Act might be utilised for the purpose of enforcing white lead regulations. I am not at liberty to make any official use of the information, but I understand that one of the principal officers of the Insurance Commission has informally expressed the opinion that there would be no insuperable difficulty in delegating to the inspectors under that Act the duty of enforcing regulations, especially in view of the fact that, to a considerable extent, the duties of the Insurance Act inspectors would be analogous to those of the white lead inspector.” (I refer you to section 63 of the Act of 1911.) “The Insurance Act inspectors are brought into close contact with employers of labour, and have large powers of inspection of books and interrogation of employees, whilst provision is made for local inquiries in places where excessive sickness prevails. Also the local Insurance committees would render valuable assistance, and probably, as has been the experience in other countries, the trade unions would be efficient safeguarders of the rights of their members, and by officially lodging complaints would relieve the painter from the necessity of lodging them in his own name. A third point is, the medical examination which I have recommended might be done by the Insurance Act doctors, and the payment for it might help to satisfy their demands, which I understand are as yet unsatisfied. My suggestion is that if your Committee are prepared to consider a system of regulation, a general committee might be called with a view to settling the details. Your Committee will do me the justice to admit that as at the moment the full method and routine of the working of the National Insurance Act is unsettled, I am unable to make any definite suggestions.” If you give me till the National Insurance Commissioners have got their arrangements made, we might really talk very much better about it. I honestly believe that if we have a will, we can find our way through.

The witness withdraw.

## THIRTY-NINTH DAY.

Friday, 18th October 1912.

PRESENT:

SIR ERNEST F. G. HATCH, BART. (*Chairman*).

LORD HENRY BENTINCK, M.P.  
 MR. E. L. COLLIS, M.B.  
 MR. W. G. SUTHERLAND.  
 MR. A. GARDNER.  
 MR. J. PARSONAGE.

MR. A. L. C. FELL.  
 MR. C. L. MASON.  
 MR. W. ROBINS.  
 E. A. R. WERNER (*Acting Secretary*).

Mr. EDWARD M. JOHNSON recalled and further examined.

22,387. (*Chairman*.) When the Committee rose last night you read a few additional paragraphs of your proof. In the first of these (paragraph 22,203) I understand you wish to draw the Committee's attention to the system of blood examinations recently introduced at Leipsic. What do you wish to say on this point?—What I wished to say was that you should ask Dr. Goadby about it. I do not know whether you did. As I explain in the proof, it is an absolutely new thing to me, and one naturally jumps, as I imagine you will jump, at anything that will tend to prevent lead poisoning. I knew that he was going to be here the same day.

22,388. In paragraph 22,249 you refer to the economic disadvantages of the prohibition of lead. Do I understand that you wish to say something more in that connection with regard to comparative prices, statistics of imports, and the like?—I think I tried to make that clear last night. I gave you the mixings, showing what the constituents were, and how I thought that we should have with zinc to have three coats to two, and how it would take longer to dry, and that the job would have to be done again much sooner. I also pointed out last night that there had been an absolutely free market for zinc for years in England, and that the imports up to date this year as against the same date last year were 9 per cent. increase in the case of white lead against 7 per cent. in the case of white zinc.

22,389. In paragraph 22,251 of your proof, do you wish to add a note advocating the application of the principle of self-inspection to the painting industry?—I have no practical experience of that. We do not have that system at present in the white lead factories, but I understand that it is really seriously advocated by people who go into these things, especially in the Home Office, just as the Germans have told us that the trades union people take good care to watch each other on the jobs—not only the masters but each other. If inspection and regulations are introduced at all (I should like to be educated on the point), and the workmen cannot be trusted, they should have the necessary machinery given to them. I think that the Germans are on the right line.

22,390. Workmen or employers?—Both. Self-inspection, I take it, is some system by which the cards and things are put up, and notes are made so that the proper duties are carried out.

22,391. Some system by which it can be insured that the regulations are carried out by the employers and employed and regularly checked?—Yes. You know more about it than I do, of course.

22,392. The lengthy statement which you wish added after paragraph 22,252 was read before the Committee rose yesterday evening. Is there anything you wish to add regarding the subjects touched upon therein: (1) The use of National Health Insurance records. (2) The utilising of the sanitary inspectors and other officers of the local authority. (3) The medical inspectors?—With regard to the use of the National Insurance records and my first point about the card, I understand that a book is kept with these

particulars of the occupations of all the people insured. I imagine that there is an approved society in connection with the Union or Association and that the book has a record.

22,393. (*Mr. Gardner*.) No. Every insured man has a book in addition to his card?—He himself has?

22,394. He himself has?—Whether he is insured in an approved society or by the State?

22,395. The card simply holds the stamps. The book is a record year after year?—Therefore, at the end of one year of the working of the Act you will be able to have a most extraordinary census of occupation. The book, I understand, shows what the employment of the person employed is.

22,396. (*Mr. Sutherland*.) It is the census of invalidity that we want in relation to occupation?—Yes.

22,397. (*Mr. Parsonage*.) The insurance book always remains the property of the man, and it does not go to the Government at the end of the year?

22,398. (*Mr. Sutherland*.) It ultimately goes to the Government; it is bound to?—I hope it does, because we should feel so much more satisfied that every statistical precaution is taken to see if prohibition is justifiable.

22,399. (*Mr. Gardner*.) The application form to become a deposit contributor or member of an approved society and the particulars must all be forwarded to the Commissioners?—Then the blue books will contain statistics?

22,400. I should think so?—That is what I want.

22,401. (*Chairman*.) Now, with regard to the second point: "The utilising of the sanitary inspectors and other officers of the local authority," what do you say?—I have nothing to add to that. Knowing that the Home Office did not approve of that way with regard to local authorities, I naturally rather emphasised the sentence.

22,402. What have you to say with regard to medical inspectors?—I think that the Insurance Act doctors will be fully able to deal with that, especially if the Home Office experts on lead poisoning could let the general practitioner of the country have some sort of up-to-date knowledge of lead poisoning. It has undergone a great transformation in recent years in the remedies applied and so on. It is possible that in some parts of the country the medical practitioner is not really thoroughly acquainted with the method of curing lead poisoning or the means of diagnosing it.

22,403. With regard to medical inspection, you doubtless recognise that the payment for medical inspection would have to be made by the employers of house-painters, just as it is now made by employers in other industries where periodical medical examination is required?—I think that in all these matters, as in my opinion the use of white lead is an enormous advantage to the community, anything which attends its use ought really to be paid for by the consumer. It is worthy of consideration whether the producer might not possibly be called upon to contribute if the employer cannot put it on the consumer, but honestly I think nowadays it is a recognised fact, although

Y y 4

18 October 1912.]

Mr. EDWARD M. JOHNSON.

[Continued.]

some recent legislation has not quite recognised it, that ultimately the consumer has to pay. We are told so in tariff matters.

22,404. You have made a lengthy statement without answering my question. With regard to medical inspection, I ask if you recognise that the payment for medical inspection would have to be made by the employers of house-painters, just as it is now made by employers in other industries where periodical medical examination is required?—I think that that is the probable result. It will come on the consumer ultimately, I think.

22,405. In the paragraph marked (N), in Q. 22,264, you call attention to a special soap. Have you brought samples of this?—Two.

22,406. What do you wish to say about them?—I would like you to examine them. I have nothing to do with these people. It is sent by Walkers, Parker, & Co., of Chester. The advantage of the soap is that it is a dry soap that can be used in cold water. It costs about 24s. a hundredweight. It is described as a soap for washing and cleansing the hands of workmen who handle poisonous metals, such as lead, tin, copper, zinc, brass, &c. It prevents lead and blood poisoning by killing the germs and microbes and bacteria, especially in cases of cuts and sores.

22,407. It sounds like an advertisement of a patent medicine. It cures everything. Has it been tried? I believe they are using it at Walker's works and elsewhere. It is good for all washing purposes.

22,408. Is the price moderate?—24s. a hundredweight. I also put in a sample of a soap recommended by our German friends which is used in Germany in white lead factories. I do not know anything about it. The Government analyst, I suppose, would like to look at it. The names of the makers are on it. It is recommended by the German people as a very good preventative of lead poisoning.

22,409. In paragraph 22,267 you refer to the desirability of encouraging trade guilds. Do you wish to call our attention to a guild formed amongst the plumbers?—Yes. Mr. Sibthorpe said a great deal about it.

22,410. Do you want to make any comment on it?—I would like to run through this to show the sort of idea. I do not know whether I may ask a question.

22,411. I do not know that we want a long dissertation on plumbers' guilds. It has nothing to do with our Inquiry. What is the point of it?—The point is that I think it is highly desirable that painters should be registered, and that as far as possible we should work with the unions under the Insurance Act or the approved societies to carry out these regulations. May I ask whether the unions represented here represent a very large percentage of the painters of the country?

22,412. (Mr. Parsonage.) Over 20,000 in my society?—What is the percentage of the whole?

22,413. (Mr. Sutherland.) 12 per cent. — The painters' trade at present is not very largely organised.

22,414. All the trade organisations represent 12 or 15 per cent. — Not more than that?

(Mr. Gardner.) In Scotland they represent a much larger percentage. We represent between 5,000 and 6,000 painters in Scotland.

22,415. (Mr. Sutherland.) That is since the new Act. What is the point regarding plumbers?—The Plumbers' Company is an old City Company, and they have made great efforts to do what they are supposed to do—to look after the plumbing trade, instead of simply schools or dinners and so on. They think they have registered now something like 25 per cent. of all the plumbers in the country. Their objects are all here on these papers. I take it that the object of a trade union is to look after its workmen and their health, get them good wages, and, in order to have a chance of getting good wages and steady employment, it would be a great advantage that there should be a body of registered painters who show by examination or otherwise that they have some real knowledge of their trade. Such men would probably be employed before others. The plumbers seem to have started out with a scheme to protect the public and to protect the

plumber himself. I think that it is most important, and I am perfectly certain, and no doubt you gentlemen have also thought of it, that there will be a great deal more painters' work to be done if prohibition of lead is carried out. When the painters come in I think that they should be skilled men, and should not be accommodating people in domestic or other work more than necessary while they are at their jobs. I would like to put this in bodily, trusting to the Committee to use it—I do not say every word of it. You see the idea? I strongly wish to support Mr. Sibthorpe. In these days there need not necessarily be any competition between labour and capital in a matter like this. There is room for a seriously worked out plan. I cannot say that I have worked the whole thing out myself. These papers are available for your secretary, and I would like to put them in for what they are worth, as showing what is passing through my mind. I will read them if you like.

22,416. As chairman of the White Lead Corroders' Section, have you consulted your colleagues on many of these important matters which you have put before us in your examination in chief?—Yes, we have had several meetings.

22,417. Have you and your colleagues considered this code of rules which you have put before us?—Yes.

22,418. And have they also considered carefully the suggestions you have made with regard to enforcing those rules?—We have not had a meeting on that, but the suggestions have been sent round to them for their approval or otherwise. I have been at meetings, and they have to a large extent left that to me.

22,419. Are they cognisant of the general purport of the suggestions you have made with regard to enforcing the rules?—With regard to National Insurance?

22,420. Yes—what you put in last night?—By now, yes, but when they were sent in to you, not.

22,421. (Dr. Collis.) You suggested that the consumer would finally have to pay. I presume that means that a higher price would be charged to him for work done, and he would have to pay for the system of regulations if established?—What I said was that it was easy to show that the consumer finally paid for regulations, but I am quite prepared to think that as regards medical inspection it would be so trifling that you would not be able to put it on the price.

22,422. If the code is drawn up on the lines you have suggested it would cost a certain amount of money to the trade, would it not?—Yes. I do not mind committing myself to stating, from what I have heard from the National Insurance Commissioners, that it might involve the appointing of about 40 extra commissioners.

22,423. Extra inspectors?—Inspectors under the National Insurance Commissioners. That is an estimate from a layman.

22,424. What is their annual income to be?—I suppose it would cost about 10,000l. a year, would it not? I would like to ask you what you think the substitution of zinc and other things would cost the consumer.

22,425. I want your opinion of the extra cost?—As a layman I would say that if 40 National Insurance Inspectors were required it would cost about 10,000l. I do not say that it is adequate. I do not say that any Government official is adequately paid.

22,426. And then there would be their travelling expenses?—Their real value would be in the moral effect, as they are likely to drop in at any moment. There would not be much travelling. They would be local, would they not?

22,427. (Chairman.) Forty would only be one in each county, so that they would have to travel?—Some counties are very small.

22,428. Do you think that one in a county could inspect all the jobs all over the country?—But the existing inspectors could do it.

22,429. (Dr. Collis.) Forty new inspectors, costing annually about 10,000l. for income, and then there are travelling, office expenses, and upkeep. Would you disagree if I suggested 4,000l. extra to cover extra

18 October 1912.]

Mr. EDWARD M. JOHNSON.

[Continued.]

expenses? You are more capable than I am of dealing with that.

22,430. Then we have the medical examination of about 150,000 men. Say they are examined four times a year. That gives 600,000 medical examinations, and if you put it at the low basis of 1s. per examination you get 30,000*l.*? Do you think that examination once a quarter would be necessary?

22,431. Yes. It has been suggested by the Germans that it should be once a month. If you divide 600,000 by 20 you get 30,000, and then there is the question of such extra expenses as would be entailed by the providing and washing of overalls? Which I am informed are provided by most reputable firms already.

22,432. (Mr. Sutherland.) By the men?—Most decent painters provide them. It would not be fair to add that.

22,433. (Dr. Collis.) The suggestion that we have had is that the provision would be put on the employers, and the washing is an important point?—I do not think that the overalls should be added.

22,434. No regulations that we have had recently, calling upon men to wear overalls, have ever been established without calling upon the employer at his expense to provide them and wash them?—I see.

22,435. (Chairman.) You have not totalled up what the approximate cost would be of the regulations which you suggest should be put into force and those which the Home Office would have to put into force?—I have not totalled it up, but it is nothing compared with what the consumer would have to pay.

22,436. Supposing that the cost of that was as high as the extra cost of using oxide of zinc in paint, should not that weigh with us?—Yes, but it will be nothing like as high.

22,437. But supposing that it is?—Then no doubt it will affect your decision.

22,438. (Dr. Collis.) You suggest that the worker engaged in handling white lead, &c., shall work in such a way as to avoid contact with the substance with the hands. Does this mean the wearing of gloves?—No, I should think they need not do that. It refers to splashing of course.

22,439. Take the previous sentence, "shall work in such a way as to avoid contact with the substance with the hands." That surely is impossible unless he is wearing gloves?—I do not think so. When he is stirring up things in a pot is it necessary to splash very much?

(Dr. Collis.) I want to get some idea of your estimate of what even you would suggest as the extra cost to be borne by the public in establishing these regulations. Whether we agree with the estimate or not is another point?

22,440. (Chairman.) You are not in a position to answer that, are you?—Some of the questions I have been asked are awfully hard to answer. I do not profess to know everything when it comes to painting, but I think it would be desirable that the men should be warned not to put their hands into the paint.

22,441. (Dr. Collis.) I thought you were suggesting gloves?—No. Absorption through the hands, provided you wash them, has been largely discounted in recent years. You know as well as I do what white lead works are like.

22,442. For inspection and medical examination, and so on, on your estimate we get to a matter of close on 60,000*l.*?—I do not know what you have reckoned as the cost of having inspectors round, for instance, to see that the 5 per cent. is not exceeded. Everything that I have put down seems to me to be necessary if you are going to allow 5 per cent. of lead in pigments. I have given a case in which I found a substitute containing 11 per cent. In future the chemical people will have a high time of it analysing lead anywhere and everywhere to see that the 5 per cent. is not exceeded. It seems to me to give away the whole case against prohibition. Prohibit it entirely rather than that.

22,443. With regard to the establishment of guilds, you consider that the opinion of these guilds would be very valuable?—If they could be got together and formed.

22,444. We have already what are practically these guilds representing in England 15 per cent., and in Scotland a larger percentage of the people employed. Their opinion will be of value, do you not think, in considering this question?—Yes, if they have sufficient data to give a really considered opinion.

22,445. They have sufficient data. They have many, many years' past experience of illness. We should be considerably assisted, therefore, by obtaining their opinion on the subject, should we not?—I presume so.

22,446. (Mr. Sutherland.) Do you think that the substitution of proprietary paints for a universal basic pigment like white lead, easily mixed by the ordinary painter with ordinary, readily accessible materials, like linseed oil and turpentine, and giving a thoroughly sound paint, would be a solution of the question which any Government should entertain?—What do you mean by "proprietary paints"—free from lead?

22,447. Non-poisonous paints?—I should think that if there were a possible substitute, we should have closed up long ago, considering the amount of money spent on advertising. We do not advertise our white lead to any extent. We have been most careful not to enter the newspapers in any way during the sitting of this Committee.

22,448. A further point involved in that is that one is not a proprietary article (lead is common to anybody) and the others are. The Government or any administrative body could not say, "You shall use Jones'?"—They could not create a monopoly.

22,449. What standard of a paint would be available to the Government departments and the painting trade if white lead were abolished?—I know of none. The only standard that I know of in a Government department (and, as I said yesterday, I supply white zinc) is that in the case of zinc the impurities must not exceed a half per cent. That is required by the India Office. I do not know of any printed formula from the Admiralty.

22,450. Is there any standard for lithopone?—I am told not. I am trying to establish what lithopone is. Judging from samples submitted to my firm for analysis it varies tremendously.

22,451. (Chairman.) If you do not know of your own knowledge do not answer?—I do not.

22,452. (Mr. Sutherland.) The same difficulty would exist with architects, professional men, and municipal departments, if to-day in all their specifications they specify genuine white lead, raw linseed oil, and pure American turpentine. They would be up against the same difficulty in the absence of a standard?—Yes.

22,453. The London Chamber of Commerce can proceed against people for breach if they fail to supply genuine white lead?—Yes. We take samples.

22,454. And prosecute?—And prosecute, and protect the consumer.

22,455. As you are familiar with the sources of supply of lead, zinc oxide, and lithopone, and as you have told us you handle both in large quantities, if lead was prohibited would there be an adequate supply of (a) zinc oxide, and (b) lithopone for some time?—I am afraid not, except at such a cost that you would have to repeal your legislation.

22,456. Is it not the case that many so-called non-poisonous paints are fortified with white lead?—Yes.

22,457. That is common knowledge, is it not?—Yes.

22,458. Can you give the Committee your opinion as to the value of lithopone for outside work?—We have specimens of it, and most of the other white lead makers since the Inquiry was started have put up boards painted with lithopone. It has changed colour. My opinion would not be very favourable at present. We shall see whether it improves with age.

22,459. How do you account for the fact that, notwithstanding the enormously increased supplies of zinc oxide and lithopone in this country, the sales of white lead are well maintained in spite of its high price?—It is very hard. I am agreeably surprised at that fact. I do not know whether the idea that you gentlemen were going to do away with lead has made everybody

18 October 1912.]

Mr. EDWARD M. JOHNSON.

[Continued.]

set to work while he can. That is an opinion that is not of much value.

22,460. Is it not the fact that enormous quantities of lithopone are used, not in house painting, but in the manufacture of linoleums and floor cloths?—Yes; that is the largest use of lithopone. There is a great demand for lithopone in rubber factories and linoleum manufactories. I am told by lithopone makers that it is not the paint trade that is causing the rise in lithopone of 5*l.* a ton, but other uses of it.

22,461. The manufacture of zinc oxide is not a protected industry. Anyone can, if he thinks fit, lay down plant and begin to manufacture it in this country to-morrow. Can you tell us the reason why it is not done?—I think that Mr. Lancaster has told you pretty fully about that—the difficulty in getting the material. I do not like to talk about conventions. A gentleman mentioned that yesterday. I should have to go into the whole matter of continental trade and the business connected with the spelter convention, and the different sources of supply of zinc. I can do it if you like, but if you will take it from me if we could get in England a reasonable chance of manufacturing oxide of zinc to compete with the foreign sources of supply, my firm in particular would have done it long ago. All the zinc at present is of foreign origin. What there is in English mines is sent out to the Vieille Montagne or Germany to be manufactured there. We are in the metal trade. If we could have got hold of any source of supply out of which we could make any money we should have done it long ago.

22,462. (*Lord Henry Bentinck.*) Is it difficult to get hold of the raw material?—It is very difficult to get hold of the raw material. The whole of it is controlled. You have heard of the nature of the ore from which the zinc is made. The Dutch zinc now on the market containing 4 or 5 per cent. of lead is said to be got from America. It might be possible under competition for English firms to get hold of their stuff instead of them, but when we have got it we have only got zinc white with a certain amount of lead, and, at present, there is no standard allowing that amount of lead to be left.

22,463. (*Chairman.*) What do you say with regard to Australia?—I would rather refer to Mr. Lancaster's evidence.

22,464. (*Mr. Sutherland.*) You would put that in your reply?—Yes. We have five or six different directors and we have all got our own subjects. It is no good my repeating.

22,465. Do you know that Dr. Leggo, the Home Office authority on the question before this Committee, and Dr. Kenneth Goadby, who is another eminent authority on the subject, both agree that the crux of the question lies in the dust produced by dry rubbing down, and that all other causes are trivial in comparison. Therefore, do you not think that the solution lies in the direction of the prohibition of dry rubbing down—in which as a practical painter I assert there is no insoluble difficulty—instead of prohibiting the use of a valuable material like white lead? It has been proved to the Committee that lead poisoning cannot arise from emanations of wet paint nor from fumes in burning off, nor through the skin, and only slightly through the alimentary canal?—Yes, that is absolutely my opinion. You are a practical painter asking the question; I am not. Anybody who has read my proof will see that that is really what it comes to. Everybody agrees as to what the main source of the danger is. Whether you prohibit the use of white lead in future or not you are face to face with the fact that if you are really honestly wanting to protect the working man from the danger of lead poisoning it is your bounden duty at the earliest possible moment to prohibit dry rubbing down forthwith, otherwise you will have the whole of your lead cases going on for 10 or 20 years, as the witnesses have told you. That is logically, I think, the only conclusion I can draw from what I have been told, and you too.

22,466. You made a suggestion on a point on which the Chairman asked a question. I understand that you do not want to compel the painter to use lead—you could not if you wished to—and you suggest that if the

painter wishes to be free of any regulations he should declare his shop a leadless shop, and get exemption?—Yes, that is what it comes to.

22,467. Then you make the point that, in any case, if the Government allowed a percentage of 5, 6, or 7 of lead in zinc, the necessity for inspection would still exist?—Yes.

22,468. So that in that case there would be no gain to the country either one side or the other?—Quite so.

22,469. If inspection is necessary for regulation, it is also necessary for prohibition, if you want to see that your rules are complied with?—Yes.

22,470. In reference to the records, if the Home Office wished to get an exact record of lead poisoning cases paid for under the Workmen's Compensation Act as distinct from the Insurance Act, it could be done, could it not, by an administrative order making the returns compulsory?—I should think so.

22,471. I understand that the suggested regulations are put in not as an arbitrary code but as a basis of discussion?—Yes.

22,472. You have been asked as to the inclusion of the provision of overalls. Now from time immemorial the operative painters have provided these overalls and provided for the washing of them and they have never grumbled or made it a ground of complaint against the employers. Therefore I take it you do not think that the practice should be interfered with?—That was my idea. I understood that it was the rule already.

(*Mr. Sutherland.*) It is.

22,473. (*Chairman.*) The same thing obtained in the Potteries. From time immemorial the men had provided their own overalls, but a committee sat and decided that the employers should provide them?—That is a matter we leave to the department, of course.

22,474. (*Mr. Gardner.*) Just one point in connection with these rules. You think it would be advisable that men be registered who are using paint. I take it that you mean that there should be a prohibition of men who are not registered from using lead paints?—I suggested that, if your body really contains the great majority of the painters of the country, but of course it does not, and therefore I am afraid it would make a monopoly.

22,475. Our bodies have nothing to do with it in the meantime. There is the question of what you call Trade Union interference with the liberty of the subject. Your suggestion simply means that no one should be allowed to work at a trade or handle lead paints unless he was properly registered?—I think it desirable for them to be registered, but if they do not think so, then it is not for me to force such a thing upon them. My ideas about Trade Unions may be different from yours.

22,476. You speak about guilds of plumbers, and so on. There would be no use in registering a man to work at the painting trade if Tom, Dick, and Harry were also going to be allowed to work at the painting trade. You would require prohibition by law, would you not?—You are taking it rather farther than I am prepared to answer at the moment. I thought it was a matter that the Committee would consider. I have handed in the papers setting forth the plumbers' views. I have not given them out in full, so I cannot very well discuss that paper, but when it is in print I will come back again some other day if you wish.

22,477. These suggestions as to regulations are simply your own? You have not consulted any master painters about them?—We thought we had consulted one or two very good master painters.

22,478. (*Chairman.*) I do not think that we can publish this about the Plumbers' Guild. It has nothing to do with the inquiry. It sets out reasons for members of Parliament why plumbers should be registered?—May I take it back and re-write it entirely from the point of view of painters. It is nothing compared with doing away with white lead.

(*Mr. Sutherland.*) I do not think that it is of much value to publish it.

22,479. (*Mr. Gardner.*) Clause E is a very good regulation, and one which I should very much like to see carried out, but I am just afraid that you have not

18 October 1912.]

Mr. EDWARD JOHNSON.

[Continued.]

got the feeling of the master painters on that clause. It deals with the provision of overalls, hot water, and time for cleansing. That is paragraph 22,264?—We are accustomed in our works to give time for washing. We have got used to it by the education of the Home Office. For the last 10 or 14 years the Home Office has helped us in our work, and I think we have helped them in regard to regulations. Much has been done to remove the prejudice that there used to be with regard to the Home Office, although I cannot say that we always pull together.

22,480. Now is it not the case that ready mixed paints have not captured the market, simply because the practical painter does not believe in a standardised

paint?—I am advised that the reason why the American habit of selling the paint ready mixed has not come into England is because such an awful lot of rubbish has been sold. The painter has had a sickener of it. He has used the stuff and been blown up by his master, who, in turn, has been found fault with by the householder. They have found it very hard to get these paints on the market, not because of their goodness, but because of their utter uselessness. Many grinders are putting a white lead paint on the market. You want one sort of mixing for some climates, one sort for outside, and one for inside. One wants flat paint and another glossy, and that is one of the difficulties with these proprietary paint people are finding.

The witness withdrew.

Mr. J. J. DOBBIE, D.Sc.

Evidence to 22,500 handed in and taken as read; witness then called in and examined.

22,481. The experiments carried out in the Government Laboratory at the request of the Committee, have been directed mainly to an examination of the conflicting statements which have been put forward with regard to the existence of lead vapours in air which has been in contact with surfaces freshly painted with lead paint. The methods of investigation employed have been exclusively chemical and physical.

22,482. It has been suggested that the discrepancies between the statements on this subject published in the French Report,\* and those made by some of the witnesses who have appeared before the Committee may be due to the employment by the French experimenters of "Trillat's Reagent" by means of which it is claimed that smaller quantities of lead can be detected than by the ordinary tests for this metal. It was thought advisable, therefore, in the first place, to compare this reagent carefully both as regards its delicacy and its reliability with sulphuretted hydrogen, the reagent usually employed in testing for and estimating small quantities of lead.

22,483. The results of this investigation are given in Appendix XXVII. They show that while Trillat's reagent may, under certain conditions, be a more delicate test for lead than sulphuretted hydrogen, it is unreliable on account of the extreme difficulty of ensuring the absence of all traces of peroxides and other oxidising agents which have the power of reacting with it to give a blue colour. As a means of estimating small quantities of lead we found it altogether unsatisfactory.

22,484. While we relied in our subsequent experiments on sulphuretted hydrogen both for the detection and estimation of lead, we nevertheless employed Trillat's reagent systematically, but were never able to obtain any satisfactory indication of lead by means of it when we had not succeeded in detecting the metal with sulphuretted hydrogen. We are unable, therefore, to concur in the suggestion that the failure of some of the witnesses who have appeared before the Committee to confirm the observations of the French experimenters was due to their having neglected to make use of this reagent.

22,485. We next turned our attention to the experiments which are described in Appendix 15 of the French Report. The results obtained in these experiments are of a very remarkable character and, if incapable of any other interpretation than that which MM. Heim and Hébert offer, would leave no room for doubt as to the volatility not only of lead compounds but of metallic lead at the ordinary temperature. We have repeated the experiments, so far as they relate to white lead and metallic lead, carefully observing every detail mentioned by the French experimenters.

22,486. The apparatus and method of experimenting were of the simplest possible description. The sub-

stance to be examined was placed in a long narrow tube having absorbing bulbs filled with sulphuric acid attached at one end. A plug of cotton wool was interposed between the tube and the absorbing bulbs to intercept any solid particles that might be carried over mechanically by the current of air which was drawn slowly through the apparatus. The length of the cotton wool plug employed in the French experiments is not stated, but in the absence of any information on the point it may be assumed that it was not less than 3 inches, the length usually employed in such experiments.

22,487. In experiments with lead filings and granular white lead made by means of this apparatus, traces of lead were always found in the sulphuric acid bulbs, but it was noticed that the cotton wool plug also contained lead and invariably in larger quantity than the sulphuric acid. It was evident, therefore, that solid particles were being carried over in the current of air and it seemed not impossible that these might be getting through the cotton wool plug in sufficient quantity to account for the indications of lead obtained in the sulphuric acid bulbs. An additional plug of cotton wool was, therefore, introduced into the apparatus and further experiments were carried out. It was found that the second plug also contained lead, although in smaller quantity than the first, but no trace of the metal could be detected in the sulphuric acid either by means of Trillat's reagent or sulphuretted hydrogen.\*

22,488. To obviate the possible objection that lead vapours might be condensed in passing through the long plugs of cotton wool which we employed, experiments were made in which the tubes containing the plugs were kept at the temperature of boiling water. These modifications of the conditions had no effect whatever upon the result.

22,489. These experiments seem to point to the conclusion that while a cotton wool plug three inches long is usually sufficient for all practical purposes, a much longer plug is required when it is desired to intercept completely the finest particles of matter that are found in suspension in the air.†

22,490. Our failure to confirm MM. Heim and Hébert's results does not, of course, dispose of the theory of plumbiferous emanations from freshly painted surfaces. Although no vapour is evolved by metallic

\* From the account of the method of experimenting in the presence of lead in the air of workshops described by MM. Heim and Hébert on page 827 of the Report, it would appear that whatever was retained by the cotton wool plug of their apparatus was regarded as lead dust, whatever passed through as lead vapour. Nothing is said as to the length of the cotton wool plug except that it was "suffisamment longue," nor is there any mention of experiments having been made to ascertain whether the whole of the lead might not have been retained by the use of a longer layer of cotton wool.

† In one of the experiments the cotton wool was replaced by asbestos without the result being in any way affected.

18 October 1912.]

Mr. J. J. DOBBIE, D.Sc.

[Continued.]

lead or lead oxide alone, it is conceivable that vapours containing lead may be produced as a result of the reactions which go on during the drying of lead paints made up with oil and turpentine. For the investigation of this question a series of experiments was carried out somewhat on the lines of those described by Mr. Klein (Experiment No. 5) in his statement to the Committee.

22,491. Having regard to the exceeding smallness of the quantities of lead alleged to be evolved from lead-painted surfaces, our experiments were planned on a large scale. A box was constructed, containing a large number of readily removable partitions, so arranged that air drawn in at one end must pass between the adjacent partitions in succession before leaving at the other. The partitions were painted on both sides, the total area of the painted surfaces being approximately, 100 square feet.

22,492. In carrying out experiments with this apparatus air was drawn through the box, and then in succession through tubes containing cotton wool and various absorbing agents. The passage of the air was continued until the paint was dry. In most of the experiments a mixture of white lead, linseed oil, and turpentine was used, but in some the turpentine and in others the oil was omitted. Driers were employed in some of the experiments.

22,493. In the experiments in which the cotton wool plug employed was of the usual length, lead could always be detected in the absorption bulbs as well as in the cotton wool. On introducing additional plugs into the arrangement we found, as in our repetition of MM. Heim and Hébert's experiments, that the whole of the lead could be trapped, no traces of the metal being now detectable in the absorption apparatus either by Trillat's reagent or by sulphuretted hydrogen.

22,494. These experiments demonstrate that a current of air which has been passed over a surface freshly painted with lead paint contains traces of lead, which though very minute, can be detected with certainty and even estimated approximately, when the experiment is conducted on a sufficiently large scale. They leave, however, no reasonable doubt that the lead is present not as a vapour, but in the form of minute solid particles.

22,495. But, whatever the source of the lead may be, and whatever the form in which it exists in the air, it is certain that the quantity is so small as to be negligible for all practical purposes. The scale and plan of our experiments enabled us not only to estimate the lead with approximate accuracy, but to determine its quantity in relation to the quantity of paint used. The details of these experiments are given in Appendix XXIX.

22,496. The quantities of lead obtained by the French experimenters were obviously of the same order as those which we obtained, as appears from the following passage in the Report:—"We ought, however, to say that this quantity of lead was so extremely small that the ordinary reactions of lead did not reveal it, and we had to utilise for its detection the new and extremely sensitive reagent discovered by M. Trillat."

22,497. The conclusions arrived at from the chemical experiments already described are supported by the spectroscopic examination of air exposed to freshly-painted surfaces. Lead forms several well-known volatile compounds whose vapours, when present, even in very minute quantity, exercise a powerfully absorptive action on light. We should expect, therefore, if any volatile lead compounds are evolved from freshly-painted surfaces, that their presence would be revealed by a spectroscopic examination. As a matter of fact, a layer of air 4 feet thick, in contact with a surface freshly painted with a mixture of white lead and oil, showed not the least trace of absorption. It is certain, therefore, if emanations of lead take place from painted surfaces that the amount is so small as not to be detectable by this method of examination, or the vapours are those of compounds which differ from the only known volatile compounds of lead in having no absorptive power. It is, of course, conceivable, but highly improbable, that such compounds exist.

22,498. A series of distillation experiments was carried out similar to those described by Mr. Klein, but on a larger scale. Our results entirely confirmed those which he obtained. It has not been deemed necessary in this case to give the details of our experiments.

22,499. In the course of our spectroscopic experiments several observations were made which may be of interest to the Committee, although they do not bear upon the question of lead emanations. At temperatures under 160° F. (70° C.) linseed oil does not evolve any vapour which absorbs light; above this temperature decomposition of the oil sets in, and the absorption becomes very marked. When the oil is mixed with white lead it behaves in exactly the same way. White lead, therefore, has no influence on the decomposition of the oil, at any rate below the temperature of 160° F., that can be detected by this method.

22,500. The poisonous character of the vapours given off by turpentine has been referred to by several of the witnesses who have appeared before the Committee. In the experiments described in Appendix XXIX. we found that traces of acid and aldehyde, as well as considerable quantities of terpin hydrate, were always present in the absorption apparatus. The acid and aldehyde might be derived either from the oil or from the turpentine, or from both. In view, however, of the results obtained in the spectroscopic examination it is doubtful if any considerable amount of decomposition of the oil occurs under 160° F. and we are, therefore, inclined to the view that the turpentine is the source of nearly all the decomposition products observed, especially as Kingzett and Woodcock\* have shown that by the aerial oxidation of turpentine, acetic and formic acids as well as formaldehyde are produced. Experiments, however, which we have just completed, afford definite evidence that boiled oil alone, a mixture of white lead and linseed oil, and a mixture of zinc oxide and linseed oil, give off aldehydic vapours at the ordinary temperature. The amount in each case is very small, and we are unable to say whether it is greater in one case than in the other.

22,501. (Chairman.) You are the principal chemist of the Government laboratory?—Yes.

22,502. In the statement that you have prepared you give an account of an investigation into the evidence for and against the possibility of lead vapours arising from drying paint?—Yes.

22,503. Put briefly, your conclusion regarding Trillat's reagent is that it is not reliable as a means of estimating very small quantities of lead?—Yes, that is the conclusion that I have come to.

22,504. You feel, therefore, that the conclusions based on the use of that reagent ought not to weigh much with the Committee?—Yes, that is my opinion.

22,505. Then, as to the experiments with metallic lead described in Appendix XV. of the French Report,† you consider that all the lead particles found in the collecting vessel must be ascribed to mechanical carrying-over, and not to emanations in the form of vapour?—Yes; that is to say in the repetition of the experiments which we have made, following the directions given by the French experimenters as closely as their accounts would permit of our doing so.

22,506. Have you both by delicate reagents and by spectroscopic methods, satisfied yourself that there are no volatile emanations which contain lead?—Yes. We have made a careful chemical investigation of the subject.‡

22,507. Do you, therefore, conclude that the nauseous vapours of drying paint are due to oil and turpentine, and not to the presence of lead?—Yes, because we have not been able to find any lead in the vapour.

22,508. Lead itself accelerates the oxidation of the oil, does it not?—I am not prepared to give an answer to that question. We have not experimented upon that point.

\* Journal of the Society of Chemical Industry, 1912, pp. 265-267.

‡ See Appendix XXX.

18 October 1912.]

Mr. J. J. DOBBIE, D.Sc.

[Continued.]

22,509. Would the presence of lead accelerate the emission of nauseous aldehyde and other vapours from the oil?—I am not prepared to answer that question. I have no experimental evidence upon the point.

22,510. Is it possible to obtain that evidence?—Yes, I think so; but I think to get an answer which would be useful to you a somewhat elaborate investigation would be involved. We are quite prepared to undertake that, if you wish it.

22,511. Would it take very long?—It is a little difficult to forecast what you may be letting yourself in for in undertaking an investigation of that kind.

22,512. You might consider it and let us know?—Certainly.

22,513. May the result of your investigation be taken to justify this Committee in disregarding emanations from drying paint as a possible source of lead poisoning?—Yes.

22,514. Then we must concentrate our attention on lead dust as the principal source of plumbism?—I think so. At any rate we have not been able to find any evidence that you have to deal with vapours containing lead.

22,515. (Dr. Collis.) Do you think that the amount of formic acid and formaldehyde produced in the drying of paint would be sufficient to affect the health in any way?—I do not think that I am justified in attempting to answer that question. All I can say upon it is that the quantities at the ordinary temperature appear to be very small.

22,516. Very small?—Yes, very small.

22,517. As to whether that small quantity might or might not affect the health of those exposed, you would not like to say?—No, I am not in a position to say.

22,518. But as far as your knowledge goes, you would expect equal amounts to come off whatever paint had been used, whether the paint was a lead paint or a zinc paint?—All that I would say upon that point is that they come off with the zinc paint as well as with lead paint, but whether in equal quantity or not I cannot say.

22,519. (Mr. Sutherland.) Did you experiment with the fumes of paint arising from burning off?—No, we made no experiments of that kind.

22,520. (Mr. Fell.) In your opinion, if the processes which cause dust in lead painting were prohibited would that do away with lead poisoning?—The processes which give rise to dust?

22,521. Yes, dry rubbing down, for instance?—I think that it would do away with direct lead poisoning, but there still remains the question of the possible indirect influence of the lead on the oil and turpentine with which the lead is mixed; but in so far as direct lead poisoning is concerned it would do away with it.

22,522. The indirect action you have not investigated?—Only to a slight extent.

22,523. (Mr. Mason.) Would you call this indirect action lead poisoning?—That is rather a medical matter than a matter for a chemist, I think. I think that this might interest the Committee: I have mentioned in my statement the amount of lead which we obtained in our experiments from something like  $\frac{1}{2}$  cwt. of lead paint. It might perhaps help to make the conceptions of these quantities a little more definite and concrete if I showed you the actual amount of lead contained (produced).

22,524. (Mr. Sutherland.) Is that from emanations?—The particles of lead that came through when we had painted about  $\frac{1}{2}$  cwt. on our apparatus amounted to about a seventh or eighth part the size of an ordinary pin's head.

22,525. (Chairman.) What deduction do you make from that?—Simply that the amount of lead that is brought mechanically from a painted surface is exceedingly small, so small as to be of no practical consequence.

22,526. (Mr. Sutherland.) Negligible?—Quite negligible.

22,527. (Chairman.) I do not understand. Will you explain?—In regard to the apparatus which I have briefly described in my statement, we painted something like  $\frac{1}{2}$  cwt. of paint on to the apparatus, and drew air over it until it was dry, and we got in

that air, when it was caused to pass through traps of cotton wool, a certain amount of lead mechanically brought over; or it would not have been trapped by the cotton wool.

22,528. (Lord Henry Bantline.) Is that an emanation?—No.

22,529. Why not?—An emanation would be a vapour, and a vapour would not be caught or retained by cotton wool.

22,530. Is an emanation a smell, or what is it?—I am using the word in the sense in which it is used in the French Report, which I have studied for the purpose of this Inquiry. What is really meant is a volatile compound of lead—a compound containing lead which is capable of existing in the state of vapour. That is what it means. What we got over could not be in that state or it would not have been retained by plugs of cotton wool. That is the total quantity of lead that we caught from the amount of paint.

22,531. (Chairman.) What was the size of the apparatus?—A big apparatus about 6 feet long, 2 feet wide, and 2 feet deep, with a large number of partitions in it, over which air was made to pass in succession.

22,532. What made you make this particular experiment?—We made the experiment to answer the question whether, during the drying of paint, there is any volatile compound containing lead given off.

22,533. I am much obliged to you. It is most valuable, but it does not appertain to anything in regard to the painter's work, does it?—I think so. It has been alleged that when a surface is painted, during drying, a vapour containing lead emanates or comes off from the surface, and the object of our experiments was to find out if we could whether or not that was the case.

22,534. (Mr. Parsonage.) Did these particles of lead come off during the process of drying?—Yes, they came off during the process of drying.

(Mr. Sutherland.) They have not come off from emanation, but they have been intercepted mechanically in the cotton wool. They have come off mechanically.

22,535. (Mr. Parsonage.) How have they come off mechanically? No one has touched it?—The current of air passing has taken it off the surface of the paint, no doubt.

22,536. (Mr. Gardner.) Then if that be the case, if that amount of solid matter, no matter how small, came off while nothing was being done to the paint, is there not a great likelihood that a great deal of solid matter comes off during the process of painting itself with the working of the brushes?—Splashing?

22,537. Quite apart from splashing?—No, I think not.

22,538. You say that this solid matter came off purely through the air passing over the painted surface while it was drying. Now, with the agitation of the brush spreading it out and working it all through, would you not get a great deal?—The brush would throw off some, but beyond that you would not have anything more coming off, I think.

22,539. (Mr. Parsonage.) This is a most important point. As I understand it, new paint, when it is drying in an ordinary room gives off certain particles of lead in the process of drying, with no one touching it?—Yes. The air has been passed through the apparatus for something like 40 days, and that is the total amount obtained by the passage of air over the surface for 40 days.

22,540. What would be the difference between the passage of the air in that case and the passage of the air in an ordinary room. Suppose that that door was painted, for example?—You have a steady pull over the surface in this apparatus, and that is more favourable for particles coming off, whereas in the case of a door being painted you have not that.

22,541. But even in the case of a door you would have air passing and something might come off?—Yes, to that extent.

22,542. Would it be poisonous?—No. You have a lot of figures before you dealing with very minute quantities. I thought that it would interest you to see what  $1\frac{1}{2}$  milligrammes really meant. You have had

18 October 1912.]

Mr. J. J. DOBBIE, D.Sc.

[Continued.]

hundredths and thousandths of milligrammes mentioned.

22,543. (*Mr. Sutherland.*) Could you make clear the difference between "emanation" and mechanically thrown off lead, because there is great doubt?—I will try again to explain. An emanation is something which comes off from the surface in the form of a vapour or gas. It has been stated by the French experimenters especially, and by one witness before the Committee, that a surface freshly painted with white lead paint evolves or gives off a vapour, and that one of the constituents of the vapour is lead. That is what I understand by "emanation."

22,544. And that you have proved does not arise?—Yes. Suppose that you have a surface painted. The turpentine that comes off from the wet surface is an emanation. Assuming that the oil undergoes decomposition, then the products that come off are emanations. It is alleged that lead comes off in the same way as a vapour. The lead drawn off mechanically from the surface consists of minute, almost infinitesimal, particles of matter set loose in a solid state, not vaporised, and carried over in the current of air into our apparatus.

22,545. (*Mr. Mason.*) Was the scrubbing action of the air in your apparatus greater than would ordinarily obtain with the draft or current of air that would exist under ordinary painting conditions?—Yes, certainly. There was a steady pull of air over the surface all the time.

22,546. (*Chairman.*) This apparatus in the laboratory can be viewed?—Yes. I shall be delighted to show it to any member of the Committee. It is at the laboratory near the Law Courts.

22,547. (*Mr. Sutherland.*) The surface that you dealt with was about 100 square feet?—Yes.

22,548. It is a fairly good surface?—It is a large surface. May I say, with reference to a question asked me, that this amount of lead here is very, very much smaller than a medicinal dose of lead. It is about one thirtieth of a minimum dose that is given medicinally in cases of severe diarrhoea, for instance. I think that it is used for that. Dr. Collis will correct me if I am wrong.

(*Dr. Collis.*) That is correct.

The witness withdrew.

## FORTIETH DAY.

Thursday, 14th November 1912.

PRESENT:

SIR ERNEST F. G. HATCH, BART. (*Chairman*).

Lord HENRY BENTINCK, M.P.  
Sir GODFREY BARING, Bart., M.P.  
Mr. E. L. COLLIS, M.B.  
Mr. W. G. SUTHERLAND.  
Mr. F. G. RICE.  
Mr. A. GARNER.

Mr. J. PARSONAGE.  
Mr. A. L. C. FELL.  
Mr. C. L. MASON.  
Mr. C. KINGGATE.  
Mr. W. ROBINS.  
E. A. R. WEBNER (*Acting Secretary*).

Mr. HEDLEY MILLER recalled and further examined.

22,549. (*Chairman.*) I understand that you wish to offer some supplementary evidence?—Yes.

22,550. Copies of that supplementary evidence have been circulated. You doubtless wish us to take it as read, as we did your written evidence on the previous occasion when you came before us?—Yes.

The following is the supplementary evidence:—

22,551. On the previous occasion on which I gave evidence before the Committee my contention that prohibition of the use of white lead for painting would effectually close the works in this country was questioned, the suggestion being made that there would still remain to the white lead manufacturers:—

- (1) The export trade; and
- (2) Other trades in which white lead is employed, viz., the potteries, linoleum and wallpaper manufacture, &c.

22,552. I have accordingly obtained figures bearing upon this contention. These figures refer to the year 1910, namely, the latest year for which complete figures were obtainable at the time of the compilation of my previous statistics.

|                                      |              |
|--------------------------------------|--------------|
| Total home manufacture of white lead | 57,946 tons. |
| Total imports of white lead          | 14,436 "     |
| Together                             | 72,382 "     |
| Total exports of white lead          | 20,219 "     |

Leaving a balance of 52,163 " being the total home consumption; the difference between this figure and the amount manufactured

in the United Kingdom is only 5,783 tons. The totals given above of home manufacture and imports, however, represent dry white lead, whereas, with the exception of 1,118 tons exported to Canada, the export figure represents ground white lead. The latter contains at least 8 per cent. of oil, and, therefore (allowing for the dry white lead exported to Canada), the export figure should really be placed at 18,690 tons of dry white lead. This reduces the difference between the home consumption and the quantity manufactured in the United Kingdom to 4,254 tons.

22,553. In so far as the home consumption of white lead for purposes other than painting is concerned, the white lead corrodors of the United Kingdom delivered, in 1910, 2,884 tons (dry). Of 125 paint grinders (i.e., all the principal firms in the country) who were asked to give, confidentially, their figures in this connection, 120 replied, of whom 3 declined to give particulars. The remaining 117 delivered, for the purposes above-mentioned, a grand total of less than 11 tons.

22,554. It is, therefore, a reasonable conclusion that at least 50,797 tons are used for the purpose of house and carriage painting in the United Kingdom.

22,555. The effect of prohibition upon the British white lead industry is obvious.

22,556. (*Chairman.*) Now you deal first with the point regarding the export trade in white lead. You take the whole manufacture of white lead in this country in round figures as 58,000 tons?—Yes.

14 November 1912.]

Mr. HEDLEY MILLER.

[Continued.]

22,557. And add to this imports 14,000 tons, making in all 72,000 tons?—Yes.

22,558. Then you subtract exports 20,000 tons, and get a balance of 52,000 tons?—Yes.

22,559. What conclusion do you wish to draw from this calculation?—I wish simply to get approximately at the quantity of white lead that is actually consumed in this country.

22,560. But do you suggest that roughly, 6,000 tons, or, to be quite precise, 5,783 tons, is all that would be left to the home manufacturers to dispose of if the use of white lead were abandoned for painting?—Yes, with the exceptions that I have made further on; that is to say, the Potteries, and so on.

22,561-2. Now, it appears to me that your deduction is wrong. The Board of Trade figures show that none of the imported white lead is re-exported. To be quite accurate, in 1910 two tons were re-exported out of the importation of 14,436 tons. The import of 14,000 tons is therefore approximately all used by paint and colour firms in the United Kingdom?—I was not intending to draw any conclusion as to what became of the import, as to whether it was used for export or used in this country. For the purpose of my argument it did not matter. But it seems to me that one must also take into consideration the fact that the foreign white lead which comes here to be ground may be then exported, in which case I take it that the Board of Trade or the Customs would have no means whatever of knowing the fact.

22,563-4. In your deductions you assume that if lead is prohibited, 14,000 tons will still be imported from foreign countries?—I think that we are rather at cross-purposes. My figures have simply been brought out in order to get approximately at the quantity, whether manufactured in this country or abroad, which is actually consumed in this country. I did not endeavour or intend to show what became of that particular 14,000 tons.\*

22,565. Excuse me, you do not. Just look at your table. Your argument is this: You say that the home production of white lead is 57,946 tons?—Yes.

22,566. The total import of white lead is 14,436; making in all 72,382. "Total exports of white lead 20,219, leaving a balance of 52,163 tons."?—Yes.

22,567. Which you say is the total home consumption. The difference between this figure and the amount manufactured in the United Kingdom is only therefore 5,783 tons. I am assuming that the import of white lead, *i.e.*, 14,000 tons, would not be purchased from abroad, and the manufacturers would get the benefit to that extent?—I have not tried to follow what becomes of the import of white lead at all.

22,568. Then your figures are fallacious?—No, I cannot agree with you there.

22,569. Then will you kindly explain? I want to ask you what would happen, in the event of the prohibition of lead, to the 14,436 tons now imported from abroad. Would that come in or not?—No; presumably the larger quantity of it would not.

22,570. Then, in that case, would it not be fair to say that the export of 20,000 tons of white lead would come from the home manufacturers entirely?—In the event of, say, a very large reduction in the demand the import and the home manufacture would be reduced in the same ratio.

22,571. I do not follow that?—In the event of a very large reduction in the use, through regulation or through prohibition, for house painting, the import figures of white lead and the home manufacture figures would fall in much the same ratio. If only one-tenth, say, of the quantity was used for purposes other than painting, lead for house painting having been prohibited, it would come to 1,400 tons import and 5,700 tons manufactured in this country.

\* The witness has since forwarded the following note:—

Foreign white lead is imported in the dry state; the negligibly small Board of Trade figures for foreign white lead re-exported refer to dry white lead. Practically all the foreign white lead goes to the various grinders in this country, and it is impossible to trace its ultimate destination; a certain proportion of it is undoubtedly exported after being ground, when it is customarily considered a British product.

22,572. Do you say that if lead were prohibited in the United Kingdom for house painting and coach painting, the vast majority of the imports of lead from foreign countries would cease?—Yes, I take it so; the larger quantity would cease.

22,573-4. What do you consider the English lead corrodors would have as a market if lead were prohibited for painting in this country?—There would be the export of white lead, which is given as 20,000 tons, and of course there are other purposes for which lead is used—roughly, 3,000 tons.

22,575. 23,000 tons in all?—Yes.

22,576. Now how do you arrive at the quantity of 2,884 tons which you say is used for other purposes than house painting?—I circularised the manufacturers.

22,577. What did you ask them?—I asked them how much white lead they had delivered during the year 1910 for purposes other than painting. It is of course all done by the manufacturers. It goes direct to the potteries.

22,578. It is an *ex parte* statement, is it not?—I have told the Committee just how I obtained it.

22,579. Have you any means of having it verified?—I am afraid not. So far as the potteries are concerned the only method of verifying it would be to get into communication with the principal pottery firms.

22,580-1. (Mr. Sutherland.) Could you furnish the Committee with the names of these firms who have replied?—That is quite simple. The names of the manufacturers of white lead I could give. There are not many of them.

22,582. How do the Board of Trade get their figures from the corrodors?—The general figures given in the blue book are the Customs' figures.

22,583. If white lead were prohibited in this country for painting purposes, it would throw that 14,000 tons which are imported on to the open market; and it would curtail the production of white lead at least 50 per cent. That would mean that prices would be very low, and the foreign white lead that had come into this country would go to compete with our producers in the open market; so that the 20,000 tons that we export now would not be a sure market for us, would it?—There is no doubt, of course, that for a certain period the foreign manufacturers who, at the present day, send white lead into this country would compete and cut the prices for the British colonies, and so on.

22,584. That would reduce, would it not, the market of the white lead corrodors?—I think that it depends very much on the period of time which is given for the putting into force of a prohibition order. Obviously at first prices might be anything.

22,585. My point is this: that you destroy the market for the foreign importers who send in here, and that quantity of stuff would be thrown on to the open market. Even if you maintain your foreign figures you cut out 30,000 tons, which is three-fifths of your own production, and it would destroy a very large amount of the lead-corroding industry, would it not?—My whole point is that a very large reduction would destroy the industry in this country entirely.

22,586. And you would have the surplus stuff that does not come in here thrown against you in foreign markets?—That is probable.

22,587. So that you cannot assume that we should export 20,000 tons if white lead were prohibited?—No. We should have, of course, the foreign competition in the British colonies, which at present, I believe, the foreigners do not touch at all.

22,588. (Chairman.) Which country would compete with England in such a case?—The countries from which the 14,000 tons come.

22,589. Which countries are those?—Principally Germany, the U.S.A., Belgium, and Holland. I do not think that any comes from France—very little in any case.

22,590. On what authority do you suggest that these countries would compete with us in our export trade?—Not on any authority at all. I simply say that it stands to reason that as manufacturers they would find some outlet for their product.

14 November 1912.]

Mr. HEDLEY MILLER.

[Continued.]

22,591. Is it your opinion only?—I should say it is obvious.

22,592. If it is so obvious you must have some reason for it?—My reason is that the manufacturer has to find some market for the goods that he is putting out. Doubtless in time he would curtail his production, but he could not do that at first.

22,593. But you do not quite answer my point. You say that if lead were prohibited in this country the export trade of this country would be in jeopardy because the production of lead in this country would be over 50 per cent. less. That was Mr. Sutherland's statement and you acquiesced?—I acquiesced to this extent—that the foreigners who have their selling agents in London now would endeavour to get in on the trade in the British possessions.

22,594. They try to get in now, do they not?—No, they do not touch them now.

22,595. Why do they not try now?—I could not say.

22,596. But on what authority do you say that the export trade would be in jeopardy, and why should these countries compete with us if lead is prohibited when they do not compete with us now?—I did not say that the export trade would be in jeopardy. I said that the export trade would be affected to a greater or less extent (to what extent we cannot say) by the fact that the foreign manufacturers who now send lead into this country would in their search for a market to get rid of their over-production probably compete and cut prices for the British Colonies.

22,597. It is a pure hypothesis?—Certainly.

22,598. (Mr. Sutherland.) It is a very natural conclusion?—I think it is the only conclusion.

22,599. (Mr. Mason.) If you have 14,000 tons which cannot be imported into England, it is fair to assume that it will cut into the 20,000 tons?—They have their business organisation in London. If it had been possible to get part of the Belgian and German market it would have been done, but it is not done, and it cannot be done because of the tariffs.

22,600. (Dr. Collis.) They would get our Colonial Market if they possibly could, but they would not be able to interfere with the 20,000 tons that we at present export. You cannot have it both ways?—It is the same thing.

22,601. No, excuse me. If we had a large surplus of manufacture which is not used up at home we should be able to hold the market more easily. There will be a greater surplus of our material also to throw on the market?—We have free trade and they have tariffs.

22,602. (Lord Henry Bentinck.) I suppose that it would be quite possible to compete very successfully in the Colonial Market against any possible increase of foreign competition. You could capture the whole Colonial Market if you wished by cutting the price at which you sell?—By cutting down below the actual cost of production, which would be done at first in order to get rid of the stuff at any price.

22,603. There might be slightly increased competition with Germany, but you could eventually capture the market?—Apart from the effect of prohibition and over-production on the part of foreigners there would not be any fear for the Colonial Market.

22,604. You could dump white lead on the Colonial Market with anybody?—Yes. There is the danger that once they have got their foot in the Colonies one never knows how long they will keep it there.

22,605. (Mr. Sutherland.) Germany is a big white lead producing country, is it not?—Yes.

22,606. (Chairman.) You stated that the white lead corrodors deliver 2,884 tons of dry white lead for purposes other than painting?—Yes.

22,607. Have you satisfied yourself that this includes all the white lead delivered direct by manufacturers to pottery, linoleum, and wall paper manufacturers and to others?—No. I cannot express an opinion on the figures one way or the other. I have already said that I put the question to the manufacturers in those words: "for purposes other than painting," and that is their reply. I give the figures for what, under the circumstances, they are worth.

22,608. You cannot suggest any plan by which we can have them verified?—No, except so far as the Potteries are concerned. I imagine that it would not be a very difficult matter to ascertain from some of the larger pottery manufacturers what quantity of lead they use as compared with their output of pottery, so to speak, and make a calculation upon that.

22,609. Would it be possible to estimate the amount used for plumbers' work—jointing of gas and hot-water pipes, and the like?—No, I have tried to do that, but there is no method of doing it. I have a note here to mention jointing.

22,610. Would not a great deal of that be supplied through the same firms who supply white lead for paint purposes?—It would, certainly. White lead is not used pure for jointing. It is used with barytes.

22,611. Might not that affect the accuracy of the figures that you received from painters?—It would to a certain extent.

22,612. So that the figures you have given us cannot be considered as reliable?—The quantity that is used for jointing can only be included in the painting figures. It would be only a small proportion.

22,613. What do you mean by a small proportion?—It is impossible to say, I have put the question to several ordinary builders. They say that quite an insignificant amount is used. It is not used pure for pipe jointing. They use barytes with the white lead. I am not talking of carriage manufacture. I do not know anything about that.

22,614. I feel an element of doubt about your evidence. You say that it is a very small amount that these people may use, and when I ask you what that small amount is you say that it is impossible to say. It might be a large amount?—No, it cannot be a large amount.

22,615. What proportion do you think it would be of the amount that is used by painters?—I am not in a position to say.

22,616. But you have been in a position to give your figures with great deliberation?—Yes, but the only person who could give an opinion on the relative amount of white lead used for jointing as compared with that used for painting is someone who is actually in the business. I said that it cannot be very large because I think it is clear to everybody that it cannot be very large.

22,617. You asked 125 paint grinders to state the amounts supplied by them for purposes other than painting, did you not?—Yes.

22,618. Of these, 117 replied stating amounts which totalled up to less than 11 tons?—Yes.

22,619. From this do you deduce that the total amount supplied for purposes other than painting does not exceed in round figures some 3,000 tons?—Yes, with the exception of the jointing which is not included.

22,620. (Mr. Sutherland.) There is not much dry lead used by painters, is there?—It is a very small quantity; I can say practically none at all dry.

22,621. Do not plumbers use, for jointing, paste white lead and mix dry red lead with it?—It is a mixture of white lead and barytes ground.

22,622. For jointing?—Yes.

22,623. Do they not use stiff paste for that purpose?—Yes, it is in that form.

22,624. They would not use dry white lead, would they?—No, I do not think so. A builder, generally speaking, does not get dry white lead at all; it is no good to him dry.

22,625. So what he uses for jointing purposes would not add to these figures at all?—It would add to a certain extent—not very much.

22,626. But they do not use it dry, which is what you were asked. The plumber does not buy his lead dry and mix it or grind it himself?—No.

22,627. He buys it in the paste?—Yes. In the ordinary way the plumber who is employed by the builder simply goes and takes a little white lead out of the same cask that the painters use.

The witness withdrew.

14 November 1912.]

Sir HENRY TANNER, C.B., I.S.O.

[Continued.]

Sir HENRY TANNER, C.B., I.S.O., examined.

22,628. (*Chairman.*) You are the principal architect in His Majesty's Office of Works?—Yes, for England and Wales.

22,629. And for the Diplomatic and Consular Services?—Yes. I have nothing to do with Scotland. We have another architect for Scotland.

22,630. I understand that you are not a practical painter?—No; I am an architect.

22,631. But you have had upwards of forty years' experience, I understand?—Yes. I have been in the office 42 years.

22,632. Do I understand that you approached the subject of leadless paint from a humanitarian standpoint?—The Home Office wrote to us in 1901 with reference to the subject of the use of white lead, and then I began to make experiments. I thought it was very desirable that we should get rid of the poisonous paints, and, as well as that, zinc white kept its colour, and that seemed to me to be rather an advantage.

22,633. With that object in view you instructed certain of your subordinates to make experiments?—Yes. I began about that time some tentative experiments. We tried them at the Post Office in the main. Then in 1904 I carried them on rather more systematically. We tried a great number of paints—I cannot tell you how many, probably about fifty I should think—on the roof of the new Patent Office Library which had been finished a little while before. It was a cast-iron roof. It had a series of panels which enabled us to do this quite well.

22,634. I understand that your experiments were pursued for several years before you requested Mr. Patterson to take the matter up?—Yes. I began very soon after we had this letter in 1901. He began, I should say, about 1905.

22,635. Since you asked Mr. Patterson to take the matter up the experiments have been more thorough and systematic?—Yes.

22,636. Now, we have been informed that after the principal experiments at the Savings Bank buildings in West Kensington had been in progress for one year, a general instruction was issued to specify zinc paints?—That is so. We gave the instruction in 1907, and here it is if you would like to have it. I am not sure whether this is the last print of it; it may be (*producing the instruction*).\* That was in June of 1907. I think that that was the final print at that time. You will see that there are some alterations made on it, but I think they belong to a later period.

22,637. Were you fully satisfied that the disuse of lead was justifiable after the experiment at the Savings Bank buildings had been in progress for only a short time?—Yes, because the Savings Bank experience was only at the end of a considerable experience before. We began, as I said just now, in 1901, and we were continuing the experiment up to the time of the Savings Bank experience, so that it had really been going on for nearly six years.

22,638. Did you also go and look at the paint work at the Savings Bank buildings yourself?—Yes, I always did that.

22,639. Did you give the instruction to use zinc paints on your own judgment alone?—My own judgment and the judgment of Mr. Patterson mainly, who has been carrying out these later experiments for me. He made the experiments and reported to me, and upon that I formed my own opinion.

22,640. Did you get the Government analyst to assist?—Yes. We had every paint that we used or tried analysed.

22,641. Have you taken steps to ascertain whether your instruction has been complied with?—I have no doubt that it has in the main, and as time has gone on we have been more strict.

22,642. Do you mean that, as there is no law prohibiting the use of lead, the general instruction of the Office of Works is in a sense tentative, and not absolute?—I do not think that it has anything to do

with the law. It is simply a question of carrying out my instructions or not carrying them out. Everybody is supposed, when I issue an instruction, to carry it out, and I think that this has been generally done.

22,643. I understand that all the paint work in the country is under your jurisdiction?—Yes, and all carried out on the instructions which I issue and on the schedules which are formed for the purpose.

22,644. (*Mr. Sutherland.*) That is in England and Wales and Ireland?—No, not Ireland; we have nothing to do with Ireland. They have their own Board of Works. It is England and Wales.

22,645. (*Chairman.*) And you know also that there are only a very few recalcitrants amongst your clerks of works?—I do not think I can say that any of them are recalcitrant. Lead paint may have been used occasionally by inadvertence or prejudice at the beginning, but I do not think that it is at all likely now.

22,646. But take the last point—prejudice—would not that be insubordination?—Yes.

22,647. What penalties are there for that?—Not a very serious penalty, but we reprimand them of course if we find them out, and as a rule we do find them out. They have not the opportunity for using other paints much.

22,648. Are you convinced now that you are right in prohibiting the use of lead?—I think so. We are getting on very well indeed with zinc white. It answers our purpose perfectly.

22,649. Will you, in the near future, issue a much more stringent order forbidding the use of lead?—We have done that already, except in the case of priming on iron or steel. We are not quite satisfied about having a good leadless paint for that yet.

22,650. Have you any system by which you can enforce the order of prohibition?—I do not quite follow. We expect that everybody will carry out our orders.

22,651. Are you able to apply a direct check in Provincial districts?—Yes. In the same way we have our printed specifications and we have our schedules which tell them what to do.

22,652. Is it not more difficult in isolated cases, where your architect or clerk of works cannot always be on the spot?—Of course we have some difficulty there sometimes in getting the builders to carry out their contracts properly, but that would apply to any circumstances.

22,653. Can you give us any particulars of details of the painting of various buildings, and the kind of paint actually used in districts other than Mr. Patterson's district?—The same regulations apply to all districts. That printed circular which I have given you, supplemented by others from time to time, is sent to everybody who has authority.

22,654. (*Sir Godfrey Baring.*) It governs all work under your control?—Yes.

22,655. (*Chairman.*) Can you supply a statement as to the conditions of those paints, where they have been examined after some years of exposure?—No, I cannot do that, I think; we have not got anything very complete in that respect.

22,656. Why is no such record kept?—Because we did not want it for our own purposes.

22,657. Any complaints regarding the unsatisfactory durability of paints would come to you as the principal architect in the ordinary course, would they not?—They would if any complaints were made by the clerks of works as to the badness of paint or anything of the sort that was supplied. They would generally report.

22,658. Are those complaints collected in your office and carefully sifted?—They are sifted at the time, but they are not collected in the sense that they are available.

22,659. Can you tell us what complaints have come to your notice since the adoption of leadless paints?—Clerks of works have complained at times that the

\* See Appendix XXII.

14 November 1912.]

Sir HENRY TANNER, C.B., I.S.O.

[Continued.]

paint is thin, or that it will not cover, or will not dry, or something of the sort. We have inquired into that, and we generally find that there is some good reason for it, either that it has been tampered with, or it has been put on in wet weather, or something of the sort.

22,660. Have these complaints been more numerous and more serious than they were before lead was generally abandoned?—I think that they have been more numerous since we have had white zinc than they were in the time of lead. We used not to get many complaints then because they were using a material which they thoroughly understood. I think that alters the case rather. And of course there is the prejudice which the ordinary man has against leadless paint. He did not think it was so good as the other, and he did not know how to deal with it. As a matter of fact it wants dealing with in a special manner. But they are getting more used to it now, and we do not get very much trouble.

22,661. Would you say that the complaints are now becoming less and less?—Certainly.

22,662. Are you prepared from your own experience to endorse Mr. Patterson's statement that paints compounded to the Office of Works formula are applicable to all kinds of outside house painting?—Yes, I am quite willing to endorse whatever he said to you in that matter. So far as my experience goes I think he was perfectly right.

22,663. Can you name any respect in which it would be harmful to prohibit the use of lead, or rather to restrict its use to not more than 5 per cent., subject to certain exceptions, such as greens, if found necessary?—I think that is quite correct. From my experience I consider that lead is not required except for the first coat on iron or steel. We hope to get rid of it even for that. We are using orange lead now for the first coat on iron or steel.

22,664. (Mr. Sutherland.) That is a lead?—It is a lead. I said so before, but it is only for the first coat on iron or steel.

22,665. (Sir Godfrey Baring.) Was the Savings Bank the most important experiment you tried with leadless paint?—We had a very large building there, divided up into numerous parts. That is why it was taken, and also because Mr. Patterson was clerk of the works there at that time.

22,666. That was the most extensive experiment?—Yes. That was in 1906.

22,667. Have you had any markedly unsatisfactory results with zinc paint; that is to say, failure as compared with the use of white lead paints?—No, I do not think I have. At the earlier period, when it was not so well understood, we did not always get so satisfactory a job as we should like, or as we get now.

22,668. Speaking generally, you think that the prejudice against zinc paint is abating?—I think so, so far as my knowledge goes at any rate.

22,669. (Mr. Sutherland.) When Mr. Patterson was before the Committee in March 1911, he submitted an estimate of the value of the painting operations carried on by the Office of Works at Question 1048: "Paints" 5,000l. per annum; labour 17,000l. to 18,000l. per annum, a total of 23,000l." Is that approximately the value of the painting work done by the Office of Works?—I could not tell you. I am not in a position to answer that question offhand. I should think that if Mr. Patterson said it, he had very good grounds for saying it, and had got the information from the office.

22,670. 23,000l.?—It is rather under the mark if anything.

22,671. As far as I can estimate there are something like 200,000 painters in the United Kingdom. At an average wage of 1l. a week, which is a fair average I should think, the labour bill of these will amount to 10,000,000l. per annum. Estimating from one's own experience that labour invariably works out at a little more than half the cost of the whole work, which would make the turnover with profit something like 20,000,000l. sterling, would you say that the experience of the Office of Works with a turnover of roughly one seven-hundredth of this amount is an adequate basis for this Committee to make a change

upon of such an enormous character?—I could not tell you. I could not answer on those figures.

22,672. No, but a great deal is being built on the experience of the Office of Works, and I wish to show that it is a very small item compared with the experience of the whole of the painting trade throughout the country?—It is comparatively small, certainly, taking the whole quantity, but it is hopeless to try to enter into the figures at all.

22,673. In view of the assertion you have just made that it is small, would you say that it is sufficient or adequate for this Committee to found upon it such a change as is involved in the abolition of white lead?—I do not think I am qualified to express an opinion on that matter at all.

22,674. But we are attaching great importance to your evidence?—We tell you the facts as far as we can. We cannot go beyond the facts.

22,675. (Lord Henry Bentinck.) Is it not the fact that you are the only person who has really conducted any experiments on a large scale in this country with leadless paints?—I cannot answer that question because I do not know what other people are doing, but I should think that the paint manufacturers with whom we have been dealing have been carrying on experiments to an equal extent.

22,676. (Mr. Sutherland.) Are you aware that there are nearly 200 different colours and shades of colour into which lead enters as a base? Would there not be great interference in the production of these various colours if Parliament prohibited white lead?—There are the greens. It cuts into them.

22,677. And the reds and chromes, all based on lead, and yellows of course?—That is why we suggest that there should be a small allowance of lead.

22,678. Is the abolition of white lead by the Office of Works an accomplished fact?—Practically.

22,679. Last year we were able to show that 5 tons of white lead had been used in London?—Mr. Patterson has already explained that. We got the information at the time.

22,680. I want to know how it came about that that 5 tons of white lead were used in St. James's Palace, Buckingham Palace and offices under your jurisdiction?—That was all explained by Mr. Patterson.

22,681. No?—He has the information.

22,682. Do you not know why it was used; at the time Mr. Patterson said you had abandoned the use of white lead?—It was used for stopping and matters of that kind.

22,683. You could not use 5 tons for stopping?—It was distributed over a great many districts, but you will get all that information from Mr. Patterson. I gave it to him for him to bring forward.

22,684. Then the same thing would apply to how it came about that the Menai Bridge was painted entirely with white lead?—I had nothing to do with the Menai Bridge; it is under the engineer.

22,685. Is it not under the Office of Works?—It is under the Office of Works, but I should have said that certain engineering works were carried out under the engineer.

22,686. Then that proves that your jurisdiction is not complete?—Lead will be stopped in the future. Directly I heard of it I saw the engineer and arranged that it should not be done again.

22,687. As a member of the Royal Institution of British Architects, you are familiar with the present practice of the profession to specify for their painting work genuine white lead, pure linseed oil, and best American turpentine. This is a general formula, is it not?—It may be so, but I do not know what private architects specify.

22,688. It is the regular formula?—He might use zinc white or something else.

22,689. At his discretion, but that is virtually the formula of the profession?—I do not think that that is anything to go by.

22,690. In specifying these, they do so because of their satisfactory experience of the paints produced by these ingredients. They are general, accessible in the open market, impersonal, and can be depended upon to make good paint. If white lead were prohibited, what

14 November 1912.]

SIR HENRY TANNER, O.B., I.S.O.

[Continued.]

could the architects specify in the light of our present experience?—I think they would specify paint with a zinc basis.

22,691. Whose paint?—That is a matter for the architect. There are plenty of paints which he can choose from.

22,692. The experience of the Office of Works has been almost exclusively with what is known as proprietary paints?—We prefer to get a paint manufacturer to supply mixed paint rather than the ordinary painter should mix his own. We find that that course is very unsatisfactory.

22,693. That is quite proper for you as a Department, but it is not for us as a Committee to recommend any particular paint. Do you think that this Committee could advise the Government to abolish white lead on the basis of your experience of proprietary paints?—I think you might, because there will be more manufacturers than ever of leadless paints. They will be more extensively manufactured.

22,694. You would not call the experiments made by the Office of Works scientific experiments?—I think they have been reasonably so of late.

22,695. The Committee have been informed that the Office of Works have never taken the bare material, white lead, zinc oxide, and lithopone, and mixed them themselves and made comparative tests of their value?—We did at first and more of late; but principally it has been done by the manufacturers.

22,696. The Committee were informed that anybody could send in a paint, and that it was applied, and its record noted?—That was so and analysed.

22,697. But that is not a scientific way of demonstrating the value of other materials against a base pigment like white lead?—We were quite satisfied with the result.

22,698. You as a Department are quite justified in doing that, but it is not a basis sufficient for this Committee to work upon?—I must leave that for the Committee.

22,699. You cannot speak of the toxic effects of your leadless paints, because I understand that the contractor takes on the burden of that (that was Mr. Patterson's statement), so that your experience does not help the Committee as to the effect on the health of the workmen, does it?—No, I cannot say that we know very much about that.

22,700. You keep no records?—No.

22,701. The question is of importance, because eminent chemists and medical men have submitted to this Committee that the emanations from so-called non-poisonous paints (non-lead paints) are poisonous—not lead-poisonous but poisonous. Does not this further complicate the question?—Certainly, I am not in a position to answer medical questions which I cannot deal with.

22,702. But it does not relieve the use of paint from the peril attaching to it?—We have no experience of anything of the kind.

22,703. You have no record?—We have no record.

22,704. You cannot say either way?—We should hear of it if it were so.

(*Mr. Sutherland.*) The Chairman did not accept such an answer from other witnesses.

(*Chairman.*) That is so. Sir Henry would not hear of all the cases probably.

22,705. (*Mr. Sutherland.*) (*To the witness.*) Do you know that this Committee, as a Committee, has never seen a single piece of work executed by the Office of Works or their contractors with these proprietary paints, nor any of the test panels painted with them, and they are relying entirely on the word of Mr. Patterson? Would you think these conclusions, which are in opposition to the embodied experience of every master painter who has been before us, sufficient to base so large a change upon, as to discard a metal which has no equal as a paint base?—So far as the examination of our work is concerned, if the Chairman desires it, we will afford any facility for the Committee to see it.

22,706. But up to now the Committee have not seen a single inch of painted surface?—Well, I am not to blame for that.

22,707. No, of course not, but that is the case. Are we to understand that you do not take exception to white lead as a paint base, but only from its effects on the health of the workmen?—I think myself that the other is rather nicer paint. It keeps its colour, which white lead never does. That is one reason.

22,708. Is it on the ground of health, or on the ground of the superiority of the paint?—And also the health of the men. That was our starting point really.

22,709. Do you know that the use of zinc oxide involves the use of considerably more oil and driers, and that these, with turpentine, are the noxious ingredients of paint, apart from lead dust? Can you suggest any way by which their use could be avoided?—No, I do not think that I can go into questions of that kind. I have said so before. I can only tell you what our experience has been so far.

22,710. You have no jurisdiction over Scotland?—No; not direct, but I think that our arrangements are carried out there just the same. Whatever I settle in London I think is adopted in Scotland, but I would not like to answer that definitely.

22,711. Substantially, there is no lead poisoning in Scotland outside the Glasgow area?—That I do not know.

22,712. You still think it necessary to use red and white lead for priming for steel and iron?—Yes, red lead for the present.

22,713. You have got no table of records of your experiments?—No, I have not them. Mr. Patterson will be able to answer anything of that kind.

22,714. I think you said that complaints were more frequent since you abandoned the use of lead?—Yes, for the reasons that I gave. We are getting over that difficulty. We get very few complaints now.

22,715. You also said that zinc paints require understanding?—They require different treatment from white lead. Workmen understand white lead, or did understand white lead, better than zinc white, but now you may put it the other way, or they understand one quite as well as the other, I think, in the majority of cases of those who work for us.

22,716. But they are a small number?—I quite agree, they are a small number, but what can be done in one case can be done in another.

22,717. Do you think that zinc paint can be applied to all the decorative painting that white lead can?—I should say that for decorative purposes it is better.

22,718. In what way?—Because it keeps its colour.

22,719. That is only one element?—But that is a very important element.

22,720. It makes very much cruder colours?—In decorating, white now takes a very large place.

22,721. Colours from lead give a very much softer effect?—I cannot very well enter into that. I do not do much decorative painting. Our colours are very ordinary.

22,722. You know Mr. Grace?—I know Mr. Grace. (*Mr. Sutherland.*) He was very positive on that point.

22,723. (*Mr. Fell.*) (*To the witness.*) Supposing that lead were prohibited, would it not be necessary to issue regulations to deal with lead painted surfaces that are already treated with lead?—I do not think so. I do not think that they would make any difference.

22,724. There would be an enormous amount of lead in lead painted surfaces that would have to be dealt with for some years in rubbing down and that sort of thing?—Yes, but we cannot help having to rub down lead which already exists in paint.

22,725. But would you not have to have regulations for it?—I should not think so. That would very soon disappear. Wherever you change from lead to zinc you have to prepare the surface.

22,726. But would there not be a big danger whilst that was disappearing, unless regulations were issued?—No, I think not, and I do not quite see what regulations you could issue.

22,727. As to the prohibition of dry rubbing down and that sort of thing?—If anything could be suggested for that, we should no doubt be glad to adopt it, but that is mainly in what you might call decorative

14 November 1912.]

Sir HENRY TANNER, C.B., I.S.O.

[Continued.]

work. You do not do very much rubbing down in ordinary outside painting, for instance.

22,728. No, it is more for interiors?—And in coach painting and things of that kind.

22,729. (Mr. Mason.) I understood you to say that your instructions, which were issued in 1907, were carried out in the main. If you were so confident of the success of your experiments, why did you not see that your people carried out the letter of the instructions?—We do as far as we are able, but, as I said before, at the beginning we had to deal with some little prejudice, and I do not think that that exists now. I think that everything is done according to our instructions.

22,730. Now with regard to complaints of the paint, I understood you to say that the Clerk of the Works would report to you at the time with regard to paint which had something the matter with it?—Yes.

22,731. But after the Clerk of Works had left, and the paint had been applied, say, for a year, would you get complaints of the paint not lasting?—That was not the effect of the question as I understood it. It was complaints by the Clerk of Works while the painting was being done as to the paint received to do the work with. He would state that the paint did not cover and that kind of thing.

22,732. I am extending the question. To whom would the complaints of the paint not lasting go?—We have not had any complaints of the paint not lasting.

22,733. Would they come to you?—Yes, as a rule. I wanted complaints to gather what information I could.

22,734. Several witnesses have told us of the value of graphite as paint for ironwork. Have you had experience of that?—No, I do not think that we have used much graphite. We have tested it on a very small scale, but not much. I think that we did it quite early in the period. It must have been in 1902 or

1903 that we tried graphite. Whether we have tried it since, I could not say.

22,735. Then you cannot confirm or refute the evidence of the witnesses on these special paints?—We did try graphite and Dixon's Crucible Co.'s graphite. That must have been quite early.

22,736. The result of those experiments was not good enough to warrant your going on?—No. We did not feel quite pleased with them. I do not say that they have not been improved or something of the sort now.

22,737. In your specifications you admit 5 per cent. of lead. Is this done to allow of cheaper zinc being used; or do you consider that it improves the lasting qualities of the paint?—There is a little lead in the zinc. You cannot get zinc quite pure, I think. If we have greens we are obliged to allow some lead at present. We have now found a colour which has little or no lead in it.

22,738. I understood from a witness who was speaking of the paint used on the labour exchanges, which are under your jurisdiction and are painted in two shades of green, to say that those paints were not leadless?—I could not be quite sure about that. I do not know what firm they were got from.

22,739. I could not tell you, but he led us to believe that it meant a very large amount of paint?—I can only make some inquiry about that.

22,740. (Mr. Rice.) I understand you to say that the Chief Engineer will in future use leadless paint in the painting of bridges and other constructional work?—Yes.

22,741. May I ask if that is owing to conviction of the efficacy and suitability of leadless paint, or is it under instruction?—It is because I represented to him that he should do it.

22,742. He has really made no experiments himself?—No, I do not think so. I think that the Menai Bridge is about the principal thing that he has got to paint.

The witness withdrew.

Mr. G. D. PATTERSON recalled and further examined.

22,743. (Chairman.) You have been asked to attend to-day in order to fill in details regarding the previous evidence which you have given on behalf of the Office of Works?—Yes.

22,744. You state that leadless paints were first tried by the Office of Works about 1902?—Yes.

22,745. Where were the leadless paints tried and what were the results?—Here is a table showing the experiments (*handing in a table* \*).

22,746. The next experiments were carried out on the Patent Office roof, were they not?—Yes.

22,747. What was the area of the surface painted with each paint on the Patent Office roof?—About a square yard of each.

22,748. Was a lead undercoating used in each case?—I could not say definitely, but I think that these early experiments were probably on either lead or oxide of iron undercoatings.

22,749. Was that before you had charge of the experiments?—Yes. I had nothing to do with the application of the paints.

22,750. Then you cannot tell us of your own knowledge what results were obtained?—My previous evidence shows that I was one of three who finally judged of their condition.

22,751. Then you have records showing which paints proved most satisfactory in the experiments on the Patent Office roof?—Yes.

22,752. Can you tell which paint was found the most satisfactory?—Nos. 3a, 16, and 204A, on the table which I hand in †.

22,753. Can you tell us who judged the paints and determined their relative merits?—Messrs. Carpenter,

Jones, and Patterson—all three Office of Works Clerks of Works.

22,754. Were all the paints used in those experiments analysed?—Yes.

22,755. Was there any lead in the paints which you have stated were found to be the most satisfactory?—There was 32.9 in No. 3 (green), 6.2 in No. 16 (brown), and 2.81 in No. 204 (brown).

22,756. What is your own opinion of the value of the experiments which were carried out before you were concerned with them?—They were very carefully conducted, and the paints used were all analysed, and the results seem to me to show that pigments as diverse as lead, iron oxide and even silica may make good paints for iron, provided the physical conditions and the medium be right.

22,757. How do you know that the experiments made before your time were very carefully conducted?—From what I heard and saw at the Patent Office, when examining the paint results, I should consider they were.

22,758. Now, when did your own experiments begin?—I was instructed in 1905 to take the matter up. As I mentioned in my previous evidence, I was not very hopeful at first, because a small experiment made about 1903 had not been happy. We very soon found that there were good zinc paints to be had.

22,759. Who instructed you to continue experimenting with leadless paints?—Sir Henry Tanner.

22,760. When did you begin to keep records of your experiments?—About 1906.

22,761. Have you records of any experiments made by you before 1906?—No, I have not, excepting such as I have obtained from official papers.

22,762. Can you give me their general purport?—Their general purport was that I satisfied myself that we could get satisfactory zinc paints, and that we

\* See Appendix XXIII.

† See Appendix XXIV.

14 November 1912.]

Mr. G. D. PATTERSON.

[Continued.]

should be justified in carrying out further experiments on a large scale.

22,763. Will you please tell us how you satisfied yourself that you could obtain satisfactory zinc paints?—By getting samples from various makers, and by mixing some myself, and trying them on boards and walls.

22,764. Was the zinc paint as good in every respect as the lead paints previously used?—In some cases they were not so satisfactory at that time, but we set ourselves to correct the defects.

22,765. That time being which year?—1905 and 1906 I am speaking of.

22,766. Will you detail the characteristics in which you found the zinc as satisfactory as the lead?—Opacity, appearance, permanence of colour, and fastness.

22,767. Now when was the experiment on a large scale put in hand?—As previously stated, in June 1906, when five blocks of the Post Office Savings Bank Building, West Kensington, were painted externally with five different ivory white paints, one a white lead paint, the other four, zinc oxide paints.

22,768. Was not the Savings Bank Building painted internally at the same time?—Only partially.

22,769. With the same paint?—With one of the zinc paints.

22,770. Were the zinc paints applied over a lead undercoating internally?—Not internally in all cases. They were externally. In regard to wood that was previously painted internally it was so, but we painted some walls and ceilings which had not been painted before.

22,771. You painted them with zinc paint?—We painted them with zinc paint, and in that case there was no lead undercoating.

22,772. Was lead undercoating used with zinc paint for zinc painting externally at the Post Office Savings Bank Building?—I have already said I think that all external work had been previously painted with lead in 1902. They were repainted in 1906, and you have evidence to show what was done.

22,773. What was the nature of the surfaces painted?—All wood and iron externally, and some of the ceilings, and I think certain of the rooms having plastered walls also on the fourth floor internally.

22,774. Now I want you to tell us in what directions these blocks face?—The boiler house, front, and back blocks run east and west, and the cross blocks north and south.

22,775. Can you tell us whether all the paints, both lead and zinc, were equally well situated for the purpose of a really genuine comparative test?—I think so.

22,776. Are you quite sure of that?—Yes. I wish that you were there to see them.

22,777. (Mr. Sutherland.) Did they all come under the same conditions of sun and the same conditions of rain? Are they exactly four square?—They are all four square, and within a point of the compass. Every part of those blocks on one side or the other gets the sun. The direction of driving rain is mainly from west and south-west.

22,778. Which part did you paint with lead?—The west cross block.

22,779. (Sir Godfrey Baring.) That is where the rain would come?—It would come obviously from the west; the other cross block was in zinc, and whatever the west cross block gets that block would get also.

22,780. (Chairman.) Did you specify a certain formula for the zinc paints?—We had learnt sufficient in the early experiments to be able to specify approximately the composition of the paint to be supplied.

22,781. Do you put in a table showing the composition of each of the five paints used in this big experiment?—Yes. (The table was handed in.)\*

22,782. Do you also indicate the condition in which the paint was found four years later?—Yes. The result of the examination of the paint in 1910 is shown

in the last column of the table which I have just handed in.

22,783. The condition of the different paints is described as "good" and "very good." By whom was the condition of the paint judged?—By myself in the first instance, checked and confirmed by Sir Henry Tanner.

22,784. Will you please explain fully what characteristics you considered it necessary to find before you marked a paint "good"?—I should say gloss fair, surface good, quite fast, and the colour changed.

22,785. What characteristics correspond to the term "very good"?—Gloss good, surface good, fast, and colour maintained.

22,786. Was the composition of the paint as given by you in that table confirmed by analysis?—That table is the result of the analysis.

22,787. How long is Office of Works' paint expected to stand in good condition externally?—Four years.

22,788. Were you so well satisfied with the results obtained with zinc paints in the experiment referred to that you have continued to specify the same formula from 1910 onwards?—We have improved somewhat on that formula.

22,789. Will you tell us in what direction?—We are now specifying that paints shall contain about 58 per cent. of zinc oxide, as compared with 50 and 56 per cent. respectively in the two best paints used in 1906. We lay stress also on the quality of the materials to be used in our paints, and we have decided to allow not more than 5 per cent. of lead in zinc paints, whereas none of the paints used in 1906 contained more than a trace.

22,790. Why have you decided to allow 5 per cent. of lead in zinc paints in the future?—As stated in my previous evidence, we consider that this amount is desirable from the point of view of stability as well as cheapness, and 10 per cent. in some other instances.

22,791. Have you since 1906 continued to use zinc paints exclusively?—Yes, with the exception of priming on wood and iron, which I deal with later in my proof.

22,792. Have you prepared a list of buildings in your own district showing the date of painting and the kind of paint used since 1907?—Yes, here is the list.\*

22,793. Can you augment this list in any way?—I was asked first of all to furnish a list in which I could say that all these paints had been used, and the dates. I am speaking from my personal knowledge. I have furnished you such a list. If you ask me have these paints been used more extensively, I say, as I am instructed, that these paints must have been used for every Crown building in London by this date.

22,794. What do you mean by "as I am instructed"?—What I mean is this: If you ask me whether a certain building is painted with so-and-so, if I know it personally I will say yes. If you ask me how I know it, I say because I visited the building during the time it was being painted. I gave the order for it, saw it in operation, saw the cans out of which the paints were being used, and so on, and therefore I speak from personal knowledge. If you ask me whether a certain other Crown building in London out of my district is painted with a particular paint, I can then only draw upon my official instructions. They are that these same paints should be used in these districts.

22,795. Now can you tell us whether any of the large public buildings, say, for instance, the Law Courts, Buckingham Palace, and the great public departments, have been painted since 1906 with zinc paints?—Of my own personal knowledge no, but, according to office instructions, yes, they have all been.

22,796. Under whose jurisdiction would the painting have been carried out in these buildings about which you have just spoken?—The previous answer was the Clerks of Works under whom they were.

\* See Appendix XXV.

\* See Appendix XXVI.

14 November 1912.]

Mr. G. D. PATTERSON,

[Continued.]

22,797. Now is it possible to call those Clerks of Works to tell us from their own knowledge whether those buildings are painted with zinc paints only?—I cannot say. Sir Henry Tanner would have been able to answer that question.

22,798. Are there certain gentlemen, Clerks of Works, who would have that knowledge?—Yes.

22,799. Have you a record showing the condition of the paint of the Post Office Savings Bank Building and the condition of the paint of the buildings which have been painted under your own superintendence?—No, I have no record.

22,800. Why has no record been kept?—We have too much to do to allow of making any unnecessary records.

22,801. Were zinc paints adopted in all districts under the control of the Office of Works?—No. The first general instruction I am able to trace is dated April, 1907.

22,802. What is the nature of that instruction?—It is that for all ordinary purposes paints with zinc oxide base are to be used, being non-poisonous and more permanent in the lighter colours.

22,803. By whom was that document issued?—By Sir Henry Tanner.

22,804. Your personal jurisdiction applies only to paint work in the London district, I understand?—Up to last year in the west of London, and now at Kew.

22,805. What other districts are there under the control of the Office of Works?—There are several London, provincial and foreign districts.

22,806. What are the authorities in the various districts subordinate to Sir Henry Tanner?—The architects, surveyors, and Clerks of Works in each case.

22,807. What authority have the surveyors and Clerks of Works themselves?—To maintain Crown property as per Office of Works instructions.

22,808. You have stated that an order was issued in April 1907 instructing that for ordinary painting zinc paints should be specified?—Yes.

22,809. This order was issued after only one year of the important test at the Savings Bank Building?—Yes.

22,810. Although master house-painters may consider one year too short a test, the Office of Works considered the zinc paints so satisfactory that they were induced to issue a general order?—Yes, taken in conjunction with previous tests, the particulars of which I have handed in.

22,811. Was that an order binding on Clerks of Works throughout the country?—Yes.

22,812. Did the Clerks of Works in districts outside London put any obstacles in the way of the substitution of zinc paints for lead?—I know of none.

22,813. Have you had any official complaints from Clerks of Works stating that the buildings were suffering in consequence of the change from lead paints to zinc paints?—Not on account of the change from lead to zinc.

22,814. Have they, on the other hand, expressed any opinions to the effect that zinc paints are as good as lead?—I have heard of none, and I can only refer you in that connection to the first table put in of experiments, and the opinions.

22,815. I am speaking now of since the general order was issued for the exclusive use of zinc paints. Have any of the officials, Clerks of Works, &c., expressed any opinion to the effect that zinc paints were as good as lead?—I have not heard of that.

22,816. Are you prepared to answer questions regarding districts other than your own?—Only generally.

22,817. Part of your painting work is done by contract, is it not?—Most of it is done by regular triennial contract. A small part only, as at Buckingham Palace, is done by special decorating contractors.

22,818. Do the special contractors not use lead paints?—No. These special contractors have to conform to our rule, and use zinc paints.

22,819. That means, then, that no lead whatever is now being used for actual paint work?—None, except for primings, which I deal with later.

22,820. Do you have the paints used by outside contractors analysed?—Yes, in case of doubt, otherwise the contractors' statements are accepted.

22,821. Can you tell us anything regarding the disease of lead by the Engineering Branch of the Office of Works?—I cannot give much information on this point, as the Engineering Branch is quite distinct from the Architects' Department, but I understand that they now use leadless paints except for iron primings. It may be of interest to note that manganese is being used in that department in place of red and white lead for jointing hot-water pipes and the like, but, of course, that does not affect painting.

22,822. Now I will ask you a few questions about priming. Are you still using lead primings in the case of woodwork?—No.

22,823. What was the date when non-poisonous primings for wood were adopted?—Instructions were given in May, 1912. We cannot say lead ceased to be used on such and such a day. Stocks in hand would be used up, probably.

22,824. What details can you give regarding the use of leadless primers for wood?—Some of them have been found quite satisfactory. There have been no complaints. I produce a board showing woodwork primed with lead and leadless primers (*producing a board*). The lead priming is put from the centre to the left of the board marked *a, b, c*. The right half of the board, *d, e, f*, is painted with leadless primers—leadless, of course, implying always the 5 per cent. of which I spoke. Over these two primings a zinc undercoating is applied over compartments *b, c, d*, and *e*, followed by a zinc finishing over *c* and *d*, both covering the priming and the undercoating.

22,825. What deduction do you make from this?—I have brought it here so that the Committee might make their own deductions. My deductions are that the primings and the paints over them are standing very well.

22,826. When was it done?—The date is on it—12 months ago.

22,827. Has that been exposed to outside elements?—Yes, all the time.

22,828. You are quite satisfied. Your deductions are that both stand equally well?—Yes.

22,829. Now what experiments did you make before you adopted non-poisonous primings for woodwork?—I tried several mixings, and we adopted the most satisfactory.

22,830. What materials did you experiment with?—Zinc oxide, lithopone, silica, chalk, and asbestos.

22,831. Over what period did you conduct the test?—Some for over three years; the last set for over 12 months.

22,832. How did you determine whether the results were satisfactory or not?—By exposing coated boards to the weather.

22,833. What do you use for priming ironwork?—Up to the present we are still using lead oxides for this purpose.

22,834. Why is this?—We have not yet completed the experiments which we have undertaken with a view of finding a satisfactory substitute.

22,835. Does that mean that you are not prepared to advocate the total prohibition of lead for painting iron?—Personally, I am not yet prepared to advocate such a prohibition of lead for painting on iron at present. Trials with a great variety of paints on iron are now going on.

22,836. Then if a general prohibition of lead were contemplated, would you advocate an exemption permitting the use of lead paints for iron work until such time as evidence is forthcoming that they can be dispensed with?—Yes, I would.

22,837. What limit of time would you suggest should be given?—Until you are able to produce evidence either one way or the other.

22,838. Do you think that if a limit of time were given, it would bring those concerned up to the scratch and they would find a substitute?—It might, but that is supposing, and I am here rather to speak from experience than from supposition or hope.

14 November 1912.]

Mr. G. D. PATTERSON.

[Continued.]

22,839. Is it your opinion that there is a great difference between one pigment and another when used on iron?—Certainly, there is much difference in pigments, but probably more importance is to be attached to the pigment's physical condition and to the medium.

22,840. Can you show us an example of the sort of tests you are making with paints for use on iron?—Yes. That is probably of interest to the Committee (producing an iron plate). Several paints have been put on it. Some of them have clean gone. There are two remaining good.

22,841. (Lord Henry Bentinck.) They have been exposed to the open air?—I produce a sample of iron plate on which seven different paints were applied. You will see that nearly all of them have disappeared in the course of 2½ years' exposure to the south-west. Of the two which remain in fairly good condition, the best is a zinc oxide paint made with boiled linseed oil specially prepared. The value of this paint is probably due to the special preparation of the oil. The second best paint consists of an iron oxide pigment with a tung oil varnish medium.

22,842. Have you records of any tests on iron, on a larger scale?—Yes, in the Savings Bank roof tanks the result was that after nine months use working with a zinc or iron oxide paint, the iron oxide tung oil paint came out best. Graphite and red lead are linked as second best and the last and worst was aluminium paint.

22,843. In your previous evidence, you alluded to the continued use of lead in stoppings?—Very little lead is now used for this purpose.

22,844. What is used in its stead?—Putty for stoppings and the pastes of good washable distempers; also slate powder and japanner's gold size are good for fillers, and we advise their use on Office of Works' work.

22,845. Is any lead still used in stoppings?—When a specially hard stopping is needed, probably some clerks of works may have a little lead added to the putty.

22,846. Can the use of lead in stoppings and fillings be prohibited?—No lead need be used we think in fillings, but the usual 10 per cent. of lead in hard stoppings and jointing putty is useful.

22,847. Does all that you have said apply to stoppings and fillings for use on iron as well as on wood?—Yes, so far as our experience goes.

22,848. Now in your previous evidence you were asked questions as to the use of five tons of lead, which it was suggested you had used recently or which had been sent to the Office of Works. In connection with this question have you now obtained reports concerning the amount of lead used in London?—I have found that at the large London depôts 56½ cwt. of lead were accounted for as having been used for primings, stoppings, plumbers' and smiths' joints and gutters and carpenters' sill and post bedding and small quantities in other places for plumbers' and smiths' work.

22,849. Do you think that any of that five tons has been used for anything except smiths' and plumbers' work, primings and stoppings?—It is very improbable.

22,850. If lead has been so used in ordinary painting, does it not affect the position of your Department?—Not in the least; I am quite sure that this small amount of lead has been used for the purposes already stated.

22,851. Have you taken steps in the district under your own charge to render it impossible for lead to be used in future for painting?—Yes, except with my specific instruction.

22,852. The considered decision, then, of your Department is that zinc and other non-poisonous paints shall be used exclusively?—Yes, with the exceptions I have stated, namely, for iron primings, the 5 per cent. allowance in general paints and the 10 per cent. in greens.

22,853. In your opinion is paint compounded for the Office of Works applicable to all kinds of outside house painting?—Yes, that is my opinion; iron priming excepted.

22,854. Can you then name any respect in which it would be harmful to prohibit the use of lead, or rather to restrict its use to not more than 5 per cent., subject to certain exceptions, such as greens if found necessary?—It might add a little to the cost of painting, and it would cause a little trouble to working painters in learning to manipulate the zinc paints. I cannot say that it would be harmful in any other way. The fact that it would lead to a wider use of ready-mixed paints I regard as a decided advantage.

22,855. (Mr. Mason.) I would like to ask you the condition of that iron plate before it was painted?—I presume you are referring to the iron plate that you have seen. It was clean bare iron; that is to say, sheet wrought iron plate, and it was thoroughly cleaned to brightness before samples of paint were put on.

22,856. With a scratch brush or something of the sort?—With sand or emery paper, cleaned down as far as you could get to the bright iron. That does not render it impossible for there to be peck holes or such like in it, but I wish that we got every iron surface prepared like it.

22,857. (Mr. Sutherland.) When you speak of zinc paints you mean proprietary varnish and enamel paints?—I speak of the zinc paints we have been using.

22,858. But they are proprietary paints, are they not?—Proprietary in the sense that they are got from manufacturing firms.

22,859. Not merely in that sense, but they are sold as "A," and "B," and "C," so and so and so and so?—They all have a name, but there is no patent about them.

22,860. No, there is no patent, but they are proprietary paints?—Yes.

22,861. If you go to the ordinary oil and colourman for a pound of paint he gives you a pound of paint mixed up with lead, or whatever it may be, but that is not A's and it is not C's. Your experience is largely restricted, so far as I can see, to the specifying of particular proprietary paints?—Our experience is based on the paints we have tried, but if you mean have we gone into a shop and said, "Give me a pound of paint," we should run the risk of having anything or nothing.

22,862. I did not suggest that, but if I go in and get a pound of paint, that is nobody's paint?—You have no guarantee.

22,863. But your office deals exclusively with particular paints?—They have done up to the present. Anybody who made up a satisfactory paint to that formula was considered. That is gradually being extended.

22,864. But you did not provide the formula in the first instance. You got your paints, used them and tested them, and then analysed them and adopted particular formulas?—Yes and no. We did that, but, as I have stated this morning, I also got pastes and mixed them myself.

22,865. I am going to ask you about that later. The broad way in which you have proceeded is by allowing anybody to send paint and you have tested them, and if you have considered them satisfactory you have analysed them and adopted that as a formula?—Yes, in part. At the same time many of these were found to be defective in certain respects, and in order to see whether those defects could be overcome we proceeded to mix them ourselves. I should say here, in justice to those firms, that they have been ever ready to help.

22,866. Yes. Nobody is condemning those firms at all. I do not deny that they are good firms?—I mention no names, but I want to say that what we have done we do not claim credit for.

22,867. When you speak of zinc paints, you do not speak of zinc oxide, but of the proprietary varnish and enamel paints that you have used?—Yes, but not enamel. I take exception to that.

22,868. Varnish paint?—Yes.

22,869. You use enamels as well?—Yes.

22,870. They are specified as enamels?—Yes.

22,871. With regard to your contracts, the contractor has the providing of the lead and all subsidiary

14 November 1912.]

Mr. G. D. PATTERSON.

[Continued.]

things, such as oil and turpentine, but these specified O.W. paints are paid for by the Office of Works direct; are they not?—No.

22,872. Does the contractor pay for them and do you report?—There again I should say yes and no to be clear.

22,873. You have a perfectly balanced condition?—With regard to our day work we pay a certain staff of men who go about touching up, doing odd jobs and so on—emergency men. These men use the paint that we get from these firms—what you call proprietary paints. We order direct and it is paid for direct.

22,874. By the Office of Works?—By the Office of Works. With regard to the painting that we put out as measured work (say a house or any large area) we specify the paint that is to be used. The contractor orders that paint and uses it, and so my answer is yes and no.

22,875. Does he pay for that?—He pays for it.

22,876. You have nothing to do with that?—No. He gets his profit and so on in the usual way.

22,877. When you were here before you gave us 18,000*l.* as painting labour, and 5,000*l.* for paint. Is that for your day-work?—No. I think that it means the total of the operation so far as I could get it.

22,878. It is not a large amount. It is only 23,000*l.* If you make it 30,000*l.*, it is not a large amount. I could find two or three painters who do almost that amount of business?—That, I am not concerned with.

22,879. So it is not a large experience to date from, is it?—I think it is.

22,880. It is for a Department, but not otherwise. Now you say that you mixed some samples yourself from zinc and lead?—Zinc.

22,881. That will do. Have you the formulas of those mixtures?—No.

22,882. No records whatever?—No. I can tell you roughly what I was after, and what they were.

22,883. You can tell us how you mixed those?—I was chiefly concerned at that time with the opacity, and I tried different proportions of the zincs with the oil, boiled oil and with double or refined boiled oil, and turps, and I gradually increased from about 40, 50, 60 per cent. and so on till I got a satisfactory opacity.

22,884. Sixty per cent. of zinc?—Yes. Some people, as you know, get as much as 70 per cent. We have had firms who, of their own initiative, sent us in samples with up to 70 per cent.

22,885. Seventy per cent. of pure zinc?—Yes.

22,886. When were the Savings Bank blocks at West Kensington last painted?—In 1910 I think.

22,887. Are they available now for the Committee to see?—Yes; in fact the Chairman and one or two of the Committee have seen them.

22,888. But the Committee have not seen them?—That is the object of the list I have handed in. In fact, gentlemen, with regard to many of these things I say "go and see."

22,889. Do you not think that the outside work at West Kensington may be still reaping some benefits from the lead that was originally put upon it in 1902. The foundation is still there?—It may or may not be. It is quite possible.

22,890. Do you think yourself that there is virtue in a percentage of lead in zinc?—To a certain extent.

22,891. You have not abandoned lead for use as a primer. Even now you are experimenting?—As far as I am concerned personally, I do not know whether you refer to the reservation I made—except when I have given instructions. I hold myself to be a little free in the sense that I carry on all sorts of experiments. I am taking that liberty in spite of departmental instructions. If there are things demanding investigation and so on I do not hesitate to put lead against zinc or one paint against another. What I am after are results.

22,892. Under whose jurisdiction is the painting of the Law Courts done?—Under Mr. Carpenter I think.

22,893. Is he an Office of Works man?—Yes; he is one of the gentlemen who examined the paints on the Patent Office roof. He is one of the three judges.

22,894. And has he to determine whether it is lead or zinc paint that is used in the painting of the Law Courts?—He would have the choosing of any one particular paint.

22,895. Can he say of his own powers "we will have this painted with lead"?—I take it that he is bound by the official instruction to which I have referred this morning—that all paint used shall be zinc paint.

22,896. If Mr. Carpenter desires to use lead, has he authority to do so?—I do not think so.

22,897. You are not sure?—From the evidence that I have already given you, I should say no.

22,898. But you have not given any evidence on this point?—Excuse me; I have already said that there is a general official instruction.

22,899. But that does not carry any weight with me in view of what I know has gone on. I do not attach the slightest weight to it. Do you tell the Committee now that no lead has been used at Buckingham Palace this year in the painting and decorating?—My instructions are that lead is not being used.

22,900. But that is not an answer at all. Can you tell us of your own knowledge that no lead has been used in the painting and decorating work at Buckingham Palace?—I cannot.

22,901. That is what I want to know?—I can only supplement that by saying that the general instructions are that zinc paints are to be used.

22,902. We know that. Those are proprietary paints, but you would not take A's paint and B's paint and the O's paint to decorate the rooms at Buckingham Palace?—I know that there are special contracts entered into for special decorative work under the Crown, and I think I explained that they are in a sense outside us, but I have the architect's assurance that they are zinc paints.

22,903. Who is the architect?—Mr. Reavell. He assures me that in any such contracts zinc is being used and not lead.

22,904. Do you say that no lead was used for painting in Buckingham Palace this year and St. James' Palace? Do you tell the Committee that the five tons of lead that have been sent to the places which I enumerated (last November, I think) were used in stopping?—I have already given evidence which says I do not say so.

(Chairman.) Let me refer to your answer to one of my questions. "In connection with a question put to you the last time you appeared before the Committee, have you now obtained reports concerning the amount of lead used in London?" The answer was, "Yes, I have found that at the large London depôts 56½ cwt. of lead were used for primings and stopping, plumbers' and smiths' joints and gutters and carpenters' sill and post bedding, and small quantities in other places for plumbers' and smiths' work." Then I asked, "Do you think any of that five tons has been used for anything except smiths' and plumbers' work, primings, and stoppings?" and your answer was, "It is very improbable."

22,905. (Mr. Sutherland.) Last year I put this question to you: "Do you know that something like five tons of lead have gone to the following places this year:—British Museum, the Horse Guards, Victoria and Albert Museum," and so on. That is question 12,991. Do you suggest that that five tons of lead, with thinners, oil, turps, and driers accompanying it, was sent to these places for stopping. There is no mention of depôts. These are not the depôts?—They are the depôts.

22,906. Were they sent for stopping purposes?—I have already given what I say they are sent for. Shall I read you the answer again?

22,907. I will ask the question, and you can put that in as the reply to it?—The reply to it is for primings, stoppings, plumbers' and smiths' joints.

22,908. What sort of smiths?—Blacksmiths and fitters, and all that come under the general term of "smith." Let me complete this: "Carpenters' sill and post beddings." You know, I daresay, that every window sill and every door post in a damp place is bedded in white lead. Eaves, gutters, and such like

14 November 1912.]

Mr. G. D. PATTERSON.

[Continued.]

usually have about three-sixteenths packing at the joints with red and white lead, and in hot water jointings it is used generally.

22,909. It is mostly red lead, is it not?—No, mixed. We have three smiths at Kew who may be called upon any hour of the day to go and make good joints, and you know that all the trades draw from the material that comes into that dépôt. Why, therefore, should it be thought that it was merely in paint that the lead was used? We are using it in practically every trade.

22,910. Do Leslie's do smith's work?—Leslie's do all the London district work.

22,911. The painting work?—The painting and the fitting, the smiths' work, plumbing and so on. What I said on the last occasion was that doubtless Mr Sutherland has verified his figures, and I accept them assuming that he has.

22,912. How do you know that the instructions sent out are carried out in other districts which are not under your own control?—Because it is understood in the Service that every officer loyally carries out the instructions that are given to him, and for myself, if I am placed in circumstances where a particular instruction does not cover I exercise my discretion, but if an instruction covers the point which I have to decide I naturally take the official instruction, and in justice to others, I should think that any other officer would do the same.

22,913. (Chairman.) Could you tell us the amount of white lead that the Office of Works use ordinarily in a year?—Do you mean in London?

22,914. Supposing that they had used five tons of lead, would not that form only an infinitesimal amount compared with the total?—It would form only a very small amount of the total used for painting. Might I remind you that at the time this statement was made there was no prohibition of lead for priming, but in addition to priming, of which a great deal is done, I suggest to you that there are many other things for which lead can be used, and for which it is used outside painting—in stoppings continually, for instance.

22,915. (Mr. Sutherland.) Such as?—Plumbers', gasfitters' and smiths' joints, hot-water pipe jointing, gutter jointing, the bedding of sills (which are, as you know, thickly bedded along the whole width of the oak sill before it is knocked down), the bottoms of doorposts, and upon cement or stonework and so on. Candidly when I think of it I am astonished that there are not more.

22,916. (Mr. Mason.) May I ask if there is now prohibition against priming with lead?—The instruction has been issued, as previously reported in my evidence, that we are now to use leadless primers.

22,917. Is that from 1907?—No, this year.

22,918. (Chairman.) Only for wood?—Yes.

22,919. (Mr. Kinggate.) With regard to the stopping you seem to infer that white lead is necessary for hard stopping. Have you tried at all zinc white with gold size for stopping? By stopping I mean the puttying up of the holes, you understand?—For puttying up holes we have not tried zinc. I have tried zinc in various combinations for fillers, but I have not tried zinc in the usual 5 or 10 per cent. for puttles for that purpose. The fact is that I have had so much to do with paints and fillers incidentally that I have not had time.

22,920. One of the great points of our industry is hard stopping. A quantity is used. We find that zinc white can be used equally as well as dry white lead with gold size for stopping. It is the rubbing-down very often with sandpaper that causes so much harm?—Are you referring now to filling or to stopping?

22,921. Stopping?—I am glad to have the hint and it shall not be lost.

22,922. (Mr. Robins.) Have you found much difficulty with regard to the painter who is in the habit of manipulating white lead having to use zinc white. Stress has been laid on the difficulty of getting a man to alter his hand from one to the other. Is that a real difficulty or is it a myth because it has been raised as a

difficulty?—I think that time would obviate any difficulty of that sort.

22,923. (Mr. Parsonage.) Could you give a formula as a standard substitute for white lead, allowing for a percentage not exceeding 5 per cent., that would do away with the necessity of specifying any proprietary paint?—I think that a formula as near that as can be given you have in the evidence which has been put in. As to every man mixing his own, which, of course, is a convenient method, there is much to be said. One class of objectors say that a man is incapable if he does not properly mix and grind the constituents together and so on, and another school say "Yes, and a man never gets the chance of making a good paint because he does not get the proper materials to do it." We find that paint manufacturers can make better paint than painters by the improvised methods of the painter's shop.

22,924. (Mr. Sutherland.) You will allow us liberty to disagree with that, will you not?—I am giving you the opinions of two schools, as well as our experience.

22,925. (Mr. Parsonage.) I think that the majority of master painters in the country would prefer to have the materials and mix their own. If some definite efficient formula could be used as a standard substitute for lead, it would go a long way towards solving the problem. I do not think that the majority of master painters would care to adopt any proprietary paint. They would prefer to mix their own, and use the thinners required according to the job?—If they got the right quality of materials, I doubt not that that is possible.

22,926. They specify for genuine white lead now. Could they have something specified definitely which was not white lead at all? Could architects specify to a certain formula to take the place of white lead?—The formula we have given is as far as we can go in answer to that.

22,927. (Mr. Sutherland.) We had barytes?—One or two of the paints tried on the Patent Office roof and marked "good" were of silica, and it must not be lost sight of by those who cling to lead as irreplaceable that in those tests barytes and silica were found equally as good as lead paints.

22,928. (Mr. Parsonage.) There is one with 56 per cent. of zinc oxide and 2 per cent. of lead, and it is very good. One with 69 per cent. of lead, has 29 per cent. of oil and varnish, against 36.6 for the one that has the zinc oxide. So that there is very little difference—only 7 per cent. The one with lead is good and the one with zinc oxide very good. If you could give us the exact quantities and something that could be put out as a standard substitute for lead, it would help us?—Might I refer to the evidence previously given—with all due deference. I have left out something which I am afraid I should not have done, but after all the proportions used so much depend on the quality of the materials used, and on the limitations of price. Nobody knows better than Mr. Sutherland that whether you can mix up a paint at 5s., 6s., or 7s., depends not only on your pigment but on your class of oil, and particularly on your class of varnish and proportion of varnish.

22,929. (Mr. Sutherland.) That is the dilemma we are in?—In previous evidence you have the proportions of varnish.

22,930. Separated?—Yes. If you look again at the official instructions, you will see that we specify good oil and copal varnish. We insist on good materials, and if you come to soft gums or resins you must not expect a good paint whatever pigment you have.

(Mr. Mason.) I think that there ought to be something more definite. I agree with what you say, Mr. Patterson, but I quite appreciate what the other side say. It certainly is a great point with Mr. Sutherland. He says, "When I ask for white lead I know exactly what I am going to have," and the other side say "We want to be able to specify something else that will make an equally good paint."

22,931. (Mr. Parsonage.) Leaving the medium out of the question altogether, could you give the formula of a pigment that would take the place of genuine

14 November 1912.]

Mr. G. D. PATTERSON.

[Continued.]

white lead that is specified now, and leave the medium to be used to suit the nature of the job?—The pigment that we are using and have had experience of appears in the table that has already been given to you.

22,932. (*Chairman.*) I quite agree with what Mr. Mason says, that before we could write a report and use your case as a strong argument in favour of the prohibition of lead, we would have to put before Parliament the component parts of the formula which has succeeded in your case?—You have that already.

22,933. But not in detail?—Yes, in detail. In the instruction of April, 1907, you have the formula to which we were then working. You have had reference also to any improvement upon that formula which has subsequently been made.

(*Mr. Mason.*) We have had given to us the mixture of oil and varnish. I ask the practical side of this Committee, "Could you mix up from that formula a suitable paint without knowing anything about it?"

(*Mr. Kinggate.*) Any man who has any technical knowledge at all could do it. He must know the varnish to begin with. If he is going to do it according to cost that is a different thing altogether.

(*Mr. Rice.*) This is the formula: "Ivory white undercoat, 58; zinc oxide, 5; chalk, silica and barium sulphate, 29; refined boiled oil and varnish, 8; per cent. volatile matter."

22,934. (*Mr. Mason.*) The difficulty is with regard to the quality of the varnish?—Do you ask the proportion of the varnish. My answer to that is that it was given on the last occasion I was here, as, roughly, for the paint we were using about a third of good copal varnish to two-thirds of oil. You will see that in the previous evidence.

22,935. (*Mr. Parsonage.*) That is for outside work?—Yes.

(*Mr. Gardner.*) If refined boiled oil was used you would not need a third of varnish even for outside work.

22,936. (*Mr. Sutherland to the witness.*) Do you think that the Office of Works experience is of that nature that it can set aside the embodied experience of the master painters of the United Kingdom?—We do not presume to say that. We offer you our experience, and it is for your Committee to settle what they think should be done.

The witness withdrew.

## FORTY-FIRST DAY.

Thursday, 11th December 1913.

PRESENT:

SIR ERNEST F. G. HATCH, BART. (*Chairman.*)

Sir GODFREY BARING, Bart., M.P.  
Lord HENRY BENTINCK, M.P.  
Mr. E. L. COLLIS, M.B.  
Mr. W. G. SUTHERLAND.

Mr. F. G. RICE.  
Mr. A. GARDNER.  
Mr. J. PARSONAGE.  
E. A. R. WERNER (*Acting Secretary.*)

Mr. B. J. MORLEY called and examined.

22,937. (*Chairman.*) Are you the foreman painter at Messrs. Cadbury Brothers Works?—Yes.

22,938. Where?—At Bournville. It is near Birmingham.

22,939. Have you been instructed to attend here to-day to give evidence regarding the use of leadless paints by Messrs. Cadbury?—Yes, by the firm.

22,940. Will you tell us what experience you have had in practical painting work?—34 years to be correct. It is between 34 and 35 years since I entered the trade.

22,941. What experience have you had during those years?—Practically a life-long experience. I have been at it all the time. I have had control of men now for 25 or 26 years.

22,942. Have you had control of a large number of men?—Yes. I have control now of anything from 30 to 50 painters.

22,943. In all kinds of work?—In all kinds of work, pretty well. It is very varied, from the mansion to the cottage.

22,944. Has the use of white lead as a paint been given up entirely by your firm?—Yes.

22,945. At what date was the change from lead to leadless paints made?—I could not quite say. It has been an evolution which commenced in 1902 when I took over the management of this department, and the change has been gradual. It commenced by experiments with half and half, and gradually we eliminated lead. It has been very gradual.

22,946. Can you fix the time when you agreed to discontinue the use of lead paint?—Three years ago it was absolutely discontinued; but seven years ago we decided to do without it as much as possible. It was one of those things that we had to move very carefully in.

22,947. Why was it one of the things that you had to move carefully in?—We knew very little about the use of oxide of zinc up to the last few years, and as to what could be done with it. The whole of the painting trade were practically in ignorance at the time as to the advantages of zinc and the disadvantages of lead. There were very many mistaken ideas. I am speaking now of my practical opinion.

22,948. (*Lord Henry Bentinck.*) Seven years ago?—Seven years ago. Three years ago we actually eliminated lead; very nearly so five years ago; very largely so seven ago; and 12 years ago we commenced the change.

22,949. (*Chairman.*) What paint materials do you now use for the Bournville works?—For our white base, pure oxide of zinc; for our general reds, oxide of iron; for our greens, what is termed a leadless green. Sometimes it is barium, sometimes it is zinc, but our principal green is made from ferrocyanide of potassium and ochre, which is an earth, that is if it is not tinted ochre. When it is tinted with a chromate of lead, it is detrimental immediately.

22,950. Are there any other things?—There are various other sorts—better class materials. We even go so far as to use carmine, which no one would think of as being lead. It is quite leadless. We use a fair amount of carmine sometimes in different works. We also use a red that is made by one firm in the country to take the place of vermilion, which stands better; it is leadless. The composition of it they will not give us.

22,951. (*Lord Henry Bentinck.*) Is carmine leadless?—Yes, it is leadless. It is practically made from the American cochineal.

22,952. (*Chairman.*) You have told us that you have altogether abandoned the use of red lead?—Yes, absolutely. It is never bought in any form.

11. December 1913.]

Mr. B. J. MORLEY.

[Continued.]

22,953. By whom are these paints, which you have spoken to us about, applied?—Mostly by my own men, but occasionally by outsiders.

22,954. What do you mean by your own men?—Men employed by the firm themselves.

22,955. By Messrs. Cadbury?—By Messrs. Cadbury Brothers.

22,956. They are applied by those men?—The paints are applied by the men that we employ.

22,957. Do you buy your paints ready mixed?—No.

22,958. How do you get them?—We buy all of them in the paste—every one of them—ground in oil or turps, as the case may require. Our oxide of zinc is bought ground in pure linseed oil.

22,959. Do you specify any particular standard for the zinc oxide you use?—Yes. My specification is 99 per cent. oxide of zinc without a trace of lead, but we have to make a little bit of an allowance, as we cannot get it all quite 99 per cent., but so long as it is free from lead, cadmium or barium and there is 98 per cent. of pure oxide of zinc we accept it.

22,960. Do you mean lead, cadmium and barium, or lead, cadmium and bismuth?—It is lead, cadmium and barium. Those are the three things so seriously affected by sulphur.

22,961. Do you also specify a standard of purity for iron oxide?—97 per cent. ferric oxide.

22,962. Are you entirely satisfied with the results obtained with leadless paints?—Yes.

22,963. Does that apply to all the paint work under your supervision?—Yes, all of it.

22,964. Can you give me a description of the kinds of painting that are under your supervision?—Yes, we have good office-work where we are now, and greenhouse work and factory work in general, both exterior and interior, comprising iron work, steel work and wood work. There are also our motor vans, locomotives and other incidental things that come into a very large works. They are all done under my supervision, and all done according to the specifications which I lay out.

22,965. Do you still buy any lead?—Yes, we buy about 5 cwt. of lead a year, which is used by our pipe fitters, much against my will.

22,966. Why must the pipe fitters have lead?—I am afraid that we have to deal with people who will not study their own interests. The firm have issued orders that they are to do without it if possible. I introduced sulphate of barium for their work, but they would not take to it.

22,967. But none of the lead is used for painting?—No; it is only used for flange work, by pipe fitters, and engine fitters.

22,968. Are you quite sure that all the actual painting work under your supervision is done entirely without lead?—I could not say but what there may be a trace, say 3 per cent. in it, because we cannot always guarantee, though we analyse things, that makers do not supply a little lead in oils or driers, which we do not expect to get, and which makers will eliminate in time. It is possible there may be 3 per cent., not more than that, creeping into it in some cases.

22,969. You said just now that the paints are mixed under your supervision?—Yes, but we cannot say that the driers do not contain a little lead, though they are specified to be pure.

22,970. Do you analyse the driers?—Yes.

22,971. Do you take a sample?—Yes, and we reject the sample if it shows much trace of lead.

22,972. What is the maximum amount of lead you would accept?—I should reject it if there was a trace really in any of it; but, in dealing with large quantities, a cask may come in, and we cannot analyse every cask. We might analyse one cask out of three, and be satisfied with the consignment, but I would not bind myself to say that the others did not contain a slight amount.

22,973. Do you tell the Committee that there is never more than 3 per cent.?—Yes. There is never more than 3 per cent., and it is not our intention to have even 3 per cent.

22,974. Do you find that the use of leadless paint materials is more costly?—No, except in very exceptional cases. I do not think that it is more costly in general.

22,975. But do not you know the quantities positively?—I can say positively that for general work it has not proved more costly to us. I have not been able to detect any difference in it.

22,976. No difference one way or the other?—No.

22,977. It is not cheaper?—I could not say positively whether it was either cheaper or dearer, because I have not been able to trace any difference in the cost of the work. It has not shown itself.

22,978. As to its durability, can you give us examples of exterior painting which has stood for a number of years; first, with the zinc-oxide paint?—Yes, both on the buildings and vehicles. There are buildings in our grounds that have been standing for seven years, and one that has been standing for 11; but with regard to the one which has been up for 11 years I would not be quite positive about its being absolutely free from lead. That was done when we were evolving this method. But with regard to seven years ago I can speak positively of two buildings that are painted absolutely without lead—absolutely.

22,979. What size of buildings were they?—Very large ones. The two that I am particularly speaking of now might be 600 feet long and 40 feet wide. All the windows and sills are done with oxide of zinc and ochre. There is simply a white and a cream colour on them. Doors—oxide of iron.

22,980. Did you paint the wood and iron with zinc paint?—Not all the wood and iron. Some of the iron has been. The whole of my colour work is done with oxide of zinc and ochre.

22,981. With regard to these two buildings which you have described to us, did you paint the wood and iron in those two buildings?—Yes, wood and iron. I could give you other instances as well. There are many about the place.

22,982. Were they new buildings?—No.

22,983. Repainted?—Yes, they were repainted. That was one disadvantage to us, because we were painting on the top of lead.

22,984. Why was it a disadvantage to you?—Because there was still a certain amount of lead left underneath.

22,985. But in what sense is that a disadvantage?—It attacks the zinc, and also because lead has a tendency to powder when it is exposed to the air, especially if there are any sulphurous fumes about, and if it has begun to deteriorate before the zinc is applied it will attack it more quickly.

22,986. Have you any instance where you have painted entirely new buildings with zinc?—Yes, two or three blocks of buildings.

22,987. How many years ago?—They are more recent. One of them is three years ago, another probably five years ago. I could tell by my books at home the date when they were painted, but not from memory.

22,988. How does the zinc paint on new buildings compare with zinc paint on old buildings with a base of lead?—My experience is that oxide of zinc paints wear better than hydro-carbonate of lead. They keep the colour better. They want more judgment in mixing, but I have never known a case of flaking or powdering from oxide of zinc when mixed with good material. When they are mixed with common rubbish it is different, and I will not say about that.

22,989. Will you give us further instances?—There is an experiment that I would like to call your attention to. In October 1910 I had a greenhouse put up, with a division in the middle of it, so that really there are two houses, and both houses are at the same temperature, and under the same conditions. I had one house painted with lead, and the other house painted with oxide of zinc. In October 1911, I examined these two houses again, and I found that the one painted with lead had discoloured seriously, and the paint had commenced to decompose very badly. What was happening was that the paint was turning quite pink.

11 December 1913.]

Mr. B. J. MOSELEY.

[Continued.]

Probably it may have been from a fungus of some description or from some sulphur given off from disinfectants. I would not say, but there it is. The zinc had remained perfectly white. In November of the present year I inspected these places again, and the lead paint is again turning quite black. That is quite a preliminary examination with regard to that. The zinc paint is still holding a pure white. This is my test book with many of the tests in. (*The witness produced a book.*)

22,990. When was that greenhouse painted?—That was painted in October of 1910. That is three years last October. The inside of a greenhouse is a good test.

22,991. Is the zinc paint not only white out thoroughly established?—Yes. It has not begun to powder, but the lead paint has begun to powder up into a small black powder.

22,992. (*Mr. Rice.*) Do you mean the inside or outside?—The inside. It is a big test inside a greenhouse. The outsides of the greenhouses were painted with oxide of zinc. The comparative test inside the greenhouses is important, I take it, on account of something published in "The Gardener" in respect of some of the houses at Kew Gardens.

(*Mr. Sutherland.*) Mr. Patterson mentioned those.

22,993. (*Chairman.*) Have you any other instances to give us?—There are a lot I could not enumerate. I might say that the whole of the factory now is painted with either oxide of iron or oxide of zinc or leadless green.

22,994. How often do you paint the different parts of your factory?—I have one place which I am going to re-paint now, which has gone eleven years since it was done, and another over ten. I might say in passing that a local place under the same conditions as the one that has been painted eleven years (our baths) has only been done 2½ years, and wants doing worse than the other. That may be from various causes.

22,995. What paint was that?—I cannot say whether it was painted with more than 75 per cent. of oxide of zinc in this particular case, because it was during the time that we were evolving the Scheme.

22,996. (*Mr. Sutherland.*) Has that gone bad?—No, it has not, and it is 11 years since it was done. One painted with lead within a stone's throw, belonging to the city of Birmingham, has been done 2½ years with lead, and it is time it was done again. The conditions are the same, as I have said.

22,997. (*Chairman.*) When do you generally begin to re-paint a building?—We do not very often re-paint more than once in seven years. We do not find it necessary, and I may say that we are finding it less necessary. This refers to outsides only. Insides are painted in advance of Factory Acts for comfort of workers and also absolute purity of manufacture.

22,998. Do you tell the Committee that you find that when you paint any building with zinc paint it wears as well as in the old days when lead paints were used?—I can say, better. There are reasons for that. I believe that I can safely say that it stands better.

22,999. Have you found that leadless paints stand equally as well as lead paints for interior painting?—That can be answered without hesitation. I have made the test, and I find that it is infinitely better.

23,000. Now what about priming?—We use zinc priming sometimes, not always. Sometimes I use for special occasions a preparation called "Duresco" or "Walpamur." There are two sorts, which are absolutely leadless.

23,001. Do I understand you to tell the Committee that in your opinion priming can be done without lead?—Yes.

23,002. (*Sir Godfrey Baring.*) Is there any work at your factory which has been done with zinc paint and which has given you any special trouble or anxiety?—No, I have not found any difficulty at all.

23,003. Under no conditions has there been any special difficulty with zinc paint?—We have found some difficulties in respect of drying, and also some difficulties in respect of getting a perfect flattening, but I am thankful to say I have overcome those difficulties.

23,004. At the present time you have no special difficulties owing to the adoption of zinc paint?—Where my difficulty is is to get the men to understand that they should do it in their own interests.

23,005. Have you used zinc paint so much that they are growing accustomed to it?—Yes, my men are, but the strange men from outside are a difficulty.

23,006. (*Dr. Collis.*) Had you in your earlier years any experience of the effect of lead upon the health of people applying lead paint?—Yes.

23,007. What was your experience then when you yourself worked with lead paint?—It has never affected me. One reason that has helped me a good deal, I believe, is that I am a teetotaler. A man who drinks should never use lead—neither a plumber nor a painter.

23,008. Have you known others affected in their health?—I have seen several affected. I have seen them lose the use of their hands. The back would be turned the opposite way to what mine is now, and the fingers would be turned up *this way* (*describing*).

23,009. Do you mean men working under your direction or your colleagues?—They have worked under my direction. They change about. They have worked for us sometimes. They are men I have met working with me, and they go at different times.

23,010. Did you during the earlier part of your time with Cadbury Brothers see men affected in that way?—No, fortunately not there.

23,011. Did you ever hear any of the men before the change was made to zinc complain in any way of their health?—No.

23,012. Not at all?—No, I have heard no complaints in this particular place.

23,013. You have not heard any complaints since the change to zinc has been made?—No. The health of my men is very good; it stands very high.

23,014. So that the change at Cadburys' from the use of lead paints to the use of zinc paints has not been associated with any alteration in the health of the men?—No, I cannot say that it has. I could not say that it has made a difference in that respect.

23,015. They were quite well before?—As soon as I took the business over I began to change to zinc. It was 1902 when I took the business over.

23,016. You began to change immediately?—Yes.

23,017. Were there any on the staff of workmen who had any sign or symptom; to your knowledge, of the effect of lead?—No, I did not see any in those left behind that showed signs of it. Once there was a doubt about one man. We had a doctor on the ground, but the doctor could not say definitely what was the matter with the man, but he showed symptoms at the top of his finger nails. That was eleven years ago. The doctor could not say it was lead but he could not say it was not.

23,018. Dr. Robb is there, is he not?—Yes, but he was not then. Dr. Richardson was our doctor then.

23,019. Does Dr. Robb see the painters at all?—Frequently.

23,020. Has he ever made any remark with regard to the condition of their health?—No, I cannot say that he has. I have heard no remark from him. I send them up with a note to be examined periodically, and he signs the note and sends it back to me, and I know it is all right. If it was not all right he would make some remark.

23,021. You say that the men are examined periodically. How often are they examined?—About every 12 months.

23,022. All the painters are examined about every twelve months?—Yes. If we get a lot of inside work, they are examined more frequently.

23,023. Do you know whether they were so examined in the old days, ten years ago, when lead was being used?—No, they were not.

23,024. So that we could not get any words to compare the doctor's remarks then and now?—No. It is only ten years ago since the firm instituted the medical staff, so one could not make comparisons in that respect.

23,025. (*Mr. Sutherland.*) If a workman is off for a day has he to explain why he is away?—Yes.

11 December 1913.]

Mr. B. J. MORLEY.

[Continued.]

23,026. And when he is sick, has he to submit himself to the doctor?—Not necessarily to our doctor now. Since the Insurance Act has come into force he can attend his own private doctor. We have no control over him in that way, but he has to submit himself to our medical man before he can resume work, and if he is taken ill on the ground he has to submit himself to our medical man before he can leave the ground.

23,027. If he is seriously ill?—It does not matter whether it is serious or not. If he wanted to go home, I should say, "Take this note to the doctor and see him first," and he would have to report himself to the doctor before he came back to work, unless it was only two or three days, when he could come to work, and report himself to the doctor afterwards. He has to report himself if he is only away half a day, and the doctor examines him.

23,028. Has he to explain his absence?—Yes, he has to explain his absence to me and to the doctor, and I keep a record of his explanation.

23,029. What do you use for your thinners with the zinc oxide?—Raw linseed oil (Baltic), American turps, and boiled oil. I have a little sample in my pocket of what I am having analysed. That is a pale boiled oil which is guaranteed absolutely leadless. (*The witness produced a sample.*) I shall have that analysed before I accept the next consignment. I do not go very far away for varnishes to mix with it. I use the ordinary varnishes we use on our general work outside.

23,030. You use varnish on it?—Yes, I use to about 56 lbs. of oxide of zinc, according to the work, anything from a pint to a quart of oak varnish.

23,031. (*Lord Henry Bentinck.*) For outside work, you say?—Yes, for outside work and inside—and liquid driers. Linoleate of manganese driers I like best.

23,032. (*Mr. Sutherland.*) Is there no lead in that?—No, it is manganese only—manganese and raw oil and turps.

23,033. Do you say that you get all your greens from a zinc base?—Not all of them. Some we get from ferrocyanide of potassium and ochre which is leadless.

23,034. Do you use lead green?—No.

23,035. Are the zinc paints more expensive?—Yes, all zincs are more expensive, but we must bear in mind, that the specific gravity of lead is about 11.35, and that of zinc is 6.4; consequently zinc will cover a considerably larger area than lead will.

23,036. Are you speaking of white or of colours?—I do not mind which it is. They are all the same in that respect. The metallic zinc and lead are somewhat different in specific gravity to the salts.

23,037. The body of the green that you would get would be an inert material. It would not be pure zinc?—We sometimes get them in bariun. They are not pure zinc, but they are not lead.

23,038. No?—I get a chromate of zinc for the yellow matter. That is a good yellow.

23,039. That is dearer, is it not?—But it is very much lighter.

23,040. Lighter in weight?—Yes, that is where it comes in, though zinc is very much dearer than lead.

23,041. It has not the staining power has it?—I rather doubt that assertion.

23,042. We have had that evidence from disinterested witnesses before the Committee?—I would certainly take my personal experience myself.

23,043. It is very much lighter to begin with?—Stainers generally are more satisfactory when used with zinc than with lead, zinc having no destructive action. They are very much more beneficial.

23,044. Do they stain zinc better than lead?—Lead has a detrimental effect on many of the stainers. I should not attempt to stain lead with zinc.

23,045. What experiment did you make in your greenhouse? What was it primed with?—It was one that had been moved from one part of our ground to another, and I had to take it as it was.

23,046. It was an old painted one?—Yes.

23,047. And it probably had lead underneath it?—Yes, I should say so. There is no doubt about that, in fact.

23,048. (*Mr. Rice.*) I am not clear as to what buildings you have painted with zinc entirely. Have you painted any new buildings? I rather gathered that you mentioned a building 600 feet long and 40 feet wide?—Two of them.

23,049. Was that building entirely painted with zinc?—Yes.

23,050. No lead at all?—No lead at all.

23,051. When was that painted?—Seven years ago. I did another about four years ago.

23,052. Are you keeping to zinc paint?—Yes. I mean zinc.

23,053. Entirely zinc paint?—Zinc and oxide of iron.

23,054. No lead?—No lead. One was done four years ago, an entirely new building. One, entirely new, was done about three years ago, and it was added to two years ago by an outside contractor. The specification then was pure oxide of zinc, but I could not say that it was.

23,055. (*Mr. Sutherland.*) There may be a doubt?—Yes. I was not clerk of the works on the job; therefore it was not my business.

23,056. (*Mr. Rice.*) Has the building which you propose to repaint next year, which has been painted for 10 years, ever been painted with lead?—Anything 10 years ago I could not guarantee with regard to lead.

23,057. With regard to this particular building that you are going to paint next year, is that lead or zinc?—Principally zinc.

23,058. It has been done 10 years?—Yes. The major part is zinc, but I could not guarantee that the building does not contain a little lead, because, as I say, it was in the stage of evolution, but I can speak with regard to seven years for certain buildings.

23,059. I gather that that building chiefly painted with zinc has lasted 10 years, and only wants repainting next year?—Yes.

23,060. The building altogether painted with zinc seven years ago is still in good condition, and does not require re-painting?—No, it does not.

23,061. You have spoken of the ignorance of people with regard to lead. When did you first discover the disadvantage of the use of lead?—I might say when I was working at Westminster Abbey.

23,062. That does not tell me when?—Twenty-six years ago. That was when I first discovered it. I saw a man break down with lead poisoning, and that set me thinking and thinking seriously.

23,063. And then when you became foreman at Cadbury's you put into practice the result of your investigations?—Yes, before then, but I did not stay where I was to see the results. When I was in Northampton, with a gentleman who has retired now, we used to use a considerable amount of zinc. The man, who was foreman of our shop when I was an apprentice, was a very great lover of zinc.

23,064. With regard to the examination of painters by the medical men at the works, he is not there for the examination of painters only, I take it, but he is there for all the staff?—Yes, it applies to everyone.

23,065. The experiment with the greenhouse we have heard about was one half lead and one half oxide of zinc. Can you tell us the comparative cost?—As I say, I could not detect any difference. The initial cost per hundredweight is considerably greater with zinc than lead, but zinc does spread so much further. It covers a greater area.

23,066. What do you say with regard to the application of zinc?—I am inclined to think that zinc is applied rather more easily than lead; I rather think so. It is my experience that it is lighter in the brush.

23,067. And therefore cheaper?—Slightly cheaper, but it would not do to say it was cheaper, because there is such a little difference.

23,068. (*Mr. Sutherland.*) You have no records?—No. I have tried to determine between the two, but I could not determine any difference between the two in labour or material. It is so slight.

23,069. That is your opinion?—I estimate for every bit of work, and if it had been much dearer I should have known. I do not just go and see a job and think

11 December 1913.]

Mr. B. J. MORLEY.

[Continued.]

I can have it as I like. Everything is regarded from the point of view of cost.

23,070. Is the cost recorded afterwards?—Yes.

23,071. (*Mr. Parsonage.*) You mentioned doing work with Walpamur or Duresco. What special reason have you for using that on woodwork?—If I had timber full of resin, I should use it to try to keep the resin where it was. That is one reason. If I had timber that was a hurried job, and wanted quickly, and could not give the priming a thorough time to harden, I should use Walpamur, and petrifying liquid. If anything else is required, which occasionally is the case, it would be boiled oil. It is only in special cases, and particularly when we have to hurry a thing, and when there is an excess of resin in the timber. It is a very good cure for keeping the resinous veins from pushing through.

23,072. The oil and turps you use in your works would be generally purer than those ordinarily used by outside contractors?—I would not like to say all contractors, because there are some very good men, and very honest men, in the trade. There are some that will use anything. I could give you an instance from a specification here. Our standard is very high. It has to pass the analyst as well as me. It passes me first, and then it passes the analyst, so you can tell it is fairly high.

23,073. I have heard complaints from men using leadless paint that it makes them ill, and they put it down to substitutes for turpentine, and the cheap thinners that are used?—May I give you an instance of what has occurred in my experience with regard to that? I specified a job at our milk factory in Shropshire. The specifications are here. Everything was specified leadless, the greens leadless and oxide of zinc and oxide of iron. I went down to that work as clerk of the works. (I superintended the job for the firm. It was done by a firm in Newport, Shropshire.) Immediately I picked up or looked at the material I knew it was not to specification. I may tell you that the first thing was the so-called turps which were what the painter will call "blue Billy." That is a petroleum mixture. One sample was good and that was the linseed oil. That was good. The zinc was not zinc at all. The brown was full of lead. The analyst's description of it after he had sampled it was, "It was not paint; it is muck." They were his words, and I had to condemn the whole lot, of course. Those things have a very detrimental effect upon a man's hands. They are liable to cause paralysis if he washes his hands in them.

23,074. Even if he is not using lead?—Yes. An excess of that sort of thing when washing your hands is liable to cause paralysis; at least so our medical man told me.

23,075. (*Chairman.*) You have supported that by an authority?—It is the medical man that told me so.

23,076. (*Mr. Gardner.*) Do you do the dwelling house work on the estate?—No. Only 18 houses come under me; the rest do not. The 18 are done on the same lines as our other work.

23,077. Outside work?—Outside and inside.

23,078. The outside work has always stood perfectly well?—Yes. The outsides of my few cottages are painted regularly every six years.

23,079. More than six years ago they were painted with white lead?—Yes, before six years ago they were painted with white lead. That was before my time.

23,080. Have you painted any houses that have stood six years with zinc?—There are six of them now—just under six years.

23,081. They have been painted with zinc and stood six years before repainting?—Yes.

23,082. What do you first coat steel and ironwork with? Do you do it with zinc?—No.

23,083. Always oxide?—Oxide of iron. If it was not previously painted, then I should coat it with oxide of iron first, if it was outdoors, not indoors. For outside steel and ironwork I should first coat with oxide of iron unless it was galvanised.

23,084. Are you of opinion that for outside work zinc would be of no use for the first coating on steel and iron?—I do not think that it is suitable for steel and iron. I do not think that oxide of zinc is really a good paint for the first coat for that.

23,085. You told us that all your colours are leadless, even the permanent reds you get?—Yes.

23,086. The manufacturer will not tell you what it is composed of?—No, but we can tell it is not lead. We have an analyst.

23,087. Are you certain that it is not stained on a base of orange lead?—Yes. We should not have it if there was lead in it at all.

23,088. You are sure that it is not a stain on orange lead?—Yes.

23,089. (*Mr. Sutherland.*) Do you have your colours analysed to see that they are leadless?—I analyse them myself, and then send them on to our analyst.

23,090. Always?—Yes, but not every consignment. We may get three casks in, and analyse two out of the three. I would not say that absolutely every one is analysed in a consignment, but every sample is analysed.

23,091. (*Lord Henry Bentinck.*) Do you always use varnish in your outside paints?—Yes, with zinc paints always.

23,092. Why do you use it?—To harden it and help it to dry.

23,093. Does it give it any lasting quality?—Yes, there is no doubt, I think, that a drop of varnish gives it a longer life. It hardens the surface, and at the same time it will allow it to be elastic, which is a great feature.

23,094. Does the addition of the varnish add very much to the cost?—No, I do not think so, for the simple reason that if you put a drop of varnish in, it does away with some of the drier. In the summer time I have had work done as a matter of fact absolutely without driers, and only used the varnish without driers. We have twenty and one things to consider.

23,095. (*Chairman.*) The zinc paint plus the varnish would cost no more than the ordinary lead paint?—More per hundredweight, but not more per yard. I do not think that it costs any more per yard. I have not been able to trace it at any rate.

The witness withdrew.

# INDEX.

## PART I.—House Painting and General References.

[For Evidence dealing specifically with Coach-Painting, see PART II.]

- ANDERSON, JOHN** (of the London Association of Master Decorators):  
 Evidence, 19,461-893.  
 Compensation for suspension: very difficult, 19,609-10.  
 Dry rubbing-down:—  
 Amount of dust created, 19,641-57.  
 Could be dispensed with, 19,713-9.  
 Time occupied at, 19,665-6.  
 Dust: exhaust possible but difficult to apply, 19,562-97, 19,790-5.  
 Education of painters: would obviate danger of paint on hands, etc., 19,761-74, 19,847-52.  
 Insurance rates: recent increase due to lead poisoning, 19,887-93.  
 Lead poisoning:  
 Cases decreasing, 19,625-7, 19,634-40.  
 Cases known of, 19,467-87.  
 Cases occur in best works, 19,862-7.  
 Education of painters in cleanliness would reduce evil, 19,623-4, 19,628-30, 19,658-64, 19,761-74.  
 Fewer cases in Scotland due to better training of painters, 19,704-12.  
 More prevalent among untrained men, 19,843-6.  
 Not a serious evil so far as his experience goes, 19,485-516, 19,619-22.  
 Reliable statistics could be obtained as result of Insurance Act, 19,692-5.  
 Some action necessary to diminish evil, 19,517-25.  
 Meals: accommodation away from paint and dust difficult in some cases, 19,536-41.  
 Outdoor clothing: storage away from paint and dust difficult, 19,547.  
 Overalls:  
 No hardship for men to provide, 19,731-3.  
 Provision and washing by employer difficult, 19,531-5, 19,725-8.  
 Storage away from paint and dust difficult, 19,542-6.  
 Painters: conditions and system of employment, meal times, etc., 19,811-37, 19,868-78.  
 Paints: some dark colours contain no lead, 19,879-86.  
 Periodical medical examination:  
 Costly and difficult to get men together, 19,796-8.  
 Workers showing signs of lead absorption could be transferred to non-lead work, 19,679-82.  
 Would agree to, 19,604-8.  
 Prohibition of lead:  
 All employers affected equally by, 19,678.  
 Desirable if only means of safeguarding health, 19,530.  
 Difficulty in carrying out, 19,671-3, 19,780-5.  
 Possible effect on public, 19,526-3, 19,675-7, 19,775.  
 Preferred to regulations in his own interests, 19,674.  
 Would make trade dependent on proprietary paints, 19,753-4.  
 Regulations:  
 Difficult to enforce, 19,632-3, 19,696-9, 19,720-4.  
 Evasion by certain employers would handicap others, 19,616-8, 19,631.  
 Facilities for washing, mess-rooms and cloak-rooms should be given by customers, 19,734-51.  
 Not so important as education of painters, 19,729-30.  
 Preferred to prohibition in interest of his clients, 19,611-5, 19,800-10.  
 Would be costly, 19,776-9.  
 Removal of old paint: solvents could be used to avoid fumes in burning off, 19,598-603.  
 Rubbing-down: proportion of work rubbed-down 19,786-9.
- ANDERSON, JOHN**—continued.  
 Washing:  
 Accommodation should be provided, 19,548-50.  
 Handkerchief used for wiping hands, 19,551-3.  
 Hot water not essential to remove paint, 19,554-60.  
 Provision of nailbrushes, soap, towels, etc., difficult, 19,561.  
 Time should be allowed, 19,837-42.  
 Washleathers, which are used for washing paint, used as towels, 19,858-61.  
 White lead: no efficient substitute for outside, 19,703.  
 Zinc paints: could replace lead for inside but not for outside, 19,701-2.
- ANDERSON, R. L.** (of the Association of Master House Painters in Scotland):  
 Evidence, 11,305-451A.  
 Compensation for suspension: would not agree to, 11,352.  
 Dry rubbing-down.  
 Amount of, 11,428-31.  
 No way of removing dust, 11,346.  
 Dust: not enough to be dangerous, 11,344-5.  
 Emanations: opening windows suggested for removal 11,347-50.  
 Foreign legislation: aware of legislation abroad, 11,324.  
 Leadless paints: very little experience of, 11,416-7.  
 Lead poisoning:  
 Does not think either stringent regulations or prohibition necessary to prevent, 11,355-61.  
 No cases known of, 11,309-14.  
 Realises extent of evil, 11,315-23.  
 Regrettable that this country should be behind others in legislation regarding, 11,325.  
 Meals:  
 Accommodation away from paint and dust impracticable in some cases, 11,340.  
 Danger of contaminating food by unwashed overalls not great, 11,382-91.  
 Outdoor clothing: storage away from paint and dust difficult in some cases, 11,342.  
 Overalls:  
 Provided and washed by men, 11,331-6.  
 Provision and washing by employer difficult, 11,337-9.  
 Storage away from paint and dust difficult in some cases, 11,341.  
 Painters:  
 Ages of, 11,401-15.  
 Sickness among, 11,392-400.  
 Periodical medical examination: unwilling to bear expense of, 11,351.  
 Prohibition of lead:  
 Preferred to regulations, 11,449-50.  
 Would reduce range of colours, 11,440-4.  
 Regulations:  
 As to washing hands and clean overall sufficient to mitigate evil, 11,363-81.  
 Impossible to observe, 11,354-5.  
 Necessary in England but not in Scotland, 11,445-8.  
 Washing: accommodation impossible to provide in some cases, 11,343.  
 White lead: best paint pigment, 11,418-27, 11,433-9.
- Antimony Paints.** (See evidence of *T. R. Atkins*: Part II. of Index.)
- ARMSTRONG, PROFESSOR HENRY EDWARD,** F.R.S. (Professor of Chemistry at the City and Guilds of London Central Institute):  
 Evidence, 15,934-16,169, 22,108-180.

- ARMSTRONG, PROFESSOR HENRY EDWARD, F.R.S.—continued.**  
 Dust: principal danger, 22,175-6.  
 Emanations:  
 French experiments criticised and duplicated, 22,108-12, 22,151-8.  
 Hygienic effect of, 22,150, 22,159-65, 22,173.  
 Rate of evaporation:  
 Different for turpentine, oil, and mixtures with zinc and lead, 15,956-63, 16,901-35, 16,057-66, 16,091-8, 16,108-31.  
 Of turpentine, 16,067-72, 16,081-9, 16,144-5.  
 Quicker with white lead and oil than with zinc and oil, 15,953-4.  
 Smell of lead paint due to oxidation of oil, 15,981-9.  
 Trillat's test unreliable, 16,036-55, 22,134-9.  
 Turpentine vapour:  
 Cause of illness from drying paint, 15,949-51, 15,966.  
 Danger depends on rate at which given off, 16,159-64.  
 Danger transitory and can be got rid of by opening windows, 15,990-9, 16,073-80, 16,134-41, 22,177-80.  
 Effect on blood, 16,152-6.  
 Volatile lead compounds not given off from drying lead paints, 15,935-48, 16,102-7.  
 Turpentine: substitutes have probably same ill-effects, 16,142-4.
- BALY, PROFESSOR E. O. C., F.R.S. (Professor of Chemistry in the University of Liverpool):**  
 Evidence, 1666-763, 16,998-7063.  
 Emanations:  
 Possibility of evolution at ordinary temperatures, 1707-9.  
 Possibility of large proportion of oil increasing rate at which given off, 1725-47.  
 Possibility of volatile compounds from burning off containing lead, 1710-2.  
 Possibility of volatile compounds from white lead paste containing lead, 1695-701.  
 Temperature at which experiments made, 1713-9.  
 Unsaturated aldehydes cause of illness from drying lead paint, 17,010-63.  
 Volatile compounds, other than linseed oil, given off from white lead paste, but not from zinc white or purex (spectroscopic test), 1666-94, 16,998-7001.  
 Volatile lead compounds not given off from drying white lead, 17,002-9.  
 Very poisonous, 1702.  
 Leadless paints: use of, in Liverpool University, 1751-6.  
 Lead poisoning: contracted from emanation experiments, 1677, 1703-6, 1748-50.
- BANOROFF, JOHN (London Organiser of the National Amalgamated Society of Operative House and Ship Painters and Decorators):**  
 Evidence, 4051-172.  
 Dry rubbing-down:  
 Amount of, 4144-65.  
 Amount of dust caused, 4063-4, 4132-41.  
 Exhaust fans impracticable, 4066.  
 Indispensable in some cases, 4067-72.  
 Moistening sandpaper not known of, 4170-2.  
 Principal danger, 4065.  
 Dust and spray:  
 Stippling causes spray, 4075-6.  
 Ventilation would reduce spray in stippling, 4077.  
 Lead poisoning: statistics of trade societies, 4053-9.  
 Meals: accommodation away from paint and dust could generally be provided, 4101-2.  
 Mixing: danger from fumes, not dust, 4060-2.  
 Overalls: generally worn and washed weekly, 4103-6.  
 Painting:  
 Present-day methods tend to increase danger, 4110-31.  
 Spraying machines very dangerous, 4079.  
 Periodical medical examination: practicable, 4107.  
 Prohibition: only solution, 4073.  
 Removal of old paint:  
 Danger from dust after burning off, 4084-5.  
 Scraping causes dust, 4086.  
 Ventilation would reduce danger from fumes, 4080-3, 4087-94, 4142-3.
- BANOROFF, JOHN—continued.**  
 Washing:  
 Accommodation important, 4098.  
 Hot water necessary, but not always obtainable, 4099-100, 4106-7.
- BARKER, JOHN WILLIAM (of the National Association of Master House Painters and Decorators):**  
 Evidence, 6879-7103.  
 Compensation for suspension: would not agree to, 7002-6.  
 Dry rubbing-down:  
 Amount of dust created, 6961-2.  
 Exhaust fans impracticable, 6963.  
 Indispensable in some cases, 6957-60.  
 Moistening sandpaper suggested to avoid dust, 7058-60.  
 Respirators practicable, 6979-7016.  
 Dust and spray: respirators suggested for avoiding splashing in painting ceilings and stippling, 6964-74, 6979.  
 Foreign regulations: aware of legislation abroad, 6929-31.  
 Hours of employment: would not agree to limitation of, because of casual nature of trade, 6993-5.  
 Insurance rates: have recently increased, 6888-91 7024-8.  
 Leadless paints:  
 Experience with, 7065-72.  
 Government should make tests and recommend substitute before prohibiting lead, 7083-7.  
 None as good as white lead, 7080-2.  
 Office of works test of four years not sufficient trial, 6987-92.  
 Only way of removing danger, 6982-4.  
 Lead poisoning:  
 Cases may have escaped employers' knowledge before Workmen's Compensation Act came into force, 7039-51.  
 Particulars of cases known, 6883-7, 6891-6.  
 Regrettable that this country should be behind others in legislation regarding, 6931.  
 Surprised and unaware of official figures showing extent of evil, 6921-3, 7061-4.  
 Master House Painters Association:  
 Have made tests to discover substitute by painting boards with different pigments, 6909-12.  
 Have taken no steps to discover extent of lead poisoning, 6897-908.  
 Unaware of and surprised at official figures showing extent of evil, 6913-23, 7075.  
 Will take up the question of lead poisoning, 7077-9.  
 Would not take exception to prohibition of lead, 7103.  
 Meals: accommodation away from paint and dust impossible in some cases, 6954-6.  
 Outdoor clothing: kept in room where paint is being used, 6950-3, 7094.  
 Overalls:  
 Provided by men, 7009.  
 Should be cleaned weekly, 6999.  
 Should be worn, 6938.  
 Stored in room where paint is being used, 6940-9.  
 Periodical medical examination: would agree to, 6996-7001.  
 Prohibition of lead:  
 Master House Painters Association would not take exception to, 7103.  
 Preferred to regulations, 7019-21, 7097-9.  
 Would not damage employers' interests, 7022-3.  
 Regulations:  
 Cost much greater than change to leadless paints, 7100-1.  
 Impossible to carry out, 7017-8.  
 Removal of old paint:  
 Can suggest nothing to remove fumes in burning off, 6975-6.  
 Solvents should be used, 7095.  
 Washing:  
 Accommodation essential, 6932-3.  
 Hot water better than cold, 6935.  
 Not always obtainable, 6936-7, 7092-3.  
 White lead: best paint for priming, 7089-91.  
 Zinc paints: None so satisfactory as lead, 7031-8.

- BENNETT, COLONEL R.** (of the Association of Master House Painters in Scotland):  
 Evidence, 11,190-304.  
 Compensation for suspension: Expense would fall on public, 11,254-6.  
 Dry rubbing-down: dust less in Scotland, as flat paints almost unknown, 11,294-9.  
 Dust: no way of removing, 11,237-44, 11,266-9.  
 Emanations: no way of removing, 11,246-50.  
 Foreign legislation: aware of legislation abroad, 11,208-9.  
 Lead poisoning:  
 No cases known of, 11,194-8, 11,270.  
 Regrettable that this country should be behind others in legislation regarding, 11,210.  
 Surprised and unaware of extent of evil, 11,199-207.  
 Meals: accommodation away from paint and dust impossible in some cases, 11,228.  
 Outdoor clothing: storage away from paint and dust impossible in some cases, 11,230.  
 Overalls:  
 Provision and washing by employer objected to, 11,226-7.  
 Storage away from paint and dust impossible in some cases, 11,229.  
 Periodical Medical Examination:  
 Expensive, 11,252-3.  
 Thinks men would object, 11,251.  
 Prohibition:  
 Effect on public, 11,303-4.  
 Effect on trade, 11,263.  
 Regulations:  
 Difficult and expensive to observe, but possible, 11,257-61.  
 Necessary in England but not in Scotland, 11,221-5.  
 Preferred to prohibition, 11,260, 11,271-5.  
 Thinks public would prefer, even if more expensive, to prohibition, 11,277-92, 11,300-1.  
 Removal of old paint: solvents could replace burning off, 11,245.  
 Washing:  
 Accommodation already provided, 11,231-3.  
 Hot water not always practicable, 11,234.  
 Towels, soap, nailbrushes, &c., could be provided, 11,235-6.  
 Zinc paints: trials unsatisfactory, 11,212-26.
- BETTINK, PROFESSOR WEFERS** (Investigator for Dutch Government):  
 Evidence, 18,414-547.  
 Emanations: do not contain lead compounds, 18,441.  
 Foreign legislation:  
 Dutch Commissions, conclusions and criticism of, 18,415-30, 18,468-73, 18,486-91, 18,504-13, 18,544-7.  
 Dutch Commissions tests, 18,435-7.  
 Lead Poisoning:  
 Cases in Holland, 18,447-66, 18,514-6, 18,530-2.  
 Statistics: none for Amsterdam, 18,449.  
 Regulations:  
 Enforcement in Holland, 18,492-6.  
 Number of inspectors in Holland, 18,501-3.  
 Removal of old paint: burning off not dangerous, 18,442.  
 Turpentine: fumes dangerous, 18,517-21, 18,536-41.  
 White lead: in dry states should be prohibited, 18,497-8.  
 Zinc paints:  
 Cost greater than lead, 18,446.  
 Covering power less than lead, 18,433, 18,481-2.  
 Durability less than lead, 18,445.  
 Not so good as lead in sulphurous atmospheres, 18,431-2, 18,474-9.  
 Damp atmospheres, 18,484-5.  
 Satisfactory for inside work, 18,483.
- Bituminous Paints:**  
 Danger from fumes in confined spaces: *Simpson*, 21,653-7.  
 See also evidence of *Mr. William Cail*.
- BONNER, FREDERICK** (Working master house decorator):  
 Evidence, 4286-432.
- BONNER, FREDERICK—continued.**  
 Dry rubbing-down:  
 Causes dust, 4313-4.  
 Indispensable in some cases, 4308-12, 4405-9.  
 Dust and spray:  
 Dangers in paperhanging, 4332-6.  
 Difficult to safeguard against, 4367.  
 No spray caused in stippling, 4315-22, 4410-2, 4421-4.  
 Lead poisoning: cases known of, 4296-7.  
 Meals: where taken, 4343-6.  
 Mixing:  
 Danger from fumes in burning-out paint cans, 4302-7.  
 No danger as lead in paste form, 4298.  
 Overalls:  
 Danger from dust, 4351-4.  
 Washing of, 4348-50.  
 Periodical medical examination: practicable, 4355-62.  
 Prohibition:  
 Best solution, 4368.  
 Discovery of a good white pigment would follow, 4373.  
 Would agree to, 4371-2.  
 Regulations: only partial remedy, 4363-5.  
 Removal of old paint:  
 Danger from fumes in burning off, 4323-4.  
 Danger from sandpapering after burning off, 4325-8.  
 Respirators suggested, 4331, 4375-89.  
 Solvents less dangerous but more expensive, 4329-30.  
 Stopping: no dust as lead in paste form, 4299-301.  
 Washing:  
 Accommodation important, 4338.  
 Hot water important but not always obtainable, 4339-40.  
 Zinc paints:  
 Application easy, 4374.  
 Better than white lead paints, 4390-1.  
 Satisfactory for ironwork, 4413-5.  
 Satisfactory for outside work, 4394-5.  
 With 5 per cent. lead as good as lead paints, 4419-20.
- Bridge Painting.** (See evidence of *Messrs. Ellison and Hunter*.)
- BYWATERS, C. H.** (of the Granitic Paint Co., Barking):  
 Evidence, 402-477.  
 Zinc paints:  
 Applied on bare walls, 441.  
 Body same as white lead, 461-2.  
 Costs same as white lead, 415.  
 Covering capacity same as lead, 417-8.  
 Durability as good as lead, 422-3.  
 Efficient substitute for lead, 442.  
 Instances of use on interiors, 424-40, 454-6, 468-73.  
 Lead chromates for colouring purposes could be dispensed with, 408-12, 463-6.  
 Medium important, 421.  
 Retains colour better than white lead, 419.  
 Use of on exteriors, 474-7.  
 Used by Office of Works, 444-50.
- CAIL, WILLIAM** (of Cail's Bitum Co., Ltd., Newcastle-on-Tyne):  
 Evidence, 19,167-19,280.  
 Bituminous compositions:  
 Composition of, 19,200-2.  
 Contain no lead, 19,210-1.  
 Contain no turpentine, 19,212.  
 Covering power twice that of lead, 19,252-9.  
 Durability, no complaints, 19,266.  
 Fumes dangerous in confined places, 19,207-8.  
 Instances of its use, 19,242-5, 19,279-80.  
 Method of application, 19,191-9, 19,214-6.  
 Not affected by atmospheric conditions or sulphur and acid fumes, 19,231-41, 19,277.  
 Price of, 19,280-5.  
 Time taken to dry, 19,227-30.  
 Where used, 19,167-90, 19,267-76.

- CAMPBELL, HENRY ALEXANDER** (of the National Association of Master House Painters and Decorators of England and Wales):  
Evidence 3371-3636.
- Dry rubbing-down:**  
Causes very little dust, 3432-3, 3503, 3526-30.  
Exhaust fans impracticable, 3495-7.  
Impossible to get rid of all the dust, 3438-41.  
Indispensable in some cases, 3421-8.  
Of sharp colours causes more dust, 3612-5.  
Proportion of to total, one-third, 3536, 3549, 3578-85, 3588-92, 3637-8.  
Suggestion to moisten sandpaper to obviate dust, 3421, 3434, 3593-4.
- Dust and spray:** no way of removing danger in painting ceilings, stippling, etc., 3442-56.
- Foreign legislation:** aware of legislation abroad, 3390-3.
- Hours of employment:**  
Men object to short hours, 3617.  
Shorter hours more healthy for men, 3616.  
Would not agree to limitation of, 3496-7.
- Insurance rates:** recent increase due to lead poisoning, 3484-9.
- Leadless paints:**  
No prejudice against them, 3516-8.  
Not as good as lead, 3513-4.  
Office of Works test of four years not sufficient trial, 3631-3.  
Trade would welcome efficient substitute, 3558-9.
- Lead paints:** should be prohibited if efficient substitute found, 3470-4.
- Lead poisoning:**  
Cases of poisoning and sickness known of very few, 3376-82, 3561-4.  
Casual men might have lead poisoning without employer's knowledge, 3565-75; 3604-8.  
Casual men more liable to, 3597-603.  
Regrettable that this country should be behind others in legislation regarding, 3393.  
Unaware of figures showing extent of evil, 3383-9.
- Meals:**  
Accommodation away from paint and dust could be provided, 3414-8.  
Food could be kept away from overalls and brushes, etc., 3551-4.  
Food rarely brought in pockets now, 3555-7.  
Messroom generally provided on large jobs, 3550.
- Mixing:**  
Done on job, 3463.  
Done with lead in paste form, 3464.
- Overalls:**  
Should be provided, 3402.  
Storage away from paint and dust could be provided, 3404-13.  
Periodical medical examination impracticable, 3524-5.  
Prohibition: preferred to regulations, 3483.
- Regulations:**  
Could not be enforced, 3479-83.  
Would carry them out if lead retained, 3475-8.
- Removal of old paint:**  
Mask impracticable to prevent fumes in burning off, 3461-3.  
Solvent should be used, 3458-60.
- Wages:** rates paid, 3586-7.
- Washing:**  
Accommodation should be provided, 3396.  
Hot water essential, 3397.  
Practicable to provide, 3398-401.  
No difficulty in supplying accommodation, 3531-3.  
Soap, towels, nailbrushes, etc., already provided, 3504-5, 3576-7.
- Zinc paints:**  
Could not replace lead paints at present, 3623-4.  
Covering power less than lead, 3625.
- CANTRILL, WILLIAM HENRY** (of the National Association of Master House Painters and Decorators of England and Wales):  
Evidence, 3817-3965.
- Dry rubbing-down:**  
Causes dust, 3873-5.  
Exhaust fans impracticable, 3876-7.  
Indispensable in some cases, 3864-72.
- CANTRILL, WILLIAM HENRY—continued.**  
**Dry rubbing-down—continued.**  
Not dangerous, 3937.  
Reasons for, 3938-9.
- Dust and spray:**  
No splashing in stippling, but from painter who applies paint, 3885-6, 3940, 3959-65.  
No way of removing spray in painting ceilings, 3878-84.
- Foreign legislation:** aware of legislation abroad, 3835-8.
- Insurance rates:** recently increased, 3941-2.
- Leadless paints:**  
Experience with, 3898-9.  
Five years' test by H.M. Office of Works sufficient to recommend prohibition, 3943-4.  
Government should make tests before prohibiting lead, 3926-9.  
Used satisfactorily by men ignorant of composition, 3900-6.
- Lead poisoning:**  
Considers it can be contracted through the skin, 3957-8.  
Legislation regarding, overdue, 3839.  
Particulars of cases, 3947-51.  
Realises extent of, 3830-5.  
Several cases known of, 3824-6.
- Meals:** sometimes taken in rooms where painting is in progress, 3856-60.
- Mixing:**  
Done on job, 3893.  
Done with lead in paste form, 3894.
- Overalls:**  
Should be washed weekly, 3852.  
Should be worn, 3851.  
Storage of, 3853-5.
- Prohibition:**  
Exemption period, five years, 3921-5.  
Only solution, 3896-7.  
Preferred to regulations, 3914.
- Regulations:** impossible to carry out, 3861-3, 3908-13.
- Removal of old paint:**  
Danger from fumes from burning off outside very small, 3887-92, 3931-3.  
Solvents should be used for interior work, 3934.
- Washing:**  
Accommodation should be provided, 3840-1.  
Hot water:  
Essential, 3842.  
Generally obtainable, 3843-50, 3925-6.
- Zinc paints:**  
Effect of climate on, 3945-6.  
Standard should be fixed, 3915-20.
- Carbon Paints.** (See evidence of Messrs. Flatau and Milne and Mr. Ellison.)
- CARFRAE, G.** (of the Association of Master House Painters in Scotland):  
Evidence, 10,803-914.
- Compensation for suspension:** would agree to, 10,859-60.
- Dry rubbing-down:**  
Dust less in Scotland, because flat paints almost unknown, 10,823-30.  
No way of avoiding dust, 10,846-9, 10,865.  
Prohibition possible, but expensive, 10,902-4.
- Emanations:** no way of removing, 10,852-4.
- Foreign legislation:** aware of legislation abroad, 10,819-22.
- Lead poisoning:**  
No cases known of, 10,807-11, 10,882-6.  
Regrettable that this country should be behind others in legislation regarding, 10,822.  
Unaware of extent of evil, 10,812-8.  
Would be reduced by use of more oil in paints, 10,862-4, 10,887-92, 10,900-1.
- Meals:** accommodation away from paint and dust difficult in some cases, 10,836-7.
- Outdoor clothing:** storage away from paint and dust impossible, 10,840-1.

CARFRAE, G.—*continued.*

- Overalls:  
 Provision and washing by employer agreed to, 10,834-5.  
 Storage away from paint and dust could be provided, 10,838-9.  
 Periodical medical examination:  
 Practicable, 10,857, 10,876-81.  
 Would agree to, 10,855-8.  
 Prohibition: would increase cost of work, 10,911.  
 Regulations:  
 Preferred to prohibition, 10,861.  
 Would be expensive, 10,912-3.  
 Removal of old paint: no way of avoiding fumes in burning off, 10,850-1.  
 Washing:  
 Hot water better than cold, 10,843-5.  
 Not always practicable, 10,842.  
 White lead: more durable than zinc, 10,905-10.  
 Zinc paints: unsatisfactory trials, 10,866-75, 10,898-9.

## CARSON, K. K. (of the London Colour, Paint, Oil and Varnish Trades Association):

- Evidence, 11,749-945.  
 Compensation for lead poisoning: no difficulty in getting re-employment, 11,849-51.  
 Dry rubbing-down:  
 Could be dispensed with, 11,781-4.  
 Respirator practicable, 11,785-97, 11,855-79, 11,891, 11,894.  
 Serious danger, 11,780.  
 Time occupied at, 11,892-3.  
 Dust: principal danger, 11,824.  
 Lead poisoning:  
 Chiefly caused by paint on hands, 11,895-900, 11,931.  
 Cleanliness alone does not give immunity from, 11,921-5.  
 Men having several attacks should leave trade, 11,832-6, 11,852-4, 11,901-9.

## Mixing:

- Fumes do not cause lead poisoning, 11,930.  
 Should be done by paint grinders, and dry white lead prohibited, 11,752-5, 11,929.

## Overalls:

- Separate room for storage should be provided, 11,758-70.  
 Should be worn and washed weekly, 11,756-7.  
 Paint grinding: same machinery could be used for zinc as for lead, 11,847.

## Periodical medical examination:

- Difficulties in, 11,812-5, 11,823, 11,891.  
 Essential, 11,799-800, 11,848.  
 Frequency of, 11,804-11.

## Prohibition: would cause unemployment, 11,884-6.

## Regulations

- Enforcement:  
 Cost of, 11,820-2.  
 Foreman should be made responsible, 11,825-31.  
 Not very difficult, 11,802-3.  
 Number of inspectors necessary, 11,816-9.  
 Not very difficult to observe, 11,843-6.  
 Would reduce lead poisoning, 11,801.

## Removal of old paint: chipping paints off ships should be prohibited, 11,839-41, 11,940-5.

## Smoking and chewing tobacco should be prohibited, 11,798.

## Washing:

- Accommodation:  
 Essential, 11,771, 11,918-20.  
 Not always used by painters, 11,914-7.  
 Practicable, 11,936-9.  
 Cold water preferred, 11,772-5.  
 Soap, towels, and brushes essential, 11,776-7, 11,935.  
 Time should be allowed, 11,778.

## CHANCELLOR, H. G., M.P., and PENWARDEN,

S. P. (of Messrs. C. Chancellor & Co., Paint Merchants):

## Evidence, 21,359-496.

## Enamels:

- Costly if used as undercoats, 21,436-8.  
 Dry slowly, 21,439-52.

CHANCELLOR, H. G., M.P. and PENWARDEN, S. P.—*continued.*

## Leadless paints:

- Composition, mixing, medium, &c., 21,359-72.  
 Trade prejudice against new materials, 21,383.

## Prohibition:

- Difficult, 21,454-9.  
 Effect on public, 21,429-30, 21,463-5.

## Zinc oxide:

- Increase demand would probably increase price, 21,423-8.  
 Supply ample, 21,421.

## Zinc paints:

- Cheaper than lead paints, 21,374-9, 21,480-1.  
 Covering power twice as great as lead, 21,373, 21,486-8.  
 Instances of use, 21,380-418.  
 No difficulty in application, 21,474-9.  
 Suitable for sulphurous atmospheres, 21,431-4.

## CHAPPELL, J. B. (of the National Association of Master House Painters and Decorators of England and Wales):

## Evidence, 6443-662.

## Compensation for suspension: would agree to, 6571-4.

## Dry rubbing-down:

- Amount of dust caused, 6587-95, 6600-2.  
 Indispensable in some cases, 6532, 6650-3.  
 Moistening sandpaper suggested to avoid dust, 6535-8.

## No means of removing dust created, 6539-41.

## Dust and spray:

- Dangerous if inhaled, 6529-31.  
 No way of avoiding splashes in painting ceilings and stippling, 6542-7.

## Emanations: not aware that volatile lead compounds are given off from lead paint, 6599-601.

## Hours of employment:

- Number per week, 6561-2.  
 Would not agree to limitation of, 6563-5, 6578.  
 Insurance rates: have recently increased, 6449-53, 6621-5.

## Leadless paints:

- Office of Works test of four years not sufficient trial, 6556-60.  
 Only way of removing danger, 6552-3, 6588.

## Lead poisoning:

- No cases of poisoning or sickness known of, 6448, 6432, 6454-6, 6602-4.  
 Regrettable that this country should be behind others in legislation regarding, 6480-1.  
 Surprised at and unaware of figures showing extent of evil, 6472-7.

## Master House Painters Association:

- Have made tests to discover substitute by painting boards with different pigments, 6467-71.  
 Have taken no steps to discover extent of lead poisoning, 6457-64, 6620.  
 Have taken no steps to mitigate poisoning, 6465-6.

## Meals:

- Accommodation away from paint and dust could be provided, 6525-6, 6633-7.  
 Should not be taken near paint, 6522-4.

## Mixing:

- Done on job, 6550.  
 Done with lead in paste form, 6551.

## Outdoor clothing: storage away from paint and dust sometimes difficult, 6515-21.

## Overalls:

- Men should wear, 6494.  
 Should be cleansed weekly, 6501-10.  
 Storage of, 6511-4.  
 Trousers overalls not necessary, 6495-500.

## Painters:

- Follow no other occupation in slack season, 6612-3.  
 Formerly were exposed to lead poisoning, 6614.  
 Healthy class of men, 6605-11.  
 Periodical medical examination: would not agree to, 6568-70.

## Prohibition of lead: would abide by decision of Committee, 6584-5.

## Regulations:

- Certain dangers would not be removed, 6583.  
 Preferred to prohibition, 6581-2.

**CHAPPELL, J. R.—continued.**

Removal of old paint: can suggest nothing to remove fumes in burning off, 6548-9.

**Washing:**

Accommodation should be provided, 6485-6, 6627-9.

**Hot water:**

Not essential, but better than cold, 6487-9, 6493. Practicable to obtain, 6630-2.

Would allow time for washing, 6489-92.

White lead: best paint pigment for exterior work, 6586.

**Zinc paints:**

Satisfactory for inside work, 6555.

Unsatisfactory for outside work, 6555, 6639-49.

**Coal Tar Paints. (See evidence of Mr. Ellison.)****COLLIS, EDGAR LEIGH, M.B. (Member of Committee: H.M. Medical Inspector of Factories):**

Evidence, 3983-4050.

Compensation for suspension: painters excluded from Hearts of Oak Society, 4049-50.

Insurance rates: recent increase in, 4015-9, 4046-8.

**Lead poisoning:**

Effect of seasonal occupation, 4021-30, 4035.

Registrar-General's figures show:

11 per cent. excess mortality, 3989-97.

Excessive Bright's disease, phthisis, and nervous disease, 3998, 4040-5.

Median age at death eight years lower than for all males, 4002-6.

Statistics of Trade Societies: 3984-9, 4007-9, 4036-9.

Show 13-14 deaths due to lead poisoning in every 100, 3999-4001.

Show median age at death eight years lower than for all males, 4002-6.

**Compensation:****For lead poisoning:**

Claims: *Parsonage*, 2750-2.

Difficulty in re-insurance and re-employment after being compensated: *Legge*, 290-2; *Devine*, 20,494-7.

Discharge of workmen through claiming: *Walsh*, 3123-9.

No difficulty in re-employment after being compensated: *Carson*, 11,849-51.

Painters excluded from Hearts of Oak Society: *Collis*, 4049-50; *Dobie*, 11,024-7.

Payable in Holland: *Nooijen*, 15,313-8, 15,323, 15,414-30.

Payable in Switzerland: *De Morsier*, 16,651.

Some men reluctant to claim: *Parsonage*, 2753; *Devine*, 20,427-33; *Walsh*, 3116; *Smith, A.*, 21,233-5.

Unaware of any claims: *Orr*, 10,764-8.

Workers unaware of: *McKillop*, 20,960-3.

**For Suspension:**

Difficult or impracticable: *Anderson, C. J.*, 19,609-10; *Honeychurch*, 20,063.

Expense would fall on public: *Bennett*, 11,254-6.

Would agree to: *Chappell*, 6571-4; *Wiltshire*, 6770-1; *Carfrae*, 10,859-60; *Dobie*, 10,990-2; *Scott*, 12,273-6.

But for permanent painters only: *Orr*, 10,607-15.

But would get rid of delicate men: *Guest*, 11,192-3.

If law: *Puttroll*, 6336; *Wilkinson*, 19,962-3.

Would insure against: *Vaughan*, 13,692-5.

Would not agree to: *Barker*, 7002-6; *Holliday*, 8536; *Walker*, 9106-7; *Anderson, R. L.*, 11,352; *Donald*, 12,348; *Wallis*, 20,631.

**CONNELL, A. (of Messrs. Meister, Lucius and Bruning):**

Evidence, 21,890-946.

**Leadless colours:**

Cost has little effect on cost of painting, 21,930.

Cost slightly more than lead, 21,908-9.

Demand increasing, 21,914-24.

Hansa colours satisfactory for reds, yellows, and greens: 21,894-907, 21,926-9.

**COOKSON, C. (of Messrs. Cookson and Co., Ltd.**

White Lead Corrodors, Newcastle-on-Tyne):

Evidence, 2119-309.

**Dry rubbing-down:**

Moistening sandpaper with wet-felt backing suggested, 2150-7, 2201-5, 2243-5.

Respirator practicable, 2142-9, 2192-200.

Emanations: does not think they contain lead, 2238-42.

Hours of work: should be as short as possible, 2184-6.

Lead poisoning: Doubtful cases, 2166-70, 2219-29, 2274-83.

**Meals:**

Accommodation away from paint and dust difficult to provide, 2176.

Should be prohibited where lead dust is in air, 2177-9.

**Overalls:**

Should be worn, 2180.

Washing of, 2181-3.

Paint grinding: white lead in dry state preferred, 2234-7.

**Periodical medical examination:**

Government should pay for, 2248-50.

Important, 2173, 2213-6, 2259-60.

Practicable, 2210-12, 2246-7.

Would minimise danger, 2131-3, 2207-8.

**Prohibition:**

Complete, regulations only partial remedy, 2129-30, 2164-5.

Loss to white lead manufacturers involved, 2126-8.

Regulations: difficult to enforce, 2230-2.

Removal of old paint: no lead fumes given off in burning off, 2158-61, 2233-7, 2251-3.

**Washing:**

Accommodation should be provided by employer, 2265-73.

Accommodation sometimes difficult to provide, 2134-6.

Hot water desirable but not always practicable, 2187-9.

**White lead:**

Dry white lead nearly all sent to colour grinders, 2306-9.

Manufacturers should be compensated if lead prohibited, 2256.

Sulphate as soluble as carbonate, 2187.

**COYSE, COMMANDER W. H., R.N.R. (Marine Superintendent, Great Eastern Railway Company):**

Evidence, 9569-9660.

Iron oxide paints, satisfactory, 9606-8.

**Ship painting:**

Lead paints still used for iron primings, 9596-602.

Possibility of finding substitute for red lead as priming coat, 9606-22.

Prohibition of lead would not affect G. E. Railway Company, 9588-91, 9657-60.

Repainting necessary on account of mechanical damage, 9636-46, 9654-6.

**Zinc paints:**

Adopted for business, not humanitarian, reasons, 9592-5.

Better than white lead, 9577-87, 9623-9.

Retain colour better than lead, 9653.

Vehicle used, 9649-52.

Will be used exclusively in future, 9574-5, 9587, 9634-5.

**CRACE, JOHN DIBBLEE (of the Incorporated Institute of British Decorators):**

Evidence, 1880-2118.

**Dry rubbing-down:**

Causes little dust, 1944, 2020, 2060.

Not indispensable, 1945-50, 2059.

Reasons for, on new paint, 2019.

Education and training of painters, 2003-8.

Foreign legislation: unaware of legislation abroad, 1993-8.

**Hours of employment:**

Number per week, 1976.

Overtime worked, 1977.

ORACE, JOHN DIBBLEE—*continued.*

Lead poisoning :  
Fewer cases in decorative work than plain painting 2096-101.  
Incidence shown by official statistics very deplorable, 1988.  
Particulars of cases known of, 1912-20, 2065-72.  
Regrettable that this country should be behind others in legislation regarding, 1999.  
Surprised at figures showing extent of evil, 1981-7.  
Leadless paints: surprised at results of Office of Works experiments: 2026-9.

## Meals:

Generally taken away from paint, 1970-5.  
Times when taken, 1968.

## Mixing paints:

Lead used in paste form, 1937-40.  
Mostly done on job, 1934-6.  
With hands unknown, 2088-9.

## Overalls:

Provided by men, 1930-1.  
Washing of, 1932, 2062-4, 2075.

## Painters:

Apprenticeship system advocated, 2003-8.  
Health of, 2032-5.

Prohibition of lead: would be disastrous to trade, 2021-5.

Regulations: difficult to enforce, 2040-5.

Removal of old paint: solvents used, 2000-2.

## Rubbing down:

Sandpaper used between coats, 2102-3.  
Sandpaper used on old coats, 1941-3.  
Wet method can generally be used throughout, 1945-50, 2059.

Stopping: composition and application, 1952-6.

Wages, 2091-3; 2109-14.

Washing accommodation, 1921-9, 1992, 2056-8, 2036-9, 2076-87, 2104-7.

Provision of hot water, 1957, 2015-8, 2048-55, 2081-7.

Zinc paints: improvements in recent years, 2018-4.

## CROW, J. K., D.Sc. (of the London Colour, Paint, Oil, and Varnish Trades Association):

Evidence, 11,946-12,183.

Driers: small amount of lead necessary: 12,039-47, 12,178-80.

## Dry rubbing-down:

Causes very little dust, 11,994-7.  
Danger very small, 12,007-8.

## Lead colours:

Greens: amount of lead required, 12,005-16.

Reds: lead necessary to obtain bright shades, 12,024-37, 12,091-113.

## Yellows:

Pale colours could be obtained with 5 per cent. soluble lead in form of chromate, 11,955, 12,067-71, 12,084-5, 12,089-90, 12,117-9.  
Strong colours require more lead than permitted by 5 per cent. solubility limit, 12,072-82.

## Leadless colours:

Dearer than lead, 11,978, 11,982-4, 12,017-8, 12,022-3.

Zinc chromate in place of lead would reduce range of colours: 11,971-6, 11,985-93.

Paint grinding: same machinery could be used for zinc as for lead, 12,181-2.

## Restriction to 5 per cent. solubility:

Admits 20 per cent. lead chromate, 12,073.  
Preferable to absolute prohibition, 12,061-3.  
Would allow sufficient lead for driers, 12,047.

Solubility of lead compounds in dilute HCl: Lead chromate only slightly soluble, 11,998-2002, 12,019-21.

Zinc: price would rise with prohibition of lead: 12,135-6.

## Zinc Oxide Combine:

Broken Hill Mines not included, 12,142-3.  
Entire corner in zinc hardly possible, 12,133-46.

## Zinc paints:

Cost more than lead, 12,065.  
Zinc sulphide unsatisfactory for outside, 12,130-2.

7700

## CUNNEW, A. (of Messrs. Szerelmey &amp; Co., Leadless Paint Manufacturers, Rotherhithe):

Evidence, 10,181-281.

Driers: no lead used; 10,199-203.

## Leadless paints:

Cost more in package but cheaper in work, 10,226.  
Covering power as good as lead, 10,219-24.  
Durability very good, 10,228-9, 10,238-41.  
Prejudice against in building trade, 10,264-74.  
Satisfactory for outside and inside work, 10,230-7, 10,242-9.

## Paints:

Greens contain 5-7 per cent. lead, 10,187, 10,250-1, 10,253.

No lead used except for greens, 10,189-98.

Prohibition: effect of, on small leadless paint manufacturers, 10,280-1.

Restriction to 5 per cent. soluble lead—some colours require more than 5 per cent. lead, 10,205-18, 10,260-3.

## Zinc paints:

No sediment with keeping, 10,277-8.

Suitable for outside painting in manufacturing towns, 10,254-6.

## CUNYNGHAME, SIR HENRY, K.C.B. (Legal Assistant Under Secretary of State for the Home Department):

Evidence, 10,282-356.

Building, definition of, 10,306.

## Foreign legislation:

Observance of regulations slack, 10,342-4  
Summary of Austrian regulations, 10,289-91.  
Summary of Belgian regulations, 10,296.  
Summary of French law, 10,288, 10,345-7.  
Summary of German regulations, 10,292-5.

## Lead poisoning:

Combined system of regulations and prohibition suggested to prevent evil, 10,302-4  
Some action necessary to prevent evil, 10,284-6.

## Prohibition:

Easy to enforce, 10,300-1.

Effect of, on imported goods painted with lead, 10,352-6.

Exemption for special articles, 10,329.

Exemption for special cases accompanied by regulations, 10,318-27.

If white lead scheduled, power should be given to add other dangerous paints to schedule, 10,306.

Summary of difficulties, exemptions, &c., 10,306-15.  
Time should be allowed for change from lead to zinc, 10,328.

With exemptions preferred to 5 per cent. solubility limit, 10,316-7, 10,335.

Regulations: practicable, and could remedy evil, 10,297-9.

## Restriction to 5 per cent. of soluble lead:

Administrative difficulty, 10,337-41.

Difficulty of painters adhering to standard, 10,348-51.

White lead: sale should be prohibited for making of paints, 10,336.

Zinc oxide: standard of purity, 10,331-4.

## DE MORSIER, M. (Reporter to the Swiss White Lead Commission):

Evidence, 16,481-673.

Compensation for lead poisoning payable in Switzerland, 16,651.

Dry rubbing-down: not indispensable, 16,581-2.

## Foreign legislation:

French Commission's findings criticised, 16,561-9, 16,626-31.

Geneva Commission's findings criticised, 16,481-518, 16,612-6, 16,664-5, 16,672-3.

Swiss Federal Councils' Proceedings, 16,519-49.

Leadless paints: experience of, 16,608-11.

## Lead poisoning:

Decrease following regulations in Switzerland, 16,600-1.

Statistics in Switzerland, 16,550-6 16,602-3, 16,641-2.

3 A 3

DE MORSIER, M.—*continued.*

- Prohibition:  
Easier to enforce than regulations, 16,657-60.  
Should follow if an efficient substitute found, 16,668.  
Would require inspection equally with regulations, 16,636.  
Regulations: enforcement in Switzerland, 16,574-80, 16,583-97, 16,617-25.  
White lead: no efficient substitute yet found, 16,640.  
Zinc paints: more difficult to apply than lead, 16,646-9.

## DEPIERRES, GASTON (of the Indestructible Paint Co., Ltd., Limhouse, B.):

- Evidence, 18,996-19,166.  
Leadless colours:  
Dearer than lead, 19,090-1.  
Reds: improvements in, 19,083-94.  
Leadless paints:  
Lithopone: increasing use of, 19,137-8.  
Satisfactory for inside work, 19,038-45.  
Lead poisoning: doubtful cases, 19,157-60.  
Paints: should be supplied ready mixed, 19,131-3.  
Prohibition:  
Easiest solution, 19,163-6.  
Practicable, 19,007-12.  
Quality of painting would not be reduced, 19,008.  
Would not interfere with business, 19,074-5.  
Restriction to 5 per cent. soluble lead: lead chromate so insoluble as not to be affected, 19,095-104.  
White lead: bad effect of sulphur gases, 19,003-6.  
Zinc: supply sufficient if lead prohibited, 19,141-5.  
Zinc oxide:  
By direct process cheaper and better, 19,016-31.  
With 4 per cent. lead admitted by certain foreign Governments, 19,034.  
With 4 per cent. lead most suitable, 19,032-7.  
Zinc paints:  
Application: special knowledge required but no great difficulty, 19,043-50.  
Better than lead for keeping, 19,052-9.  
Cost same as lead, 19,051.  
Covering power better than lead, 19,060-1, 19,114-8.  
Efficient substitute for white lead, 19,073.  
Guarantee given, 19,054, 19,059.  
Retain colour as well as lead, 19,119-27.

## DEVINE, JOSEPH (of the National Amalgamated Society of Operative House and Ship Painters):

- Evidence, 20,334-556.  
Compensation for lead poisoning:  
Difficulty in re-engagement after receiving compensation, 20,494-7.  
Some men reluctant to claim, 20,427-35.  
Dry rubbing-down: cheaper than wet process, 20,379-80.  
Dust and spray:  
Greatest danger, 20,414.  
No way of avoiding spray in stippling unless lead prohibited, 20,362-5, 20,381, 20,415-22.  
Leadless paints:  
Practicable for outside, 20,437-9.  
With varnish durability increased for outside, 20,440-5, 20,469-86.  
Lead poisoning:  
Clean men may be affected, 20,340, 20,391-2.  
Details of cases, 20,337-51, 20,451-68, 20,502-6, 20,522-3, 20,533-5.  
Distribution of regulations and literature may tend to lessen evil, 20,498-501, 20,507-17, 20,524-9.  
Principal causes of, 20,352-61, 20,366-70.  
Meals:  
Accommodation away from paint and dust impossible in some cases, 20,395-8.  
Food sometimes contaminated by dust, 20,554-6.  
Mixing: methods of, 20,332-3, 20,540-3.  
Periodical medical examination: not favoured, 20,423-6.  
Prohibition: only remedy, 20,436.  
Regulations: will not remove danger, 20,384-5, 20,527.  
Rubbing down: wet method impossible in some cases, 20,371-8, 20,519-21.

DEVINE, JOSEPH—*continued.*

- Overalls:  
Generally worn, 20,399-403.  
No hardship for men to provide and wash, 20,487-93.  
Washed weekly, 20,404-5.  
When washed, 20,544-53.  
Turpentine: causes danger from paint fumes, 20,355-7.  
Washing accommodation essential, 20,387.  
Hot water:  
Better than cold, 20,388-93.  
Not always practicable, 20,394.  
Zinc paints:  
No difficulty in application, 20,449-50.  
No effect on health, 20,446-8.

## DOBBIE, JAMES J., D.Sc. (Principal Chemist of the Government Laboratory):

- Evidence, 22,481-548.  
Dry rubbing-down: prohibition would do away with direct lead poisoning, 22,519-22.  
Emanations:  
Not sufficient in amount to be detectable from painted surfaces, 22,490-6, 22,523-48.  
No volatile lead compounds given off from metallic lead, 22,485-9, 22,505.  
Spectroscopic test, 22,497-9, 22,506.  
Trillat's test not reliable, 22,481-4, 22,501-4.  
Turpentine source of most of the decomposition products, 22,500, 22,507-18.

## DOBIE, W. F. (of the Association of Master House Painters in Scotland):

- Evidence, 10,915-11,068.  
Compensation for suspension:  
Painters excluded from Hearts of Oak Society, 11,024-7.  
Would agree to, 10,990-2.  
Driers: kinds used, 11,030-1.  
Dry rubbing-down:  
Dust less in Scotland, 10,978-83.  
Might be dispensed with, but quality of work would suffer, 11,051-3.  
Reasons for, 11,053-7.  
Time occupied at, 10,988.  
Emanations: no way of avoiding, 10,986-7.  
Lead poisoning:  
Cases known of, 10,919-23.  
Deplorable, if statistics reliable, 10,937.  
Does not think either stringent regulations or prohibition necessary to prevent, 10,998-1002.  
Does not think official figures refer to Scotland in the same way as to England, 10,924-36, 10,940-50, 11,004-18.  
Meals: accommodation away from paint and dust difficult in some cases, 10,955-8, 11,060-3.  
Outdoor clothing: storage away from paint and dust difficult in some cases, 11,060-3.  
Overalls:  
Collect dust if not stowed away, 10,959-64.  
Provision and washing by employer difficult, 10,952-4.  
Painting: a healthy occupation, 11,023-9.  
Periodical medical examination:  
In England but not in Scotland, 10,926-30.  
Would agree to, 10,989.  
Prohibition: would lead to adulteration of paints, 11,065-8.  
Regulations:  
If impracticable, prohibition only alternative, 11,002-3.  
Impossible to observe, 10,998.  
Would entail increased charges, while use of leadless paints would mean more frequent painting, 10,993-8.  
Removal of old paint: solvents could replace burning off, 10,984-5.  
Washing:  
Danger in wiping hands on handkerchiefs, 10,973-7.  
Hot water not always practicable, 10,966.  
Towels, soap, and nailbrushes: would agree to provide, 10,967-72.

DOBLE, W. F.—*continued.*

- Zinc paints:  
 Defects in Office of Works paints, 11,036-9.  
 Excellent, but flat surface cannot be obtained, 11,032-5, 11,042-4, 11,064.  
 Not so good as lead for outside work, 11,045.

## DONALD, JOHN R. (of the Association of Master

- House Painters in Scotland):  
 Evidence, 12,294-354.  
 Compensation for suspension: would not agree to pay, 12,348.  
 Dry rubbing-down:  
 Can suggest no way of removing dust, 12,344.  
 Causes little dust, 12,341-3.  
 Leadless paints:  
 Could replace lead paints, 12,323-4.  
 Dearer than lead paints, 12,325.  
 Experience with, 12,315-24.  
 Lead poisoning:  
 Cases known of very few, 12,298-303.  
 Incidence shown by official statistics very deplorable, 12,312.  
 Surprised at figures showing extent of evil, 12,304-11.  
 Meals: accommodation away from paint and dust impossible in some cases, 12,334-6.  
 Outdoor clothing: storage of away from paint and dust impossible, 12,338.  
 Overalls:  
 Provided by men, 12,332.  
 Provision by employers difficult, 12,333.  
 Storage of, 12,337.  
 Periodical medical examination:  
 Difficult to carry out, 12,346-7.  
 Would agree to if law, 12,345.  
 Washing: accommodation difficult to provide, 12,339-40.

## Driers:

- Amount of lead necessary small: *Crow*, 12,039-47, 12,178-80; 10-15 per cent.: *Holzappel*, 11,524-31.  
 Kinds used: *Dobie*, 11,030-1.  
 No lead used: *Cumneo*, 10,199-203.

## Dry Rubbing-down:

- Amount of: *Parsonage*, 2884; *Lowe*, 3303-5, 3316-30; *Campbell*, 3536, 3549, 3578-85, 3588-92, 3637-8; *Harris*, 3699, 3796-9; *Bancroft*, 414-65; *Anderson, R. L.*, 11,428-31; *McKillop*, 20,776-8, 20,888-98.  
 Amount of sandpaper used: *Parsonage*, 2899-909.  
 Cheaper than wet process: *Devina*, 20,379-80.  
 Danger:  
 Great: *McKillop*, 20,765.  
 Not recognised: *Cantrill*, 3937; *Grundy*, 7199-217, 7283-7.  
 Very small: *Crow*, 12,007-8; *Simpson*, 21,577-83.  
 Unless person susceptible to poisoning: *Plumb*, 18,401-11.  
 Dangerous: *Wait*, 1465.  
 Dust created: *Webb*, 4191-2; *Bonner*, 4313-4; *White*, 9515-8; *McKillop*, 20,781-6, 20,797-800; *Smith, A.*, 21,113-5.  
 Amount of: *Legge*, 201-6; *Harris*, 3703, 3763-9; *Cantrill*, 3873-5; *Bancroft*, 4083-4, 4132-41; *Chappell*, 6587-95, 6660-2; *Wiltshier*, 6850-2; *Barker*, 6961-2; *McDermid*, 7379-85; *Anderson, J.*, 19,641-57.  
 Large: *Parsonage*, 2648-52, 2844; *Holzappel*, 11,550.  
 Less in Scotland, as flat paints almost unknown: *Carfrae*, 10,823-30; *Dobie*, 10,978-83; *Gucst*, 11,146-54; *Bennett*, 11,294-9.  
 Small: *Crace*, 1944, 2020, 2060; *Campbell*, 3432-3, 3503, 3526-30; *Puttrel*, 6273-8, 6282; *Crow*, 11,994-7; *Scott*, 12,256-7, 12,287; *Donald*, 12,341-3; *Plumb*, 18,291-2; *Wilkinson*, 19,990-5.  
 And not injurious: *Orr*, 10,618-32, 10,674-6, 10,779-81.  
 From carbon paints: *Flatau and Milnes*, 386-7.  
 Dust does not float in air but falls to ground: *Wilkinson*, 19,949-59.

Dry Rubbing-down—*continued.*

- Dusty process: *Wiltshier*, 6727.  
 Exhaust fans impracticable: *Walsh*, 3112-3; *Campbell*, 3435-7; *Harris*, 3709; *Cantrill*, 3876-7; *Bancroft*, 4066; *Webb*, 4198; *Puttrel*, 6281; *Wiltshier*, 6725-6; *Barker*, 6963; *McDermid*, 7378; *Holliday*, 8493; *Higgs*, 8927; *Holzappel*, 11,554; *Kaup*, 14,235.  
 Felt and polish suggested as an alternative: *McDermid*, 7453-65.  
 Frequent sweeping of floors suggested to remove dust: *Puttrel*, 6286-93.  
 Indispensable in some cases: *Parsonage*, 2653-6, 2727-31, 2886-98; *Pickles*, 2956-61, 2995; *Walsh*, 3088-9, 3114; *Wilson*, 3165-6; *Lowe*, 3265-7; *Campbell*, 3421-8; *Harris*, 3697, 3702; *Cantrill*, 3864-72; *Bancroft*, 4067-72; *Webb*, 4199-207; *Bonner*, 4308-12, 4405-9; *Chappell*, 6532, 6650-3; *Wiltshier*, 6722-4; *Barker*, 6957-60; *Grundy*, 7198, 7289-96; *Holliday*, 8491; *Higgs*, 8925; *Walker*, 9077; *White*, 9256-61, 9416-7, 9444-5; *Orr*, 10,633-47; *Styles*, 14,082-3, 14,152; *McKillop*, 20,779-80, 20,792-6, 20,801-2.  
 Methods in Belgium: *Ricker-Devroede*, 14,897-909.  
 Moistening paint before sandpapering done in Germany: *Niederhauser*, 16,374-9.  
 Moistening sandpaper to prevent dust:  
 Impracticable: *Parsonage*, 2845-8; *Plumb*, 18,378-83.  
 Not known of: *Bancroft*, 4170-2.  
 Rarely done: *Harris*, 3790-2.  
 Suggested: *Cookson*, 2150-7, 2201-5, 2243-5; *Campbell*, 3434, 3523-4; *Chappell*, 6535-8; *Barker*, 7058-60; *White*, 9872-7, 9514, 9519-20; *Orr*, 10,760-3; *Wilkinson*, 19,946-8.  
 No way of removing dust created: *Campbell*, 3438-41; *Harris*, 3710-7; *Chappell*, 6539-41; *Wiltshier*, 6730-1; *McDermid*, 7377; *Carfrae*, 10,846-9, 10,865; *Anderson, E. L.*, 11,346; *Donald*, 12,344; *Styles*, 14,084; 14,153-5.  
 Not indispensable: *Crace*, 1945-50, 2059; *Puttrel*, 6272; *Holzappel*, 11,551, 11,556-7; *Carson*, 11,781-4; *Vaughan*, 13,645-58, 13,733-42; *Morton*, 13,900-8; *Griffiths*, 13,996-4000; *Kaup*, 14,230-4; *Meissl*, 14,688, 14,725-9; *Ricker-Devroede*, 14,896; *Nootjen*, 15,283; *Niederhauser*, 16,303-4; *De Morsier*, 16,581-2; *Sibthorp*, 17,790-3, 17,900-6, 18,000-14; *Plumb*, 18,106, 18,295-304; *Anderson, J.*, 19,713-9; *Smith, A.*, 21,088-9, 21,125-6, 21,286-9, 21,352-4.  
 But would not like to do without it: *McDermid*, 7369-76.  
 Of zinc painted surfaces, containing lead dangerous: *Klein*, 16,906-11.  
 Of zinc paints as dangerous as lead: *Ricker-Devroede*, 14,886-95.  
 Of zinc paints dangerous: *Plumb*, 18,156-62, 18,268-81, 18,354-5.  
 Only done on good work: *McKillop*, 20,976-80.  
 Principal danger: *Parsonage*, 2637, 2647, 2883; *Pickles*, 2954, 3026; *Wilson*, 3164, 3217-22; *Bancroft*, 4065; *Mockford*, 8738-9; *Higgs*, 9006-7; *Holzappel*, 11,549; *Carson*, 11,780.  
 Prohibited in Germany: *Niederhauser*, 16,292.  
 Prohibition:  
 Essential: *Rambousek*, 14,526.  
 Might be tried: *Orr*, 10,771-5.  
 But quality of work would suffer: *McDermid*, 7492-8; *Dobie*, 11,051-3.  
 No insuperable difficulties: *Rivet*, 15,609-15.  
 Not strictly enforced in Belgium: *Ricker-Devroede*, 15,062-5.  
 Possible but expensive: *Carfrae*, 10,902-4.  
 Possible for old work but not for new work: *Wiltshier*, 6728-9; *McDermid*, 7436-49.  
 Would do away with direct lead poisoning: *Dobbie*, 22,519-22.  
 Would greatly reduce lead poisoning: *Klein*, 16,943, 16,966.  
 Would not remove all danger: *Pickles*, 2996-9.  
 Reasons for: *Crace*, 2019; *Cantrill*, 3935-7; *White*, 9442-3; *Orr*, 10,776-8; *Dobie*, 11,053-7; *Smith, A.*, 21,349-51.

**Dry Rubbing-down—continued.****Respirators:**

Only suggestion: *Holliday*, 8402; *Higgs*, 8928-9, 8974-8; *Walker*, 9078-80, 9119-20; *Scott*, 12,200-8, 12,280-3; *Morton*, 13,909-12; *McKillop*, 20,766-74.

But thinks impracticable: *Harris*, 3707-8.

Practicable: *Cookson*, 2142-9, 2192-200; *Darker*, 6979, 7016; *White*, 6202-7; 9298-306; *Carson*, 11,785-97, 11,855-79, 11,891, 11,894.

Should be worn: *Puttrell*, 6279-80; *Willis*, 11,706-8.

Suggested: *Orr*, 10,638-40; *Rivet*, 15,424-8; *Klein*, 16,839.

Uncomfortable: *McKillop*, 20,775.

Sandpapering of coats most dangerous: *Holzappel*, 11,543.

Sharp colours create more dust: *Campbell*, 3612-5.

Should be prohibited: *Klein*, 16,858; *Johnson*, 22,465.

After burning off: *Sibthorpe*, 17,765-7.

On old work: *Higgs*, 9008-21.

Time occupied at: *Webb*, 4198-4, 4278-85; *Dobie*, 10,988; *Carson*, 11,892-3; *Plumb*, 18,293-4; *Anderson, J.*, 19,965-6; *Smith, A.*, 21,090-9, 21,346-8.

**Dust and Spray (See also Dry Rubbing Down):**

Danger in paperhanging: *Bonner*, 4332-6.

Danger in stippling diminished by increased use of distempers: *Parsonage*, 2849-53.

Dangerous if inhaled: *Chappell*, 6529-31.

Determination of amount in air: *Kaup*, 14,194.

Difficult to safeguard workers against: *Bonner*, 4367; *Griffiths*, 14,051.

Exhaust fans to remove dust:

Impracticable: *Legge*, 177-8, 198-9; *Parsonage*, 2683, 2726; *Pickles*, 2994; *Orr*, 10,586-8; *Wilkinson*, 19,943-5; *Honeychurch*, 20,061; *Willis*, 20,628.

Possible but difficult to apply: *Anderson, J.*, 19,562-97, 19,790-5.

Inhalation experiments (animals) with dust of zinc and lead: *Goadby*, 15,761-84.

No dust in paint-shop: *McKillop*, 21,016, 21,037-40.

No splashes created in stippling: *Harris*, 3724-7, 3811-3; *Bonner*, 4315-22, 4410-2; 4421-4; *Grundy*, 7229-33.

But from man who applies the paint: *Cantrill*, 3885-6, 3949, 3959-65.

No way of avoiding danger from splashes in stippling or painting ceilings: *Campbell*, 3442-56; *Harris*, 3718-21; *Cantrill*, 3878-84; *Puttrell*, 6294-7, 6306-10; *Chappell*, 6542-7; *Wiltshier*, 6732-7; *Grundy*, 7218-26; *McDermid*, 7980-95; *Holliday*, 8494-8, 8501-2; *Higgs*, 8930-5; *Walker*, 9081-4; *Vaughan*, 13,659-69; *Morton*, 13,913-8; *Griffiths*, 14,001; *McKillop*, 20,808-10; *Smith, A.*, 21,158-69.

Unless lead prohibited: *Devino*, 20,362-5, 20,381, 20,415-22.

No way of removing dust: *Laidler*, 744-6; *Guest*, 11,117-20; *Bennett*, 11,237-44, 11,266-9.

Not breathed by painters: *Harris*, 3722-3; *Grundy*, 7227-8, 7255-8.

Not dangerous if inhaled: *Wiltshier*, 6720-1.

Not enough created to be dangerous: *Anderson, R. L.*, 11,344-5.

Principal danger: *Legge*, 273-4, 302, 334; *Parsonage*, 2861; *Carson*, 11,824; *Edginton*, 13,095; *Kaup*, 14,227, 14,239; *Leyendecker*, 16,459-62; *Goadby*, 15,925-8; 21,996-7, 22,034-50, 22,064-70; *Klein*, 16,838-42, 16,944; *Devino*, 20,414; *Smith, A.*, 21,240, 21,282; *Armstrong*, 22,175-6.

**Respirators:**

Impracticable: *Parsonage*, 2680-2, 2857, 2910.

No knowledge of wearing: *McKillop*, 20,888-91.

Only suggestion: *White*, 9275, 9347-60.

Storage of, difficult: *Parsonage*, 2858-9, 2911-4.

Suggested for avoiding splashes created in stippling and painting ceilings: *Webb*, 4212-6, 4267; *Barker*, 6964-74, 6979; *McKillop*, 20,811-4.

Splashes created in stippling and painting ceilings: *Parsonage*, 2672-9; *Bancroft*, 4075-6.

Dangerous: *Pickles*, 2962, 3024-5, 3029-32; *Walsh*, 3090; *Wilson*, 3167; *Lowe*, 3264; *Webb*, 4208-11, 4264-6.

**Dust and Spray—continued.**

Ventilation would reduce danger of spray in stippling: *Bancroft*, 4077.

Very little splashing in stippling: *Higgs*, 8936-9.

Washable distempers could replace lead paints for walls and ceilings: *Puttrell*, 6298-305, 6311; *Holliday*, 8499-500, 8557-70.

Washing hands and face suggested as remedy for splashes in stippling: *Wiltshier*, 6738-45; *White*, 9268-72.

**EDGINTON, R. W., M.D. (Certifying Factory Surgeon for North Birmingham):**

Evidence, 13,082-165.

Dust: principal danger, 13,095.

Emanations: may cause lead poisoning, 13,151-2.

Leadless paints: only way of removing danger, 13,101.

Lead poisoning:

Cleanliness alone will not prevent, 13,105-13.

Confirmatory symptoms in every case, 13,092.

Details of cases, 13,090-1.

Eagerness of men to be certified, 13,132-4.

Eleven cases observed, three reported to Home Office, 13,083-9.

Increase in known cases due to Workmen's Compensation Act, 13,160-5.

Knowledge of cases due to application for certificates under Workmen's Compensation Act, 13,123-31.

Long hours increase danger, 13,139-49.

Regulations: impracticable, 13,102-4.

Washing: accommodation difficult to provide, 13,153-6.

**Education of Painters:**

Apprentices:

Instructed in cleanliness rather than in avoidance of dust: *Puttrell*, 6373-83.

Taught to avoid lead poisoning: *Puttrell*, 6403-4.

Apprenticeship system advocated: *Crace*, 2003-8; *Wilkinson*, 20,015-6; *Johnson*, 22,267.

Important: *Klein*, 16,863-8, 16,912-22, 16,940-2; *Francis*, 17,393-6; *Humphreys*, 17,375-401.

Trade guilds suggested: *Johnson*, 22,409-15.

Would obviate danger of paint on hands, &c.: *Anderson, J.*, 19,761-74, 19,847-52.

**ELLISON, GEORGE (Resident Engineer to the South-Eastern and Chatham Railway at Charing Cross and Cannon Street Stations):**

Evidence, 10,424-506.

Bridge painting:

Leadless paints widely used by South-Eastern and Chatham Railway, 10,426-7.

Prohibition of use of lead would not interfere with, 10,468.

Carbon paints:

As durable and efficient as lead, 10,459-6.

Cost, 10,458-62.

Coal tar paints:

Cost, 10,458-62.

Durable and very efficient, 10,432-43, 10,502.

Preparation, uses, and application, 10,428-31.

Graphite paints:

Silica-graphite paints:

Can be covered by lighter tinted paints, 10,478-92.

Cannot be used white, 10,452.

Cost, 10,458-62.

Superior to lead, 10,447-9, 10,503-6.

Where used, 10,444-6.

Zinc paints: as good as lead, 10,463-7, 10,493-501.

**Emanations:**

Bacterial growth experiments: *Goadby*, 21,947-22,001.

French experiments disagreed with: *Goadby*, 15,831-42.

Dangerous: *Webb*, 4227.

French experiments criticised: *Klein*, 16,854-5, 16,898-905; *Armstrong*, 22,108-42, 22,151-3.

From burning off old lead paint:

Do not contain lead: *Klein*, 16,951-7.

Possibility of their containing lead: *Bäly*, 1710-2.

**Emanations—continued.**

- From dry white lead do not contain lead: *Baly*, 17,002-9.
- From drying paint:  
Do not contain lead: *Goadby*, 15,660-79; *Armstrong*, 15,935-48, 16,102-7; *Klein*, 16,790-901, 16,846-8, 16,877-80; *Bettink*, 18,441.
- Does not think they contain lead: *Cookson*, 2238-42; *Chappell*, 6599-601; *Orr*, 10,596-8; *Rambousek*, 14,636-7; *Leyendecker*, 16,398.
- Produce headache, but not lead poisoning: *Legge*, 213-5.
- Thinks they contain lead: *Parsonage*, 2689-92, 2860; *Plumb*, 18,234-45, 18,338-9.
- May cause lead poisoning: *Edginton*, 13,151-2.
- Not sufficient to be detectable: *Dobbie*, 22,490-6, 22,523-48.
- From heating metallic lead do not contain lead: *Dobbie*, 22,485-9, 22,505; *Goadby*, 15,828-30.
- From white lead or litharge do not contain lead: *Klein*, 16,789-9, 16,950.
- From white lead paste, possibility of their containing lead: *Baly*, 1695-701.
- Given off from paint: *Klein*, 16,774-9, 16,881-92.
- Hygienic effect of: *Armstrong*, 22,150, 22,159-65, 22,173.
- Nature of volatile products given off from linseed oil: *Klein*, 16,781-2.
- No way of removing: *Pickles*, 2993; *Carfras*, 10,852-4; *Dobie*, 10,986-7; *Guest*, 11,122-6; *Bennett*, 11,246-50.
- Opening windows suggested to remove danger: *Wiltshier*, 6791-2; *Anderson, R. L.*, 11,347-50.
- Possibility of evolution at ordinary temperatures: *Baly*, 1707-9.
- Prohibition of lead only remedy for: *McDermid*, 7451-7, 7466-72.
- Pug mill vapours free from lead: *Klein*, 16,811, 16,893-7.
- Rate of drying of paints: *Klein*, 16,780.
- Rate of evaporation:  
Different for turpentine, oil, and mixtures with zinc and lead: *Armstrong*, 15,956-63, 16,001-35, 16,057-66, 16,091-8, 16,108-31.
- Of turpentine: *Armstrong*, 16,067-72, 16,081-9, 16,144-5; *Klein*, 16,812-5.
- Possibly increased by using large proportion of oil: *Baly*, 1725-47.
- Quicker with white lead and oil than zinc and oil: *Armstrong*, 15,953-4.
- Respirators would not prevent inhalation: *Parsonage*, 2787-90.
- Smell of lead paint due to oxidation of oil: *Armstrong*, 15,981-9.
- Spectroscopic test: *Baly*, 1666-94, 16,998-7001; *Dobbie*, 22,497-9, 22,506.
- Trillat's test unreliable: *Goadby*, 15,679-88, 15,918; *Armstrong*, 16,036-55, 22,134-9; *Dobbie*, 22,481-4, 22,501-4.
- Turpentine vapour:  
Cause of illness from drying paints: *White*, 9504-6; *Kaup*, 14,441-5, 14,462; *Goadby*, 15,689-752, 15,789-96, 15,843-60, 15,861-80, 22,098-107; *Armstrong*, 15,949-51, 15,966; *Sibthorpe*, 17,971-3.
- Danger varies with rate at which given off: *Armstrong*, 16,159-64.
- Effect on the blood: *Armstrong*, 16,152-6.
- Effects transitory and can be got rid of by opening windows: *Armstrong*, 15,990-9, 16,073-80, 16,134-41, 22,177-80.
- May predispose to lead poisoning: *Goadby*, 15,797-800; 15,881-3.
- Might account for higher incidence of Bright's disease among painters: *Goadby*, 15,801-3.
- Unsaturated aldehydes cause of illness from drying lead paint: *Baly*, 17,010-63.
- Volatile lead compounds very poisonous: *Baly*, 1702.
- Cannot be prepared from linseed oil and lead compounds: *Klein*, 16,802-10, 16,854.

**Enamels:**

- Costly, if used as undercoats: *Chancellor and Penwarden*, 21,436-8.
- Dry slowly: *Chancellor and Penwarden*, 21,439-52.
- Generally made from zinc: *Rivet*, 15,445-7.
- Initial cost higher, but cheaper in end: *Philip*, 8641-7, 8687-8, 8694-704.
- Trade not increasing: *Rivet*, 15,442-4.
- Zinc satisfactory for outside work: *Wilson*, 3206-10.
- Zinc superior to lead for inside work: *Philip*, 8631-6.

**EXPERT-BEZANÇON, EUGENE (of E. Expert-Bezançon & Co., White Lead Manufacturers, Aubervilliers, France):**

- Evidence, 15,078-205.
- Foreign legislation, France: law relating to use of white lead in paints, 15,079-83.
- Parliamentary Commission's Inquiry, 15,085-99.
- Hours of employment: in white lead factories, 15,201-4.
- Lead poisoning:  
Cleanliness alone does not give immunity, 15,115-6.
- Statistics:  
French method of collecting criticised, 15,134-41, 15,153-9, 15,195-6.  
In France, 15,129-33, 15,142-51.
- Prohibition: mistake made in France, 15,118-20.
- White lead:  
Specified by architects, 15,161-8.  
Still largely used in France, 15,108-12.
- Zinc: price would rise with prohibition, 15,102.
- Zinc oxide:  
Failure of attempts to manufacture, 15,100.  
Kind of zinc used in indirect process, 15,178-87.  
Monopoly in France, 15,101, 15,173-7.  
Zinc oxide combine: Broken Hill probably included, 15,188-91.
- Zinc paints:  
Cost more than lead, 15,121-4.  
Render bridges and structures unsafe, 15,125-8.  
Use of, in France, 15,169-71, 15,192-4.

**FLATAU, CAPT. L. S., and MILNES, F. H. (of the Rabok Manufacturing Co., Carbon Paint Manufacturers, Sheffield):**

- Evidence, 344-401.
- Carbon paint:  
Composition, 348-51.  
Costs only half as much as lead, 354, 391, 400.  
Covering capacity same as lead, 356-7.  
Durability excellent, 355, 362, 377-8.  
Instances of its use on interiors and exteriors, 363-76, 381-2.  
Medium important, 384, 401.  
Mixes well with other pigments and ordinary medium, 359-60.  
Superior to lead, 380.  
Two coats of white will completely hide dark colour, 388-99.  
White colours not made, 352.  
Dry rubbing-down of carbon paints causes very little dust, 386-7.

**Filling:**

- Alabastine:  
Could replace lead, *Smith, A.*, 21,146-57.  
Used, *McKillop*, 20,803-7, 20,892-7.
- Composed largely of lead generally, *Plumb*, 18,363-8.
- Method of smoothing: *Harris*, 3704, 3782-4.  
And application, *Parsonage*, 2658-62.
- Seventy-five per cent. leadless, *Wiltshier*, 6849.
- White lead can be prohibited, *Nooijen*, 15,214.

**Foreign Legislation:**

- Austria:  
Summary of:  
Regulations, *Legge*, 193; *Kaup*, 14,211, 14,468-7.  
Report of Commission, *Kaup*, 14,188-210, 14,426-7.
- Use of lead:  
Prohibited for interior painting, *Cumyngham*, 10,289-91.  
Restricted, *Kaup*, 14,271-8.

**Foreign Legislation—continued.**

- Austria—continued.**  
Witnesses heard by Commission, *Kaup*, 14,936-7, 14,249-59.  
Aware of legislation abroad, *Garson*, 2524-5; *Campbell*, 3590-4; *Harris*, 3660-2; *Cantrill*, 3835-8; *Barker*, 6929-31; *Holliday*, 8460-3; *Higgs*, 8895-6; *White*, 9224-6; *Orr*, 10,541-6; *Carfras*, 10,819-22; *Bennett*, 11,208-9; *Anderson, R. L.*, 11,324.
- Belgium:**  
Dry rubbing-down prohibited, *Cunynghame*, 10,296.  
Inquiry leading to law in regard to white lead, *Ricker-Devroede*, 14,836-52.  
Summary of regulations, *Leyge*, 187-90.
- France:**  
Commission's Inquiry:  
*Expert-Bezançon*, 15,085-99.  
Findings criticised, *Villemot*, 16,187-95, 16,221-35; *De Morcier*, 16,626-31.  
Prohibition:  
Law permits 3 per cent. lead, *Pisart*, 18,882-9.  
Of white lead, with exemptions, *Cunynghame*, 10,288, 10,345-7.  
Summary of law, *Leyge*, 191-4; *Expert-Bezançon*, 15,079-83.
- Germany:**  
Dry rubbing-down prohibited, *Cunynghame*, 10,293.  
Inquiry and conclusions of Department of Commerce and Industry, *Leyendecker*, 16,388-93.  
Putting off working clothes and washing compulsory, *Cunynghame*, 10,292-5.  
Smoking of cigars or cigarettes prohibited, *Cunynghame*, 10,295.  
Summary of regulations, *Leyge*, 183-6; *Kaup*, 14,215-6, 14,423-5, 14,435-7; *Leyendecker*, 16,385-6.  
Taking of food or drink at work prohibited, *Cunynghame*, 10,295.
- Holland:**  
Commission's Inquiry: *Nooijen*, 15,231-82.  
Findings criticised, *Nooijen*, 15,332-43, 15,400-13; *Bettink*, 18,415-30, 18,468-73, 18,486-91, 18,504-13, 18,544-7.  
Reasons for, *Nooijen*, 15,301-8.  
Tests with zinc paints, *Bettink*, 18,435-7.  
Durability criticised, *Sibthorpe*, 17,954-9.
- Switzerland:**  
Federal Council's proceedings, *De Morcier*, 16,519-49.  
Geneva Commission's Findings criticised, *De Morcier*, 16,481-518; 16,612-6, 16,664-5, 16,672-3.  
Unaware of legislation abroad, *Crace*, 1993-8.  
United States: method of dealing with white lead question, *Humfrey*, 2610-6.  
Will obtain information of, *White*, 9425-38.
- FRANCIS, CAPT. MATTHEW** (of Matthew Francis & Sons, Halkyn, near Holywell, North Wales):  
Evidence, 17,236-339.  
Education of workers: important, 17,333-6.  
Lead:  
Decrease in British output, 17,241-2.  
Fluctuation in price and output, 17,259-73, 17,308-23.  
Proportion used for white lead making, 17,247-57.  
Lead mining: Prejudicial effect of prohibition, 17,239-40, 17,258, 17,274-80.  
Painting: other trades as dangerous, 17,243, 17,281-6, 17,304-7.  
Prohibition:  
Effect on spelter manufacture, 17,270-1, 17,324-8.  
Should follow if regulations impossible to enforce, 17,293-4.  
Regulations:  
Enforcement of, 17,295-303.  
Suggestions for, 17,287-92.  
Would reduce danger, 17,244.  
Washing accommodation difficult to provide, 17,337-9.
- GARDNER, ARCHIBALD** (Member of the Committee and Secretary of the Scottish Society of Operative House and Ship Painters):  
Evidence, 3973-982.  
Lead Poisoning: Statistics of Trade Societies, 3973-8, 3982.

**GARDNER, ARCHIBALD—continued.**

- Painters: more liable to accident in Scotland than England, 3979-81.  
Painting: same process in Scotland as in England, 3979.
- GARDNER, HENRY** (of Messrs. Henry R. Merton & Co., Ltd., and the Merton Metallurgical Co. Ltd., London):  
Evidence, 17,402-488.  
Lead:  
English better for white lead making and commands better price than foreign, 17,419-22, 17,448-9, 17,484-8.  
Fluctuation in price and output, 17,413-8, 17,439-47, 17,465-83.  
Proportion used for white lead making, 17,404.  
Lead Mining: prejudicial effect of prohibition, 17,405-12, 17,423-38, 17,450-8.
- GARSON, J. W.** (of Messrs. Lewis Berger & Sons Ltd., Paint Manufacturers, Homerton, London):  
Evidence, 2490-587.  
Foreign legislation: aware of legislation abroad, 2524-5.  
Insurance rates: would decrease with prohibition of lead, 2542-4.  
Leadless paints: experiments being made to find good substitute for lead, 2558-63.  
Office of works: paints cost more than lead paints to produce, 2572-6.  
Prohibition: would not affect paint grinders, 2526-9, 2545-6, 2551-2.  
White lead: best paint for outside work, 2549, 2553.  
Zinc paints:  
Addition of varnish increases durability and cost, 2564-5, 2571.  
As good as lead paints, 2495-500.  
Cost greater than lead, but cover 10 per cent. more, 2501-3.  
Durability equal to lead if properly mixed, 2508-12.  
Price would fall with increased demand, 2576.  
Recent improvements in, 2530-1.  
Retain colour better than lead, 2504-5.  
Special treatment required, 2534-5.
- GIRAUD, M.** (of Giraud & Co., Zinc Oxide Manufacturers, London), and **PETIT, M.** (of Carlier Frères, Zinc Oxide Manufacturers in France):  
Evidence, 21,694-819.  
Zinc oxide: supply sufficient if lead prohibited, 21,742-3.  
Zinc paints:  
Cheaper on work but dearer by weight than lead, 21,707-8.  
Composition, manufacture, medium and use, 21,696-703, 21,771-83, 21,789-819.  
Covering power greater than lead, 21,704-7, 21,798-800.  
Durability better than lead, 21,712-24.  
Increasing use of, 21,758-61.  
Instances of use, 21,725-33, 21,745-57.  
Keeps well, 21,817-9.  
Suitable for iron and steel, 21,734-41.  
Suitable for sulphurous atmospheres, 21,784-8.  
Superior to lead paints, 21,762-70.
- GOADBY, KENNETH WELDON, M.R.C.S., D.P.H., &c.** (Consulting Pathologist, Specialist Medical Referee under Workmen's Compensation Act):  
Evidence, 15,652-15,933, 21,947-22,107.  
Dust:  
Inhalation experiments (animals) with dust of zinc and lead, 15,761-84.  
Principal cause, 15,925-8, 21,996-7, 22,034-50, 22,064-70.  
Emanations:  
Experiments re effect of vapours from mixtures of lead and zinc on bacterial growth, 21,947-2001.  
French experiments regarding inhibition of growth of organism disagreed with, 15,831-42.  
From lead filings do not contain lead: 15,828-30.  
Trillat's test unreliable, 15,679-38, 15,918.

- GOADBY, KENNETH WELDON, M.R.C.S., D.P.H., &c.—continued.**  
 Emanations—*continued.*  
 Turpentine vapour:  
 Cause of illness from drying paints (animal experiments), 15,689-752, 15,789-96, 15,843-60, 15,861-80, 22,093-107.  
 May predispose to lead poisoning, 15,797-800, 15,881-3.  
 Might account for high incidence of Bright's disease among painters, 15,801-3.  
 Volatile lead compounds not given off from drying lead paints, 15,660-79.  
 Lead poisoning:  
 Blood examination important, 15,816-26, 22,022-9.  
 Doubtful cases, 15,809-15.  
 Inoculation experiments, 15,753-60, 22,071-92.  
 Lead not absorbed through the skin, 22,057.  
 Minimal dose, 15,884-93.  
 Mortality serious, 15,804-8.  
 Poisoning and sickness due almost entirely to lead dust and turpentine, 22,004-7.  
 Produced by liberation of latent lead in the body by other diseases, 22,017-21.  
 Susceptibility and immunity, 15,785-8.  
 Prohibition: not warrantable, 22,008-9.  
 Regulations would reduce lead poisoning to nil, 15,906.  
 Removal of old paint: burning off dangerous, 15,901-5, 15,924.  
 Turpentine:  
 Minimal dose, 15,922.  
 Poisoning from, 15,914, 22,004-7.  
 Washing: hot water not important, 22,061-3.
- Graphite Paints:**  
 Not found satisfactory. *Tanner*, 22,734-6.  
 Silica graphite paints:  
 Can be covered by lighter tinted paints, *Ellson*, 10,478-92.  
 Cannot be used white, *Ellson*, 10,452.  
 Cost, *Ellson*, 10,458-62.  
 Superior to lead, *Ellson*, 10,447-9, 10,503-6.  
 Where used, *Ellson*, 10,444-6.  
 With zinc oxide durable protection for iron and steel, *Line*, 9932-3, 10,023-7.
- GRIFFITHS, FRANK (of the National Federation of Building Trades Employers):**  
 Evidence, 13,972-14,053.  
 Dry rubbing-down: Could be dispensed with, 13,996-4000.  
 Dust and spray:  
 Difficult to safeguard workers against, 14,051.  
 No way of avoiding splashes in stippling, 14,001.  
 Lead poisoning: more prevalent among casual men, 14,023-30.  
 Outdoor clothing: storage away from paint and dust difficult in some cases, 14,043.  
 Overalls:  
 Provision and washing by employer difficult, 14,032-6.  
 Storage away from paint and dust impossible in some cases, 14,037-40.  
 Periodical medical examination:  
 Difficult, 14,002, 14,004-7, 14,044-50.  
 Serious if occupier has to pay, 14,020-2.  
 Regulations:  
 Enforcement difficult, 13,988-95, 14,009-14, 14,018-9, 14,031, 14,041-2.  
 Should be tried before prohibition, 14,015-7.  
 Washing accommodation could be provided, 13,985-7.
- GRUNDY, FREDERICK (of the National Association of Master House Painters and Decorators of England and Wales):**  
 Evidence, 7104-296.  
 Dry rubbing-down:  
 Danger not recognised, 7199-217, 7283-7.  
 Indispensable in some cases, 7198, 7289-96.  
 Dust and spray:  
 No way of avoiding splashes in painting ceilings, 7218-26.  
 No splashing in stippling, 7229-33.  
 Not breathed by workers, 7227-8, 7255-8.
- GRUNDY, FREDERICK—continued.**  
 Leadless paints:  
 Insufficient covering power and durability for priming, 7240-3.  
 Satisfactory for last coat for interior and exterior work, 7236-9.  
 Lead poisoning:  
 Cases of poisoning and sickness known of, very few, 7108-19, 7259-61.  
 Chief cause is eating food with unwashed hands, 7148.  
 Regrettable that this country should be behind others in legislation regarding, 7147.  
 Unaware of figures showing extent of evil, 7137-45.  
 Master House Painters Association:  
 Have made no scientific experiments to discover substitute for lead, 7128-31.  
 Have taken no steps to discover extent of poisoning, 7120-7.  
 Realise extent of lead poisoning evil, 7132-6.  
 Meals:  
 Accommodation away from paint and dust impossible in some cases, 7196-7.  
 Sometimes taken in rooms where painting is in progress, 7192-5.  
 Outdoor clothing: hung up in rooms where painting is in progress, 7189-91.  
 Overalls:  
 No danger in taking home dirty overalls, 7178-85.  
 Provision by employer difficult, 7279-82.  
 Should be cleaned weekly, 7168-70.  
 Should be worn, 7160-1.  
 Sometimes stored in room where painting is in progress, 7186-8.  
 Trouser overalls not necessary, 7162-7.  
 Workers should be responsible for washing, 7171-7, 7268-70, 7271-8.  
 Removal of old paint: no fumes in burning off, 7233-5.  
 Substitutes: paints composed of lead and zinc satisfactory, 7243-4.  
 Washing:  
 Accommodation essential, 7149-50.  
 Hot water not essential but better than cold, 7151, 7156-7.  
 Not always obtainable, 7158-9.  
 Only necessary to remove loose paint off hands, 7152-5, 7246-54.  
 Soap, towels, &c., already provided, 7263-5.
- GUEST, E. (of the Association of Master House Painters in Scotland):**  
 Evidence, 11,069-189.  
 Compensation for suspension: Would agree to, but would get rid of delicate men, 11,132-3.  
 Dry rubbing-down: Dustless in Scotland as flat paints almost unknown, 11,146-54.  
 Dust: no way of removing, 11,117-20.  
 Emanations: no way of removing, 11,122-6.  
 Leadless paints: not so good as lead, 11,155-60.  
 Lead poisoning:  
 Does not admit we are behind other nations in legislation regarding, 11,088-91.  
 No cases known of, 11,073-7.  
 Some action necessary, 11,092-3.  
 Surprised at figures showing extent of evil, 11,078-88.  
 Meals: accommodation away from paint and dust could be provided, 11,097-102, 11,176-9.  
 Outdoor clothing: storage away from paint and dust impracticable, 11,108-11.  
 Overalls:  
 Provision and washing by employer impossible, 11,096.  
 Storage away from paint and dust difficult, 11,103-7, 11,175-6.  
 Periodical medical examination: would agree to, but difficult, 11,127-31.  
 Prohibition:  
 Would agree to, if efficient substitute found, 11,182-5.  
 Would reduce quality of work, 11,187-9.

GUEST, E.—*continued.*

- Regulations:  
 Difficult to enforce, 11,135-45.  
 Preferred to prohibition: 11,134, 11,142.  
 Would eliminate evil, 11,094-5.  
 Removal of old paint: solvents could replace burning off, 11,121.  
 Washing: accommodation difficult to provide, 11,112-6.  
 Zinc paints:  
 Cost more and not so satisfactory as lead, 11,170-3.  
 Unlikely to stand Scottish climate, 11,162-9.

## HALL, THOMAS (of the London Master Builders Association):

- Evidence, 9530-568.  
 Leadless paints:  
 Nothing against Office of Works' paints, 9555-8.  
 Satisfactory tests, 9564-5.  
 Lead poisoning:  
 Cases known of, 9535-41, 9566-8.  
 Extent of evil realised, 9550-1.  
 Regrettable that this country should be behind others in legislation regarding, 9553.  
 London Master Builders Association: have taken no steps to reduce lead-poisoning evil, 9542-9.  
 Prohibition: preferred to regulations, 9553-4, 9559.

## HARDWICK, WILLIAM ROSCOE, B.Sc., F.I.C. (Consulting Chemist to Purex, Ltd., Greenford):

- Evidence, 1764-879.  
 Lead paints:  
 Purex:  
 Cheaper than white lead or zinc, 1781.  
 Comparison of qualities with white lead, 1767-88.  
 Less poisonous than white lead, 1798-806, 1845-7.  
 More durable than white lead, 1778.  
 Retains colour better than white lead, 1777.  
 Where used, 1872-7.  
 Lead poisoning: cases occurring in manufacture and spraying of Purex, 1807-11, 1821-6, 1832-41.  
 Painting: spraying dangerous, 1862-4.  
 Prohibition:  
 Purex should be exempted, 1819.  
 Would entail loss to white lead manufacturers, 1813-4.  
 Rubbing down: less required with Purex than white lead, 1789-97, 1827-30, 1859-61, 1865-7.

## HARRIS, H. VIGURS (of the National Association of Master House Painters and Decorators of England and Wales):

- Evidence, 3639-816.  
 Dry rubbing-down:  
 Amount of dust caused, 3703, 3763-9.  
 Can suggest no way of removing dust, 3710-7.  
 Exhaust fans impracticable, 3709.  
 Extent of, 3699, 3796-9.  
 Indispensable in some cases, 3697, 3702.  
 Mask only suggestion, but thinks it impracticable, 3707-8.  
 Moistening sandpaper with turpentine rarely done, 3790-2.  
 Dust and spray:  
 No splashes on face and hands in stippling, 3724-7, 3811-3.  
 No way of removal in painting ceilings, 3718-21.  
 Not breathed by painters, 3722-3.  
 Filling: could be rubbed down with pumice-stone and water, 3782-4, 3704.  
 Foreign regulations: aware of legislation abroad, 3660-2.  
 Hours of employment: restriction in hours would not save painters from poisoning, 3787-9.  
 Lead paints: necessary for some outside work, 3738-43.  
 Lead poisoning:  
 Cases of poisoning and sickness known of very few, 3645-53.  
 Incidence among paint mixers, 3803-10.  
 Realises magnitude of evil, 3654-9.  
 Regrettable that this country should be behind others in legislation regarding, 3661.

HARRIS, H. VIGURS—*continued.*

- Meals:  
 Sometimes taken in rooms where painting is going on, 3689-94, 3780-1.  
 Taking meals in paint shop might be injurious, 3770-73, 3775-9.  
 Mixing paints:  
 Breaking up of lead done by machinery, 3731.  
 Done in paint shop, 3730.  
 Overalls:  
 Should be provided, 3675-9.  
 Trousers not necessary, 3680.  
 Very little dust collects on them, 3686-8.  
 Workers should not be made responsible for washing the overalls, 3681-5.  
 Paints: Mixtures one-third lead and two-thirds zinc stand better than white lead, 3785-6.  
 Prohibition of lead:  
 Only solution, 3732-5.  
 Preferred to regulations, 3745-62.  
 Regulations: difficult to enforce, 3695.  
 Removal of old paint: can suggest nothing to prevent inhalation of fumes in burning off, 3728-9.  
 Rubbing down; wet process cannot be used between coats, 3701, 3705-6.  
 Washing accommodation essential, 3663-7.  
 Hot water:  
 Not always obtainable, 3672-4, 3774.  
 Not essential but better than cold, 3668-71.

## HEYDORN, A. F. (of Ragsone &amp; Co. Ltd., Bow):

- Evidence, 478-571.  
 Zinc paint:  
 Can be used for filling and flattening and enamelling, 543-55.  
 Cost same as lead, 488.  
 Covering capacity greater than lead, 490-2, 512, 517-9, 537-42.  
 Does not chalk, 493-5, 520-3.  
 Durability equal to lead, 489.  
 Instances of its use, 500-4.  
 Mixes well with other pigments and ordinary vehicles, 493-9, 526, 534, 568-71.  
 Not recommended for sign-writing, 486, 535-6.  
 Retains colour better than lead, 496.  
 Spreading capacity greater than lead, 497, 511, 513-6.

## HIGGS, FREDERICK (of the National Federation of Building Trades Employers):

- Evidence, 8852-9024.  
 Dry rubbing-down:  
 Exhaust fans impracticable, 8927.  
 Indispensable in some cases, 8925.  
 Principal danger, 9006-7.  
 Respirators suggested, 8928-9, 8974-8.  
 Should be prohibited on old work, 9008-21.  
 Dust and spray:  
 No way of removal in painting ceilings, 8930-5.  
 Very little splashing in stippling, 8936-9.  
 Foreign legislation: aware of legislation abroad, 8895-6.  
 Hours of employment: would agree to limitation of, but inconvenient, 8958-61, 8997-9001.  
 Insurance rates:  
 Have recently increased, 8858-9;  
 But not due to lead poisoning, 8860-4, 8990-1.  
 Leadless paints:  
 Committee could not recommend proprietary articles, 8983-6.  
 Covering power not good, 8945-6.  
 Would welcome Office of Works' formula if satisfactory, 8954-7.  
 Lead poisoning:  
 No cases of poisoning or sickness known of, 8857, 8865-9, 8972-3.  
 Regrettable that this country should be behind others in legislation regarding, 8897-8.  
 Unaware of figures showing extent of evil, 8883-94.  
 Meals: accommodation away from paint and dust generally practicable, 8917-23.  
 National Federation of Building Trades Employers:  
 Have made no experiments to discover substitute, 8879-82.  
 Have taken no steps to discover extent of lead poisoning, 8873-8.

HIGGS, FREDERICK—*continued.*

- Overalls:  
Men should provide their own, 8908-11.  
Some being kept in paint shop, 8915-6.  
Would object to washing them at employer's expense, 8911-4.  
Prohibition: preferred to regulations, 8962-8, 9022-4.  
Regulations: difficult to carry out, 8924.  
Removal of old paint: no means of preventing fumes in burning off, 8940-4.  
Washing:  
Accommodation essential, 8899-900.  
Hot water desirable, but not always obtainable, 8901-7.  
Would allow time for, 9002-3.  
White lead: best paint pigment, 8979-82, 8987-9.  
Zinc paints:  
Covering power not so good as lead, 8947-51.  
Durability not so good as lead, 8952-3.

## HOLLIDAY, J. S. (of the Institute of Builders):

- Evidence, 8417-616.  
Compensation for suspension: would not agree to, 8536.  
Dry rubbing-down:  
Exhaust fans impracticable, 8493.  
Indispensable in some cases, 8491.  
Respirators suggested, 8492.  
Dust and spray:  
No way of removal in painting ceilings and stippling, 8494-8, 8501-2.  
Washable distempers could replace lead paints for walls and ceilings, 8499-500, 8557-70.  
Foreign legislation: aware of legislation abroad, 8460-3.  
Hours of employment:  
Limitation of, impracticable, 8576-7.  
Would not agree to limitation of, 8522-5.  
Institute of Builders:  
Have taken no steps to discover extent of lead poisoning, 8441-7.  
Have taken no steps to discover substitute, 8451-4.  
Would have considered question of lead poisoning if it had been brought before them, 8591-5.  
Insurance rates: recent increase not due to lead poisoning, 8425-35, 8553.  
Leadless paints:  
Experiments should be made before prohibiting lead, 8582-4.  
If efficient one found, lead should be prohibited, 8512, 8596-8.  
Office of Works' test of four years not sufficient to warrant prohibition, 8513-21, 8581.  
Twelve months suggested for making trials, during which time no regulations should be made, 8599-616.  
Lead poisoning:  
No cases of poisoning or sickness known of, 8422-3, 8436-7, 8529-30, 8541-9.  
Regrettable that this country should be behind others in legislation regarding, 8463.  
Surprised at and unaware of figures showing extent of evil, 8455-9.  
Meals:  
Accommodation away from paint and dust should be provided, 8479-82.  
Generally practicable, 8485-90.  
Outdoor clothing: storage away from paint and dust impossible, 8478-9.  
Overalls:  
Storage away from paint and dust sometimes difficult, 8475-7.  
Would not object to provide them if custom, 8469-71.  
Would wash them if custom, 8472-4.  
Periodical medical examination:  
Impracticable, 8570-80.  
Would not say whether in favour or not, 8531-5.  
Prohibition of lead:  
Only remedy, 8506-8.  
Preferred to regulations, 8537-40.  
Removal of old paint:  
No way of removing fumes in burning off, 8504-5.  
Solvents generally used, 8503, 8554-6.

HOLLIDAY, J. S.—*continued.*

- Washing:  
Accommodation essential, 8465.  
Hot water not generally obtainable, 8466-8.  
Zinc paints: not so good as lead, 8510-11.  
HOLZAPFEL, M. (of the North-East Paint and Oil Trades Association):  
Evidence, 11,452-632.  
Driers: 10-15 per cent. of lead necessary, 11,524-31.  
Dry rubbing-down:  
Could be prohibited, 11,551, 11,556-7.  
Creates considerable dust, 11,550.  
Exhaust fans impracticable, 11,554.  
Principal danger, 11,549.  
Iron oxide paints: cheaper than lead, 11,485.  
Leadless paints: nature and uses of, 11,454-67, 11,474-80, 11,493-5.  
Lead paints:  
Necessary for certain purposes, 11,510-3.  
Valuable in promoting drying, 11,518.  
Lead poisoning: thinks it can be caused by absorption through skin, 11,568-71.  
Mixing: red lead dangerous, 11,572-5.  
Prohibition: would affect decorating trade, 11,514-7, 11,529.  
Removal of old paint: chipping red lead from ships holds dangerous, 11,544.  
Rubbing down:  
Length of time before new paint can be rubbed down wet, 11,560-1, 11,564-7.  
Wet process more expensive than dry, 11,552-3, 11,558-9.  
White lead: better paint base than zinc, 11,502-3.  
Zinc:  
Dependent on foreign countries for supplies, 11,540.  
Dust not harmful, 11,468-73.  
Zinc oxide: amount of lead present, 11,519-23.  
Zinc paints:  
Addition of varnish:  
Adds to cost, 11,504-6.  
Gives permanency, 11,496-500.  
Might facilitate drying sufficiently, 11,611-2.  
Dearer by weight, but cheaper in bulk than lead, 11,486-92, 11,608.  
Dry slowly (interiors), 11,586-7, 11,605-6, 11,609-10.  
Durability as good as lead, 11,585.  
Satisfactory for ships, 11,464, 11,481-3, 11,616-8, 11,624-32.  
Where applied, 11,576-84, 11,621-3.

## HONEYCHURCH, J. J. (of the London Association of Master Decorators):

- Evidence, 20,017-190.  
Compensation for suspension impracticable, 20,063.  
Dust: exhaust draught impossible, 20,061.  
Leadless paints: no scientific trials made, 20,074-81, 20,105-11.  
Lead poisoning:  
Cases of poisoning and sickness known of, 20,023, 20,117-26.  
No steps taken by London Association of Master Decorators to diminish evil, 20,030-1.  
Some action necessary, 20,043.  
Unaware of extent of evil, 20,035-42.  
Very deplorable, 20,041-2.  
Meals:  
Accommodation away from paint and dust impossible in some cases, 20,047.  
Mostly taken away from work, 20,048-52.  
Outdoor clothing: storage away from paint and dust impossible, 20,054-6.  
Overalls:  
Provision and washing by employers impossible, 20,046, 20,139-49.  
Storage apart from paint and dust practicable, 20,053.  
Storage in paint-shop not dangerous, 20,150-1.  
Painting: comparative cost of lead and zinc, 20,099-104.  
Paints: effect of introduction of ready-mixed paints, 20,127-33.  
Periodical medical examination: possible, 20,062.

**HONEYCHURCH, J. J.—continued.**

- Prohibition complete, regulations only partial, remedy, 20,044-5.  
Would not agree to, 20,065-9.
- Regulations:  
Difficult to observe, 20,064, 20,072.  
Householders should provide facilities for mess-rooms, washing, cloakrooms, &c., 20,152-3.  
Wages: rates of, 20,176-8, 20,181-90.  
Washing:  
Accommodation should be provided, 20,057.  
Hot water not always obtainable, 20,058.  
Provision of towels, soap, &c., possible, 20,059-60.  
White lead: better than zinc for outside, 20,154-8.  
Zinc paints:  
Could replace lead for inside work, 20,159-67.  
Easy as lead to apply, 20,179-80.  
More expensive than lead, 20,091-8, 20,134-6.  
Retain colour better than white lead, but not such good covering power, 20,082-90.  
Twice as many coats required as with lead, 20,174-5.

**HOOPER, EGBERT GRANT, F.I.C., F.C.S. (Super-**

- intending Chemist at the Government Laboratory):  
Evidence, 10,104-180.  
Leadless colours:  
Reds: how obtainable, 10,157-61.  
Yellow dyes used as substitute for lead chromate, 10,154-5.  
Zinc chromate could replace lead chromate in dark green colours so as to bring it within 5 per cent. solubility limit, 10,130-40, 10,162-4.  
Zinc chromate could replace lead chromate without serious increase of cost, 10,149-53, 10,165.  
Restriction to 5 per cent. soluble lead:  
Difficulty of matching paints, 10,168-72.  
Guarantee should be given by makers of ready-made paints, 10,167.  
Proportion of soluble lead could easily be determined, 10,107-12.  
Standardisation of paints, 10,175-80.  
Solubility of lead compounds in dilute HCl: of different lead compounds, 10,113-29.  
Solubility test could be made in Government laboratory, 10,156-7:  
Method of analysis, 10,142-8, 10,166.  
Would involve no difficulty, 10,141.

**Hours of Employment:**

- In white lead factories: *Expert-Bezançon*, 15,201-4.  
Limitation of:  
Advocated: *Roeh*, 16,771-2.  
Difficult owing to seasonal nature of trade: *McDermid*, 7,405-8, 7,417.  
Impracticable: *Holliday*, 8576-7.  
Workers would probably object: *Laidler*, 972-4;  
*Campbell*, 3617; *White*, 9,439-41.  
Would agree to: *Puttrel*, 6326-30, 6338; *Wiltshier*, 6762-4, 6804-6; *White*, 9287-9; *Vaughan*, 13,682-7.  
But inconvenient: *Higgs*, 8958-61, 8997-9001.  
If custom, *Walker*, 9094-9.  
Would make trade more healthy: *Campbell*, 3616.  
Would not agree to *Campbell*, 3496-7; *Chappell*, 6563-5, 6578; *Holliday*, 8522-5.  
Because of seasonal nature of trade: *Barker*, 6993-5.  
Would not save painters from lead poisoning: *Harris*, 3787-9.  
Number per week: *Laidler*, 714-5, 910-3; *Grace*, 1976-7; *Parsonage*, 2684-8, 2915-7; *Chappell*, 6561-2; *Morton*, 13,929; *McKillop*, 20,922-3; *Smith*, 21,355.  
Overtime worked: *Grace*, 1977.  
Should be as short as possible: *Cookson*, 2184-6.
- HUMFREY, WILLIAM A. (of the Brimsdown Lead Co., Ltd., Brimsdown, Middlesex):**  
Evidence, 2588-624.  
Foreign legislation: method of dealing with white lead question in U.S.A., 2610-6.  
Prohibition:  
Loss to white lead manufacturers involved, 2594, 2604-7.  
Should follow if complete substitute found, 2603,

**HUMFREY, WILLIAM A.—continued.**

- Regulations:  
Difficult to enforce, 2617-21.  
Suggestions to reduce lead poisoning, 2595-602
- HUMPHREYS, EDWARD NOEL (of the East Halkyn Mining Co., Ltd., and the New North Halkyn Mines, Ltd.):**  
Evidence, 17,340-401.  
Education of workers: important, 17,375-401.  
Lead: proportion used for white lead making, 17,352-62, 17,383-4.  
Lead mining:  
Capital and number of men employed, 17,340-6, 17,385-94.  
Prejudicial effect of prohibition, 17,347, 17,363-72.  
Painting: other trades as dangerous, 17,348-9, 17,373-5.  
Regulations:  
Difficult to enforce, 17,376-82.  
Would reduce lead poisoning 17,350
- HUNTER, PETER JOHNSTONE (Inspector of the Forth Bridge Railway Co.):**  
Evidence, 21,497-567.  
Bridge painting:  
Iron oxide:  
Better than lead for outer coats, 21,513-30.  
Cheaper than lead, 21,521.  
Leadless primings could probably be found, 21,522-3, 21,563-7.  
Lead paints best for priming, 21,508-9, 21,558-61.  
Red lead used alone unsatisfactory, 21,555-7.  
Three-quarters of paint used on Forth bridge lead-  
less, 21,499-507.  
Lead poisoning: cases known of, 21,525-52.  
Prohibition: practicable with reservations for iron primings, 21,562.

**Institute of Builders:**

- Have taken no steps to discover extent of lead poisoning: *Holliday*, 8441-7.  
Have taken no steps to discover substitute for lead: *Holliday*, 8451-4.  
Would have considered question of lead poisoning if it had been brought before them: *Holliday*, 8591-5.

**Insurance Rates for Painters:**

- Higher than for plasterers: *Laidler*, 718-25.  
Lower in Scotland than in England: *Orr*, 10,647-56, 10,782-6.  
Recent increase: *Laidler*, 726; *Cantrill*, 3941-2; *Collis*, 4015-9, 4046-8; *Puttrel*, 6174-5, 6343-9; *Chappell*, 6449-53, 6621-5; *Wiltshier*, 6671-2; *Barker*, 6888-91, 7024-8; *McDermid*, 7304-5; *Higgs*, 8858-9; *White*, 9489-93; *Vaughan*, 13,534-6; *Morton*, 13,831-2.  
Due to lead poisoning: *Campbell*, 3484-9; *Anderson, J.*, 19,887-93.  
No knowledge of: *Walker*, 9032-3.  
Not due to lead poisoning: *Higgs*, 8860-4, 8990-1.  
Would decrease with prohibition of lead: *Garson*, 2542-4.

**Iron Oxide Paints:**

- Can replace red lead on double bottoms in Navy: *Philip*, 8623-5; *Mockford*, 8729-35, 8836-7.  
Cheaper than lead paints: *Schobert*, 9686, *Holzappfel*, 11,485.  
Composition and vehicle used in anti-corrosive paints: *Schobert*, 9661-73; 9705-27.  
Covering power greater than lead: *Schobert*, 9674-5.  
Instances of use:  
*Schobert*, 9687-95; 9729-34.  
On Belginn State Railways: *Pisart*, 21,846-8.  
Not so good as lead for priming: *Mockford*, 8830-5.  
Satisfactory on ships: *Coysh*, 9606-8.  
Satisfactory protection for iron and steel: *Schobert*, 9696-704; *Rivet*, 15,484; *Morley*, 23,082-4.  
Used in confined spaces: *Simpson*, 21,593-5, 21,643-6.
- JOHNSON, EDWARD M. (of Messrs. Locke Lancaster and W. W. & R. Johnson & Sons, Ltd., Lead Desilverisers and White Lead Corrodors, Millwall, London):**  
Evidence, 22,181-480.

- JOHNSON, EDWARD M.—*continued*.  
 Dry rubbing-down: should be prohibited, 22,465.  
 Education of workers:  
 Advocated, 22,267.  
 Trade guilds suggested, 22,409-15.  
 Lead:  
 Combine for white lead making, 22,383-4.  
 Pig-lead mainly a British product, 22,278-85.  
 Lead Mining: prejudicial effect of prohibition, 22,370-82.  
 Lead Poisoning:  
 Mortality and sickness not disputed, 22,286-98.  
 National Health Insurance records might be used for compiling statistics, 22,392-400.  
 Reduction following on regulations elsewhere, 22,242-62, 22,333-8.  
 Some action necessary, 22,299-301.  
 Painters: registration suggested, 22,474-6.  
 Painting: other occupations more dangerous, 22,341-6.  
 Paints: specification of, 22,452-4.  
 Periodical medical examination: cost would fall on consumers, 22,403-4.  
 Prohibition:  
 Failure in foreign countries, 22,227-41, 22,351-5.  
 Inspection necessary, 22,467-8.  
 No statistical or scientific reason for, 22,184-226, 22,269-72.  
 Total prohibition preferred to 5 per cent. solubility limit, 22,442.  
 Regulations:  
 Enforcement, 22,356-60, 22,389-91.  
 Cost would be borne by consumers, 22,420-37.  
 Suggestions for, 22,263-6, 22,361-9, 22,385-6.  
 Turpentine: predisposes to lead poisoning, 22,302-3.  
 Washing: special soap to prevent poisoning, 22,405-8.  
 Zinc oxide:  
 Difficulty in manufacture in England, 22,461-4.  
 Supply would not be sufficient if lead prohibited, 22,455.  
 Toxicity of, 22,311-5.  
 Zinc paints: more turpentine and oil necessary than with lead, 22,305-10.
- KAUP, DR. IGNAZ (Departmental Chief of the Central Organisation of Social Hygiene in Berlin):  
 Evidence, 14,186-512.  
 Dry rubbing-down:  
 Can be dispensed with, 14,230-4.  
 Exhaust impossible, 14,235.  
 Dust:  
 Determination of amount in air, 14,194.  
 Principal danger, 14,227-9.  
 Emanations: danger from turps and oil but not from lead, 14,441-5, 14,462.  
 Foreign legislation:  
 Austria:  
 Lead restricted, 14,271-8.  
 Regulations have reduced lead poisoning, 14,212-4.  
 Summary of Commissions Report, 14,188-210, 14,426-7.  
 Regulations, 14,211, 14,463-7.  
 Witnesses heard before Commission, 14,236-7, 14,249-59.  
 Germany:  
 Regulations have reduced lead poisoning, 14,217-25.  
 Summary of regulations, 14,215-6, 14,423-5, 14,435-7.  
 Leadless paints:  
 No special medium used in Austrian and German experiments, 14,280-3.  
 Trials made in Austria and Germany not conclusive, 14,238-48, 14,260-70.  
 Lead paints:  
 Only necessary for final coat, 14,261.  
 Should be labelled poisonous, 14,226.  
 Lead poisoning:  
 Attacks among house painters not reportable in Germany, 14,217, 14,225.  
 Minimum attack rate in Vienna (3.5%) still unduly high, 14,367-8.  
 Slow reduction in Germany due to lack of control of regulations, 14,397-403.
- KAUP, DR. IGNAZ—*continued*.  
 Lead poisoning—*continued*.  
 Statistics for Germany, 14,417-22.  
 Vienna, 14,345-77, 14,409-16, 14,459-61, 14,473-6.  
 Training painters would reduce evil, 14,468-70.  
 Prohibition for inside work would reduce lead poisoning to ordinary trade risk, 14,379-84.  
 Regulation:  
 Enforcement of:  
 By inspection in Austria and Germany, 14,287-90, 14,291-329, 14,385-96.  
 Insufficient inspection, 14,385, 14,443-9.  
 Number of inspectors in various countries, 14,291-5.  
 Practicable by sanitary inspectors, &c., 14,224, 14,405-6.  
 Exemptions for small employers in Vienna, 14,336-44.  
 Practicable for users of leadless paints, 14,330-5, 14,452.
- KLEIN, CARL ADOLPHE (Chief Chemist, Brimsdown Lead Co.):  
 Evidence, 16,773-997.  
 Dry rubbing-down:  
 Of zinc-painted surfaces which contain lead dangerous, 16,906-11.  
 Prohibition of, would greatly reduce lead poisoning, 16,943, 16,966.  
 Respirator suggested, 16,839.  
 Should be prohibited, 16,858.  
 Dust: principal danger, 16,838-42, 16,944.  
 Education of painters important, 16,863-8, 16,912-22, 16,940-2.  
 Emanations:  
 French experiments disagreed with, 16,854-5, 16,898-905.  
 Nature of volatile products given off by linseed oil, 16,781-2.  
 Pug-mill vapours free from lead, 16,811, 16,893-7.  
 Rate of evaporation of turpentine in drying paints, 16,812-5.  
 Drying of paints, 16,780.  
 Trillat's list unreliable, 16,856-7.  
 Volatile compounds given off from paint, 16,774-9, 16,881-92.  
 Volatile lead compounds:  
 Cannot be prepared from linseed oil and lead compounds, 16,802-10, 16,845.  
 Not given off from drying lead paint, 16,790-801, 16,846-8, 16,877-80.  
 Not given off from white lead or litharge (distillation experiments), 16,783-9, 16,950.  
 Not given off in burning of lead paints, 16,951-7.  
 Leadless paints: qualities of, 16,816-29.  
 Lead poisoning:  
 Absorption through skin given as a cause by painters, 16,962-5.  
 Casual workers more liable to, 16,923-30.  
 Effect of:  
 Alcohol, 16,931-8, 16,972-6.  
 Social conditions, 16,945-8, 16,967-71, 16,984-96.  
 Paint: effect of sulphurous fumes on lead and zinc paints, 16,832-4.  
 Paint grinding: importance as regards durability, 16,836.  
 Regulations: enforcement of, 16,859-62, 16,977-8.  
 Washing: hot water unnecessary, 16,981-3.  
 White lead:  
 Best paint pigment, 16,837.  
 Spreading power better than zinc, 16,835.
- LADLER, G. G. (of the National Association of Master House Painters and Decorators of England and Wales):  
 Evidence, 572-1040.  
 Dust and spray: no way of removing dust, 744-6.  
 Hours of employment:  
 Men like to work overtime, 972-4.  
 Number of hours per week, 714-5, 910-3.  
 Insurance rates:  
 Higher than for plasterers, 718-25.  
 Recent increase in, 726.

LAIDLER, G. G.--*continued.*

- Lead poisoning:  
Better training of men would reduce evil, 760-6, 1011-5.  
Deplorable, 731.
- Leadless paints:  
No experience with, 895-909, 926.  
Office of Works test not sufficient trial, 995-1008.
- Meals:  
Places where taken, 703-10, 914-7, 970-1.  
Times when taken, 699-702.
- Mixing paints:  
Mostly done on job, 1018-21.  
No exhaust where mixing done dry, 642-3.  
Way in which done, 614-22.
- Overalls:  
Provided by men, 637.  
Washing of, 639-41, 1016-7.
- Painting: hands and clothes got soiled, 691-6, 940-3.
- Paints: durability on exteriors, 987-94.
- Regulations:  
Difficult to enforce, 1010.  
Preferred to prohibition, 732-7, 767-81.
- Removal of old paint: methods of, 674-86.
- Rubbing-down: methods of, 644-58, 789-94, 834-84, 953-8.
- Stopping: composition and application of, 666-9.
- Washing:  
Accommodation should be provided, 623-36, 660-4, 782-8, 741-3.  
Not now provided, 622-36.
- Hot water:  
Essential, 670-2.  
Practicable, 806-8, 944-52, 964-6, 1021-40.
- LANCASTER, HARRY C. (of Messrs. Locke, Lancaster & Co., and W. W. & R. Johnson & Sons, Ltd., Lead Desilverers and White Lead Corroders, Millwall, London):  
Evidence, 17,559-656.  
Lead: combine for white lead making, 17,585-8.  
Prohibition:  
Exemption period five years, 17,643-4.  
Would make trade dependent on foreign sources for raw material, 17,568.  
Zinc: shortage would occur if lead prohibited, 17,610-34.  
Zinc oxide:  
British ores unsuitable for manufacture by direct process, 17,560-6, 17,569-76.  
Difficulties in manufacture in England, 17,582-609, 17,641-2.  
Direct process best, 17,567, 17,577-81.  
Five per cent. lead necessary, 17,648-53.  
Production of, 17,635-40.

#### Lead:

- Capital invested and number employed in smelting industry: *Miller*, 17,071-3; 17,103-4, 17,130-2.
- Combine for white lead making: *Lancaster*, 17,585-8; *Johnson*, 22,383-4.
- Consumption:  
For painting purposes: *Rivet*, 15,567-73.  
In England: *Matton*, 17,489, 17,497-8.  
Decrease in British output: *Francis*, 17,241-2.  
Dependent on foreign sources for supply: *Miller*, 17,159-60.  
English lead better for white lead making and slightly dearer than foreign lead: *Gardner, H.*, 17,419-22, 17,448-9, 17,484-8; *Matton*, 17,524-30.  
Fluctuation in price and output: *Francis*, 17,259-73, 17,308-23; *Gardner, H.*, 17,413-8, 17,439-47, 17,465-83; *Matton*, 17,500-17.  
Pig lead mainly a British product: *Johnson*, 22,278-85.  
Prejudicial effect of prohibition on price: *Miller*, 17,069, 17,096-7.  
Prejudicial effect of prohibition on smelting industry: *Miller*, 17,074.  
Production in England: *Miller*, 17,094-5, 17,152-8.  
Proportion used for white lead making: *Francis*, 17,247-57; *Humphreys*, 17,352-62, 17,383-4, *Gardner, H.*, 17,404; *Matton*, 17,499.  
Reasons why foreign importer should not suffer as much as English producer if white lead prohibited: *Matton*, 17,518-23, 17,531-58.

Lead Colours. (See evidence of *Dr. Crow.*)

#### Leadless Colours:

- All colours obtainable: *Line*, 10,092-102.  
Aniline, use of, *Patterson*, 1165-7.  
Cost has little effect on cost of painting: *Connell*, 21,930.  
Cost more than lead: *Crow*, 11,978, 11,982-4, 12,017-8, 12,022-3; *Depierres*, 19,090-1; *Connell*, 21,908-9, 21,930.  
Cost of painting would not be increased, *Line*, 10,093.  
Demand increasing: *Connell*, 21,914-24.  
Greens likely to be available soon: *Patterson*, 12,928.
- Reds:  
How obtainable: *Hooper*, 10,157-61.  
Improvements in: *Depierres*, 19,083-94.  
Satisfactory: *Morley*, 23,037-44, 23,085-90.  
For reds, yellows, and greens: *Connell*, 21,894-907, 21,926-9.
- Yellow dyes used as substitute for lead chromate: *Hooper*, 10,154-5.
- Zinc chromate:  
Could replace lead chromate in dark greens so as to bring it within 5 per cent. solubility limit: *Hooper*, 10,130-40, 10,162-4.  
Could replace lead chromate without serious increase in cost: *Hooper*, 10,149-53, 10,165.  
In place of lead chromate would reduce range of colours: *Crow*, 11,971-6, 11,985-93.

Leadless Paints. (See also *Bituminous Paints, Carbon Paints, Coal Tar Paints, Graphite Paints, Iron Oxide Paints, Zinc Paints.*)

- Application and mixing: no insuperable difficulties: *Parsonage*, 2759-60; *Pickles*, 3010-1.  
As good as lead paints: *Patterson*, 12,935, 13,047-53.  
Better than lead paints for greenhouses: *Morley*, 22,989-92.  
Climate of England may affect less than climate of Vienna: *Meissl*, 14,703-4.  
Composition, mixing, medium, &c.: *Chancellor and Penwarden*, 21,359-72; *Morley*, 22,949-73, 23,029-32, 23,072-3.  
Cost:  
More than lead: *Donald*, 12,325.  
In package, but cheaper on work: *Cunnew*, 10,226.  
Of painting would be increased: *McDermid*, 7402-3.  
Same as lead: *Morley*, 22,974-7.  
With special medium not much more than lead: *Milton*, 20,278-82, 20,325-31.  
Could replace lead paints: *Donald*, 12,323-4.
- Covering power:  
As good as lead: *Cunnew*, 10,219-24.  
Better than lead: *Milton*, 20,270.  
Insufficient for priming: *Grundy*, 7240-3.  
Not good: *Higgs*, 8945-6.  
Drying difficulties overcome: *Morley*, 23,002-3.
- Durability:  
As good as lead: *Wilson*, 3245-6.  
Increased by addition of varnish: *Patterson*, 12,905-6; *Devino*, 20,410-5, 20,469-86.  
Insufficient for priming: *Grundy*, 7240-3.  
On Canterbury Post Office: *Wiltshier*, 6756-8, 6823-35, 6863-75; *Patterson*, 12,918-25, 13,006-12.  
Stand well for seven years: *Morley*, 22,994-7.  
Very good for outside and inside work: *Cunnew*, 10,228-9, 10,238-41.
- Effect on health:  
No complaints: *Patterson*, 13,036-8.  
Not toxic: *Tanner*, 22,699-704.  
Efficiency of: *Leggs*, 164-5.  
Efficient substitute for lead would be welcomed by trade: *Campbell*, 8558-9.
- Experience of: *Cantrill*, 3898-9; *Barker*, 7065-72; *Scott*, 12,206-17; *Donald*, 12,315-24; *De Morsier*, 16,608-11.  
Commissioners of Irish Lights: *Sibthorpe*, 17,814-8.  
Guinness's Brewery: *Sibthorpe*, 17,835-47.  
Length of: *Patterson*, 1043-7.

**Leadless Paints—continued.**Experience of—*continued.*

None: *Laidler*, 895-909, 926; *Wallis*, 20,633-4, 20,647-9, 20,658-68; *McKillop*, 20,929-31.

Very little: *Orr*, 10,683-94; *Anderson, R. L.*, 11,416-7.

Extent of use: *Legge*, 169-71.

Formula for: *Patterson*, 22,923-36.

If Office of Works can dispense with lead, other firms should be liable to do so: *Vaughan*, 13,679A-80, 13,767-8, 13,798-9, 13,810-2.

Instances of use: *Patterson*, 22,792-5; *Morley*, 22,879-88, 23,048-63.

Instructions for use by Office of Works: *Tanner*, 22,632-54, 22,729.

Leadless primings used for woodwork by Office of Works: *Patterson*, 22,822-32, 22,916-8.

## Lithopone:

Defects in regard to light: *Vickers*, 19,359-62.

Increasing use of: *Depierres*, 19,137-8.

Largely used in France: *Pisart*, 18,925-8.

Satisfactory for inside work: *Pisart*, 18,919-22; *Milton*, 20,275-7.

Unsatisfactory for outside work: *Wait*, 1474-8.

London Chamber of Commerce Inquiry: *Miller*, 17,078-81, 17,112-4, 17,133-7.

## Medium:

Important: *Milton*, 20,245, 20,264-6, 20,269-71.

No special medium used in German and Austrian tests: *Kaup*, 14,280-3.

Nature and uses of: *Holzappel*, 11,454-67, 11,474-80, 11,493-5.

No objectionable smell: *Wilson*, 3202-5.

Not appreciated by workers: *Patterson*, 1062.

Not so good as lead paints: *Campbell*, 3513-4; *Barker*, 7080-2; *Mockford*, 8758-61; *White*, 9402-4, 9414-5; *Guest*, 11,155-60.

## Office of Works paints:

Kinds used: *Patterson*, 22,857-69, 22,880-5.

Nothing against them: *Hall*, 9555-8.

Only possible way of removing danger: *Cantrill*, 3896-7; *Chappell*, 6552-3, 6583; *Wiltshier*, 6752; *Barker*, 6982-4; *McDermid*, 7400-1; *Edginton*, 13,101; *Vaughan*, 13,676-9.

## Practicable:

For ceilings: *White*, 9446-50.

For outside work: *Devine*, 20,437-9.

## Prejudice:

Against new materials: *Philip*, 8651; *Chancellor and Penwarden*, 21,383; *Milton*, 20,283-9.

Due to adulteration: *Schobert*, 9677.

In the building trade: *Cunnew*, 10,264-74.

None: *Campbell*, 3516-8; *Patterson*, 1060-1.

Proportion of varnish and driers used: *Patterson*, 12,902-4.

Proprietary articles could not be recommended by Committee: *Higgs*, 8983-6.

Qualities of: *Klein*, 16,816-29.

Satisfactory: *Morley*, 22,962-3.

For inside work: *Depierres*, 19,038-45.

For inside and outside work: *Cunnew*, 10,230-7; 10,242-9.

For last coat for interior and exterior work: *Grundty*, 7236-9.

Strange that Office of Works should succeed where others have failed: *Willis*, 11,720-3.

Superior to lead as well as better for workmen: *Tanner*, 22,707-8.

## Tests:

Being made to find good substitute for lead: *Garson*, 2558-63.

Five years' test by Office of Works sufficient to recommend prohibition: *Cantrill*, 3943-4.

Made in Austria and Germany not conclusive: *Kaup*, 14,238-48, 14,260-70; *Rambousek*, 14,584-91, 14,633-4, 14,648-52.

Made by Office of Works: *Patterson*, 22,743-57, 22,886-9.

Surprised at results of: *Crace*, 2026-9.

No scientific trials made: *Honeychurch*, 20,074-81, 20,105-11.

Of leadless primings for ironwork being made: *Patterson*, 22,833-42.

r 7700

**Leadless Paints—continued.**Tests—*continued.*

Office of Works in same position as ordinary employer regarding: *Patterson*, 12,936-9.

Office of Works test of four years not sufficient trial: *Laidler*, 995-1008; *Campbell*, 3631-3;

*Chappell*, 6556-60; *Barker*, 6987-92; *Holliday*, 8513-21, 8581; *White*, 9284-6, 9375-6, 9380, 9405; *Orr*, 10,706-12; *Scott*, 12,219-24; *Vaughan*, 13,793-6; *Styles*, 14,120-4.

Satisfactory: *Hall*, 19564-5; *Styles*, 14,101-14; *Milton*, 20,246-63, 20,290-5.

Should be made before lead prohibited: *Cantrill*, 3926-9; *Barker*, 7083-7; *Holliday*, 8582-4; *Philip*, 8684; *White*, 9381-3, 9388-9.

Nature of: *White*, 9384-5, 9371-2.

Twelve months suggested for trials, during which time no regulations should be made: *Holliday*, 8599-616.

Two years not sufficient trial: *Sibthorpe*, 17,965.

Unsatisfactory and costly: *Morton*, 13,926-8.

Unsatisfactory: *Rambousek*, 14,523-5, 14,562-6; *Meissl*, 14,678-9, 14,689-702, 14,790-6.

## Use of:

Decreases lead poisoning in Navy: *Mockford*, 8827-9.

In England: *Leyendecker*, 16,424-8.

In Liverpool University: *Baly*, 1751-6.

Would entail more labour: *Sibthorpe*, 17,865-88.

Used satisfactorily by men ignorant of composition: *Cantrill*, 3900-6.

Varnish should be added for outside work: *Line*, 9930.

Very few complaints received by Office of Works: *Tanner*, 22,652-61, 22,714.

Water distempers largely used for flattening and ceiling work: *Wiltshier*, 6843-6.

White, with special medium, more durable than lead: *Milton*, 20,245.

Will be used on bridges in future: *Tanner*, 22,740.

Would be accepted if equal to lead: *White*, 9396-7.

Would welcome Office of Works formula if satisfactory: *Higgs*, 8954-7; *Walker*, 9091-3.

Zinc sulphide useless for exteriors: *Willis*, 11,660.

**Lead Mining:**

British ore contains very little silver: *Miller*, 17,127-9.

Capital invested and number of men employed: *Humphreys*, 17,340-6, 17,385-94.

Prejudicial effect of prohibition: *Miller*, 17,070, 17,098-101a; *Francis*, 17,239-40, 17,258, 17,274-80; *Humphreys*, 17,347, 17,363-72; *Gardner, H.*, 17,405-12, 17,423-38, 17,450-8; *Mutton*, 17,492-5; *Johnson*, 22,370-82.

**Lead Paints:**

Application easier than zinc: *Villomot*, 16,201-3, 16,246-8.

Best paint for outside work: *Rival*, 15,469-72, 15,485, 15,529-34; *McIlugh*, 20,687.

Change colour in impure atmospheres: *Smith, J. C.*, 1611, 1633-4.

Covering power greater than zinc: *Mockford*, 8756-7.

Dangers recognised by Admiralty: *Philip*, 8622.

Defects of: *Patterson*, 1059.

Durability greater than zinc: *Carfrac*, 10,905-10; *Vaughan*, 13,779-80.

Essential for outside work, but could be prohibited for inside work: *Walker*, 9090; *Milton*, 20,239-43; 20,267-8.

Guarantee given: *Niederhauser*, 16,362.

## Necessary:

For certain purposes: *Holzappel*, 11,510-3.

For final coat only: *Kaup*, 14,261.

No better than zinc on greenhouses or in warm, moist atmospheres: *Patterson*, 12,929-33.

No efficient substitute yet found: *Niederhauser*, 16,277, 16,355; *De Morsier*, 16,640.

For outside work: *Ricker-Devroede*, 14,825; *Sibthorpe*, 17,894; *Anderson, J.*, 19,703.

s B

**Lead Paints—continued.**

- Overrated, because obtainable pure. *Schobert*, 9676-7.
- Preferred to zinc :
- By master painters of Belgium : *Ricker-Devroede*, 14,934-8.
- For painting greenhouses : *Ricker-Devroede*, 14,865-73.
- Priming on iron and steel :
- Possibly needed for : *Mockford*, 8 805-9.
- Still used for, by Office of Works : *Tanner*, 22,662-4, 22,712; *Patterson*, 22,833-4.
- Purex (see evidence of *Mr. W. R. Hardwick*).
- Sharp colour, amount used in Scotland : *McKillop*, 20,933-1003.
- Should be labelled poisonous ; *Smith, J. C.*, 1626-7; *Kaup*, 14,226; *Rambousek*, 14,668; *Meissl*, 14,685; *Sibthorpe*, 17,916-7.
- Prohibited if efficient substitute found : *Campbell*, 3470-4.
- Smell injurious : *Mockford*, 8742.
- Specified by architects : *Expert-Bezançon*, 15,161-8.
- As a matter of habit : *Munby and Worriacott*, 2390-2.
- Spreading power better than zinc : *Klein*, 16,835.
- Superior to zinc : *Plumb*, 18,101-2, 18,104, 18,122-3, 18,305.
- Used for painting outsides of ships in Navy : *Philip*, 8652-6.
- Valuable in promoting drying : *Holzappel*, 11,518.

**Lead Poisoning :**

- Absorption through the skin :
- Considered as a cause of poisoning : *Cantrill*, 3957-8; *Holzappel*, 11,568-71.
- Given as a cause by painters : *Klein*, 16,962-5.
- Lead not absorbed, *Goadby*, 22,057.
- Surprised that it is not a cause of poisoning : *Puttrel*, 6384-8.
- Action taken on notified cases : *Legge*, 150-1, 234-7.
- Among plumbers : *Legge*, 238-9.
- Attacks among house painters not reportable :
- In Germany : *Kaup*, 14,217, 14,225.
- In United Kingdom : *Legge*, 148 9; *Schooling*, 18,725-7.
- A very serious evil : *Goadby*, 15,804-8; *McHugh*, 20,683, 20,694, 20,701.
- Blood examination important : *Goadby*, 15,816-26, 22,022-9.
- Cases arising in manufacture and spraying of Purex : *Hardwick*, 1807-11, 1821-6, 1832-41.
- Cases arising in paint mixing : *Harris*, 3803-10.
- Cases decreasing in number : *Anderson, J.*, 19,625-7, 19,634-40.
- Cases in Belgium : *Ricker-Devroede*, 14,950-4.
- Cases in Holland : *Bottink*, 18,447-66, 18,514-6, 18,530-2.
- Cases in which compensation has been paid : *McKillop*, 20,966-75.
- Cases may escape employers' knowledge : *Campbell*, 3565-75, 3604-8; *Barker*, 7039-51; *Walker*, 9130, 9137-40.
- Cases occur in best works : *Anderson, J.*, 19,862-7.
- Cases occur in spite of precautions : *Mockford*, 8825-6.
- Cases of poisoning and sickness due to lead known of : *Lowe*, 9256-63; *Webb*, 4176 87; *Bonner*, 4296-7; *Wiltshier*, 6669-70, 6673-7; *Mockford*, 8726; *White*, 9147-55; *Hall*, 9535-41, 9566-8; *Orr*, 10,511-8; *Dobie*, 10,919-23; *Leyendecker*, 16,430-7; *Sibthorpe*, 17,695, 17,988-95; *Plumb*, 18,115-21; *Anderson, J.*, 19,467-87; *Honeychurch*, 20,023, 20,117-26; *Milton*, 20,201-23; *Hunter*, 21,525-52; *Simpson*, 21,571-6; *Morley*, 23,006-9.
- Details of : *Grace*, 1912-20, 2065-72; *Wilson*, 3195-201; *Cantrill*, 3947-51; *Barker*, 6883-7, 6891-6; *White*, 9316-9, 9471; *Edginton*, 13,090-1; *Devine*, 20,337-51, 20,451-68, 20,502-6, 20,522-3, 20,533-5; *McKillop*, 20,717-64, 20,932-59; *Smith, A.*, 21,046-78, 21,083-7, 21,306-37.

**Lead Poisoning—continued.**

- Cases of poisoning and sickness due to lead known of—continued.
- None : *Chappell*, 6448, 6452 6, 6602-4, *McDermid*, 7,301, 7306-10; *Holliday*, 8422-3, 8436-7, 8529-30, 8541 9; *Higgs*, 8858, 8865-9, 8972-3; *Carfrae*, 10,807-11, 10,882-6; *Guest*, 11,073-7; *Bennett*, 11,194-8, 11,270; *Anderson, R. L.*, 11,309-14; *Wilkinson*, 19,897-907.
- In Holland : *Nooijen*, 15,221-30, 15,321-2, 15,431-4.
- Several : *Cantrill*, 3824-6.
- Very few : *Campbell*, 3376-82, 3561-4; *Harris*, 3645-53; *Puttrel*, 6173-80, 6389-402, 6407-14; *Grundy*, 7108-19, 7259-61; *Walker*, 9029-31, 9034-8, 9112-8; *Scott*, 12,188-94; *Donald*, 12,298-303; *Vaughan*, 13,533-40; *Morton*, 13,828-30, 13,833-6, 13,953-5; *Wallis*, 20,559, 20,564-73.
- Casual men more liable to : *Campbell*, 3597-603; *Griffiths*, 14,023-30; *Klein*, 16,923-30.
- Cleanliness alone does not give immunity from : *Parsonage*, 2814-7; *Pickles*, 3063-7; *Wiltshier*, 6787-90; *Carson*, 11,921-5; *Edginton*, 13,105-13; *Expert-Bezançon*, 15,115-6; *Devine*, 20,340, 20,391-2; *Smith, A.*, 21,238-9.
- Compensation for : see Compensation.
- Compulsory notification useful : *Legge*, 160, 293-5; *Smith, J. C.*, 1624-5.
- Confirmatory symptoms in every case : *Edginton*, 13,092.
- Contracted from emanation experiments : *Baly*, 1677, 1703-6, 1748-50.
- Danger from smoking : *Legge*, 208-12, 216-7.
- Danger from unclean hands : *Legge*, 208-12, 216-7; *Pickles*, 2973-5.
- Considered to be greater than from dust : *Puttrel*, 6353-72; *Grundy*, 7148; *McDermid*, 7434-5; *Carson*, 11,895-900, 11,931; *Ricker-Devroede*, 14,989-94.
- Surprised that it only accounts for 5 per cent. of cases : *Puttrel*, 6435-7.
- Danger in house painting greater than in other lead industries : *Legge*, 175-6.
- Death rates : *White*, 9364-70, 9470.
- Diseases predisposing to : *Rambousek*, 14,672-3.
- Diseases resulting from or aggravated by : *Legge*, 243-50; *Parsonage*, 2754-5; *Orr*, 10,677-82.
- Distribution of literature and regulations may tend to lessen evil : *Devine*, 20,498-501, 20,507-17, 20,524-9.
- Does not admit we are behind other countries in legislation regarding : *Guest*, 11,088-91.
- Does not think either stringent regulations or prohibition necessary to prevent evil : *Dobie*, 10,998-11,002; *Anderson, R. L.*, 11,355-61.
- Doubtful cases : *Cookson*, 2166-70, 2219-29, 2274-83; *Goadby*, 15,809-15; *Depiarras*, 19,157-60.
- Eagerness of men to be certified : *Edginton*, 13,132-4.
- Education of painters in cleanliness would reduce evil : *Laidler*, 760-6, 1011-5; *White*, 9513; *Kaup*, 14,468-70; *Plumb*, 18,107, 18,112; *Anderson, J.*, 19,623-4, 19,628-30, 19,658-64, 19,761-74; *Wilkinson*, 19,987-8, 19,996-9.
- Effect of alcohol : *Puttrel*, 6405-6; *Klein*, 16,931-8, 16,972-6.
- Effect of seasonal nature of trade : *Collis*, 4021-30 4035; *White*, 9463-9, 9494-7; *Sibthorpe*, 17,673.
- Effect of social conditions : *Klein*, 16,945-8, 16,967-71, 16,984-96.
- Eleven cases observed, three reported to Home Office : *Edginton*, 13,083-9.
- Extent of evil :
- As shown by official figures very deplorable : *Laidler*, 731; *Craco*, 1988; *Campbell*, 3389; *Harris*, 3659; *Cantrill*, 3835; *Puttrel*, 6217; *Chappell*, 6477; *Wiltshier*, 6690; *Barker*, 6928; *Grundy*, 7145; *McDermid*, 7338; *Holliday*, 8459; *Higgs*, 8893; *Walker*, 9054-5; *White*, 9223; *Hall*, 9551; *Orr*, 10,540; *Carfrae*, 10,818; *Dobie*, 10,937; *Guest*, 11,088; *Bennett*, 11,207; *Anderson, R. L.*, 11,323; *Scott*, 12,203; *Donald*, 12,312; *Vaughan*, 13,572-3; *Morton*, 13,859; *Styles*, 14,067; *Wilkinson*, 19,917-20; *Honeychurch*, 20,041-2; *Wallis*, 20,582.

**Lead Poisoning—continued.**Extent of evil—*continued.*In certain districts: *Sibthorpe*, 17,943-50.Partly realised: *Harris*, 3654-9; *Cantrill*, 3830-5; *Puttrel*, 6439-42; *Wiltshier*, 6682-8, 6690; *Hall*, 9550; *Anderson, R. L.*, 11,315-22.Serious in Birmingham, and many cases not classed as lead poisoning which should be: *Line*, 9913-25, 9976-85, 10,029-34, 10,102-3.Unaware of, and surprised at: *Crace*, 1981-7; *Campbell*, 3383-9; *Chappell*, 6472-6; *Barker*, 6921-8, 7061-4; *Grundy*, 7137-44; *McDermid*, 7499-506; *Holliday*, 8455-9; *Higgs*, 8883-94; *Walker*, 9046-55; *Carfrae*, 10,812-8; *Guest*, 11,078-88; *Bennett*, 11,199-207; *Scott*, 12,195-203; *Donald*, 12,304-11; *Vaughan*, 13,584-73, 13,776-8; *Morton*, 13,843-59; *Styles*, 14,058-67; *Wilkinson*, 19,908-16; *Honeychurch*, 20,035-42; *Milton*, 20,226-38; *Wallis*, 20,574-81.Fewer cases in decorative work than in plain painting: *Crace*, 2096-101.Fewer cases in Scotland: *Orr*, 10,526-8, 10,662-73, 10,714-46.Due to better training of men: *Anderson, J.* 19,704-12; *Sibthorpe*, 17,896-9.Due to more white work done in England: *Smith, A.*, 21,079-82.Reasons for: *Parsonage*, 2828-43.Incidence greater among railway painters than house painters: *Vaughan*, 13,781-5.Increase in number of cases due to Workmen's Compensation Act: *Edginton*, 13,160-5.Inhalation danger: *see* Dust and Spray.Inoculation experiments: *Goadby*, 15,753-60, 22,071-92.Inquiry by National Federation: *White*, 9328-40.Knowledge of cases due to application for certificates under the Workmen's Compensation Act: *Edginton*, 13,123-31.Large number of cases due to carelessness of men: *Puttrel*, 6268-71.Legislation regarding, overdue: *Cantrill*, 3839.Men having several attacks should leave trade: *Carson*, 11,832-6, 11,852-4, 11,901-9.Minimal dose: *Goadby*, 15,884-93.Minimum attack rate in Vienna (3.5 per cent.) still unduly high: *Kaup*, 14,367-8.Mortality and sickness not disputed: *Johnson*, 22,286-98.No steps taken by London Association of Master Decorators to diminish evil: *Honeychurch*, 20,030-1.Not a serious evil: *Anderson, J.*, 19,485-516, 19,619-92.Occurrence, etiology, and prevention: *Roch*, 16,681-91, 16,699-708.Plumbers do not suffer because they are trained: *Wiltshier*, 6818-9.Possibility of cases among ship painters being classed as house painters: *Legge*, 298-301, 314.Precautionary measures taken by Admiralty: *Mookford*, 8766-78, 8811-24.Suggested, *Rambousek*, 14,527-30, 14,635.Pressure of work and long hours increase danger: *Legge*, 268-72; *Edginton*, 13,139-49.Principal causes of: *Legge*, 162-3; *Pickles*, 2991-2; *Walsh*, 3087; *Plumb*, 18,163-77, 18,181-4, 18,289-90, 18,384; *Devine*, 20,352-61, 20,366-70.Produced by liberation of latent lead in the body by other diseases: *Goadby*, 22,017-21.Proportion of cases among painters and plumbers: *Legge*, 297.Reduction in cases following on regulations: *Willis*, 11,693-702; *Johnson*, 22,242-62, 22,333-8.In Austria: *Kaup*, 14,211-4; *Rambousek*, 14,516-7, 14,629-32, 14,638-47; *Meissl*, 14,676.In Germany slew: *Kaup*, 14,217-25, 14,397-404; *Niederhäuser*, 16,269-70, 16,278-87; *Leyendecker*, 16,387, 16,417-20, 16,456-8.In Switzerland: *De Morsier*, 16,600-1.**Lead Poisoning—continued.**Regrettable that this country should be behind others in legislation regarding: *Crace*, 1999; *Campbell*, 3393, *Harris*, 3661; *Puttrel*, 6221-4; *Chappell*, 6480-1; *Barker*, 6931; *Grundy*, 7147; *McDermid*, 7340; *Holliday*, 8463; *Higgs*, 8897-8; *Walker*, 9057; *White*, 9227; *Hall*, 9553; *Carfrae*, 10,822; *Bennett*, 11,210; *Anderson, R. L.*, 11,325; *Vaughan*, 13,575; *Morton*, 13,861; *Styles*, 14,068-70.Regulations would reduce evil: *Plumb*, 18,188-95.Severity of cases: *Legge*, 161.Sickness mainly due to lead dust and turpentine: *Goadby*, 22,004-7.Small experience of, due to casual employment of men: *White*, 9479-85.Some action necessary to prevent evil: *Smith, J. C.*, 1631-2; *Cunynghame*, 10,284-6; *Orr*, 10,642; *Guest*, 11,092-3; *Sibthorpe*, 17,658-9, 17,697-8; *Anderson, J.*, 19,517-25; *Wilkinson*, 19,921; *Honeychurch*, 20,043; *Johnson*, 22,299-30.

Statistics:

Could be compiled from returns under National Insurance Act: *Anderson, J.*, 19,692-5; *Johnson*, 22,392-400.For Amsterdam none: *Bettink*, 18,449.For Austria: *Kaup*, 14,345-77, 14,409-16, 14,459-61, 14,473-6; *Meissl*, 14,715-24, 14,734-46.For Bohemia: *Rambousek*, 14,573-8, 14,622-8, 14,660-1.For France: *Expert-Bezançon*, 15,129-33, 15,142-51.Method of collecting criticised: *Expert-Bezançon*, 15,134-41, 15,153-9, 15,195-6.For Geneva: *Roch*, 16,677-8, 16,709-25, 16,757-66.For Germany: *Kaup*, 14,417-22.For Switzerland: *De Morsier*, 16,550-6, 16,602-3, 16,641-2.For trade unions: *Parsonage*, 2627-31, 3966-72; *Gardner, A.*, 3973-8, 3982; *Baneroft*, 4053-9. Disputed: *Wilkinson*, 19,982-6.For United Kingdom: *Legge*, 152-8, 278-80, 306-7.Accuracy of: *Legge*, 251-7.Disputed: *Orr*, 10,519-40, 10,713; *Dobie*, 10,924-36, 10,940-50, 11,004-18.Estimation of probable number of cases: *Legge*, 159, 240-2.Occupational mortality: *Schooling*, 18,549-601, 18,665-95, 18,747-803.Occupational sickness: *Schooling*, 18,602-64, 18,704-46, 18,831-65.One death in 54 among housepainters: *Schooling*, 18,698-703.Registrar-General's figures, *Collis*, 3989-4006.Trade Societies' figures, *Collis*, 3984-9, 3999-4009, 4036-9.Surprised that properly trained men should contract lead poisoning: *Wilkinson*, 20,007-9.Susceptibility and immunity: *Goadby*, 15,785-8; *Smith, A.*, 21,241-5.System of combined regulations and prohibition suggested, *Cunynghame*, 10,302-5.Unclean men more liable to: *Lowe*, 3362-6.Untrained or careless men most liable to: *Legge*, 276-7; *Parsonage*, 2744-9, 2811-3, 2865, 2881; *Wiltshier*, 6813-7; *White*, 9307-15; *Vaughan*, 13,743-55; *Rambousek*, 14,653; *Meissl*, 14,730-3; 14,807-10; *Anderson, J.*, 19,843-6; *Wilkinson*, 20,013-4.Would be reduced by use of more oil in paints: *Carfrae*, 10,862-4, 10,887-92, 10,900-1.**LEGGÉ, THOMAS MORISON (H.M. Senior Medical**

Inspector of Factories):

Evidence, 148-343.

Dry rubbing down: amount of dust created, 201-6.

Dust:

Chief cause of lead-poisoning, 273-4, 302, 334.

Exhaust impracticable, 177-8, 198-9.

Emanations produce headache but not lead-poisoning, 213-5.

Foreign legislation:

Austrian regulations, 193.

Belgian regulations, 187-90.

LEGG, THOMAS MORISON—*continued.*

- Foreign legislation—*continued.*  
 French regulations, 191-4.  
 German regulations, 183-6.
- Leadless paints:  
 Efficiency of, 164-5.  
 Extent of use of, 169-71.
- Lead-poisoning:  
 Action taken on notified cases, 150-1, 234-7.  
 Among house painters not notifiable as outside scope of Factories and Workshops Act, 148-9.  
 Among plumbers, 238-9.  
 Compulsory notification of house painters useful, 160, 293-5.  
 Danger from smoking and lead on hands, 208-12, 216-7.  
   In house-painting greater than in other lead industries, 175-6.  
 Diseases resulting from or aggravated by, 243-50.  
 Estimation of probable number of cases, 159, 240-2.  
 More frequent in first two years of employment, 308-10.  
 More prevalent among unskilled men, 276-7.  
 Possibility of cases among ship painters being classed as house painters, 298-301, 314.  
 Pressure of work increases danger, 268-72.  
 Proportion of cases among painters and plumbers, 297.  
 Severity of cases, 161.  
 Sources of, 163-3.  
 Statistics, 152-8, 278-80, 306-7.  
   Accuracy of, 251-7.
- Mixing:  
 Exhaust impracticable, 342-3.  
 No dust if lead in paste form, 282-3.
- Overalls:  
 Cleaning of, 339-40.  
 Provided by men, 337.  
 Occupiers in Germany, 338.
- Painting:  
 No regulations as outside scope of Factory Act, 172-4.  
 Spraying dangerous, 304-5.  
 Workshops often in dirty condition, 327-30.
- Periodical medical examination:  
 At six monthly intervals not of much use, 260-2.  
 Difficulties of, 179-82.  
   In Belgium, 189-90.  
 Transference of men showing signs of lead absorption to other work useful, 264-5.
- Turpentine: ezema from substitutes, 316-8.
- Washing:  
 Provision of buckets and soap could be enforced, 335-6.  
 Very little accommodation now provided, 331-3.
- Workmen's Compensation Act:  
 Difficulty in re-insurance and re-employment of men after receiving compensation, 290-2.  
 Duties of certifying surgeon under, 284-9.  
 Procedure in cases of poisoning, 228-33.
- Zinc paints, different in application to lead paints, 166-7.

## LEYENDEOKER, HANS (President of the German

- White Lead Manufacturers' Association):  
 Evidence, 16,383-480.  
 Dust: principal danger, 16,459-62.  
 Emanations: does not think they contain lead, 16,398.
- Foreign legislation:  
 German regulations, summary of, 16,385-6.  
 Inquiry and conclusions, 16,388-93.
- Leadless paints: use of in England, 16,424-8.
- Lead poisoning:  
 Cases known of, 16,430-7.  
 Reduction following on regulations slow in Germany, 16,387, 16,417-20, 16,456-8.
- Paints: standardisation of, 16,396.
- Regulations: enforcement in Germany, 16,394-5, 16,401-16, 16,421-2, 16,438-55.
- White lead: best paint base, 16,465-80.

## LINE, CHARLES A. (Consultant on House Decoration):

- Evidence, 9903-10,103.  
 Graphite paints: with zinc oxide durable protection for iron and steel, 9932 3, 10,023-7.
- Leadless colours:  
 All colours obtainable, 10,092-102.  
 Would not increase cost of painting, 10,093.
- Leadless paints: varnish should be used with, for outside work, 9930.
- Lead poisoning: serious evil in Birmingham, and many cases not classed as lead which should be, 9913-25, 9976-85, 10,029-34, 10,102-3
- Paints: vehicle more important than pigment, 9931-2.
- Prohibition: practicable, 9974.
- Zinc oxide:  
 Increased demand would:  
   Lead to manufacture in England, 9972.  
   Not lead to increase in price, 9973.  
 Method of production, 9954-5.
- Zinc paints:  
 Durability very good, 9958-69.  
 Lead not necessary, and water paints satisfactory for undercoats, 9946-50, 9986-92, 10,074-89.  
 Require special treatment as regards vehicle, 9934-41, 10,045-8.  
 Vehicles recommended, 10,042-4, 10,055-62.
- Zinc sulphide:  
 Covering power double that of lead, 9943-5.  
 More durable than lead for outside, 9993-10,022.

## LOWE, FRANK (of the National Amalgamated Society of Operative House and Ship Painters and Decorators):

- Evidence, 3254-370.
- Dry rubbing-down:  
 Amount of, 3303-5, 3316-30.  
 Indispensable in some cases, 3265-7.
- Dust and spray: danger from spray in stippling or painting ceilings, 3264.
- Lead poisoning:  
 Cases known of, 3256-63.  
 Unclean men more liable to, 3362-6.
- Meals: where taken, 277-8.
- Mixing:  
 Danger from fumes, 3271-3.  
   In burning out paint-caus, 3294-302, 3306-15.
- Overalls:  
 Danger of contaminating food by dirty overalls, 3281-4.  
 Generally worn and washed weekly, 3279-80.
- Prohibition: only solution, 3285.
- Removal of old paint:  
 Danger from:  
   Fumes in burning off, 3268, 3289-92, 3331-2.  
   Sandpapering after burning off, 3269-70.
- Rubbing-down: wet process impracticable after burning off, 3333-6.
- Washing:  
 Accommodation important, 3274.  
 Hot water difficult to obtain, 3275, 3337-44, 3366-70.
- Zinc paints:  
 Application easy after a little experience, 3348, 3352-3.  
 As good as lead, 3286-7.  
 Instances of use, 3345-52, 3355-61.  
 With varnish added satisfactory for outside, 3354.

## McDERMID, JOHN HENRY (of the National Association of Master House Painters and Decorators of England and Wales):

- Evidence, 7297-506.
- Dry rubbing-down:  
 Abolition of, would mean rougher work, 7492-8.  
 Causes dust, 7379-85.  
 Could be abolished for old work but not for new, 7436-49.  
 Exhaust fans impracticable, 7378.  
 No means of removing dust created, 7377.  
 Suggests felt and polish as an alternative, 7458-65.  
 Would not like to do without it between coats, 7369-76.

**McDERMID, JOHN HENRY—continued.**

Dust and spray: no way of removing danger in painting ceilings and stippling, 7386-95.  
Emanations: prohibition of lead only remedy, 7451-7, 7466-72.

Hours of employment: restriction to 48 hours difficult owing to seasonal nature of trade, 7405-8, 7417.

Insurance rates: recently increased, 7304-5.

Leadless paints:

Only way of removing danger, 7400-1.

Would increase cost of painting, 7402-3.

Lead poisoning:

Considers danger from uncleanness greater than from dust, 7434-5.

No cases of poisoning or sickness known of, 7301, 7306-10.

Regrettable that this country should be behind others in legislation regarding, 7340.

Unaware of extent of evil, 7499-506.

Master House Painters Association:

Extent of lead-poisoning evil not realised, 7323-38.

Have made tests to discover substitute by painting boards with different pigments, 7318-22.

Have taken no steps to discover extent of poisoning, 7311-7.

Meals:

Accommodation away from paint and dust impossible in some cases, 7422-4.

Invariably taken away from paint-work, 7363-8.

Mixing: done in paste form, 7398, 7484.

Outdoor clothing:

Storage away from paint and dust difficult in some cases, 7360-1, 7491.

Would provide suitable storage, 7429, 7489-90.

Overalls:

Generally taken home daily, 7353-6.

Should be provided, 7347-8.

Should be washed weekly, 7349-52.

Sometimes left in room where painting is done, 7357-9.

Storage apart from paint and dust sometimes impossible, 7362.

Would object to provide and wash overalls, 7425.

Periodical medical examination: would agree to it, but not for employer to pay, 7409-13, 7431.

Regulations: preferred to prohibition of lead, 7432.

Removal of old paint: can suggest nothing to remove fumes in burning off, 7396-7.

Washing:

Accommodation essential, 7341-2.

Hot water:

Desirable, 7343.

Generally obtainable, 7344-6, 7488.

Would agree to provide hot water, towels, soap, &c., 7418-21.

Zinc paints: cost more and are less stable than lead, 7477-81.

**McHUGH, J. (of the National Association of Master House Painters and Decorators):**

Evidence, 20,681-712.

Lead paints: considered best for outside work, 20,687.

Lead poisoning: very serious evil, 20,683, 20,694, 20,701.

Meals: times when taken, 20,707-12.

Prohibition preferred to Regulations by Liverpool Master Builders Association, 20,693, 20,704-6.

Regulations: impossible to carry out, 20,694.

Zinc paints:

As easy to apply as lead, 20,697-9.

Cost about same as white lead, 20,689-91.

Cost would rise if lead prohibited, 20,692.

Increasing use of, in Liverpool, 20,695-6.

Pure zinc oxide with varnish as good as white lead, 20,687-8.

**McKILLOP, DAVID (of the Scottish Painters' Society):**

Evidence, 20,713-21,040.

Dry rubbing-down:

Amount of, 20,776-8, 20,988-98.

Causes dust, 20,781-6, 20,797-800.

Great danger, 20,765.

Indispensable in some cases, 20,779-80, 20,792-6, 20,801-2.

u 7790

**McKILLOP, DAVID—continued.**

Dry rubbing-down—continued.

Only done on good work, 20,976-80.

Respirators:

Only suggestion, 20,766-74.

Uncomfortable, 20,775.

Dust and spray:

No dust in paint-shop, 21,016, 21,037-40.

No way of removing danger in painting ceilings, 20,808-10.

Respirator:

No knowledge of wearing, 20,888-91.

Only possible remedy for danger in stippling, 20,811-4.

Filling: alabastine used, 20,803-7, 20,892-7.

Hours of employment in Edinburgh, 20,922-3.

Leadless paints: no experience with, 20,929-31.

Lead paints: amount of sharp colour used in Scotland, 20,993-1003.

Lead poisoning:

Cases in which compensation has been paid, 20,966-75.

Details of cases among members of Scottish Painters' Society, 20,717-64, 20,932-59.

Many men do not know of compensation for, 20,960-3.

Meals:

Food sometimes kept in bag, 20,907-9.

Taken to work in paper in pocket, 20,864-6.

Time allowed, 20,924-6.

Mixing:

Done in shop or on job, 20,819-22.

Done with lead in paste form, 20,823-5.

No dust created, 21,015.

Overalls:

Kept in workroom, 20,906.

No hardship for men to supply and clean, 21,033-6.

Provided and washed by men, 20,858-60, 20,867-74.

Periodical medical examination advocated, 20,876-7a.

Prohibition: only remedy, 20,881-7.

Regulations: difficult to enforce by inspection, 20,910-2.

Removal of old paint: no danger from fumes in burning off, 20,815, 20,913-21.

Rubbing down:

Length of time required before new paint work can be rubbed down wet, 21,004-12.

Wet method can be used on old coats, 20,787-91.

Stopping: material not likely to soil hands, 20,832-4.

Turpentine: danger of substitutes, 20,816-8, 20,898-900.

Washing:

Accommodation important, 20,836.

Hot water: not essential and prefers cold, 20,840-6, 20,894-7.

Soap, towels, nail-brushes, &c., not always available, 20,852-7, 20,904-5, 21,025-32.

Time should be allowed, 20,837.

Water difficult to obtain sometimes, but generally available, 20,847-51, 21,019-24.

Zinc paints: prejudice against, 20,901-3.

**Master House Painters Association:**

Extent of poisoning:

Not realised: *Barker*, 6913-28, 7075; *McDermid*, 7323-38.

Realised: *Puttrel*, 6210-6; *Grundy*, 7132-6.

Have made no scientific experiments to discover a substitute for lead: *Puttrel*, 6192-7; *Grundy*, 7128-31.

Have made tests to discover substitute by painting boards with different pigments: *Chappell*, 6467-71; *Wiltshier*, 6678-81; *Barker*, 6909-12; *McDermid*, 7318-22.

Have taken no steps to discover extent of lead poisoning: *Puttrel*, 6181-91; *Chappell*, 6457-64, 6620; *Barker*, 6897-908; *Grundy*, 7120-7; *McDermid*, 7311-7.

Or prevent it: *Vaughan*, 13,541-7.

Have taken no steps to mitigate lead poisoning: *Chappell*, 6465-6.

Have tried to educate apprentices at technical schools to be clean and so combat lead poisoning: *Puttrel*, 6198-209.

**Master House Painters Association—continued.**

- Untrained men taken on in busy season: *Wiltshier*, 6820-2.  
 Will take up the question of lead poisoning: *Barker*, 7077-9.  
 Would not take exception to prohibition of lead: *Barker*, 7103.

**MATTON, JULIUS (Member of the Metal Exchange):**

- Evidence, 17,489-558.  
 Lead:  
 Consumption in England, 17,489, 17,497-8.  
 English better for white lead making and commands better price than foreign, 17,524-30.  
 Fluctuation in prices and output, 17,500-17.  
 Proportion used for white lead making, 17,499.  
 Reasons why foreign importer should not suffer so much as English producer if white lead prohibited, 17,518-23, 17,531-58.  
 Lead mining: prejudicial effect of prohibition, 17,492-5.

**Meals:**

- Accommodation away from lead paint and dust:  
 Can generally be provided: *Campbell*, 3414-8; *Bancroft*, 4101-2; *Puttrell*, 6255-9; *Chappell*, 6525-6, 6633-7; *Wiltshier*, 6709-15; *Holliday*, 8483-90; *Higgs*, 8917-23; *Orr*, 10,565-71, 10,789-96; *Guest*, 11,097-102, 11,176-9; *Scott*, 12,232-4.  
 Difficult or impossible in some cases: *Cookson*, 2176; *Parsonage*, 2721-3; *Pickles*, 2983-5; *Walsh*, 3104-6; *Barker*, 6954-6; *Grundy*, 7196-7; *McDermid*, 7422-4; *Walker*, 9074; *Carfrae*, 10,836-7; *Dobie*, 10,955-8, 11,060-3; *Bennett*, 11,228; *Anderson, R. L.*, 11,340; *Donald*, 12,334-6; *Vaughan*, 13,640-4, 13,815-6; *Morton*, 13,898-9; *Styles*, 14,077a-80; *Anderson, J.*, 19,536-41; *Wilkinson*, 19,926-7; *Honeychurch*, 20,047; *Devine*, 20,395-8; *Wallis*, 20,592-7.  
 Generally provided on large jobs: *Parsonage*, 2927-38; *Campbell*, 3550.  
 Should be provided: *Holliday*, 8479-82.  
 By householders: *Wallis*, 20,644-5.  
 Sometimes provided but no real need for it: *White*, 9252.  
 Danger of contamination of food by dirty overalls, paint brushes, &c.: *Lowe*, 3281-4; *Campbell*, 3551-4; *Anderson, R. L.*, 11,382-91; *Devine*, 20,554-6.  
 Eating meals in paint shop might be injurious: *Harris*, 3770-3, 3775-9.  
 How taken to, and kept at, work: *Campbell*, 3555-7; *McKillop*, 20,864-6, 20,907-9.  
 Should be prohibited near paint or lead dust: *Cookson*, 2177-9; *Puttrell*, 6251-4, 6260-2; *Chappell*, 6522-4.  
 Times when taken: *Laidler*, 699-702; *Crace*, 1968; *Sibthorpe*, 17,937-42, 17,978-80; *McHugh*, 20,707-12; *McKillop*, 20,934-6.  
 Where eaten: *Laidler*, 703-10, 914-17, 970-1; *Wilson*, 3239-42, 3250-3; *Lowe*, 3277-8; *Webb*, 4270-1; *Bonner*, 4343-6.  
 Away from work mostly: *Crace*, 1970-5; *McDermid*, 7363-8; *Honeychurch*, 20,043-52.  
 In rooms when painting is in progress sometimes: *Harris*, 3689-94, 3780-1; *Cantrill*, 3856-60; *Grundy*, 7192-5; *Wilkinson*, 19,928-31.

**MEISSI, ODO MARIA (Master Painter, of Vienna):**

- Evidence, 14,688-832.  
 Dry rubbing-down could be dispensed with, 14,688, 14,725-9.  
 Leadless paints:  
 Climate of England may affect less than climate of Austria, 14,703-4.  
 Unsatisfactory, 14,678-9, 14,689-702, 14,790-6.  
 Lead paints should be labelled "Poisonous," 14,685.  
 Lead poisoning:  
 Decrease in, due to Regulations in Austria, 14,676.  
 In Austria, 14,715-24, 14,734-46.  
 More prevalent among unclean and untrained men, 14,730-3, 14,807-10.  
 Paints: effect of varnish, 14,771-5.

**MEISSI, ODO MARIA—continued.**

- Periodical medical examination: Austrian regulations regarding, not strictly enforced, 14,721.  
 Red lead: indispensable for ironwork, 14,682-5, 14,823-32.  
 Regulations:  
 Enforcement of, in Austria, 14,677, 14,705-14, 14,758-9.  
 Necessary, 14,757.  
 Zinc paints:  
 Cost about same as lead, 14,797-801.  
 Covering power less than lead, 14,680-1.  
 Not so durable as lead, 14,761-4.  
 Oil separates from pigment if kept a long time, 14,749-53.  
 With varnish satisfactory for outside, 14,816-20.
- MILLER, HEDLEY (of the London Chamber of Commerce):**  
 Evidence, 17,064-235, 22,549-627.  
 Lead:  
 Capital invested and number employed in smelting industry, 17,071-3, 17,103-4, 17,130-2.  
 Dependent on foreign sources for supply, 17,159-60.  
 Prejudicial effect of prohibition:  
 On price, 17,069, 17,096-7.  
 On smelting industry, 17,074.  
 Production in England, 17,094-5, 17,152-8.  
 Leadless paints: London Chamber of Commerce Inquiry, 17,078-81, 17,112-4, 17,133-7.  
 Lead mining:  
 British ore contains very little silver, 17,127-9.  
 Prejudicial effect of prohibition, 17,070, 17,098-101a.  
 Paints: relative prices of zinc and lead, 17,116-8.  
 Prohibition:  
 Effect on other industries, 17,067-8.  
 Would close white lead works, 17,088-9.  
 Red lead: capital invested and output, 17,074, 17,106-8.  
 Regulations: should be given a trial before lead prohibited, 17,199.  
 White lead:  
 Amount manufactured, exported, re-exported, and consumed in United Kingdom, 17,065, 17,086-7, 17,090-3, 22,551-2, 22,556-71.  
 Amount used for painting purposes, 17,228-35, 22,553-5.  
 Amount used for purposes other than painting, 17,119-22, 22,576-82, 22,606-27.  
 Best paint pigment, 17,110-1.  
 Capital invested, 17,066.  
 Effect of prohibition:  
 On export trade, 22,596-605.  
 On market, 22,572-86.  
 Foreign competition, 22,587-95.  
 Trade dependent on foreign sources in some measure, 17,123-6.  
 Zinc:  
 Dependent on foreign sources for supply, 17,161-2.  
 Production in England, 17,152-8.  
 Zinc oxide:  
 History, capital invested, production, &c., 17,076-7, 17,082.  
 Importation increasing, 17,138-40.  
 Mainly a foreign product, 17,194-6.  
 Manufacture in England, 17,167-72.  
 Difficult, 17,198, 17,216-20.  
 Only substitute for lead in any way efficient, 17,075.  
 Price would rise with increased demand, 17,173-83, 17,197.  
 Used for other purposes than painting, 17,223-6.  
 Zinc paints:  
 Application difficult, 17,147-51, 17,202-6.  
 Failure of experiments, 17,190-2.  
 Increasing use of, 17,207-15.  
 Satisfactory for inside work, but not for outside, 17,077, 17,083.
- MILNES, F. H.:** See FLATAU, CAPT. L.S.  
**MILTON, JOHN (of the London Association of Master Decorators):**  
 Evidence, 20,191-333.

**MILTON, JOHN—continued.**

- Leadless paints:  
 Cost with special medium not much more than white lead, 20,278-82, 20,325-31.  
 Covering power better than white lead, 20,270.  
 Lithopone satisfactory for inside, 20,275-7.  
 Medium important, 20,245, 20,264-6, 20,269-71.  
 Satisfactory trials, 20,246-63, 20,290-5.  
 Trade prejudice against new materials, 20,283-9.  
 White, with special medium, more durable than lead, 20,245.
- Lead poisoning:  
 Cases of poisoning and sickness known of, 20,201-23.  
 Surprised at extent of evil, 20,226-38.
- Overalls:  
 Provided and washed by men, 20,299-302.  
 Provision by employer objected to, 20,305-7.  
 Would agree to wash them, 20,303-4.
- Periodical medical examination: would agree to, 20,321.
- Prohibition:  
 Possible effect on public, 20,244.  
 Preferred to regulations, 20,240, 20,324.
- Washing:  
 Facilities already provided, 20,308-11, 20,315-20.  
 Hot water not essential, 20,312-4.  
 Provision of towels objected to, 20,321.
- White lead: could be prohibited for inside work, but not for outside, 20,239-43, 20,267-8.
- Zinc paints: pure zinc oxide not such good covering power as white lead, 20,272-3.

**Mixing paints:**

- Breaking up of lead done by machinery, *Harris*, 3731.
- Dangerous: *Rivet*, 15,462-3.
- Difficulty in bringing process under Factory Act: *Smith, J. C.*, 1636-8.
- Dropped hands among colourmen after several years' work: *Parsonage*, 2694-709.
- Dust not created as lead in paste form: *Crace*, 1937-40; *Campbell*, 3464; *Cantrill*, 3894; *Banner*, 4298; *Wiltshier*, 6785, 6847-8; *McDermid*, 7398, 7484; *Sibthorpe*, 17,907; *McKillop*, 20,823-5, 21,015; *Smith, A.*, 21,181-2, 21,187.  
 If lead in paste form: *Legge*, 282-3.
- Exhaust fans impracticable: *Legge*, 342-3.  
 Not installed where mixing done dry, *Laidler*, 642-3.
- Fumes, dangerous: *Pickles*, 2970-2; *Walsh*, 3094-5; *Wilson*, 3174-84, 3193-4; *Low*, 3271-3; *Bancroft*, 4060-2; *Wobb*, 4188-9, 4195-6.  
 In burning out paint cans: *Low*, 3294-302, 3306-15; *Wobb*, 4190; *Banner*, 4302-7.  
 Do not cause lead poisoning: *Carson*, 11,930.
- No decrease in amount of dry-mixing: *Plumb*, 18,246-61.
- Red lead dangerous: *Holzappel*, 11,572-5.
- Should be done by paint manufacturers: *Wait*, 1457-61, 1515-6, 1530; *Carson*, 11,752-5, 11,929.  
 With lead in paste form: *Puttrel*, 6316-9; *Chappell*, 6551.
- Use of ready-mixed paints increasing: *Rivet*, 15,464-7.
- Way in which done: *Laidler*, 614-22; *Devine*, 20,382-3, 20,540-3.  
 With hands known: *Wait*, 1511-4, 1524-9.  
 Unknown: *Crace*, 2088-9.
- Where done: *Pickles*, 2966-9.  
 In paint shop: *Harris*, 3730; *Smith*, 21,180.  
 Or on job: *McKillop*, 20,819-22.  
 Mostly on job: *Laidler*, 1018-21; *Crace*, 1034-6; *Campbell*, 3463; *Cantrill*, 3893; *Chappell*, 6550; *Wiltshier*, 6749, 6784.

**MOCKFORD, GEORGE BEVAN (Foreman of Painters at H.M. Dockyard, Portsmouth):**

- Evidence, 8721-851.
- Dry rubbing-down: principal danger, 8738-9.
- Iron oxide paints:  
 Not so good as lead for priming, 8830-5.  
 Substituted satisfactorily for lead in confined spaces, 8729-35, 8836-7.
- Leadless paints:  
 Results not so good as lead, 8758-61.

**MOCKFORD, GEORGE BEVAN—continued.**

- Leadless paints—*continued.*  
 Use of, decreases lead poisoning in Navy, 8827-9.
- Lead paints:  
 Greater covering power than zinc, 8756-7.  
 Possibly needed for priming on iron and steel, 8805-9.  
 Smell injurious, 8742.
- Lead poisoning:  
 Cases known of, 8726.  
 Cases still occur in spite of precautions, 8825-6.  
 Precautions against, taken by Admiralty, 8766-78, 8811-24.
- Prohibition:  
 For insides not a hardship, 8810.  
 Practicable with reservations for iron primings, 8780-5.
- Ship painting: interiors in Navy done every two or three years, 8786, 8793-8, 8801-3.
- Washing: hot water essential, 8768-9.
- Zinc paints:  
 As durable as white lead, 8791-2.  
 Extended use of, requisite to obviate danger, 8741, 8764.  
 Grey colour for outsides of ships in Navy could be obtained, 8839-51.  
 Preferred to white lead for finishing coats in Navy, 8736.  
 Retain their colour better than lead, 8804.  
 Used for interior painting in Navy, 8743-6.  
 Used for royal apartments on H.M. Yacht "Victoria and Albert," 8747-52.

**MORLEY, B. J. (Foreman Painter of Messrs. Cadbury, Ltd., of Bournville):**

- Evidence, 22,937-23,095.
- Iron oxide paints: satisfactory on iron and steel, 23,082-4.
- Leadless colours: satisfactory, 23,037-44, 23,085-90.
- Leadless paints:  
 Better than lead on greenhouses, 22,989-92.  
 Composition, mixing, medium, application, 22,949-73, 23,029-32, 23,072-3.  
 Cost same as for lead, 22,974-7.  
 Drying difficulties overcome, 23,002-3.  
 Instances of use, 22,978-88, 23,048-63.  
 Satisfactory, 22,962-3.  
 Stand well for seven years, 22,994-7.
- Lead poisoning: cases known of, 23,006-9.
- Painters: health of, 23,010-28.
- Turpentine: danger of inferior qualities, 23,074-5.
- Zinc paints:  
 Addition of varnish does not increase cost, 23,094-5.  
 Increases durability, 23,091.  
 Cost more than lead but cover greater area, 23,035-6.  
 Easy to apply, 23,066.  
 Satisfactory for outside work, 23,076-81.

**MORTON, G. H. (of the National Federation of Building Trades Employers):**

- Evidence, 13,824-971.
- Dry rubbing-down:  
 Could be dispensed with, 13,900-8.  
 Respirators, only suggestion, 13,909-12.
- Dust and spray: no way of avoiding splashes in painting ceilings and stippling, 13,913-8.
- Hours of employment: number per week, 13,929.
- Insurance rates: have recently increased, 13,831-2.
- Leadless paints: unsatisfactory and costly trials, 13,926-8.
- Lead poisoning:  
 Cases known of very few, 13,828-30, 13,833-6, 13,953-5.  
 Regrettable that this country should be behind others in legislation regarding, 13,861.  
 Unaware of extent of evil, 13,848-59.
- Meals: accommodation away from paint, &c., impossible in some cases, 13,898-9.
- National Federation of Building Trades Employers:  
 Have taken no steps to prevent evil, 13,837-43.  
 Realise extent of evil, 13,844-7.
- Outdoor clothing: storage away from paint difficult in some cases, 13,880-97.
- Overalls: provision and washing by occupier objected to, 13,871-8.

**MORTON, G. H.—continued.**

- Periodical medical examination:  
 Transference of suspended persons to other work practicable, 13,948-52.  
 Would not agree to, 13,930-8.
- Prohibition:  
 Complete, regulations only partial, remedy, 13,924-5.  
 Preferred to regulations, 13,939-42, 13,957.
- Regulations:  
 Enforcement impossible, 13,867-70.  
 Would involve increased charges, while use of lead would involve more frequent painting, 13,958-62.
- Removal of old paint: no way of avoiding fumes in burning off, 13,919-23.
- Rubbing-down: time occupied at, 13,943-7.
- Washing:  
 Accommodation should be provided, 13,862-4.  
 Hot water difficult to provide in some cases, 13,865-6.
- Zinc paints:  
 More expensive than lead for outsides, 13,967-71.  
 Satisfactory for outside work, 13,963-6.

**MUNBY, A. E., A.R.I.B.A., and WONNACOTT, W., A.R.I.B.A., F.S.I. (of the Royal Institute of British Architects):**

- Evidence, 2310-489.
- Lead paints: specified as a matter of habit, 2390-2.
- Paints:  
 Comparative covering powers of lead and zinc, 2471-6.  
 Fine grinding:  
 Importance of, 2320-6.  
 Increased durability, 2318-19, 2412-21.
- Greens:  
 Difficult to obtain without lead, 2346.  
 Materials generally used, 2369-78.
- Medium important, 2379-88.
- Standardisation needed, 2317.
- Use of barium sulphate, 2366-8.
- Weight for given area should be specified, 2327-8, 2422-6.
- Prohibition: architects generally would welcome if possible, 2394-5.
- Restriction to 5 per cent. soluble lead: safe to assent to, 2350-6, 2452-7.
- White lead: lead sulphate has excellent durability, 2365.
- Zinc oxide: recent improvements in, 2401-9.
- Zinc paints:  
 As good as lead for inside, 2329.  
 Cost no greater than lead, 2330, 2333-4.  
 Could replace lead for interior work, 2335-6.  
 Covering power:  
 Increased by addition of basic sulphate of lead, 2479-88.  
 Not so good as lead, but spreading power greater, 2331-2, 2427-8.  
 Difficulty in specifying by architects, 2440-50.  
 Failings of, 2359-64.  
 Lighter colour not so durable as lead outside, 2345.  
 Not so easy to apply as lead, 2338, 2429-30.  
 Treatment needed not same as lead, 2340-4.  
 Unsatisfactory for iron work, 2477-8.

**National Federation of Building Trades Employers:**

- Extent of evil not thoroughly recognised: *White*, 9177-223, 9372-4.
- Extent of evil realised: *Morton*, 13,844-7.
- Have made no experiments to discover substitute: *Higgs*, 8879-82; *White*, 9174-6.
- Have taken no action to prevent evil: *Morton*, 13,837-43.
- Have taken no steps to discover extent of lead poisoning: *Higgs*, 8873-8.
- Have taken steps to discover extent of lead poisoning: *White*, 9156-73.

**NIEDERHAÜSER, EMIL (Master Painter, of Cologne):**

- Evidence, 16,267-382.
- Dry rubbing-down:  
 Can be dispensed with, 16,303-4

**NIEDERHAÜSER, EMIL.—continued.**

- Dry rubbing-down—continued.  
 Moistening paint before sandpapering in Germany, 16,374-9.  
 Prohibited in Germany, 16,292.
- Lead poisoning: reduction following on regulations in Germany slow, 16,269-70, 16,278-87.
- Overalls: provided and washed by men in Germany, 16,319-24.
- Prohibition:  
 Effect on other trades, 16,276.  
 Impracticable, 16,330, 16,335.
- Regulations:  
 Enforcement in Germany, 16,271, 16,288-302, 16,314-6, 16,325-9.  
 Should be tried before prohibition, 16,356.
- Rubbing down: length of time required before new paint can be rubbed down wet, 16,305-9.
- Washing:  
 Hot water impracticable, 16,311-2.  
 Time not allowed in Germany, 16,366-9.
- White lead:  
 Better than zinc for outside work, 16,272-3.  
 Guarantee given, 16,302.  
 No satisfactory substitute found, 16,277, 16,355.
- Zinc paints:  
 Addition of varnish increases durability, 16,347-8.  
 No difficulty in application, 16,370-1.  
 Not so durable as lead, 16,344-6, 16,349-54.  
 Would not guarantee, 16,363.

**NOOIJEN, M. (of the Guild of Dutch Master Painters)**

- Evidence, 15,206-436.
- Compensation for lead poisoning payable in Holland, 15,313-8, 15,323, 15,414-30.
- Dry rubbing-down: can be dispensed with, 15,283.
- Filling: white lead can be prohibited, 15,214.
- Foreign legislation:  
 Dutch White Lead Commission:  
 Findings, 15,231-82.  
 Findings criticised and disagreed with, 15,332-43, 15,400-13.  
 Reasons for, 15,301-8.
- Lead poisoning: no cases in Holland, 15,221-30, 15,321-2, 15,431-4.
- Paints: medium important, 15,379-86.
- Regulations: enforcement of, in Holland, 15,294-300.
- Rubbing down: wet method can be used between coats, 15,283-9, 15,374-8.
- White lead: best paint for outside work, 15,208, 15,212, 15,361.
- Zinc paints:  
 Cost more for labour than lead, 15,251-7, 15,349-56.  
 Dry slower than lead, 15,387-93.  
 Effect of climate on, 15,344-8.  
 Effect of sulphurous atmospheres, 15,213, 15,231-40.  
 Inferior to lead in humid atmospheres, 15,242-50.  
 No special training of painters needed to apply it, 15,363-8.  
 With suitable medium suitable for inside and outside, but still inferior to lead, 15,209-11, 15,327-31.

**Office of Works (See also evidence of Sir H. Tanner and Mr. J. D. Patterson):**

- Large users of paints: *Willis*, 11,661-4.
- Paints cost more than lead paints to produce: *Garson*, 2572-6.
- Paints generally mixed by manufacturers: *Tanner*, 22,695-8.
- Supply lead to: *Rivet*, 15,636-51.

**ORR, JAMES M. (of the Association of Master House Painters in Scotland):**

- Evidence, 10,507-802.
- Compensation:  
 For lead poisoning: unaware of any claims, 10,764-8.  
 For suspension: would agree to, but for permanent painters only, and not casual men, 10,607-15.

**ORR, JAMES M.—continued.**

- Dry rubbing-down:  
 Amount of dust caused very little and not injurious, 10,618-32, 10,674-6, 10,779-81.  
 Indispensable in some cases, 10,633-47.  
 Moistening sandpaper suggested to avoid dust, 10,760-3.  
 Prohibition might be tried, 10,771-5.  
 Reasons for, 10,776-8.  
 Respirator suggested, 10,638-40.  
 Dust: exhaust fans impossible, 10,586-8.  
 Emanations: does not think they contain lead, 10,596-8.  
 Foreign legislation: is aware of legislation abroad, 10,541-6.  
 Insurance rates: lower in Scotland than England, 10,647-56, 10,782-6.  
 Leadless paints:  
 Office of Works test of 4 years not sufficient trial, 10,706-12.  
 Very little recent experience of, 10,683-94.  
 Lead poisoning:  
 Cases known of, 10,511-8.  
 Reliability of official statistics disputed, 10,519-40, 10,713.  
 Some action necessary, 10,642.  
 Thinks Scottish painters suffer less than English, 10,526-8, 10,662-73, 10,714-46.  
 Unaware that it predisposes to consumption, 10,677-82.  
 Meals: accommodation away from paint, &c., could be provided, 10,565-71, 10,789-96.  
 Outdoor clothing: storage away from dust, &c., possible, but difficult, 10,573-7, 10,791, 10,797-8.  
 Overalls:  
 Provision and washing by employer objected to, 10,558-64.  
 Should be worn, 10,752-4.  
 Periodical medical examination:  
 Impracticable, 10,769.  
 Would agree to, 10,599-606.  
 Prohibition:  
 Would agree to, if regulations impracticable, 10,547-57.  
 Would lower quality of painting, 10,641.  
 Regulations:  
 Difficult to observe, 10,589, 10,696-704.  
 Preferred to prohibition, 10,616-7, 10,695.  
 Removal of old paint: no remedy for fumes in burning off, 10,590-5.  
 Washing:  
 Accommodation important, 10,578.  
 Impracticable in some cases, 10,579-85.  
 Hot water practicable, 10,801-2.

**Outdoor Clothing:**

- Danger from dust: *Pickles*, 3057-8.  
 Sometimes hung up in room where painting is in progress: *Barker*, 6950-3, 7094; *Grundy*, 7189-91.  
 Storage away from paint and lead dust:  
 Could be provided: *Wiltshier*, 6708, 6717-9.  
 Difficult or impossible: *Chappell*, 6515-21; *McDermid*, 7360-1, 7491; *Holliday*, 8478-9; *Carfrae*, 10,840-1; *Dobie*, 11,060-3; *Guest*, 11,108-11; *Bennett*, 11,230; *Anderson, R. L.*, 11,342; *Donald*, 12,337; *Vaughan*, 13,630-9, 13,729-32; *Morton*, 13,880-97; *Griffiths*, 14,043; *Styles*, 14,077; *Anderson, J.*, 19,547; *Honeychurch*, 20,054-6; *Wallis*, 20,603-4.  
 Possible, but difficult: *Orr*, 10,573-7, 10,791, 10,797-8.  
 Would agree to provide, *McDermid*, 7429, 7489-90.

**Overalls:**

- Dust collecting on overalls:  
 Dangerous: *Parsonage*, 2718-20; *Pickles*, 2988-9; *Walsh*, 3109-10; *Bonner*, 4351-4; *Dobie*, 10,959-64.  
 None: *Sibthorpe*, 17,908-15.  
 Not dangerous: *Grundy*, 7178-85; *Plumb*, 18,316-8.  
 Very little: *Harris*, 3686-8.  
 No hardship for workers to provide and clean: *Anderson, J.*, 19,731-3; *Devine*, 20,487-93; *Wallis*, 20,636-8; *McKillop*, 21,033-6.

**Overalls—continued.**

- Not worn by railway painters: *White*, 9510-2.  
 Provided and washed by workers in Germany: *Niederhäuser*, 16,319-24.  
 Provided by men: *Legge*, 337; *Laidler*, 637; *Crace*, 1930-1; *Barker*, 7009; *Anderson, R. L.*, 11,331-6; *Scott*, 12,230; *Donald*, 12,332; *Milton*, 20,299-302; *McKillop*, 20,858-60, 20,867-74.  
 Provision and washing:  
 Difficult or impossible: *Orr*, 10,558-64; *Dobie*, 10,952-4; *Guest*, 11,096; *Bennett*, 11,226-7; *Anderson, R. L.*, 11,337-9.  
 In Germany: *Legge*, 338.  
 Not objected to: *Carfrae*, 10,834-5; *Vaughan*, 13,623-8.  
 Serious item: *Styles*, 14,073-5.  
 Workers might object: *Sibthorpe*, 17,920-5.  
 Provision by employer:  
 Difficult or impossible: *Grundy*, 7279-82; *Donald*, 12,333; *Griffiths*, 14,032-6; *Anderson, J.*, 19,531-5, 19,725-8; *Wilkinson*, 19,924-5; *Honeychurch*, 20,046, 20,139-49.  
 No reason for: *Walker*, 9064-9.  
 Not objected to, if custom: *Holliday*, 8469-71.  
 Objected to: *McDermid*, 7425; *White*, 9237-40; *Scott*, 12,231, 12,288-9; *Morton*, 13,871-8; *Sibthorpe*, 17,768-71; *Milton*, 20,305-7.  
 Should be provided by workers: *Higgs*, 8908-11; *Plumb*, 18,314-5.  
 Should be worn: *Cookson*, 2180; *Campbell*, 3402; *Harris*, 3675-9; *Cantrill*, 3851; *Puttrell*, 6240; *Chappell*, 6494; *Wiltshier*, 6698; *Barker*, 6938; *Grundy*, 7160-1; *McDermid*, 7347-8; *Orr*, 10,752-4; *Carson*, 11,756; *Wilkinson*, 20,010-2.  
 Storage: *Cantrill*, 3853-5; *Chappell*, 6511-4; *Walker*, 9073; *Scott*, 12,235-51; *Donald*, 12,337.  
 Away from paint and dust:  
 Difficult or impossible: *McDermid*, 7362; *Holliday*, 8475-7; *Guest*, 11,103-7, 11,175-6; *Bennett*, 11,229; *Anderson, R. L.*, 11,341; *Griffiths*, 14,037-40; *Styles*, 14,076; *Anderson, J.*, 19,542-6; *Wilkinson*, 19,932-3; *Wallis*, 20,598-602, 20,678-80.  
 Could be provided: *Campbell*, 3404-13; *White*, 9244-51; *Carfrae*, 10,838-9; *Honeychurch*, 20,053.  
 In paint shop not dangerous: *Honeychurch*, 20,150-1.  
 In rooms where painting is in progress: *Wiltshier*, 6704-7; *Barker*, 6940-9; *Grundy*, 7186-8; *McDermid*, 7357-9.  
 Separate room should be provided: *Carson*, 11,758-70.  
 Trousers overalls unnecessary: *Harris*, 3680; *Chappell*, 6495-500; *Grundy*, 7162-7.  
 Washing of: *Legge*, 339-40; *Laidler*, 639-41, 1016-7; *Crace*, 1932, 2062-4, 2075; *Cookson*, 2181-3; *Bonner*, 4348-50; *Walker*, 9070-2; *Devine*, 20,404-5; *Wallis*, 20,587-8, 20,590-1.  
 Done at home or in laundry: *Wiltshier*, 19,942; *Devine*, 20,544-53; *Smith, A.*, 21,213-27.  
 Should be done by men: *Puttrell*, 6241-2; *Plumb*, 18,314-5.  
 Should be done weekly: *Cantrill*, 3852; *Chappell*, 6501-10; *Wiltshier*, 6699-701; *Barker*, 6939; *Grundy*, 7168-70; *McDermid*, 7349-52; *Carson*, 11,756.  
 Workers should be made responsible for: *Grundy*, 7171-7, 7271-8.  
 Workers should not be made responsible for: *Harris*, 3681-5.  
 Would agree to: *White*, 9241-3; *Milton*, 20,303-4.  
 In custom, *Holliday*, 8472-4.  
 Would not agree to, at employers' expense: *McDermid*, 7425; *Higgs*, 8912-4.  
 Where kept when not in use:  
 In bags with food: *Puttrell*, 6243-6; *Wiltshier*, 6702-3.  
 In paint shop: *Higgs*, 8915-6.  
 In work-room: *McKillop*, 20,906.  
 Left on job: *Puttrell*, 6247-50.  
 Taken home daily: *McDermid*, 7353-6.

**Overalls—continued.**

Worn and washed weekly: *Parsonage*, 2716-7; *Pickles*, 2986-7, 3056, 3071-5; *Walsh*, 3107-8; *Lowe*, 3279-80; *Bancroft*, 4103-6; *Webb*, 4235-42; *Devine*, 20,399-403; *Smith, A.*, 21,205-9.  
In Belgium: *Ricker-Devroede*, 14,910.

**Painters:**

Ages of: *Anderson, R. L.*, 11,401-15.  
Conditions, system of employment, mealtimes, &c.: *Anderson, J.*, 19,811-37, 19,868-78.  
Estimated number of: *White*, 9361-3.  
Follow no other occupations in slack seasons: *Chappell*, 6612-3.  
Formerly more exposed to dangers of lead poisoning: *Chappell*, 6614.  
Health of: *Crace*, 2032-5; *Chappell*, 6605-11; *Morley*, 23,010-28.  
More liable to accidents in Scotland than in England: *Gardner, A.*, 3979-81.  
Proportion of unskilled men in Trade Unions: *Sibthorpe*, 17,702-30.  
Registration advocated: *Plumb*, 18,869-73; *Johnson*, 22,474-6.  
Should be provided with work in winter: *Scott*, 12,292-3.  
Sickness among: *Anderson, R. L.*, 11,392-400.

**Paint Grinding** (See also "Mixing"):

Important as regards durability: *Klein*, 16,836.  
Industry should be considered in any action to reduce lead poisoning among house painters: *Willis*, 11,648-50.  
No difference to trade whether lead or zinc ground: *Willis*, 11,670-87.  
Same machinery could be used with zinc as lead: *Carson*, 11,847; *Crow*, 12,181-2.  
White lead in dry state preferred: *Cookson*, 2284-7.

**Painting:**

Amount done by Office of Works: *Tanner*, 22,669-74.  
Architects responsible for specifications: *White*, 9393-5.  
Ceilings could be done without lead, *White*, 9446-50.  
Cost:  
Comparison of lead and zinc: *Honeychurch*, 20,099-104.  
Lead cheaper than zinc: *Patterson*, 1114.  
Hands must get soiled in certain operations: *Laidler*, 691-6, 940-3; *Smith, A.*, 21,188-9.  
Healthy occupation: *Dobie*, 11,023-9.  
Instructions of:  
Commissioners of Irish Lights and Public Works: *Sibthorpe*, 17,679-88.  
Office of Works: *Patterson*, 22,796-820, 22,892-8.  
Office of Works:  
Contracts:  
Extent of: *Patterson*, 1048-52, 22,877-9.  
Way in which carried out: *Patterson*, 1168-74, 12,971-82, 13,054-70, 22,871-6.  
Other trades as dangerous: *Francis*, 17,243, 17,281-6, 17,304-7; *Humphreys*, 17,348-9, 17,373-5; *Johnson*, 22,341-6.  
Present-day methods tend to increase danger: *Bancroft*, 4110-31.  
Process same in Scotland as in England: *Gardner, A.*, 3979.  
Spraying:  
Abandoned because unhealthy: *Philip*, 8692, 8711-3.  
Dangerous: *Legge*, 304-5; *Wait*, 1462-4; *Hardwick*, 1862-4; *Bancroft*, 4079.  
Trade not regulated, as outside scope of Factory Act: *Legge*, 172-4.  
Workshops often in dirty condition, *Legge*, 327-30.

**Paints:**

Barium sulphate: use of, in paints: *Munby and Wonnacott*, 2366-8.  
Composition, mixing: comparative qualities of lead and zinc: *Villemot*, 16,172-86.  
Constituents and their functions: *Smith, J. C.*, 1566-89, 1652-3.

**Paints—continued.**

Cost: comparison of lead and zinc: *Smith, J. C.*, 1615-22; *Patterson*, 12,910-4; *Rivet*, 15,476-80, 15,486-7; *Miller*, 17,716-8.  
Covering power: comparison of lead and zinc: *Munby and Wonnacott*, 2471-6; *Rivet*, 15,495-503; 15,543-5.  
Dark colours: some do not contain lead: *Anderson, J.*, 19,879-86.  
Durability:  
Four years a good trial: *Wiltshier*, 6876-7.  
Increased by fine grinding: *Munby and Wonnacott*, 2318-9, 2412-21.  
Mixtures of one-third lead and two-third zinc better than white lead: *Harris*, 3785-6.  
On exteriors: *Laidler*, 987-94.  
Effect of varnish: *Meissl*, 14,771-5.  
Efficiency tests: comparison of lead and zinc: *Smith, J. C.*, 1601-10, 1654-7; *Patterson*, 12,944-67, 12,983-8; *Rivet*, 15,473-83; *Sibthorpe*, 17,850-64.  
Fine grinding: importance of, *Munby and Wonnacott*, 2320-6.  
Grades used by Office of Works: *Patterson*, 1053-8.  
Greens:  
Contain 5-7 per cent. of lead: *Cunnew*, 10,187, 10,250-1, 10,253.  
Difficult to obtain without lead: *Munby and Wonnacott*, 2346.  
Materials generally used: *Munby and Wonnacott*, 2369-78.  
Lead necessary for some outside work: *Harris*, 3738-43.  
Lead sulphate a good and nearly harmless paint base: *Wait*, 1467-71.  
Medium:  
Important: *Munby and Wonnacott*, 2379-88; *Nooijen*, 15,379-86.  
More important than pigment: *Line*, 9931-2.  
No lead used except for greens: *Cunnew*, 10,189-98.  
Obliterating power: comparison of lead and zinc: *Vickers*, 19,331-55.  
Ready-mixed paints:  
Effect of introduction: *Honeychurch*, 20,127-33.  
Should be supplied: *Depierres*, 19,131-3.  
Specification by architects: *Johnson*, 22,452-4; *Tanner*, 22,687-91.  
Standardisation: *Munby and Wonnacott*, 2317; *Leyendecker*, 16,396.  
Sulphurous atmospheres: effect on lead and zinc: *Klein*, 16,832-4.  
Weight for given area should be specified: *Munby and Wonnacott*, 2327-8, 2422-6.  
Weight important: *Philip*, 8673-5.

**PARSONAGE, JOSEPH** (Member of the Committee and Representative of the National Amalgamated Society of Operative House and Ship Painters and Decorators):  
Evidence, 2625-949, 3966-972.  
Compensation for lead poisoning:  
Claims, 2750-2.  
Some men reluctant to claim, 2753.  
Dry rubbing down:  
Amount of, 2884.  
Sandpaper used, 2890-909.  
Causes considerable dust: 2648-52, 2844.  
Indispensable in some cases: 2653-6, 2727-31, 2886-98.  
Moistening sandpaper with turps impracticable, 2845-8.  
Principal danger, 2637, 2647, 2883.  
Dust and spray:  
Caused in painting ceilings and stippling, 2672-9.  
Danger in stippling diminished by increase in use of distempers, 2849-53.  
Exhaust fans impracticable, 2683, 2726.  
Principal danger, 2861.  
Respirator impracticable, 2680-2, 2857, 2910.  
Storage of difficult, 2858-9, 2911-4.  
Emanations:  
Respirator would not prevent inhalation, 2787-90.  
Thinks they cause poisoning, 2689-92, 2860.  
Filling: application, and methods of smoothing, 2658-62.  
Hours of work: number per week, 2684-8, 2915-7.

PARSONAGE, JOSEPH—*continued*.

- Leadless paints : no insuperable difficulties in application or mixing, 2759-60.
- Lead poisoning :  
Cleanliness alone does not give immunity, 2814-7.  
Fewer cases in Scotland : reasons for, 2828-43.  
Predisposes to other diseases, 2754-5.  
Statistics of trade societies, 2627-31, 3966-72.  
Untrained men more liable to, 2744-6, 2748-9, 2811-13, 2865, 2881.
- Meals :  
Accommodation away from paint impossible in some cases, 2721-3.  
Generally provided on building jobs, 2927-38.
- Mixing : dropped hands among colourmen after several years' work, 2694-709.
- Overalls :  
Danger from dust, 2718-20.  
Generally worn and washed weekly, 2716-7.
- Periodical medical examination : impracticable as too many men would be rejected, 2738-43, 2797-810.
- Prohibition : only solution, 2725, 2732, 2747, 2756.
- Removal of old paint :  
Rubbing down after burning off dangerous, 2693.  
Scraping off causes dust, 2710.
- Rubbing down :  
Methods of, 2638-45, 2663-6.  
Wet rubbing between coats impracticable, 2667-71.  
Very little danger, 2885.
- Wages : rates of, 2866-78.
- Washing :  
Accommodation important, 2711-5.  
Impracticable in some cases, 2767-77.  
Painters generally take advantage of it, 2782-3.  
Facilities sometimes refused by employer, 2943-9.  
Hot water never refused to men when available, 2939-42.  
Not always obtainable, 2713, 2778-81, 2818-28.  
Time not allowed, 2920-4, 2926.

## PATTERSON, GEORGE DOBSON (of H.M. Office of Works) :

- Evidence, 1041-178, 12,902-13,081, 22,743-936.
- Leadless colours :  
Greens likely to be available soon, 12,928.  
Use of aniline, 1165-7.
- Leadless paints :  
As good as lead, 12,935, 13,047-53.  
Durability increased by addition of varnish, 12,905-6.  
Durability on Canterbury Post Office, 12,918-25, 13,006-12.  
Instances of use, 22,792-5.  
Kinds used by Office of Works, 22,857-69, 22,880-5.  
Leadless primings being tested for ironwork, 22,833-42.  
Used for wood by Office of Works, 22,822-32, 22,916-8.  
Length of experience, 1043-7.  
Men do not complain of ill-health from, 13,036-8.  
No prejudice against, 1060-1.  
Not appreciated by workers, 1062.  
Office of Works in same position as ordinary employer as regards experiments, 12,936-9.  
Proportion of driers and varnish used, 12,902-4.  
Standard formula, 22,923-36.  
Tests made by Office of Works, 22,743-57, 22,886-9.
- Lead paints :  
Defects of, 1059.  
No better than zinc in greenhouses or warm moist atmospheres, 12,929-33.  
Still used for priming on iron and steel, 22,833-4.
- Lead poisoning : cases in painting Menai Bridge, 13,039-40.
- Painting :  
Cheaper with zinc than lead, 1114.  
Extent of Office of Works contracts, 1048-52, 22,877-9.  
Instructions of Office of Works, 22,796-820, 22,892-3.  
Way in which Office of Works contracts are carried out, 1168-74, 12,971-82, 13,054-70, 22,871-6.

PATTERSON, GEORGE DOBSON—*continued*.

- Paints :  
Comparative tests with lead and zinc by Office of Works, 12,944-67, 12,983-8.  
Grades used by Office of Works, 1053-8.  
Relative prices of lead and leadless paints, 12,910-4.
- Prohibition :  
Exemption period two or three years, 1149-51.  
Office of Works experience sufficient to warrant it, 12,968-70.  
Practicable and not a dangerous step, 1116-7.  
Practicable with reservations for greens and iron primings, 1121, 13,001-2, 22,852-4.  
Restriction to five per cent. soluble lead :  
Greens require up to ten per cent. lead, 1120, 12,927-8, 12,940-1, 13,013-24.  
Practicable except for greens, 13,071-9.  
Stopping : ten per cent. lead useful, 22,843-9, 22,919-21.
- White lead : reasons for continued use by Office of Works, 12,989-3,000, 13,025-36, 13,041-6, 22,899-915.
- Zinc paints :  
Continual improvements in, 1128-30.  
Difficulties in drying, opacity, &c., overcome by experiment, 1063-71.  
Difficulty in getting dark shades, 1093-106.  
Difficulty in specification by architects, 1154-7.  
Flat finish practicable, 12,916-7.  
Less coats required than with lead, 1072.  
Medium :  
Important, 1143-8, 1175.  
Used, 1107-12.  
No practical difficulty in application, 1123-5, 22,922.  
Percentage of impurity which should be allowed in pure zinc oxide, 1134-41.  
Repainting only done at normal intervals, 22,816-7.  
Satisfactory for outside and inside work, 1092, 1118-9, 1131.  
Tests made by Office of Works :  
Details of, 22,767-87.  
Satisfactory, 22,758-66.  
Trade prejudice against new materials, 1158-61.  
With varnish added :  
Better than lead, 12,909.  
No more costly than lead, 12,907-8.  
With five per cent. lead :  
Gives stability and lessens cost, 22,788-90.  
Good substitute for white lead for interior painting, 1079-90.
- PENWARDEN, S. P. : See CHANCELLOR, H. G.
- Periodical Medical Examination :  
Invented, *McKillop*, 20,876-7.
- Cost :  
Cannot afford to pay : *Styles*, 14,081.  
Expensive : *Bennett*, 12,252-3; *Anderson, J.*, 19,796-8.  
In Belgium : *Rieker-Devroede*, 15,002-6.  
Serious if occupier has to pay : *Griffiths*, 14,020-2.  
Should be borne by Government : *Cookson*, 2248-50.  
Would fall on public : *Johnson*, 22,403-4.  
Would be unwilling to pay : *Anderson, R. J.*, 11,351.  
Difficulties of : *Leggo*, 179-82; *Carson*, 11,812-5, 11,823, 11,891; *Donald*, 12,346-7; *Griffiths*, 14,002, 14,004-7, 14,044-50; *Anderson, J.*, 19,796-8; *Smith, A.*, 21,230-2.  
In Belgium : *Leggo*, 189-90.  
None : *Sibthorpe*, 17,930.  
Frequency of : *Carson*, 11,804-11.  
At six-monthly intervals not of much value : *Leggo*, 260-2.  
Important or essential : *Cookson*, 2173, 2213-6, 2259-60; *Carson*, 11,799-800, 11,848; *Smith, A.*, 21,229.  
Impracticable : *Campbell*, 3524-5; *Holliday*, 8570-80; *Orr*, 10,769.  
As too many men would be rejected : *Parsonage*, 2738-43, 2797-810.  
Might be a good thing : *Wilkinson*, 19,960-1.  
Necessary in England; but not in Scotland : *Dobie*, 10,926-30.  
Not favoured or of much use : *Walsh*, 3115; *Devine*, 20,423-6.

**Periodical Medical Examination—continued.**

Objection by workers possible: *Bennett*, 11,251; *Smith, A.*, 21,230-2.

Onerous: *Wallis*, 20,630-5.

Practicable or possible: *Cookson*, 2210-12, 2246-7; *Pickles*, 3004-6; *Bonner*, 4255-62; *Carfrae*, 10,857, 10,876-81; *Honeychurch*, 20,062.

Regulation regarding:

Not strictly enforced in Austria: *Meissl*, 14,721.

Not severe enough in Belgium: *Ricker-Devroede*, 14,921-8, 14,955-6, 14,987-9, 14,995-5001.

Should be made by Insurance doctors: *Rivet*, 15,578-80.

Transference of men showing signs of lead absorption to non-lead work possible: *Morton*, 13,948-52; *Anderson, J.*, 19,679-82.

And useful: *Lagge*, 264-8; *Sibthorpe*, 17,931-4, 18,081-5.

Vexatious and useless: *Ricker-Devroede*, 14,926.

Would agree to: *Barker*, 6996-7001; *White*, 9290-3; *Orr*, 10,599-606; *Carfrae*, 10,855-8; *Dobie*, 10,989; *Vaughan*, 13,689-91; *Sibthorpe*, 17,794-5; *Plumb*, 18,108; *Anderson, J.*, 19,604-8; *Milton*, 20,321.

But difficult: *Guest*, 11,127-31.

But not for employers to pay: *Willshier*, 6765-9; *McDermid*, 7409-13, 7431.

If law: *Puttrell*, 6331-5; *Donald*, 12,345; *Scott*, 12,269-72.

Would minimise danger: *Cookson*, 2131-3; 2207-8.

Would not agree to: *Chappell*, 6568; *Walker*, 9100-5; *Morton*, 13,930-8.

PETIT, M.: See GIRAUD, M.

**PHILIP, ARNOLD (Admiralty Chemist):**

Evidence, 8617-720.

Iron oxide paints: can replace red lead on double bottoms, &c., in Navy, 8623-5.

Lead paints:

Dangers recognised by Admiralty, 8622.

Used for painting outsides of ships in Navy, 8652-6.

Leadless paints:

Tests should be made before prohibiting lead, 8684.

Trade prejudice against new materials, 8651.

Painting: spraying abandoned because unhealthy, 8692, 8711-3.

Paints: weight important in painting in Navy, 8673-5.

Ship painting: durability on exteriors not important, as repainting due to mechanical damage, 8657, 8669-71.

Zinc paints:

Could replace lead for outsides in Navy, 8665-8, 8705-9.

Enamels superior to lead for insides of ships, 8631-6.

Initial cost higher, but cheaper in end, 8641-7, 8687-8, 8694-704.

Increasing use of, in Navy for inside painting, 8626-30.

Not used for outsides in Navy, 8658, 8681-3.

Proportion used in paints in Navy, 8637-40, 8663-4.

Retain colour better than lead, 8714-20.

Satisfactory for interior work on ships, 8648-50.

**PICKLES, WILLIAM (of the National Amalgamated Society of Operative House and Ship Painters and Decorators):**

Evidence, 2950-3084.

Dry rubbing-down:

Indispensable in some cases, 2956-61, 2995

Principal danger, 2954, 3026.

Prohibition of, would not remove all dangers, 2996-9.

Dust and spray:

Exhaust fans impracticable, 2994.

Stippling dangerous, 2962, 3024-5, 3029-32.

Emanations: no way of avoiding, 2993.

Leadless paints: no insuperable difficulties in application or mixing, 3010-1.

Lead poisoning:

Cleanliness alone does not give immunity, 3063-7.

Danger from paint on hands, 2973-5.

Source of 2991-2.

**PICKLES, WILLIAM—continued.**

Meals: accommodation away from paint and dust impracticable in some cases, 2983-5.

Mixing:

Danger from fumes of lead, 2970-2.

Where done, 2966-9.

Outdoor clothing: danger from dust, 3057-8.

Overalls:

Danger from dust, 2988-9.

Generally worn and washed weekly, 2986-7, 3056, 3071-5.

Periodical medical examination: practicable, 3004-6.

Precautionary measures: difficult to carry out, 2990.

Prohibition:

Only solution, 3007, 3062.

Practicable, 3008-9, 3012-3.

Total prohibition preferred to 5 per cent. limit of solubility, 3014.

Regulations: observance of, difficult, 2990.

Removal of old paint:

Rubbing down after burning off dangerous, 2963-5.

Use of solvents in place of burning off not desirable, 3033-4.

Rubbing down: wet process not dangerous, 3000-3.

Washing:

Accommodation important, 2976.

Hot water practicable, but difficult in some cases, 2977-81, 3035-49, 3081-4.

Time should be allowed, 3050-5, 3083.

Zinc paints:

As good as lead for inside, 3015, 3059-60.

Satisfactory for outside, 3017-23.

**PISART, F. (Managing Director of the Maastricht Zinc White Co.):**

Evidence, 18,866-995, 21,820-889.

Foreign legislation: France, prohibition law permits 3 per cent. lead, 18,882-9.

Iron oxide paints: use of, on Belgian State Railways, 21,846-8.

Leadless paints:

Lithopone satisfactory for inside, 18,919-22.

Largely used in France, 18,925-8.

Restriction to 5 per cent. solubility: admits 8 per cent. lead sulphate, giving great covering power for outside work, 21,839-45.

Zinc: price would rise with prohibition of lead temporarily, 18,905-18, 18,992-5.

Zinc oxide:

Difficulty in manufacture in England, 18,933-46, 18,984-7.

Dust not dangerous, 21,853-65.

Pure zinc oxide not satisfactory, 18,948-9, 18,957-8, 21,838.

Zinc paints:

As good as lead, 18,876-80.

Covering power greater than lead, 18,903-4, 18,959-61.

Durability good, 18,880.

Satisfactory substitute for lead paints, 18,871, 18,890-2, 18,929-3, 18,950.

Use of:

In Norway and Sweden, 18,872-5.

On Belgian State Railways, 18,951-3, 18,988-90, 21,820-35, 21,876-89.

Zinc oxide with 4 per cent. lead most suitable, 18,893-902, 18,923-4.

**PLUMB, GEORGE (Foreman Painter of G. Trollope, Ltd.):**

Evidence, 18,100-413.

Dry rubbing-down:

Can be dispensed with, 18,106, 18,295-304.

Danger very small unless person susceptible to poisoning, 18,401-11.

Time occupied at, 18,293-4.

Very little dust created, 18,291-2.

Emanations: thinks they contain lead, 18,234-45, 18,338-9.

Filling: generally composed largely of lead, 18,363-8.

Lead poisoning:

Cases known of, 18,115-21.

Greater cleanliness will reduce evil, 18,107, 18,112.

**PLUMB, GEORGE—continued.**

- Lead poisoning—*continued.*  
 Modes of causation, 18,163-77, 18,181-4, 18,289-90, 18,384.  
 Regulations would reduce evil, 18,188-95.  
 Mixing: no diminution in amount of dry mixing, 18,246-61.  
 Overalls:  
 No danger from dust, 18,316-8.  
 Workers should provide and wash them, 18,314-5.  
 Painters: registration advocated, 18,369-73.  
 Periodical medical examination: would agree to, 18,108.  
 Prohibition: would not obviate need for inspection, 18,111, 18,319-21, 18,359-62.  
 Red lead: best paint for ironwork, 18,103, 18,135-6, 18,395-400.  
 Regulations:  
 Amount of inspection necessary, 18,196-233.  
 Householders should provide facilities as to mess-rooms, &c., 18,344-9.  
 Inspectors should have right of entry into private houses, 18,350-3.  
 Would agree to, 18,322-7.  
 Rubbing down:  
 Glass-paper moistened with turps impracticable, 18,378-83.  
 Moist method impracticable in some cases, 18,178-80, 18,262-7.  
 Washing accommodation:  
 Difficulty in some cases, 18,306-13.  
 Essential, 18,109.  
 White lead:  
 Superior to zinc, 18,101-2, 18,104, 18,122-3, 18,305.  
 Use of, in ship painting, 18,328-37.  
 Zinc paints:  
 Not so durable as lead, 18,133, 18,386-94.  
 Often adulterated with lead, 18,124-32.  
 Thinks dust harmful, 18,156-62, 18,268-81, 18,354-5.

**Prohibition of Lead:**

- All employers equally affected by: *Anderson, J.*, 19,678.  
 Architects generally would welcome, if possible: *Munby and Wonnacott*, 2394-5.  
 Best solution: *Bonner*, 4368.  
 Better for the trade than regulations: *Puttrel*, 6339-42.  
 Complete, regulations only partial, remedy: *Cookson*, 2129-30, 2164-5; *Puttrel*, 6320-2; *Morton*, 13,924-5; *Honeychurch*, 20,044-5.  
 Desirable if only means of safeguarding health: *Anderson, J.*, 19,530.  
 Difficult to carry out: *Rambousek*, 14,519-22; *Anderson, J.*, 19,671-3, 19,780-5; *Chancellor and Penwarden*, 21,454-9.  
 Difficulty in standardising paints: *Sibthorpe*, 17,960-3.  
 Discovery of a good leadless white pigment would follow: *Bonner*, 4373.  
 Easiest solution: *Depierres*, 19,163-6.  
 Effect on:  
 Imported goods painted with lead: *Cunynghame*, 10,352-6.  
 Other trades: *Niederhauser*, 16,276; *Miller*, 17,067-8.  
 Painting trade: *Hardwick*, 1813-4; *Crace*, 2021-5; *Humphrey*, 2594, 2604-7; *Barker*, 7022-3; *White*, 9453-5; *Bennett*, 11,263; *Holzappel*, 11,514-7, 11,529; *Styles*, 14,173-5; *Depierres*, 19,074-5.  
 Paint-making trade: *Garson*, 2526-9, 2545-6, 2551-2; *Cunnaw*, 10,280-2; *Willis*, 11,642, 11,724-7; *Rivet*, 15,488-94.  
 Public: *White*, 9401; *Bennett*, 11,303-4; *Anderson, J.*, 19,526-9, 19,675-7, 19,775; *Milton*, 20,244; *Chancellor and Penwarden*, 21,429-30, 21,463-5.  
 Spelter trades: *Francis*, 17,270-1, 17,324-8.  
 White lead trade: *Cookson*, 2126-8; *Miller*, 17,088-9.  
 Enforcement:  
 Difficult: *Roch*, 16,753-4.  
 Easier than regulations: *De Morsier*, 16,657-60.  
 Easy: *Cunynghame*, 10,300-1.

**Prohibition of Lead—continued.**

- Exemption:  
 For special articles: *Cunynghame*, 10,329.  
 For special cases accompanied by regulations: *Cunynghame*, 10,318-27.  
 Period: *Patterson*, 11,49-51; *Cantrill*, 3921-5; *Cunynghame*, 10,328; *Rivet*, 15,573; *Lancaster*, 17,643-4.  
 Failure in foreign countries: *Johnson*, 22,227-41, 22,351-5.  
 For inside work:  
 Not a hardship: *Mockford*, 8810.  
 Would reduce lead poisoning to ordinary trade risk: *Kaup*, 14,379-84.  
 If white lead scheduled, power should be given to add other dangerous paints to schedule: *Cunynghame*, 10,306.  
 Impracticable: *Niederhauser*, 16,330, 16,335; *Sibthorpe*, 17,674-8.  
 Inspection necessary: *De Morsier*, 16,636; *Sibthorpe*, 17,797-801, 17,969-70; *Plumb*, 18,111, 18,319-21, 18,359-62; *Johnson*, 22,467-8.  
 Master House Painters' Association would not take exception to: *Barker*, 7103.  
 Mistake made in France: *Expert-Bezançon*, 15,118-20.  
 No statistical or scientific reason for: *Johnson*, 22,184-226, 22,269-72.  
 Not warrantable: *Gouldby*, 22,008-9.  
 Office of Works' experience sufficient to warrant it: *Patterson*, 12,968-70; *Tanner*, 22,693.  
 Only solution: *Parsonage*, 2725, 2732, 2747, 2756; *Pickles*, 3007, 3062; *Wilson*, 3137-92; *Walsh*, 3111; *Lowe*, 3285; *Harris*, 3732-5; *Cantrill*, 3896-7; *Bancroft*, 4073; *Holliday*, 8506-8; *Devine*, 20,436; *Wallis*, 20,583-4; *McKillop*, 20,881-7.  
 If mask impracticable: *White*, 9276-80.  
 Opinion of master house painters in Belgium: *Ricker-Devroede*, 14,957-66, 15,029-45.  
 Opposition to, comes chiefly from white lead manufacturers: *Rambousek*, 14,583.  
 Practicable: *Pickles*, 3008-9, 3012-3; *Line*, 9974; *Depierres*, 19,007-12.  
 And not a dangerous step: *Patterson*, 1116-7.  
 For inside work only: *White*, 9398-400, 9406-11; *Styles*, 14,147-9.  
 With reservations for iron primings and greens: *Patterson*, 1121, 13,001-2, 22,852-4; *Mockford*, 8780-5; *Hunter*, 21,562.  
 Preferred to regulations: *Campbell*, 3483; *Harris*, 3745-62; *Cantrill*, 3914; *Wiltshier*, 6778-83; *Barker*, 7019-21, 7097-9; *Holliday*, 8537-40; *Higgs*, 8962-8, 9022-4; *Walker*, 9108-11; *Hall*, 9553-4, 9559; *Anderson, R. L.*, 11,449-50; *Morton*, 13,939-42, 13,957; *Milton*, 20,240, 20,324; *Wallis*, 20,632.  
 By Liverpool Master Builders' Association, *McHugh*, 20,693, 20,704-6.  
 By Master Painters' Federation of Belgium: *Ricker-Devroede*, 14,841.  
 In his own interests: *Anderson, J.*, 19,674.  
 Purox should be exempted: *Hardwick*, 1819.  
 Quality of painting:  
 Would be reduced: *Orr*, 10,641; *Guest*, 11,187-9.  
 Would not be reduced: *Depierres*, 19,008.  
 Should follow:  
 If complete substitute found: *Humphrey*, 2603; *Holliday*, 8512, 8596-8; *De Morsier*, 16,668.  
 If regulations impracticable: *Francis*, 17,293-4.  
 Summary of difficulties, exemptions, &c.: *Cunynghame*, 10,306-15.  
 Total prohibition:  
 Preferred to 5 per cent. solubility limit: *Pickles*, 3014; *Johnson*, 22,442.  
 With exemptions for certain purposes: *Cunynghame*, 10,316-7, 10,335.  
 Would abide by decision of Committee: *Chappell*, 6584-5.  
 Would agree to: *Bonner*, 4371-2;  
 If efficient substitute found: *White*, 9451-2, 9460; *Guest*, 11,182-5.  
 If regulations impracticable: *Orr*, 10,547-57.

**Prohibition of Lead—continued.**

- Would cause repainting of ships to be done in foreign ports : *Sibthorpe*, 17,691.
- Would increase cost of painting : *Carfrae*, 10,911 ; *Sibthorpe*, 17,689, 17,820-34.
- Would lead to adulteration of paints : *Dobie*, 11,065-8.
- Would make trade dependent :
  - On foreign sources for material : *Lancaster*, 17,568.
  - On proprietary paints : *Anderson, J.*, 19,753-4.
- Would mean more painters, and public would suffer : *Anderson, J.*, 19,674-8, 19,775.
- Would not affect :
  - Great Eastern Railway Company : *Coysh*, 9,588-91, 9,657-60.
  - Orient Steamship Company : *Tuke*, 10,393.
- Would not agree to : *Honeychurch*, 20,065-9.
- Would reduce range of colours : *Anderson, R. L.*, 11,440-4 ; *Willis*, 11,640.

**PUTTRELL, J. (of the National Association of Master House Painters and Decorators of England and Wales) :**

- Evidence, 6165-442.
- Compensation for suspension: would agree to it if law, 6336.
- Dry rubbing-down :
  - Causes very little dust, 6273-8, 6282.
  - Exhaust fans impracticable, 6281.
  - Frequent sweeping of floors suggested to remove dust, 6286-93.
  - Not indispensable, 6272.
  - Respirators should be worn, 6279-80.
- Dust and spray :
  - Lead could be abandoned for ceilings and stippling surfaces, 6298-305, 6311.
  - No way of avoiding splashes in painting ceilings and stippling, 6294-7, 6306-10.
- Education of painters :
  - Apprentices instructed in cleanliness rather than in avoidance of dust, 6373-83.
  - Apprentices taught to avoid lead poisoning, 6403-4.
- Hours of employment: would adhere to limitation of, 6326-30, 6338.
- Insurance rates for painters have recently increased. 6174-5, 6343-9.
- Lead poisoning :
  - Cases of sickness and poisoning known of, 6173, 6176-80, 6389-402, 6407-14.
  - Cases would be less if painters were abstainers, 6405-6.
  - Considers danger from unclean hands greater than from lead dust, 6353-72.
  - Deplorable, 6217.
  - Extent of, not recognised locally, 6439-42.
  - Large number of cases due to carelessness of men, 6288-71.
  - Regrettable that this country should be behind others in legislation regarding, 6221-4.
  - Surprised that danger from unclean hands only accounts for 5 per cent. of cases, 6435-7.
  - Surprised that poisoning cannot be contracted by absorption of lead through skin, 6384-8.
- Master House Painters Association :
  - Have made no scientific experiments to discover a substitute for lead, 6192-7.
  - Have taken no steps to discover extent of lead poisoning, 6181-91.
  - Have tried to educate apprentices at technical schools to be clean and so combat lead poisoning, 6198-209.
  - Realise extent of lead poisoning evil, 6210-6.
- Meals :
  - Can be taken generally away from lead paints and dust, 6255-9.
  - Should not be taken near paint or dust, 6251-4, 6260-2.
- Mixing of paints should be done with lead in paste form, 6316-9.
- Overalls :
  - Kept in bags with food, 6243-6.
  - Left on job, 6247-50.
  - Should be cleaned by men, 6241-2.
  - Should be worn, 6240.
- Periodical medical examination: would agree to if necessary, 6331-5.

**PUTTRELL, J.—continued.**

- Prohibition of lead :
  - Better for trade than regulations, 6339-42.
  - Complete, regulations only partial, remedy, 6320-2.
  - Regulations : would increase cost of painting, 6433-4.
  - Removal of old paint : can suggest nothing to remove fumes in burning off, 6312-5.
  - Rubbing down: generally done by wet process and very little dust caused, 6264-7.
  - Turpentine: no substitutes used, 6431-2.
- Washing :
  - Accommodation necessary, 6225-7, 6438.
  - Already provided for painters, 6417-25.
  - Hot water :
    - Generally obtainable, 6236-9.
    - Not essential, but better than cold, 6228-35.
- Zinc paints :
  - Covering power not so good as lead, 6324, 6427-9.
  - Durability not so great as lead, 6324.

**RAMBOUSEK, DR. JOSEF (Official of the Government of the Kingdom of Bohemia) :**

- Evidence, 14,513-673.
- Dry rubbing-down: prohibition of, essential, 14,526.
- Emanations: do not contain lead, 14,636-7.
- Leadless paints :
  - Trials made in Bohemia, 14,584-91, 14,648-52.
  - Austria not conclusive, 14,633-4.
  - Unsatisfactory, 14,523-5, 14,562-6.
- Lead paints: should be labelled "Poisonous," 14,668.
- Lead poisoning :
  - Diseases predisposing to, 14,672-3.
  - Great reduction of, in lead works, 14,516-7, 14,629-32, 14,638-47.
  - Statistics for Bohemia, 14,573-8, 14,622-8, 14,660-1.
  - Suggested precautions, 14,527-30, 14,635.
  - Untrained men more liable, 14,653.
- Prohibition :
  - Difficult, 14,519-22.
  - Opposition to, comes chiefly from white lead makers, 14,583.
- Regulations :
  - Distinction between inside and outside painting difficult, 14,518.
  - Effect of in reducing lead poisoning in Austria, 14,516-7, 14,629-32, 14,638-47.
  - Enforcement of :
    - By inspection in Austria, 14,531-72, 14,671.
    - Insufficient inspection, 14,518, 14,526.
  - Turpentine: danger of substitutes, 14,656-7.
  - White lead: important industry in Austria, 14,598-617.

**Red Lead :**

- Best paint for iron and steel work: *Sibthorpe*, 17,757-60, 18,044-52 ; *Plumb*, 18,103, 18,135-6, 18,395-400 ; *Simpson*, 21,632-8.
- Capital invested and output: *Miller*, 17,074, 17,106-8.
- Indispensable for iron work: *Meissl*, 14,682-5, 14,823-32.
- Only material which will dry under water: *Sibthorpe*, 17,744-8, 17,810-3, 18,029-32.

**Regulations :**

- As to washing overalls and mess rooms, &c., could be carried out: *White*, 9253-5.
- Building to be defined: *Cunynghame*, 10,306.
- Certain dangers would not be removed: *Chappell* 6583.
- Cost much greater than change to leadless paints: *Barker*, 7100-1.
- Cost of, in paint-grinding works: *Willis*, 11,709-18.
- Cost of painting would be increased: *Puttrell*, 6433-4 ; *Carfrae*, 10,912-3 ; *Rivet*, 15,585-601 ; *Anderson, C. J.*, 19,776-9 ; *Wallis*, 20,657 ;
- While use of leadless paints would mean more frequent painting: *Dobie*, 10,993-8 ; *Vaughan*, 13,706-19, *Morton*, 13,958-62.
- Distinction between outside and inside painting difficult: *Rambousek*, 14,518.
- Enforcement of: *Rivet*, 15,620-5 ; *Roch*, 16,738-43, 16,746-50 ; *Klein*, 16,859-62, 16,977-9 ; *Francis*, 17,295-303 ; *Johnson*, 22,356-60, 22,389-91.

**Regulations—continued.****Enforcement of—continued.**

- By local policemen, or sanitary inspectors, or Inland Revenue officers, or by special sub-inspectors: *Vaughan*, 13,588-622, 13,817-23.
- By sanitary inspectors practicable: *Kaup*, 14,224, 14,405-6.
- Cost: *Carson*, 11,820-2; *Sibthorpe*, 17,785-9.  
Less than prohibition: *Sibthorpe*, 17,671.  
Would be borne by consumers: *Johnson*, 22,420-37.
- Difficult: *Cookson*, 2230-2; *Humphrey*, 2617-21; *Humphreys*, 17,376-82; *McKillop*, 20,910-2; *Smith, A.*, 21,295-6.
- Foreman should be made responsible: *Carson*, 11,825-31.
- In Austria: *Kaup*, 14,287-329, 14,385-96; *Rambousek*, 14,531-72, 14,671; *Meissl*, 14,677, 14,705-14, 14,758-9.
- In Belgium: *Ricker-Devroede*, 14,911-20.
- In Germany: *Kaup*, 14,287-329, 14,385-96; *Niederhauser*, 16,271, 16,288-302, 16,314-6, 16,325-9; *Leyendecker*, 16,394-5, 16,401-16, 16,421-2, 16,438-55.
- In Holland: *Nooijen*, 15,294-300; *Bettink*, 18,492-6.
- In Switzerland: *De Morsier*, 16,574-80, 16,583-97, 16,617-23.  
Slack: *Roch*, 16,767.
- Inspection insufficient, amount necessary: *Plumb*, 18,196-233; *Kaup*, 14,385, 14,448-9; *Rambousek*, 14,518, 14,526.
- Not very difficult: *Carson*, 11,802-3.
- Number of inspectors in various countries: *Kaup*, 14,291-5; *Bettink*, 18,501-3.  
Necessary: *Carson*, 11,816-9.  
For Dublin: *Sibthorpe*, 17,776-84, 18,069-71.
- Private house inspection: *Ricker-Devroede*, 14,883; *Rivet*, 15,616-9; *Plumb*, 18,350-3.
- Evasion by certain employers would handicap others: *Anderson, J.*, 19,616-8, 19,631.
- Exemptions:  
For small employers in Vienna: *Kaup*, 14,336-44.  
Practicable for leadless paint users: *Kaup*, 14,330-5, 14,452.
- Facilities for messrooms, cloakroom, and washing should be provided by householders: *Sibthorpe*, 17,926-9; *Plumb*, 18,344-9; *Anderson, J.*, 19,734-51; *Honeychurch*, 20,152-3.
- If impracticable, prohibition only alternative: *Dobie*, 11,002-3.
- Impracticable: *Edginton*, 13,102-4.  
Some: *Wilkinson*, 19,965-81.
- Observance:  
Difficult and expensive, but possible: *Bennett*, 11,257-61.  
Difficult or impossible: *Laidler*, 1010; *Crace*, 2040-5; *Pickles*, 2990; *Campbell*, 3479-83; *Harris*, 3695; *Cantrill*, 3861-3, 3908-13; *Wiltshier*, 6772-5; *Barker*, 7017-8; *Higgs*, 8924; *Walker*, 9075-6; *Orr*, 10,589, 10,696-704; *Dobie*, 10,998; *Guest*, 11,135-45; *Anderson, R. L.*, 11,354-5; *Scott*, 12,278-9, 12,284-6; *Morton*, 13,867-70; *Griffiths*, 13,988-95, 14,009-14, 14,018-9, 14,031, 14,041-2; *Styles*, 14,162-72; *Anderson, J.*, 19,632-3, 19,696-9, 19,720-4; *Honeychurch*, 20,064, 20,072; *Wallis*, 20,627-8; *McHugh*, 20,694.
- Difficulty with small jobs: *Wiltshier*, 6776  
Necessary and not objected to: *White*, 9296; *Meissl*, 14,757; *Plumb*, 18,322-7.  
Necessary in England, but not in Scotland: *Bennett*, 11,221-5; *Anderson, R. L.*, 11,445-8.  
Not as important as education of painters: *Anderson, J.*, 19,729-30.  
Not necessary for old lead-painted surfaces if lead prohibited: *Tanner*, 22,723-8.  
Not troublesome or vexatious: *Sibthorpe*, 17,700-1.  
Not very difficult: *Carson*, 11,843-6.  
Practicable: *Rivet*, 15,522-3, 15,577.  
And would remedy evil: *Cunynghame*, 10,297-9.  
If reasonable: *Wallis*, 20,585.

**Regulations—continued.****Observance—continued.**

- Preferred to prohibition of lead: *Laidler*, 732-7, 767-81; *Chappell*, 6581-2; *McDermid*, 7432; *White*, 9297; *Orr*, 10,616-7, 10,695; *Carfrae*, 10,861; *Guest*, 11,134, 11,142; *Bennett*, 11,260, 11,271-5; *Scott*, 12,277; *Vaughan*, 13,696-705; *Sibthorpe*, 17,699, 18,067-8; *Wilkinson*, 19,964.
- But as they are impossible to carry out, would agree to prohibition: *Styles*, 14,085-99, 14,125-46, 14,176-85.
- By public, even if more expensive: *Bennett*, 11,277-92, 11,300-1.  
In the interest of his clients: *Anderson, J.*, 19,611-5, 19,800-10.
- Proposed code or suggestions for: *Humphrey*, 2595-602; *Roch*, 16,696, 16,734-7; *Francis*, 17,287-92; *Sibthorpe*, 17,660-70; *Johnson*, 22,263-6, 22,361-9, 22,385-6.
- Should be given a trial before lead prohibited: *Griffiths*, 14,015-7; *Styles*, 14,116-9; *Rivet*, 15,575; *Niederhauser*, 16,356; *Roch*, 16,697; *Miller*, 17,199; *Sibthorpe*, 18,086-99.
- Should be made while tests for discovering a suitable leadless paint are carried out: *White*, 9386-7.  
Would eliminate or greatly reduce evil: *Guest*, 11,094-5; *Carson*, 11,801; *Scott*, 12,205; *Goadby*, 15,906; *Roch*, 16,694; *Francis*, 17,244; *Humphreys*, 17,350.  
Would not remove evil: *Devine*, 20,384-5, 20,527.
- Removal of old paint:**
- Burning off:**  
Can suggest no way of removing fumes: *Harris*, 3728-9; *Webb*, 4217-9, 4226; *Puttrel*, 6312-5; *Chappell*, 6548-9; *Wiltshier*, 6746-8; *Barker*, 6975-6; *McDermid*, 7396-7; *Holliday*, 8504-5; *Higgs*, 8940-4; *Orr*, 10,590-5; *Carfrae*, 10,850-1; *Morton*, 13,919-23.  
Danger from fumes: *Walsh*, 3091; *Wilson*, 3168-9; *Lowe*, 3268, 3289-92, 3331-2; *Bonner*, 4323-4; *Goadby*, 15,901-5, 15,924.  
Very small: *Cantrill*, 3887-92, 3931-3; *Walker*, 9087-8, 9122-5; *White*, 9377-9, 9390; *Sibthorpe*, 17,761-4.  
No fumes given off: *Grundy*, 7233-5; *McKillop*, 20,815, 20,913-21; *Smith, A.*, 21,170-5.  
No lead fumes given off: *Cookson*, 2158-61, 2233-7, 2251-3.  
Not dangerous: *Bettink*, 18,442.
- Chipping paint off ships:  
Dangerous: *Holzappel*, 11,544.  
Should be prohibited: *Carson*, 11,839-41; 11,940-5.  
Method of: *Laidler*, 674-86.  
No danger from lead: *Wail*, 1466.
- Respirator or mask:  
Impracticable to prevent inhalation of fumes in burning off: *Campbell*, 3461-3.  
Suggested to prevent inhalation of fumes in burning off: *Bonner*, 4331, 4375-89; *White*, 9273-4; *Vaughan*, 13,670-5.
- Rubbing down with sand-paper after burning off dangerous: *Parsonage*, 2693; *Pickles*, 2963-5; *Walsh*, 3092-3; *Wilson*, 3170-1; *Lowe*, 3269-70; *Bancroft*, 4084-5; *Webb*, 4220-2; *Bonner*, 4325-8.
- Scraping off:  
Causes dust: *Laidler*, 680-4; *Parsonage*, 2710; *Bancroft*, 4086.  
Dangerous: *Webb*, 4223-4.
- Solvents:  
Better than burning off: *Smith, A.*, 21,176-9, 21,290-1.  
Could be used instead of burning off and so avoid fumes: *Crace*, 2000-2; *Campbell*, 3458-60; *Barker*, 7095; *Walker*, 9085-6, 9121; *Dobie*, 10,984-5; *Guest*, 11,121; *Bennett*, 11,245; *Anderson, J.*, 19,598-603.  
Generally used: *Holliday*, 8503, 8554-6.  
For inside work: *Cantrill*, 3934.  
Less dangerous but more expensive than burning off: *Bonner*, 4329-30.  
Use of, in place of burning off not desirable: *Pickles*, 3033-4.

**Removal of old paint—continued.**

Ventilation would reduce danger from fumes. *Bancroft*, 4080-3, 4087-94, 4142-3.

**Restriction to 5 per cent. of soluble lead:**

Administration difficulty: *Cunynghame*, 10,337-41.

Admits:

20 per cent. lead chromate: *Crow*, 12,073.

8 per cent. lead sulphate, giving great covering

power for outside work: *Pisart*, 21,839-45.

Difficulty of painters in adhering to standard:

*Cunynghame*, 10,348-51.

Greens:

No difficulty involved: *Smyth*, 13,454-64.

Require up to 10 per cent. lead: *Patterson*, 1120, 12,927-8, 12,940-1, 13,013-24.

Guarantee should be given by makers of ready-mixed paints: *Hooper*, 10,167.

Lead chromate so insoluble as not to be affected: *DePierres*, 19,095-104.

Matching paints: difficulty in: *Hooper*, 10,168-72.

Might do more harm than good: *Sibthorpe*, 17,802-3.

Practicable except for greens: *Patterson*, 13,071-9.

Preferable to absolute prohibition: *Crow*, 12,061-3.

Proportion of soluble lead could easily be determined, *Hooper*, 10,107-12.

Reds:

Difficulty can be overcome: *Smyth*, 13,549.

Difficulty involved: *Rivet*, 15,506-15.

Safe to assent to: *Munby and Wonnacott*, 2350-6, 2452-7.

Some colours require more than 5 per cent. lead: *Cunnew*, 10,205-18, 10,260-3.

Standardisation of paints: *Hooper*, 10,175-80.

Would allow sufficient lead for driers: *Crow*, 12,047.

Would still involve danger: *Roch*, 16,728-33.

**RICKER-DEVROEDE, CHARLES (Master Painter, of Brussels):**

Evidence, 14,833-15,077.

Dry rubbing-down:

Can be dispensed with, 14,896.

Methods of, in Belgium, 14,897-909.

Of zinc paints as dangerous as with lead, 14,886-95.

Prohibition of, not strictly enforced in Belgium, 15,062-5.

Foreign legislation: Belgium: inquiry leading to law regarding white lead, 14,836-52.

Lead poisoning:

Cases in Belgium, 14,950-4.

Cleanliness more important than removal of dust in diminishing, 14,989-94.

Overalls: worn and washed weekly in Belgium, 14,910.

Periodical medical examination:

Cost of, in Belgium, 15,002-6.

Not severe enough in Belgium, 14,921-8, 14,955-6, 14,987, 14,995-501.

Vexatious and useless, 14,926.

Prohibition:

Opinion of master painters in Belgium, 14,957-66, 15,029-45.

Preferred to regulations by Master Painters Association of Belgium, 14,841.

Regulations:

Enforcement of:

In Belgium, 14,911-20.

Private house inspection difficult, 14,883.

White lead:

Manufacture important industry in Belgium, 14,972-4.

No efficient substitute for outside work, 14,835.

Preferred by master painters of Belgium, 14,934-8.

Preferred for painting greenhouses, 14,865-73.

Zinc paints:

Difficulty in mixing and application, 14,857-9, 14,948-61, 15,075-7.

Drying difficult on outsides, 14,860-1.

Largely used for interior work, 14,834.

Not durable for outside work, 15,016-20.

Use of, by Belgian State Railways, 14,968-70, 15,009-15.

**RIVET, ALBERT ROBERT (of Messrs. T. and W. F. Miloe, Ltd., Paint and Colour Manufacturers, London):**

Evidence, 15,437-651.

Dry rubbing-down:

No insuperable difficulties in prohibition, 15,609-15.

Respirator suggested, 15,524-8.

Enamels:

Generally made from zinc, 15,445-7.

Trade not increasing, 15,442-4.

Iron-oxide paints: satisfactory for iron work, 15,484.

Lead consumption for painting purposes, 15,567-73.

Lead paints: best for outside work, 15,469-72, 15,485, 15,529-34.

Mixing:

Dangerous, 15,462-3.

Use of ready-mixed paints increasing, 15,464-7.

Office of Works: supply lead to, 15,636-51.

Paints:

Comparative covering powers of lead and zinc, 15,495-503, 15,543-5.

Comparative prices of lead and zinc, 15,476-80, 15,486-7.

Comparative tests with lead and zinc, 15,473-83.

Periodical medical examination: should be made by insurance doctors, 15,578-80.

Prohibition:

Effect on paint grinders, 15,488-94.

Exemption period, 3-5 years, 15,573.

Regulations:

Enforcement of, 15,620-5.

Increased cost involved, 15,585-601.

Practicable, 15,522-3, 15,577.

Private house inspection, 15,616-9.

Should be tried before prohibition, 15,575.

Restriction to 5 per cent. soluble lead: would leave great difficulty for red colours, 15,506-15.

White lead: in dry state should be prohibited in paint shops, 15,630-5.

Zinc oxide:

Combine: Broken Hill Mines connected, 15,566.

Containing small proportion of lead inferior to

pure zinc oxide, 15,457-61, 15,537-40, 15,548-55.

Price would rise with increased demand, 15,454-6.

Supply dependent on foreign sources, 15,449-53, 15,563-5.

Zinc paints:

Cost greater than lead, because needing more oil, 15,555-62.

Pure zinc paints next best to white lead, 15,504-5.

**ROCH, Dr. MAURICE (Chef de Clinique at the Cantonal Hospital, Geneva):**

Evidence, 16,674-772.

Hours of work: restriction advocated, 16,771-2.

Lead poisoning:

Occurrence, etiology, and prevention, 16,681-91, 16,699-708.

Statistics for Geneva, 16,677-8, 16,709-25, 16,757-66.

Prohibition: difficulty in enforcement, 16,753-4.

Regulations:

Enforcement, 16,738-43, 16,746-50.

In Switzerland slack, 16,767.

Should be tried before prohibition, 16,697.

Suggested code, 16,696, 16,734-7.

Would prevent lead poisoning, 16,694.

Restriction to 5 per cent. soluble lead: would still involve danger, 16,728-33.

Washing: time should be allowed, 16,744-5.

**Rubbing-down. (See also "Dry Rubbing-down.")**

Amount of, on preparatory work: *Smith, A.*, 21,338-45.

Length of time before new paint can be rubbed down wet: *Holzappel*, 11,560-1, 11,564-7; *Niederhäuser*, 16,305-9; *McKillop*, 21,004-12; *Smith, A.*, 21,107-12, 21,268-72.

Less required with purex than with white lead: *Hardwick*, 1789-97, 1827-30, 1859-67.

Methods of: *Laidler*, 644-58, 789-94; *Crace*, 1941-3; *Parsonage*, 2638-45, 2663-6.

Time occupied at: *Morton*, 13,943-7.

Undercoats generally done with sandpaper: *Laidler*, 835-84, 953-8; *Crace* 2102-3.

**Rubbing-down—continued.**

- Unnecessary on one-coat work: *Smith, A.*, 21,121-4.  
 Wet method:  
 Can be used between coats: *Nooijen*, 15,283-9, 15,374-8.  
 Can generally be used throughout: *Crace*, 1945-50, 2059.  
 Cannot be used between coats: *Parsonage*, 2667-71; *Harris*, 3701, 3705-6.  
 Generally used and very little dust created: *Puttrel*, 6264-7.  
 Impracticable after burning off: *Lowe*, 3333-6.  
 Impracticable in some cases: *Plumb*, 18,178-80, 18,262-7; *Devine*, 20,371-8, 20,519-21.  
 More expensive than dry method: *Holzappel*, 11,552-3, 11,558-9; *Smith, A.*, 21,273-5.  
 Not dangerous: *Parsonage*, 2885; *Pickles*, 3000-3.  
 Suitable for new work if paint sufficiently hardened: *Smith, A.*, 21,104-6, 21,116-20, 21,127-44.  
 Suitable for old work: *McKillop*, 20,787-91; *Smith, A.*, 21,100-3, 21,285.  
 Used for all woodwork: *Laidler*, 649-55.
- SCHOBERT, G. (of Messrs. Schoberts, Ltd., Paint Manufacturers, London):  
 Evidence, 9661-743.  
 Iron oxide paints:  
 Composition: vehicle used in anti-corrosive paints, 9661-73, 9705-27.  
 Cost less than lead, 9686.  
 Covering power greater than lead, 9674-5.  
 Instances of use, 9687-95, 9729-34.  
 Lightness an advantage, 9678-85.  
 Satisfactory protection for iron and steel, 9696-704.  
 Leadless paints: trade prejudice against new materials due to adulteration, 9677.  
 Lead paints: over-rated because obtainable pure, 9676-7.
- SCHOOLING, JOHN HOLT, F.R.S.S. (Consulting Actuary):  
 Evidence, 18,548-865.  
 Lead poisoning: attacks among house painters not reportable in United Kingdom, 18,725-7.  
 Statistics:  
 Occupational mortality, 18,549-601, 18,665-95, 18,747-803.  
 Sickness, 18,602-64, 18,704-46, 18,831-65.  
 One death in 54 of English house painters, 18,698-708.
- SCOTT, J. (of the Association of Master House Painters in Scotland):  
 Evidence, 12,184-293.  
 Compensation for suspension: would agree to 12,273-6.  
 Dry rubbing-down:  
 Causes little dust, 12,256-7, 12,287.  
 Indispensable in some cases, 12,259.  
 Suggests nothing but respirators to obviate the dust, 12,260-8, 12,280, 12,282-3.  
 Leadless paints:  
 Experience with, 12,206-17.  
 Office of Works test of four years not sufficient trial, 12,219-24.  
 Lead poisoning:  
 Cases of poisoning and sickness known of very few, 12,188-94.  
 Unaware of figures showing extent of evil, 12,195-203.  
 Meals: accommodation can be provided away from lead paint and dust, 12,232-4.  
 Overalls:  
 Provided by men, 12,230.  
 Storage of, 12,235-51.  
 Would object to provide, 12,231, 12,288-9.  
 Painters should be provided with work in winter, 12,292-3.  
 Periodical medical examination: would agree to if law, 12,269-72.  
 Regulations:  
 Difficult to observe in some cases, 12,278-9, 12,284-6.  
 Might mitigate lead poisoning, 12,205.  
 Preferred to prohibition of lead, 12,277.  
 Washing: hot water could be provided, 12,252-4.

x 7790

**Ship-painting:**

- (See evidence of *Commander Coysh, Mr. Mockford, Mr. Philip, Mr. Simpson, Captain Tuke.*)  
 Frequent painting of exteriors due to mechanical damage to paint: *Philip*, 8657, 8659-71; *Coysh*, 9636-46, 9654-6; *Tuke*, 10,399-403.  
 Hulls painted with leadless black paint: *Tuke*, 10,379-80.  
 Interiors in Navy done every two or three years: *Mockford*, 8786, 8793-8, 8801-3.  
 Lead only used as a small proportion of funnel and ventilator paint: *Tuke*, 10,362, 10,365-6, 10,382-5.  
 Lead paints still used for iron primings: *Coysh*, 9596-602.  
 More dangerous than house-painting: *Walsh*, 3117-22, *White*, 9320-1.  
 Possibility of finding substitute for red lead as priming coat: *Coysh*, 9606-22.  
 Surprised that precautions taken by Admiralty have not prevented lead poisoning: *White*, 9322-4.
- SIBTHORPE, JOHN (Master House Painter of Dublin):  
 Evidence, 17,657-18,099.  
 Dry rubbing-down:  
 After burning off should be prohibited, 17,765-7.  
 Could be dispensed with and enforced, 17,790-3, 17,900-6, 18,000-14.  
 Emanations: illness comes from turpentine and not lead, 17,971-3.  
 Foreign legislation: exception taken to life of zinc paints in Dutch Report, 17,954-9.  
 Leadless paints:  
 Experience of Commissioners of Irish Lights, 17,814-8.  
 Guinness's Brewery, 17,835-47.  
 Two years' test not sufficient trial, 17,965.  
 Use of, would entail one-quarter more labour, 17,865-88.  
 Lead paints: should be labelled "Poisonous," 17,916-7.  
 Lead poisoning:  
 Cases known of, 17,695, 17,988-95.  
 Effect of seasonal occupation, 17,673.  
 Fewer cases in Scotland due to better training, 17,896-9.  
 Incidence in certain districts, 17,943-50.  
 Some action necessary, 17,658-9, 17,697-8.  
 Meals: times when taken, 17,939-42, 17,978-80.  
 Mixing: done in paste form, 17,907.  
 Overalls:  
 Men might resent wearing overalls supplied by employer, 17,920-5.  
 No dust from spots of paint, 17,908-15.  
 Provision by employer objected to, 17,768-71.  
 Painters: proportion of unskilled men in Trade Unions, 17,702-30.  
 Paints:  
 Comparative tests with lead and zinc, 17,850-64.  
 Instructions of Commissioners of Irish Lights and Public Works, 17,679-88.  
 Periodical medical examination:  
 No difficulty, 17,930.  
 Transference of men suspended to other work useful and practicable, 17,931-4, 18,081-5.  
 Would agree to, 17,794-5.  
 Prohibition:  
 Difficulty in standardising paints, 17,960-3.  
 Impracticable, 17,674-8.  
 Would cause re-painting of ships to be done in foreign parts, 17,691.  
 Would increase cost of painting 50 per cent., 17,689, 17,820-34.  
 Would not obviate need for inspection, 17,797-801, 17,969-70.  
 Red lead:  
 Best material for first coat on iron, 17,757-60, 18,044-52.  
 Only material that will dry under water, 17,744-8, 17,810-3, 18,020-32.  
 Regulations:  
 Enforcement, cost of, 17,785-9.  
 Less than cost of prohibition, 17,671.  
 Number of inspectors necessary for Dublin, 17,776-84, 18,069-71.

s c

SIBTHORPE, JOHN—*continued.*Regulations—*continued.*

Householders should provide facilities for mess-rooms, &c., 17,926-9.

Not troublesome or vexatious, 17,700 1.

Preferred to prohibition, 17,699, 18,067 8.

Proposed code, 17,660-70.

Should be given a trial before prohibition, 18,086-99.

Removal of old paint: fumes from burning off not dangerous, 17,761-4.

Restriction to 5 per cent. soluble lead: might do more harm than good, 17,802-3.

Washing accommodation and facilities could be provided, 18,015-9.

White lead: no efficient substitute for outside work, 17,894.

## Zinc paints:

Durability not so good as lead, 17,804-9.

Experiments a failure, 18,033-43.

Extra coats required, 17,891-3.

No difficulty in application, 17,996-9.

## SIMPSON, WALTER (Foreman Painter at Messrs. John Brown &amp; Co.'s Engineering and Shipbuilding Works, Clydebank):

Evidence, 21,568-693.

Bituminous paints: danger from fumes in confined spaces, 21,653-7.

Dry rubbing-down: not very dangerous, 21,577-83.

Lead poisoning: cases known of, 21,571-6.

Oxide of iron paints: used in confined spaces, 21,593-5, 21,643-6.

Red lead: best priming for iron and steel, 21,632-8.

Turpentine: danger from fumes, 21,648-51.

Washing: facilities provided insufficient, 21,665-93.

## Zinc paints:

Get soft in water, 21,640-2.

Not so durable as lead, 21,619-29.

Stand well, but experience with, limited, 21,584-92, 21,596-618, 21,658-62.

## SMITH, ARTHUR (of the Scottish Painters' Society):

Evidence, 21,041-358.

## Dry rubbing-down:

Causes dust, 21,113-5.

Could be dispensed with almost entirely, 21,088-9, 21,125-6, 21,286-9, 21,352-4.

Reasons for, 21,349-51.

Time occupied at, 21,090-9, 21,346-8.

Dust and spray: no way of removing danger in painting ceilings, stippling, &c., 21,158-69.

Filling: alabastine could replace lead, 21,146-57.

Hours of employment in Aberdeen, 21,355.

## Lead poisoning:

Cleanliness alone would not remove evil, 21,238-9.

Details of cases, 21,046-78, 21,083-7, 21,306-37.

Fewer cases in Scotland due to more white work being done in England, 21,079-82.

Inhalation main cause, 21,240, 21,282.

Men reluctant to claim compensation, 21,233-5.

Some men more susceptible than others, 21,241-5.

## Mixing:

Done with lead in paste form, 21,181-2.

Generally done in paint shop, 21,180.

No danger with lead in paste form, 21,187.

## Overalls:

Generally worn and washed weekly, 21,205-9.

Washed at home or in laundry, 21,213-27.

Painting: hands must get soiled in certain operations, 21,188-9.

## Periodical medical examination:

Difficult, and men might resent it at first, 21,230-2.

Necessary precaution, 21,229.

Regulations: difficulty of enforcement by inspection, 21,295-6.

## Removal of old paint:

No danger from fumes in burning off, 21,170-5.

Solvents better than burning off, 21,176-9, 21,290-1.

## Rubbing down:

Amount of on preparatory work, 21,338-45.

Length of time required before new paint work can be rubbed down wet, 21,107-12, 21,268-72.

Not necessary on one coat work, 21,121-4.

SMITH, ARTHUR—*continued.*Rubbing down—*continued.*

Pumice-stone and water suitable for old work, 21,100-3, 21,285.

Pumice-stone or powder and water more suitable for new paint if sufficiently hardened, 21,104-6, 21,116-20, 21,127-44.

Wet method more expensive than dry, 21,273-5.

## Washing:

Accommodation important, 21,190.

Hot water better than cold, 21,198.

Time should be allowed, 21,191-4.

Towels, soap, nail-brushes, &c., should be provided, 21,195-7.

Water sometimes difficult to obtain, 21,199-204.

White lead: smell dangerous, 21,233-4.

## Zinc paints:

Covering power as good as lead, 21,254-67.

Durability equal to lead except in sulphurous atmospheres, 21,250-3.

Retain colour better than lead, 21,249.

Very little used in Scotland, 21,292-4, 21,300-2.

## SMITH, J. CRUICKSHANK, B.Sc. (Director, Technical Adviser, Indestructible Paint Co., Ltd.):

Evidence, 1554-665.

Lead paints: should be labelled poisonous, 1626-7.

## Lead poisoning:

Compulsory notification useful, 1624-5.

Lead should either be prohibited or trade regulated, 1631-2.

Mixing: difficult to bring it under Factory Act, 1636-8.

## Paints:

Comparative cost of lead and zinc, 1615-22.

Efficiency of lead and zinc, 1601-10, 1654-7.

Constituents of, and their functions, 1566-89, 1652-3.

## White lead:

Better for priming on wood than zinc, 1661-5.

Changes colour in impure atmospheres, 1611, 1633-4.

## Zinc paints:

Could replace lead without increase in cost, 1623, 1639-40, 1658.

Increasing use of, 1635.

Superior to lead for inside: 1612-3.

For outside with proper vehicle, 1614.

Trade prejudice against new materials, 1590-600.

Zinc oxide: standard of purity, 1641-51.

## SMYTH, C. J. (of Messrs. Mauder Bros., Wolverhampton):

Evidence, 13,398-526.

## Restriction to 5 per cent. soluble lead:

Involves no difficulty for green colours, 13,454-64.

Thinks difficulty for reds can be overcome, 13,459.

## Zinc paints:

Cost by weight slightly dearer, by quantity same as lead, 13,402, 13,443-5.

Cost increased when varnish is added, 13,504-6, 13,518-21.

Covering power good, 13,416-9.

Durability good, 13,404, 13,420-42, 13,446-53.

Medium important, 13,507-17.

Suitable for decorators, 13,488-503.

## Solubility of Lead Compounds in dilute Hydrochloric Acid:

Lead chromate only slightly soluble: *Crow*, 11,998-2002, 12,019-21.

Of different lead compounds: *Hooper*, 10,113-29.

## Solubility test:

Could be made in Government laboratory: *Hooper*, 10,156-7.

Method of analysis: *Hooper*, 10,142-S, 10,166.

Would involve no difficulty: *Hooper*, 10,141.

## Stopping:

Composition and application: *Laidler*, 666-9; *Crace*, 1952-6.

Dangerous: *Webb*, 4229.

Material not likely to soil hands: *McKillop*, 30,832-4.

No dust created as lead in paste form: *Bonner*, 4299-301.

**Stopping**—*continued.*

Ten per cent. lead useful: *Patterson*, 22,843-9, 22,919-21.

**STYLES, W. J.** (of the London Master Builders' Association):

Evidence, 14,054-185.

Dry rubbing-down:

Indispensable in some cases, 14,082-3, 14,152.  
No way of removing dust, 14,084, 14,153-5.

Leadless paints:

Office of Works' test not sufficient trial, 14,120-4.  
Trials very good for internal and external work, 14,101-14.

Lead poisoning:

Regrettable that this country should be behind others in legislation regarding, 14,068-70.  
Unaware of extent of evil, 14,058-67.

Meals: accommodation away from paint, &c., difficult, 14,077a-80.

Outdoor clothing: storage away from paint, &c., impossible, 14,077.

Overalls:

Provision and washing by employer serious, 14,073-5.

Storage away from paint, &c., impossible, 14,076.

Periodical medical examination: cannot afford to pay, 14,081.

Prohibition:

Practicable for interior work but not for exterior, 14,147-9.

Would not interfere with business, 14,173-5.

Regulations:

Impossible to carry out, 14,162-72.

Preferred, but as they are impossible to carry out, would agree to prohibition, 14,085-99, 14,125-46, 14,176-85.

Should be tried before lead prohibited, 14,116-9.

Washing:

Accommodation not always practicable, 14,071.

Hot water impossible in some cases, 14,072.

**TANNER, SIR HENRY** (Principal Architect of H.M. Office of Works):

Evidence, 22,628-742.

Graphite paints: not found satisfactory, 22,734-6.

Leadless paints:

No knowledge of toxic effect, 22,699-704.

Origin of, and instructions for use, by Office of Works, 22,632-54, 22,729.

Superior to lead as well as better for workmen, 22,707-8.

Very few complaints received by Office of Works, 22,655-61, 22,714.

Will be used on bridges, &c., in future, 22,740.

Lead paints: still used for priming on iron and steel, 22,662-4, 22,712.

Office of Works' paints generally mixed by manufacturers, 22,695-8.

Painting: amount done by Office of Works, 22,669-74.

Paints: specification by architects, 22,687-91.

Prohibition: Office of Works' experience sufficient to warrant, 22,693.

Regulations: not necessary for old painted surfaces if lead prohibited, 22,723-8.

White lead: use of by Office of Works, 22,676-86.

Zinc paints:

Different treatment required, 22,715-6.

No complaints as to durability, 22,730-2.

Prejudice against abating, 22,668.

Retain colour better than lead, 22,717-22.

**TUKE, CAPT. F. M.** (Marine Superintendent of the Orient Steamship Co.):

Evidence, 10,357-423.

Frequent painting of exterior of ships due to mechanical damage to paint, 10,399-403.

Hulls painted with leadless black paint, 10,379-80.

Lead only used as a small proportion of funnel and ventilator paint, 10,362, 10,365-6, 10,382-5.

Prohibition of lead would not affect Orient Steamship Co., 10,393.

Zinc paints:

Cost of exterior painting of ships slightly dearer than lead, 10,390-1, 10,394.

**TUKE, CAPT. F. M.**—*continued.*

Zinc paints—*continued.*

Cost—*continued.*

Of interior painting of ships same as with lead, 10,375-6.

Easy to apply, 10,409, 10,412-5.

How mixed, 10,416-21.

Reasons for use of, 10,395-8, 10,422.

Satisfactory for ships, 10,374, 10,378, 10,388-9, 10,392.

Used exclusively for ordinary painting for 35 years, 10,363-4.

Except for funnels and ventilators, 10,367-73, 10,381.

Used for priming both on wood and metal, 10,404-8.

**Turpentine:**

Causes of danger from fumes of paint: *Bettink*, 18,517-21, 18,536-41; *Devine*, 20,355-7; *Simpson*, 21,648-51.

Minimal dose: *Goadby*, 15,922.

Poisoning or ill-effects from: *Wilson*, 3225-8; *Goadby*, 15,914, 22,004-7.

Predisposes to lead poisoning: *Johnson*, 22,302-3.

Source of most of the decomposition products: *Dobbie*, 22,500, 22,507-18.

Substitutes or inferior qualities:

Dangers from: *Webb*, 4228, 4268-9, 4272; *Rambousek*, 14,656-7; *Armstrong*, 16,142-4; *McKillop*, 20,816-8, 20,898-900; *Morley*, 23,074-5.

Eczema from: *Legge*, 316-8.

None used: *Puttrell*, 6451-2.

**VAUGHAN, J. C.** (of the National Association of Master House Painters and Decorators of England and Wales):

Evidence, 13,527-823.

Compensation for suspension: would have to insure against, 13,692-5.

Dry rubbing-down: could be dispensed with, 13,645-58, 13,733-42.

Dust and spray: no way of avoiding splashes in painting ceilings and stippling, 13,659-69.

Hours of employment: would agree to limitation to 48 hours, 13,682-7.

Insurance rates: have recently increased, 13,534-6.

Leadless paints:

If Office of Works can dispense with lead, other people should be able to do so, 13,679a-80, 13,767-8, 13,798-9, 13,810-2.

Office of Works' test of four years not sufficient trial, 13,793-6.

Only complete remedy, 13,676-9.

Lead-poisoning:

Cases known of very few, 13,533, 13,537-40.

Incidence greater among railway painters than house painters, 13,781-5.

Regrettable that this country should be behind others in legislation regarding, 13,575.

Unaware of extent of evil, 13,548-73, 13,776-8.

Untrained and dirty men suffer most, 13,743-55.

Meals: accommodation away from paint impossible in some cases, 13,640-4, 13,815-6.

National Association of Master House Painters: have taken no steps to discover extent of lead poisoning or prevent it, 13,541-7.

Outdoor clothing: storage away from paint difficult in some cases, 13,630-9, 13,729-32.

Overalls: provision and washing by employer not objected to, 13,623-5.

Periodical medical examination: would agree to, 13,689-91.

Regulations:

Enforcement by local policemen, or sanitary inspectors, or Inland Revenue officers, or by special sub-inspectors, 13,588-622, 13,817-23.

Preferred to prohibition, 13,696-705.

Would involve increased charges, while use of leadless paints would mean more frequent painting, 13,706-19.

Removal of old paint: respirator suggested against fumes in burning off, 13,670-5.

- VAUGHAN, J. C.—continued.**  
 Washing:  
 Accommodation essential, 13,577-9.  
 Hot water impracticable in some cases, 13,580-6.  
 White lead:  
 Best paint for outside work, 13,759-66.  
 More durable than zinc, 13,779-80.  
 Zinc paints:  
 Increasing use of, 13,757-8.  
 Not equal to lead for outside work, 13,802-8.
- VICKERS, ARCHIBALD** (of Messrs. Archibald Vickers, Ltd., Paint and Varnish Manufacturers, London):  
 Evidence, 19,281-432.  
 Leadless paints: defects of lithopone in regard to light, 19,359-62.  
 Zinc paints:  
 As good as lead, 19,375-8.  
 Better for sea atmospheres than lead, 19,403-11.  
 Can replace lead paints for inside and outside, 19,356-8.  
 Comparative obliterating power of zinc and lead paints, 19,331-55.  
 Cost no greater than lead, 19,297-308, 19,413-23.  
 Covering power good, 19,296, 19,363-8.  
 Durability good, 19,310-2.  
 Instances of their use, 19,313-30.  
 Medium important, 19,286, 19,424-5.  
 No difficulty in application, 19,426-32.  
 Trade prejudice against new materials, 19,379-402.  
 Zinc oxide by indirect process most suitable, 19,289-91.
- VILLEMOT, A.** (President of the Colour and Varnish Manufacturers' Association, Paris):  
 Evidence, 16,170-266.  
 Foreign legislation: France: Commission's findings criticised, 16,187-95, 16,221-35.  
 Lead paints: easier to apply than zinc, 16,201-3, 16,246-8.  
 White lead:  
 Not dangerous enough to be prohibited, 16,184-6.  
 Still largely used in France, 16,208-9, 16,252-5.  
 Zinc oxide:  
 Difficulty in manufacture, 16,236-40.  
 Supply would not be enough if lead prohibited, 16,211-6.  
 Zinc paints:  
 Comparison with white lead, 16,172-81.  
 Covering power not so good as lead, 16,177.  
 Increasing use of, 16,259-66.  
 Unsatisfactory for outside work, 16,171, 16,241.  
 With varnish not so durable as lead, 16,242-4.
- Wages:**  
 Rates of: *Crace*, 2091-3, 2109-14; *Parsonage*, 2866-78; *Campbell*, 3586-7; *Wiltshier*, 6807-12; *Wilkinson*, 20,002-6; *Honeychurch*, 20,176-8; 20,181-90.
- WAIT, D.** (Works Chemist of Messrs. R. Gay & Co. Ltd., Paint Manufacturers, Stratford, London):  
 Evidence, 1452-553.  
 Dry rubbing-down dangerous, 1465.  
 Leadless paints: lithopone not satisfactory for outside work, 1474-8.  
 Mixing:  
 Should be done by paint manufacturers, 1457-61, 1515-6, 1530.  
 Sometimes done with hands, 1511-4, 1524-9.  
 Painting: spraying dangerous, 1462-4.  
 Paints: lead sulphate a good and nearly harmless paint base, 1467-71.  
 Removal of old paint: no danger from lead, 1466.  
 Zinc paints:  
 Composition of, 1493-4, 1499-501.  
 Durability good, 1484-7.  
 Equal to lead, 1509-10.  
 No difficulty in application, 1532-4.  
 Not so popular as white lead, 1481-2.  
 Price of, 1495-8.  
 Same as lead, 1540-1.  
 Require thinning if exposed to air for long time, 1535-9.  
 Satisfactory for inside and outside work, 1479-80.  
 Standardisation of, 1502-8.
- WAIT, D.—continued.**  
 Zinc paints—continued.  
 Tendency to settle of ready-made paints, 1531, 1550-2.  
 Trials of, 1483.
- WALKER, F. L.** (of the London Master Builders Association):  
 Evidence, 9025-140.  
 Compensation for suspension: would not agree to, 9106-7.  
 Dry rubbing-down:  
 Indispensable in some cases, 9077.  
 Respirator suggested, 9078-90, 9119-20.  
 Dust and spray: no means of removal in painting ceilings and stippling, 9081-4.  
 Hours of employment: would agree to limitation if custom, 9094-9.  
 Insurance rates: no knowledge of increase, 9032-3.  
 Leadless paints: if Office of Works substitute satisfactory, it should be used, 9091-3.  
 Lead poisoning:  
 Cases may occur without employer's knowledge, 9130, 9137-40.  
 Cases of poisoning and sickness known of very few, 9029-31, 9034-8, 9112-8.  
 Regrettable that this country should be behind others in legislation regarding, 9057.  
 Unaware of figures showing extent of evil, 9046-55.  
 Meals: accommodation away from lead paint and dust impossible in some cases, 9074.  
 Overalls:  
 No reason why employer should provide them, 9064-9.  
 Storage of, 9073.  
 Washing of, 9070-2.  
 Periodical medical examination: would not agree to, 9100-5.  
 Prohibition of lead: preferred to regulations, 9108-11.  
 Regulations: difficult to carry out, 9075-6.  
 Removal of old paint:  
 Fumes from burning off not dangerous, 9087-8, 9122-5.  
 Solvents could be used, 9085-6, 9121.  
 Washing:  
 Accommodation essential, 9058-9.  
 Hot water not generally obtainable, 9060-3.  
 Towels, soap, &c., already provided, 9131-3.  
 White lead: essential for outside work, but could be prohibited for inside, 9090.
- WALLIS, WILLIAM F.** (of the National Federation of Building Trades Employers):  
 Evidence, 20,557-680.  
 Compensation for suspension: would not agree to, 20,631.  
 Dust: exhaust impossible, 20,628.  
 Leadless paints: no experience with, 20,633-4, 20,647-9, 20,658-68.  
 Lead poisoning:  
 Cases known of very few, 20,559, 20,564-73.  
 Unaware of extent of evil, 20,574-82.  
 Meals:  
 Accommodation away from dust, &c., impossible in some cases, 20,592-7.  
 Household should provide facilities, 20,644-6.  
 Outdoor clothing: storage away from dust, &c., difficult, 20,603-4.  
 Overalls:  
 No hardship for men to provide, 20,636-8.  
 Provision and washing by employer practicable, 20,597-91.  
 Storage away from dust, &c., difficult, 20,598-602, 20,678-80.  
 Periodical medical examination: onerous, 20,630, 20,635.  
 Prohibition:  
 Only remedy, 20,584.  
 Preferred to regulations, 20,632.  
 Regulations:  
 Difficult to enforce, 20,627.  
 Practicable if reasonable, 20,585-6.  
 Would increase cost of work, 20,657.  
 Removal of old paint: no way of removing fumes in burning off, 20,629.

**WALLIS, WILLIAM F.—continued.**

- Washing:  
 Accommodation important, 20,605-10.  
 Hot water: not always practicable, 20,611-3.  
 Nailbrushes, towels, soap, &c., should be provided, 20,618-20, 20,639-43.  
 Time should be allowed, 20,614-7.  
 White lead: men averse to giving it up, 20,650-2.

**WALSH, J. (of the National Amalgamated Society of Operative House and Ship Painters and Decorators).**

- Evidence, 3085-157.  
 Compensation for lead poisoning:  
 Man discharged through claiming, 3123-9.  
 Men reluctant to claim, 3116.  
 Dry rubbing-down:  
 Exhaust fans impracticable, 3112-3.  
 Indispensable in some cases, 3088-9, 3114.  
 Dust and spray: danger from spray in stippling and painting ceilings, 3090.  
 Lead poisoning: chief causes of, 3087.  
 Meals: accommodation impracticable in some cases, 3104-6.  
 Mixing: danger from fumes, 3094-5.  
 Overalls:  
 Danger from dust, 3109-10.  
 Generally worn and washed weekly, 3107-8.  
 Periodical medical examination: not much use, 3115.  
 Prohibition: only solution, 3111.  
 Removal of old paint:  
 Burning off dangerous, 3091.  
 Rubbing down after burning off dangerous, 3092-3.  
 Ship painting: more dangerous than house painting, 3117-22.  
 Washing:  
 Accommodation essential, 3099.  
 Hot water desirable, but not always obtainable, 3100-1.  
 Zinc paints:  
 Application easy after a little experience, 3139-48.  
 As good as lead, 3130-8, 3149-50.  
 Failure due to bad mixing, 3155-7.

**Washing:**

- Accommodation:  
 Already provided: *Crace*, 1921-9; *Puttrell*, 6417-25; *Bennett*, 11,231-3.  
 Difficult or impossible to provide: *Cookson*, 2134-6; *Parsonage*, 2767-77; *Orr*, 10,579-85; *Guest*, 11,112-6; *Anderson, R. L.*, 11,343; *Edginton*, 13,153-6; *Donald*, 12,339-40; *Styles*, 14,071; *Francis*, 17,337-9; *Plumb*, 18,306-13.  
 Generally used by painters if provided: *Parsonage*, 2782-3.  
 Important: *Parsonage*, 2711-5; *Pickles*, 2976; *Walsh*, 3099; *Lowe*, 3274; *Bancroft*, 4098; *Wobb*, 4230; *Bonner*, 4338; *Orr*, 10,578; *Carson*, 11,771, 11,918-20; *McKillop*, 20,836; *Smith, A.*, 21,191.  
 Not always used by painters: *Carson*, 11,914-7.  
 Not provided: *Laidler*, 623-36.  
 Now provided very scanty: *Leggo*, 331-3.  
 Practicable to provide: *Crace*, 2036-9; *Campbell*, 3531-3; *Carson*, 11,936-9; *Griffiths*, 13,985-7; *Sibthorpe*, 18,015-9.  
 Should be provided: *Laidler*, 623-36, 660-4; 741-3, 782-8; *Crace*, 1992; *Cookson*, 2265-73; *Campbell*, 3396; *Harris*, 3663-7; *Cantrill*, 3840-1; *Puttrell*, 6225-7, 6438; *Chappell*, 6485-6, 6627-9; *Wiltshier*, 6693-4; *Barker*, 6932-3; *Grundy*, 7149-50; *McDermid*, 7341-2; *Holliday*, 8465; *Higgs*, 8899-900; *Walker*, 9058-9; *White*, 9228-9; *Vaughan*, 13,577-9; *Morton*, 13,862-4; *Plumb*, 18,109; *Anderson, J.*, 19,548-50; *Honeychurch*, 20,057; *Devine*, 20,387; *Wallis*, 20,605-10.  
 Sometimes provided: *Wilson*, 3229-38.  
 Cold water preferred to hot: *Carson*, 11,772-5; *McKillop*, 20,840-6, 20,894-7.  
 Facilities (Towels, soap, nail-brushes, &c.):  
 Already provided: *Campbell*, 3504-5; 3176-7; *Grundy*, 7263-5; *Walker*, 9131-3; *Milton*, 20,308-11, 20,315-20.  
 Insufficient: *Simpson*, 21,665-93.

x 7700

**Washing—continued.**

- Facilities—continued.  
 Could be provided: *Bennett*, 11,235-6; *Honeychurch*, 20,059-60; *Wallis*, 20,618-26, 20,639-43.  
 Difficult to provide: *Anderson, J.*, 19,561.  
 Essential: *Carson*, 11,776-7, 11,935; *Smith, A.*, 21,195-7.  
 Not always available: *McKillop*, 20,852-7, 20,904-5, 21,025-32.  
 Sometimes refused by employer: *Parsonage*, 2943-9.  
 Would agree to provide: *McDermid*, 7418-21; *Dobie*, 10,967-72.  
 Handkerchiefs used for wiping hands: *Anderson, J.*, 19,551-3.  
 Dangerous, *Dobie*, 10,973-7.  
 Hot water:  
 Better than cold: *Barker*, 6395; *Carfrae*, 10,843-5; *Devine*, 20,388-93; *Smith, A.*, 21,198.  
 Could be provided: *Laidler*, 806-8, 944-52, 964-66, 1021-40; *Crace*, 2048-55, 2031-7; *Campbell*, 3398-401; *Cantrill*, 3843-50, 3925-6; *Puttrell*, 6236-9; *Chappell*, 6630-2; *McDermid*, 7344-6, 7488; *White*, 9230-6; *Orr*, 10,801-2; *Scott*, 12,232-4.  
 Desirable: *McDermid*, 7343.  
 Desirable, but not always obtainable: *Crace*, 2015-8; *Cookson*, 2137-9; *Walsh*, 3100-1; *Wilson*, 3185-6, 3243-4; *Wiltshier*, 6695-7; *Barker*, 6935-7, 7092-3; *Grundy*, 7158-9; *Higgs*, 8901-7.  
 Essential: *Laidler*, 670-3; *Campbell*, 3397; *Cantrill*, 3842; *Mockford*, 8768-9.  
 Essential, but not always obtainable: *Bancroft*, 4099-100, 4166-7.  
 Never refused to men when available: *Parsonage*, 2939-42.  
 Not essential: *Klein*, 16,981-3; *Anderson, J.*, 19,554-60; *Milton*, 20,312-4; *Joadby*, 22,061-3.  
 Not essential, but better than cold: *Harris*, 3668-71; *Puttrell*, 6228-35; *Chappell*, 6487-8, 6493; *Grundy*, 7151, 7156-7.  
 Not obtainable always: *Parsonage*, 2713, 2778-81, 2818-28; *Lowe*, 3275, 3337-44, 3366-70; *Harris*, 3672-4, 3774; *Wobb*, 4231-3; *Bonner*, 4339-40; *Holliday*, 8466-8; *Walker*, 9060-5; *Carfrae*, 10,842; *Dobie*, 10,966; *Bennett*, 11,234; *Vaughan*, 13,580-6; *Morton*, 13,865-6; *Styles*, 14,072; *Niederhaiser*, 16,311-2; *Honeychurch*, 20,059-60; *Devine*, 20,394; *Wallis*, 20,611-3.  
 Practicable, but difficult to obtain in some cases: *Pickles*, 2977-81, 3035-49, 3081-4.  
 Only necessary to remove loose paint off hands: *Grundy*, 7152-5, 7246-54.  
 Provision of buckets and soap could be enforced: *Leggo*, 335-6.  
 Regulation not necessary as men provide their own facilities: *Wilkinson*, 19,934-41.  
 Soap: special kind to prevent lead poisoning, *Johnson*, 22,405-8.  
 Time for washing:  
 Not allowed: *Parsonage*, 2920-4, 2926; *Wobb*, 4274-7.  
 In Germany: *Niederhaiser*, 16,366-9.  
 Should be allowed: *Pickles*, 3050-5, 3083; *Carson*, 11,778; *Roeh*, 16,744-5; *McKillop*, 20,837; *Smith, A.*, 21,191-4.  
 Would agree to allow: *Chappell*, 6489-92; *Higgs*, 9002-3; *Wallis*, 20,614-7.  
 Towels: objects to provide: *Milton*, 20,321.  
 Wash-leathers, which are used for washing paint, used as towels: *Anderson, J.*, 19,858-61.  
 Water sometimes difficult to obtain: *Smith, A.*, 21,199-204.  
 But generally available: *McKillop*, 20,847-51, 21,019-24.

**WEBB, GEORGE (Foreman Painter):**

- Evidence, 4173-285.  
 Dry rubbing-down:  
 Causes dust, 4191-2.  
 Exhaust fans impracticable, 4198.  
 Indispensable in some cases, 4199-207.  
 Time occupied at, 4193-4, 4278-85.

3 C 3

WEBB, GEORGE—*continued.*

- Dust and spray:  
 Danger from spray in stippling and painting ceilings, 4208-11, 4264-6.  
 Mask suggested, 4212-6, 4267.  
 Emanations: dangerous, 4227.  
 Lead poisoning: cases known of, 4176-87.  
 Meals: where taken, 4270-1.  
 Mixing:  
 Danger from fumes, 4188-9.  
 In burning out paint cans, 4190.  
 Principal danger, 4195-6.  
 Overalls: generally worn and washed weekly, 4235-42.  
 Removal of old paint:  
 Danger from sandpapering after burning off, 4220-2.  
 No way of avoiding fumes in burning off, 4217-9, 4226.  
 Scraping off dangerous, 4223-4.  
 Stopping: dangerous, 4229.  
 Turpentine: substitutes dangerous, 4228, 4268-9, 4272.  
 Washing:  
 Accommodation important, 4230.  
 Hot water difficult to obtain, 4231-3.  
 Time not allowed, 4274-7.  
 Zinc paints:  
 Experience of, 4245-52.  
 Ill-effects from, less than from lead, 4244, 4253-5.

## WHITE, A. G. (of the National Federation of Building Trades Employers):

- Evidence, 9141-529.  
 Dry rubbing-down:  
 Causes dust, 9515-8.  
 Indispensable in some cases, 9256-61, 9416-7, 9444-5.  
 Mask practicable, 9262-7, 9298-306.  
 Reasons for, 9442-3.  
 Dust and spray:  
 Frequent washing of face suggested to avoid danger in stippling and painting ceilings, &c., 9268-72.  
 Mask only suggestion, 9275, 9347-60.  
 Emanations: colic due to turpentine and not lead, 9504-6.  
 Foreign legislation:  
 Is aware of it, 9224-6.  
 Will obtain information of, 9425-38.  
 Hours of work:  
 Workers would probably object to limitation, 9439-41.  
 Would agree to limitation, 9287-9.  
 Insurance rates: recent increase in, 9489-93.  
 Leadless paints:  
 Nature of tests which should be made before lead prohibited, 9384-5, 9371-2.  
 None efficient after many experiments, 9402-4, 9414-5.  
 Office of Works' test of four years not sufficient trial, 9284-6, 9375-6, 9380, 9405.  
 Test of 10 years necessary before lead prohibited, 9381-3, 9388-9.  
 Would be accepted if equal to lead, 9396-7.  
 Lead poisoning:  
 Careful training would reduce evil, 9513.  
 Cases more frequent among lower class of painters, 9307-15.  
 Cases of poisoning and sickness known of, 9147-55.  
 Death rates, 9364-70, 9470.  
 Deplorable, 9223.  
 Details of cases, 9316-19, 9471.  
 Effect of seasonal nature of trade, 9463-9, 9494-7.  
 Regrettable that this country should be behind others in legislation regarding, 9227.  
 Results of inquiry by National Federation, 9328-40.  
 Small experience of, probably due to casual employment, 9479-85.  
 Meals: accommodation sometimes supplied, but no real need for it, 9252.  
 National Federation of Building Trades Employers:  
 Extent of lead poisoning evil not thoroughly realised, 9177-223, 9372-4.

WHITE, A. G.—*continued.*

- National Federation of Building Trades Employers—*continued.*  
 Have made no experiments to discover substitute, 9174-6.  
 Have taken steps to find out extent of lead poisoning, 9156-73.  
 Overalls:  
 Not worn by railway painters, 9510-2.  
 Storage away from dust and paint could be arranged for, 9244-51.  
 Would agree to wash them weekly, 9241-3.  
 Object to provision by employer, 9237-40.  
 Painting:  
 Architects responsible for specifications, 9393-5.  
 Ceiling, &c., could be done with leadless paints, 9446-50.  
 Painters: estimated number of, 9361-3.  
 Periodical medical examination: would agree to, 9290-3.  
 Prohibition of lead:  
 Effect on trade, 9453-5.  
 Only remedy if mask impracticable, 9276-80.  
 Practicable for inside, 9398-400, 9406-11.  
 Public would suffer if prohibited for outside, 9401.  
 Would agree to, if efficient substitute and not too costly, 9451-2, 9460.  
 Regulations:  
 As to washing, overalls, meal rooms, &c., could be carried out, 9253-5.  
 Necessary and not objected to, 9296.  
 Preferred to prohibition, 9297.  
 Should be made while tests of leadless paints are made, 9386-7.  
 Removal of old paint:  
 Mask suggested to avoid fumes, 9273-4.  
 Very little danger from fumes in burning off, 9377-9, 9390.  
 Rubbing down: moistening sandpaper to avoid dust might be tried, 9472-7, 9514, 9519-20.  
 Ship painting:  
 More dangerous than house painting, 9320-1.  
 Surprised that precautions taken by Admiralty have not prevented lead poisoning, 9322-4.  
 Washing:  
 Accommodation should be provided, 9228-9.  
 Hot water practicable to obtain, 9230-6.  
 Zinc paints:  
 Not so good as lead, 9281-3.  
 Use of, for ship painting, 9522-9.  
 White Lead:  
 Amount manufactured, exported, re-exported, and consumed in the United Kingdom: *Miller*, 17,065, 17,086-7, 17,090-3, 22,551-2, 22,556-71.  
 Amount used for painting purposes: *Miller*, 17,228-35, 22,553-5.  
 Amount used for purposes other than painting: *Miller*, 17,119-22, 22,576-82, 22,606-27.  
 Best paint pigment: *Higgs*, 8979-82, 8987-9; *Ander-son*, *R. L.*, 11,418-27, 11,433-9; *Leyendecker*, 16,465-80; *Klein*, 16,837; *Miller*, 17,110-1.  
 For outside work: *Garson*, 2549, 2553; *Chappell*, 6586; *Vaughan*, 13,759-66; *Nooijen*, 15,208, 15,212, 15,361; *Honeychurch*, 20,154-8.  
 Better paint pigment than zinc: *Holzappel*, 11,502-3.  
 For outside work: *Niederhäuser*, 16,272-3.  
 For priming: *Smith, J. C.*, 1661-5; *Barker*, 7089-91.  
 Capital invested: *Miller*, 17,066.  
 Compensation should be paid to corroders if lead prohibited: *Cookson*, 2256.  
 Dry white lead:  
 Nearly all sent to colour grinders: *Cookson*, 2306-9.  
 Sale should be prohibited: *Rivet*, 15,630-5; *Bettink*, 18,497-8.  
 Effect of prohibition on export trade: *Miller*, 22,596-605.  
 On market: *Miller*, 22,572-86.  
 Foreign competition: *Miller*, 22,587-95.  
 Guarantee given, *Niederhäuser*, 16,362.  
 Important industry in Austria: *Rambousek*, 14,598-617.  
 In Belgium: *Ricker-Devoe*, 14,972-4.  
 Men averse to giving it up: *Wallis*, 20,650-2.

**White Lead—continued.**

- Not dangerous enough to be prohibited: *Villemot*, 16,184-6.
- Sale should be prohibited for making paints: *Cunyng-hame*, 10,336.
- Smell dangerous: *Smith, A.*, 21,283-4.
- Still largely used in France: *Expert-Bezançon*, 15,108-12; *Villemot*, 16,208-9, 16,252-5.
- Trade dependent on foreign sources in some measure: *Miller*, 17,123-6.
- Use of, by Office of Works: *Patterson*, 12,989-3000, 13,025-36, 13,041-6, 22,899-915; *Tanner*, 22,767-86.
- In ship painting: *Plumb*, 18,328-37.
- WILKINSON, C. E.** (of the London Association of Master Decorators):  
Evidence, 19,894-20,016.  
Compensation for suspension: would agree to if law, 19,902-3.
- Dry rubbing-down:  
Dust does not float in air but falls to ground, 19,949-59.  
Moistening glass paper suggested to remove dust, 19,946-8.  
Very little dust created, 19,990-5.
- Dust: exhaust fans impracticable, 19,943-5.
- Lead poisoning:  
Education of painters in cleanliness the solution 19,987-8, 19,996-9.  
No cases known, 19,897-907.  
Some action necessary, 19,921.  
Surprised that properly trained men should contract lead poisoning, 20,007-9.  
Trade union statistics disputed, 19,982-6.  
Unaware of extent of evil, 19,908-20.  
Untrained men more liable, 20,013-4.
- Meals:  
Accommodation difficult in some cases, 19,926-7.  
Frequently taken in rooms where work is going on, 19,928-31.
- Overalls:  
Generally worn in good shops, 20,010-2.  
Provision by employer impracticable, 19,924-5.  
Storage away from dust and paint impracticable, 19,932-3.  
Washed at home, 19,942.
- Painters: should all be trained men, 20,015-6.
- Periodical medical examination: might be a good thing, 19,960-1.
- Regulations:  
Preferred to prohibition, 19,964.  
Some impracticable, 19,965-81.
- Wages: rates of, 20,002-6.
- Washing: regulations not necessary, as men provide their own towels, soap, &c., 19,934-41.
- WILLIS, A. W.** (of the London Colour, Paint, Oil, and Varnish Trades' Association).  
Evidence, 11,633-748.
- Dry rubbing-down: respirators should be worn, 11,706-8.
- Leadless paints:  
Strange that Office of Works should succeed where others have failed, 11,720-3.  
Zinc sulphide useless for exterior work, 11,660.
- Lead poisoning: reduction in paint and colour works following on regulations, 11,693-702.
- Office of Works: large users of paints, 11,661-4.
- Paint grinding:  
Industry should be considered in any action to reduce lead poisoning among house painters, 11,643-50.  
No difference to trade whether lead or zinc ground, 11,670-87.
- Prohibition:  
Effect on paint grinders, 11,642, 11,724-7.  
Would reduce range of colours, 11,640.
- Regulations: cost of, in paint-grinding works, 11,709-18.
- Zinc paints:  
Importance of medium, 11,739-48.  
Not as good as lead for outside even with varnish added, 11,729-33.  
Not so durable as lead for outside, 11,651-5.  
Only substitute for white colours, 11,639.

- WILSON, FREDERICK** (of the National Amalgamated Society of Operative House and Ship Painters and Decorators of England and Wales):  
Evidence, 3158-253.
- Dry rubbing-down:  
Indispensable in some cases, 3165-6.  
Principal danger, 3164, 3217-22.
- Dust and spray: danger from spray in stippling and painting ceilings, 3167.
- Leadless paints:  
As durable as lead, 3245-6.  
No objectionable smell, 3202-5.
- Lead poisoning: details of cases, 3195-201.
- Meals: where taken, 3239-42, 3250-3.
- Mixing: danger from fumes, 3174-84, 3193-4.
- Prohibition: only solution, 3187-92.
- Removal of old paint:  
Burning off dangerous, 3168-9.  
Rubbing down after the burning off dangerous, 3170-1.
- Turpentine: ill-effects from, 3225-8.
- Washing:  
Accommodation sometimes provided, 3229-38.  
Hot water desirable but not always obtainable, 3185-6, 3243-4.
- Zinc paints: enamels satisfactory for outside, 3206-10.
- WILTSHIER, ARCHIBALD** (of the National Association of Master House Painters and Decorators of England and Wales):  
Evidence, 6663-878.
- Compensation for suspension: would agree to, 6770-1.
- Dry rubbing-down:  
Amount of dust caused, 6850-2.  
Can suggest no remedy for dust created between coats, 6730-1.  
Dusty process, 6727.  
Exhaust fans impracticable, 6725-6.  
Indispensable in some cases, 6722-4.  
Should be prohibited on preparatory work, 6728-9.
- Dust and spray:  
Not dangerous if inhaled, 6720-1.  
No way of avoiding splashes in painting ceilings, 6732-7.  
Washing hands and face immediately after stippling suggested as remedy, 6738-45.
- Emanations: could be partially removed by ventilation, 6791-2.
- Filling: 75 per cent. leadless, 6849.
- Hours of employment:  
Painters not continually employed painting, 6839-42.  
Would agree to limitation of, 6762-4, 6804-6.
- Insurance: rates have recently increased, 6671-2.
- Lead paints: matured preferred to new as better, 6786, 6793, 6799-801.
- Leadless paints:  
Office of Works paint not satisfactory on Canterbury Post Office, 6756-8, 6823-35, 6863-75.  
Only way of removing dangers, 6752.  
Water distempers largely used for flitting and ceiling work, 6843-6.
- Lead poisoning:  
Cases of poisoning and sickness known of, 6669-70, 6673-7.  
Cleanliness does not give immunity from, 6787-90.  
Plumbers do not suffer because they are trained, 6818-9.  
Realises extent of, 6682-3, 6690.  
Untrained men more liable to poisoning as less cleanly, 6813-7.
- Master House Painters Association:  
Have made experiments with leadless paints, 6678-81.  
Untrained men taken on in busy season, 6820-2.
- Meals: accommodation away from paint and dust can be provided, 6709-15.
- Mixing:  
Done on job, 6749, 6784.  
Done with lead in paste form, 6785, 6847-8.
- Outdoor clothing: place away from lead paint and dust could be provided, 6708, 6717-9.
- Overalls:  
Ought to be worn, 6698.

**WILTSCHIER, ARCHIBALD—continued.****Overalls—continued.**

Should be cleaned weekly, 6699-701.

Sometimes kept in bags, 6702-3.

Sometimes kept in rooms where painting is in progress, 6704-7.

Paints: four years a good trial as to durability, 6876-7.

Periodical medical examination: would agree to, but not for employer to pay, 6765-9.

Prohibition of lead preferred to regulations, 6778-83.

**Regulations:**

Could not be enforced, 6772-5.

Difficulty with small jobs, 6776.

Removal of old paint: can suggest nothing to prevent fumes in burning off, 6746-8.

Wages: rates of, 6807-12.

**Washing:**

Accommodation essential, 6693-4.

Hot water essential but not always obtainable, 6695-7.

Zinc paints: durability not good, 6753-5.

WONNACOTT, W.: see MUNBY, A. E.

**Workmen's Compensation Act:**

Duties of certifying factory surgeons: *Legge*, 284-9.

Procedure in cases of poisoning: *Legge*, 228-33.

**Zinc:**

Dependent on foreign countries for supplies: *Holzappel*, 11,540; *Miller*, 17,161-2.

Dust not harmful: *Holzappel*, 11,468-73.

Price would rise with prohibition of lead: *Crow*, 12,135-6; *Expert-Bezançon*, 15,102.

Temporarily: *Pisart*, 18,905-18, 18,992-5.

Production in England: *Miller*, 17,152-8.

Shortage would occur if lead prohibited: *Lancaster*, 17,610-34.

Supply sufficient if lead prohibited: *Depierres*, 19,141-5.

**Zinc Oxide:**

Amount of lead present: *Holzappel*, 11,519-23.

Combine, Broken Hill Mines:

Connected: *Expert-Bezançon*, 15,188-91; *Rivet*, 15,566.

Not connected: *Crow*, 12,142-3.

Difficulties or failure of manufacture: *Expert-Bezançon*, 15,100; *Villemot*, 16,236-40; *Miller*, 17,198, 17,216-20; *Lancaster*, 17,582-669, 17,641-2; *Pisart*, 18,933-46, 18,984-7; *Johnson*, 22,461-4.

Direct process:

Better than indirect: *Lancaster*, 17,567, 17,577-81; *Depierres*, 19,016-31.

British ore unsuitable: *Lancaster*, 17,560-6, 17,569-76.

Cheaper than indirect: *Depierres*, 19,016-31.

Dust not dangerous: *Pisart*, 21,853-65.

Five per cent. lead necessary: *Lancaster*, 17,648-53.

Four per cent. lead:

Admitted by certain foreign governments: *Depierres*, 19,034.

Most suitable: *Pisart*, 18,893-902, 18,923-4; *Depierres*, 19,032-7.

History, capital invested, production, &c.: *Miller*, 17,076-7, 17,082.

Importation increasing: *Miller*, 17,198-40.

Increased demand:

Would lead to manufacture in England: *Line*, 9972.

Would not lead to increase in price: *Line*, 9973.

Would probably lead to increase in price: *Rivet*, 15,454-6; *Miller*, 17,173-83, 17,197; *Chancellor and Penwarden*, 21,423-8.

Indirect process:

Kind of zinc used: *Expert-Bezançon*, 15,178-87.

Most suitable: *Vickers*, 19,289-91.

Mainly foreign product: *Miller*, 17,194-6.

Methods of production: *Line*, 9954-5.

Monopoly:

Entire corner in zinc hardly possible: *Crow*, 12,133-46.

In France: *Expert-Bezançon*, 15,101, 15,173-7.

Only substitute for lead in any way efficient, *Miller*, 17,075.

Production of: *Lancaster*, 17,635-40.

**Zinc Oxide—continued.**

Pure zinc oxide:

Not satisfactory: *Pisart*, 18,948-9, 18,957-8, 21,838.

Superior to that containing small proportion of lead: *Rivet*, 15,457-61, 15,537-40, 15,548-55.

Recent improvements in: *Munby and Wonnacott*, 2401-9.

Standard of purity: *Cunynghame*, 10,331-4.

Supply:

Ample: *Chancellor and Penwarden*, 21,421.

Dependent on foreign sources: *Rivet*, 15,449-53, 15,563-5.

Not sufficient if lead prohibited: *Villemot*, 16,211-6; *Johnson*, 22,455.

Sufficient if lead prohibited: *Giraud and Petit*, 21,742-3.

Toxicity of: *Johnson*, 22,311-5.

Used for other purposes than painting: *Miller*, 17,223-6.

**Zinc Paints:**

Adopted for business, not humanitarian reasons: *Coysb*, 9592-5.

Adulteration of, with lead: *Plumb*, 18,124-32.

Application:

Different from lead: *Legge*, 166-7.

Difficult: *Miller*, 17,147-51, 17,202-6.

More difficult than lead: *Munby and Wonnacott*, 2338, 2429-30; *Ricker-Devroede*, 14,857-9, 15,048-61, 15,075-7; *De Morsier*, 16,646-9.

No real difficulty: *Wait*, 1532-4; *Bonner*, 4374;

*Tuke*, 10,409, 10,412-5; *Patterson*, 1123-5, 22,922; *Niederhäuser*, 16,370-1; *Silthorpe*, 17,996-9; *Vickers*, 19,426-32; *Devina*, 20,449-50; *Chancellor and Penwarden*, 21,474-9; *Mortley*, 23,066.

After a little experience: *Walsh*, 3139-48; *Lowe*, 3348, 3352-3.

But special knowledge required: *Depierres*, 19,048-50.

For competent painters: *Honeychurch*, 20,179-80; *McHugh*, 20,697-9.

No special training needed: *Nooijen*, 15,363-8.

As good as lead: *Wait*, 1509-10; *Garson*, 2495-500; *Walsh*, 3130-8, 3149-50; *Lowe*, 3286-7; *Ellson*, 10,463-7, 10,493-501; *Pisart*, 18,876-80; *Vickers*, 19,375-8.

For inside work: *Munby and Wonnacott*, 2329; *Pickles*, 3015, 3059-60.

Better than lead: *Bonner*, 4390-1; *Coysb*, 9577-87, 9623-9; *Giraud and Petit*, 21,762-70.

For inside work: *Smith, J. C.*, 1612-3.

For outside work with proper medium: *Smith, J. C.*, 1614.

For sea atmospheres: *Vickers*, 19,403-11.

With addition of varnish: *Patterson*, 12,909.

Can be used for filling, flatting, and enamelling: *Heydorn*, 543-55.

Climatic effect: *Cantrill*, 3945-6; *Nooijen*, 15,344-8:

Inferior to lead in humid atmospheres: *Nooijen*, 15,242-50; *Bettink*, 18,484-5.

Inferior to lead in sulphurous atmospheres: *Nooijen*, 15,213, 15,231-40; *Bettink*, 18,431-2, 18,474-9.

Suitable for sulphurous atmospheres: *Chancellor and Penwarden*, 21,431-4; *Giraud and Petit*, 21,784-8.

Unlikely to stand Scottish climate: *Guest*, 11,162-9.

Comparison with white lead, *Villemot*, 16,172-81.

Composition: *Wait*, 1493-4, 1499-501.

Composition, manufacture, medium, and use: *Giraud and Petit*, 21,696-708, 21,771-83, 21,789-819.

Cost:

Cheaper than lead: *Chancellor and Penwarden*, 21,374-9, 21,480-1.

Dearer by weight, but cheaper on work as its bulk is greater: *Garson*, 2501-3; *Holzappel*, 11,486-92, 11,608; *Smyth*, 13,402, 13,443-5; *Giraud and Petit*, 21,707-8.

Dearer than lead: *McDermid*, 7477-81; *Guest*, 11,170-3; *Expert-Bezançon*, 15,121-4; *Bettink*, 18,446; *Honeychurch*, 20,091-8, 20,134-6.

Because needing more oil: *Rivet*, 15,555-62.

For outside: *Tuke*, 10,390-1, 10,394; *Morton*, 13,967-71.

**Zinc Paints—continued.****Cost—continued.**

Dearer than lead—*continued.*

For re-painting, *Nooijen*, 15,251-7, 15,349-56.

Increased by addition of varnish: *Holzappel*, 11,504-6; *Smyth*, 13,504-6, 13,518-21.

No dearer than lead with addition of varnish: *Patterson*, 12,907-8.

Not increased by addition of varnish: *Morley*, 23,094-5.

Same as lead: *Heydorn*, 488; *Wait*, 1495-8; 1540-1; *Munby* and *Wonnacott*, 2330, 2333-4; *Meissl*, 14,797-801; *Depierres*, 19,051; *Vickers*, 19,297-308, 19,413-23; *McHugh*, 20,689-91.

For interior painting: *Take*, 10,375-6.

Would fall with increased demand: *Garson*, 2576.

Would rise if lead prohibited: *McHugh*, 20,692.

Could not replace lead paints at present: *Campbell*, 3623-4.

Could replace lead paints: *Depierres*, 19,073; *Pisart*, 18,871, 18,890-2, 18,929-33, 18,950.

For inside work: *Munby* and *Wonnacott*, 2335-6.

For inside and outside work: *Vickers*, 19,356-8.

For inside but not outside work: *Anderson, J.*, 19,701-2.

For outside work in Navy: *Philip*, 8665-8, 8705-9.

Without increase in cost: *Smith, J. C.*, 1623, 1639-40, 1658.

**Covering power:**

As great as lead: *Smith, A.*, 21,254-67.

Extra coats required: *Sibthorpe*, 17,891-3.

Good: *Smyth*, 13,416-9; *Vickers*, 19,296, 19,363-8.

Greater than lead: *Heydorn*, 490-2, 512, 517-9, 537-42; *Pisart*, 18,903-4, 18,959-61; *Depierres*, 19,060-1, 19,114-8; *Chancellor* and *Penwarden*, 21,373, 21,486-8; *Giraud* and *Petit*, 21,704-7, 21,798-800.

Increased by addition of basic sulphate of lead:

*Munby* and *Wonnacott*, 2479-88.

Not so great as lead: *Campbell*, 3625; *Puttrell*, 6324, 6427-9; *Higgs*, 8947-51; *Meissl*, 14,680-1; *Villamot*, 16,177; *Bellink*, 18,433, 18,481-2; *Honeychurch*, 20,082-90, 20,174-5; *Milton*, 20,272-3.

But spreading power greater: *Munby* and *Wonnacott*, 2331-2, 2427-8.

Of zinc sulphide double that of lead: *Line*, 9943-5.

Defects in Office of Works paints: *Dobie*, 11,036-9.

Do not chalk: *Heydorn*, 493-5, 520-3.

Dry rubbing-down dangerous: *Ricker-Devroede*, 14,886-95; *Klein*, 16,906-11; *Plumb*, 18,156-62, 18,268-81, 18,354-5.

Drying:

Difficult in outside work: *Ricker-Devroede*, 14,860-1.

Difficulties overcome: *Patterson*, 1063-71.

Facilitated by addition of varnish: *Holzappel*, 11,611-2.

Slower than lead: *Holzappel*, 11,586-7, 11,605-6, 11,609-10; *Nooijen*, 15,387-93.

Durability:

As good as lead: *Heydorn*, 489; *Wait*, 1509-10; *Mockford*, 8791-2; *Holzappel*, 11,585.

Except in sulphurous atmospheres: *Smith, A.*, 21,250-3.

If properly mixed: *Garson*, 2508-12.

Better than lead: *Giraud* and *Petit*, 21,712-24.

Good: *Wait*, 1484-7; *Smyth*, 13,404, 13,420-42, 13,446-53; *Pisart*, 18,880; *Vickers*, 19,310-2.

Increased by addition of varnish: *Garson*, 2564-5, 2571; *Holzappel*, 11,496-500; *Niederhäuser*, 16,347-8; *Morley*, 23,091.

No complaints: *Tanner*, 22,730-3.

Not good: *Wiltshier*, 6753-5; *Ricker-Devroede*, 15,016-20.

Not so good as lead: *Puttrell*, 6324; *Higgs*, 8952-3; *Willis*, 11,651-5; *Meissl*, 14,761-4; *Niederhäuser*, 16,344-6, 16,349-54; *Sibthorpe*, 17,804-9; *Plumb*, 18,133, 18,386-94; *Bellink*, 18,445; *Simpson*, 21,619-29.

Even with varnish added: *Villamot*, 16,242-4.

Of zinc sulphide better than lead for outside work: *Line*, 9993-10,022.

Very good: *Line*, 9958-69.

**Zinc Paints—continued.**

Dust harmful even if non-poisonous: *Plumb*, 18,156-62, 18,268-81, 18,354-5.

Experience of: *Webb*, 4245-52.

Extended use of, requisite to obviate danger: *Mockford*, 8741, 8764.

Failings of: *Munby* and *Wonnacott*, 2359-64.

Failures due to faulty mixing: *Walsh*, 3155-7.

Flat finish:

Cannot be obtained: *Dobie*, 11,032-5, 11,042-4, 11,064.

Practicable: *Patterson*, 12,916-7.

Found to stand well, but experience with limited: *Simpson*, 21,584-92, 21,596-618, 21,658-62.

Greens: difficult to get dark shades: *Patterson*, 1093-106.

Grey colours for outside of ships in Navy could be obtained: *Mockford*, 8839-51.

Guarantee:

Given: *Depierres*, 19,054, 19,059.

Would not give: *Niederhäuser*, 16,363.

Ill-effects from:

Less than from lead: *Webb*, 4244, 4253-5.

None: *Devine*, 20,446-8.

Improvements in: *Patterson*, 1128-30; *Crace*, 2013-4; *Garson*, 2530-1.

Increasing use of: *Miller*, 17,207-15.

Keeping:

Better than lead: *Depierres*, 19,052-9.

Good: *Giraud* and *Petit*, 21,817-9.

No sediment: *Cunnew*, 10,277-8.

Require thinning if exposed to air for a long time: *Wait*, 1535-9.

Tendency to settle if kept for a long time: *Meissl*, 14,749-53.

Of ready-mixed paints: *Wait*, 1531, 1550-2.

Largely used for interior work: *Ricker-Devroede*, 14,834.

Less coats required than with lead: *Patterson*, 1072.

Light colours not so durable as lead outside: *Munby* and *Wonnacott*, 2345.

Medium:

Important: *Patterson*, 1143-8, 1175; *Smyth*, 13,507-17; *Vickers*, 19,286, 19,424-5.

Kind recommended: *Line*, 10,042-4, 10,055-62.

Kind used: *Patterson*, 1107-12; *Coysk*, 9649-52.

More needed than with lead: *Johnson*, 22,305-10.

Treatment, special kinds required: *Munby* and *Wonnacott*, 2340-4, *Garson*, 2534-5; *Line*, 9934-41, 10,045-8; *Tanner*, 22,715-6.

Mix well with other pigments and ordinary vehicles: *Heydorn*, 498-9, 526, 534.

Not recommended for sign writing: *Heydorn*, 486, 535-6.

Not so good as lead: *Barker*, 7031-8; *Holliday*, 8510-1; *White*, 9281-3; *Guest*, 11,170-3.

For outside work: *Dobie*, 11,045; *Vaughan*, 13,802-8.

For outside work even with varnish added: *Willis*, 11,729-33.

Not so popular as lead: *Wait*, 1481-2.

Not used for outside work in the Navy: *Philip*, 8658, 8681-3.

Preferred to white lead for finishing coats: *Mockford*, 8736.

Prejudice against: *Patterson*, 1158-61; *Smith, J. C.*, 1590-600; *Vickers*, 19,379-402; *McKillop*, 20,901-3; *Tanner*, 22,668.

Proportion of total paints used in Navy: *Philip*, 8637-40, 8663-4.

Pure zinc oxide:

Next best to white lead: *Rivet*, 15,504-5.

Percentage of impurity which should be allowed: *Patterson*, 1134-41.

With varnish as good as lead: *McHugh*, 20,687-8.

Render bridges and structures unsafe: *Expert-Bezanson*, 15,125-8.

Repainting done at normal intervals: *Patterson*, 22,816-7.

Retention of colour:

As good as lead: *Depierres*, 19,119-27.

Better than lead: *Heydorn*, 496; *Garson*, 2504-5; *Philip*, 8714-20; *Mockford*, 8804; *Coysk*, 9653, *Willis*, 11,739-48; *Honeychurch*, 20,082-90; *Smith, A.*, 21,249; *Tanner*, 22,717-22.

**Zinc Paints—continued.****Satisfactory:**

For decorators: *Smyth*, 13,488-503.

For inside work: *Wait*, 1479-80; *Chappell*, 6555; *Philip*, 8648-50; *Mockford*, 8743-6; *Bellink*, 18,483.

For inside and outside work: *Patterson*, 1092, 1118-9, 1131.

For inside work but not for outside work: *Miller*, 17,077, 17,083.

For iron and steel: *Bonner*, 4413-5; *Giraud* and *Petit*, 21,734-41.

For outside work: *Wait*, 1479-80; *Pickles*, 3017-23; *Bonner*, 4394-5; *Cunnew*, 10,254-6; *Morton*, 13,963-6; *Morley*, 23,076-81.

With addition of varnish: *Lowe*, 3354; *Meissl*, 14,816-20.

For ships: *Tuke*, 10,374, 10,378, 10,388-9, 10,393; *Holzappel*, 11,464, 11,481-3, 11,616-8, 11,624-32.

Soften in water: *Simpson*, 21,640-2.

Special treatment required: *Garson*, 2534-5.

Specification, difficulties: *Patterson*, 1154-7; *Munby* and *Wonnacott*, 2440-50.

Spreading power greater than lead: *Heydorn*, 497, 511, 513-6.

Standardisation of: *Wait*, 1502-8; *Cantrill*, 3915-20.

Standard of purity: *Smith, J. C.*, 1641-51.

Tests or trials: *Wait*, 1483, 1518-23.

Details of: *Patterson*, 22,767-87.

Failures: *Miller*, 17,190-2.

Satisfactory: *Patterson*, 22,758-66.

Unsatisfactory: *Carfrae*, 10,866-75, 10,898-9; *Bennett*, 11,212-20; *Sibthorpe*, 18,033-43.

**Unsatisfactory:**

For iron work: *Munby* and *Wonnacott*, 2477-8.

For outside work: *Chappell*, 6555, 6639-49; *Villemot*, 16,171, 16,241.

**Use of:**

Increasing: *Smith, J. C.*, 1625; *Philip*, 8626-30; *White*, 9522-9; *Faughan*, 13,757-8; *Expert*.

**Zinc Paints—continued.****Use of—continued.****Increasing—continued.**

*Bezançon*, 15,169-71, 15,192-4; *Villemot*, 16,259-66; *McHugh*, 20,695-6; *Giraud* and *Petit*, 21,758-61.

In Norway and Sweden: *Pisart*, 18,872-5.

In Scotland very small: *Smith, A.*, 21,292-4, 21,300-2.

Instances: *Heydorn*, 500-4; *Lowe*, 3345-52, 3355-61; *Vickers*, 19,313-30; *Chancellor* and *Penwarden*, 21,380-418; *Giraud* and *Petit*, 21,725-33, 21,745-57.

On Belgian State Railways: *Ricker-Devroede*, 14,968-70, 15,009-15; *Pisart*, 18,951-3, 18,988-90, 21,820-35, 21,876-89.

On royal apartments on H.M. Yacht "Victoria and Albert," *Mockford*, 8747-52.

Used exclusively except for funnels and ventilators: *Tuke*, 10,367-73, 10,381.

Used exclusively for ordinary ship painting for 35 years: *Tuke*, 10,363-4.

Used for priming both on wood and metal: *Tuke*, 10,404-8.

Water paints satisfactory for undercoats: *Line*, 9946-50, 9986-92, 10,074-89.

Where applied: *Holzappel*, 11,576-84, 11,621-3.

Will be exclusively used in future: *Coysh*, 9574-5, 9587, 9634-5.

With 5 per cent. lead:

As good as lead paints: *Bonner*, 4419-20.

Gives stability and lessens cost: *Patterson*, 22,788-90.

Good substitute for white lead for interior work: *Patterson*, 1079-90.

With suitable medium satisfactory for inside and outside work, but still inferior to lead: *Nooijen*, 15,209-11, 15,327-31.

## PART II.—Coach Painting References.

[For Evidence dealing with House-Painting and General Questions, see PART I.]

### Agricultural Implements :

- American : *Crow*, 12,037, 12,161-2.
- Effect of prohibition of lead on foreign competition :  
*Crow*, 12,030-1, 12,036-7, 12,105-7.
- Extent of imports : *Crow*, 12,035.
- Importance of red colour for : *Crow*, 12,032-4.

### Alizarin Colour :

- Unaware that Midland Railway Company has given up : *Connell*, 21,935.

### ALLEN, HARRY (Painter, 106, Woodhall Road, Thornbury, Bradford):

- Evidence, 5014-89.
- Bedding of canvas :
  - Leadless material used, 5043.
  - Powders on exposure to weather, 5054.
- Body fitters :
  - Do not come in contact with lead, 5023-4.
  - Work of, 5022.
- Bodymakers : lead not handled, 5020.
- Enamel : used instead of varnish, 5041, 5073-6.
- Filling :
  - Dispensed with, 5030-2.
  - Number of coats applied, 5077-82.
- Jointing :
  - Composition of, 5019.
  - Tendency of leadless material to powder, 5056.
- Leadless paints :
  - Composition, 5048-9.
  - Covering power greater than lead, 5047, 5057, 5083-9.
- Durability :
  - As good as lead, 5069.
  - Due to varnish, 5046, 5062-4.
  - Easy to apply, 5060-1.
  - Health of men improved since using, 5050-2.
  - Length of experience with, 5044.
  - No cases of illness since adoption of, 5053.
  - Not more costly than lead, 5047.
  - Opacity same as with lead, 5057-60.
  - Satisfactory, 5045.
- Priming : leadless, 5026-7.
- Rubbing down :
  - Both methods used after stopping, 5034.
  - Dry method employed between :
    - Finishing coats, 5042.
    - Priming coats, 5028.
  - Not dangerous after filling and stopping, 5035.
- Stopping : leadless, 5033.
- Tramcars :
  - Kept in sheds at night, 5067-8.
  - Repainted every two years, 5065.
- Washing :
  - Done every night, 5072.
  - Special soap used, 5070.
- Wheels : purchased in finished state, 5036-8.
- White lead : unnecessary for body-fitting, 5024.

### Antimony Paints. (See evidence of *T. R. Atkins*.)

#### Aprons :

- Danger from dirty : *Cornett*, 12,834.
- Generally worn by painters : *Maythorn*, 5685-6; *Cornett*, 12,829.
- Provided : *Baker*, 9792.
- Seldom cleaned : *Cornett*, 12,830-3.

### ARNOLD, W. J. (representing the Institute of British Carriage Manufacturers):

- Evidence, 6098-164.
- Leadless paints :
  - No trials with, 6119.
  - Unaware that Midland Railway and Bradford Corporation use only, 6121-2.

### ARNOLD, W. J.—*continued*.

- Lead poisoning :
  - Case known of, 6103, 6113
  - Something should be done to remove evil, 6116
  - Surprised at official statistics, 6114-5, 6118.
- Meals : not eaten in paint shop, 6137.
- Motor cars :
  - Daimler :
    - Aware of use of leadless paint on, 6123.
    - Class of customers, 6127.
    - Class of finish, 6124-6.
    - Customers would demand highest finish, 6128.
    - Experience insufficient to judge durability of paint, 6129-32.
  - Outdoor clothing : cloak-room not provided, 6138-9.
  - Overalls : worn and supplied by workmen, 6139.
  - Painting : less care taken with than formerly, 6156.
  - Prohibition of lead :
    - Agreed to if efficient lead substitute found, 6120.
    - Preferred to regulations, 6142.
  - Rubbing down :
    - Dry method :
      - Can be dispensed with for wheels, 6146-7.
      - Dust contains lead, 6110-1.
      - Unable to suggest remedy for danger, 6112.
      - Used for stopping, 6160.
    - Wheels :
      - Both methods used, 6106-9, 6143-4.
      - Priming coats done wet, 6148-9, 6157-8.
      - Wet method satisfactory for, 6145-9.
- Washing :
  - Accommodation :
    - Painters prefer pail and horsehair to lavatory, 6136, 6161-3.
    - Provided, 6134.
    - Soap and nail-brushes provided, 6135.
    - Time allowed for, 6164.
  - Wheels :
    - Hard stopping not used, 6154-5.
    - Spokes waxed before they are received, 6151-3.
    - Stopping rarely used, 6159.
- Workmen :
  - Number employed, 6102.

### ATKINS, T. R. (Antimony Paint Manufacturer) :

- Evidence, 12,689-748.
- Antimony :
  - Not affected by sulphur fumes, 12,736.
  - Oxide : imported from Australia, 12,724.
- Paint :
  - Contains small percentage of lead, 12,703-5, 12,725-6.
  - Costs less than lead, 12,701, 12,737-9.
  - Covering power :
    - Greater than lead, 12,693-4, 12,737-9.
    - Not improved by adding lead, 12,730.
  - Makes a perfect white when mixed with zinc, 12,695-6, 12,745.
  - Manufactured in England, 12,715-6, 12,721-2.
  - Non-poisonous, 12,702, 12,747-8.
  - Possibility of adulteration, 12,741-2.
  - Substitute for lead paint, 12,692, 12,723, 12,743-4.
  - Supplied as raw material to grinders, 12,701, 12,740.
  - Testimonials, 12,708-16.
  - Tests with, 12,697-700, 12,705-7, 12,717-20
  - Sulphide, white in colour, 12,731-5.
- Zinc paint : more body obtained by adding lead, 12,728-9.

### AUSTIN, H. (Representing the Society of Motor Manufacturers and Traders):

- Evidence, 13,166-397.

AUSTIN, H. *continued.*

- Bodies :  
 Re-varnishing necessary every two years, 13,289-90.
- Turne plates :  
 Occasionally used, 13,293.  
 Painted with lead, 13,294-5.  
 Tin-coated steel used in place of, 13,293-9.
- Bodymakers : contact with lead, 13,280.
- Dust :  
 Arises from dried paint splashes, 13,333-5.  
 Exhaust ventilation :  
 Not costly, 13,277, 13,280-3.  
 Possible to apply to wheels, 13,278.  
 Practicable; 13,275-6, 13,332-6a.  
 The principal danger, 13,274.
- Filling : mixed with lead, 13,350.
- Hours of employment :  
 Number, 13,256.  
 Overtime :  
 Extent, 13,257.  
 Motor car industry responsible for, 13,258.
- Restriction :  
 Men would not agree to, 13,262-4.  
 Objected to, 13,259-68, 13,279.
- Jointing :  
 Lead used, 13,377.  
 Paste not tried, 13,378-9.
- Leadless paints :  
 Could be used for chassis, 13,194-6.  
 "Non-poisonous white lead" tried, 13,311-7.  
 No trials with, 13,182, 13,300.  
 Society has not tested merits of, 13,180.  
 Unaware of Midland Railway Co.'s, 13,189-92.
- Lead poisoning :  
 Attributed to carelessness, 13,224-31.  
 Cases known of, 13,173-9, 13,318-9, 13,337-9.  
 Compensation for suspension : not objected to if made general, 13,272.  
 Increase probably due to increase in carriage building, 13,176.  
 No knowledge of two cases reported from his works, 13,218-23, 13,303-10.  
 Notice only taken of serious cases, 13,323-31.  
 Regulations would eliminate, 13,217.  
 Society has not inquired as to precautions, 13,181.  
 Something should be done to remove evil, 13,177.  
 Unaware of official statistics, 13,178-9.
- Meals :  
 Messroom provided, 13,241-2  
 Provision made for storage, 13,243.
- Motor cars :  
 Daimler :  
 Aware that leadless paints are used, 13,193.  
 Class of customers, 13,204.  
 Class of work, 13,201-3.  
 'Two years' trial of paint insufficient, 13,205-16, 13,345-6, 13,364-71.  
 Require varnishing every two years, 13,373-5.  
 Subject to rougher usage than carriages, 13,372.
- Outdoor clothing : would agree to provide cupboard for, 13,249-50.
- Overalls :  
 Cupboard provided for storage, 13,248.  
 Not provided, 13,244.  
 Provision by employer objected to, 13,245-6  
 Would agree to regular washing, if regulation made, 13,247.
- Paint :  
 Difficulty in adhering to aluminium, 13,301-2  
 Good base important, 13,347-51.  
 Object of lead in, 13,352-63.
- Paint shop :  
 Impervious floors in : 13,251.  
 Cleaned down wet weekly, 13,252-3.  
 Would agree to daily washing, 13,254-5.
- Periodical medical examination : would agree to 13,269-71.
- Priming : contains lead, 13,350.
- Prohibition of lead :  
 Agreed to if substitute found, 13,188.  
 Effect on trade by foreign competition, 13,185-6, 13,340-4.

AUSTIN, H. *continued.*

- Prohibition of lead *continued.*  
 Preferred to regulations, 13,320-2, 13,396-7.  
 Would cause some difficulty, 13,183-9.  
 Would not increase cost of painting, 13,187.
- Regulations :  
 Not costly, 13,273, 13,279  
 Would eliminate dangers, 13,217.
- Rubbing down :  
 Dry : greatest danger 13,389-90.  
 Wet : practicable for wheels, 13,380-8.
- Varnish : more important than pigment, 13,291-2.
- Washing :  
 Accommodation : provision advocated, 13,233-4.  
 Facilities :  
 Hot water should be provided, 13,235-6.  
 Nail-brushes always available, 13,238.  
 Soap always available, 13,238.  
 Towels should be supplied regularly, 13,237.  
 Time for : would agree to allow, 13,239-40.
- White lead :  
 The most convenient substance for paint, 13,197-200.
- Workmen :  
 Careless and dirty, 13,339.  
 Health of, 13,287-8.  
 Number employed, 13,169.  
 Number in contact with lead, 13,170-2.

## AWCOCK, WILLIAM (representing the United Kingdom Society of Coachmakers):

- Evidence, 12,504-688.
- Bedding of canvas :  
 Leadless material could be used, 12,657-60.  
 Not particularly dangerous, 12,572.  
 Sometimes done with japan and white lead, 12,571.
- Bodymakers :  
 Exposed to danger, 12,523.  
 Exposed to dust from rubbing down, 12,531-2.
- Carriage-makers :  
 Contact with lead, 12,524.  
 Exposed to dust from rubbing down, 12,532.
- Filling :  
 Lead not necessary for, 12,540, 12,671-7.  
 Number of coats applied, 12,539.
- Hours of employment :  
 Number, 12,590, 12,593.  
 Overtime :  
 Motor car industry responsible for, 12,594.  
 Prevalence of, 12,595.  
 Restriction desirable in lead processes, 12,591-2.
- Lead poisoning :  
 Careful and careless men suffer from, 12,597-600.  
 Cases :  
 Known of, 12,507-11, 12,596, 12,661-6.  
 Not reported, 12,627-8, 12,661-6.  
 Due to lead dust, 12,629.  
 Extent of evil, 12,512-21.  
 Increase due to increased use of dry white lead, 12,630-7.  
 Slight illnesses attributable to, 12,521, 12,615-26, 12,647-51, 12,678.  
 Workmen should be educated as to danger of lead, 12,645.
- Meals :  
 Kept and eaten in workshop, 12,582.  
 Provision of mess-room not general, 12,583-5, 12,656.
- Motor-cars :  
 Dangers not affected by introduction of, 12,568-70.  
 Evidence applies to, 12,568.
- Outdoor clothing :  
 Cloakroom not provided, 12,586, 12,656.  
 Kept in workshop, 12,587.
- Overalls : not worn by painters, 12,588-9.
- Painters :  
 Habits cleaner than formerly, 12,679, 12,685-6.  
 Health of, 12,678-83.  
 Short-lived, 12,687.
- Priming :  
 Contains lead, 12,528.  
 Number of coats applied, 12,526-7.

**AWCOCK WILLIAM—continued.**

Prohibition of lead: the only remedy for dangers, 12,576.

**Rubbing down:**

Done by special class of men, 12,684.

**Dry method:**

Done in bodymakers' shop, 12,531-2.

Dust a serious danger, 12,533, 12,558-9.

Substitute for lead the only remedy, 12,537.

**Employed:**

Between filling coats, 12,541.

For priming coats, 12,529-30.

Exhaust ventilation impracticable, 12,536, 12,564.

**Indispensable for:**

Priming coats, 12,534-5.

Wheels and carriage underwork, 12,560-3.

**Wet method:**

Danger from dirty water, 12,548-52, 12,638-45.

Difficulty in obtaining clean water, 12,646.

Employed after filling coats, 12,546-7, 12,565

Impracticable for priming coats, 12,534-5.

Quantity of water necessary, 12,639-44.

Spray: not aware of any process causing, 12,574.

**Stopping:**

Composition, 12,543.

Mixed frequently by user, 12,544.

Mixing dangerous, 12,545.

**Washing:****Accommodation:**

Provided, 12,553, 12,577-8, 12,655.

Recent improvements in, 12,652-3.

Horsehair used instead of nail-brush, 12,580.

**Hot water:**

Not available, 12,579.

Provision important, 12,580.

Lead-contaminated water used for, 12,548-56, 12,655.

Pail used for, 12,654-5.

Soap and towels provided, 12,655.

Soiling of hands unavoidable, 12,576.

Time not allowed, 12,581.

Wheels and carriage underwork: method of treatment, 12,558-64.

White lead: object of its use, 12,670.

**Zinc paints:**

As durable as lead for lining, 12,610-2.

As good as lead, 12,604.

Better colour than lead, 12,603.

No difficulty in applying, 12,601-2, 12,605.

No difficulty in mixing, 12,606-7.

**BAILEY, ERNEST (Headmaster, Polytechnic, Regent Street, W.):**

Evidence, 5168-497.

**Bedding of canvas:**

Glue used for, 5301-4, 5441-5, 5476.

**White lead:**

Not generally used, 5301-4, 5441-5.

Sometimes used, 5477.

**Bodymakers:**

Contact with lead, 5463-4.

Number employed, 5172-3.

Use of jointing paste by, 5224.

**Carriage-makers:**

Contact with lead, 5248.

Work of, 5247.

**Dust:**

Formed by dried paint splashes, 5436-9.

From brushing workers' clothes, 5339-40.

In the atmosphere, 5372.

No danger of inhalation, 5185, 5374.

**Filling:**

Composition, 5259-60.

Contains lead, 5261.

Not much danger from, 5281, 5295.

**Hours of employment:**

Extent of overtime, 5346-7.

Number, 5345.

Reduction unnecessary, 5348-9.

**Jointing:**

Composition, 5225.

**BAILEY, ERNEST.—continued.****Jointing—continued.****Leadless paste:**

Not tried, 5240, 5452.

Should be tried, 5245.

Unsatisfactory, 5240-4, 5402-4.

**Lead paste:**

Firm who does not use, 5453-4.

No danger with, 5220, 5236-7.

The best material, 5226-8.

Wet lead compounds used in mixing, 5230-1.

Object of, 5239, 5465-72.

**Leadless paints:**

If finish as good, lead could be abandoned, 5218.

No trials with, 5184, 5397, 5403, 5451.

Unaware that some firms use only, 5193-7, 5205-7.

Unsatisfactory, 5403-4.

**Lead poisoning:**

Cases known of, 5174-7, 5351-5, 5400-1.

Caused chiefly by dry lead compounds, 5409.

Contracted through the skin, 5377-85, 5422-9.

Due to dirtiness and drink on part of workmen, 5186-91, 5373-85, 5440.

Examination of blood will indicate, 5413.

Impossible to protect coach makers against, 5430-2.

Increase probably due to greater number of men employed, 5450.

No knowledge of official statistics, 5175-83.

Regulations would eliminate, 5219.

Something should be done to mitigate evil, 5178.

Unaware that cases are as numerous as years ago, 5449.

Unknown amongst bodymakers, 5232-4.

**Meals:****Mess-room:**

Provided, 5328-9.

Tables and chairs provided, 5331.

Warmed in winter, 5330.

Taken in workroom, 5333-5.

**Motor cars:**

Amount of lead required for filling metal panels, 5294, 5494-7.

**Daimler:**

Customers same class as those of other makers, 5203-4.

Doubt expressed as to finish and durability of paint, 5208-11, 5214-5.

Good, but not of highest finish, 5200-2.

Surprised that company has received no complaints, 5205-11.

Finish not so good as those of horse carriages, 5371.

Hard stopping unnecessary for underwork, 5298-300.

Lead not much used for attaching metal underwork, 5297-8.

**Overalls:**

Not provided, 5336.

Unnecessary, 5337.

**Paint:****Lead emanations:**

Unaware of danger from, 5414-5.

Use of helmet or prohibition of lead the only safeguard, 5416-21.

Should be allowed to settle before use, 5410-2.

**Painters, class for:**

Lead paint not much used, 5391-5.

Number of pupils, 5386-90.

Same practice taught as in the shop, 5393.

**Paint shops:****Floors:**

Made of wood, 5341-3.

Sprinkled with damp sawdust before sweeping, 5344.

**Periodical medical examination:**

If necessary would welcome, 5356-60.

Not provided for, 5350.

**Priming:**

Contains lead, 5252.

Number of coats applied, 5260-1.

BAILEY, ERNEST—*continued.*

- Prohibition of lead :  
 The simplest precaution, 5220-2.  
 Would agree to, if satisfactory substitute found, 5192, 5218, 5368, 5462.
- Regulations :  
 Effect on industry, 5361-5.  
 Those under Factory Act already observed, 5366-7.
- Rubbing-down :  
 Dry method :  
 Causes much dust, 5229.  
 Dangerous, 5287, 5405, 5493.  
 No remedy known of, 5292-3, 5406-8.  
 Not done between priming coats on bodies, 5253, 5473-5, 5489.  
 Wheels and carriage underwork : 5277-87, 5479-80.  
 Dust contains lead, 5280-6.  
 Stopping, 5283-93, 5491-2.  
 Not done between filling coats, 5262.  
 Unnecessary between priming coats, 5254-5.  
 Wet method :  
 Employed :  
 After filling coats, 5256-8.  
 To remove staining, 5272-3.  
 Impossible for wheels and carriage underwork, 5288-91, 5487-8.  
 Staining : object of, 5270-1.
- Stopping :  
 Composition, 5264.  
 Mixing :  
 Danger from dry white lead powder, 5266-9.  
 Done by user, 5265.  
 No trials with substitute for lead, 5446-7.  
 Sometimes dangerous, 5263, 5274, 5295-6.  
 Where used, 5283-4.
- Washing :  
 Accommodation :  
 Necessary, 5238.  
 Provided, 5306.  
 Essential before meals, 5338.  
 Facilities :  
 Hot water always obtainable, 5309-14.  
 Soap and nail brushes provided, 5322-4.  
 Towels supplied and cleaned weekly, 5316-21.  
 Personal cleanliness important, 5305.  
 Time not allowed, 5325-7.
- White lead :  
 Gives best finish, 5216-7, 5457-8.  
 No trials made with substitute, 5184, 5397, 5403, 5451.  
 The most perfect substance for paint, 5108, 5459-60.  
 Used to obtain good groundwork, 5457-62.  
 Would agree to prohibition if satisfactory substitute found, 5192, 5462.
- Workmen :  
 Habits greatly improved, 5448, 5481.  
 Number of bodymakers, 5172-3.
- BAKER, H. B. (of Messrs. Rothschild & Baker, Perambulator Manufacturers) :  
 Evidence, 9744-849.  
 Aprons : provided, 9792.  
 Filling :  
 Composition, 9833.  
 Leadless, 9781.  
 No trouble with, 9782.
- Gimp pins :  
 Lead poisoning from, 9786-7, 9821.  
 Eliminated by use of electro-plated gimp pins, 9788.
- Japanning : no lead used, 9846-9.
- Leadless paints :  
 As durable as lead, 9768-70.  
 As good as lead for all purposes, 9763-4.  
 Colours : large variety used, 9828-31.  
 Cost the same as lead, 9765-7.  
 Exclusively used, 9758-60.  
 Manufacturer guarantees freedom from lead, 9776.  
 No complaints from customers, 9770-1, 9824-7.  
 Three or four years a substantial test, 9771-5.

BAKER, H. B.—*continued*

- Lead poisoning :  
 Cases :  
 Due to gimp pins, 9786-8, 9821.  
 Known of, 9789, 9839.  
 Lead abandoned because of, 9761-2.  
 None since abandonment of lead, 9780.  
 Occurred in spite of precautions, 9790-5.
- Meals : Not taken in workrooms, 9790.
- Perambulator making :  
 No foreign competition, 9838.  
 Painting similar to carriage painting, 9777-8.
- Perambulator Manufacturers' Association :  
 Proportion of firms in membership, 9748-51.  
 Would approve of his evidence, 9752-4.
- Priming :  
 Leadless, 9779, 9813-4.  
 Use of whitening possible for, 9815-9.
- Prohibition of lead : Perambulator Manufacturers should not object to, 9840-2.
- Rubbing-down :  
 Dry method :  
 Amount, 9822.  
 Dust arises chiefly from the filling, 9832.  
 Employed for priming coats, 9780.  
 Exhaust ventilation impracticable, 9798-812.  
 Wet method :  
 Employed for first coat and stopping, 9834-6.  
 Too expensive, 9823.
- Stopping :  
 Leadless, 9783-5, 9837.  
 Whitening not used for perambulators, 9820.
- Washing :  
 Accommodation :  
 Men indisposed to use, 9793.  
 Provided, 9790-1.  
 Time allowed for, 9794.
- Workmen :  
 Number employed, 9755.  
 Number in contact with paint, 9756.  
 Painters : class of, 9843-5.
- BALL, H. S. (Works Manager of Messrs. Chubb & Sons, Safe Manufacturers, Wolverhampton) :  
 Evidence, 9850-902.  
 Lead poisoning :  
 Cases, 9864.  
 Cases due to use of lead stopping and rubbing down, 9876-7.  
 Eliminated by using zinc stopping, 9865, 9891.
- Priming :  
 Lead, 9893.  
 Object of, 9897-900.
- Rubbing-down :  
 Dry method : the principal danger, 9862-3, 9877, 9892.
- Safe manufacture :  
 Evidence applicable to trade generally, 9854-7.  
 Firms engaged in, 9853.  
 No employers' association, 9852.
- Stopping : amount, 9896.  
 Done over priming coats, 9893-6.  
 White lead abandoned for, 9858, 9878-82.  
 Zinc white mixed and used like lead, 9859-61.
- White lead :  
 Basis for most paints, 9873-4, 9880.  
 No objection to restriction for stopping, 9872, 9881-9.  
 Unnecessary for unexposed surfaces, 9871.  
 Used in form of liquid paint for brush work, 9869, 9873-5.
- Zinc paint :  
 Cost rather less than lead, 9868.  
 Finish and durability better than lead, 9867.  
 Painters prefer to use, 9866.
- Bedding of Canvas :  
 Lead : *Readman*, 12,397.  
 Could be prohibited : *Goodman*, 8134-5.  
 Not generally used : *Bailey*, 5301-4, 5441-5 ; *Maythorn*, 5640-2 ; *Meier*, 5855 ; *Goodman*, 8132-3, 8333.  
 Sometimes used : *Bailey*, 5477 ; *Awcock*, 12,571.

**Bedding of Canvas—continued.**

Leadless material: *Jordan*, 1236-43; *Swain*, 4935, 4972-4; *Allen*, 5943; *Spencer*, 5126; "X," 7635-7; *Readman*, 12,440-3.  
 Could be used: *Awcock*, 12,657-70.  
 Does not powder: *Spencer*, 5127.  
 Glue: *Bailey*, 5301-4, 5441-5, 5476.  
 Gold size: *Meier*, 5853-4.  
 Powders on exposure to the weather: *Allen*, 5054.  
 Method: *Goodman*, 8130-1; *Readman*, 12,398.  
 Not particularly dangerous: *Awcock*, 12,572.

**Bedding of Lights :**

Lead not used: *Readman*, 12,444.  
 Method: *Jordan*, 1287-9; *Readman*, 12,445-7.

**Bituminous Paints :**

Colour: *Cail*, 19,278.  
 Durability at high temperatures: *Cail*, 19,277.  
 Not used for:  
 Motor cars: *Cail*, 19,279.  
 Woodwork: *Cail*, 19,276.  
 Used on tramcars: *Cail*, 19,274-5.

**Bodies :**

Primed before received for painting: *Swain*, 4957-8.  
 Re-varnishing necessary every two years: *Austen*, 13,289-90.  
 Terno plates:  
 Occasionally used: *Mulliner*, 7880-9; *Austin*, 13,293.  
 Painted with lead: *Austin*, 13,294-5.  
 Tin-coated steel used in place of: *Austin*, 13,293-9.

**Body Fitters :**

Do not come in contact with lead: *Allen*, 5023-4.  
 Work of: *Allen*, 5022.

**Bodymakers :**

Contact with lead: *Jordan*, 1256-7; *Steinitz*, 1440-1; *Kinggate*, 4446; *Willix*, 4609-13, 4628; *Daly*, 4771-2; *Bailey*, 5403-4; *Maythorn*, 5563; *Fuller*, 5945-6, 5963-5; *Mulliner*, 7936-7; *Goodman*, 8041-3, 8349-50; *Cornett*, 12,767-9; *Austin*, 13,280.  
 Exposed to dust made by painters: *Steinitz*, 1391-4, 1409-14; *Kinggate*, 4461; *Willix*, 4628; *Daly*, 4785; *Fuller*, 5962; *Awcock*, 12,531-2; *Cornett*, 12,777.  
 Exposed to risk: *Awcock*, 12,523.  
 Lead not handled by: *Swain*, 4896-8; *Allen*, 5020; *Goodman*, 8329-32.  
 Not exposed to danger: *Fuller*, 5938-9; "X," 7514; *Goodman*, 8057-9, 8308-11.  
 Number employed: *Bailey*, 5172-3.  
 Number in trade union: *Kinggate*, 4549.  
 Soiling of hands with lead avoidable: *Goodman*, 8046-7.  
 Time occupied in using lead: *Fuller*, 5941.  
 Use of jointing paste by: *Bailey*, 5224.  
 Work of: *Swain*, 4894-5.  
 Not so dangerous as painting: *Legge*, 114-20.

**Brush Hands :**

Class of work done by: *Daly*, 4881-2, 4855.  
 Not of such clean habits as painters: *Daly*, 4854.  
 Trade union excludes from membership: *Daly*, 4843-5.

**Burning-off :**

Blow lamp used: *Readman*, 12,482-3.  
 Danger from fumes: *Legge*, 98.  
 Respirators a complete protection: *Legge*, 147.  
 Not done: *Steinitz*, 1364-5.  
 Not very unhealthy: *Readman*, 12,484-6.  
 Seldom necessary: *Readman*, 12,462.  
 Some dust caused: *Readman*, 12,487-8.

**CAIL, WILLIAM** (of Cail's Bitmo Co., Ltd., Newcastle-upon-Tyne):

Evidence, 19,274-9.  
 Bituminous paints:  
 Colour, 19,278.  
 Durability at high temperatures, 19,277.  
 Not used for:  
 Motor cars, 19,279.  
 Woodwork, 19,276.  
 Used on tramcars, 19,274-5.

**Carriage-Makers :**

Contact with lead: *Kinggate*, 4453-5; *Willix*, 4617-9, 4628; *Daly*, 4776-8, 4857; *Bailey*, 5248; *Maythorn*, 5575; *Fuller*, 5935-6, 5963-5; *Croall*, 6086-7; "X," 7522, 7680-1, 7687-91; *Mulliner*, 7953-8; *Goodman*, 8062-7; *Awcock*, 12,524; *Cornett*, 12,768.  
 Exposed to dust made by painters: *Kinggate*, 4461; *Willix*, 4621; *Daly*, 4785; *Fuller*, 5953-7; *Mulliner*, 7955; *Awcock*, 12,532; *Cornett*, 12,777.  
 Few now employed, "X," 7518-9, 7677.  
 Lead not used by: *Swain*, 4896-8.  
 Time occupied in using lead: *Fuller*, 5950-2.  
 Work of: *Kinggate*, 4452, 4489-92; *Willix*, 4614-6, 4652-5; *Daly*, 4774-5; *Swain*, 4894-5; *Bailey*, 5247; *Maythorn*, 5574; "X," 7520-1.

**Coachbuilding :**

Application of French regulations to: *Cunynghame*, 10,345-6.  
 Definition: *Legge*, 16-9; *Fuller*, 5914-5.  
 Number of works: *Legge*, 37-44.  
 Use of white lead in: *Fuller*, 5927, 5932.

**CONNELL, A.** (representing Messrs. Moister, Lucius and Bruning):

Alizarin colour: unaware that Midland Railway Company has given up, 21,935.

**COOKSON, C.** (of Messrs. Cookson & Co., Ltd., White Lead Corrodors, Newcastle-on-Tyne):

Evidence, 2292-8.  
 Lead poisoning: susceptibility to, 2294-6.  
 Regulations:  
 Enforcement of, 2292.  
 Would render painting less dangerous than employment in lead works, 2293.

**CORNETT, R. J.** (representing the United Kingdom Society of Coach-makers):

Evidence, 12,749-901.  
 Aprons:  
 Danger from dirty, 12,833.  
 Generally worn by painters, 12,829.  
 Seldom cleaned, 12,830-3.  
 Body-makers:  
 Contact with lead, 12,767-9.  
 Exposed to dust made by painter, 12,777.  
 Carriage-makers:  
 Contact with lead, 12,768.  
 Exposed to dust made by painter, 12,777.  
 Dust:  
 Exhaust ventilation:  
 Impracticable in paint shop, 12,781-5.  
 Possible for removal of dust in mixing stopping, 12,794.  
 From dirty overalls dangerous, 12,833.  
 Emanations from lead paint:  
 Danger from, 12,809.  
 Illness due to, 12,810-4, 12,891.  
 Filling:  
 Lead, 12,788.  
 Number of coats applied, 12,787.  
 Hours of employment:  
 Number, 12,834.  
 Overtime:  
 Detrimental to health, 12,892.  
 Extent, 12,835-6.  
 Should be abolished, 12,893.  
 Lead colour: number of coats applied, 12,802.

CORNETT, R. J. *continued.*

- Leadless paints :  
 Durability satisfactory, 12,860-8.  
 Tests with, 12,846-60.  
 Zinc :  
   Powdering of, 12,848, 12,889.  
   Would stand without varnish, 12,890.
- Lead poisoning :  
 Cases known of, 12,752-9.  
 Cases of death partly attributable to, not certified as, 12,883-4.  
 Everyone working in lead more or less affected, 12,875-7.  
 Increase due to :  
   Less cubic air space for the men, 12,894.  
   Use of quick colours, 12,899-901.  
 Men have died or left the trade because of, 12,756-66, 12,871-4.
- Meals :  
 Kept and eaten in workshop, 12,824.  
 Messroom not generally provided, 12,825-6.
- Motor cars : evidence applies to, 12,805.
- Outdoor clothing :  
 Cloak-room sometimes provided, 12,827.  
 Sometimes placed in workshop, 12,828.
- Overalls : not generally worn by painters, 12,829.
- Periodical medical examination :  
 Not desirable, 12,837-8.  
 Unfair to workmen, 12,837-44, 12,895-8.  
 Workmen would object to, 12,878-82.
- Priming :  
 Contains lead, 12,772-3.  
 Number of coats applied 12,771-17.
- Prohibition of lead :  
 The only remedy for lead poisoning, 12,815.
- Rubbing down :  
 Dry method :  
   Done in paint or body-shop, 12,775-6.  
   Dust, a considerable danger, 12,775, 12,795, 12,800-2.  
   Employed :  
     Between priming coats, 12,774.  
     For wheels and carriage underwork, 12,790, 12,869-70.  
     Sometimes after filling coats, 12,796-7.  
   Not done between filling coats, 12,789.  
 Wet method :  
   Employed after filling coats, 12,795.  
   Impracticable for :  
     Priming coats, 12,779-80.  
     Wheels and carriage underwork, 12,801.
- Stopping :  
 Composition, 12,790.  
 Mixed by painter, 12,791.  
 Mixing dangerous, 12,792-3.
- Tramcar and railway work : dangerous because of inside painting, 12,807-8.
- Washing :  
 Accommodation frequently provided, 12,817-8.  
 Facilities :  
   Hot water not always available, 12,819-22.  
   Nail-brushes not always available, 12,819.  
   Soiling of hands unavoidable, 12,816.  
   Time generally allowed for, 12,823.

## CROALL, P. (representing the Institute of British Carriage Manufacturers) :

- Evidence, 5983-6097.
- Carriage-makers : contact with lead, 6086-7.
- Emanations : not aware that they arise from wet lead paint, 6036.
- Filling : object of, 6081.
- Leadless paint :  
 No trials with, 6001.  
 Unaware that Midland Railway and Bradford Corporation use only, 6018-9.
- Lead poisoning :  
 Compensation for : liability not insured, 5992-3.  
 Due to carelessness, 5996-9.  
 Importance of evil recognised, 6031.  
 No cases in his works, 5989-90, 6030, 6088-9.  
 Reason for immunity of his works from, 5990, 6037.  
 Something should be done to remove evil, 5998.

CROALL, P. *continued.*

- Lead poisoning - *continued.*
- Statistics :  
 Doubt expressed as to fatal cases included, 5995.  
 Unaware of official, 5994.
- Lining :  
 Difficult if lead prohibited, 6020-2, 6027, 6094.  
 No trials with zinc-white, 6095-7.
- Motor cars :  
 Could be cleaned with hose, sponge, and leather, 6090-4.
- Daimler :  
 Customers would demand high-class finish, 6007-8, 6017, 6062.  
 Finish of highest quality, 6004-5.  
 Instance of bad paint on, 6002, 6011, 6070-3.  
 Lead would not have been abandoned imprudently, 6011-3.  
 Method of painting not condemned because of one bad instance, 6070, 6074-7.  
 Paint work not so durable as lead, 6014-6.  
 Surprised that Company are satisfied with leadless paints, 6009-10.
- Painters :  
 Average age, 6047, 6055-60.  
 Continuity of employment, 6034.  
 Health, 6046.
- Priming :  
 Object of, 6081.  
 Rubbed off except in grain, 6078.
- Prohibition of lead :  
 Exemption :  
   Required for lining, 6020-2, 6027.  
   Suggested for higher class coach-builders, 6028-9.  
   For filling and priming, 6081-3.  
   Preferred to regulations, 6027, 6069.  
 Satisfactory lead substitute should first be found and tried, 6062-5.
- Regulations :  
 Effect on industry, 6026.  
 Objected to, for period pending prohibition, 6066-8.
- Washing of hands insisted on before men leave work, 5990.
- White lead :  
 Amount used in painting a motor car, 6032, 6038-41.  
 Not used dry, 6035.  
 Object of using, 6077-80.  
 The most perfect substance, 6003.
- Workmen :  
 Health, 6044-54, 6084-5.  
 Number employed, 5988.
- Workmen's Compensation Act : insurance of workmen under, 5993.
- CROW, J. K., D.Sc. (representing the London Colour, Paint, Oil, and Varnish Trades Association) :
- Evidence, 11,952-70, 12,028-37, 12,072-90, 12,105-7, 12,127, 12,147-62.
- Agricultural implements :  
 American, 12,037, 12,161-2.  
 Effect of prohibition of lead on foreign competition, 12,030-1, 12,036-7, 12,105-7.  
 Extent of imports, 12,035.  
 Importance of red colour for, 12,032-4.
- Lead colours :  
 Reds :  
   Cost of, on motor cars, 12,154-9.  
   Important, 12,028.  
   Lead indispensable, 12,029.  
 Yellows for lining, 11,952-3, 11,962, 12,072-8, 12,086-90, 12,127.
- Lining :  
 Comparative amount of paint used, 11,970.  
 No danger involved, 11,963-6, 12,083.
- Yellow colours :  
 Covering power of lead chromate of 50 per cent. strength, 11,962.  
 Exemption from 5 per cent. limitation of lead necessary, 12,086-90, 12,127.  
 Proportion of lead in, 11,952-3.

CROW, J. K., D.Sc. *continued.*

- Lining *continued.*
- Yellow colours *continued.*
- Strong colour impossible with 5 per cent. lead and remainder zinc chrome, 12,072-82.
- Zinc not as opaque as lead chrome, 11,954-61, 12,147-53.

CUNYNGHAME, SIR HENRY, K.C.B. (Legal Assistant Under Secretary of State for the Home Department):

- Evidence, 10,345-56.
- Coach-building: application of French Regulations to, 10,345-6.
- Foreign competition:
  - Prohibition of imported goods:
    - Difficult, 10,352-3.
    - Effect on motor car trade, 10,354-6.
- Painters: mixing of paints by, 10,348-51.

DALY, BERNARD (Coach-painters' brush hand, 7, Harper Street, Everton, Liverpool):

- Evidence, 4757-882.
- Body-makers:
  - Contact with lead, 4771-2.
  - Exposed to painter's dust, 4785.
- Brush-hands:
  - Class of work done by, 4881-2, 4855.
  - Not of such clean habits as painters, 4852-4.
  - Trade union excludes from membership, 4758-61, 4843-5.
- Carriage-makers:
  - Contact with lead, 4776-8, 4857.
  - Exposed to painters' dust, 4785.
  - Work of, 4774-5.
- Filling:
  - Contains lead, 4791.
  - Danger in applying, 4792.
- Flatting: not dangerous, 4807.
- Hours of employment:
  - Number, 4830-1.
  - One-break system advocated, 4834, 4851-2.
  - Prevalence of overtime, 4830-1.
  - Restriction desirable, 4834.
  - Vary according to season, 4831-3.
- Joining: lead used in, 4773.
- Lead paints:
  - Purox:
    - As easy to apply as white lead, 4849.
    - Durability not so good as white lead, 4849-50, 4867.
    - Effect on workers, 4879-82.
    - Not absolutely innocuous, 4847, 4867.
    - Substitute for white lead, 4847.
    - Unaware of any cases of lead poisoning from, 4848.
- Lead poisoning:
  - Concealment through fear of discharge, 4800.
  - Diseases induced by, 4766.
  - Extent among labourers, 4769.
  - Fatal cases, 4764-5.
  - Labourers and brush-hands suffer as much as painters, 4767-8.
  - Men refused employment if suffering from, 4859-60.
- Meals:
  - Danger of working in morning before taking food, 4835.
  - Eaten in workshop, 4822.
- Mess-room:
  - Rarely provided, 4823.
  - Should be provided, 4824.
- Motor car trade:
  - More dust created than in carriage work, 4808.
  - Piece work a special danger, 4809.
- Outdoor clothing:
  - Cloakroom not available, 4825.
  - Collects dust, 4828.
  - Kept in workshop, 4826-7.
- Overalls:
  - Become dirty quickly, 4868-9.
  - Rarely worn, 4829.
  - Should be worn and cleaned weekly, 4870.
- Painters: cleaner in habits than formerly, 4875-6.

DALY, BERNARD *continued.*

- Periodical medical examination:
  - Desirable, 4836.
  - Men would favour, 4858.
- Priming: contains lead, 4780-1.
- Rubbing-down:
  - Dry:
    - Abolition necessary to remove danger of dust, 4789.
    - Body-makers and carriage-makers exposed to dust, 4785.
    - Done between priming coats, 4782-4.
    - Exhaust ventilation difficult, 4788, 4805.
    - The principal danger, 4786.
    - Wheels and carriage underwork:
      - Dangerous, 4803.
      - Much dust caused, 4802.
    - Not done between filling coats, 4793.
  - Wet:
    - After filling coats: 4,799.
    - Danger from, 4800.
    - Impracticable for:
      - Priming coats, 4787.
      - Wheels, &c., 4804.
- Stopping:
  - Leadless: 4877.
  - Equal to lead but takes longer to apply, 4878.
  - Mixed by painter or brush-hand, 4796.
  - Mixing very dangerous, 4797-8.
  - White lead, 4795.
- Trade union: brush-hands excluded from membership, 4758-61, 4843-5.
- Tramcar and railway work:
  - Bad conditions in some factories, 4839-40.
  - More dangerous than carriage work, 4810.
- Varnishing:
  - Emanations dangerous, 4806, 4861-2.
  - Special room provided on account of dust, 4863.
- Washing:
  - Accommodation, inadequate, 4812-4.
  - Hot water and nail-brushes not always available, 4815, 4818.
  - Soiling of hands unavoidable, 4811.
  - Time not always allowed for, 4819-21.

DE MORSIER, M. (Reporter to the Swiss White Lead Commission):

- Evidence, 16,542, 16,604-6, 16,669-72.
- Foreign legislation: Regulation in Geneva referred only to the use of white lead powder, 16,672.
- Leadless paints:
  - Geneva Commission's evidence as to, 16,669-72.
  - Good results possible, but more coats required, 16,604-6.
- On railway rolling stock: report by Swiss Factory Inspectors, 16,542.

Driers:

- Contain lead: *Spencer*, 5164-7.

Dust. (See also **Rubbing-down: Dry.**)

- Amount: *Daly*, 4808; *Bailey*, 5229; "X," 7546; *Mulliner*, 7856-9.
- Amount of lead in the air important: *Kaup*, 14,485.
- Arisen from dried paint splashes: *Steinitz*, 1410-3; *Bailey*, 5436-9; *Maythorn*, 5687-8; *Austin*, 13,333-5.
- Caused in burning-off: *Readman*, 12,487-8.
- Danger from: *Maythorn*, 5734-40.
- Has not been considered: *Mulliner*, 7800.
- Exhaust ventilation:
  - Cost: *Austin*, 13,277, 13,280-3.
  - Difficult or impracticable: *Kinogate*, 4405, 4488; *Willis*, 4632, 4651; *Daly*, 4788, 4805; *Maythorn*, 5743-4; *Baker*, 9798-812; *Awcock*, 12,530, 12,564; *Cornett*, 12,781-5.
  - For large areas: *Legge*, 136-8.
  - For wheels, &c.: *Maythorn*, 5619-24; "X," 7564; *Goodman*, 8115, 8123-5, 8129.
  - To fix to the hand: *Legge*, 139.
- Does not remove all dust: *Edginton*, 13,097-100.
- Installation agreed to: *Goodman*, 8195.

3 D

**Dust** *continued.*Exhaust ventilation *continued.*

- Practicable : *Austin*, 13,275-6, 13,332-6a.  
 For removing dust in mixing or rubbing stopping : *Goodman*, 8095, 8102-3, 8372; *Cornett*, 12,794.  
 For wheels, &c. : *Legge*, 64; *Austin*, 13,278.  
 From dirty overalls, dangerous : *Cornett*, 12,833.  
 From mixing stopping : *Kinggate*, 4475; *Maythorn*, 5592-4.  
 In the atmosphere : *Bailey*, 5372.  
 Method of estimating lead : *Legge*, 61.  
 Material used on floors to prevent : *Maythorn*, 5763-7, 5772.  
 No danger of inhalation : *Bailey*, 5185, 5374.  
 No more dangerous in evening than in morning : *Legge*, 131-3.  
 Not created in priming : *Goodman*, 8078-81.  
 On workmen's clothes : *Willix*, 4672; *Daly*, 4828; *Bailey*, 5339-40.  
 Ordinary ventilation insufficient to remove danger : *Maythorn*, 5745.  
 Principal danger : *Austin*, 13,274.  
 Use of helmet to prevent inhalation deprecated : *Maythorn*, 5515, 5544.  
 Workmen exposed to : *Goodman*, 8374-7.

## EDGINTON, R. W., M.D. (Certifying Factory Surgeon for North Birmingham):

- Evidence, 13,093-103, 13,121-2, 13,135-7, 13,157-8.  
 Lead paint : Abandoned because of lead poisoning 13,157-8.  
 Lead poisoning :  
 Cases known of, 13,093-4, 13,121-2.  
 Prevention possible only by use of substitute for lead, 13,101.  
 Regulations : difficult to apply, 13,103.  
 Rubbing-down :  
 Dry method :  
 Exhaust apparatus does not remove all dust, 13,097-100.  
 Largely replaced by wet process, 13,096, 13,135-7.

**Enamel :**

- Used instead of varnish, *Allen*, 5041, 5073-6.

**Exhaust Ventilation.** (See **Dust**.)

## EXPERT-BEZANÇON, EUGENE (of E. Expert-Bezanson &amp; Co., White Lead Manufacturers, Aubervilliers, France):

- Evidence, 15,106-7, 15,197-204.  
 Hours of employment : In white lead works in France, 15,201-4.  
 Prohibition of lead : French law does not apply to coach painting, 15,106-7, 15,197-200.

**Filling :**

- Composition : *Legge*, 52; *Kinggate*, 4468; *Bailey*, 5259-60; *Baker*, 9833; *Readman*, 12,388.  
 Contains lead : *Kinggate*, 4470; *Willix*, 4635; *Daly*, 4791; *Bailey*, 5261; *Maythorn*, 5584; "X," 7535-6; *Goodman*, 8085-8; *Cornett*, 12,788; *Austin*, 13,350.  
 Danger in applying : *Daly*, 4792.  
 Dispensed with : *Allen*, 5030-2.  
 Lead :  
 Best known substance : *Mulliner*, 7764-5, 7855.  
 Not necessary : *Kinggate*, 4538; *Maythorn*, 5585-7; *Awcock*, 12,540, 12,671-7.  
 Small amount necessary : *Meier*, 5845-7.  
 Leadless : *Legge*, 58-9, 127-30; *Swain*, 4909-13; *Spencer*, 5131; *Meier*, 5844; *Baker*, 9871; *Smyth*, 13,409.  
 No trouble with : *Baker*, 9872.  
 Satisfactory : *Jordan*, 1200-3, 1305-7; *Spencer*, 5132.  
 Not much danger from : *Bailey*, 5281, 5295.  
 Number of coats applied : *Kinggate*, 4467; *Allen*, 5077-82; *Maythorn*, 5595; "X," 7533-4; *Readman*, 12,387; *Awcock*, 12,539; *Cornett*, 12,789.  
 Object : *Kinggate*, 4469; *Croall*, 6081.

**Finishing :**

- Number of coats applied : "X," 7568 74; *Readman*, 12,390-3.

**Flatting :**

- Not dangerous : *Kinggate*, 4493-5; *Willix*, 4656; *Daly*, 4807.

**Floors :**

- Cleaned daily : *Steinitz*, 1390, 1418 21, 1426-30; *Readman*, 12,438.  
 Impervious :  
 An advantage for swilling down : *Maythorn*, 5768-8.  
 Cleaned down wet : *Mulliner* 7817-8; *Goodman*, 8161-3; *Austin*, 13,252-3.  
 By special man : *Mulliner*, 7819.  
 Cost : *Goodman*, 8188.  
 Exist in some works : *Maythorn*, 5770.  
 Provided in London : *Mulliner*, 7816.  
 Should be smooth : *Maythorn*, 5771.  
 Would agree to daily washing : *Austin*, 13,254-5.  
 Sprinkled with damp sawdust before sweeping : *Bailey*, 5344.  
 Swept with moist dust-preventing material : *Maythorn*, 5688, 5691, 5751-2, 5763-7, 5772.  
 Wooden : *Bailey*, 5341-3; *Maythorn*, 5691.  
 Cleaned weekly : *Goodman*, 8162-3.  
 Necessary for good painting : *Goodman*, 8158-60, 8188-90.

**Foreign Competition :**

- Belgians chief competitors : *Mulliner*, 7870-1.  
 Effect of prohibition of lead : *Kinggate*, 4524; *Mulliner*, 7751; *Goodman*, 8204; *Crow*, 12,030-1, 12,036-7, 12,105-7; *Austin*, 13,185-6, 13,340-4.  
 Prohibition of imported goods :  
 Difficult : *Cunynghame*, 10,352-3.  
 Effect on motor car trade : *Cunynghame*, 10,354-6

**Foreign Legislation :**

- French law : application of : *Cunynghame*, 10,345-6; *Expert-Bezanson*, 15,106-7, 15,197-200; *Villemot*, 16,234.  
 Geneva : *De Morsier*, 16,672.

## FULLER, S. C. L. (Representing Institute of British Carriage Manufacturers):

- Evidence : 5900-82.  
 Body-makers :  
 Contact with lead, 5945-6, 5963 5.  
 Not exposed to danger, 5938-9.  
 Time occupied in using lead, 5941.  
 Work in room where bodies are painted, 5962.  
 Carriage makers :  
 Contact with lead, 5935-6, 5963-5.  
 Time occupied in using lead, 5950-2.  
 Work in room while painting is being done, 5953 7.  
 Coach building :  
 Definition, 5914 5.  
 Use of white lead in, 5927, 5932.  
 Emanations from lead paints : no smell from pure white lead and oil, 5960-1, 5968.  
 Jointing :  
 Lead used in, 5920, 5941.  
 Leadless :  
 Not tried, 5942-3.  
 Would use, if men benefited, 5944.  
 Leadless paints :  
 Could not replace lead for lines, 5972, 5976, 5979-82.  
 Institute has not tested merits of, 5916.  
 Lead poisoning :  
 Attack rate not reduced in last eight years, 5910.  
 Compensation for : liability insured, 5907.  
 Extent :  
 Deplorable as shown by official statistics, 5926.  
 Not serious in coach-building industry, 5917-9, From drinking water, 5922, 5931.  
 Inquiry as to, in West of England, 5911, 5934.  
 Institute has made no efforts to combat, 5918-9.

FULLER, S. C. L.—*continued.*

- Lead poisoning—*continued.*  
 No cases known of, 5904-6.  
 Risk arises only in certain classes of works, 5913.  
 Something should be done to prevent, 5912.  
 Statistics:  
   Doubt expressed as to fatal cases included, 5909.  
   Not aware of official, 5908-9, 5922.  
   Surprised that works, previously free, unexpectedly have succession of cases, 5906.
- Lining:  
   Done with pencil, 5973.  
   Exemption required for, if lead prohibited, 5977-8.  
   Leadless paints could not replace tub-lead for, 5972, 5976, 5979-82.  
   Not sandpapered, 5974-5.
- Painting: sometimes done in carriage and body-shops, 5937, 5966-7.
- Priming: done in carriage shop, 5953-6.
- Prohibition of lead:  
   Exemption suggested for artistic work, 5977-8.  
   Preferred to regulations, 5925, 5927-30.
- Regulations:  
   Necessity for, not admitted, 5923-4.  
   Would apply equally to painters and carriage builders, 5958-9.
- Washing:  
   Accommodation:  
   Body-makers do not require and would not use, 5939-40.  
   Not specially provided for body-makers, 5947-9.
- Workmen:  
   Health of, 5970-1.  
   Number employed, 5903.

## GARSON, J. W. (of Messrs. Lewis Berger &amp; Sons, Ltd., Paint Manufacturers, Homerton, London):

- Evidence, 2554-6, 2566-7, 2577.  
 Zinc paint:  
   Difficulty as to drying, 2581.  
   Exported, 2554-6.  
   Hard undercoats cannot be obtained with, 2582-3.  
   Masury process not experimented with, 2577-80.  
   Used, after filling, 2584-6.  
   Used for motor and carriage work in form of enamel, 2566-7.

## Gimp Pins:

- Lead poisoning from: *Baker*, 9786-7, 9821.  
 Eliminated by use of electro-plated gimp pins:  
   *Baker*, 9788.

## GOODMAN, W. L. (Representing the Society of Motor Manufacturers and Traders):

- Evidence, 7995-8416.  
 Bedding of canvas:  
   Lead:  
   Could be prohibited, 8134-5.  
   Not used, 8132-3, 8333.  
   Method, 8130-1.
- Body-makers:  
   Can avoid soiling hands with lead, 8046-7.  
   Do not use lead in France and America, 8329-32.  
   Lead used by, 3041-3, 8349-50.  
   Not exposed to danger, 8057-9, 8308-11.
- Carriage-makers:  
   Lead used by, 8062-3.  
   Liable to get lead on the hands, 8064-7.
- Coach-painting: not a healthy occupation, 8378-9.
- Dust:  
   Exhaust ventilation:  
   Impracticable for wheels, &c., 8115, 8123-5, 8129.  
   Would agree to instal, 8195.  
   Not created in priming process, 8078-81.  
   Workers exposed to, 8374-7.
- Emanations of lead: question has not been considered, 8274-6.
- Filling: Lead used for, 8085-8.

GOODMAN, W. L.—*continued.*

- Floors:  
   Impervious:  
   Cleaned wet, 8161.  
   Too expensive, 8188.
- Wooden:  
   Necessary to good painting, 8158-60, 8188-90.  
   Would be cleaned weekly, 8162-3.
- Hours of employment:  
   Number, 8164-7.  
   Overtime: prevalence, 8165.  
   Restriction not desired, 8168-9.
- Jointing:  
   Glue not suitable for, 8334-40.  
   Leadless paste not known of, 8061.  
   Object of, 8060.  
   White lead paste, 8041-3.  
   Mixed with oil, 8045.  
   No danger from, 8044, 8047-51.  
   Workmen can avoid soiling hands, 8046.
- Leadless paints:  
   Examples of bad work with, 8279-86.  
   Midland Railway Company's experience not important, 8015, 8288-9.  
   No trials with, 8013, 8220-1, 8356.  
   Not prepared to experiment with, 8287-90, 8348.  
   Society has tested merits of, 8010.  
   Would adopt if as good as lead, 8292, 8357-8.
- Lead paint: French bodies painted with, 8280-2.
- Lead poisoning:  
   Can be contracted through cut finger, 8359-60.  
   Cases may not be reported, 8297-302.  
   Compensation for suspension: would lead to malingering, 8192-4.  
   Evils non-existent, 8012, 8040, 8296.  
   Factory Inspectors' instructions observed, 8011.  
   No cases known of, 8004-9, 8040.  
   No fear amongst men to attribute illness to, 8343-7.  
   Possible for men to suffer from, without being aware of it, 8303-7.  
   Statistics: doubt as to correctness, 8006, 8367-9.
- Meals:  
   Eaten at work bench, 8150-1.
- Messroom:  
   Available, but men will not always use, 8148-52, 8341-2.  
   Provision impossible in small works, 8181-4.  
   Should be eaten outside works, if room is not available, 8181-4.
- Motor cars: Daimler:  
   Durability and finish of paint, 8018-39.  
   Recent improvements in, 8351-5.  
   Repainting generally done by other firms, 8026, 8028-9.
- Outdoor clothing: Cloakroom tried and found impracticable, 8185-6.
- Overalls:  
   Not provided, 8153.  
   Painters should wear, 8156.  
   Unnecessary, 8154.  
   Would not agree to provide, 8157, 8187.
- Paint shops: sometimes unhealthy, 8380-5.
- Periodical medical examination:  
   Agreed to for painters, 8174, 8191, 8269-70.  
   Bad for workmen, 8171, 8261-7, 8271-2.  
   Not provided for, 8170.  
   Would not agree to for workmen other than painters, 8172-5.
- Priming:  
   Contains lead, 8070.  
   No dust created, 8078-81.  
   Number of coats applied, 8068-9.
- Prohibition of lead:  
   Agreed to if satisfactory lead substitute found, 8014, 8206.  
   Effect on foreign competition, 8204.  
   Urged for certain classes of workers, 8176-8.
- Regulations:  
   Effect on industry, 8179.  
   Enforcement:  
   Non-observance by workmen, 8196, 8201.  
   Onus should be on factory inspectors, 8197-200, 8202-3.  
   Preferred to prohibition, 8206.

GOODMAN, W. L.—*continued.*

## Rubbing-down:

## Dry method:

Can be dispensed with between priming coats, 8074, 8084.

Dust dangerous in small room, 8401-4, 8408-12.

Employed before body is painted, 8071-2.

Not done between priming coats, 8075-7.

Sometimes used in coarse filling, 8073.

## Stopping:

Dangerous, 8094, 8099-101, 8363-4, 8370-1.

Fan suggested to remove dust, 8095, 8102-3, 8372.

Place could be set apart for, 8407.

## Wheels and carriage underwork:

Always sandpapered, 8104-12.

Could be prohibited, 8126.

Exhaust ventilation impracticable, 8124-5, 8129.

Good general ventilation will overcome risk, 8113-4, 8295.

Much lead dust caused, 8106-12, 8116-22.

Priming coats, 8082-3.

Should be sandpapered in a place set apart, 8123, 8127-8, 8362-3.

Time occupied, 8120-1.

Not done between filling coats, 8089.

Wet method used after filling, 8097-9.

## Stopping:

Danger from handling dry white lead, 8094.

Not used on coach bodies and motors, 8090-4, 8323-8.

Prohibition of lead agreed to, 8096.

## Washing:

## Accommodation:

Amount, 8138-9.

Prepared to provide adequate, 8140-1.

Provided, 8137.

Hot water: willing to supply, 8142.

Nailbrushes and soap provided, 8144.

Personal cleanliness important, 8136.

Time allowed, 8145-7.

Towels supplied clean daily, 8143.

Wheels: could be painted in place set apart, 8123-8, 8293.

## White lead:

Best substance known, 8017, 8207-9, 8213-7.

Dangerous if put into mouth, 8054-6.

Not dangerous to use, 8052-3, 8361, 8373-4, 8398-406.

Object, 8312-22.

## Substitutes:

No trials with, 8013, 8220-1, 8277-8, 8356

Society has not tested merits, 8010.

## Workmen:

Health, 8222-56, 8291.

Number employed, 7999.

Number in contact with lead, 8000-3.

Painters of better habits than formerly, 8413-6.

## HARDWICK, W. R., B.Sc., F.I.C. (Consulting

Chemist to Purex, Ltd., Greenford):

Evidence, 1860-9.

Rubbing-down: not done with purex, 1860-9.

Spraying: especially dangerous with lead paint, 1862-4.

## Heating Apparatus:

Steinitz, 1422-4; Maythorn, 5760-2; Readman, 12,435-6.

## HEYDORN, A. F. (of Ragosino &amp; Co., Ltd.,

Bow):

Evidence, 561-7.

## Zinc Paint:

Suitability for sign-writing, 562-7.

Supplied to coach-builders, 561.

## HOLZAPFEL, M. (of the North-East Paint and Oil

Trades Association):

Evidence, 11,599-604.

## Leadless:

Colours: 11,602-4.

Enamels supplied for tramcars, 11,599-601.

## Hours of Employment:

In French white lead works: *Expert-Bezangon*, 15,201-4.

Long hours in lead processes dangerous, "X," 7598.

Number: *Jordan*, 1248-9; *Steinitz*, 1395-7; *Kinggate*, 4510, 4530; *Willix*, 4674; *Daly*, 4831; *Bailey*, 5345; *Maythorn*, 5692; "X," 7593, 7597; *Mulliner*, 7820; *Goodman*, 8164-7; *Awcock*, 12,590, 12,593; *Cornett*, 12,834; *Austin*, 13,256.

## One-break system:

Advocated: *Daly*, 4834, 4851-2.

Tried: *Kinggate*, 4570.

## Overtime:

Detrimental to health: *Cornett*, 12,892.

Extent: *Kinggate*, 4530-7; *Bailey*, 5346-7; *Mulliner*, 7821; *Cornett*, 12,835-6; *Austin*, 13,257.

Motor-car industry responsible for: *Kinggate*, 4514; *Awcock*, 12,596; *Austin*, 13,258.

Prevalence: *Kinggate*, 4511-8; *Willix*, 4675-9; *Daly*, 4830-1; *Maythorn*, 5693-4, 5717-9; *Mulliner*, 7822; *Goodman*, 8165; *Awcock*, 12,595.

Should be abolished: *Cornett*, 12,893.

## Restriction:

Desirable: *Willix*, 4680; *Daly*, 4834; *Awcock*, 12,591-2; *Kaup*, 14,506-12.

Men would not agree to: *Austin*, 13,262-4.

Objected to: *Austin*, 13,259-68, 13,279.

Unnecessary or undesirable: *Bailey*, 5348-9; *Maythorn*, 5695; "X," 7599; *Mulliner*, 7823-8; *Goodman*, 8168-9.

Would reduce wages: "X," 7600; *Mulliner*, 7824, 7828.

Vary according to season: *Daly*, 4831-3.

## IRELAND, W. E. (Rolling Stock Superintendent,

London County Council Tramways):

Zinc paints: tests, 19,455-60.

## Japanning:

No lead used: *Baker*, 9846-9.

## JOHNSON, EDWARD M. (of Messrs. Locko,

Lancaster & W. W. & R. Johnson & Sons, Ltd.,

Lead Desilverisers and White Lead Corroders,

Millwall, London):

Evidence, 22,264, 22,266.

Regulations: suggestions for, 22,264, 22,266.

## Jointing:

Composition: *Allen*, 5019; *Bailey*, 5225.

Glue unsuitable: *Goodman*, 8334-40.

Lead: *Legge*, 53; *Steinitz*, 1336-40; *Kinggate*, 4447-9; *Willix*, 4610-1; *Daly*, 4773; *Fuller*, 5920, 5941; "X," 7515, 7634; *Goodman*, 8041-3; *Readman*, 12,448-9; *Austin*, 13,377.

## Paste:

Mixed with oil: *Goodman*, 8045.

No danger with: *Bailey*, 5229, 5236-7; *Maythorn*, 5565-7, 5714-6; *Goodman*, 8044, 8047-51.

Not used: *Bailey*, 5453-4.

Soiling of hands avoidable: *Goodman*, 8046.

The best material: *Bailey*, 5226-8.

Used moist: *Maythorn*, 5563-6, 5713.

Wet lead compounds used in mixing: *Bailey*, 5230-1.

Leadless: *Legge*, 58-9, 127-30; *Steinitz*, 1415;

*Swain*, 4889-94, 4960-4; *Line*, 10,066-7;

*Readman*, 12,450-2.

Equal to lead: *Kinggate*, 4525-6, 4564-7;

*Willix*, 4620-2.

## Paste:

Not tried: *Bailey*, 5246, 5452; *Fuller*, 5942-4;

*Goodman*, 8061.

Satisfactory: *Jordan*, 1194-7; *Maythorn*,

5571-3.

Should be tried: *Bailey*, 5245.

Unsatisfactory: *Bailey*, 5240-4, 5402-4.

Practicable: *Kinggate*, 4450.

Tendency to powder: *Kinggate*, 4555-63; *Allen*,

5056.

**Jointing—continued.**

- Method for wood panels: "X," 7516-7.
- Object of: *Bailey*, 5239, 5465-72; *Maythorn*, 5570; *Goodman*, 8060.
- Paste not tried: *Austin*, 13,378-9.

**JORDAN, THOMAS** (Chief Foreman Painter, Midland Railway Carriage Works, Derby):

- Evidence, 1179-317.
- Body-makers:
  - Contact with lead, 1256-7.
  - Lead poisoning amongst, 1251-3.
  - Same washing facilities as painters, 1258.
- Colours: lead dispensed with, 1218-20.
- Filling: leadless, satisfactory, 1200-3, 1305-7.
- Finishing coats:
  - Leadless, 1208.
  - Varnish used to preserve paint, 1209-12.
  - Hours of employment, 1248-9.
- Jointing: leadless paste satisfactory, 1194-7.
- Lead paint:
  - Abolition has caused no practical inconvenience, 1225.
  - Replaced by zinc, 1182-5.
- Lead poisoning:
  - Amongst body-makers, 1251-3.
  - Less since adoption of zinc paint, 1187-93.
  - More amongst men working inside vehicles than outside, 1254-5, 1279-86.
  - Since lead dispensed with, 1187-93, 1267-78.
- Lining: vermilion used for, 1213.
- Meals: not taken in workshop, 1250.
- Overalls: supplied only to colour-mixers, 1259.
- Priming: zinc no different in behaviour from lead, 1198-9.
- Repainting: done every four years, 1312.
- Roofs:
  - Bedded with leadless jointing paste, 1236-42.
  - Lights bedded with felt soaked in oil, 1287-9.
- Rubbing-down: dry method used, 1207.
- Sign-writing:
  - Chalking due to turpentine, 1294-6.
  - Leadless paints used, 1214-5.
- Stopping: leadless, satisfactory, 1204-6.
- Thinners: turpentine, 1216.
- Varnishing:
  - Number of coats used, 1209-12.
  - Vehicles re-varnished annually, 1243-7, 1290-2.
- Vermilion:
  - Harmless, 1232-5.
  - Used for lining, 1213.
- Washing:
  - Accommodation provided, 1261.
  - Facilities for body-makers, 1258.
- Workmen: health improved since adoption of zinc paint, 1300-4.
- Zinc paint:
  - As good as lead, 1186, 1221-4.
  - Cheaper than lead, 1262-6.
  - No difficulty in working, 1228-9, 1308-11.
  - Requires no more varnish than lead, 1293.
  - Six years' trial sufficient, 1226-7, 1313-5.

**KAUP, DR. IGNAZ** (Departmental Chief of the Central Organisation of Social Hygiene in Berlin):

- Evidence, 14,201, 14,230, 14,248, 14,345-6, 14,351-3, 14,453-7, 14,479-512.
- Dust: amount of lead in air important, 14,485.
- Hours of employment: restriction suggested for lead processes, 14,506-12.
- Leadless paints: trials by Austrian State Railways, 14,248, 14,500-2.
- Lead paints: dispensed with by Prussian State Railways for inside carriage, 14,453-6.
- Lead poisoning:
  - Decrease in Austria effected by regulations, 14,491-2.
  - Fewness of cases in Austria due to absence of dry rubbing-down, 14,479-81, 14,487.
  - Inquiry by Austrian Commission as to, 14,487-8.
  - Constitution of Commission, 14,494.
  - Pre-disposition to, 14,504-5.
  - Statistics for Vienna, 14,345-7, 14,354.

**KAUP, DR. IGNAZ—continued.**

- Prohibition of lead: unnecessary if dry rubbing-down stopped, 14,489-90.
  - Rubbing-down:
    - Wet method employed in Austria for coaches and railway carriages, 14,201, 14,230, 14,479-84, 14,495-9.
- 
- KINGGATE, C.**
- (a member of the Committee; representing the United Kingdom Society of Coach Makers):
- Evidence, 4433-604.
  - Body-makers:
    - Contact with lead, 4446.
    - Exposed to painters' dust, 4461.
    - Number in trade union, 4549.
  - Carriage-makers:
    - Contact with lead, 4453-5.
    - Exposed to dust, 4461.
    - Work of, 4452, 4489-92.
  - Coach-paintors:
    - Number in trade union, 4549.
    - Regularity of employment, 4573-5.
  - Dust: from mixing of stopping, 4475.
  - Filling:
    - Composition, 4468.
    - Lead can be dispensed with, 4538.
    - Number of coats applied, 4467.
    - Object of, 4469.
    - Often contains lead, 4470.
  - Flattling:
    - Cloth and pumice stone used, 4493-4.
    - Not a dangerous process, 4495.
  - Hours of employment:
    - Motor industry responsible for increased, 4514.
    - Number, 4510, 4530.
    - One-break system tried, 4570.
  - Overtime:
    - Extent, 4530-7.
    - Prevalence, 4511-8.
  - Jointing:
    - Lead for, 4447-9.
  - Leadless:
    - Equal to lead, 4525-6, 4504-7.
    - Liable to powder, 4555-63.
    - Practicable, 4450.
  - Lead colour:
    - Cracks under surface if badly mixed, 4544.
    - Powders unless kept covered with varnish, 4545-8.
  - Lead paint:
    - Easier to replace than in house painting, 4543.
    - Efficient substitutes available, 4522-3.
  - Lead poisoning:
    - Absorption through skin unlikely, 4509.
    - Body making involves great risk of, 4445.
    - Cases not always reported, 4436-7, 4550.
    - Evil extensive and serious, 4438-9.
    - Increase due to long hours of work, 4527-9.
    - Liability of carriage-makers to, 4551-3, 4568.
  - Meals:
    - Eaten in workplaces, 4506, 4572.
    - Messrooms rarely provided, 4507.
  - Motor car work: 4496.
  - Outdoor clothing: cloakroom not provided, 4508.
  - Overalls:
    - Employer should provide, 4509.
    - Not worn by coach-paintors, 4509.
  - Paint: causes of cracking, 4544-8, 4600-3.
  - Periodical medical examination:
    - Not desirable, 4519.
    - Workmen would object to, 4520.
  - Priming:
    - Contains lead, 4458.
    - Number of coats applied, 4457.
  - Prohibition:
    - Effect on industry in regard to foreign competition, 4524.
    - Necessary for complete removal of danger, 4500, 4521.
    - Suggested, 4466.
  - Regulations: would not completely remove the danger, 4521.

**KINGGATE, C.—continued.****Rubbing-down :****Dry method :**

Body-makers and carriage-makers exposed to dust, 4400-1.

Dust : the principal danger, 4462, 4485-6.

Exhaust apparatus to remove dust difficult, 4465, 4488.

Prohibition of lead the only remedy, 4466.

**Used :**

Between priming coats, 4459-60.

For wheels and carriage under-work, 4484.

Not done between filling coats, 4471.

**Wet method :**

Impracticable, 4463-4, 4487.

Used after filling coats, 4480-3.

**Staining :**

Composition of, 4476-7.

No danger involved, 4479.

Object of, 4478.

**Stopping :**

Composition of, 4473.

Lead can be dispensed with, 4538.

Mixed by user, 4474.

Mixing dangerous, 4475.

**Trade union :**

Membership fee, 4590-2.

Mortality records of members, 4441-4.

Number of members, 4440, 4549.

Sick pay to members small, 4593-6.

Tramcar work : lead used in, 4497-0.

Varnish : number of coats applied to carriages, 4539-42.

**Washing :****Accommodation :**

Desirable, 4583-9.

Not generally provided, 4502-5, 4569, 4576.

Danger in use of dirty buckets for, 4569, 4579, 4597-8.

No difficulty in obtaining clean water, 4582.

Time not allowed for, 4504.

Use of buckets with clean water not objected to, 4577-81.

Workmen : number in contact with lead, 4440-1.

**Lead Colour :**

Cracks under surface if badly mixed : *Kinggate*, 4544.

Number of coats applied : *Cornett*, 12,802.

Powders unless kept covered with varnish : *Kinggate*, 4545-8.

**Reds :**

Cost of on motor cars : *Crow*, 12,154-9.

Important : *Crow*, 12,028.

Lead indispensable : *Crow*, 12,029.

Yellows for lining : *Crow*, 11,952-3, 11,962, 12,072-82, 12,086-90, 12,127.

**Leadless Colour :**

*Jordan*, 1218-20; *Willix*, 4683; *Holzapsfel*, 11,602-4.

Lemon-yellow difficult to obtain; *Readman*, 12,412-6, 12,420-1, 12,458-9.

**Leadless Paints. (See also Antimony, Bituminous, Motor Cars : Daimler, Zinc.)**

Application : *Steinitz*, 1373-4; *Willix*, 4713, 4748-9; *Allen*, 5060-1.

Colours used : *Baker*, 9828-31.

Composition : *Steinitz*, 1323-6; *Allen*, 5048-9.

**Cost :**

Less than lead : *Steinitz*, 1448.

More than lead : *Willix*, 4747, 4755-6; *Smyth*, 13,402.

Same as lead : *Allen*, 5047; *Spencer*, 5106, 5109, 5133-4; *Baker*, 9765-7.

Could be used on chassis : *Austin*, 13,194-6.

Could not be used for all purposes : *Maythorn*, 5531; "X," 7613-27, 7643-55, 7699-701.

Covering power greater than lead : *Allen*, 5047, 5057, 5083-9; *Spencer*, 5106.

Demand has not increased : *Smyth*, 13,403.

Discontinued in Germany for railway carriages : *Leyendecker*, 16,397.

**Leadless Paints—continued.****Durability : Wait**, 1547-9.

As good as lead : *Allen*, 5069; *Baker*, 9768-70.

Due to varnish : *Allen*, 5046, 5062-4; *Spencer*, 5108, 5111, 5140, 5154-7; *Niederhäuser*, 16,336-40.

No complaints as to : *Baker*, 9770-1, 9824-7; *Smyth*, 13,404.

Satisfactory : *Swain*, 4890-2, 4995-6; *Cornett*, 12,860-8; *Morley*, 22,978.

Enamels for tramcars : *Holzapsfel*, 11,599-601.

Examples of bad work with : *Goodman*, 8279-86.

Exclusively used : *Baker*, 9758-60.

For inside work : *Willix*, 4732-5, 4740-3.

Freedom from lead guaranteed : *Baker*, 9776.

Geneva Commission's evidence as to : *De Morsier*, 16,669-72.

Health of men improved since using : *Jordan*, 1300-4; *Willix*, 4754; *Swain*, 4999-5000; *Allen*, 5050-2; *Readman*, 12,474.

Length of experience with : *Allen*, 5044; "X," 7603-4, 7607.

Materials obtainable in England : *Swain*, 5002.

More coats required than with lead : *De Morsier*, 16,604-6.

No trials with : *Bailey*, 5184, 5397, 5403, 5451; *Maythorn*, 5522-4; *Meier*, 5819, 5863, 5890;

*Croall*, 6001; *Arnold*, 6119; *Mulliner*, 7746-50; *Goodman*, 8013, 8220-1, 8356; *Austin*, 13,182, 13,300.

**Not tested by :**

Institute of British Carriage Manufacturers : *Maythorn*, 5561; *Fuller*, 5916.

Society of Motor Manufacturers : *Mulliner*, 7744; *Austin*, 13,180.

**Opacity :**

Not so good as lead : *Spencer*, 5106-7.

Same as lead : *Willix*, 4714, 4750; *Allen*, 5057-60.

Practicable for vehicles other than tramcars : *Spencer*, 5113-4.

Processes in which used : *Swain*, 4943-9, 5009-13.

Progress with : *Legge*, 78.

Report by Swiss Factory Inspectors as to : *De Morsier*, 16,542.

Satisfactory : *Steinitz*, 1321-2, 1371-2; *Willix*, 4685-7, 4744-6; *Allen*, 5045; *Spencer*, 5101;

"X," 7606; *Baker*, 9763-4.

For priming : *Smyth*, 13,465.

For wheels : *Schobert*, 9742-3.

Superior to lead : *Swain*, 4996.

Tests : *Willix*, 4688-90, 4715-6, 4736-9; *Spencer*, 5096, 5101-5, 5111; "X," 7607-10; *Goodman*, 8010; *Cornett*, 12,846-60.

Length of time necessary for : *Maythorn*, 5549-59; *Meier*, 5830-2, 5873-8; *Baker*, 9771-5.

**Trials by :**

Austrian State Railways : *Kaup*, 14,248, 14,500-2.

Prussian State Railways : *Leyendecker*, 16,467-71.

Unaware that Midland Railway and Bradford Corporation use : *Bailey*, 5193-7, 5205-7; *Maythorn*, 5527-30; *Croall*, 6018-9; *Arnold*, 6121-2;

*Mulliner*, 7761-3; *Goodman*, 8015, 8288-9; *Austin*, 13,189-92.

Unsatisfactory : *Bailey*, 5403-4.

**Used for :**

Motors, vans and locomotives : *Schobert*, 9737-41; *Smyth*, 13,406-8, 13,486-8; *Ricker-Devroede*, 15,067-72; *Morley*, 22,964.

Railway carriages : *Line*, 10,051-2.

Underwork of carriages and trucks : *Wait*, 1543-6.

Would adopt if as good as lead : *Bailey*, 5218; *Maythorn*, 5525-6; *Meier*, 5895-9; *Goodman*, 8292, 8357-8.

**Lead Paint :****Abandonment :**

By Belgian State Railways : *Pisart*, 18,900-1, 21,823-35, 21,879-80.

Has caused no practical inconvenience : *Jordan*, 1225.

**Lead Paint—continued.****Abandonment—continued.**

On account of lead poisoning: *Spencer*, 5095-7, 5112; *Baker*, 9761-2; *Readman*, 12,424, 12,428-9; *Edginton*, 13,157-8; *Smyth*, 13,476. Possible: *Swain*, 4936.

Dispensed with by Prussian State Railways for inside: *Kaup*, 14,453-6.

Easier to replace than in house-painting: *Kinggate*, 4543.

**Emanations:**

Danger from: *Cornett*, 12,809.

Illness due to: *Cornett*, 12,810-4, 12,891.

No smell from pure white lead and oil: *Fuller*, 5960-1, 5968.

Possible from tub-lead: *Maythorn*, 5728-33.

Question not considered: *Goodman*, 8273-6.

Unaware of danger from: *Bailey*, 5414-5.

Unaware that they arise: *Croall*, 6036.

Use of helmet or prohibition of lead the only safeguard: *Bailey*, 5416-21.

French bodies painted with: *Goodman*, 8280-2.

French railway carriages painted with: *Villemot*, 16,231-4.

**Necessary for:**

First two coats: "X," 7614-8.

Lining: *Fuller*, 5972, 5976, 5979-82.

Railway carriages: *Niederhäuser*, 16,273; *Leyen decker*, 16,391.

Opacity: *Maythorn*, 5546.

**Purex:**

Application: *Daly*, 4849.

Durability: *Daly*, 4849-50, 4867.

Effect on workers: *Daly*, 4879-82.

Not absolutely innocuous: *Daly*, 4847, 4867.

Substitute for white lead: *Daly*, 4847.

Trials with: *Spencer*, 5098-100.

Unaware of lead poisoning from: *Daly*, 4848.

**Reinstated after abandonment by:**

Belgian State Railways: *Ricker-Devroede*, 14,969.

German State Railways: *Meissl*, 14,779.

Replaced by leadless: *Jordan*, 1182-5; *Steinitz*, 1321.

Satisfactory substitute available: *Kinggate*, 4522-3.

Use of: unhealthy, *Mulliner*, 7988-91.

**Lead Poisoning:****Attributed to:**

Carelessness or drink: *Bailey*, 5186-91, 5373-85, 5440; *Croall*, 5996-9; "X," 7677-9; *Austin*, 13,224-31; *Niederhäuser*, 16,273.

Lead dust: *Legge*, 79-81; *Bailey*, 5409; *Ball*, 9876-7; *Awcock*, 12,629.

Blood-examination will disclose: *Bailey*, 5413.

Careful and careless men both suffer from: *Awcock*, 12,597-600.

**Cases:**

Known of: *Steinitz*, 1321, 1341, 1381-2; *Daly*, 4764-5; *Spencer*, 5124; *Bailey*, 5174-7, 5351-5, 5400-1; *Meier*, 5806, 5815; *Arnold*, 6103, 6113; "X," 7510-2, 7629-30; *Mulliner*, 7729, 7738, 7937, 7952-3; *Baker*, 9789, 9839; *Ball*, 9864; *Readman*, 12,424-32; *Awcock*, 12,507-11, 12,596, 12,661-6; *Cornett*, 12,752-9; *Edginton*, 13,093-4, 13,121-2; *Austin*, 13,173-9, 13,318-9, 13,337-9.

None known of: *Maythorn*, 5502-3, 5791-6; *Fuller*, 5904-6; *Goodman*, 8004-9, 8040.

Notification of: *Legge*, 2-9, 86.

Not reported: *Kinggate*, 4436-7, 4450; "X," 7656-8; *Goodman*, 8297-302; *Awcock*, 12,627-8, 12,661-6.

Number of: *Legge*, 10-11, 26-8, 44.

**Caused by:**

Chipping off paintwork of engines: *Sibthorpe*, 17,749-54.

Drinking-water: *Fuller*, 5922, 5931.

Gimp pins: *Baker*, 9786-8, 9821.

Sandpaper stopping in the nails; "X," 7611-2.

**Compensation for:**

Liability insured: *Meier*, 5810; *Fuller*, 5907.

Liability not insured: *Maythorn*, 5511; *Croall*, 5992-3.

**Lead Poisoning—continued.****Compensation for—continued.**

Not paid since abandonment of lead: *Spencer*, 5117.

Paid: *Spencer*, 5115-20.

**Compensation for suspension:**

Could not agree to: *Maythorn*, 5703-4; *Mulliner*, 7839.

Not objected to, if made general: *Austin*, 13,272.

Unnecessary: *Mulliner*, 7838.

Would lead to malingering: *Goodman*, 8192-4.

Concealment of symptoms by workmen: *Steinitz*, 1431-7; *Daly*, 4860.

Not probable: *Mulliner*, 7969; *Goodman*, 8343-7.

Contracted in previous work: *Mulliner*, 7970-4.

Contracted through the skin: *Bailey*, 5377-85, 5422-9; *Goodman*, 8359-60.

Unlikely: *Legge*, 79-81; *Kinggate*, 4599.

Deaths partly attributed to, not certified as: *Daly*, 4766; *Cornett*, 12,883-4.

**Decrease:**

General in factories: *Legge*, 12.

In Austria due to regulations: *Kaup*, 14,491-2.

Since using leadless paints: *Jordan*, 1187-93, 1267-78.

Difficulty of diagnosis: *Legge*, 85, 88-92, 99-102.

Eliminated by using zinc stopping: *Ball*, 9865, 9891.

Everyone working in lead more or less affected: *Cornett*, 12,875-7.

Extent of evil: *Kinggate*, 4438-9; *Daly*, 4767-9; *Maythorn*, 5515; *Fuller*, 5917-9, 5926; *Mulliner*, 7922-4; *Goodman*, 8012, 8296; *Awcock*, 12,512-21.

Factory inspectors' instructions observed: *Bailey*, 5366-7; *Mulliner*, 7807, 7890-4; *Goodman*, 8011.

Greater amongst men working inside vehicles: *Jordan*, 1254-5, 1279-86, 1316-7.

Illness due to lead not diagnosed as, or attributed to: *Legge*, 134-5; *Readman*, 12,471-3.

Impossible to protect coach-makers against: *Bailey*, 5430-2.

In Austria: *Kaup*, 14,479-81, 14,487-8.

**Incidence:**

Considerable in perambulator works: *Legge*, 16, 36.

Would be lessened by proper ventilation: *Legge*, 82-4.

**Increase:****Due to:**

Absence of remedial measures: *Legge*, 13.

Increased use of white lead: *Awcock*, 12,630-7.

Increase in coach-building: *Bailey*, 5450; *Mulliner*, 7789-90; *Austin*, 13,176.

Less cubic air space: *Cornett*, 12,894.

Long hours or pressure of work: *Legge*, 123-6; *Kinggate*, 4527-9; *Rambousek*, 14,662-3.

Use of quick colours: *Cornett*, 12,899-91.

Workmen's Compensation Act: *Legge*, 87.

Not aware of: *Bailey*, 5449; *Mulliner*, 7737-8.

Inquiry as to: *Fuller*, 5911, 5934.

By Austrian Commission: *Kaup*, 14,487-8, 14,494.

By factory inspectors: *Legge*, 37-45.

Lead abandoned because of: *Spencer*, 5095-7, 5112; *Baker*, 9761-2; *Readman*, 12,424, 12,428-9; *Edginton*, 13,157-8; *Smyth*, 13,476.

Liability of body-makers to: *Jordan*, 1251-3; *Steinitz*, 1388-9; *Kinggate*, 4445; *Willix*, 4609-13; *Bailey*, 5232-4; *Mulliner*, 7934-7.

Liability of carriage-makers to: *Kinggate*, 4551-3, 4568.

Men refused employment if suffering from, *Daly*, 4859-60.

**No inquiry as to precautions by:**

Institute of British Carriage Manufacturers:

*Maythorn*, 5562; *Meier*, 5820; *Fuller*, 5918-9.

Society of Motor Manufacturers: *Mulliner*, 7745; *Austin*, 13,181.

No knowledge of cases reported from his works: *Austin*, 13,218-23, 13,303-10.

Notice only taken of serious cases: *Austin*, 13,323-31.

Not prevalent among wheelwrights: *Legge*, 122-3.

**Lead Poisoning** *continued.*

- Occurred in spite of precautions: *Baker*, 9790-5.  
 Precautions for mitigating evil: *Legge*, 63-77, 82-4.  
 Prohibition of lead the only remedy: *Legge*, 63; *Kinggate*, 4500, 4521; *Willix*, 4636, 4684, 4689; "X," 7681-4; *Aweock*, 12,575; *Cornett*, 12,815; *Edginton*, 13,101.  
 Proportion of cases to number of men employed: *Mulliner*, 7743.  
 Regulations would eliminate: *Bailey*, 5219; *Maythorn*, 5560; *Meier*, 5834; *Austin*, 13,217.  
 Reliability of information obtained from workmen: *Mulliner*, 7733.  
 Risk arises only in certain classes of works: *Maythorn*, 5517-21; *Fuller*, 5913.  
 Sequoia of: *Legge*, 121.  
 Since using leadless paint: *Steinitz*, 1327-32, 1375-80.  
 Slight illness attributable to: *Meier*, 5891-4; *Readman*, 12,471-3; *Aweock*, 12,521, 12,615-26, 12,647-51, 12,678.  
 Something should be done to remove evil: *Bailey*, 5178; *Maythorn*, 5516; *Meier*, 5814, 5867; *Fuller*, 5912; *Croall*, 5998; *Arnold*, 6116; *Austin*, 13,177.  
 Special drink to ward off, unaware of: *Mulliner*, 7967-8.  
 Stationary in coach-painting industry: *Legge*, 86.  
 Statistics:  
 For Bohemia: *Rambousek*, 14,660-1.  
 For Vienna: *Kaup*, 14,345-7, 14,354.  
 Official:  
 • Body-makers included: *Legge*, 107, 113; *Mulliner*, 7735-6.  
 Doubt expressed as to accuracy: *Fuller*, 5909; *Croall*, 5995; *Goodman*, 8006, 8367-9.  
 Necessity for: *Legge*, 31-2.  
 Reliability of: *Legge*, 9.  
 Surprised at: *Arnold*, 6114-5, 6118.  
 Tabulation by severity: *Legge*, 20-3.  
 Unaware of: *Bailey*, 5175-83; *Maythorn*, 5512-4; *Meier*, 5811-3, 5817-9; *Fuller*, 5908-9, 5922; *Croall*, 5994; *Austin*, 13,178-9.  
 Surprised that works, previously free unexpectedly have succession of cases: *Meier* 5807-9; *Fuller*, 5906.  
 Susceptibility to: *Legge*, 103-6; *Cookson*, 2294-6; *Kaup*, 14,504-5.  
 Symptoms: *Legge*, 24-5, 105.  
 Workmen:  
 Have died or left the trade on account of: *Cornett*, 12,756-66, 12,871-4.  
 In painting department do not suffer more than others: *Mulliner*, 7831-5.  
 Might suffer and not go to a doctor: *Maythorn*, 5797-9.  
 Should be educated as to danger of lead: *Aweock*, 12,645.  
 Works immune from: *Swain*, 4949-56; *Maythorn*, 5503-4, 5508-10; *Croall*, 5989-90, 6030, 6037, 6088-9; *Readman* 12,470.

**LEGGIE, THOMAS MORISON, M.D.** (H.M. Senior Medical Inspector of Factories):

- Evidence, 1-147.  
 Body-making:  
 Danger not so great as in painting, 114-20.  
 Burning-off:  
 Danger from fumes, 98.  
 Respirators a complete protection, 147.  
 Coach-building:  
 Definition, 16-9.  
 Number of works, 37-44.  
 Coach-painting:  
 Inquiry by factory inspectors as to dangers in, 37-45.  
 Processes, 51.  
 Dry rubbing-down:  
 Amount considerable in motor-car industry, 56.  
 Dust is the principal danger, 60, 79-81.

**LEGGIE, THOMAS MORISON, M.D.**—*continued.*

- Dry rubbing-down—*continued.*  
 Exhaust ventilation:  
 Impracticable:  
 Fixed to the hand, 139.  
 For large arons, 136-8.  
 Practicable for wheels, 64.  
 Priming coats, 93.  
 Quicker and less expensive than wet method, 50.  
 Works where this method alone is used, 46, 49.  
 Dust:  
 Method of estimating lead in air, 61.  
 No more dangerous in evening than in morning: 131-3.  
 Filling:  
 Composition, 52.  
 Leadless, 58-9, 127-30.  
 Jointing:  
 Lead, 53.  
 Leadless, 58-9, 127-30.  
 Leadless paints: progress with, 78.  
 Lead poisoning:  
 Absorption through the skin improbable, 79-81.  
 Breathing of dust containing lead the chief cause, 79-81.  
 Cases:  
 Notification of, 2-9, 86.  
 Number, 10-11, 26-8, 44.  
 Classes of work in which reported cases occur, 26, 33-5.  
 Decreasing generally in factories, 12.  
 Difficulty of diagnosis, 85, 88-92, 99-102.  
 Illness due to lead not diagnosed as, 134-5.  
 Incidence:  
 Considerable in perambulator works, 16, 36  
 Would be lessened by proper ventilation, 82-4.  
 Increase due to:  
 Absence of remedial measures, 13.  
 Pressure of work, 123-6.  
 Workmen's Compensation Act, 87.  
 Not prevalent among wheelwrights, 122-3.  
 Precautions for mitigating evil, 63-77, 82-4.  
 Sequela of, 121.  
 Stationary in coach-painting industry, 86.  
 Statistics:  
 Body-makers included with painters, 107, 113.  
 Necessity for, 31-2.  
 Reliability of, 9.  
 Tabulation by severity, 20-3.  
 Susceptibility to, 103-6.  
 Symptoms, 24, 105.  
 Severity below the average, 25.  
 Lead workers: number, 29-30, 36, 43-5.  
 Meals: mess-room advocated, 76-7.  
 Motor-car painting processes, 54.  
 Paint: industries in which used, 14-5.  
 Respirators:  
 Compressed air, 140-7.  
 Efficiency, 65-9.  
 Rubbing down (See also "Dry Rubbing-down"):  
 Dispensed with for railway trucks, 46-8.  
 Wet method:  
 Danger from dried splashes, 62.  
 Not possible for wheels and rounded surfaces, 56-7.  
 Prevalence, 94-7.  
 Priming coats, 97.  
 Works in which it is the only method, 46-7, 57.  
 Stopping: lead used for, 53.  
 Washing:  
 Accommodation advocated, 72.  
 Facilities advocated, 74.  
 Hot water necessary, 73-4.  
 Personal cleanliness important, 71.  
 White lead:  
 Substitutes:  
 Progress with, 78.  
 Tried for jointing and filling, 58-9, 127-30.

**LEYENDECKER, HANS** (President of the German White Lead Manufacturers' Association):

Evidence: 16,391, 16,397.

LEYENDECKER, HANS—*continued.*

- Leadless paints:
  - Discontinued in Germany for railway carriages, 10,397.
  - Trials by Prussian State Railways, 10,467-71.
- Lead paints: necessary for railway carriages 10,391.

## LINE, CHARLES A. (Consultant on House Decoration):

- Evidence: 10,051-2, 10,066-7.
- Jointing: leadless, 10,066-7.
- Leadless paints: used for railway carriages, 10,051-2.

## Lining:

- Comparative amount of paint used: *Crow*, 11,970.
- Difficult if lead prohibited: *Croall*, 6020-2, 6027, 6084.
- Done with pencil: *Fuller*, 5973.
- Exemption required if lead prohibited: *Fuller*, 5977-8.
- Lead essential for: *Fuller*, 5972, 5976, 5979-82.
- No danger involved: *Crow*, 11,963-6, 12,083.
- No sandpapering: *Fuller*, 5974-5.
- No trials with zinc-white: *Croall*, 6095-7.
- Tests with zinc- and lead-paint: *Robins*, 12,355-67.
- Vermilion used for: *Jordan*, 1213.
- Yellow colours:
  - Covering power of lead chromate of 50 per cent. strength: *Crow*, 11,962.
  - Exemption from 5 per cent. limitation of lead necessary: *Crow*, 12,086-90, 12,127.
  - Proportion of lead in: *Crow*, 11,952-3.
  - Strong colour impossible with 5 per cent. lead and remainder zinc chrome: *Crow*, 12,072-82.
  - Zinc not so opaque as lead chrome: *Crow*, 11,954-61, 12,147-53.
- Zinc white satisfactory for: *Robins*, 12,357; *Readman*, 12,496-8.

## MAYTHORN, F. A. (President of Institute of British Carriage Manufacturers):

- Evidence, 5498-800.
- Aprons: worn by painters instead of overalls, 5085-6.
- Bedding of canvas: lead not used, 5640-2.
- Body-makers: contact with lead, 5563.
- Carriage-makers:
  - Contact with lead, 5575.
  - Work of, 5574.
- Compensation:
  - For lead poisoning: liability not specially insured, 5511.
  - For suspension: could not agree to, 5703-4.
- Dust:
  - Dangers from, 5734-40.
  - Material used on floors to prevent:
    - Applied every two or three months, 5764.
    - Satisfactory, 5763-7, 5772.
  - Not much arises from paint which falls on floor, 5687-8.
  - Ordinary ventilation not sufficient to remove danger, 5745.
  - Use of helmet to prevent inhalation deprecated, 5515, 5544.
- Emanations: possible from tub-lead, 5728-33.
- Filling:
  - Contains small proportion of lead, 5584.
  - Lead in:
    - Might be abandoned, 5587.
    - Not absolutely essential, 5586.
    - Object of, 5585.
  - Number of coats applied, 5595.
- Heating apparatus: hot water, 5760-2.
- Hours of employment:
  - Number for coach painters, 5692.
  - Prevalence of overtime, 5693-4, 5717-9.
  - Restriction not desired, 5695.
- Jointing:
  - Leadless: Yellow ochre and oil satisfactory, 5571-3,

MAYTHORN, F. A.—*continued.*

- Jointing—*continued.*
  - Lead paste:
    - No dust caused by mixing or after drying, 5567, 5714-6.
    - Unaware of any danger with, 5565.
    - Used moist, 5563-6, 5713.
    - Workers' hands soiled with, 5568-9.
  - Object of, 5570.
- Leadless paints:
  - Could not be used for some purposes, 5531.
  - Durability not tested, 5523-4.
  - If as good as lead, would prefer to use, 5525-6.
  - Instituto has not taken steps to test merits of, 5561.
  - Length of time necessary for proper test, 5549-59.
  - Not tried, 5522.
  - Unaware that Midland Railway and Bradford Corporation use only, 5527-30.
- Lead paints: more opaque than any other, 5546.
- Lead poisoning:
  - Extent, as indicated by statistics, very serious, 5515.
  - Immunity due to cleanliness and system of painting employed, 5503-4, 5508-10.
  - Instituto has not inquired as to precautions against, 5562.
  - No cases known of, by:
    - Doctors, 5795-6.
    - Members of Instituto, 5791-2.
    - Witness, 5502-3.
  - Risk arises chiefly in certain classes of work, 5517-21.
  - Something must be done to remove evil, 5516.
  - Unaware of official statistics, 5512-4.
  - Workers might suffer and not go to a doctor, 5797-9.
- Meals:
  - Messroom not provided, 5661.
  - No provision made for storage, 5663.
  - Not eaten in paint shop, 5661-2, 5669.
  - Sometimes eaten in places where lead is used, 5664-9.
- Motor-cars:
  - Daimler:
    - Experience of leadless paints insufficient, 5549-54.
    - Quality and finish of high class, 5533-40.
    - Views as to leadless paints not modified on account of, 5543.
  - Lead not used on metal underwork, 5631-3.
  - Life of paint depends on its treatment, 5773-80.
  - Require varnishing once or twice a year, 5551.
- Outdoor clothing: cupboard provided for, 5689-90.
- Overalls:
  - Kept on benches when not in use, 5677-9.
  - Not contaminated with lead dust, 5680-4.
  - Not worn by painters, 5672, 5685-6.
  - Place for storage not provided, 5676.
  - Provided by men, 5670.
  - Washed weekly, 5671, 5675.
- Paint shop:
  - Floors:
    - Impervious:
      - An advantage for swilling down, 5768-9.
      - Exist in some works, 5770.
      - Should be smooth, 5771.
    - Not impervious and washable, 5691.
    - Swept with moist dust-preventing material, 5688, 5691, 5751-2, 5763-7, 5772.
- Periodical medical examination:
  - If useful, would welcome, 5698-702.
  - Not provided for, 5696-7.
- Priming:
  - Contains lead, 5505, 5579.
  - Work first prepared with leadless wood-filler, 5577.
- Prohibition of lead:
  - Effect on white motor cars, 5712.
  - Possible without inflicting hardship on industry, 5523.
  - Preferred to regulations, 5709-11.
- Regulations:
  - Cost would kill the industry, 5705-8.
  - Would eliminate danger, 5560.

MAYTHORN, F. A.—*continued.*

- Rubbing-down:  
 Dry method:  
   Could be dispensed with for finishing coats, 5629.  
   Danger from dust, 5734-40.  
   Exhaust ventilation difficult to apply, 5743-4.  
   Prepared to prohibit it for stopping of curved surfaces and underwork of motors, 5639.  
   Time occupied in, 5741-2.  
   Wheels and carriage underwork:  
     Exhaust ventilation practicable, but cost prohibitive, 5619-24.  
     No remedy for danger, if any exists, 5617.  
     Pigment not hard enough to create dust, 5600-5, 5781-90.  
     Stopping not dangerous, 5606-14, 5734-6.  
 Not done between:  
   Filling coats, 5588.  
   Priming coats, 5507, 5580-2.  
 Wet method:  
   Employed after:  
     Filling coats, 5596-7.  
     Finishing coats, 5625-9.  
     Priming coats, 5506.  
   Impossible for wheels and underwork, 5615-8.  
   Possible for hard stopping, 5635-6.  
 Stopping:  
   Composition, 5590.  
   Hard stopping not much used on:  
     Underwork and curved surfaces of motors, 5634.  
     Wheels and carriage underwork, 5606-7.  
   Lead generally used, 5589.  
   Mixed by user, 5591.  
   No dust from mixing dry white lead, 5592-4.  
 Stove enamelling: could not be used instead of stopping, 5637-8.  
 Ventilation: system installed, 5754-9.  
 Washing:  
   Accommodation:  
     Amount, 5646.  
     Not provided for all men in body shop, 5746-9.  
     Provided, 5645, 5746-7.  
   Facilities:  
     Hot water:  
       Available but not laid on, 5647.  
       Important, 5648-9.  
     Soap and nail brushes:  
       Available, 5653-7.  
       Man employed to look after, 5655.  
     Towels:  
       Important to have clean, 5652.  
       Supplied twice weekly, 5650-1.  
     Personal cleanliness important, 5644.  
     Time allowed for, 5659-60.  
 White lead:  
   Age specified for, 5726-7.  
   Purchased as "tub-lead," 5723-5.  
   Substitutes:  
     Durability not tested, 5523-4.  
     Not tried, 5522.  
 Workmen:  
   Difficulty in obtaining, 5695, 5720-2.  
   Number employed, 5501.

**Meals:**

- Danger of working in morning before taking food:  
*Daly*, 4835.  
 Eaten in workshop: *Steinitz*, 1307-9; *Kinggate*, 4506, 4572; *Willix*, 4666-7; *Daly*, 4822; *Maythorn*, 5664-9; "X," 7589; *Goodman*, 8150-1; *Awcock*, 12,582; *Cornett*, 12,824.  
 Kept in workshop: *Bailey*, 5333-5; "X," 7589; *Awcock*, 12,582; *Cornett*, 12,824.  
 Mess-room:  
   Advocated: *Legge*, 76-7; *Willix*, 4669; *Daly*, 4824.  
   Impossible in small works: *Goodman*, 8181-4.  
   Men will not always use: *Goodman*, 8341-2.  
   Not general: *Kinggate*, 4507; *Daly*, 4823; "X," 7590; *Awcock*, 12,583-5, 12,656; *Cornett*, 12,825-6.

**Meals—continued.**

- Mess-room—*continued.*  
 Not provided: *Steinitz*, 1366; *Willix*, 4668; *Maythorn*, 5661; *Mulliner*, 7810.  
 Provided: *Bailey*, 5328-31; *Goodman*, 8148-52, 8341-2; *Austin*, 13,241-2.  
 Warmed in winter: *Bailey*, 5330.  
 Not taken or eaten in workshop: *Jordan*, 1250; *Maythorn*, 5661-2, 5669; *Arnold*, 6137; *Mulliner*, 7811; *Baker*, 9790.  
 Storage room:  
   Not provided: *Maythorn*, 5663.  
   Provided: *Austin*, 13,243.

## MEIER, ABRAHAM (Representing the Institute of British Carriage Manufacturers):

- Evidence, 5801-99.  
 Bedding of canvas:  
   Gold size used for, 5853-4.  
   White lead not often used, 5855.  
 Filling:  
   Leadless used, 5844.  
   Small amount of lead necessary for good work, 5845-7.  
 Leadless paints:  
   If as good as lead, would be anxious to use, 5895-9.  
   Length of time necessary to test, 5832, 5873-8.  
   No knowledge of, 5863.  
   No trials with, 5819, 5890.  
   Two years not a sufficient test, 5830, 5861.  
 Lead poisoning:  
   Case known of, 5806, 5815.  
   Compensation for: liability insured, 5810.  
   Evil should be rectified, 5814, 5867.  
   Institute has made no efforts to combat, 5820.  
   Men away occasionally from work may be suffering from, 5891-4.  
   Regulations would eliminate evil, 5834.  
   Statistics: unaware of official, 5811-3, 5817-9.  
 Surprised that works, previously free, unexpectedly have succession of cases, 5807-9.  
 Motor cars:  
   Daimler:  
     Class of customers, 5826.  
     Finish demanded by customers, 5827.  
     Leadless paint on:  
       Durability, 5828-33.  
       Looks of highest finish, 5822-5.  
       Probably used for economical reasons, 5833.  
       Two years an insufficient test, 5830-2.  
       Unaware that it is leadless, 5821.

- Priming:  
   Contains lead, 5839.  
   Number of coats applied, 5837-8.  
 Prohibition of lead:  
   Preferred to Regulations, 5868-72.  
   Quality of work would suffer by, 5859-60.  
 Regulations:  
   Inevitable if lead continues in use, 5836-8.  
   Would eliminate lead poisoning, 5834.  
 Rubbing-down:  
   Dry method unnecessary for priming coats, 5840-2.  
   Wet method used for bodies, 5852.  
 Stopping:  
   Contains lead, 5848.  
   Mixed by head painter, 5849.  
   No danger from mixing dry white lead, 5850-1.  
 White lead: the most perfect substance for paint, 5821-2, 5890.  
 Workmen: number employed, 5805.  
 Workmen's Compensation: insurance rate same for all workers, 5879-89.

## MEISSL, ODO MARIA (Master Painter, of Vienna):

- Evidence: 14,775-6, 14,779.  
 Lead paint: reinstated, after being abandoned, by German State Railways, 14,779.  
 Paint: varnish not used for highest class work, 14,775-6.

- MORLEY, B. J.** (Foreman Painter, of Messrs Cadbury, Ltd., Bournville):  
 Evidence, 22,964, 22,978.  
 Leadless paints:  
 Durability, 22,978.  
 Used on motor vans and locomotives, 22,964.
- Motor Cars** (See also evidence of *Austin, Goodman, and Mulliner*):  
 Amount of lead required for filling metal panels:  
*Bailey*, 5294, 5494-7.  
 Amount of stopping required: "X," 7697 8, 7720.  
 Cleaning of: *Croall*, 6090-4.  
 Daimler:  
 Class of customers: *Bailey*, 5203-4; *Meier*, 5826-7; *Arnold*, 6127; *Austin*, 13,204.  
 Leadless paint on:  
 Aware of: *Arnold*, 6123; *Austin*, 13,193.  
 Better results obtainable with lead: *Mulliner*, 7851-5.  
 Class of finish: *Bailey*, 5200-2, 5208-11, 5214-5; *Maythorn*, 5533-40; *Meier*, 5822 5; *Croall*, 6004-5; *Arnold*, 6124-6; *Mulliner*, 7763, 7766 77; *Goodman*, 8018 39; *Austin*, 13,201-3.  
 Demanded by customers: *Meier*, 5827.  
*Croall*, 6007-8, 6017, 6062; *Arnold*, 6128.  
 Durability: *Bailey*, 5208-11, 5214-5; *Meier*, 5828-33; *Croall*, 6014-6; *Goodman*, 8018-39.  
 Formula might not be satisfactory: *Mulliner*, 7781-2.  
 Instances of bad results: *Croall*, 6002, 6011, 6070-3; *Mulliner*, 7783-5, 7851 5, 7871-6.  
 Lead would not have been abandoned imprudently: *Croall*, 6011-3.  
 Probably used for economical reasons: *Meier*, 5833.  
 Recent improvements: *Goodman*, 8351 5.  
 Surprised that Company are satisfied with: *Croall*, 6009-10.  
 Surprised that Company have received no complaints: *Bailey*, 5205-11.  
 Two years' trial insufficient: *Maythorn*, 5549-54; *Meier*, 5830-2; *Arnold*, 6129-32; *Austin*, 13,205-16, 13,345-6, 13,364-71.  
 Unaware of: *Meier*, 5821.  
 Worth a trial: *Mulliner*, 7786-8, 7844-50.  
 Repainted by other firms: *Goodman*, 8026, 8028-9.  
 Dangers:  
 Increased by introduction of: "X," 7575-9, 7629-31.  
 Not affected by introduction of: *Avcock*, 12,568-70.  
 Same as with ordinary coach work: *Willix*, 4657.  
 Finish not so good as that of horse carriages: *Bailey*, 5371.  
 General evidence applicable to: *Kinggate*, 4496; *Willix*, 4657; *Cornett*, 12,805.  
 Industry increasing: *Mulliner*, 7740 2.  
 Lead not used for attaching metal underwork: *Bailey*, 5297-8; *Maythorn*, 5631-3.  
 Less filling used than for carriages: "X," 7692-3.  
 More dust created than in carriage-work, *Daly*, 4808.  
 More lead used than for carriages: "X," 7694-6, 7719-22.  
 Painting processes: *Legge*, 54.  
 Piece-work a special danger: *Daly*, 4809.  
 Require varnishing:  
 Every two years: *Austin*, 13,373-5.  
 Once or twice a year: *Maythorn*, 5551.  
 Should not be classed with railway carriages: *Mulliner*, 7739.  
 Subject to rougher usage than carriages: *Austin*, 13,372.
- Mouldings**:  
 Fixed with lead: *Readman*, 12,467-8.
- MULLINER, A. F.** (representing the Society of Motor Manufacturers and Traders):  
 Evidence, 7723-994.  
 Body-makers:  
 Contact with lead, 7936-7.  
 Not so liable to lead poisoning as painters, 7934-5.  
 Carriage-makers:  
 Contact with lead, 7953-8.  
 Work in same place as painters, 7955.  
 Dust:  
 Danger has not been considered, 7860.  
 Very little produced, 7856-9.  
 Filling: white lead the best known substance, 7764 5, 7855.  
 Floors:  
 Impervious:  
 Cleaned down wet every morning, 7817-8.  
 Labourers specially employed to clean, 7819.  
 Provided in London, 7816.  
 Foreign competition:  
 Belgians the chief competitors, 7870-1.  
 Effect of prohibition of lead, 7751.  
 Hours of employment:  
 Number, 7820.  
 Overtime:  
 Extent, 7821.  
 Prevalence, 7822.  
 Restriction:  
 Unnecessary, 7823 8.  
 Would reduce wages, 7824, 7828.  
 Leadless paints:  
 No trials with, 7746-50.  
 Society has not tested merits, 7744.  
 Unaware that Midland Railway and Bradford Corporation use only, 7761-3.  
 Lead paints: use of, unhealthy, 7988-91.  
 Lead poisoning:  
 Cases:  
 Increase with number of men employed, 7789-90.  
 Known of, by inquiring amongst workmen, 7729, 7738, 7937, 7952-3.  
 Compensation for suspension:  
 Unnecessary, 7838.  
 Would rather cease to use lead, 7839.  
 Contracted in previous work, 7970-4.  
 Evil somewhat magnified, 7922-4.  
 Factory inspectors' instructions always observed, 7807, 7890-4.  
 Fear of men to attribute illness to lead, not heard of, 7969.  
 Liability of body-makers to, 7934-7.  
 Men do not suffer from the more insidious forms of, 7831-5.  
 Not increasing, 7737-8.  
 Proportion of cases to number of men employed important, 7743.  
 Reliability of information obtained by employers from workmen, 7733.  
 Society has not considered precautions necessary, 7745.  
 Specially prepared drink to ward off, not known of, 7967-8.  
 Statistics, 7735-6.  
 Meals:  
 Mess-room not provided, 7810.  
 Not taken in factory, 7811.  
 Motor cars:  
 Bodies: use of Terne plates, 7880-9.  
 Daimler:  
 Leadless paint:  
 Better results with lead, 7851-5.  
 Formula might not be satisfactory, 7781-2.  
 Instances of bad results, 7783-5, 7581-3, 7871-6.  
 Prepared to use, 7844-50.  
 Quality of work, 7763, 7766-77.  
 Worth a trial, 7786-8.  
 Industry increasing, 7740-2.  
 Should not be classed with railway carriages, 7739.  
 Outdoor clothing: room provided for storage, 7815.

**MULLINER, A. F.—continued.****Overalls :**

- Not provided, 7812
- Storage room :
  - Not provided, 7813.
  - Should be insisted on if lead used, 7814.
- Painters :**
  - Constantly changing employment, 7976-8.
  - Number employed, 7728, 7976.
  - Occupation unhealthy, 7982-9.
- Periodical medical examination :**
  - If necessary, would welcome, 7836-7.
  - In lead industries, 7829-30.
- Priming : lead used for, 7948-51.**
- Prohibition of lead :**
  - Effect on foreign competition, 7751.
  - Experience of Daimler Co. does not justify, 7940.
  - Inferior work would result, 7753-4, 7943-7.
  - May not necessarily increase cost, 7752.
  - Preferred to Regulations, 7843-4.
  - Would agree to conditionally, 7755-60, 7778-80, 7991-4.
- Regulations : would be expensive, 7840-2.**
- Rubbing-down :**
  - Dry method :**
    - Amount of lead dust caused, 7916-21.
    - Very little done, 7858, 7902-3, 7910-5.
    - Wheels sandpapered between each coat, 7959-60, 7964.
  - Wet method used for chassis and metal work, 7904-7, 7961-4.**

**Washing :**

- Accommodation :**
  - Amount, 7797-9.
  - Provided for all workers in lead, 7796, 7938-9
- Facilities :**
  - Soap and nail-brushes provided, 7808.
  - Towels supplied regularly, 7805-7.

**Hot water :**

- Not laid on, 7800.
- Use of, not imperative, 7801-4, 7980-1.

**Personal cleanliness important, 7795.****Time allowed for, 7794, 7809.****Workmen :**

- Cleaner in habits than formerly, 7975.
- Health, 7895-901, 7925-33, 7965-6.
- Number employed, 7728, 7731.
- Number in contact with lead, 7729-32, 7976.
- Workmen's Compensation Act: insurance rate, 7861-8, 7877-9.

**NIEDERHAÜSER, EMIL (Master Painter, of Cologne) :**

- Evidence, 16,273, 16,336-40, 16,357-8.
- Carriage-painting: cannot be compared with house-painting, 16,357-8.
- Leadless paints: success due to use of varnish, 16,336-40.
- Lead poisoning: uncleanness the chief cause, 16,273.
- White lead: necessary for railway carriages, 16,273.

**NOOLJEN, M. (of the Guild of Dutch Master Painters) :**

- Evidence, 15,235, 15,398-9.
- White lead: no trials with substitutes, 15,398-9.
- Zinc paint: cannot be used for locomotives, 15,235.

**Outdoor Clothing :**

- Cloak room or cupboard :**
  - Not provided: *Kinggate*, 4508; *Willix*, 4670-2; *Daly*, 4825; *Arnold*, 6138-9; "X," 7591; *Awcock*, 12,586, 12,656.
  - Provided: *Maythorn*, 5689-90; *Mulliner*, 7815.
  - Sometimes provided: *Cornett*, 12,827.
  - Tried and found impracticable: *Goodman*, 8185-6.
  - Would agree to provide: *Austin*, 13,249-50.
- Kept in workshop: *Willix*, 4672; *Daly*, 4826-7; *Awcock*, 12,587; *Cornett*, 12,828.

**Overalls :**

- Become dirty quickly: *Daly*, 4868-9.
- Kept on work-benches: *Maythorn*, 5677-84.
- Necessary: *Daly*, 4870.
- Not provided by employer: *Bailey*, 5336; *Mulliner*, 7812; *Goodman*, 8153; *Austin*, 13,244.
- Not worn by painters: *Kinggate*, 4509; *Maythorn*, 5672, 5685-6; "X," 7592; *Awcock*, 12,588-9; *Cornett*, 12,829.
- Painters should wear: *Goodman*, 8156.
- Provision by employer:
  - Objected to: *Goodman*, 8157, 8187; *Austin*, 13,245-6.
  - Urged: *Kinggate*, 4509.
- Provision for storage:
  - Made: *Austin*, 13,248.
  - Not made: *Maythorn*, 5676; *Mulliner*, 7813.
  - Should be insisted on: *Mulliner*, 7814.
- Rarely worn: *Willix*, 4673; *Daly*, 4829.
- Supplied only to colour-mixers: *Jordan*, 1259.
- Unnecessary: *Bailey*, 5337; *Goodman*, 8154.
- Washing :**
  - Should be done weekly: *Daly*, 4870; *Maythorn*, 5671, 5675.
  - Would agree to if regulation made: *Austin*, 13,248.
- Workmen not compelled to wear: *Steinitz*, 1350-2, 1407-8.
- Worn and supplied by workmen: *Maythorn*, 5670; *Arnold*, 6139.

**Paint :**

- All colours obtainable with 5 per cent. of soluble lead: *Smyth*, 13,476-85.
- Cracking, causes of: *Kinggate*, 4544-8, 4600-3.
- Difficulty in adhering to aluminium: *Austin*, 13,301-2.
- Good base important: *Austin*, 13,347-51.
- Industries in which used: *Legge*, 14-15.
- Life of, depends on its treatment: *Maythorn*, 5773-80.
- Mixing of: *Cunynghame*, 10,348-51; *Readman*, 12,410.
- Now paint stands satisfactorily on old: *Readman*, 12,463, 12,478-81.
- Object of lead in: *Austin*, 13,352-63.
- Pigment sometimes destroyed down to wood: *Readman*, 12,494-5.
- Should be allowed to settle before use: *Bailey*, 5410-2.

**Painters :**

- Average age: *Croall*, 6047, 6055-60.
- Class for:
  - Lead paint not much used: *Bailey*, 5391-5.
  - Number of pupils: *Bailey*, 5386-90.
  - Same practice taught as in the shop: *Bailey*, 5393.
- Class of: *Baker*, 9843-5.
- Habits cleaner than formerly: *Daly*, 4875-6; *Spencer*, 5159; *Goodman*, 8413-6; *Awcock*, 12,670, 12,685-6.
- Health of: *Croall*, 6046; *Awcock*, 12,678-83.
- Mixing of paints by: *Cunynghame*, 10,348-51.
- Number employed: *Swain*, 5003; *Mulliner*, 7729, 7976.
- At State Railway Works, Malines: *Riesker-Devroede*, 14,970.
- Number in trade union: *Kinggate*, 4549.
- Regularity of employment: *Kinggate*, 4573-5; *Croall*, 6034; *Mulliner*, 7976-8.
- Short-lived: *Awcock*, 12,687.

**Painting, Coach :**

- American process: *Swain*, 4937-42, 4971-2, 4997-8.
- Cannot be compared with house-painting: *Niederhäuser*, 16,357-8; *Plumb*, 18,356-7.
- Cost of labour compared with cost of material: *Spencer*, 5138-9.
- Done chiefly in paint shop: *Spencer*, 5123.
- Sometimes in carriage and body-shops: *Fuller*, 5937, 5953-6, 5966-7; *Mulliner*, 7956.

**Painting, Coach -continued.**

Inquiry by factory inspectors as to dangers: *Legge*, 37-45.  
 Less care taken with than formerly: *Arnold*, 6156.  
 Method for framears: *Readman*, 12,385-409.  
 Not a healthy occupation: *Mulliner*, 7982-9; *Goodman*, 8378-85.  
 Processes: *Legge*, 51, 54.  
 With leadless materials: "X," 7702-10.

**Perambulators.** (See evidence of *Mr. H. B. Baker*.)

Works: lead poisoning in: *Legge*, 16, 36.

**Perambulator Manufacturers' Association:**

Proportion of firms in membership: *Baker*, 9748-51.  
 Would approve of his evidence: *Baker*, 9752-4.

**Periodical Medical Examination:**

Agreed to: *Austin*, 13,269-71.  
 For painters: *Goodman*, 8174, 8191, 8269-70.  
 Desirable: *Willie*, 4681; *Daly*, 4836; "X," 7601-2.  
 Hardship on workmen: *Goodman*, 8171, 8261-7, 8271-2; *Cornett*, 12,837-44, 12,895-8.  
 If necessary, would welcome: *Bailey*, 5356-60; *Maythorn*, 5698-702; *Mulliner*, 7836-7.  
 In lead industries: *Mulliner*, 7829-30.  
 Not desirable: *Kinggate*, 4519; *Cornett*, 12,837-8.  
 Not provided for: *Bailey*, 5350; *Maythorn*, 5696-7; *Goodman*, 8170.  
 Of lead workers and young persons: *Steinitz*, 1367-8.  
 Workmen would favour: *Daly*, 4858.  
 Workmen would object to: *Kinggate*, 4520; *Cornett*, 12,878-82.

**PISART, F.** (Managing Director of the Maastricht Zinc White Co.):

Evidence, 18,900-1, 21,823-35, 21,879, 21,887.  
 Lead paints: abandoned by Belgian State Railways, 18,900-1, 21,823-35, 21,879.  
 Zinc oxide: amount used by Belgian State Railways, 21,887.

**PLUMB, GEORGE** (Foreman Painter, of G. Trollope Ltd.):

Evidence, 18,356-8.  
 Coach-painting: conditions different from house-painting, 18,356-7.  
 Zinc paints: if varnished could be used for vehicles, 18,358.

**Priming:**

Lead: *Kinggate*, 4458; *Willie*, 4623-5, 4684, 4742-3; *Daly*, 4780-1; *Bailey*, 5252; *Maythorn*, 5505, 5579; *Meier*, 5839; "X," 7529-30; *Mulliner*, 7948-51; *Goodman*, 8070; *Ball*, 9893; *Readman*, 12,386; *Awcock*, 12,528; *Cornett*, 12,772-3; *Austin*, 13,350.  
 Leadless: *Swain*, 4900-4, 4959, 4965-7, 4984-91; *Allen*, 5026-7; *Baker*, 9779, 9813-4; *Smyth*, 13,465-6, 13,524-6.  
 Wood-filler, *Maythorn*, 5577.  
 No dust created: *Goodman*, 8078-81.  
 Number of coats applied: *Kinggate*, 4457; *Bailey*, 5250-1; *Meier*, 5837-8; "X," 7525-8; *Goodman*, 8068-9; *Awcock*, 12,526-7; *Cornett*, 12,771-1a.  
 Object, *Croall*, 6081; *Ball*, 9897-900.  
 Rubbed off except in the grain, *Croall*, 6078.  
 Whitening possible for: *Baker*, 9815-9.  
 Zinc no different from lead in its behaviour: *Jordan*, 1198-9.

**Prohibition of Lead:**

Advocated: *Kinggate*, 4466; "X," 7659, 7685-6, 7712-3.  
 Agreed to:  
 If efficient substitute found: *Willie*, 4691-3; *Bailey*, 5192, 5218, 5368, 5462; *Croall*, 6062-5; *Arnold*, 6120; *Mulliner*, 7755-60, 7778-80, 7991-4; *Goodman*, 8014, 8206; *Austin*, 13,188.  
 For filling and priming: *Croall*, 6081-3.  
 For stopping: *Goodman*, 8096.

**Prohibition of Lead -continued.**

Effect on:

Cost of painting: *Mulliner*, 7752; *Austin*, 13,187.  
 Industry: *Maythorn*, 5523; *Austin*, 13,183-9.  
 By foreign competition: *Kinggate*, 4524; *Mulliner*, 7751; *Goodman*, 8204; *Crow*, 12,030-1, 12,036-7, 12,105-7; *Austin*, 13,185-6, 13,340-4.

Quality of work: *Meier*, 5859-60; *Mulliner*, 7753-4, 7943-7.

White motor cars: *Maythorn*, 5712.

Exemption:

Required for lining and artistic work: *Fuller*, 5977-8; *Croall*, 6020-2, 6027; *Crow*, 12,086-90, 12,127.

Suggested for higher-class coach-builders: *Croall*, 6028-9.

French law as to: *Expert-Bezançon*, 15,106-7, 15,197-200.

Not affected by: *Swain*, 5005.

Not justified by Daimler Co.'s experience: *Mulliner*, 7940.

Perambulator manufacturers should not object to: *Baker*, 9840-2.

Possible for bedding canvas: *Goodman*, 8134-5.

Preferred to regulations: *Maythorn*, 5709-11; *Meier*, 5868-72; *Fuller*, 5925, 5927-30; *Croall*, 6027, 6069; *Arnold*, 6142; *Mulliner*, 7843-4; *Austin*, 13,320-2, 13,396-7.

The only remedy for dangers: *Legge*, 63; *Kinggate*, 4500, 4521; *Willie*, 4636, 4684, 4689; "X," 7581-4; *Awcock*, 12,575; *Cornett*, 12,815; *Edginton*, 13,101.

The simplest precaution: *Bailey*, 5220-2.

Unnecessary if dry rubbing-down stopped: *Kaup*, 14,489-90.

Urged for certain classes of workers: *Goodman*, 8176-8.

Welcomed: *Steinitz*, 1449.

**Railway Work.** (See also evidence of *Jordan* and *Kaup*.)

Bad conditions in some factories: *Daly*, 4830-40.  
 Leadless paints supplied to foreign railways: *Wait*, 1544.

Lead used on French railway carriages: *Villemot*, 16,231-4.

More dangerous than carriage work: *Willie*, 4658, 4701; *Daly*, 4810.

Repainting done every four years: *Jordan*, 1312.

Report of Swiss Factory Inspectors as to leadless paints for: *De Morsier*, 16,542.

**RAMBOUSEK, DR. JOSEF** (Official of the Government of the Kingdom of Bohemia):

Evidence, 14,460-3.

Lead-poisoning:

Overwork conducive to, 14,662-3.

Statistics for Bohemia: 14,660-1.

**READMAN, WILFRED** (Foreman Painter at the London County Council Tramways Car Repair Depot, Charlton):

Evidence, 12,368-503, 19,433-54.

Bedding of canvas:

Leadless, 12,440-3.

Lead used, 12,397.

Method of, 12,398.

Bedding of lights:

Lead not used, 12,444.

Method, 12,445-7.

Burning-off:

Blow-lamp used for perished paint, 12,482-3.

Not very unhealthy, 12,484-6.

Seldom necessary, 12,462.

Some dust caused, 12,487-8.

Filling:

Composition, 12,388.

Number of coats applied, 12,387.

Finishing:

Number of coats applied:

Inside, 12,392.

Outside, 12,390, 12,393.

**READMAN, WILFRED—continued.****Jointing:**

- Leadless, 12,450 2.
- Lead used, 12,448 9.
- Leadless colour: lemon yellow difficult to obtain, 12,412 6, 12,420 1, 12,458-9.
- Lead poisoning:
  - Cases known of, 12,424 32.
  - Illness due to lead not attributed to, 12,471-3.
  - Immunity due to cleanliness and good ventilation, 12,470.
  - Zinc paints adopted on account of, 12,424, 12,428-9.

**Lining:**

- Zinc-white satisfactory, 12,496-8.
- No different from lead in application, 12,497-8.

Mouldings: fixed with lead, 12,467-8.

**Paint:**

- Mixed by colourman, 12,410.
- New paint stands satisfactorily on old, 12,463, 12,478 9.
- Old paint not always removed, 12,478-81.
- Pigment sometimes destroyed down to wood, 12,494 5.

**Painting:**

- Method of, for:
  - Car-floors, &c. 12,395.
  - Dashes and staircases, 12,394.
  - Light colours, 12,393.
  - New work, 12,385-409.

**Paint shop:**

- Floors swilled down daily, 12,438.
- Heating and ventilation of, 12,435-6.

Priming: composition, 12,386.

**Rubbing-down:**

- Dry method:
  - Employed for second coat of lead colour, 12,404-5.
  - Seldom employed, 12,381.

**Not done on:**

- Midland Red coats, 12,406.
- Priming coats, 12,399.
- Wet method employed for:
  - Filling, 12,389, 12,400, 12,402.
  - First coat of lead colour, 12,403.
  - Stopping, 12,375.

**Sign-writing:**

- Zinc-white satisfactory, 12,496-8.
- No different from lead in application, 12,497-8.

**Stopping:**

- Composition, 12,374.
- Zinc-white used for, 12,384.

Tramcars: renovated annually, 12,373-81, 12,464-6, 12,480, 12,489-91.

**Varnish:**

- Method of using, 12,407-9.
- More important than pigment, 12,454-5, 12,476-7, 12,491.

**Washing:**

- Accommodation provided, 12,437.
- Nailbrushes supplied, 12,437.
- Towels renewed daily, 12,437.

**White lead:**

- Abolition beneficial to health, 12,474.
- Could be dispensed with, 12,418-9, 12,456-7, 12,475, 12,499-502.

Window-frames: treatment of, 12,391.

Workmen: number in contact with lead, 12,433-4.

**Zinc paints:**

- Adopted because of lead poisoning, 12,424.
- Experiments with, 12,382, 19,433-54.
- No different from lead in application, 12,497-8.
- No different from lead in preparation, 12,503.
- Satisfactory, 12,383, 12,422-3, 12,496-8.

**Regulations:**

- Application of: *Fuller*, 5958-9.
- Cost of: *Mulliner*, 7840-2; *Austin*, 13,273, 13,279.
- Effect on industry: *Bailey*, 5361-5; *Maythorn*, 5705-8; *Croall*, 6026; *Goodman*, 8179.
- Enforcement: *Cookson*, 2292-3; *Edginton*, 13,103.
- Non-observance by workmen: *Goodman*, 8196, 8201.
- Onus should be on factory inspectors: *Goodman*, 8197-200, 8202-3.

**Regulations—continued.**

- Exemption from, would mean a saving in cost: *Swain*, 5004-6.
- Inevitable if lead continues in use: *Meier*, 5836 8.
- Necessity for, not admitted: *Fuller*, 5923-4.
- Objected to, for period pending prohibition of lead: *Croall*, 6006-8.
- Preferred to prohibition of lead: *Goodman*, 8206.
- Suggestions for: *Johnson*, 22,264, 22,266.
- Would eliminate dangers: *Bailey*, 5219; *Maythorn*, 5560; *Meier*, 5834-8; *Austin*, 13,217.
- Would not completely remove dangers: *Legge*, 63; *Kinggate*, 4521; *Willix*, 4682.

**Respirators:**

*Legge*: 65-9, 140 7.

**RICKER-DEVROEDE, CHARLES (Master Painter, of Brussels):**

- Evidence, 14,969-70, 15,009-10, 15,066-72.
- Leadless paint: used on motor cars in Brussels, 15,067-72.
- Painters: number employed at State Railway Works, Malines, 14,970.
- White lead: Belgian State Railways returned to, through trouble with zinc, 14,969.
- Zinc paint: not entirely abandoned by Belgian State Railways, 15,009-10.

**ROBINS, W. (a Member of the Committee):**

Evidence, 12,355-67.

**Lining:**

- Comparative tests with zinc and lead, 12,355-67.
- Zinc paint:
  - Better than lead, 12,357.
  - Easier to apply than lead, 12,357, 12,366.
  - Keeps colour better than lead, 12,358, 12,364-5.

**Rubbing down:**

- Both methods used:
  - After stopping: *Allen*, 5034; *Arnold*, 6106-9, 6143-4.
  - For wheels: *Arnold*, 6106-9, 6143-4.
- Done by special class of men: *Awcock*, 12,684.

**Dry:**

- Abolition necessary to remove danger of dust: *Daly*, 4789.
- After filling coats: *Cornett*, 12,796-7.
- Impossible: "X," 7551.
- Amount: *Legge*, 56; *Mulliner*, 7858, 7902-3, 7910-5; *Baker*, 9822.
- Before painting bodies: *Goodman*, 8071-2.
- Between filling coats: *Goodman*, 8073; *Awcock*, 12,541.
- Between finishing coats: *Allen*, 5042; *Readman*, 12,404-5.
- Can be dispensed with: *Maythorn*, 5629.
- Between priming coats: *Legge*, 93; *Kinggate*, 4459-60; *Willix*, 4626-7; *Daly*, 4782-4; *Allen*, 5028; "X," 7531-2; *Baker*, 9780; *Awcock*, 12,529-30; *Cornett*, 12,774.
- Can be dispensed with: *Swain*, 4905-8, 4923, 4983; *Meier*, 5840-2; *Goodman*, 8074, 8084.
- Dispensed with:
  - For railway trucks: *Legge*, 46-8.
  - In Austria: *Kaup*, 14,201, 14,230, 14,479-84, 14,495-9.

**Dust from:**

- Amount: *Bailey*: 5229; *Mulliner*, 7916-21.
- Arises chiefly from filling: *Baker*, 9832.
- Body-makers and carriage-makers exposed to: *Steinitz*, 1391-4, 1409-14; *Kinggate*, 4461; *Willix*, 4628; *Daly*, 4785; *Fuller*, 5953-7, 5962; *Mulliner*, 7955; *Awcock*, 12,531-2; *Cornett*, 12,775-7.
- Contains lead: *Bailey*, 5280-6; *Arnold*, 6110-1.
- Dangerous in small room: *Goodman*, 8401-4, 8408-12.
- The principal danger: *Legge*, 60, 79-81; *Kinggate*, 4462, 4485-6; *Willix*, 4629, 4648; *Daly*, 4786; *Bailey*, 5287, 5405, 5493; *Maythorn*, 5734-40; "X," 7553, 7558-60, 7578-9, 7682-4; *Ball*, 9862-3, 9877, 9892; *Awcock*, 12,533, 12,558-9; *Cornett*, 12,775, 12,795, 12,800-2; *Austin*, 13,389-90.

**Rubbing down—continued.****Dry—continued.**

- Employed : *Jordan*, 1207.  
 Exhaust ventilation : see under "Dust."  
 Indispensable for :  
   Priming coats : *Awcock*, 12,534-5.  
   Some processes : *Willix*, 4709.  
   Wheels and carriage underwork : *Awcock*, 12,560 3.  
 Largely replaced by wet method : *Readman*, 12,381 ; *Edginton*, 13,096, 13,135 7.  
 No remedy for danger : *Bailey*, 5292-3, 5406-8 ; *Maythorn*, 5617 ; *Arnold*, 6112  
 Not done on priming coats : *Goodman*, 8075 7.  
 On curved surfaces and mouldings : *Steinitz*, 1346-7.  
 On stopping : *Arnold*, 6160.  
   Dangerous : *Goodman*, 8094, 8099 101, 8363-4, 8370-1.  
   Fan suggested to remove dust : *Goodman*, 8095, 8102-3, 8372.  
   Place could be set apart for : *Goodman*, 8407.  
 On wheels and carriage underwork : *Kinggate*, 4484 ; *Willix*, 4647 ; *Bailey*, 5277-87, 5479-80 ; *Mulliner*, 7959-60, 7964 ; *Goodman*, 8104 12 ; *Cornett*, 12,799, 12,869-70.  
 Amount of dust caused : *Daly*, 4802 ; *Maythorn*, 5600-1, 5781-90 ; *Goodman*, 8106-12, 8116-22.  
 Can be dispensed with : *Arnold*, 6145-7 ; *Goodman*, 8126.  
 Dangerous : *Daly*, 4863 ; "X," 7555-60.  
 Good ventilation will overcome risk : *Goodman*, 8113-4, 8295.  
 Indispensable : *Awcock*, 12,560-3.  
 Place set apart suggested : *Goodman*, 8123, 8127 8, 8362-3.  
 Priming : *Goodman*, 8082-3.  
 Stopping : *Bailey*, 5283-93, 5491-2 ; *Maythorn*, 5606 14, 5734 6.  
 Time occupied : *Goodman*, 8120 1.  
 Prohibition of lead the only remedy for danger : *Kinggate*, 4466 ; *Willix*, 4633.  
 Quicker and less expensive than wet method : *Legge*, 50.  
 Time occupied : *Willix*, 4721-31 ; *Maythorn*, 5741-2.  
 Works in which it is the only method : *Legge*, 16, 49.  
 Not dangerous :  
   After filling and stopping : *Allen*, 5035.  
   If leadless filling and stopping used : *Swain*, 4924-5.  
 Not done between :  
   Filling coats : *Kinggate*, 4471 ; *Daly*, 4793 ; *Swain*, 4914 ; *Bailey*, 5262 ; *Maythorn*, 5588 ; "X," 7537 8 ; *Goodman*, 8089 ; *Cornett*, 12,789.  
   Finishing coats : *Swain*, 4931-4.  
   Priming coats : *Bailey*, 5253, 5473-5, 5489 ; *Maythorn*, 5507, 5580-2 ; *Readman*, 12,399.  
 Not done with Purex : *Hardwick*, 1860 9.  
 Unnecessary between filling coats : *Bailey*, 5254 5.  
 Wet :  
   Amount of water necessary : *Awcock*, 12,639-44.  
   Danger in : *Legge*, 82 ; *Willix*, 4644-5 ; *Daly*, 4800 ; *Awcock*, 12,548-52, 12,638-45.  
   Difficulty in obtaining clean water : *Awcock*, 12,646.  
   Impracticable : *Kinggate*, 4463 4, 4487 ; *Willix* 4630-1.  
   For priming coats : *Legge*, 97 ; *Daly*, 4787 ; *Awcock*, 12,534-5 ; *Cornett*, 12,779-80.  
   For wheels and carriage underwork : *Legge*, 56 7 ; *Willix*, 4649 ; *Daly*, 4804 ; *Bailey*, 5288-91, 5487 8 ; "X," 7561 3 ; *Cornett*, 12,801.  
 Method generally employed : *Steinitz*, 1349.  
 On chassis and metal work : *Mulliner*, 7904-7, 7961-4.  
 On filling coats : *Kinggate*, 4480 3 ; *Daly*, 4799 800 ; *Bailey*, 5256-8 ; *Maythorn*, 5596-7 ; "X," 7550-1 ; *Goodman*, 8097-9 ; *Readman*, 12,389, 12,400, 12,402 ; *Awcock*, 12,546-7, 12,565 ; *Cornett*, 12,795.

**Rubbing down—continued.****Wet—continued.**

- On finishing coats : *Maythorn* 5625-9 ; *Readman*, 12,403.  
 On priming coats : *Steinitz*, 1443-7 ; *Maythorn*, 5506.  
 On staining coats : *Willix*, 4642-3 ; *Bailey*, 5272-3 ; "X," 7550 1.  
 On stopping : *Maythorn*, 5635-6 ; *Baker*, 9834-6 ; *Readman*, 12,375.  
 On wheels and carriage underwork : *Arnold*, 6106-9, 6143-4.  
   After filling in tramcar work : *Willix*, 4702 4.  
   Impracticable : *Daly*, 4804 ; *Bailey*, 5288 91, 5487-8 ; *Maythorn*, 5615 8 ; *Cornett*, 12,801.  
   Practicable : *Austin*, 13,380-8.  
   Priming coats : *Arnold*, 6148 9, 6157-8.  
   Satisfactory : *Arnold*, 6145-9.  
 Prevalence : *Legge*, 94-7.  
 Too expensive : *Baker*, 9823.  
 Works in which it is the only method : *Legge*, 46-7, 67 ; *Swain*, 4921-2, 4969-70 ; *Spencer*, 5125.  
**Safe Manufacture.** (See evidence of *Mr. H. S. Ball*.)  
 SCHOBERT, G. (of Messrs. Schobert's Ltd., Paint Manufacturers, London):  
 Evidence, 9737 43.  
 Leadless paints :  
   Schobert's :  
     Satisfactory for wheel work, 9742 3.  
     Used on motors and carriages, 9737-41.  
 SIBTHORPE, JOHN (Master House Painter, of Dublin):  
 Evidence, 17,749-54, 17,975-7.  
 Coach-painting : no practical experience of, 17,975-7.  
 Lead poisoning : surprised that cases have been caused by chipping off old paintwork on engines, 17,749-54.  
**Sign-writing :**  
 Chalking due to turpentine : *Jordan*, 1294-6.  
 Leadless paints used : *Jordan*, 1214-5.  
 Suitability of zinc paints : *Heydorn*, 562-7 ; *Readman*, 12,496-8.  
 SMYTH, C. J. (of Messrs. Mauder Bros., Ltd., Wolverhampton):  
 Evidence, 13,400-9, 13,455-6, 13,476-8, 13,522-6.  
 Filling, leadless, 13,409.  
 Leadless paint :  
   Adopted on account of lead poisoning, 13,476.  
   Costs slightly more than lead, 13,402.  
   Demand has not increased, 13,403.  
   Has proved satisfactory for priming, 13,465.  
   No complaints received as to durability, 13,404.  
   Supplied for coach-painting, 13,399-401.  
   Used by one motor-car firm for five years, 13,406-8, 13,486-8.  
 Paint, all colours obtainable with 5 per cent. of soluble lead, 13,476 85.  
 Priming :  
   Leadless :  
     Composition, 13,524-6.  
     Satisfactory, 13,465-6.  
 SPENCER, C. J. (General Manager, Bradford Corporation Tramways):  
 Evidence, 5090-167.  
 Bedding of canvas :  
   Leadless material used, 5126.  
   Does not powder, 5127.  
 Driers : contain slight amount of lead, 5164-7.  
 Filling :  
   Leadless material used, 5131.  
   No complaints as to, 5132.  
 Leadless paints :  
   Cost of painting approximately equal to lead, 5106, 5109, 5133-4.  
   Covering power greater than lead, 5106.

SPENCER, C. J. *continued.*

- Leadless paints- *continued.*  
 Durability dependent on varnish, 5108, 5111, 5140.  
 Opacity not so good as lead, 5106-7.  
 Practicable for vehicles other than tramcars, 5113-4.  
 Satisfactory, 5101.  
 Trials or tests, 5096, 5101-5, 5111.
- Lead paints :  
 Abandoned because of fatal case of lead poisoning, 5095-7, 5112.  
 Purex : trials unsatisfactory, 5098-100.
- Lead poisoning :  
 Case in paint shop, 5124.  
 Compensation for :  
 Nothing paid since abandonment of lead, 5117.  
 Paid for fatal case, 5115-20.
- Painters : cleaner in habits than formerly, 5159.
- Painting :  
 Cost of labour compared with that of material, 5138-9.  
 Done chiefly in paint shop, 5123.
- Rubbing-down : wet method employed, 5125.
- Stopping :  
 Leadless, 5128.  
 Does not crack, 5128-30.
- Thinners : Raw linseed oil the best, 5149-53.
- Tramcars :  
 Cleaning of : neutral soap used, 5141-4.  
 Repainting :  
 Cost not increased by use of leadless paints, 5139.  
 Done every two years, 5135-7.
- Varnish :  
 Life of the paint depends on, 5154-7.  
 Two coats applied, 5158.
- Washing :  
 Accommodation :  
 Amount, 5162.  
 Good in tramway shops, 5122, 5145-6.  
 Difficulty in getting men to wash, 5147.  
 Facilities (nail brushes, soap, towels, hot water) :  
 Good, 5121.  
 Provided, 5160-1.

## Spray :

- Especially dangerous with lead paint : *Hardwick*, 1862-4.  
 Not aware of any process causing : *Awecock*, 12,574.

## Staining :

- Composition of : *Kinggate*, 4476-7 ; " X," 7548.  
 No danger involved : *Kinggate*, 4479 ; *Willix*, 4641.  
 Object of : *Kinggate*, 4478 ; *Bailey*, 5270-1 ; " X," 7549.  
 When applied : " X," 7547.

## STEINITZ, JOHN (Manager, Brush Electrical Engineering Co., Falcon Works, Loughborough) :

- Evidence, 1318-451.  
 Aerograph : no experience with, 1345.
- Body-makers :  
 Contact with lead, 1440-1.  
 Dust in shop, 1301-4, 1409-14.  
 Shop swept every evening, 1300, 1418-21, 1426-30.  
 Washing as necessary as for painters, 1442.
- Burning-off, not done, 1364-5.
- Dust :  
 Arises from dried paint splashes on floor, 1410-3.  
 In body-makers' shop, 1301-4.
- Hours of employment, 1395-7.
- Joining :  
 Lead, 1336-40.  
 Leadless, 1415.
- Leadless paint :  
 Cheaper than lead paint, 1448.  
 Composition of, 1323-6.  
 No practical difficulties in applying, 1373-4.  
 Satisfactory, 1321-2, 1371-2.
- Lead paint : replaced by leadless, 1321.

STEINITZ, JOHN- *continued.*

- Lead poisoning :  
 Concealment through fear of discharge, 1431-7  
 Confined to body-makers, 1388-9.  
 No cases amongst painters, 1400-4.  
 Number of cases, 1321, 1341, 1381-2.  
 Since using leadless paint, 1327-32, 1375-80.
- Meals :  
 Eaten in workshop, 1397-9.  
 Mess-room not provided, 1366.
- Overalls : workers not compelled to wear, 1350-2, 1407-8.
- Paint shop :  
 Heated by steam pipes, 1422-4.  
 Swept down every evening, 1390, 1418-21, 1426-30.
- Periodical medical examination : of lead workers and young persons, 1367-8.
- Prohibition of lead : welcomed, 1449.
- Rubbing-down :  
 Dry method :  
 Dust arising from, 1413-4.  
 On curved surfaces, 1346-7.  
 Wet method :  
 Generally employed, 1349.  
 Used on priming coats, 1443-7.
- Stopping : sandpaper not used, 1425.
- Washing :  
 Accommodation :  
 Enforced use of, 1362-3.  
 Provided, 1353-9, 1405-6, 1437.
- Facilities :  
 Hot and cold water provided, 1353.  
 Nail brushes provided, 1355.  
 Soap provided, 1354.  
 Towels supplied clean daily, 1355-6.  
 Necessary for body-makers, 1442.  
 Time allowed for, 1359-61, 1438, 1450-1.
- Workmen : number in contact with lead, 1343-4, 1409.
- Workmen's compensation : insurance rate same for painters as for other workers, 1369-70, 1383-5.
- Stopping :  
 Amount : *Ball*, 9896.  
 Composition : *Legge*, 53 ; *Kinggate*, 4473 ; *Willix*, 4637 ; *Bailey*, 5264 ; *Maythorn*, 5590 ; *Readman*, 12,374 ; *Awecock*, 12,543 ; *Cornett*, 12,790.
- Hard stopping :  
 Not much used on underwork : *Maythorn*, 5606-7, 5634.  
 Unnecessary on underwork : *Bailey*, 5298-300.
- Lead : *Daly*, 4795.  
 Abandoned for : *Ball*, 9858, 9878-82  
 Can be dispensed with : *Kinggate*, 4538.  
 Generally used : *Maythorn*, 5589 ; *Meier*, 5848 ; " X," 7541.  
 Prohibition agreed to : *Goodman*, 8096.
- Leadless : *Jordan*, 1204-6 ; *Daly*, 4877 ; *Swain*, 4916-20, 4925, 4968 ; *Allen*, 5033 ; *Spencer*, 5128 ; *Baker*, 9783-5, 9837.  
 Does not crack : *Spencer*, 5129-30.  
 Zinc-white : *Ball*, 9859-61 ; *Readman*, 12,384.
- Mixing :  
 Dangerous : *Kinggate*, 4475 ; *Willix*, 4639-40 ; *Daly*, 4797-8 ; *Bailey*, 5266-9 ; *Awecock*, 12,545 ; *Cornett*, 12,792-3.  
 Done by usor : *Kinggate*, 4474 ; *Willix*, 4638 ; *Daly*, 4796 ; *Bailey*, 5265 ; *Maythorn*, 5591 ; *Meier*, 5849 ; " X," 7542-3 ; *Awecock*, 12,544 ; *Cornett*, 12,791.  
 Not dangerous : *Meier*, 5850-1.
- No trials with lead substitutes : *Bailey*, 5446-7.
- Not used on coach bodies and motors : *Goodman*, 8090-4, 8323-8.
- Sometimes dangerous : *Bailey*, 5263, 5274, 5295-6 ; *Goodman*, 8094.
- When used : *Willix*, 4636 ; *Bailey*, 5283-4 ; " X," 7539-40 ; *Ball*, 9893-6.
- Whiting not used for perambulators : *Baker*, 9820.
- Stove Enamelling :  
 Could not be used instead of stopping : *Maythorn*, 5637-8.

- SWAIN, J. T.** (Foreman Painter, The Daimler Motor Co., Coventry):  
 Evidence, 4883-5013.  
 Bedding of canvas: Non-poisonous lead and varnish used, 4935, 4972-4.  
 Bodies: primed before received for painting, 4957-8.  
 Body-makers:  
 White lead not used by, 4896-8.  
 Work of, 4894-5.  
 Carriage-makers:  
 White lead not used by, 4896-8.  
 Work of, 4894-5.  
 Filling: leadless, 4909-13.  
 Jointing:  
 Leadless material used: 4889, 4960.  
 Cracking between bedding less than with lead, 4963-4.  
 No complaints as to durability, 4891-2.  
 Satisfactory, 4890, 4961-2.  
 The only material used by body-makers, 4894.  
 Leadless paints or materials:  
 Adopted because of cheapness, 4952-3, 4975-6.  
 Durability satisfactory, 4890-2, 4995-6.  
 Health of workmen improved since adoption of, 4999-5000.  
 Immunity from lead poisoning due to, 4949-56.  
 Materials obtainable in England, 5002.  
 Processes in which used, 4943-9, 5009-13.  
 Superior to white lead, 4996.  
 Lead paints: possible to abandon use of, 4936.  
 Lead poisoning: immunity due to use of leadless paints, 4949-56.  
 Painting:  
 American process:  
 Cost not dependent on use of waste varnish, 4975-8.  
 Could be applied to trams and railway carriages, 4941, 4981-2.  
 Description of, 4971.  
 Introduced in view of danger from lead, 4942.  
 Material costs less, but labour more than with lead, 4939-40.  
 No lead used in, 4937-8.  
 Perishing starts from the top and not from the base, as with lead, 4997-8.  
 Priming:  
 Leadless: 4900-4, 4959.  
 Composition, 4965-7.  
 More elastic and less liable to crack than lead, 4988-91.  
 One coat only used, 4984-6.  
 Prohibition of lead, firm not affected by, 5005.  
 Regulations, exemption would mean saving in cost, 5004-6.  
 Rubbing-down:  
 Dry method unnecessary between priming coats, 4905-8, 4923, 4983.  
 No danger if leadless stopping and filling used, 4924-5.  
 Not done between:  
 Filling coats, 4914.  
 Finishing coats, 4931-4.  
 Wet method only employed, 4921-2, 4960-70.  
 Stopping:  
 Leadless:  
 Composition, 4968.  
 Equal to lead, 4916-8.  
 No complaints as to, 4919-20.  
 No danger with, 4925.  
 Turpentine:  
 Trouble caused by use of substitute, 4993.  
 Used with filling, 4992.  
 Varnish: waste could be used for inferior railway work, 4975-80.  
 Wheels and underwork: leadless enamel used on, 4926-30.  
 Workmen:  
 Health improved since adopting leadless paints, 4999-5000.  
 Number of painters employed, 5003.  
 x 7700
- Teeth, Cleaning of:**  
 Facilities not provided: *Willix*, 4665.  
 Men might not use tooth brushes, if provided: *Willix*, 4719-20.
- Thinners:**  
 Raw linseed oil the best: *Spencer*, 5149-53.  
 Turpentine: *Jordan*, 1216.
- Trade Union:**  
 Brush hands excluded: *Daly*, 4758-61, 4843-5.  
 Membership fee: *Kinggate*, 4590-2.  
 Mortality records of members: *Kinggate*, 4441-4.  
 Number of members: *Kinggate*, 4440, 4549.  
 Sick pay to members small: *Kinggate*, 4593-6.
- Trams** (See also evidence of *Ireland*, *Readman*, *Spencer*, and *Steinitz*):  
 Bad conditions in some factories: *Daly*, 4839-40.  
 Kept in sheds at night: *Allen*, 5067-8.  
 Lead used for: *Kinggate*, 4497-9.  
 Painting dangerous: *Willix*, 4658, 4701.  
 Because of inside work: *Daly*, 4810; *Cornett*, 12,807-8.  
 Repainting:  
 Annually: *Readman*, 12,373-81, 12,464-6, 12,480, 12,489-91.  
 Cost not increased by use of leadless paints: *Spencer*, 5139.  
 Every two years: *Allen*, 5065; *Spencer*, 5135-7.  
 Substitute for lead available for certain work, *Willix*, 4705-7, 4710-1.  
 Washing:  
 Done every night. *Allen*, 5072.  
 Special or neutral soap used: *Allen*, 5070; *Spencer*, 5141-4.  
 Window panes, treatment of: *Readman*, 12,391.
- Turpentine:**  
 Trouble caused by use of substitute: *Swain*, 4992-3.
- Varnish:**  
 Emanations dangerous: *Daly*, 4806, 4861-2.  
 Method of using: *Readman*, 12,407-9.  
 More important than pigment: *Readman*, 12,454-5, 12,476-7, 12,491; *Austin*, 13,291-2.  
 Not used for highest-class work: *Meissl*, 14,775-6.  
 Number of coats: *Jordan*, 1209-12; *Kinggate*, 4539-42; *Spencer*, 5154-7.  
 Object of: *Jordan*, 1209-12.  
 Special room for work with: *Daly*, 4863.  
 Success of paint due to: *Allen*, 5046, 5062-4; *Spencer*, 5154-7; *Niederhäuser* 16,336-40.  
 Vehicles re-varnished annually: *Jordan*, 1243-7, 1290-2.  
 Waste could be used for inferior railway work: *Swain*, 4975-80.
- Ventilation:**  
 System installed: *Maythorn*, 5754-9; *Readman*, 12,435-6.
- Vermilion:**  
 Harmless: *Jordan*, 1232-5.  
 Used for lining: *Jordan*, 1213.
- VILLEMOT, A** (President of the Colour and Varnish Manufacturers' Association, Paris):  
 Evidence, 16,231-4.  
 Coach-painting: French law does not apply to, 16,234.  
 Lead paint: French railway carriages painted with, 16,231-4.
- WAIT, D.** (Works Chemist of Messrs. R. Gay & Co., Ltd., Paint Manufacturers):  
 Evidence, 1542-9.  
 Leadless paint:  
 Durability, 1547-9.  
 Used for underwork of carriages and trucks, 1543-6.

**Washing :****Accommodation :**

Amount : *Spencer*, 5162; *Maythorn*, 5046; *Mulliner*, 7797 9; *Goodman*, 8138 9.

Good in tramway shops : *Spencer*, 5122, 5145-6.

Inadequate : *Daly*, 4812 4; "X," 7586.

Men indisposed to use : *Spencer*, 5147; *Fuller*, 5939 40; *Baker*, 9793.

Necessary or desirable : *Kinggate*, 4583 9; *Bailey*, 5238.

Not specially provided for body-makers : *Jordan*, 1256 8; *Maythorn*, 5746 9; *Fuller*, 5947-9.

Painters prefer pail and horschair to lavatory : *Arnold*, 6136, 6161 3.

**Provision of :**

Advocated : *Legge*, 72; *Austin*, 13,233 4.

Made : *Jordan*, 1261; *Steinitz*, 1353-9, 1405-6, 1437; *Bailey*, 5306; *Maythorn*, 5645, 5746-7; *Arnold*, 6134; *Mulliner*, 7796, 7938-9; *Goodman*, 8137; *Baker*, 9790 1; *Readman*, 12,437; *Awcock*, 12,553, 12,577 8, 12,655; *Cornett*, 12,817 8.

Not general : *Kinggate*, 4502-5, 4569, 4576; *Willix*, 4661.

Recent improvements in : *Awcock*, 12,652 3.

Compulsory : *Steinitz*, 1362 3.

**Facilities :**

Advocated : *Legge*, 72-4.

**Hot water :**

Agreed to provide : *Goodman*, 8142.

Available : *Steinitz*, 1353; *Spencer*, 5160-1; *Bailey*, 5309-14; *Maythorn*, 5647.

Important : *Legge*, 73-4; *Maythorn*, 5648-9; *Awcock*, 12,580.

Not available : *Willix*, 4662-3; *Daly*, 4815, 4818; "X," 7587; *Mulliner*, 7800; *Awcock*, 12,579; *Cornett*, 12,819-22.

Not imperative : *Mulliner*, 7801-4, 7880-1.

Should be provided : *Austin*, 13,235-6.

**Nail brushes :**

Available : *Steinitz*, 1355; *Spencer*, 5160 1; *Bailey*, 5322-4; *Maythorn*, 5653-7; *Arnold*, 6135; *Mulliner*, 7808; *Goodman*, 8144; *Readman*, 12,437; *Austin*, 13,238.

Horschair used instead of : *Awcock*, 12,580.

Not always available : *Willix*, 4662-3; *Daly*, 4815, 4818; "X," 7587; *Cornett*, 12,819.

Person employed to look after : *Maythorn*, 5655.

**Soap :**

Available : *Steinitz*, 1354; *Spencer*, 5160-1; *Bailey*, 5322-4; *Maythorn*, 5653-7; *Arnold*, 6135; *Mulliner*, 7808; *Goodman*, 8144; *Awcock*, 12,655; *Austin*, 13,238.

**Towels :**

Frequency of renewal : *Steinitz*, 1356; *Bailey*, 5315-21; *Goodman*, 8143; *Readman*, 12,437.

Provided : *Steinitz*, 1355-6; *Spencer*, 5160-1; *Bailey*, 5315-21; *Maythorn*, 5650-2; *Mulliner*, 7805-7; *Goodman*, 8143; *Readman*, 12,437; *Awcock*, 12,655.

Should be supplied regularly : *Austin*, 13,237.

Insisted on before men leave work : *Croall*, 5990.

Lead-contaminated water used : *Awcock*, 12,548-56, 12,655.

Necessary before meals : *Bailey*, 5338.

Necessary for body-makers : *Steinitz*, 1442.

No difficulty in obtaining clean water : *Kinggate*, 4582.

Personal cleanliness important : *Legge*, 71; *Bailey*, 5305; *Maythorn*, 5644; *Mulliner*, 7795; *Goodman*, 8136.

Soiling of hands unavoidable : *Willix*, 4660; *Daly*, 4811; "X," 7585, 7679; *Awcock*, 12,576; *Cornett*, 12,816.

**Time for :**

Allowed : *Steinitz*, 1359-61, 1438, 1450-1; *Maythorn*, 5659-60; *Arnold*, 6164; *Mulliner*, 7794, 7809; *Goodman*, 8145-7; *Baker*, 9794; *Cornett*, 12,823.

Not allowed : *Kinggate*, 4504; *Willix*, 4664; *Daly*, 4819-21; *Bailey*, 5325-7; "X," 7588; *Awcock*, 12,581.

Would agree to allow : *Austin*, 13,239-40.

**Washing—continued.**

Use of dirty pails : *Kinggate*, 4569, 4577 81, 4597-8; *Awcock*, 12,654-5.

**Wheels and Carriage Underwork (See also Rubbing-down):**

Could be painted in place set apart : *Goodman*, 8123 8, 8293.

Hard stopping, little or none used : *Maythorn*, 5606 7, 5634; *Arnold*, 6154-5.

Leadless enamel used on : *Swain*, 4926-30.

Method of treatment : *Awcock*, 12,558-64.

Purchased in finished state : *Allen*, 5036-8.

Spokes waxed before they are received : *Arnold*, 6151 3.

Stopping rarely used : *Arnold*, 6159.

**White Lead :**

Abolition beneficial to health : *Jordan*, 1300-4; *Swain*, 4999-5000; *Allen*, 5050-2; *Readman*, 12,474.

Age specified for : *Maythorn*, 5726-7.

Amount used in painting a motor car : *Croall*, 6032, 6038-41.

Basis for most paints : *Ball*, 9873-4, 9880.

Best finish obtained with : *Bailey*, 5216-7, 5457-8.

Can be dispensed with : *Readman*, 12,418-9, 12,456-7, 12,475, 12,499-502.

For body fitting : *Allen*, 5024.

For exposed surfaces : *Ball*, 9871.

Dangerous if put into mouth : *Goodman*, 8054-6.

Mixing not dangerous if done carefully : "X," 7544-5.

Not dangerous to use : *Goodman*, 8052-3, 8361, 8365-6, 8373-4, 8398-406.

Not used dry : *Croall*, 6035; *Ball*, 9869, 9873-5.

Object of its use : *Bailey*, 5457-62; *Croall*, 6077-80; "X," 7671-6; *Goodman*, 8312-22; *Awcock*, 12,670; *Austin*, 13,352-63.

Purchased as "tub-lead" : *Maythorn*, 5723-5.

Restriction not objected to for stopping : *Goodman*, 8096; *Ball*, 9872, 9881-9.

Substitutes : (See also Leadless paints.)

No trials with : *Bailey*, 5184, 5397, 5403, 5451; *Maythorn*, 5522-4; *Goodman*, 8013, 8220-1, 8277-8, 8359; *Nooijen*, 15,398-9.

Possible for tramcar and railway work : *Willix*, 4705-7, 4710-1.

Progress with : *Legge*, 78.

Tried for filling and jointing : *Legge*, 58-9, 127-30.

The most perfect substance for paint : *Bailey*, 5198 5459-60; *Meier*, 5821-2, 5890; *Croall*, 6003; *Goodman*, 8017, 8207-9, 8213-7; *Austin*, 13,197-200.

For filling : *Mulliner*, 7764-5, 7855.

**WILLIX, DAVID** (Operative Coach painter, 59, Hatfield Street, Belfast) :

Evidence, 4605-756.

Body-makers : contact with lead, 4609-13, 4628.

Carriage makers :

Contact with lead, 4617-9, 4628.

Work of, 4614-6, 4652-5.

Colours : leadless, 4683.

Filling : contains lead, 4635.

Flattening : not dangerous, 4656.

Hours of employment :

Number, 4674.

Overtime not prevalent, 4675-9.

Restriction in lead processes beneficial, 4680.

Jointing :

Lead for, 4610-1.

Leadless substitute equal to lead, 4620-2.

Leadless paint :

Costs more than lead, 4747, 4755-6.

Effect on health, 4754.

For inside work, 4732-5, 4740-3.

Opacity same as lead, 4714, 4750.

Satisfactory, 4685-7, 4744-6.

Spreads more easily than lead, 4713, 4748-9.

Tests of, 4688-90, 4715-6, 4736-9.

Lead poisoning :

Body-making involves great risk of, 4609-13.

Impossible to remove danger except by prohibition, 4659.

WILLIX DAVID—*continued.*

- Meals :**  
 Eaten in workshop, 4666-7.  
 Mess-room :  
   Not provided, 4668.  
   Should be provided, 4669.
- Motor car work :** as dangerous as ordinary coach work, 4657.
- Outdoor clothing :**  
 Cloakroom not provided, 4670.  
 Collects dust, 4672.  
 Kept in workshop, 4671.
- Overalls :** seldom worn by coach painters, 4673.
- Periodical medical examination :** necessary, 4681.
- Priming :** contains lead, 4623-5, 4684, 4742-3.
- Prohibition :**  
 Necessary for removal of danger, 4633.  
 Possible if satisfactory leadless paint found, 4691-3.
- Regulations :** would reduce, but not remove the danger, 4682.
- Rubbing-down :**  
 Dry method :  
   Body-makers and carriage-makers exposed to dust, 4628.  
   Dust, the principal danger, 4629, 4648.  
   Exhaust ventilation impracticable, 4632, 4651.  
   Indispensable for some processes, 4709.  
   Prohibition of lead the only remedy for danger, 4633.  
   Time necessary to rub down a railway carriage, 4721-31.  
 Used :  
   Between priming coats, 4626-7.  
   For wheels and carriage underwork, 4647.
- Wet method :**  
 Danger to pumicer, 4644-5.  
 Impracticable, 4630-1, 4649.  
 Possible in tramcar work after filling, 4702-4.  
 Used :  
   After staining coat, 4642-3.  
   For body work, 4642-6.
- Staining :** not dangerous, 4641.
- Stopping :**  
 Applied after priming, 4636.  
 Composition, 4637.  
 Mixed by painters, 4638.  
 Mixing dangerous, 4639-40.
- Teeth, cleaning of :**  
 Facilities not provided, 4665.  
 Men might not use tooth-brushes if provided, 4719-20.
- Tramcar and railway work :**  
 Dangerous, 4658, 4701.  
 Substitute for lead possible in certain processes, 4705-7, 4710-1.
- Washing :**  
 Accommodation not provided, 4661.  
 Facilities not provided, 4662-3.  
 Soiling of hands unavoidable, 4660.  
 Time not allowed, 4664.

**Workmen :**

- Careless and dirty : *Austin*, 13,339.
- Difficulty in obtaining : *Maythorn*, 5695, 5720-2.
- Habits greatly improved : *Bailey*, 5448, 5481; *Mulliner*, 7975.
- Health : *Fuller*, 5970-1; *Croall*, 6044-54, 6084-5; *Mulliner*, 7895-901, 7925-33, 7965-6; *Goodman*, 8222-56, 8291; *Austin*, 13,287-8.
- Careless as to : "X," 7716-8.
- Improved since using leadless paints : *Jordan*, 1300-4; *Swain*, 4999-5000, 5003; *Allen*, 5050-2; *Readman*, 12,474.
- Number employed : *Maythorn*, 5501; *Meier*, 5805; *Fuller*, 5903; *Croall*, 5988; *Arnold*, 6102; *Mulliner*, 7728, 7731; *Goodman*, 7999; *Baker*, 9755; *Austin*, 13,169.
- Number in contact with lead : *Legge*, 29-30, 36, 43-5; *Steinitz*, 1343-4, 1409; *Kinggate*, 4440-1; *Mulliner*, 7729-32, 7976; *Goodman*, 8000-3; *Readman*, 12,433-4; *Austin*, 13,170-2.
- Number in contact with paint : *Baker*, 9756.

**Workmen's Compensation Act :**

Insurance rate : *Steinitz*, 1369-70, 1383-5; *Meier*, 5879-89; *Croall*, 5993; *Mulliner*, 7861-8, 7877-9.

**"X," Mr. (Operative Coach Painter) :**

- Evidence, 7507-722.
- Bedding of canvas : leadless material for, 7635-7.
- Body-makers : exposed to very little risk, 7514.
- Carriage-makers :  
 Contact with lead, 7522, 7680-1, 7687-91.  
 Few now employed, 7518-9, 7677.  
 Work of, 7520-1.
- Dust :**  
 Does not arise from wet lead, 7523-4.  
 Very little caused by handling dry white lead, 7546.
- Filling :**  
 Contains some lead, 7535-6.  
 Number of coats applied, 7533-4.  
 Object of using lead, 7671-6.
- Finishing :** number of coats, 7568-74.
- Hours of employment :**  
 Long hours in lead processes very dangerous, 7598.  
 Number, 7593, 7597.
- Overtime :**  
 Restriction would affect wages, 7600.  
 Undesirable, 7599.
- Jointing :**  
 Lead used, 7515, 7634.  
 Method employed for wood panels, 7516-7.
- Leadless paint :**  
 Cannot replace lead for all purposes, 7613-22, 7643-55, 7699-701.  
 Finish of Midland Railway carriages, 7661-7.  
 Invented for his health's sake, 7711.  
 Length of experience with, 7603-4, 7607.  
 Satisfactory, 7606.  
 Should be used in place of lead if good one be found, 7659, 7685-6, 7712-3.  
 Trials with, 7607-10.  
 Used by Bradford Corporation, 7668-70.
- Lead paints :**  
 Entire replacement by leadless paints impossible, 7623-7.  
 Necessary for first two coats, 7614-8.
- Lead poisoning :**  
 Cases known of, 7510-2, 7629-30.  
 Cases not reported, 7656-8.  
 Caused by sandpaper stopping in the nails, 7611-2.  
 Due to carelessness, 7677-9.  
 Use of lead substitute the only way to remove danger, 7581-4.
- Meals :**  
 Mess-room seldom provided, 7590.  
 Often kept and eaten in workshop, 7589.
- Motor cars :**  
 Introduction has increased dangers, 7575-9, 7629-31.  
 Less filling used than for carriages, 7692-3.  
 More lead used than on carriages, 7694-6, 7719-22.  
 Some do not require a great deal of stopping, 7697-8, 7720.
- Outdoor clothing :** cloak room not provided, 7591.
- Overalls :** coach-painters do not wear, 7592.
- Painting :** sequence of processes with leadless material, 7702-10.
- Periodical medical examination :**  
 Desirable, 7601.  
 Suspension from work in lead processes desirable, 7602.
- Priming :**  
 Number of coats applied to carriages, 7525-8.  
 Practically all lead, 7529-30.
- Prohibition of lead :** advocated, if possible, 7659, 7685-6, 7712-3.
- Rubbing-down :**  
 Dry method :  
   Impossible after filling coats, 7551.  
   Occasionally employed between priming coats, 7531-2.

"X," Mr.—*continued.*Rubbing-down—*continued.*Dry method—*continued.*

Principal danger, 7553, 7558-60, 7578-9, 7682-4.

Wheels and carriage underwork:

Exhaust ventilation hardly practicable, 7664.

Extremely dangerous process, 7555-60.

Not done between filling coats, 7537-8.

Wet method:

Employed after filling and staining, 7550-1.

Impossible on wheels, etc., 7561-3.

Staining:

Applied on the stopping, 7547.

Composition, 7548.

Object, 7549.

Stopping:

Lead, 7541.

Mixed by painter, 7542-3.

When applied, 7539-40.

Washing:

Accommodation: generally inadequate, 7586.

Facilities rarely available, 7587.

Time not allowed, 7588.

Unavoidable soiling of hands, 7585, 7679.

White lead: mixing not dangerous if done carefully, 7544-5.

Workmen: careless as to health, 7716-8.

Zinc paints:

Insufficient body, 7641-2.

Not used unless mixed with other compounds, 7638-40.

## Zinc Oxide:

Amount used by Belgian State Railways: *Pisart*, 21,887.

## Zinc Paints:

Adopted because of lead poisoning: *Readman*, 12,424.As good as lead: *Jordan*, 1180, 1221-4; *Awcock*, 12,604.Better colour than lead: *Awcock*, 12,603.Cannot be used for locomotives: *Nooijen*, 15,235.Cost less than lead: *Jordan*, 1262-6; *Ball*, 9868.Could be used for vehicles if varnished: *Plumb*, 18,358.Difficulty as to drying: *Garson*, 2581.

Durability:

Better than lead: *Ball*, 9867.For lining: *Awcock*, 12,610-2.Experiments with: *Readman*, 12,382, 19,433-54;*Ireland*, 19,455-60.Exported: *Garson*, 2554-6.Finish better than lead: *Ball*, 9867.Hard undercoats impossible with: *Garson*, 2582-3.

Insufficient body: "X," 7641-2.

Masury process not tried: *Garson*, 2577-80.No difficulty in applying: *Jordan*, 1228-9, 1308-11;*Readman*, 12,497-8; *Awcock*, 12,601-2, 12,605.No difficulty in mixing: *Readman*, 12,503; *Awcock*, 12,606-7.

Not entirely abandoned by Belgian State Railways:

*Ricker-Devroede*, 15,009-10.Painters prefer to use: *Ball*, 9866.Powdoring of: *Cornett*, 12,848, 12,889.Require no more varnish than lead: *Jordan*, 1293.Satisfactory: *Readman*, 12,383, 12,422-3, 12,496-8.Six years' trial sufficient: *Jordan*, 1226-7, 1313-5.Suitability for sign-writing: *Heydorn*, 562-7;*Readman*, 12,496-8.Supplied to coach-builders: *Heydorn*, 561; *Smyth*, 13,399-401.Used after filling: *Garson*, 2584-6.Used in form of enamel: *Garson*, 2566-7.Would stand without varnish, *Cornett*, 12,891.
