witnesses that it was necessary to open up a country before you could get labour from it; what do you mean by "open up"?—My words, I think, were, I had seen they were opening up sparsely populated districts.

6,783. Do you think in such districts the opening up has no effect; I do not quite understand your answer?—It would have so little effect that it would not be worth while.

6,784. Where are these sparsely populated districts?—I do not know.

6,785. Then you base your opinion on something which as far as you are concerned is non-existent?—No, I base it on my knowledge generally of meeting these men and knowing exactly what used to take place and go on and the way it was worked.

6,786. Will you explain that a little more fully? What did go on and how it was worked?—The way the boys were recruited? You say I am basing that on something that is non-existent, and I say my knowledge is from men that did the work; I have never been in the country.

6,787. Will you explain what you know and heard?—If I started to explain to you what I know and what I have heard I would keep you here for about a week. If there is anything particular you would like me to explain, any particular point, I shall be glad.

6,788. I understood from the tenor of your replies that you do not agree with the methods that were employed. Could you not summarise them in a few sentences?—The methods that were employed or are employed?

6,789. The methods that were employed?—When?

6,790. I understand from your reply that you do not agree with the methods employed. Could you not summarise these methods?—Do you mean the methods employed before the war or now?

6,791. At the time you refer to when you say that you would keep us here a week to tell us all about it?—I do not think I quite grasp what you mean. What exactly do you want me to explain.

6,792. You said just now that you know a great deal about the methods that were employed?—I beg your pardon, I said that what I know, I know from other men; I do not think I said I knew a great deal.

6,793. I understood the recital of what you knew would have kept us here a week and what you have said is not a great deal?—Oh, well, it would take a long time anyhow.

6,794. Would you mind summarising it for the information of the Commission?—Well, what shall I summarise? Shall I start where I began or what?

6,795. I must leave that entirely to you to decide. We want information about these things. You know and have heard a good deal about these things, and want you to tell us what you know?—Yes, but I do not quite know where to start.

6,796. Do you agree with these methods you speak of?—Again I want to know which methods you refer to. You said "were employed" and I want to know what time you were speaking of.

6,797. I am simply framing my questions upon your answers. I understand you to say that you had heard a great deal from parties engaged in recruiting about the methods employed, and naturally I ask you to tell us what these methods are?—Well, much the same as now. It is simply a question of runners going out and collecting natives and sending them to white men placed at convenient parts of the country who forward them on to the frontier, the same as it is now except that one man brought them right through the country. They were brought to me and at that time I was more or less in charge and they looked upon me as a sort of "baas."

6,798. Is there anything further in connection with this system that you can tell us about?—The present system, do you mean?

6,799. Yes, the present system if it is the present system? I do not know, I am asking you?—Well, of course, I mentioned the way the boys are brought across the country; I know this has a great deal to do with their objection to the present system and the method of contracting them has also done much to prevent the labour coming forward.

6,800. The CHAIRMAN: You mean taking them in the territory?—Yes, and possibly bring them up too, because before the war they used to be quite able to put 500 or 600 boys on the mail train. The ordinary passenger train in the past left at night and on arriving in Waterval the boys were delayed and kept there and brought on again the following night. Before that if the gang was a large one, and could not get beyond Pretoria with that train, we would have to come on with the next goods train or something of that sort.

6,801. Mr. TAINTON: You say the boys should have free ingress and egress. What is the present system?—The border is policed both by the Portuguese and the W.N.L.A., and no boys can go over the border. Every boy must go to the frontier town to be vaccinated and get passes and to be asked where he is going to work; what is his own name, and who is his father and all that sort of thing. The boys do not understand these things and things they do not understand they are afraid of more or less.

6,802. The Portuguese Government make a revenue out of these boys?—Yes.

6,803. Is that system not necessary in the interest of the Government revenue?—But I think there might be some means of altering it. There ought not to be any great difficulty in finding out. There are only one or two well-known paths natives come out by, and the man in charge can usually report to the Commandant of the nearest fort, or the Portuguese authorities could arrange to get the boys that were sent up by the different men from the C.S.A.R. when they took tickets. If they were to place an agent at these stations, it would only be one or two stations that would be used.

6,804. You mentioned sparsely populated districts just now. Do you know of any in Portuguese territory?—No, I told you I did not know Portuguese territory actually. I take it boys coming out to work come out just as well without white men going in as they would if white men went in.

6,805. Have you any idea of the number available?—From where?

6,806. In the district you are acquainted with?—That is the Transvaal side of Kimberley.

6,807. You have no idea of the number available from Portuguese territory?—No, I do not remember the figures, and in any case all that I know is simply the evidence given by witnesses before this Commission.

6,808. You state that in certain years there were not so many coming out?—Certain months.

6,809. One month you stated it might be 2,000 and another month again it might rise to as much as 6,000. What is that variation due to?—Food principally, the seasons of the year, when the Kaffirs are ploughing and again when they reap their crops and the fruits are ripe.

6,810. But if they have a good average season does that keep them at home?—In some cases I believe it does.

6,811. But would the variation be as much as these figures you have mentioned from 2,000 to 6,000?—I think quite likely it might not get down as low, and, too, it might be a little higher.

6,812. If such influences as that were at work in any one year, do you think it would make much difference whether the compounds here were improved or whether the means of communication were improved?—If the compounds were improved

that would probably make a little difference, but as to the means of communication I do not suppose the boys object to wasting a day on the road.

6,813. The improvement of the compounds and the improvement of the means of communication would not make such a great difference as between 2,000 and 6,000?—No.

6,814. The main causes then are those affecting the native at the other end?—I think so.

6,815. We have been told the number of Portuguese boys coming out, and the average number is very large in proportion to the population. Can you give any explanation of that difference and tell us why they come out more readily than other natives?—I do not know why unless perhaps that that was one of the first fields opened, and then, too, perhaps there is a difference in the seasons. As I say, I believe a great part of that country is very damp, the ground is very damp. I do not know for a fact myself, as the only part I know is between Komatipoort and Delagoa Bay. That can be seen from the mealies which grow to no height and bear no cobs of any size.

6,816. Then does the fertility of the soil affect the question there?—Well, it would make some difference to their supplies of crops.

6,817. Mr. PERROW: You mention that you think it would be better if the six months' contract for the natives was done away with on the mines?—Yes.

6,818. And I think you also said the average rate of pay should be from £2 to £3 per month.

6,819. I think you mention £3?—I finished up by saying that the average should be lower than that.

6,820. Supposing we get a batch of boys, 300 or 400 boys, new boys that never were on the mines nor in the mines before, and their contract is per month, what good would these boys be to the company for the first month?—Practically none at all, but I take it if the boy comes he does not come for a month.

6,821. Then say he comes for two?—Probably from that part of the country he does not come for two months. I should say that these boys stay up here at least six to eight months of their own accord. I have known a boy to stay for a number of years.

6,822. Why do you think it would be better for the six months' contract to be done away with?—I think the boys do not understand it and do not like that sort of thing. A boy might stay of his own free will 12 months, whereas he would not be bound down to six.

6,823. It is a big responsibility for a miner to take 20 or 30 new boys to work one month and then, when they get their £2 10s. or £3, they would leave that mine?—That I understand and I know it was a difficult question before the war.

6,824. You believe a three to four months' contract is better than a six months' ?—That I think would probably make a difference.

6,825. Mr. PHILIP: I understood you to say that you had runners in the country?—Yes, I had runners in the country.

6,826. But you told us just before that boys came of their own accord to work and there was really no necessity to recruit at all. They were on their way to work at Kimberley and other places when met?—I was speaking of some years before that.

6,827. You also made the remark that with these boys there would be no result and whether any recruiter went into their country at all they would come out equally as well without them?—That is in sparsely populated districts which I mentioned and very probably in the others also, because if perhaps one or two white men went in they might get one or two, but they might come out of their own accord to work.

6,828. Can you give us the actual number of those sent out before the war?—I think you heard me say it would be quite a guess.

6,829. That was as far as the monthly numbers went, but you can say how many you sent out annually?—No.

6,830. I should have thought that if you sent such a large number you would have made it your business to know?—I used to know, but I have forgotten.

6,831. Can you tell us how much before the war you used to get for recruiting them on the average?—There were one or two systems. For instance, I started on a salary and the runners used to go out on wages with perhaps £1 or 30s. in order to buy food for themselves and any boys they might recruit. That was a failure, as the boys used to get to the stores or to their own kraals and come back in a week's time. You might not see a boy for a month or six weeks, when he would turn up with a boy or two and expect his pay. Then the boys were sent out on results, and that was a matter, of course, between the different men in the country as to what was paid the runners.

6,832. But at the time you were sending such large numbers up to the Rand, can you tell us the average of what the mines used to pay per boy?—The mines I had nothing to do with.

6,833. Then who ever employed you?—That was the Manager of the R.N.L.A. and the boys used to cost him from 60s. to 65s.

6,834. Was that the cost down there?—No, landed here.

6,835. And the railway fare was under a sovereign?—Yes, I think it was under a sovereign, and was reduced once or twice until it is what it is now.

6,836. You say it would cost you £3 per boy exclusive of the railway fare?—Yes, but of course there was the conducting and there were white men running up and down, all being paid wages which was quite an item.

6,837. Do you think it would be fair for the mines to pay £2 per boy?—Do you mean here or down below.

6,838. No, down below. Do you think it would be fair of the mines to engage boys on these terms who would then go to some other mines?—No, I know it is a benefit to the mines to have this contract, but my idea was to supplement the supply and to help the boys to come out.

6,839. Mr. EVANS: Before the war you acted as a representative of the R.N.L.A., I understand?—Yes.

6,840. That was at Komatipoort?—Yes, I lived at Komatipoort.

6,841. When did you start recruiting after the war?—I think the date of my licence is the 24th April.

6,842. You say on 24th April last?—Yes.

6,843. Can you give me a rough idea as to how many natives you have recruited altogether since 24th April?—I could make a guess; I suppose about 200.

6,844. Are there any Portuguese boys included in that number?—There may be an odd one or two.

6,845. You are not recruiting at all in Portuguese territory?—No, my licence is for the Transvaal. My runners bring me boys—two, three, or half-a-dozen as the case may be—and I have to give them passes, putting down wherever they tell me they come from and what their father's name and their own name on their passes, but it does not matter to me where they come from, whether Portuguese territory or anywhere else.

6,846. You have runners out and as long as they bring you boys you do not enquire as to where they come from?—I do not enquire. I have, of course, to fill in their passes, but wherever the boys come from that does not prevent me from sending them.

Of course my boys cannot go over the border, and I do not expect them to. One or two may come of their own accord and perhaps be brought in by my boys.

6,847. From what part exactly do they obtain the boys?—Some Swazis and some a little further north, Nomahasha's boys, on the Swazi border.

6,848. You consider the contract system a mistake. How are you engaging your boys, free?—No, also on contract.

6,849. What contract?—Do you mean the length of time?

6,850. Yes?—Twelve months.

6,851. Are you recruiting for many mines?—I do not know how many there are, but I think more than one. It is one firm.

6,852. You say that the boys ought to be able to choose their own mines. What choice have the boys whom you are recruiting?—They have this choice, that they are told where they are going to and the rate of pay they are to get, and the length of time I want them for. If the boy does not agree to these terms, then it is no use my sending him up. That is the choice the boys have.

6,853. That is practically the same as the Association are doing?—I have never heard that the Association pointed out to the boys what mines they were going to until they arrived up here.

6,854. You have not heard that they are given the choice down there?—No.

6,855. On what grounds are you basing your calculations that the mines are not getting as many boys as they could get?—I think the chief thing is their all having to go to the frontier and the way they are brought across country, and I also think that some competition in the country would not hurt the supply.

6,856. As to the modifications you suggest, do they all depend upon the Portuguese Government?—I am not sure, but as far as letting boys come in and out of course it would. The Portuguese provide the conductors of the boys across country, but I believe that was part of the agreement made, that so many Portuguese should be employed, but whether for any particular work I do not know.

6,857. But apart from what is dependent upon the Portuguese Government what modifications do you suggest?—Well, I do not see what there is to suggest. I do not know whether anyone has tried, but I understand no one can get a licence to recruit in Portuguese territory except through the W.N.L.A., so that any of those things which I have mentioned would be through the Portuguese Government or through the Association.

6,858. Have you tried at all to get a licence since the war for Portuguese territory?—No.

6,859. Have you any idea how the number coming up now compares with the number before the war?—No, I do not know the number coming now, and then again, as I said just now, it depends on the seasons. I see most of the boys coming through on the trains in gangs of from 400 to 800, or whatever it might be, but I could not tell you what number came through at the same time of the year previous to the war.

6,860. Can you give me a rough idea as to which was the best period as far as recruiting is concerned, prior to the war, the period during which you got most natives?—The period during which most natives were sent up prior to the war, I think, would probably be about the time the W.N.L.A. started.

6,861. What year would that be in?—I think 1897.

6,862. Do you know that the average net monthly increase of natives on the Rand during that year was less than 450?—You say the net monthly decrease?

6,863. No, the net monthly increase of natives working on these fields during 1897 was 426?—How does that compare now, may I ask?

6,864. Well, something about 2,000 now?—Net increase?

6,865. Yes, net increase?—Then I may have been wrong about the time, but still at that time you, of course, know, I suppose, that there was nothing like the present organisation, nothing like the money spent, and nothing like the pressure of want of these boys that there is now.

6,866. Yes, I see you have got a suggestion here, your second suggestion, that there should be an indaba of all chiefs of tribes? Do you think it wise in the interest of the country to bring Kaffirs together and thereby give them an opportunity of coming to an understanding amongst themselves and combining against the white inhabitants?—No, when I put that in I did not mean that they should be all brought together in one place or at one time. I think further down I said something else there as to keeping them apart, but that only refers to tribes liable to clash.

6,867. You suggest that the chiefs of tribes likely to clash should be called together separately?—I should think there would be no harm in calling the chiefs of different tribes together.

6,868. Did you ever hear of such a proposal being made under the Boer regime?—No, not that I remember.

6,869. Was it not their policy to divide the Kaffirs and keep the chiefs apart?—Yes, but then the boys at that time, I take it, were not treated perhaps as fairly altogether as they are now. The Kaffirs, I suppose you know, do not look upon an Englishman in the same way as they do upon a Boer. They are afraid of a Boer but not of an Englishman. That is what it practically amounts to. What I meant by that suggestion was that the chiefs of the different tribes, the supreme chiefs and some of his petty chiefs, should be brought together and have the matter explained to them.

6,870. Then you go on to suggest the application of some coercive measures in order to force the Kaffirs to work. What measure do you suggest?—Well, that I have not thought out. I take it that the Government by themselves cannot do it. They have lots of gentlemen with the time and ability to work out some scheme whereby the native races should be made to pay something towards the keep up of the country and to work. I look on it that there is something wrong when the dominant white race, practically the whole of them, have to work for their living while a Kaffir squats where he likes, picks the eyes out of the country, the best part of the country, and does not work.

6,871. Have you read Messrs. Breyner and Wirth's evidence?—Yes.

6,872. Have you seen their estimates of the numbers of natives likely to be got from Portuguese territory?—I did see it, but I do not quite remember what it was.

6,873. I think that from the whole of Portuguese East Africa it works out at something like 150,000, rather more than half from the southern portion of Gazaland, and the rest from the Zambesi. What is your opinion on that?—Part of that must be, I think, more or less guess-work or only an opinion, because I do not think they could have much of an idea as to what could be got north of the Zambesi. They may know that there is a big native population there, but these natives may not come out to work or come down here. I think it is very probable, as there is quite a large part inland of Inhambane, and perhaps Gazaland, but they do not know the numbers there. They collect taxes, I think, from a lot of the Kaffirs, but there is quite a lot of the country they never attempt to collect taxes in.

6,874. What would be your estimate of the numbers that are likely to be got from Portuguese territory under the most favourable conditions?—I have nothing to go by. If I simply pass an opinion I would have to base it on Breyner's evidence given before this Commission which I have seen in the newspapers. I have no means of judging.

6,875. Do you think there is any likelihood of doing very much better than what was done before the war?—Yes, very much more. You perhaps have statistics before you. Can you tell me what number were coming in before the war?

6,876. There were supposed to have been about 80,000 or rather more Portuguese boys in the Transvaal before the war?—Well, from Portuguese territory, I am unable to tell you, but we never had a higher increase per month than about 1,000 at the best period. Of course since the war there is no reason why you should not have had this big increase that you say you have had, because naturally there were no boys here, or very few, owing to the war. All the boys that were turned out had to come back again. After you had once got that number here again, that is when the net increase would come in, *i.e.*, when you have filled up to the same extent as you were when the year started.

6,877. Yes, that is what I want your opinion on. How much better are we likely to do than we did before the war after we have got the total number of Portuguese boys here?—I think with this extra organisation you have and doing away with the two or three things I have mentioned there is no reason why the 1,000 per month should not be doubled anyway; that is nothing out of the way, only 12,000 boys in six months.

6,878. That would mean four or five times better than what you did in 1897?—That is very possible.

6,879. You think that is a possibility?—Certainly.

6,880. That is an average net increase of 2,000 a month?—I take it that if things could

be arranged, if some of these things, whatever they may be that the boys object to, could be found out and removed, there would not be nearly so many boys leaving per month as there are arriving.

6,881. Your estimate is that after we have reached the maximum before the war we ought to get a net increase from Portuguese territory of 2,000 a month?—Yes. Well, it may be a little higher if, as you stated, it was 1,000 before the war.

6,882. That was the very best period, and it never was 1,000 for any long period altogether?—I thought you put that as the average?

6,883. No, the very best that they did was in the beginning of 1898?—Well, if the very best you did was 1,000, naturally I must put my estimate at 2,000, as the very best. What I mean is that there is no reason why, with the extra organisation, and the amount of money being spent, it should not be double.

6,884. And supposing we are unable to induce the Portuguese Government to accept the modifications you suggest, do you still adhere to the 2,000?—No, I do not think you would do any better than you did before.

6,885. The CHAIRMAN: The Commission is very much obliged to you, Mr. Dyer, but before you go, I omitted to ask you whether you have before you "Evidence of F. W. Dyer"?—Yes.

6,886. Will you hand that in as your evidence-in-chief on which the cross-examination is based?—Yes, I do not think I need add anything to it.

The Commission then adjourned until the following (Wednesday) morning at 10.30 am.

## EIGHTEENTH DAY.

*Wednesday, 26th August, 1903.*

THE COMMISSION SAT AT 10.30 A.M.

Mr. S. J. HULLEY, called, sworn and examined.

6,887. The CHAIRMAN: Mr. Hulley, have you before you a memorandum headed "Statement of Mr. Sam J. Hulley, Native Pass Office, Barberton"?—Yes.

6,888. Do you wish to hand that in as your evidence-in-chief?—Yes.

6,889. The memorandum was as follows:—

Statement of Mr. Sam J. Hulley, Native Pass Officer, Barberton.

With reference to your circular "B" of the 3rd instant on the subject of labour, I have the honour to give you a short account of what I consider are points which should be brought forward and will follow your programme as nearly as possible:—

(1). District with which witness is acquainted—Barberton.

(2). Length of time during which witness has known such district—Seventeen years.

(3). Character of natives of such district—law-abiding, mostly refugee Swazis and Shangaans, with a sprinkling of all tribes from surrounding districts and Colonies.

(a). Usual work—farm work, mines, general servants, agriculturalists, wagon drivers.

(b). Usual food—mealies, mealie meal, kaffir corn, light beer, pumpkins, sweet potatoes, beans and occasionally meat. Mine boys are better fed than those living on farms and the ordinary domestic servant.

(c). Usual pay—mines, from 30s. to 75s. per working month of 30 days and food; farms, from

25s. to 40s. per month and food; store boys, from 35s. to 60s. per month and food; domestic servants, from 15s. to 55s. per month and food; public works and engineers, from 30s. to 40s. per month and food. This last class is the cause of great dissatisfaction amongst natives employed by private individuals. The hours are easy and food good, and too much work is not a failing.

Physique, aptitude, special ailments (if any)—A good deal of malaria in the low-lying parts of the district. Most of the natives are strong, able-bodied men.

(c). Special conditions (if any) affecting labour supply which would (a) induce, (b) deter from willingness to come to Transvaal to work—The Proclamation of the Plakkers Wet, and restraining crowds of natives from squatting on Government land would cause a large number of natives to seek employment. In my opinion, the character of the native police at the mines keeps labour away to a great extent, as they fine and punish the natives, both those working and visitors. These constables or police are not in the employ of the Government, but of the mines.

(f). Approximate numbers available—Barberton district, 4,500 men, exclusive of outsiders and squatters who have moved into the country during the past four years.

(g). Enterprises, agricultural and industrial (if any) managed by Europeans in such district, and numbers of natives required for such enterprises—Agricultural, at present, say 750 natives; mines, at present, 3,000 natives; both could do with a lot more labour; public works, at present, say 300 men.

THIS VOLUME IS TIGHTLY BOUND

The great difficulty with natives here is due to the fact that Swazis do not feel disposed to enter into a contract for more than a month at a time. This could be changed, should employers of labour decide not to engage for any period less than six months.

6,890. How long have you resided in Barberton district?—Nearly 17 years.

6,891. You are now Native Pass Officer there, I understand?—Yes.

6,892. How long have you held that position?—Since 1897.

6,893. What other work have you done there? What were you doing before that?—I was head timekeeper at the Sheba Mine for some years; I have done a little farming on my own account, but a very little. I have generally had to do with natives all the time.

6,894. In one position or another?—Yes.

6,895. What is the extent of your farming experience?—It is very small indeed. I have simply had a small farm for the past few years.

6,896. Do you know how many natives are now employed in the Barberton district on the mines?—I think I have a return which I made up for the people of the mines for June. I do not think I have anything for July. I think I have the numbers which I made up from the passes for June.

6,897. You know approximately the number?—I think I have the number. It will be one or two out, but I think it is about right; 2,325 were employed on the mines in June, that is exclusive of a few hundred employed at Kaapsche Hoop and on the Three Sisters. I cannot get figures there because they have not got a record of how many passes have been issued on the mines.

6,898. Are you not understating the number considerably?—No, sir, that is made up from my pass-book.

6,899. I think the July figures were given by the Commissioner of Mines as 4,000 odd engaged on the mines in the Barberton District?—Yes, I saw that.

6,900. Are there any number of natives employed in the district on other work, take farming for instance?—There are a good number employed on the farms.

6,901. Have you any record of that?—I have also made that up for June—207. That does not include boys who are squatting.

6,902. What does that include then? Boys actually working on farms?—Yes, in Barberton district.

6,903. Does that include boys who might be squatting on farms and only work irregularly for the farmers?—No.

6,904. It simply includes boys working for farmers who have come in from outside?—Yes.

6,905. Are there any other industries in the district employing any number of boys?—There are the Health Board, the Public Works Department and the Royal Engineers.

6,906. How many do they employ respectively?—The Health Board employs about 40, the Engineers 76, and the Public Works Department 185.

6,907. Are there any other employers of labour on a big scale?—The railways employ a little over 60. I can only give the numbers as those for whom passes were issued. If passes were not taken out for any of these boys then my figures are not correct.

6,908. But presumably the Government Departments and Health Board would adhere to the regulations?—Oh, yes, the Health Board would, but the Public Works had some men working outside, and I know for a fact that for one month they did not get their passes for a lot of the boys.

6,909. Would it make any serious difference to the numbers you have given?—For the Public Works Department it would perhaps make a difference of 100.

6,910. Are there any other large employers of labour?—No.

6,911. Have you any figures to show how many natives are employed in the town?—834. There are a few kitchen boys and store boys and general servants.

6,912. Where is all this labour got from?—The store and kitchen boys are principally Zingilis coming from British Tongaland to a sprinkling of course of Portuguese boys from the adjoining part of Portuguese Tongaland. The mine boys are principally Shangaans and Chopies.

6,913. Do you know how they come in, is it of their own accord?—Yes, I think they nearly all come in of their own accord except in the case of some of the mines, who have during the last few months been getting some from the Association, the Sheba Mine, for instance.

6,914. Do you know if there is a plentiful supply of labour?—No, we have not enough for our own requirements. The total male population in Barberton district—residents, that is—is 4,500. These figures are approximate. The Native Affairs people make their census by those who actually paid hut-tax as close upon 4,000, but I think that by the time all the hut-tax is paid my figures will be very nearly correct, that there are 4,500 adult males living in Barberton district. There are 3,000 natives in the district who have come in for labour and trekked over the border in the past few years who are not so to say permanent residents. That includes boys working in the mines, of course.

6,915. You say there is a scarcity of labour, therefore you can do with more boys?—Yes.

6,916. You have no idea what the shortage of natives may be?—No, because the mines are going very slowly. There is not much work doing, and it is hard to say how many would be required, but the natives during the present month up to the 20th to whom travelling passes were issued were 400 for natives going up to Pretoria and Johannesburg to seek employment. A lot of these natives come from British Tongaland.

6,917. How do you account for so many natives asking for passes to come and seek work in Pretoria and Johannesburg when you are short of labour in your own district?—Well, the Tongas are not mine boys, and the rates of wages paid to the general servants in the district are not so high as I am told they are receiving in this part of the world. Also these Tongas have a great idea of learning, so they come to places where they can be within reach of a school. There is a great movement among them to be taught to read and so on, so it is a very difficult matter to get these boys to go on the farms for that reason.

6,918. Do you not draw a considerable number of natives from Swaziland?—Not very many. We have a lot of Swazi refugees who are residents in this district. They are frequently confounded by people from up country with the Swazis living in Swaziland. It is really only an imaginary border between ourselves and the Swazis. They are refugees who have trekked into the country. They keep up their traditions and so on, but are living within the border of the Transvaal.

6,919. These are the Swazis to whom you refer as not caring to work for more than a month?—I am speaking of the Swazis from Swaziland, others I would term refugees living within the district.

6,920. For how long a period does a Swazi work?—Generally about four months.

6,921. Still he does not care to engage for that period?—He will only engage for one month at a time.

6,922. I suppose they come in of their own accord?—We have no recruiting except that just started in Swaziland, but as far as we are concerned, there has been no recruiting.

6,923. Mr. EVANS: How are the farmers off for labour?—Most of them are very short of labour.

- 6,924. What wages do they pay?—The farmers pay from 30s. to £2 per month with food.
- 6,925. Do you think they could get a better supply if they increased their rate of wages?—I do not think so.
- 6,926. What do you think is the effect of high wages on the natives. Does it tend to shorten the period for which they work?—I do not think so.
- 6,927. You do not think the amount a native earns makes any difference in the period he works for?—No, I do not think so. I think if they are well paid they acquire tastes and habits and spend more money. The actual saving amounts to very little.
- 6,928. What natives would these be: I am speaking of the Tongas in particular.
- 6,929. Mr. PHILIP: You estimate the male population at 4,500 for the whole district?—The residents, yes.
- 6,930. Would all these natives be capable of work, or do you include the very old and young?—I think that the very old men would not be included in that estimate.
- 6,931. Then this number of men is capable of work?—Yes.
- 6,932. That would not suffice for your own requirements?—Oh, dear, no.
- 6,933. There is no possibility of one getting labour from there?—No. Some men are being recruited from our northern border along the railway line occasionally by the labour agency, whatever its name is, and I think it should not be done. It is taking labour away from us to take to other parts.
- 6,934. Do you know anything about the Lydenburg District?—No.
- 6,935. Mr. FORBES: You say there are 207 at the present time employed on farms?—Yes.
- 6,936. How many do you consider they require there for farming?—For present requirements I should say about 500 in addition to the natives who are living on farms with their masters.
- 6,937. Then, if there was a plentiful supply of labour there would be other farms starting there?—Yes.
- 6,938. You also refer in this statement, you recommend that the Squatter Law be put in force, and also restrain the natives from squatting on Government farms?—Yes.
- 6,939. This Squatters' Law, then, tends to distribute natives when there are too many on private farms, does it not?—Yes.
- 6,940. Are there any farmers down there who have too many natives for their requirements?—I do not know if you are aware that the leasehold farms on the De Kaap fields have been cut up into very small pieces. A man may possibly have 20 or 30 allotments, and I take it as the law reads that he can have five families for himself on each of these different farms, five on each farm or allotment, that, I take it, is how the law reads, and of course he will not employ these people. They will keep him. A man having a lot of these boys on the ground, I take it, can put five families in each piece.
- 6,941. In the Barberton fields a man with 500 acres would probably cultivate the most of the land, probably all of it?—Oh, no, it is only the level down near the river where large areas are cultivated.
- 6,942. Then the Government lands you refer to are the Government locations down there?—There are no Government locations, but a number of Government farms have not been sold, and the natives have gradually kept on to this land until there are about 1,200 males living on Government lands and paying nothing except their general tax. They have gone from private farms to Government land.
- 6,943. You recommend removing them to private farms?—I should recommend their paying a rental or being removed.
- 6,944. Mr. TAINTON: How long have you been in Barberton?—Going on for 17 years.
- 6,945. You say that the labour supply is short?—Yes.
- 6,946. Is that your experience generally? Is it usually short?—It has been short since 1897 in my experience. Before that date we had plenty of labour.
- 6,947. Can you give any reason why it has become short?—Well, I think on account of recruiting.
- 6,948. What recruiting?—The recruiting for the Rand.
- 6,949. Do you think that the progress of the mining industry here is having the effect of making the labour supply of Barberton short?—Yes, I would not put it quite like that. I would put it that the mines used to bring natives to Johannesburg, turning the course of the supply so that we cannot get natives to come from Gazaland from where we drew our principal supply. It was diverted by the chiefs and the Portuguese. It was a money-making business. They were sent up here and not allowed to come to Barberton.
- 6,950. Who prevented them?—The Portuguese.
- 6,951. But the Portuguese have no authority beyond the border?—Well, when they get beyond the border they are in the hands of agents.
- 6,952. I suppose they could leave the agents, there was no compulsion?—Well, I do not know about compulsion, but I saw a good deal down at Komatipoort in 1897, and I noticed that the natives were in compounds guarded by native police. If they were free to go I do not see what the police were doing.
- 6,953. Was it your impression that the men were not at liberty to go as they pleased?—Yes.
- 6,954. Coercion was used?—Well, I suppose there was gentle persuasion. I should not like to say coercion.
- 6,955. Do you think that in Barberton you would have had sufficient natives for your own supply, sufficient to meet the demands of your local supply?—No.
- 6,956. It is only this foreign supply from Portuguese territory which gave you a surplus?—Yes.
- 6,957. If that deflection of your labour supply to the Rand continues, it is likely that the scarcity in the district will be permanent?—Yes.
- 6,958. You could get an extra supply from Portuguese territory?—Yes, if the natives are allowed to come into the Barberton district, we should have any amount of them for our own wants.
- 6,959. I do not understand that statement?—I mean to say that I have had a good deal to do with natives, and they tell me that in Portuguese territory they cannot get a pass to enable them to seek work except on the Rand. The arrangement is made somehow between the Portuguese Government and the Association, and the recruiting is done in Portuguese territory. Any natives going to Barberton to work go without a pass, they run away, abscond from the country.
- 6,960. Am I to understand your reply to mean this—that the Portuguese Government prevents its natives coming to any other labour market than the Rand?—I would not say that, because I believe that some of the natives have been recruited by the Association for the Sheba Mine, but I mean that the native is not free to go where he likes to seek work. He cannot get a pass in Portuguese territory to seek work where he would wish.
- 6,961. Then I must put it this way that the Portuguese Government recognises only the W.N.L.A. as a recruiting agency in its territory and prevents the boys coming to any other market?—I would take it that that is correct, yes.
- 6,962. Are you here in an official capacity at all?—No, sir.
- 6,963. You are in the employ of the Government, are you not?—Yes.

6,964. Were you asked to come here by any local body in Barberton?—No.

6,965. The mining industry is not in a very flourishing condition in Barberton?—No, it is not, indeed.

6,966. Is there much agriculture?—No, not very much. We have had drawbacks. The cattle are all dead with redwater, and ploughing with donkeys is a very slow process.

6,967. You have considerable native districts in the neighbourhood?—A good many.

6,968. If the demand for the natives is so small from the mines and agriculture, and there are large numbers of natives in the surrounding country, how do you account for the scarcity of the supply?—For the mines?

6,969. For the whole industry?—For the mines it is very simple, for the savages do not care to go underground.

6,970. My question was general. The industrial development of the district is small, the supply of raw material is there. How do you account for your labour supply being so short?—I should say that the reason why we have no more labour is because the natives are wealthy enough to live without work.

6,971. Where do they get their wealth from?—They have been living there many years and do very well on the farms.

6,972. Which farms?—The farms they are living on.

6,973. Private farms?—Yes, and Government farms.

6,974. Then your suggestion to enforce the Squatters' Law is really intended to strike at natives living on their land and prevent them from using their present facilities for obtaining a living?—Yes, I think they should be put on the same footing as the European. I fail to see why they should be allowed to squat on Government land when we are not allowed to do so. I mean that they have no more right to the land than we have, I take it.

6,975. But the European is not compelled to work unless he wishes. Why should the native be compelled?—I do not say compel him to work but compel him to get off Government land or make him pay rent.

6,976. Then would your remedy be to make them pay for the land they hold?—I maintain that they do not hold the land, that they are simply squatters utilising the land and making a living from it. They have no business on the land at all.

6,977. They have been a long time in the country?—Some of them. There was a great influx when the Portuguese made some drastic law some years back. There was an influx into the reserve. These natives do not belong to the Transvaal at all. They are merely squatters.

6,978. But dealing with natives within the Transvaal, am I to understand that your suggestion is that they should be deprived of their land?—They have no land. They never had any land. Their land is in Swaziland. These are Government farms on which the natives are gradually encroaching until they cover the whole country and then murmur at being removed.

6,979. I am not arguing. I want your opinion on the whole question. It seems to me that the natives were in the country before the whites came into it, and I do not quite understand your statement that they have no land, and that they must be removed from such lands as they are occupying at present?—I do not know what you are driving at, but my idea is this, that these natives are pure and simply squatters. They have gradually removed over from Swaziland and encroached on Government land, for which they paid no rent.

6,980. But your reply is concerned only with a small section of the country. I am speaking generally and am taking the whole Transvaal. From your reply I take it that you wish to see the natives removed from the ground they now occupy?

—I only wish them to be removed from land on which they are squatting, or force them to pay rent.

6,981. Do you think that would affect the labour supply?—They would certainly have to work more.

6,982. Is it your experience that a tax has any effect on the labour supply?—Well, this present taxation, this £2 business, has only come in now. The natives have been three years without paying taxes. The thing is quite new, and we do not know where the boot will pinch.

6,983. But in your experience has taxation much effect on the labour supply?—I cannot say, because in the time that I had to do with all these matters there was no taxation on natives coming from outside sources except in their own country of which I know nothing.

6,984. Now, as to these occupation farms. You said that a number of natives on some of them will keep the farmer. What does that mean?—I mean that it is not necessary for him to work. He can let them land and charge them so much for the land, and they give him a certain amount of labour and he makes a very good thing out of it.

6,985. Well, if you enforce the Squatters' Law and drive them to private land, will you not extend that system?—No, because then every farmer, I take it, will have more than enough in the valley for the wants of the valley, and some of these natives would have to go to the high veld, where they are badly wanted.

6,986. But the effect of the legislation you suggest would drive natives to the farms; that is in the direction of the native supporting the farming industry and keeping the farmer as you put it just now?—On a large farm it would not have that effect. It would give him labour because he would only be entitled to his five families.

6,987. Is it not true that the farmer usually makes a contract with his natives to let them plough as much land as they want in return for a certain amount of service?—Yes, and in some cases they pay rent.

6,988. As a rule they get their value for their labour in the shape of land?—Yes, and grazing.

6,989. Is it a good thing to encourage the native to produce more in that way and to compete with the white farmers?—We want all the food that can be produced in the country.

6,990. You would get it at any cost even at the risk of making the farmers dependent upon the native earnings?—No, I do not think so. I should say not.

6,991. You would not go as far as that?—No.

6,992. Mr. WELTRESIDE: Do I understand aright that in your opinion there are sufficient natives for the industrial development of the Barberton district, provided that some gentle persuasion could be used to induce them to work?—No, we have not enough in the district.

6,993. In the surrounding district, Swaziland for instance?—In Swaziland, of course, there is any number of natives; but within the district of Barberton we have not sufficient natives for our own requirements.

6,994. Then I must have misunderstood one of your answers. I was quite under the impression that you thought there were sufficient natives to provide for the development of the country if gentle persuasion could be used?—No, I do not think I said that.

6,995. You say that this £2 tax is quite new. Have you formed any opinion of your own as to how it is going to affect the natives? Is it going to bring them out to work in your opinion?—No.

6,996. Is it not going to drive them out?—No.

6,997. Your remedy, if I understand aright, is for the Government to prevent them from squatting on Government land?—Yes, I think it would be a step towards it, if they were prevented from squatting free on Government land.

6,998. Mr. QUINN: You have been 17 years, I understand, in Barberton district?—Yes.

6,999. And you have been in a good position to observe the habits of the natives?—Yes.

7,000. Some witness has told us that when a natives goes out to work he goes to acquire just sufficient money to obtain for himself something that he wants, and then he goes back satisfied. Now from what you said, I understand that it is your opinion that wants are created. The boys come in contact with other boys and with Europeans, when they come to the labour fields, and they see things that they want, and like white people these desires grow as they get older. They continue to spend more and more money, and they do not save it. Is that what you wish to be understood to say? That is your opinion?—Yes.

7,001. So that the stream of natives coming backwards and forwards to and from the centres of industry where they are earning money will tend to increase the amount of goods sold in the country?—Yes.

7,002. Enormously?—Yes.

7,003. The idea of a boy saving a little money in order to get some little thing, and then be satisfied, is, in your opinion, quite erroneous?—Yes, I think so. The natives come and go. The native comes and works for a time and then he goes back to the place with the bundle of things which he has purchased, and remains away for three or six months. Then they return again. There are some natives, a considerable quantity, whom I know very well, have been working in Barberton district for 15 years now, with occasional holidays—frequent holidays—and they are still working.

7,004. You agree with other witnesses then that, firstly, the desire of these boys to get things which they see other boys have, or that they see in stores, brings them out to work more frequently than they otherwise would come, and, secondly, that by coming out to work and spending the money which they have earned they contribute to the prosperity of the country?—Yes.

7,005. Mr. BRINK: You say that when a farmer is fortunate to have natives working on his farm these natives keep him?—Yes.

7,006. What do you mean by that?—In some instances a farmer does nothing on his farm. He has these natives and they do all the work. I am speaking now of leasehold farmers in the De Kaap Valley, you understand. My evidence is that of Barberton district only.

7,007. We have evidence yesterday to show that the natives when they do live on the farms, render a certain amount of service to the farmer. When they do so they get paid for it at a reasonable wage. They can get very good pay for squatting on these farms. Your idea is quite different?—I do not wish to imply that the native does not get well paid. He gets paid well enough, and makes any amount of money, but the farmer makes it without any trouble at all. He simply sits and makes it.

7,008. I want to be quite clear about this; it is my duty as representing the farmers here to-day. You were alluding to the Plakkers Wet of five families on one farm?—Yes.

7,009. By keeping the farmer. What do you mean? How much money do these five families produce to keep the farmer?—I think I said in my evidence-in-chief that the allotments in the Kaaps Valley were of various sizes, from about 20 acres up to 3,000 morgen and more—large pieces of land—and I take it that on every one of these allotments, a man can put five families. He may have a dozen of these allotments. I am not quite sure as to the reading of the law. I leave that to others, but I take it, that for every farm he has got he can put on five families, and that means he may have—well, I know of a case in Barberton district where one man has about 30 such allotments.

7,010. And if they had 30 allotments, they have 150 natives squatting?—They could have.

7,011. They could have? That is a supposition. But you say you know of cases in Barberton district where farmers have 30 allotments?—Yes.

7,012. By that you wish to imply that they have five families to each farm?—Oh, no, I imply nothing of the kind. I simply say that where you can have five families to each allotment, then it is an easy matter for a man with a large number of allotments, which represents really very small pieces of land, to have a lot of natives there who will do well in them, and the farmer will do very well without any work whatever.

7,013. It is a thing that might possibly happen? Is that your meaning?—Well, I think some people are making an easy living out of it.

7,014. Making a living out of the native?—Yes.

7,015. Will you tell me how?—By the rents they receive from these different natives.

7,016. In your statement here you speak of the natives squatting on Crown land. Now, we all know that the natives are not much schooled, and they are illiterate, but do you mean to say the natives would go on the Boer farms to work for him and keep his family when he has the opportunity to go and squat on Government land?—I know other parts of the country, and I do not know of a single instance of what you have mentioned where the native keeps a Boer family—not a single instance. I was not speaking of Boer farmers.

7,017. Well, it is immaterial whether it is a Boer farmer or an English farmer, or any other farmer?—A lot of these natives are living on Government land. They have moved from Swaziland, and may have moved from private land, but in the very rich portions of the Kaap Valley, some certain portions of it are pretty thickly populated by natives who are living on the farmers' land.

7,018. Farmers' land? Is the farmer living there?—In the district—in most instances.

7,019. And do you know more or less what they pay to the farmer for these plots of ground?—£2 a hut, some of them.

7,020. That would mean £10 for every plot, and 30 plots would give the farmer £300. Do you know of any farmer who has got 30 plots with five families on each?—No.

7,021. Can you give me any idea how many families are living on these plots which you were speaking of?—No, there are a number living on them, I cannot give you the figures. There are a number living on some of these plots.

7,022. Mr. PERROW: Are the boys on the mines in Barberton employed from month to month?—I think at the Ivy they are generally employed for six months. That is what I am informed by Mr. Watts. At the Sheba I know I registered a lot for 12 months at the Pass Office. The general rule at the smaller mines is that the native comes and engages himself by the month at a month's notice.

7,023. And the pay on the mines is from 30s. to 70s.?—Yes.

7,024. Where do you get these figures from?—I got this information from the people on the mines. I asked them and they told me that in extreme cases where a boy can work a machine drill he gets as high as 75s. At the time when I was working with natives I gave no more than 50s. That was the highest pay we gave.

7,025. Do you think that this is a fair pay for the native?—I think 75s. is rather high myself.

7,026. Mr. QUINN: With regard to the way in which some of these large farms are cut up into allotments. In addition to the natives paying for the ground they are allowed to cultivate, do they not give a certain amount of free service to the farmer whose land they are on?—On most of these farms I should say they do not, because they are absentee landlords. The owners of the farms do not live on the farms. On the farms that I am particularly referring to, where I say the native keeps the farmer, the farmer is not on his farm at all.

7,027. Is he a Boer farmer?—I should say he was not. I should say he was a British farmer.

7,028. Are there many of these farms?—Not very many, but there are a number.

7,029. Are there any farms that you know of, speaking naturally, only of the part which you profess to know something about, where in addition to paying hut tax, the natives contribute something in the nature of free labour. Some witness has spoken in a peculiar way of natives paying a hut tax, and lending a few of their children as well?—Yes, I know on some of the farms they give a certain amount of labour, but it is very difficult indeed to get the labour.

7,030. So that as a rule so far as your experience goes it would be safe to say that all the farmer receives is rent for the piece of ground the native takes from him?—I should say that so far as Kaaps Valley is concerned that would be so.

7,031. Mr. WHITESIDE: In reference to the terms of service of the boys in the Barberton district, you tell us that some go out for contracts of six months, some for twelve months, and on the smaller mines they are engaged at a monthly rate. Can you give us any idea of the influence this has on the smaller mines? Are they kept well supplied with boys on the shorter term, or are the larger mines, who engage their boys by contract, better supplied?—At the smaller mines it is purely a matter of the employers. If he is a good man and has a good name with the natives, the natives when they leave send their brothers to work there. They make it a little preserve of their own.

7,032. Consequently, that would tend to show that the smaller mines have no difficulty in getting native labour?—Yes, I should take it that that is the case.

7,033. Mr. TAINTON: Do you know Natal at all?—No.

7,034. Do you know any other part of South Africa where squatting upon private farms is allowed?—I can hardly say. I have been away from Cape Colony for very many years and I hardly know what goes on down there. I have been told that in Natal there is squatting, but I do not know.

Mr. W. MOORCROFT EDWARDS, called, sworn and examined.

7,035. The CHAIRMAN: Have you before you a memorandum dated Krugersdorp, July 24th?—Yes, sir.

7,036. The memorandum was read by the Secretary as follows:—

7,037. The subjects on which I desire to give evidence are:

(1). Squatting on farms; its detrimental effect on agricultural labour.

(2). The native marriage system, whereby women are practically bought as slaves: the man living on their labour and doing no work himself.

(3). The Labour Association: its effect on the native mind.

(4). What will induce natives to come to the centres of work with offer of service.

(a). I know the whole of the Transvaal more or less intimately, the district of Krugersdorp especially.

(b). My knowledge extends over 40 years.

7,038. The CHAIRMAN: You are connected with the Farmers' Association and that neighbourhood, are you not?—Yes.

7,039. What do you call the Association?—The Krugersdorp District Farmers' Association.

7,040. Are you President of it?—Yes.

7,041. When was it formed?—About nine months ago.

7,042. Has it a large membership?—Yes.

7,043. Can you tell us approximately how many members?—I think something over 300.

7,044. Are you a farmer there yourself?—I am just farming on a small scale, but I am the owner of a lot of land.

7,045. In that district?—Not in Krugersdorp district only. In Rustenburg and Zoutpansberg.

7,046. Agricultural land?—Yes, all suitable for agriculture.

7,047. Are you working any of these farms?—No, I am working a small farm in the Krugersdorp district.

7,048. Have you been long in the Transvaal?—Yes.

7,049. Many years?—Yes.

7,050. Do you know any other part of South Africa?—Yes, I know Cape Colony pretty well.

7,051. From a farming point of view?—Yes.

7,052. Do you employ many natives yourself?—I employ them when I can get them.

7,053. You have a difficulty in getting them?—I have a difficulty, yes.

7,054. How many would you employ on your small farm that you speak about?—On my farm where I am living I would employ ten natives. I do employ ten and more sometimes. I have got a large fruit garden which wants attending to, with a large number of trees, and when I can get natives I have always not less than eight, sometimes ten, or more, according to the season. I can constantly employ ten.

7,055. If you could get double the number, or a much larger number, have you work for them?—Yes. Then I should farm my other land as well.

7,056. You know the size of the average farm in the Transvaal?—Yes.

7,057. Witnesses have given us different opinions as to the number of natives each farmer requires all the year round. Can you tell us the number of natives the average farmer would require?—It depends upon the kind of farm. If he is a stock farmer pure and simple, he does not require so many natives. If he is an agricultural farmer, he requires a good many more. It also depends upon the farm that he has. Some farmers go in for a larger agricultural farm than others, but I should say that where a man has sufficient land under cultivation, the average per acre, if it is properly farmed, would be one native to every three acres. A stock farmer would not require so many. If he has, say, 3,000 sheep, he would require four or five native labourers, and for 150 head of cattle he would require about two boys.

7,058. Assuming a stock farm only, what would be the average number of natives the farmer in your district would want?—It depends upon the number of stock which he has upon his farm. There are no farms properly enclosed as they should be for a stock farm, but if the farm is enclosed the farmer can also do with very much less labour. For instance, take it that a man has a farm of 3,000 morgen, a good stock farm, and the whole of the farm is enclosed. He would be more independent of labour than if the farm was not enclosed, because if a farm was not enclosed he would have to have a "herd" constantly with the stock. If the farm was enclosed, the stock might go without a "herd"—they would not be attended to as they should be, but still he would not be so dependent upon labour and would attend to it more or less himself.

7,059. What is the number of head of stock which the average farmer in your district would have?—I should say about one beast to every four acres.

7,060. But they have not anything like that. On the average how many head of stock would be run?—Well, of course, now there is hardly any stock in the country, but before the war that was about the average.

7,061. Are you speaking of sheep and cattle boys?—No, I speak of cattle only. Sheep would require about two acres per head, but our district is not a sheep country.

7,062. You say the average farm is 3,000 morgen, 6,000 acres, with one beast to every four acres, that is 1,500 head of cattle. There are very few farmers in this country who have ever had that number of cattle?—There are farmers who have had 900 and 1,000 head of cattle or more.

7,063. The Commission would like to know, Mr. Edwards, assuming the farm to be unenclosed and assuming the farmer to own the average number of cattle, how many natives would he want to do that?—I should say if he had 150 head of cattle he would require from two to three boys.

7,064. Does that include boys for work in the house?—No, he would require a boy in the house. Three boys would be sufficient.

7,065. A farmer on an unenclosed farm with 150 head of cattle would want about three Kaffirs for his farm?—Yes.

7,066. And if the farm was enclosed?—He would want one boy.

7,067. Housework included?—The work which would want attending to would be milking the cattle.

7,068. You say there are no sheep farmers in your district?—Very few.

7,069. But you know about sheep farming?—Yes.

7,070. Assuming the average number of sheep on a farm unenclosed?—If he had 3,000 head of sheep he would want about five boys.

7,071. In addition to any cattle that he had?—Cattle would have to be herded separately. He would want about five boys for his sheep. The sheep would not go in one flock; they would be divided into different herds.

7,072. Then for his cattle he would want?—A boy in addition to look after the cattle. I would like you to understand that where a man is sheep farming and he has his farm stocked with sheep, he cannot keep a large number of cattle on the farm. He would only keep a small number of cattle for his immediate requirements.

7,073. Would such a farmer cultivate a certain number of acres of ground in addition?—If he had it, yes—if he had suitable ground for it.

7,074. How many acres would he probably cultivate?—It is very difficult to say. On some farms 20 acres, some more and some less.

7,075. How many natives would he want to cultivate 20 acres in addition to the natives you have already spoken of?—If his land is properly cultivated he would want about one native to every three or four acres.

7,076. That would be five natives cultivating 20 acres of ground?—Yes, he ought to have that. I have got 20 acres, and, as I said, I can almost constantly employ 10 boys on my ground—that is a boy to look after my horse, one to look after my fowls, and some eight boys working on the land.

7,077. With all this information in detail, can you not give us as things are to-day an idea what number of natives on an average each farmer would require?—The average throughout the country?

7,078. Throughout your own district to start with?—I should say each farm would require at least six boys taking the average.

7,079. We have had it given here as high as 10 upon the average?—I think 10 is a rather high average, the way farming is carried on at present. I presume farming will be carried on very differently in a few years, and if labour could be got the people would employ more labour. Farming would be carried on in a more progressive way than it is at present, but taking it at present I think six boys on an average would be sufficient—some farms would take more and some less, and that is in addition to the farmer himself and his children also working.

7,080. Assuming that there was a plentiful supply of labour in the country, what would be the estimated average for a farmer to employ?—I should say at least 10, if not more.

7,081. And would it be an increasing number as years go on?—Yes.

7,082. In your letter which has been read, Mr. Edwards, under the first head you say "squattling on the farm has a detrimental effect on agricultural labour?" Can you tell us what you mean by that?—I mean this, that there are many farms where large numbers of natives are squattling. Some of the farms belong to the Government, and some belong to private individuals. Take it that I am a farmer, and I have a number of natives living on my farms who are working for me. My next door neighbour is not living on his farm, but he allows niggers to squat upon it. If I have any dispute with my boys and they become dissatisfied, they simply leave my farm, and they go and squat on my neighbour's farm, for which they very often pay rent. I had an instance a little time ago, I had some families on my place and they got dissatisfied because I would not increase their wages and they went a little distance away. There they got land to squat upon, and they all went there.

7,083. You know the working of the Plakkers' Wet?—Yes, more or less.

7,084. Do you approve of the principle of the Plakkers' Wet?—Not exactly. I think that the Plakkers' Wet might be made to work very well with a little alteration.

7,085. Its main provision is, I understand, that no farmer should be allowed, unless for some special reason, to have more than five native families living on his farm?—Yes, but then if he wants to let his farm to the natives, he can cut it up into different pieces and on each piece he can put five families. I think it should be altered in this way, that a farmer should be allowed to get as much labour as he likes upon his farm even if he exceeded five, but he should not be allowed to let land to squatters, or if he was I think I would go so far as to say unless he was living on his farm himself, he should not be allowed to put a number of squatters upon it.

7,086. Your next sub-head, "B" "native marriage system whereby the women are practically bought as slaves"—what do you mean by that?—I mean to say that these women are bought as wives, but they are practically slaves, inasmuch as they are looked upon as his property. A native's wealth is reckoned upon the number of wives that he has got. These women have to work for him, and if one native dies his next heir inherits these women; they are then his property. I think it should be put a stop to; I have found that natives living a somewhat civilised life and having one woman only, are more inclined to work, than those living in out-of-the-way places and allowed to buy women just as they like.

7,087. The evidence given to us by Sir Godfrey Lagden showed that there was very little polygamy in the Transvaal—I think I am right in saying somewhere about 11 per cent. of the married natives are polygamists?—I think that at Zoutpansberg when I was there, and knew the district, some time ago almost all the natives there were polygamists. I think this is so in Swaziland and almost all the outlying districts at the present day.

7,088. When you speak of the Labour Association, "its effect on the native mind," what do you mean by that?—I can only speak from the opinion that I get from the natives themselves. I have asked them why they do not go back and work on the mines as freely as they did before, and I know from my experience also before the war, the natives are recruited by the Associations from different places, from different tribes, and these natives are sent off to the mines which they do not care about going to. They say they want to pick their own mines; they do not want to be forced to work in mines which they do not know or that they do not care for. Then overseers are put over natives, and are of a different tribe to them.

7,089. You mean native overseers?—Yes, I put it in this way. You may be recruiting 10 natives from the Cape Colony, 10 from the Zoutpansberg,

and 10 from Delagoa Bay and you send these 30 natives to one mine, and you put a Swazi over them, there is great ill-feeling between the different tribes and the Swazi is continually irritating the others, and they object very much to it. That is one of the reasons which they give.

7,090. The evidence given to us by the Chairman of the W.N.L.A. was to the effect that at first owing to the military regulations no choice of master could be given to the native when he was recruited. Only certain mines were allowed to be run, but he informed us that that is all altered now, and when a native is recruited he is given his choice of a mine, and he is sent there, and that when he arrives on the Rand he is again given his choice and is sent there, and that the balance who have no choice are sent where they happen to be wanted. Did you know this was the practice now?—No, I did not, and the natives do not seem to know it, because I was just speaking to some boys very recently, and they said they wanted to go and find their own masters; they did not want to be forced as they were to go to a master whom they did not know.

7,091. Any other reason why they are not turning out to work again?—No, I cannot tell you, but there must be some other strong reason because at present the natives seemed to be stopped from coming to work, and still they are in a bad way out in their kraals. I have only just come back from the bush country, and there I saw the natives, some of whom are practically starving. They had no food, but there is a difficulty in getting them to work. I think myself the chiefs had something to do with it. They are trying perhaps to prevent boys from coming to the mines so as to bring pressure to bear upon the mine-owners so as to increase the wages. And I think if a law could be passed so as to do away with all chiefs in the country, it would have a good effect.

7,092. What do you mean by doing away with the chiefs—breaking up the tribal system?—I think so, yes. These native chiefs exercise a lot of influence over the people, and if a chief gets a crochot, and he thinks that the boys ought not to come to work, he simply gives such an order and the boys do not come. They will not come.

7,093. Do you know an instance where a chief had done that?—Oh, yes, several instances before the war.

7,094. Before the war?—Yes.

7,095. And I understand you to say in your recent visit to the Zoutpansberg you found the chiefs exercising it?—No, I do not say so now. But I say there must be some reason for keeping these boys from coming, because they are so badly off for food now.

7,096. Several witnesses have told us that the popular idea that when there has been a failure of crops the natives turn out in larger numbers, is inaccurate and exaggerated—and the natives fear to leave home when their womenfolk and children are unprovided with food. They would rather sit and starve with them. Is that your experience?—I do not think so. I do not think the native is such an idiot as all that. I think if he knows he can go and get employment and get money to send to his women that he will do so.

7,097. Mr. QUINN: What is the size of your farm at Krugersdorp—the amount under cultivation?—It is 24 acres, and then I have rights over 3,000 morgen—6,000 acres.

7,098. It is a farm of 6,000 acres?—That I have rights over, yes. I have a portion of a farm which is actually mine, and then I have servitude over the remainder of the farm.

7,099. What is the average size of the farms in your district?—About 6,000 acres, and then many of the better farms are cut up into smaller pieces.

7,100. What is the average amount of each of these farms under cultivation?—Well, some farms vary much more than others. There is, for instance, a farm which I know in our district, Hekpoort; I

think the farm is about 8,000 acres, and it has about 40 owners—who are all living on and cultivating portions of the farm.

7,101. Can you give us any idea of the average? You have quoted to us now a very exceptional case. Can you give us any idea what the average is of land under cultivation on the average farm in your district. One witness has given it to us as one-sixtieth. Mr. Everard told us (v. qu. 583) that he believed one-sixtieth would be the outside limit?—He comes from a stock country. Our district is principally an agricultural district, and I should say that in our district, taking an average, there is no farm which has less than fifty acres under cultivation.

7,102. That is about the average that has been given. Is there any other portion of this farm that you are on under cultivation besides your 24 acres?—Yes.

7,103. Much of it?—Yes.

7,104. How much?—I believe about 60 acres.

7,105. You have other farms, Mr. Edwards, you tell us. Are any of those at all being cultivated?—No.

7,106. How many have you got?—I have got two farms and another portion of a farm.

7,107. Are there any boys squatting on those farms of yours?—No.

7,108. What do you pay your boys? What are the boys paid in your neighbourhood?—Round about Krugersdorp and near the mines we have to pay about the same wages that the mines are paying. We pay from £2 to £3 a month.

7,109. An average of £2 10s. perhaps?—Yes, and a good boy is very often given more than that.

7,110. And you have eight?—At present I have on my farm seven natives and a white man.

7,111. What kind of produce is raised principally on these farms, generally speaking? You have an intimate knowledge of the country generally, and as a farmer and president of the farmers' Association perhaps you could tell us what kind of produce is grown?—Wheat and oat, hay and potatoes.

7,112. Not mealies?—Oh, yes, mealies. Wheat and oat hay is one crop. On the same land again we put in mealies. On some of the land we put in mealies only, that is where you have land which is not suitable for wheat.

7,113. The amount of mealies grown by the farmers on the Transvaal is very great, I suppose?—It is very great in a good season.

7,114. You put that down as possibly being the principal thing they grow—mealies?—No, I should say wheat and oat hay principally. In our part of the country it is wheat and oat hay.

7,115. Generally speaking, you think there is a great quantity of mealies grown?—Yes.

7,116. How does it affect the farmers? You know that mealies are used by the natives largely. Now, supposing no more mealies were wanted by the natives, how would it affect the farmers? Suppose that the big market of mealies which is provided for the farmers by the gold mines, a very large amount is used on the mines—suppose that market was shut down, could you grow rice instead of mealies on these farms?—No, it would affect the farmer very materially.

7,117. I asked the question because I have letters from several farmers on the subject. It would be a serious loss to the farmers?—Very serious indeed.

7,118. You could not substitute rice or rear ducks?—No. Mealies are used for everything, and it would be a very serious thing if mealie growing were stopped.

7,119. A very serious thing?—Yes.

7,120. You thoroughly understand the subject, I believe. I want you to give your opinion as a leading agriculturalist as to how long it would be before the farmers in the Transvaal get into a

position to export their produce? I am taking it for granted that the markets are very limited at present?—Yes.

7,121. Before the farms in the Transvaal, or anything like a reasonable quantity of them, were being worked to the best advantage, you would have no market. You would soon supply the whole of the Transvaal and the Orange Free State, and after that demand was met you would have to export or stop growing?—Well, I do not know. We have a very good market at present in Johannesburg when things are in full swing. I should say Johannesburg is one of the best markets in the Transvaal.

7,121A. Undoubtedly, but my point is this: take these big farms where 60 or 100 acres are being cultivated, there still remains an immense amount of land that is not being used. Suppose the farmers set to work with all the latest farming appliances and used the land to the best advantage, is it not true that we should produce an enormous quantity, far and away beyond anything Johannesburg is likely to require?—Yes.

7,122. Therefore you could not carry on on a big scale unless you exported. Whether you have cattle, wheat, or whatever you raise, you would very soon fill up the requirements of the local market, because, after all, the whole of the whites in the Transvaal do not eat anything like the amount consumed in a large town at home like Glasgow or Liverpool, so you would soon fill up the demands even if you had a market for all you grew?—Yes.

7,123. Therefore you would very soon arrive at the condition of things when you would either have to export your produce to Canada or New Zealand and other places or you would have to give up growing it. How long do you think we shall be before we are in a position to compete with New Zealand?—It is a long way off still. As far as stock is concerned it will be 15 years at least before we have sufficient stock for the country, perhaps more. Large irrigation works would have to be undertaken before we can have a surplus stock over and above what we require for the country.

7,124. It will not be very soon—not for 15 years at least?—Fifteen years, at all events.

7,125. So that to take the number of farms in the Transvaal and to say that so many boys are required for a given farm, or a given area, and multiply that number of farms by the assumed number, and say that the result represented the farming requirements would be nonsense?—Yes, you could not do it for this reason: There are many farms in this country that are not fit for anything else but stock farming, and farming will, as time goes on, be improved. Farmers will fence their farms, and they will do with very much less labour. Then there are farms in the Bush country which at present people are only using for winter grazing, and which are not fit for anything else. Then there are farms in the unhealthy districts where people cannot live in the summer time, so you cannot take an average of the farms throughout the country.

7,126. Mr. WHITESIDE: In Clause "D" of your statement you say: "The Labour Association, its effect on the native mind." Now, from your knowledge of the working of the Association do you think it is a satisfactory organisation for recruiting?—I do not think so. The natives do not seem to be satisfied.

7,127. Can you make any suggestions by which it could be improved, or would you abolish it altogether?—Well, I would not abolish recruiting entirely, but I think that recruiting carried on in the way it is is not beneficial.

7,128. What do you mean by not being beneficial?—To the labour market, I mean.

7,129. Do you think that the methods of the recruiters are not satisfactory?—Well, I think the recruiting should be free more or less for everybody to bring in as many natives as he possibly could to the mines, and to take them to any man that

he wishes to take them to, or that they wished to go to. They should not be taken to one compound and parcelled out for that compound.

7,130. You also say in Clause "D" what will induce natives to come to the centres for work with offers of service. Can you amplify it at all?—What I meant was this, that if some of the natives have a great desire for learning or improving themselves; and I think if there were facilities here on the mines where these natives might be taught or where they might go to school at night time, or any other time, it would induce them to adopt civilised habits more or less, too. It would make them feel inclined to wear clothes; and as they were being educated, so their wants would increase. I think the great thing is to increase, if possible, the wants of the natives so that he is obliged to earn money to supply his wants.

7,131. I see your knowledge of the country extends over 40 years?—Yes.

7,132. Have you come in contact much with boys that have been employed for any length of time on the mines?—Yes.

7,133. What impression did they give you of the conditions of work on the mines. Are they satisfied?—Yes.

7,134. Do they speak well of it?—Yes. I have not heard any complaints. Of course sometimes I have heard boys complaining of certain mines not treating them well; but, take it on the whole, I think they are satisfied.

7,135. Some of them complain that they are not treated well. What was the nature of the ill-treatment—have you any idea of it?—No. I think it is very often that raw natives come in and they are placed under people that do not understand them and that is simply misunderstanding.

7,136. Mr. TAINTON: You said just now that you thought it was necessary to increase the wants of the natives?—Yes.

7,137. How does it affect the labour supply?—Well, it will affect it very materially, because the native would have to go to work to get the money to supply his wants.

7,138. Can you give us, roughly, his principal wants at present?—Well, the wants of some natives are very few.

7,139. No. I am speaking of the average native as we know him in the kraals. Do not take exceptional cases. We want to get the average inhabitant of this country as you know him?—Well, his wants are very few. I will tell you why. The native, if he sees a piece of Government ground, perhaps a good piece of agricultural land, he has no difficulty in going to squat on the land. He goes and lives there, and he gets so many women, and they work for him, and he has no necessity to work himself at all. He pays no rent for the land whatever, and if he can just raise sufficient crops and keep a cow or two to supply him with milk he is perfectly satisfied. Now I think that where it is necessary to have locations on Government ground, the land should be cut up into stands or erven and each man should have his own particular piece of ground which he would have to cultivate and improve to a certain extent, and pay certain sanitary rates which would be necessary for the health of the place. And, as I said just now, the power of the chiefs should be entirely done away with. Such a place should be regarded as a sort of township with a magistrate or official over it. The natives in this place would in time live a sort of civilised life, and as he becomes more civilised his wants will increase.

7,140. We have got rather away from the point I wanted to bring out. Every human being, so far as I know him, measures his industry by his wants?—Yes.

7,141. That is the economic standard which we have to gauge him by?—Yes.

7,142. No, I want you to give as clearly as you can from your wide experience what are the main

wants of the average native inhabitant of South Africa as you know him?—You mean his personal wants?

7,143. His wants as he stands to-day? What are they?—In the kraals all his wants are sufficient meales to keep him and his family. These are his only wants.

7,144. Quite sure?—Yes, I take it that a white man would be the same. It does not apply only to the native. If a white man could go into a place where he could get land for nothing, upon which he could live without labour, he would do so.

7,145. You are going now into how he satisfies his wants. I want you to give us a list of his main wants. You have given us food?—That is all he does want. He is satisfied if he has sufficient food, sufficient corn to make beer, enough for him to drink, and sufficient milk for him and his children. Then his wants are supplied. His clothing in the outlying districts is practically nil.

7,146. Then the food supply of the natives is practically at the bottom of this labour question. Is that your opinion?—As this food factor varies, so the labour supply varies? Yes, to a great extent it is so.

7,147. Is it not true that there is a section of the natives who have acquired additional wants in the way of clothing and European goods?—Yes, that is the custom of partially civilised natives.

7,148. Is it a large section?—No, not a very large section compared with the numbers outside it.

7,149. You see you have given us two classes of natives—those who have merely their food wants, and those who have an additional scale of wants?—Yes.

7,150. Is the one class, the smaller class, growing rapidly? That is to say, are the natives who want other things increasing rapidly?—No, not rapidly, but I think they are on the increase.

7,151. We have been taking as a rough standard of the increase of the natives' demand for European goods the amount of goods supplied by the traders' stores?—Yes.

7,152. Take your experience for the last 20 or 30 years. Do you think that that demand has increased very rapidly, the demand for European goods?—Not rapidly. It has increased certainly, but I do not think the increase has been as great as it should have been.

7,153. We have some evidence before us to show that it is very, very slow. What I would like to know is this, do you think that we can wait, that this country ought to wait until it has created these additional wants in the native population so as to affect the labour supply, and give us the labour we want?—No, I do not think so, but I think measures ought to be taken at once to increase those wants.

7,154. Do you expect any great and immediate result in that direction?—Yes, I think the result would come very soon.

7,155. What remedy do you propose?—The remedy that I propose is cutting up the Government land where large numbers of natives are living, cutting it up into small pieces, you might call them stands or erven, and let each individual native take his piece of ground for which he would have to pay a rent, and on which he would have to make certain improvements, also doing away with the power of the chiefs in the country. I think that the chiefs' influence over the natives has a detrimental effect upon the labour supply.

7,156. Your proposal then is to make the native a small farmer?—A small farmer, yes, if you like to call him so.

7,157. Well, that is what I understood you to say?—And also I would not allow any squatting to be carried on on private lands.

7,158. What would be the effect in your opinion upon the individual native if you gave him individual tenure as you propose?—Well, the effect would be this. If you wanted a labourer you could go to that individual native, and he could give you

an answer because he would be an independent man. To-day he is not. Before he could give you an answer he would have to consult his chief.

7,159. Well, supposing you go to him and ask him to come and labour for you, in your opinion he will come?—No, my opinion is this. If he wanted money he would come, but if he were under the control of the chief it would not matter whether he wanted money or not. It the chief said, "No, I will not allow you" I think it is quite possible that that native would stand a lot of starvation before he would go and work.

7,160. I gather from your replies that you think the effect of giving the native land of his own would be to improve and make him want more things?—Yes, I think so.

7,161. Do you think he would improve his land, cultivate it, hedge it, ditch it, and improve the value of it? Is that a probable result?—Yes, I think to a great extent it would. But these locations would be townships. I do not mean that he would be able to go and get a large tract of land where he could carry on agricultural farming. If he chose to live in a township, then he must put up with the rules and regulations of the township. If he wishes to live on a farm let him go and get land from the farmer and give his labour for it.

7,162. What sized plot would you give him?—Just sufficient for him to build his house and have a garden. I should not give him too much land. I should not give him any land for nothing. He should have no more privileges than the white man has. If he wants land he should pay something for it the same as I and any other person has to do.

7,163. So that your scheme would involve as a preliminary the wholesale confiscation of the native land in the country?—Which do you call the native land?

7,164. It means wholesale confiscation of the land now occupied by the natives under communal tenure?—No, it would not. If there are natives who have their own land, I do not know how you can interfere with it, excepting that you said to them, "you must give up the land." The land does not belong to the chief. He cannot do simply as he likes. If they have paid for the land, I do not see how you can take it from them, but they are living on land they have not paid for, that is what I am speaking of.

7,165. I take your remedy to apply to the whole of the native population of the country and not alone to a section of it. It amounts to this. You suggest that they should get each an individual plot of land. Now from your other replies that seems to involve the confiscation of all the land at present held under the tribal system. If it applies to the whole of South Africa that is a necessary corollary?—Well, in this country a very large portion of the land is held by the natives under the Government.

7,166. Under the Government?—But the land does not belong to them. Most of them are refugees who come from other parts. You must go back and look at the position of the native before the white man came. The natives that are in the country at present, the Basuto tribes were simply the slaves of the Matabele, and these natives have become rich under the white man's Government. They never had land. The land that they occupied before the white man came belonged to the Matabele chief.

7,167. I understand your argument is, then, that it would be no confiscation?—No.

7,168. Now take the native on his individual plot. You know South Africa intimately and will appreciate the question. When pressure is put upon the native he satisfies, or rather he meets that pressure not by going into outside districts to work, but by producing more for his land. Is not that so?—No, I do not think so.

7,169. Is not that your experience?—No. He would be absolutely in the same position as a white man living in a town. That man has his plot of

ground upon which he is living and he has to be continuously employed at something for him to live, and the native would be the same.

7,170. But if you give him a piece of land which is any size at all, you give him an asset which he can cultivate. Now is it not probable that this idea of individual tenure which is not peculiar to yourself—the opinion is common in other parts of the country, I have heard it frequently expressed—is it not probable that if you force the native into the position of a small farmer he will become one?—You mean that he would farm his land himself.

7,171. Yes, farm his land and meet his small need for money out of the produce of the land. Is not that your opinion?—No, I do not propose giving him an unlimited supply of land. He must pay for what he has, too. I have to pay for my land when I get it, and why should the native get it for nothing?

7,172. What area would you give him?—Well, not more than what is going in most townships occupied by white people.

7,173. Do you think the results of this stupendous dislocation, the breaking up of the whole tribal system, do you think the results will be immediate?—Yes, I think within a few years we would be beginning to feel the good results.

7,174. These boys that you speak of as being on your farm, are they able-bodied men? In giving the Chairman the average number required, you mentioned certain figures. Does that mean able-bodied men?—Yes. For herds you generally employ the younger boys from 15 to 20; for agricultural work you want boys from 20 to 30.

7,175. I think it is the practice of farmers in order to meet these varying demands to get families on their farms, native families I mean?—Yes, they get native families on their farms so as to supply their wants.

7,176. If you take the average number of boys wanted on a farm as 10, what number of natives, men, women and children, would that mean on the farm? Supposing you had 10 able-bodied men there, what number of natives would that mean on the farm? Would the proportion of able-bodied men be one in three, one in four, or one in five?—That would mean, I suppose, that you would have about 20 souls on your place. Some of the men would have children and some would not.

7,177. Let me call your attention to this fact. All population statistics show that at least 50 per cent. of any population must be classed as children below 15?—Well, I have doubted the number.

7,178. No, you have only doubled the proportion of able-bodied. You take 20 people as the population of the farm, and according to all population statistics one-half would be children. That is the general result which all population statistics go to show?—I said 10 men.

7,179. Yes, and then you doubled the able-bodied to give the total number on the farm. If you have a population of 20 on your farm, 10 would be children?—I said 10 men. I allowed the others to include women and children. I do not mean that all these men have wives or children. Probably five of them would have wives and five would not. Again I do not take it that all these 10 men are necessarily living on the farm. There are some who would be hired from elsewhere. I myself object as a farmer to having too many people living on the same farm with me. I would rather hire them from elsewhere, for this reason, that they are continually growing richer in stock and it is a source of nuisance to me. I cannot depend upon the quality of my stock.

7,180. If I understand you aright, the proportion of men on your farm is high, because it includes a number of men drafted in from elsewhere, because many of the farmers would not have these men living on their farm continually. They would rather hire them?—Yes.

7,181. Take these men whom you employ, what proportion would they be of the native population of the country—one in three, one in four, or one in five?—I cannot understand your question properly.

7,182. You require a certain number of adult males on your farm and their ages vary?—Yes.

7,183. Suppose you had a native population of, we will say, 100,000 men, women and children, what proportion of that population would be suitable for farm service?—Well, if they would work they are all suitable, because in many parts of the country women and children are employed in farm work. There is lots of work on a farm that can be done by women and young children.

7,184. My question refers to your estimate just now. I do not think you intended us to include women and children in that estimate?—No, but you asked me if I had a population of 100,000 men, women and children, what proportion would be suitable for farm service. Did you not say so?

7,185. Yes, farm labour on the basis given by you to the Chairman.—Well, according to my figures 50,000 would be available, because I said if 10 men were employed on the farm it would mean a total population of 20. Only if there were a population of 100,000 it would depend how many boys were able to work.

7,186. Then are we to understand that your reply to the Chairman as to the number of labourers employed on the farms includes children as well?—Oh, yes, boys of course. I said so. I said we employed boys from 15 to 20, and we employ them at a lesser age than that.

7,187. This is a very important point. I will show you presently what I mean. I took a population of 100,000, and you say that 50,000 of these would be available. Now, I should like to point out to you that in the first place 50,000 would be women or females?—It is not necessary for the 50,000 to be women, because many of the men would not be married. Many of them would be from 15 to 20, and a native is not a married man at 20.

7,188. I am afraid we are at cross purposes at present. Take a native population of 100,000, the half of those would be females?—I do not see why.

7,189. That is the usual proportion?—No, it is not so. Supposing I have a kraal on my place and there are 100,000 souls in the kraal, it is not necessary that 50,000 should be women.

7,190. It is not necessary, but it is usually the case, because a great number are children, and a large number are unmarried men. I did not say women; I said "females." The half of the population of any country is, roughly, a female population, the other half consisting of males. Now your figure practically compels us to take the whole male population, the native male population as available on farms. I do not think that is your meaning?—I did not take it that you meant a big population throughout the country.

7,191. That is what I want you to give us. I want you to give us what proportion of the native population of the country is available on the farms, taking it in the ordinary way as being boys above 12 and under 15. I am not trying to catch you?—You mean to say, supposing there were 100,000 natives how many would be available for labour?

7,192. Taking the females and little ones out of it. What proportion would be available for labour?—Well, I should say about one-fourth.

7,193. That is what I have been trying to get at. You did not quite understand my question.

The Commission then adjourned for luncheon until 2.30.

7,194. The CHAIRMAN: Mr. Tainton, will you continue?

7,195. Mr. TAINTON: Before lunch, Mr. Edwards, we were dealing with the question of the proportion of the native population and its relation to agricultural demands. We misunderstood each other somewhat in question and answer. My reason for pressing the point was this, that we shall have to calculate what number of available agricul-

tural labourers can be obtained from any given population. Now if we had taken your first answer of one in two, that would have obliged the Commission to assume that out of a total population in the Transvaal of, say 600,000 persons, 300,000 of them are available for agriculture labour, and I am sure that was not your meaning?—No, it would have been wrong. I should say 25 per cent. would be about a fair average to take.

7,196. There is another point dealt with in your main statement, and that is the influence of polygamy upon the supply of labour. I think you are in favour of legislating with a view to limiting or destroying that particular custom or practice amongst the natives?—Yes.

7,197. Suppose you did legislate on these lines, what do you think would be the practical effect upon this question of labour supply?—Well, it would have this effect. It would have a tendency to making the native adopt civilized habits, and wherever they adopt civilized habits they are more inclined to work. It increases their wants for clothing and other necessaries of life.

7,198. There was one view of the question I should like your opinion about. Do you know that at present the money required for the dowry is one of the causes why the men now work; is that not so?—Yes, it may be so.

7,199. In view of your experience, say of Cape Colony, does it not go to shew that one of the reasons driving young men out to work is this "lobola" matter inasmuch as they require money for cattle to buy wives with?—I do not think so. I think in nine cases out of ten this "lobola" has had a tendency to make the natives steal stock to buy these women, and I think most of the thieving in the Cape Colony is owing to this "lobola" business. I think if a native lived more of a civilized life he would be more inclined to work.

7,200. But thieving is surely due to defective administration. Suppose that that were made difficult or impossible, would these demands for wives not then drive the men into the labour market?—No, I do not think so. I think the natives of this country would be only too glad if such a law was passed that they could get the women without paying for them.

7,201. When you say "the natives," is it your opinion that the native women would readily agree to such a change?—Yes.

7,202. Is it not your experience that women are conservative in this matter as in others?—I do not think so. When the native dies he may have five or six wives, and these women simply go over to the other man, the heir, who takes them as his property. He inherits them through the estate of his father or brother. I do not think the women would care for anything of the kind. They are not consulted in any way in the matter and I know many women object to go to the men who have bought them, and they have been compelled to go.

7,203. I think some witnesses have told us that the women were rather in favour of this practice, because the possession of two or three wives increases the social status of the man, and therefore improves the social status of the women?—My experience has been just different.

7,204. Suppose you do away with it, would that not very greatly affect the whole body of the native civil law which is bound up with the marriage tie and the question of inheritance, ownership of land and such subjects?—Yes, I think it would, but under our present Government I am of opinion that it should be done away with or else if you want to go in for class legislation then do it. If you have class legislation to a certain extent, then have it to the whole extent, because practically that is allowing the natives to carry on class legislation as far as it suits them and not as far as it suits us, the white people.

7,205. Then your idea is to put the natives under the same marriage laws as white people?—Yes, and I think it would have a very good effect.

7,206. Would it not create the problem of the surplus woman amongst the Kaffirs?—Well, let the surplus women go and work. They would very likely go and work and would be compelled to do so.

7,207. Do you mean, in short, to strike at one of the bases of the whole native social system?—Yes.

7,208. In order to improve the labour supply?—Not only to improve the labour supply, but it will in my opinion improve the natives in every way.

7,209. Do you think it will make them better citizens?—Yes.

7,210. I think, in reply to Mr. Quinn, you said that there was not an immediate prospect before the agricultural industry of supplying the internal demands of this country and enable any surplus to be exported. Do you think it possible this country will ever become an exporting country, exporting agricultural produce?—Yes, I think so, and I take it from my own experience. I have 12 acres of land upon which I have 1,000 imported fruit trees, and if I had 50 acres to cultivate in the same way as my 12 acres are cultivated, I think I could supply the whole of Krugersdorp market with fruit.

7,211. If your neighbours cultivated to the same extent what would happen?—It would bring down the price of fruit very considerably.

7,212. Do you think the existing market would be sufficient to consume the products of, say, the Krugersdorp farms?—Do you mean if they all went in for fruit?

7,213. Went in for agriculture as extensively as yourself?—No, I think we should overstock the market in time, though it would take some time. You must remember that if you plant fruit trees to-day, it takes six or seven years before that very tree has come to maturity.

7,214. I was not dealing with the fruit industry alone, but with the agricultural production generally. The point is that if all the farmers cultivated to the same extent as you do, would they not flood the existing market and bring down prices?—You see I am only cultivating fruit, and I can only speak as far as fruit is concerned. If they all went in for fruit or all that could go in for fruit, I have no doubt it would in time glut this market, but I know there are farms in the Transvaal that should produce at least 2,000 to 3,000 bags of wheat and upon which there are not one bag grown to-day.

7,215. Would not the effect of increased agricultural production be to flood the existing market which is not very large and bring down prices very much?—It would bring down the price of living and in that way the price of wages. The more food that the country produces and brings into the market the less expensive living will be in the towns and in that way it will bring down wages.

7,216. Would you as a farmer like to see the internal markets of the country developed and increased?—Yes, I would, I will not say simply as a farmer, but as a resident of the Transvaal I should like to see us able to supply the market with everything they want even if there was more than they require.

7,217. How would you propose to increase the demand for agricultural produce?—Simply by labour, by getting cheaper labour.

7,218. What would you do with that labour?—Employ it on the farm.

7,219. You do not take my question. How would you propose to increase the demand for agricultural produce in the country. It is no use for the farmer to produce large quantities of produce unless he has a market?—I would do so to simply help in the development of the country. If the farmers were prospering, their industry would also prosper.

7,220. Then is it in the interests of the farmer to see the mining industry prosper?—Most certainly it is.

7,221. Would you as representing a section of the farming interests use every means to improve these local markets?—Certainly I would.

7,222. I see you were present as Chairman, I think, of the agricultural meeting at Hekpoort the other day?—Yes.

7,223. Do you think your views as to the advisability of encouraging the extension of the internal markets of the country is generally shared by the Boers?—What was that referring to?

7,224. The Boers who were at the meeting at Hekpoort?—What did I say?

7,225. I am asking whether your view as to the advisability of encouraging the extension of the local markets of the country is generally shared by the Boers who were at that meeting?—Oh, yes, I am quite sure of it.

7,226. Take the farm Luipaardsvlei, where I think you are living. You were cultivating some 24 acres there?—Yes.

7,227. Does that represent the total cultivated land upon that farm?—Oh, no, there are two other farmers on the farm besides myself.

7,228. What would you say is the present extent of the cultivated land on that farm?—I should say about 60 acres altogether.

7,229. It is not an exceedingly good agricultural farm, is it; it is an ordinary high veld farm?—Well, it was not considered so very good, but we have found that fruit grown on that land and on land without water far better than we ever expected, and the experiment that has been tried by me has been a complete success. I have got 1,000 imported trees, and I grow very fine fruit, as fine as can be grown in the country, and I am doing that without water. The idea before was that you always had to have water before you could go in for fruit. That idea has now been done away with, so that very nearly the whole of that farm would be planted with fruit were it not for the mines that are on it. If you had a farm like Luipaardsvlei with no mines on it, you could plant several hundred thousand fruit trees on it.

7,230. Would they bear fruit without a water supply?—Yes.

7,231. What is true of Luipaardsvlei would, I suppose be, true of the Rand?—Of the high veld, yes. Wherever timber trees grow the same as they do in Johannesburg, fruit trees grow in the same way; they get their moisture from underneath the soil, and they produce excellent fruits. I have fruit trees which get no water but which produce better fruit than fruit trees that are being continually supplied with water.

7,232. What is the average size of the farms in the Transvaal?—It is supposed to be 3,000 morgen a farm.

7,233. That is what they are supposed to be, and I think the old farms are that size, but what is the average size now?—I think most of the farms have 10 to 40 owners now. The custom is that wherever there is a water supply the land that is brought under the water is divided into plots and the outside ground is common property. Most of the best farms are therefore divided into agricultural plots, and the ground not suitable for agriculture is common grazing ground for all the owners.

7,234. From your experience of Luipaardsvlei, I understand that much of the land which has hitherto been regarded as worthless for agricultural purposes can be so employed?—Yes.

7,235. You said that most of the farms had an average of perhaps 50 acres cultivated in the Kruiersdorp district?—Yes, but I have been thinking since that that is a very small average.

7,236. Well, now, suppose we take as an average, we shall say 60 acres, as the land which can be cultivated upon the ordinary 3,000 morgen farm—6,000 acres?—Yes.

7,237. That would give, say one per cent. of the land as available for agricultural purposes. Do you think that would be an excessive estimate for the whole of the Transvaal?—No, I think it a very small estimate.

7,238. You said you employ, if we work out your figures, three boys per acre?—I say three boys per acre.

7,239. I think you said three or four?—I said one boy for every three acres.

7,240. Yes, I beg your pardon. That would give, say, 20 men employed upon the 60 acres?—Yes.

7,241. And if you take one in four of the population as being so engaged you would get 80 natives per three thousand morgen farm?—That is provided the whole of the 3,000 morgen was under cultivation?

7,242. No, 60 acres only are under cultivation. You would require 20 natives to work 60 acres?—Yes.

7,243. And take the proportion of one in four, which you gave us just now, that gives you 80 natives for the farm?—As I said before, it is not necessary for the whole of these natives to be residing on that farm.

7,244. But I am merely getting at the actual figures for the whole country?—I understand you it is so.

7,245. I believe that the number of farms in the Transvaal is 11,000, certainly over 10,000, and if we multiply that figure of 80 by 1,000 we would require a population of 800,000 to meet the demands of the agricultural industry in the near future?—Yes, but are these 10,000 farms cultivated to the extent I have just stated?

7,246. No, I am merely assuming that the demand of the country—local demand—for produce increases to this extent, that one per cent. of the land in the Transvaal is under cultivation. Then that we shall require a native population of 800,000 to meet that demand?—If there were ten thousand farms under cultivation, that would be so.

7,247. And as the native population of the Transvaal is only 600,000, the extension of this agricultural demand seems to threaten us with a demand for labour from the country which there is no prospect of meeting from the available population?—Yes, but I never said that farmers had sufficient labour. I have always maintained that they have not sufficient labour.

7,248. I was simply working out your figures and showing how they would tell on the whole question of the labour supply?—Yes.

7,249. Now, we are told by one or two witnesses that in order to make natives work our only remedy is to compel them. Do you agree with that view?—No, I do not agree with forced labour unless it is in such a way as to compel the native to work by increasing his wants; but he must be a free agent. He must not be commandeered, as the saying is to go and work, or forced to go.

7,250. What would be your objection to employ such compulsion?—Simply because it is a form of slavery, and I do not approve of it.

7,251. Can you give us the reasons for your disapproval? I am interested in your answer, and that is why I ask?—I disapprove of forcing any human being to do what he is disinclined to do.

7,252. Is it not true that a considerable section of the agricultural population of this country is disposed to adopt as a remedy legislation which amounts practically to compulsion?—I do not think so. My experience of the farmers in our district is that they are very lenient with their servants, more so than the farmers of the Cape Colony.

7,253. You do not think, that as far as you know the farmers, they would agree with the view expressed yesterday by General Cronje that the only way to settle the labour question is to compel the natives to work?—I do not agree with it. If you can bring pressure to bear upon them so that it is a necessity for them to go to work, I say so, because it is for their own good, but to go and drive them out to work against their will, I am opposed to that.

7,254. You would not agree with the policy of strengthening the power of the chiefs and backing that power with the authority of the Government so as to force the boys out from the locations to go and work?—No, I am in favour of doing away with the power of the chiefs.

7,255. I think you said in reply to a member of the Commission, that in the Bushveld, where you have been lately, you found a considerable number of natives who are very short of food, and who yet refuse to go out to work?—I did not go there and ask if they would go to work, but I saw the natives and I could see that many of the children were in a half-starved condition, and they complained about having no food. The men and women I saw stated they had no food, and I did not ask them whether they would go and work, but there they were and they were not going out to work.

7,256. Can you give us a possible explanation of that disinclination to come out? Would it be because of the chiefs operating probably with the object of pressing the mine-owners to raise wages?—Yes, I know a few years ago it did happen that the mines reduced the wages here. The chiefs were calling their men in and prohibiting them from going to work. The circumstances that year were favourable, because the natives had a good deal of food, but I know they did call their men in, and they were ordered to remain and not go to work again until the wages were raised. I always think that, with the native, it is a great mistake, if you have once established a system to try and alter it, because it takes them some time before they can understand it.

7,257. The effect, then, of increasing the power of the chiefs would be to place the control of the labour supply of the country in the hands of the chiefs?—Exactly.

7,258. One possible result might be a corner in prices?—Yes, you are placing the power in the hands of the chief and his counsellors, and you are dependent upon their humour for the labour of their tribe.

7,259. Are you aware that many of the chiefs made money out of this practice which was in vogue before the war, under which they had power to turn out boys?—I have heard it was so, that the chiefs received a good bit of money. I know it for a fact that they received so much money per head for every boy they could send out of their country, and I think chiefs often made use of this to increase the price. They simply said "Next time we want more," and so that would go on, because they had no idea when they were asking a fair price. That sort of thing would go on with them when there was a scarcity of labour on the mines, and they would bring pressure to bear for obtaining a higher price per head.

7,260. I suppose it is a fair inference that the chiefs would like to revert to the old system, and make money out of the boys again?—Certainly.

7,261. Is it not possible that their influence is exercised now in the direction of keeping the boys from the market?—I think it is very likely it is so.

7,262. Mr. BRINK: Have you any Kaffir locations in your district?—Yes, there is a farm just off, filled up with natives, not very far from Krugersdorp at present.

7,263. A recognised location by the Government or not?—No, not recognised by the Government. I do not know whether any of the buildings are recognised by the Government. This farm was bought by some man at Krugersdorp, and from what I can understand he is letting it to natives. I know many of those squatting on the farm. A great many natives that were living with farmers before have gone to this place.

7,264. Then I have no doubt it will be to your advantage to have a location close by to draw your supplies from?—No, I think it is greatly to our disadvantage.

7,265. You said that the labour supply for the Krugersdorp district was very scarce?—Yes, it is not sufficient.

7,266. That means that farmers cannot obtain labour?—They cannot obtain labour. No.

7,267. Where do you get your labour from? From your district more or less?—The farmer get their labourers from Rustenburg and from the Krugersdorp district. From round near there I may say.

7,268. Mostly from Rustenburg?—Yes.

7,269. And you pay the boys from £2 to £3 per month?—Yes.

7,270. You can afford to work a farm which is close to a railway station at that rate?—If the labour was good I should not object to give the boys £3 per month, but the labour we have there is not worth it, because if I employ the boys, and I cannot look after them myself, I have to employ white men to look after them, because when I am not there they do not do any work. If I could get boys that I could trust when I am away I would willingly give them £3 and I would do it gladly.

7,271. You say it is hard to work a farm and pay this. Would it not be much harder for farmers living away from the railways at the present time?—Yes, that is so.

7,272. Do you know the farmers of Rustenburg complain about the scarcity of labour?—Yes, I believe farmers over that part of the country are complaining. In fact I have seen it on the farms myself.

7,273. As a practical farmer of great experience it is your opinion that there is a great scarcity of labour all over the Transvaal?—Yes, I have not any doubt about it. I am sure of it. I have seen women and children working on these farms in a way that I would not like to see white men working. They have been compelled to do it because they cannot get other labour. Instead of children going to school they go slaving on these farms.

7,274. You have very many farmers in the Krugersdorp district. The farms are very much subdivided, very much split up? You mention Hekpoort?—Yes, when I said Hekpoort there in one farm in the Hekpoort Valley. There are quite 40 owners of this farm. I know there are other farms down the valley which are cut up almost to the same extent.

7,275. You require a large number of labourers for the district of Krugersdorp?—I consider Hekpoort only, should employ 200 labourers and that is not too much.

7,276. You see what I am getting at: I want to get at the figure Mr. Tainton wanted. Now if we have 11,600 farms in this country, say taking the average of about 10 boys per farm (can we take 10 boys per farm?) although there are of course a large number of farms not working at the present time?—Out of the 10,000 farms I do not think you can count upon more than 5,000 that would require the number of labourers I have stated.

7,277. Two hundred?—Oh, no. I am speaking of the average. Every farmer does not want 200, I put my average down at 10. I think that taking an average of 5,000 farms requiring 10 labourers, and that is a low average, it is the least that can be done with.

7,278. That is 50,000 labourers?—Yes.

7,279. And according to your practical opinion it is a low average?—Yes, that is a low average.

7,280. Do you know any farm that can produce from 2,000 to 3,000 sacks of wheat in the near future?—The Hekpoort farm has produced considerably more than that.

7,281. At the present moment are there farms not producing a single sack which could produce with labour that quantity of wheat?—Yes, that is quite correct.

7,282. Nearly every farm like that wants labour?—Yes.

7,283. And have not got it?—They have not got it at present.

7,284. In answer to a member of the Commission about mealies, mealies being sold by the farmers, there was something said about changing it for rice. I wish to ask you, Mr. Edwards, whether the Boers will sell their mealies?—Oh, yes.

7,285. Do you think so?—Yes.

7,286. Do not the natives sell more mealies than the Boers?—I do not think so.

7,287. You think the Boers sell quite as much?—Yes, if not more.

7,288. Mr. PHILIP: Mr. Edwards, with reference to your remarks on the Labour Association, you do not seem to think it works well?—I have had no experience with the Labour Association. I have got my information, as I said, from the natives themselves. It is the impression they gave me.

7,289. But you think free recruiting would be better?—I think so, yes.

7,290. And yet since peace was declared the average net results of the recruiting was far better than it was before the war?—Of course I am not in a position to say whether that is so or not.

7,291. You know, of course, we have got more than double the boys at present employed in the town than we had before the war?—Yes, but I understand there are not the same number of boys employed throughout the mines that were before the war.

7,292. No, there are not, but in the town of Johannesburg we have over 40,000 alone?—I am not in a position to say.

7,293. Which is more than double what we had before the war. There are a great many employed on other works here, so our Labour Association is not a failure in respect of that; they are recruiting just as well. Do you not think free recruiting would raise the price of wages by competition?—No, I do not think so. I think you ought to endeavour to always stock the labour market as much as possible. The mistake was made by reducing the wages of the boys when there was a great scarcity of labour. Anyone understanding the nature—I want you to understand it in this way—For instance, the native comes from a long distance, say from the Crocodile River and works 10 or 12 of them on a farm or on the mines. If they have been successful the men go back to their people and next year these 10 will come out again and perhaps bring 10 more with them. The following year they will bring 20 with them. The mines reducing the wages at a time when there was a scarcity of labourers has induced the natives that would have come to the mines to remain away. And before they can be got they have to be educated up to what is taking place now. Remember that the change was sudden and it takes some time to convince the native.

7,294. Do you know that in Portuguese territory especially we have been recruiting more boys at the low rate of wages than we were before the war?—Is it not possible that perhaps the Portuguese officials have been induced to use pressure to compel the boys to come in?

7,295. That I do not know?—Because I know that whenever they want labour at Delagoa Bay they bring pressure to bear upon the chiefs to compel the boys to come in to work. I went down there recruiting some years ago and some of the officials wanted me to hold out some inducement to them and they would force the boys to come to me. I was not prepared to give them what they wanted and the consequence was I could not get the number of boys that I wanted.

7,296. Well, at present we have up here about 80,000 boys from Portuguese territory, and in the mines, altogether. Well, at any rate the male adult population fit to work in the Transvaal, boys from 18 to 20, is about 60,000. That is not more than sufficient for the requirements of the farms?—The farmers will require very nearly 60,000.

7,297. So we have to look outside the Transvaal for the whole of the labour supply for the mines?—Yes, I have no doubt that the great proportion of

the labour for the mines will have to be got from outside the Transvaal. I have no doubt about it.

7,298. Mr. EVANS: In your experience in South Africa do you remember a time when employers had all the labour they required?—In the Cape Colony yes, but not in the Transvaal. There was always a scarcity of labour there.

7,299. Well, that would be some time back in the Cape Colony?—Yes, I had some friends there just lately come from the Cape Colony and the farms there recruited boys from 15s. to 20s. a month, say from 10s. to 20s. a month. I do not think there is a great scarcity of farm labour in the Cape Colony. I have not been there recently. I have had no experience of native labour there myself, only from other people. I do not think there is a scarcity in the eastern provinces in the Cape Colony.

7,300. Mr. DONALDSON: Do you think that the demand for labour among farmers at Krugersdorp is as great now as before the war?—Oh, yes.

7,301. Do you think it is more?—The demand for labour on the farms is on the increase.

7,302. On the increase?—Yes, because farmers are endeavouring to keep up with the demand, and as the demand increases for produce so they try to increase the output of their farms. On many of the farms the output has increased considerably. The output of wheat and oat-hay.

7,303. Then is it your opinion that more labourers are required in the district on farms than before the war?—Well, not just at the present moment, but it will be very soon; whilst the country develops so, the demand for labour will increase.

7,304. What you say is, if I understand you correctly, that you think that at present it is a little more and in the future it will be still greater?—I will tell you why the demand is more just at present. A great many of the farmers had natives on their farms before the war who were working for them. These natives have been removed from these farms and have not got back for some reason or other. Some of them are gradually coming back now. So that at present for that reason the demand is always far greater than it was before the war.

7,305. The want is greater?—Yes.

7,306. But what I want to ask you is, if all the farmers in the Krugersdorp district got all the labour they required, all they wished, would they require more labour than they did before the war?—Yes, they would require more.

7,307. But the fact is that at present they have fewer. They have fewer than they had?—Yes.

7,308. Mr. QUINN: I understood you to say, in reply to another member of the Commission, that you gave it as your opinion that we never had sufficient labour here?—Well, I do not mean we never had sufficient labour in the country, I mean there has been labour in the country, but we have not been able to get it.

7,309. I am speaking of the mines now. Do you mean that for the mines?—No, the farmers as well.

7,310. I do not know whether you are aware that in 1897—perhaps you will remember the Industrial Commission?—Yes.

7,311. When several of the leading mining men gave evidence before the Commission; you remember that?—Yes.

7,312. And their evidence was to the effect that they had more boys than they wanted. Do you remember that?—Yes.

7,313. And they proposed a reduction in the wages because they had plenty of labour, and the Commission set about reducing wages?—Yes, I remember that. That is the time I speak of; the chiefs tried to bring pressure to make them go out to work.

7,314. So your expression of opinion with regard to a shortage, always being that on the Rand, is subject to that correction?—Yes.

7,315. How do you arrive at 60,000 required for the farms; so many per farm, or so many farms?—I take it there are 5,000 farms in the country and on an average (my figures may not quite agree) but on an average each farm would require about 10 natives.

7,316. Now, suppose to-day 50,000 natives were available for these farms, is there the remotest chance to-day of these natives being employed on these farms?—Must I take into consideration the natives already employed on the farms?

7,317. Take the whole lot?—You mean to say take those who are there and add 50,000 natives available?

7,318. I mean this; suppose 10 boys were available for each farm. Could these 10 boys get work on every one of these farms?—I think so.

7,319. What would they do?—Well, they would go in for agricultural farming and stock farming and other farming.

7,320. How many farms are there in the Transvaal?—I am not sure, but a gentleman said just now over 10,000 farms in the Transvaal.

7,321. You do not know yourself?—No, unless I went into it. But I should say there were rather more than that, instead of less.

7,322. Have you any idea of the number of natives employed on the farms before the war, say in the year 1897, when labour was so very plentiful?—No, I could not tell, but I should say there must have been 10,000 to 15,000 boys employed.

7,323. Now, do you know what the population of the Transvaal is?—The white population?

7,324. No, the coloured population?—I do not know, but, judging from what I have seen, I always put it down at about one million.

7,325. Well, we have available from Sir Godfrey Lagden the actual figures for the first time, and it is considerably under a million. In answer to a question a few minutes ago, a member of the Commission got you to agree to a statement of his that practically the whole of the male labour available in the Transvaal, if the farmers could get all they wanted, would be required by the farms. Have you any idea how many of the something like 620,000 natives in the Transvaal are available for work on the mines and farms?—No, I could not give you any idea, but I think there are more natives than that in the country. I think that estimate is far below the number.

7,326. Well, in the figures given to the Commission by Sir Godfrey Lagden, something like 45,000 or 50,000 is given as available for the mines in addition to something like 50,000 or 60,000, who for many reasons would remain on farms. Do you know anything of that?—No, I do not say only 60,000 natives are available. I say what the farms require. I am not in a position to say how many natives are available in the country.

7,327. You did not see the full significance of the question, that if all the farms could get what they wanted all the labour in the country would be taken up by the farmers?—I meant to say what the farmers require. He was giving his own figures, not my figures. I maintain there are a great deal more than 40,000 natives in the Transvaal, and I put down the farmers' requirements at 50,000, and I think if you put down the available number of labourers in the Transvaal at 200,000, you will be nearer the mark.

7,328. Mr. TAINTON: In reply to the question just put by Mr. Quinn, you are dealing with the present demand and not the future demands due to the growth of the agricultural industry in this country?—No, I put down that 50,000 that will be sufficient for the next three or four years to come.

7,329. Did you say they could employ 50,000 at present?—Yes, they could employ that number at present, but that would be sufficient for the next two or three years, because at present there is a lot of extra work going on on farms that will not be required always.

7,330. I put a question just now that I wish to put again. Considering the probable expansion of the agricultural industry of the country is one per cent. a high estimate of the agricultural area of the Transvaal?—No, it is not.

7,331. Taking one per cent. or 60 acres per 6,000 morgen farm, the figure you gave as to the number of boys employed per acre stands as one for three acres?—Yes.

7,332. Did rinderpest have much effect upon the natives; did it drive them out to work?—No, it did not seem to have such great effect upon them.

7,333. Do you remember the year it ravaged the country?—The first time it made its appearance was in 1896.

7,334. In 1896 or 1897?—Yes, in 1896 it made its first appearance.

7,335. Do you think there is any connection between this surplus labour in 1897 of which we have heard so much, and rinderpest?—I do not think so.

7,336. You think it was merely a normal surplus?—Yes, I think it was the circumstances of that time just favouring the labour market.

7,337. I did not know you were a recruiter at any time, Mr. Edwards, but I want to ask you a question about your experience. You said, I think, that you found a difficulty in recruiting natives in Portuguese territory because you were not prepared to square the officials?—Yes.

7,338. What year was that?—I think it was in 1897 or 1898. I am not quite sure of the year. It was in 1898, I think.

7,339. I gathered from your replies that you thought coercion was employed in Portuguese districts with respect to the labour question?—Yes, when I was there, the Portuguese officials wanted a lot of labour. They went to one chief that I knew and he was arrested and put into gaol until his tribe could supply so many boys.

7,340. Are you sure of these facts?—I am quite certain of them. I will swear to them.

7,341. Was that the year when there was this surplus on the Rand?—No.

7,342. In 1897?—No. There was no surplus then, because I brought myself, I think, 70 or 80 boys back with me.

7,343. Was that in 1897?—It was in 1898, I think it was. I made a stipulation at the mine where I took the boys that they were to have their own chief over them whom they had brought with them. Those boys remained, and some of them were still on that mine after the war, having remained right through the war.

7,344. Are you aware that about 1897 or 1898 the mines had something like, it has been said, about 80,000 boys from the East Coast working there?—No, I do not say so.

7,345. No, but are you aware of the fact?—No, I am not. I do not remember the position. I only know what I have seen in the papers. I cannot tell what numbers there were.

7,346. From the evidence we have had, from a number of witnesses from Portuguese territory, the proportion of boys coming to work from those territories is very much higher than the proportion coming from other South African territories. What is your explanation of that difference?—Well, I think the boys from the East Coast are boys who are more inclined to work on mines than any other tribe in South Africa, and they do not care about working as agriculturists, they prefer working on the mines.

7,347. How far then does this factor of compulsion which you have mentioned just now come in to swell the labour supply?—I did not say that it did. I said that it was quite possible.

7,348. It is merely your opinion that it does so?—Yes, I think it is very likely.

7,349. Have you any other fact bearing upon that opinion other than the one you mentioned just now?—There was more than one chief imprisoned while I was there.

7,350. More than one?—Yes, first they wanted 200 boys and they put the chief into gaol until his tribe could supply the number. When they were supplied he was released. There was another chief taken from near Delagoa Bay and the same thing was done to him. He remained in prison for some time until he could supply the number of boys. Mind you, I do not say these boys came to the Rand. The Portuguese officials wanted them, I believe, for themselves on harbour works and one thing and another. But I know that was done, and I know for a fact it has been done before, because I understand the native language well, and I was amongst the natives a great time while I was down there.

7,351. The CHAIRMAN: The Commission is very much obliged to you for the evidence you have given.

Mr. T. R. PRICE, called, sworn, and examined.

7,352. The CHAIRMAN: Mr. Price, have you before you a document headed "Central South African Railways: Returns of Natives Employed During January, 1903, and on 31st July, 1903, as per Returns from District Officers"?—Yes.

7,353. Do you wish to put that in as your evidence-in-chief?—Yes, I do.

7,354. The statement was as follows:—

#### CENTRAL SOUTH AFRICAN RAILWAYS.

Returns of natives employed during January, 1903, and on 31st July, 1903, as per returns from District Officers:—

##### (a). Employed on Ordinary Railway Work.

Department.	January, 1903.	July, 1903.
Maintenance, Johannesburg...	2,375	1,335
" Pretoria ...	2,070	1,344
" Bloemfontein...	629	1,621
" Kroonstad ...	415	782
" Waterval Boven	1,000	974
<b>Total Maintenance ...</b>	<b>6,489</b>	<b>5,956</b>

	12,303	12,402
New Construction ... ..	1,078	3,092
<b>Total all Departments ...</b>	<b>13,381</b>	<b>15,434</b>

Rates of wages paid by different Departments:—

Maintenance: £2 10s. 0d. per month of 30 days, with food and lodging.

Traffic: 2s. 6d to 3s. 6d. per day without food, lodging supplied.

Locomotive: 2s. 6d. to 4s. per day, no food or housing.

Medical: 2s. 6d. to 4s. per day, no food or housing.

Telegraphs: 1s. 10d. to 3s. per day, with food and lodging.

General Manager, etc.: 2s. 6d. to 3s. per day, and find themselves.

New Construction: £2 10s. 0d. to £3 per month, with food and lodging.

Average cost of feeding is about 6½d. in Maintenance Department.

Capital expenditure for compounds, etc., is not worked out owing to compounds not being completed, and therefore figures would be incomplete.

The following table shows the number of natives actually paid and the amount of wages paid to them for the month of January, 1903, also number of natives employed in July, 1903:

Department.	January, 1903. No. of Natives.	Wages Paid.	July, 1903. No. of Natives
		£ s. d.	
Maintenance ... ..	6,489	15,781 6 3	5,956

Chief Accountant and Volunteers.	18	—	—
	12,303	37,296 16 9	12,402

The expenditure for July is not yet obtainable, as the wages sheets have to be collected from outlying stations—the information will be submitted later.

The apportionment of the natives employed during July, 1903, by the Administration in the Orange River Colony and Transvaal respectively is as follows:—

Department.	Transvaal.	O. R. Colony.	Total.
Maintenance ... ..	3,704	2,252	5,956
Traffic ... ..	1,748	310	2,058
Cartage (Departmental)...	460	43	503
Cartage (Contractors) ...	208	19	227

General ... ..	36	—	36
<b>Totals ... ..</b>	<b>9,129</b>	<b>3,273</b>	<b>12,402</b>

The amounts authorised for compounds, etc., are as follows:—

Item 10 (Budget Est.), Cartage Compound, Braamfontein, £4,310 complete.

Item 27 (Budget Est.), Native Huts, Germiston, £900 complete.

Item 91 (Budget Est.), Engineering Compound, Braamfontein, £13,179 complete.

Item 92 (Budget Est.), General Compound, Germiston, £11,632, in course of construction.

Item 100 (Budget Est.), General Compound, Pretoria, £20,000, to be built.

Total amount authorised, £50,021.

In addition to the above, there is the old N.Z.A.S.M. Compound at Braamfontein, estimated to accommodate 800 to 1,000 natives. The estimated capacity of the other compounds is as under:—

Cartage (Braamfontein), 380 natives and quarters for 24 married boys.

Engineering (Braamfontein), 932 natives.

General (Germiston), 1,020 natives.

General (Pretoria), 2,000 natives.

Arrangements have been made and are being carried out for the betterment of the food supplied to natives and the rations now sanctioned are as follows: Salt, ½oz. per day; mealie meal, 3lbs. per day; meat (fresh), 2lbs. weekly (whenever possible); pumpkins and potatoes, 1lb. weekly. Treacle is also issued as liberally as possible, and is found to be an excellent addition to the ordinary rations; it being also valuable as an anti-scorbutic.

To the foregoing must be added New Construction, as follows:—

I. Returns of natives employed.

(b.) On construction work.

Departmentally (January) ..	...	1,078
Week ending July 18th, Departmentally ..	...	865
Week ending July 18th, by Contractors ..	...	2,167

Totals ...	1,078	865	2,167

2. Rates of wages paid to natives employed on (b) construction work.—Wages paid January Departmentally from 1s. to 1s. 8d. per working day—month of 30 days—from £1 10s. 0d. to £2 10s. 0d. respectively.

Wages now paid from £2 10s. 0d. to £3 per month of 30 working days, but Agents have been authorised to offer £3 per month because of their inability to recruit at £2 10s. 0d.

2. Rates of wages paid to natives employed (c) by contractors.—Unable to say what contractors are paying, but think it is from £3 per month.

3. Total cost per month of housing and feeding.—Unable to give this information. Natives live in camps. Compound expenses are made up of Police boys, cooks, sweepers, and mealie meal, coal and meat.

For the purpose of estimates, the average cost per native, in respect of compound expenses, was calculated at 8d.

4. Districts recruited from and how and where recruited.—At present, natives are recruited from Basutoland only—by native agents. We used to obtain natives from the Pietersburg district, but now are allowed to recruit only south of the latitude of Pretoria, and Basutoland is the only place where we have procured natives—and results have been very unsatisfactory—though we are now negotiating for some from Natal.

The above refers to boys obtained departmentally. Contractors are getting their boys from Basutoland for the Harrismith-Bethlehem and Modderpoort Railways. The contractor on the Johannesburg-Vereeniging Railway is getting his boys from Queenstown in Cape Colony, and has so far had difficulty in getting them.

7,355. You are General Manager of the Central South African Railways?—Yes.

7,356. How long have you occupied that position?—Since August of last year.

7,357. Previous to that you were General Manager of the Cape Government Railways?—I was.

7,358. For how long a period?—I was in the service of the Cape Government since 1880. I was General Manager, so far as I remember, for about 18 months; previous to that I was Chief Traffic Manager and Assistant General Manager for about 10 years.

7,359. So that you are fully acquainted with the working of railways in connection with the labour supply for that purpose?—Yes.

7,360. You have submitted a return to us which shows that in January of this year, excluding new construction, you employed 12,303 natives?—I did.

7,361. And in July of this year you were employing 12,402?—That is so.

7,362. In January you were employing on new construction 1,078 natives and in July 3,032?—Yes.

7,363. The grand total being 13,281 in January and in July 15,434?—Yes. I do not know if the Commission would consider it convenient if I put in a return of natives who were employed in June, because in June we employed some 3,000 more than we did in July; that is, on open lines. I have it if it would be of any convenience.

7,364. I think such a rapid falling off in the number employed is a matter of importance. Can you put that in?—I can put it in.

7,365. Witness put in a return as follows:—

NATIVE LABOUR RETURNS.

The following table shows the number of natives actually paid and the amount of wages paid to them for the months of January and June, 1903:—

Department.	January, 1903.			June, 1903.		
	No. of Natives.	Wages Paid.		No. of Natives.	Wages Paid.	
Maintenance .. .. .	6,489	£ 15,781	s. 6	9,606	£ 22,953	s. 19

Total .. .. .	12,303	37,290	16 9	15,910	46,266	17 10

7,366. I take it that that statement is on all fours with the other statement received in regard to the total figures?—That is so, yes, excepting that I have not given new construction. I could give that if needs be. I am dealing with open lines.

7,367. This statement for June shows the number of natives employed on maintenance, 15,910?—Yes.

7,368. And at the end of July, 12,402?—Yes.

7,369. Can you give any explanation of that very large decrease within a period of one month?—A great many of these boys' time contracts had expired; others had left owing to the winter season coming on, and we were unable to get them replaced.

7,370. Was any attempt made on your part to re-engage?—The utmost endeavour was made.

7,371. Did any large number of those whose time had expired re-engage?—I think not.

7,372. Are you able to give the Commission any information as to the number of natives employed per mile on open lines?—Well, our length of line open is 1,335 miles, that is counting the double and treble lines as just one mile, but if they are worked out on the basis of a single line, the length is 1,378 miles, so it becomes merely a matter of calculation. Our difficulty is that from month to month the natives vary owing to our inability to get sufficient.

7,373. Have you made that calculation of any one month, take July? Will you make that

calculation and just give us the figures? Take July, which is 12,402. It gives exactly nine, does it not?—A little over nine taking the mileage at 1,335; it is just nine, taking the mileage at 1,378.

7,374. In comparing one railway service with another, it is a common way of arriving at the respective number of boys employed, is it not?—No, I think it is a very unsound way of calculating because the conditions are not equal practically on any one line. The sounder way, although it is not entirely sound, is to take the volume of traffic carried because it is almost a universal rule, approximately accurate in calculation, that the labour employed approximates to the volume of traffic carried.

7,375. Yes, but we shall deal later with the commoner, but not the sounder, way according to you. Can you tell us the number of natives employed per mile open in Cape Colony at any one time?—I telegraphed to enquire and I received a reply that they are getting up information. But the total labour employed, so far as I can gather from the telegram here, which was mutilated in transmission, is 13,104.

7,376. Do you know the mileage of lines open in Cape Colony?—The Cape Colony line is 2,196 miles. The extension to Bulawayo, which is worked by the Cape, is 588, making a total of 2,784 miles.

7,377. In that figure of 13,104 natives, is that mileage of 588 included?—Yes.

7,378. Have you the same figures for Natal?—Yes, I can furnish Natal. The Natal mileage is 635 miles. According to the General Manager's report for last year, they employed 7,049 natives, which work out at 11.25 per mile. I think these figures will indicate to the Commission the unsoundness of merely taking the mileage as a basis.

7,379. Yes, I quite agree with that. I do not think the Commission will dispute that. Do you happen to have similar figures for the working of the Z.A.S.M. previous to the war?—The figure was mentioned to me, but I have not sufficient knowledge of what is intended to be covered by it, neither do I remember what was said. I have an idea it was mentioned about 5,000 for the Z.A.S.M., but I am not sure that is right.

7,380. Have you the figures of the Orange River Colony before the war?—No.

7,381. Or for the Portuguese Railway?—No.

7,382. I understand, Mr. Price, there are special conditions influencing the number of natives employed by you per mile at the present which do not apply to other railways in South Africa?—Yes.

7,383. Will you tell the Commission what those conditions are?—They are dealing first of all with the traffic and with the Locomotive Department; owing to the greater volume of our trade we employ a very much larger number of natives per mile than is employed either in Natal or in Cape Town. With the permission of the Commission I will put in a copy of a statement I prepared for the Railway Committee, showing the traffic dealt with on our line of 1,335 miles as compared with the whole of the Cape and Natal. It shows that approximately on our comparatively short line the tonnage is nearly equal to the tonnage of the two other systems put together. Obviously, therefore, having that tonnage to deal with, the number of natives required for handling the goods at our various stations and the number of natives required to coal the engines and do the other locomotive work, is correspondingly greater. That will be a factor that will practically always apply to this system so long as the traffic continues as heavy as it does. But there have been and there are likely to continue, certainly I should think from one to two years, the factors that throughout the war the lines were practically untouched and they were further very much damaged by the enemy during the war. Owing to the maimed and neglected condition of the line we have had during the last year to employ an additional staff to repair the damages and gradually get the line up to a better condition in a permanent way. We have further

been using very much heavier engines than formerly, so as to enable us to bring the traffic forward. All this results in the employment of a very considerable addition to the staff of native labour. In addition to that a large number of men is required to provide for the additional facilities that are absolutely essential to get work carried on. Our engineer estimates approximately that in view of the present condition of our line we require for maintenance purposes about 4,600 natives per annum and for the additional work to which I have alluded as being essential another 4,600 natives per annum or a total in the Maintenance Department of 9,200.

7,384. Do you mean to compare that figure, 9,200, with the 1,335 employed in the Maintenance Department in July?—No.

7,385. I beg your pardon, the total is 15,434?—Yes. I wish to bring to the notice of the Commission that in consequence of the inability to obtain the number of natives for the month of July and subsequently we have been seriously hindering the essential work necessary to be carried on to get the lines into proper working order. I may perhaps be allowed to mention that in consequence of the absence of these natives between June and July, in July as compared with June, we have been compelled to discharge from the 1st of June to the present 654 artisans, all of whom would be employed, if not the same men, then men of a similar type, for doing a similar class of work, if we had had the natives. There were no natives available and much to our regret we simply had no work for the artisans to do. Given the natives we could have employed them.

7,386. Then when you find the shortage of natives which sub-division of your work do you deprive of labour? You seem to have deprived the Maintenance Department for the bulk of the shortage?—The falling off has mainly been in the Maintenance. We felt a shortage in the Traffic Department, and we felt a shortage in the Locomotive Department. What happens in the Traffic Department when we run short is that we are unable to effect delivery of goods at the various stations with the satisfaction we would desire. But we take up a good deal of casual labour and we use every stationmaster as practically a recruiting officer, and in one way and another we seem to manage with an effort to get approximately the men we want, although we do not always get enough and the work suffers in consequence. The Maintenance Department, on the other hand, suffers badly. A certain amount of maintenance must go on in order to get the line into anything like decent order. The other has to stand over.

7,387. You spoke of a statement you wish to hand in. Have you a copy with you?—Yes. The statement that I wrote on the 17th August to the Railway Committee is as follows:—

Central South African Railways,  
General Manager's Office,  
Johannesburg, 17th August, 1903.

(Copy.)

No. 209.

The Commissioner.

REPRESENTATIONS MADE AT RECENT  
INTER-COLONIAL COUNCIL MEETING  
REGARDING DELAYS TO TRAFFIC IN  
TRANSIT.

With reference to Section 10 of my Report, No. 182 of to-day's date, the Railway Committee will perhaps the better realise the pressure put upon our resources if I may be permitted to point out that:—

- (1). The Central South African Railways with its 1,335 miles of railway, in its maimed condition imperfectly equipped in every respect (necessarily quite unavoidable in the circumstances) had crowded in upon it for transport during the year ending June 30th, 1903, of traffic 3,665,835 tons, besides passengers, parcels, mails, etc., etc.

(2). While during the year ending December 31st 1902, the Cape Government Railways with its 2,196 miles and the Natal Government with its 635 miles, or a total of 2,831 miles, carried between them 3,922,518 tons, besides passengers, parcels, mails, etc., etc.

(Signed) T. R. PRICE,  
General Manager.

7,388. The point in that statement is?—The point so far as this Commission is concerned is with regard to the suggestion that we employ a larger number of boys per mile than the Cape Government. On our 1,335 miles of line we have carried nearly the same tonnage as the two other systems put together with their 2,831 miles of railway.

7,389. The mileage is more than double?—Considerably more than double.

7,390. Are there any other considerations concerning the number of boys per mile that you wish to refer to?—I think I have mentioned all material points. There is a minor one. We have an independent Telegraph Department of our own that employs a certain number of boys, but that does not affect the issue very materially.

7,391. Have you improved the housing and feeding conditions of the natives recently?—Yes, we have spent a large amount of money as is indicated in the statement in building compounds. In addition to that we were advised that we ought to improve the feeding by giving the natives meat and vegetables, and we have arranged to supply them with 2lbs. of meat per week and a fair supply of treacle, which, in addition to the vegetables, is said to be better in its results than lime juice in avoiding scurvy.

7,392. You speak under "wage paid" of paying £2 10s. to £3 per month of 30 working days?—Yes.

7,393. Your month then is not a calendar month but 30 working days?—Yes.

7,394. The same as the mines?—Yes.

7,395. I notice you propose through your recruiting agents to offer the natives £3 per month now; I am referring to page 5?—That is in construction, but not maintenance.

7,396. What is the wage of boys on maintenance?—50s.

7,397. And on construction, instead of offering 50s., you are now offering 60s.?—Yes, the wage on construction was £2 10s. to £3, but they experienced so much difficulty in getting natives that they proposed increasing the rate to £3.

7,398. Do you think that will increase the number you will be able to secure?—It may for a time be the means of our securing natives from other people. It may also to a certain extent increase the number coming out to work at present. I must say I am very sorry we have been obliged to do it because of the serious consequences involved or rather which are likely to follow.

7,399. What serious consequences do you refer to?—Well, as was stated by the last witness, once the pay of a native is increased, it becomes extremely difficult to reduce that rate. We are employing on open lines anywhere between 12,500 and 16,000 natives. An increase in wages on that number of, say 6d. per day, means a practically permanent expenditure of about £100,000 per year. That has to be met out of revenue, and that is why I regret that on construction it has been found necessary to make that increase.

7,400. You think the giving of this increase on construction may have the effect of causing your natives engaged on maintenance and the other departments to demand the same rate of wage?—One fears it. It is a difficulty. We have the internal difficulty at present and the Commission is aware how matters of that sort are looked upon by the natives.

7,401. What was your experience in the Cape Colony with regard to the supply of natives for railway purposes?—I think I am able to speak on that subject from 1881 onwards. At Port Elizabeth,

where I was Assistant Traffic Manager of the Midland System, and afterwards at East London, where I was Traffic Manager of the Eastern System, I was Wharf Master at Buffalo Harbour also, while Traffic Manager of the Eastern System, having charge of all the arrangements of the port. We employed very large numbers of natives, the more so on the Eastern System with the port arrangements, and we were right in the heart of the native territory of the Cape Colony. My recollection is that for very many years almost until the time I left the supply was plentiful, and when we ran short at all, all we had to do was to send to the various locations and we got the natives at, I think, 6d. per day less than I understand they are paying them now. I think that we used to pay the natives about 2s. per day and a good native after we got him experienced we used to pay 2s. 3d. to 2s. 6d. per day, but as time went on and the country got developed the difficulty in getting natives gradually became more and more; and especially when the Transvaal gold mines opened up, natives drifted away to the Transvaal and the supply for local purposes was not so easy to get. As time went on the difficulty became more and more. I remember when I afterwards went to the Eastern System, when I was Chief Traffic Manager, I had to use very special efforts to secure natives even for the frontier. Similarly for the purpose of securing sufficient natives we inspanned, if I may use the word, the good offices of the Secretary for Native Affairs. We had constantly to communicate with him in order to get him to scour through the magistrates of the various districts to keep up a supply. We managed through these efforts to keep up the supply, but sometimes it was difficult.

7,402. When you were speaking of a wage of 2s. and 2s. 3d. per day, did you supply food in addition to that?—No.

7,403. Did the natives feed themselves?—Yes.

7,404. When you left the Cape service then, as far as the Eastern district was concerned, the question of native labour supply was an increasing difficulty?—It was throughout the Cape Colony. I am speaking of the latter time when I was both Chief Traffic Manager and General Manager, the difficulty was getting acute then.

7,405. Have you a recruiting department of your own in the C.S.A.R. here?—We have and we have not. In the case of the Traffic Locomotive Departments we do recruit to a certain extent. We recruit in Zululand and Natal, where we have tried and failed. In Rhodesia we have tried and failed to get any. I personally communicated with the Resident Commissioner of Bechuanaland some time ago to try and get boys for the Maintenance Department. We have sent down to Sekukuni's country and Northern Transvaal, and I think we have enquired in Pondoland; however it was found our efforts in the Cape Colony and in Basutoland were liable to interfere with the Native Labour Association, and we therefore allowed them to recruit for us. We secured from the Native Labour Association during the year 5,617, *i.e.*, in addition to our own efforts.

7,406. Do you mean the year ending 30th June last?—I have given the number of natives obtained through the Labour Association up to the present. Of the boys they got for us in addition to our own efforts they secured 4,198 from the Cape and 382 from Basutoland, the remainder coming from the Northern Transvaal, the East Coast, some from Bechuanaland, some from the Western Transvaal and some locally. In addition to that I went to the Native Affairs Department and through their Commissioners we were able to get from them some 1,944 natives in the same period. The remainder we have got by our own efforts. The remainder of the natives we have been able to secure to keep up the supply to as much as it is, represents our own efforts.

7,407. I take it these efforts through these different channels will continue?—Oh, yes.

7,408. Mr. DONALDSON: Is it a fact, Mr. Price, that on the railway in Natal at present they are

carrying out considerable alterations and improvements?—I am unable to speak with any personal knowledge.

7,409. I saw in the paper this morning that the Prime Minister of Natal said they were doing it?—I should think it quite likely.

7,410. They are reducing their gradients and widening their curves?—I should say it is quite likely, but it is not within my knowledge.

7,411. If that was so would that add to the number of natives per mile they are employing there?—It would add to the number.

7,412. That is to say normal conditions would lessen the number per mile?—I should think the authorities will tell you the number of natives they employ is the same as in our own case, dependent upon the traffic to be carried. I have no wish to suggest at all that the number of natives the Natal authorities employ is high.

7,413. But if they were not carrying out that sort of work they would require fewer natives per mile?—It is probable.

7,414. You told us just now that you carried a certain tonnage over the C.S.A.R. system and in the Cape and Natal they carried just very slightly more, I think, but you did not tell us how far that tonnage was carried on an average. Can you give us that information?—No.

7,415. Would it be fair to suppose that the bulk of that tonnage carried over the Cape lines was carried over the main lines?—I happened to look at the tonnage statement forming part of the Cape Report that has been introduced for the last two years, and I observed that their proportion last year corresponded very much with the proportion of the previous year which is that more than half of the Cape Colony traffic is carried a distance of under 50 miles. I can place the Commission in possession of the information if they wish it.

7,416. Can you give us the information about the C.S.A.R. line, how far?—No, the information is being got out now for the last half-year, and it will be kept for the future.

7,417. Will it be long before that information is available?—Yes, I should think it will be about six weeks before it will be all available.

7,418. Do you employ any coolies; by coolies I mean Indians, on the C.S.A.R. system?—Not to any extent.

7,419. Mr. EVANS: Supposing you were free to recruit everywhere in South Africa excepting Portuguese East Africa, could you get all the natives you require?—I understand we are at present free to recruit excepting in Portuguese East Africa, and we do not succeed in getting all we want. The only territory that has not been exploited by us as far as I know is Swaziland, and we were told by the Labour Association they were doing the best they could for us there.

7,420. Then what is your shortage, roughly?—We are short, according to the statement submitted, of about 3,500 natives.

7,421. That is for the current working of the line?—The current working and what is essential to keep the line in decent working order.

7,422. Supposing labour is plentiful, how many do you require?—16,000.

7,423. That is for current working?—Yes, open line work.

7,424. How long will 16,000 be sufficient for you?—I should say we shall require that for quite two years, and by that time I anticipate the additional lines that will be opened and in view of the fact that new lines require extra men to keep them in good working order, I cannot think that we are likely to require less than that for a good many years to come, probably not at all. I think we shall always require 16,000 natives.

7,425. For the current working of the railway?—Yes, I think so.

7,426. What is your monthly wastage? Supposing that the 3,000 you are short of was made up, how

many would you require per month?—We have not kept a record of that, and it would have been difficult to ascertain, because practically each department has been using its utmost endeavours to secure natives and has been doing so more or less in its own way. We would get out the information, but it would take a good deal of time to get out, and therefore I cannot say positively what the wastage is likely to be, but I dare say it would not be an unfair estimate to assume the natives remain with us for six months on the average.

7,427. That you think would be about the average length of their stay?—That is my impression. We shall take steps to keep the record in that form for the future, *i.e.*, to keep a record of the wastage.

7,428. Now does that 16,000 include absolutely all the natives that are employed by the railway except on new construction either by contractors or other people?—I should say 16,000 should be sufficient. We employ at present, in addition to the figures I have given, four contractors who have between them 400 natives, so I think we may take it 16,000 is about our requirements for several years to come.

7,429. Can you give us an estimate of the requirements for new construction?—I think the answer to that would be as many as they could get. It depends upon the speed in which you want new construction carried out.

7,430. I suppose the quicker it is done the better from an economical point of view?—I think so.

7,431. Then can you give us a figure?—I am not able to do that. The new construction is not under my control, but under the control of the Railway Commissioner.

7,432. We can get that from another witness?—Yes, Captain Pritchard is here, and will be able to give it you.

7,433. Now would it not be possible to economise natives on the railway by more extensive use of white men for work that is now done by Kaffirs?—Of course everything is possible. The only question is whether this country can afford to pay the cost that would be involved.

7,434. What are your views on the subject?—Well, my personal view is this, that with the experience we have had of white labour for the class of manual labour usually done by natives in this country, if it is to be filled in with white people and be a white man's country, and to progress in the way we are all looking for it to do, we cannot afford the expense that would be involved. I have consulted with our Chief Resident Engineer of open lines, and he estimates that white labour for doing maintenance work such as we get Kaffir labour to do now, and after making a reasonable allowance for any extra working capacity, the white man's labour as compared with natives is in the relation of £1 which it costs for a native to about £2 10s. or £3 according to the conditions obtaining in the case of the white man. The details have been given to me, and if the Commission wish it I shall be pleased to furnish them with a copy of the report I received shewing how the Chief Resident Engineer arrives at his calculation. But, fortunately or unfortunately, as one may choose to look at it, we have practical experience of what employing white men on work, where we have hitherto employed Kaffirs means, in the case of the doubling of the line from Braamfontein to Krugersdorp. The figures are not finally completed, but are sufficiently complete to furnish an accurate estimate. If that work had been done by native labour entirely, the entire cost would have been £39,699. We have employed on the work about 600 white men and a certain amount of work has been done by native labour, and what ought to have cost us a little under £40,000 is going to cost us £80,950.

7,435. That is considerably more than double?—Rather more than double.

7,436. When you take it into account the fact that you have also employed natives?—Yes, these figures of the actual results serve to confirm the

Engineer's impressions as to what the probable cost would be if the work of that character was done exclusively by white labour.

7,437. That is two or three times as much?—He estimates it under favourable conditions at two-and-a-half times and under certain other conditions three times.

7,438. Can we have that report put in?—Certainly. (The witness hands in the following statement.)

The CHAIRMAN: I think it might be read for the information of the Commission.

7,439. The witness read the statement:—

Office of the Chief Resident Engineer,  
Johannesburg, 25th August, 1903.

COMPARATIVE COST OF NAVVIES  
WITH NATIVES.

I estimate the total cost of doubling the main line, Braamfontein to Krugersdorp, including the provision of new stations and extensions of existing ones, employing white labour, at:

Labour ... ..	£80,950
Material ... ..	75,860
Total ... ..	£156,810

exclusive of expropriation..

The cost of all labour substituting native for white as regards unskilled labour, £39,699, or, on the gross total of this work, the cost of all labour is raised about 104 per cent. by the substitution, in part, of white for native labour.

This does not, however, represent a fair charge as between white and native labour, as it must be remembered that native labour has been used in part on this work and that, further, the proportion is reduced by the fact that all the charges for the white skilled labour, artisans, gangers, etc., remain the same on both sides.

H. A. MICKLEM,  
Chief Resident Engineer.

The General Manager,  
Johannesburg.

I may say with regard to that, this increase has been particularly unfortunate for us, because we really thought we were making a very liberal estimate for the doubling of that line, and were hoping a surplus would be available for further extensions, but, instead of our estimate of £150,000 covering the work, we shall have a shortage which will have to be met out of revenue in some way or other. The report on the comparative estimates of white and native labour, also by the Chief Resident Engineer, is rather a lengthy report, dated 27th May.

7,440. Do I understand the Chief Resident Engineer himself is coming after you?—If you so desire. Perhaps we could deal with that when he is before us.

7,441. Mr. EVANS: What I would like to get at is Mr. Price's own experience, whether his previous experience and experiments with white labour confirms the conclusion arrived at by the Resident Engineer. That is the point I want to get at. That is why I should rather like to have the statement of the Resident Engineer.

7,442. The CHAIRMAN: I understand Mr. Price is going off to Bloemfontein to-night?—I have to meet the Town Council to-morrow, but in view of the importance of this matter I can telegraph postponing my interview if it is wished. Then perhaps we might have it read if you think it necessary.

7,443. Mr. EVANS: I would suggest we should have it read.

7,444. The witness read the following statement:—

S. 768. (Copy)

27th May, 1903.

Sir,—I have the honour to enclose herewith a statement comparing the relative working capacity and cost of English navvies and natives, and also the cost of work performed by each.

This estimate has been based as regards work on earth bank, as I have most information on this point, and it forms the principal item in the construction of new lines. In the case of rock work, the result would be slightly more favourable to white labour, but I consider that the cost of the English labour would still exceed that of the native by 100 per cent.

You will note:

- (1). That no allowance has been made for the cost of recruiting white labour. I take it this would not exceed 1d. per diem per man.
- (2). Food includes the cost of food on Sundays.
- (3). Camp equipment, etc., provides for tents, blankets, beds, towels, soap, etc.
- (4). Invalids. This item does not represent the total loss owing to the sickness of the man under consideration. It is a proportion of the cost incurred in passage money out and home of men who fall sick, and whose work is consequently lost to the railway. I have not taken account in these calculations of the expense incurred whilst men are off sick, as the charge is common to either form of labour, but the expense due to this cause is higher with white labour than with native.
- (5). Passage out and back, railway journey, cost of food on journey—expenses in connection with journey taken at £30 in all.
- (6). Same remarks apply as to (4).
- (7). Bonus calculated on 10 cub. yards, *vide* comparative working capacity.
- (8). Natives' wages, 50s. per month. Recruiting, £3 for six months. Food, 13s. per month. Coal and passes, 3s. per month.
- (9). I have been somewhat favourable to the white labour in the comparison of capacity.
- (10). It will be understood by you that the comparison of cost does not represent the whole cost in each case, as items common to both labour, such as sickness, holidays, office expenditure, etc., are omitted from the comparison.

I have the honour to be,

Sir,

Your obedient servant,

(Signed) H. A. MICKLEM, Major,  
Chief Resident Engineer.

The Railway Commissioner,  
Johannesburg.

7,445. Mr. EVANS: Have you any further observations to make on that report?—I do not think so.

7,446. Have you had any previous experience of attempts to use white men to do Kaffir's work in South Africa?—Not that I can recollect.

7,447. Do you know how this present attempt is going on? Are the navvies satisfied with the position or are they giving trouble?—I made enquiries with regard to that, and my information is that the bulk of them are likely to return to England at the conclusion of their agreement. My further information is that a portion of the navvies are good and a portion are not.

7,448. Your information goes to show a portion might be induced to continue with that class of work here?—My information is that very few will remain. My information also is that a certain section of the navvies are good men, but the others did not seem to be desirable white men from the point of view of making this a white man's country.

7,449. How do you account for their disinclination to remain and go on at that work?—I should put it down to the character of the navy. As is well known, he has peculiarities of his own, peculiar to that class of work. I should imagine that would be the reason.

7,450. Do you think it possible to get any large numbers of these men, supposing we were even prepared to pay the price?—I happened to be in England at the time when the cable came for employing the last batch of navvies that were engaged, and the officer who is in the Colonial Office, told off to engage their services, informed me that he experienced very great difficulty in getting the men. He informed me that when he went down to the west of England to secure the last batch of these men he found himself unable to secure all the men he was commissioned to get. He certainly did not speak to me in any hopeful way of being able to get any considerable number of suitable men for doing that particular class of work beyond what they had secured. I may further say that when I got to Cape Town they besought me to try and make some arrangement so as not to bring the navvies out in large batches owing to their turbulence when they landed in Capetown, and asked me to arrange so that not more than 50 at a time be imported.

7,451. Mr. PHILIP: According to your statement, you had on maintenance in July an average of a little over 4½ boys per mile, 5,900?—Yes.

7,452. And you stated, I think, you would require in February about 9,200 for maintenance?—Yes, we require them now.

7,453. That will be about seven per mile?—Yes, for the whole of the work that is to be done.

7,454. Can you tell me what is the average per mile they employ on the Cape Railways for maintenance. Is it not three per mile?—No, it is less than that for actual maintenance. For ordinary maintenance, that is the upkeep of the line, once it was in good order, the Netherlands Company

used to have a man per kilometre for purely maintenance. With the increased traffic our engineer considers we shall require two men per mile on this line.

7,455. What work will the other five men be doing?—Station work, ballasting, relaying and improving the general upkeep of the line.

7,456. With reference to the new construction, I suppose you are consulted with reference to works and so on?—The intention is to consult me. I have not been consulted previously, but the intention is to do so in future.

7,457. Do you know that they have just advertised for tenders for about 300 miles fresh line?—Yes.

7,458. And I believe the conditions are inserted as to time limits?—I have not seen the contracts, but I daresay that will be so.

7,459. Mr. TAINTON: I see the rate of wages paid give an average of about £3 per month per native. Is that so?—The rate of wages in the Maintenance Department is £2 10s. with food, and in the other Departments, with few exceptions, they are paid so much per day without food.

7,460. I was taking the total given us in this supplementary return?—I daresay it works out at that.

7,461. There were according to this return 12,303 boys in January who received £37,296 and in June there were 15,910 who received £46,266. Roughly, that would give wages £3 per month?—Yes.

7,462. You say that you have difficulty in getting boys. Is that so?—That is so.

7,463. Is railway work popular amongst natives?—It has that reputation.

7,464. There is not much danger or discomfort attached to it, is there?—Not specially so.

7,465. If you had more unattractive employment, carrying risks to life and conditions unfavourable to health, such as we have in the mining industry, is it a fair inference that it would be necessary to pay considerably higher wages in such an industry in order to compete with your tariff of wages on the railways?—My information is, that railway work is preferred to mine work.

7,466. It is a fair conclusion, therefore, that in order to get boys against the competition of the railways, we should have to pay them more than £3 per month on the mines?—I should think it likely, though it is to be remembered that there are quite a large number of boys who absolutely decline to go underground, who like surface work, and who prefer railway surface work. I am not sure that the comparison is exactly on all fours, as there are some boys who will work underground and there are others who absolutely refuse, but I should imagine, taking one thing with another, it would be more difficult to get boys to go underground, than it would be to get boys to work above ground on the railway, but that is only an impression.

7,467. Comparing the mining industry with the railways from the natives' point of view, is it your impression that we should have to pay a higher rate on the mines than £3 per month?—I should think that likely.

7,468. When, therefore, you offer £3 per month you are practically offering the inducement of higher wages?—To some extent that would be so. It must be remembered that in our case about half the boys—in taking this statement you have worked out, roughly, about £3 per boy—but about half of these boys get food and others do not.

7,469. That would reduce the average rate paid per month if we exclude the food value?—Yes.

7,470. How long have you been in the country?—Since 1880.

7,471. Can you tell us what the railway mileage of South Africa was at that time?—The mileage in Cape Colony was from Capetown to Beaufort West, Port Elizabeth to Cookhouse, Alicedale to Grahamstown, and Port Elizabeth to Graaff-Reinet; on

the East London line from East London to Queenstown and Blaney to King William's Town. The distance from East London to Queenstown is 154 miles and to King William's Town a branch is 10 miles; that is 164. From Port Elizabeth to Graaff-Reinet is 182 and Port Elizabeth to Cookhouse about 130 miles. The Grahamstown branch, I think, is 37 miles. From Cape Town to Beaufort West, I think, is about 340 miles. Then the line was opened to Wynberg, which makes six miles more. There is the Malmesbury branch which, I think, is about 30 miles, and then there was the Stellenbosch loop line, which I suppose would be about 25 miles. This I am giving you quite roughly from memory, but that was the condition of affairs when I came to this country.

7,472. That comes to about 900 miles?—Yes.

7,473. Do you know what the position was in Natal?—I am not quite sure whether the line had extended to Pietermaritzburg, but I think it was only from Durban to Pietermaritzburg about that time.

7,474. What is the distance?—I am not quite sure, but I think about 60 miles.

7,475. There were no railways in the Transvaal or the Free State?—No.

7,476. Of this total of 4,532 miles about 3,500 have been built since you were in the country?—Yes.

7,477. Do you think it a fair inference that railway construction will continue in the future at even a greater ratio?—I should say so.

7,478. I mean in the Transvaal and Orange River Colony?—Yes.

7,479. Under ordinary conditions do you expect to see the country's railway system develop in the future as rapidly as in the past?—If the policy of developing the internal resources of the country and encouraging the occupation of the land in the interior by white people is continued, undoubtedly the building of railways will be obliged to continue.

7,480. What is the average number of men employed per mile on the construction of a railway?—I think I would rather that the construction engineer answers that.

7,481. You could not give us the rough figures?—Not from my own knowledge.

7,482. It is probable then I take it we may expect the Railway Department to be a constant competitor in the labour market?—I should say so.

7,483. Do you think it will become so in an increasing ratio?—If railway construction goes on, yes; and similarly, yes, for the maintenance of the lines subsequently; the maintenance and working of the new lines as they are opened will require natives to be employed.

7,484. You state that during your experience you had found in the Cape Colony increasing difficulty in supplying your labour demands?—That was our experience.

7,485. Is it not true that the area which has come under European influence, the area of native districts inhabited by a native population, has enormously extended since 1881?—Yes, and I attribute to that fact mainly the increasing difficulty in obtaining the native labour supply that was formerly available.

7,486. Why do you attribute it to that fact?—The development of the country requiring native labour.

7,487. Then does your experience as a large employer of labour go to show that the demand for labour for the industrial expansion of the country has exceeded the labour supply for a long period of years?—Judging from the growth of the traffic of the railways, not only large centres like Johannesburg and Kimberley, but at the smaller stations, I should say, undoubtedly, yes.

7,488. Unless, therefore, we tap new sources of supply, do you think there is any prospect of this labour shortage with which you are familiar being

overcome?—I must confess that the outlook to me from a Railway Manager's point of securing a sufficient native labour supply is disquietening.

7,489. Is it not true that in this interval European expansion has practically enveloped the whole of the native territories of South Africa?—I cannot speak of that from my own knowledge. I should say it has probably, but that is merely an opinion.

7,490. I did not perhaps make my question clear, I mean that in this interval the natives living as independent tribes have been absorbed and the Europeans have now overlapped their boundaries and so to speak enveloped these native territories?—They have certainly encroached on them in the Cape Colony, and I should say in the Transvaal as far as my knowledge of the country has gone; the answer to your question would probably be, yes. I should also judge that in the Orange River Colony, as the result of railway construction, that the European has encroached upon the native, assuming the country to have been occupied by natives.

7,491. There are then no untapped native labour markets in South Africa?—I know of none for railway purposes.

7,492. Would you say then assuming the railway development of the country proceeds as rapidly as in the past, that there is any prospect of your obtaining the labour for that railway development?—At the present time our only hope of securing our requirements is in the Portuguese territory. In the future, as far as I am able to judge, I am not able to see any other direction in which I can look for an increased supply beyond what we are at present getting, because the figures show that already during the past year we have drawn through the Native Labour Association over 4,000 natives from the Cape. If their internal development proceeds, and their railway construction, I should view that source of supply as becoming distinctly more and more precarious.

7,493. Then if this is true of railway work, which I understand is popular amongst the natives, the outlook is even less favourable for other industries such as mining?—I should certainly not regard it as better.

7,494. I suppose we shall have an opportunity of dealing with these figures as to the cost of white labour when the Resident Engineer is called?—He will be entirely at the service of the Commission to give evidence when wished.

7,495. I should like, however, to ask you whether your personal opinion is on all fours with that of other witnesses we have had to the effect that white men in South Africa are not partial to work and the tendency is for them to devolve the actual manual labour upon the native?—That is our experience.

7,496. Is it your experience with the navy class?—Well, we have only had this consignment of navvies on the Krugersdorp extension, and have not heard that they transfer their work to the natives, and I therefore cannot say whether they do or do not.

7,497. The CHAIRMAN: I think it is quite impossible for us to finish to-night. I was going to suggest we should adjourn. I think it very important we should finish with you, Mr. Price?—Very well. I will telegraph immediately to the Mayor of Bloemfontein asking him to excuse me.

After some discussion, it was agreed that Mr. Price's examination should be continued.

7,498. Mr. TAIN'TON: I would like to get your valuable opinion as to the relative value of white and coloured labour. I think we were trying to arrive at your opinion, Mr. Price, as to the effect of an inferior labouring class upon a white superior labouring class, and I asked you whether you found white railway employees affected by the fact that they had inferiors under them, and to what extent they shirked work?—I would not say that they shirk their work, but what we have done is to recognise the fact that white manual labour cannot be got, and cannot be expected to be got alongside of native labour. We have therefore aimed in the

direction of our work that the white man shall have a class of work where he will be master of the native, the servant, and as far as my railway experience goes I think that that is for a good many years to come at all events the best position to take with regard to the white men in South Africa.

7,499. You have employed the white man then as the directing intelligence, and not merely as the manual labourer?—As far as we possibly can, we have employed the white man as the directing agent.

7,500. And the wages you have been paying for have been paid for brain labour, and not for manual labour?—That is so.

7,501. Do you think it would be good that the brain power, the directing agency, should be taken from its present work and turned on to do the manual work?—The impression I have always had in that direction is this, that instead of improving the natives by doing so, we deteriorated the white man as a general rule. There are exceptions to that rule, but as a general rule the tendency would be rather to deteriorate the white man if he is to do the class of work generally performed in this country by the native. That is the judgment I have formed during the time I have lived in this country.

7,502. Is it sound business principle to employ skilled labour worth a great deal in unskilled labour which can be done by inferior workers?—It would not be a good principle to employ an intelligent white man such as we ordinarily have in this country for manual labour to compete with the natives. If, therefore, we are to have the manual work done in competition with the native, I think there is no escaping from the conclusion that the type of white man you will be employing is a type I should be very sorry to see predominating in South Africa.

7,503. Then for inferior work you want an inferior agent?—Yes.

7,504. It is not sound business or a sound economic principle to employ a consulting engineer as a rock shoveller?—I do not think I would employ him myself. I would not be inclined to do so anyway.

7,505. Mr. QUINN: I suppose you have met engineers, Mr. Price, who would be more profitably employed shovelling rock than engineering. But this by the way. How long have you been acquainted with the labour shortage?—Do you mean in this country?

7,506. I would rather put it in this way. What labour shortage have you experienced before the war?—I had not been in Johannesburg 24 hours before the requirements of native labour were dinned into me.

7,507. Is that since the war or previous to the war?—Since August of last year.

7,508. I understood you to say to someone in answer to a question suggested by you that you had been experiencing a labour shortage, but I understand you meant by that since the close of the war?—I cannot speak of the Transvaal with regard to pre-war days subsequent to 1894, but I can in the Cape Colony, and for years we had been short there before the war.

7,509. You say in Cape Colony?—Yes, it was for that reason we had to inspan the Native Affairs Department to come to our help.

7,510. And did they get natives for you?—Yes, through the magistrates.

7,511. So the natives were there?—We generally got them from the Native Affairs Department after they had scoured the country, if I might use the word, through the magistrates.

7,512. My point is that the fact that you did not get labour generally necessarily proves that it was not to be had?—Well, it took this form. In the Cape Colony we had to increase our rates of pay substantially to secure them.

7,513. That is admitted, but we have had several witnesses, including Mr. Liefeldt, the Resident

Magistrate for the Transkei, telling us that there was plenty of labour there which would be induced to come up by better wages?—I shall be very glad to communicate with Mr. Liefeldt to-morrow and try to secure some for the Transvaal. What is his address?

7,514. The Secretary will give it to you?—I shall receive it with pleasure.

7,515. Now with regard to the boys you get from the Native Labour Association. Is it not a fact that a large number of natives in the service of your department are natives who will not recruit for the W.N.L.A. owing to the six months' contract being insisted upon?—I cannot say that. I cannot say whether that is so or not. All I can say is we are not relying solely on the Native Labour Association, or the Native Affairs Department. We beseech them to help us all they can and then proceed to help ourselves all we know how.

7,516. You were present when that deputation met Sir A. Lawley the other day?—I was.

7,517. Do you remember Sir Percy Girouard saying that the great bulk of the boys working on railway construction were boys who would not come to the mines owing to the six months' contract?—I did not hear him say so, as far as I can remember, but I did hear him mention that many boys would not go underground who would work on the surface, and it was that that led me, following up what he said, to warn the deputation not to run away with the idea that we should not want further boys. I emphasised the fact that we must have at least 1,000 per month in addition to the natives we were able to secure for ourselves. We wanted this number if we were to work the line, not in a satisfactory, but in a reasonably safe way.

7,518. You know that the mines will not take boys on three months' contract?—I have understood that, and am prepared to say we will take boys practically for any term, or almost on any terms provided the wages are not disturbed, for the reasons I have mentioned, but I will say this, as in the case of the mines, so is it with the Railway Administration, the boys are not of very much use to us for some time after we secure them unless they have previously done railway work.

7,519. You will take the boys without any contract?—We are in that desperate condition that we are practically taking any boys from anywhere if they will only come along.

7,520. Can you tell the Commission how many boys you have in the service of the railway who are three months' boys?—No, I cannot say.

7,521. My point is to show that a very large number of boys—every witness we have had from Basutoland has laid stress on that point that they will sign on for three months, and not for six months, while the mines being short of boys want to make terms with them and boys will not agree?—I should say in answer to that, I doubt very much whether we have entered into any contract with a boy for three months. We take him and keep him as long as he is content to stay. I think it will be difficult for me to get the information definitely in time for the information to be of use to this Commission, that is in two or three weeks, but I think it will be found that very few boys are not got for three months. It means that if they will not sign on for at least six months we take them for as long as they will stay, and part with them when we cannot keep them any longer.

7,522. The W.N.L.A. prevent or object to your recruiting in Portuguese territory?—Yes, that is so. That is the only territory where large numbers of natives, very large numbers are to be had. We have scoured practically South Africa, as far as it is open to us, excepting Portuguese East Africa, and we have only on two occasions tried to get in that territory, once in August last year, and again when I was away as a sort of last resort.

7,523. Do you know the proportion of East Coast natives the mining people bring to this place as compared to other boys?—I have no personal information.

7,524. I believe it is about 5 to 1, so that they shut you out of the only place here where natives really are in very large numbers?—I suppose that will be so, I know we carry very large numbers of boys from that direction.

7,525. I understand tenders are out for about 300 miles of railway?—Yes.

7,526. Is there a condition stipulating that contractors shall not engage to use more than a certain number of natives per mile?—I understand there is, but as I said I have not seen the contract, and in regard to these contracts in the past I have not been consulted.

7,527. Do you remember the other day that Sir Percy Girouard gave as a limit for these 300 miles 10 boys per mile, which would give a total of 3,000 boys?—My recollection is that he said he was prepared to limit the number of boys to be employed on construction to 6,000, that a previous arrangement had been made to employ up to 10,000, but with a view to meeting the mines, he had reduced his requirements to 6,000, but I am not sure that he laid sufficient emphasis on the fact that as a consequence of that the construction would be a good deal delayed.

7,528. I think you will find that he stated that one of the conditions they are to impose is that they were going to limit the number of natives to 10 per mile. There was some talk at the meeting of the Chamber of Mines of your department making demands upon labour which would in the course of a few years amount to 60,000 additional boys for construction. I suppose that is inaccurate?—I have no personal knowledge of that either way.

7,529. It was made in my presence?—I have no knowledge of this statement.

7,530. Have you any personal knowledge of the probability of your department requiring in the next four years 60,000 natives?—Well, if the policy of this country were to push forward the construction of these railways, and it was resolved that we were to be able to do so as economically as possible, I should regard 60,000 as no doubt the number to employ for doing the work quickly, either whether we employ contractors to do the work or did it ourselves, because the more boys you can employ within certain limits the more profitable the work is on a contract, and the more economical the line can be built by the railway.

7,531. Has any demand been made as far as you know by the Railway Department for 60,000 boys as the estimate within the next few years?—No such demand has been made by the General Manager of Railways. I am unable to say whether the Commissioner has made such a demand.

7,532. What is the Commissioner, what is his position?—The Railway Commissioner is the officer responsible to the Government of this Colony for the whole of the railways, open lines as well as construction lines. With regard to the open lines, the administration of these railways rests with the General Manager under the Commissioner, but with regard to the construction of railways they are vested in the Commissioner, who has under him the Chief Engineer for the constructing of those new railways, so that really in respect to new construction I am only speaking with partial authority.

7,533. Some time ago were not the compounds of the natives in a very bad condition.—They were not satisfactory.

7,534. Were they in a very bad condition?—Well, that is a relative term. They were in very good condition as compared with the condition the Netherlands Company had them in, and bad as compared with what they are now.

7,535. What I mean is that the medical authorities, the Medical Officer of Health, had occasion to insist upon an immediate improvement?—He did report on their being in an unsatisfactory condition.

7,536. Did he insist on an immediate improvement?—What he indicated from his point of view as being wanted was immediately done, and we have gone a good deal further since.

7,537. I know it has been improved, but what I want to get at is the condition then as having an effect on the supply?—Yes.

7,538. Is it correct to say you had a very large amount of sickness, had you scurvy?—Yes, and we immediately remedied it by a supply of lime juice and by other means.

7,539. But the Medical Officer of Health also called attention to that fact?—I think it was mentioned in his report.

7,540. Mr. EVANS: Supposing, Mr. Price, you had all the natives you require, how many more white men could you employ as a result?—If we had the 3,000 odd natives that I mentioned, we could employ immediately the 654 artisans we have dispensed with, and the Engineer informs me he could employ quite 300 more in addition. I think it would be fair to say that if we had a sufficient supply of native labour we could employ artisans for the next 12 months, if not longer, quite 1,000 more than we employ now.

7,541. Mr. PHILIP: Mr. Quinn, I think it was, who asked you a question about engaging boys for three months. I suppose you have had recruiting agents in Basutoland, have you not?—Yes.

7,542. And you were quite willing to take all the Basutos that would come forward on a three months' engagement?—We were.

7,543. And have you been successful in getting them?—We have not got as many as we want.

7,544. You only got a few, I understand?—They were few in number.

7,545. The CHAIRMAN: Mr. Price, the W.N.L.A. has, I understand, at different times recruited natives for you in Portuguese East Africa, or supplied you with natives recruited there?—The information given to me and obtained from the W.N.L.A., the sources as from Portuguese East Africa, they supplied us with 94 boys.

7,546. They are supplying you from time to time with natives, however?—Yes, they are as the result of a recent arrangement at an interview with the High Commissioner. I believe some of the boys latterly must be coming from Portuguese territory.

7,547. Then an answer you gave to one Commissioner that you were shut out from recruiting there really means that you were shut out from having an independent recruiting agency there?—Yes.

7,548. Not shut out from getting natives there with their assistance?—I think latterly we have been getting boys from Portuguese East Africa. All we say to the Association is "we do not ask you where you get the boys from, but give us the boys."

7,549. What was your experience with regard to recruiting in Zululand, which was a privilege granted to you by the Natal Government that no one else has had outside the Natal Colony?—It was not very satisfactory; I think I have the number, but I know we did not get many.

7,550. You said, in answer to one Commissioner, that you latterly took boys on for short or long periods as long as they cared to stay?—Yes.

7,551. Do you mean to convey to the Commission by that that in recruiting boys at a distance, costs you anything from 40s. to 60s. to get them you are willing to recruit them even for one month's service?—No, that was not what I wished to convey to the Commission. I said our station-masters and various agencies in the Transvaal and Orange River Colony are able to pick up boys and when we secure these boys we do not usually enter into contracts with them, but just engage them for as long as we can retain their services.

7,552. Then in recruiting boys from a distance costing from 40s. to 60s., you would insist on a contract of some time?—Yes, for some reasonable term.

7,553. What would you call reasonable?—We have a minimum of three months in Basutoland, but as far as I can remember in the other territories we press for six months.

7,554. The Commission is very much obliged to you for coming here and for the evidence you have

given us. May I ask if we can have Captain Pritchard to-morrow?—Yes. Would you like Captain Pritchard and Major Micklem, who is Chief Resident Engineer?

7,555. It would probably be desirable to have both?—They are both present, and I am sure I can speak for both of them that they will be very pleased to attend.

The Commission adjourned until Thursday at 10 a.m.

## NINETEENTH DAY.

*Thursday, 27th August, 1903.*

THE COMMISSION SAT AT 10.30 A.M.

Major H. A. MICKLEM, R.E., D.S.O., Chief Resident Engineer, C.S.A.R., called, sworn and examined.

7,556. The CHAIRMAN: You are Chief Resident Engineer, I understand, in charge of all open lines?—Yes.

7,557. You were present yesterday when Mr. Price was examined here?—Yes.

7,558. Does the question of the supply of native labour come specially before your department?—Yes, more before my department than any other department of the railway.

7,559. Do you agree in the main with the figures he gave us yesterday with regard to the supply of native labour which you have now?—Yes.

7,560. He made a statement with regard to the number required in addition to what you now have?—Yes.

7,561. Do you know what the figure was?—The figures required for the open lines in addition to what we now have is between 3,000 and 4,000 boys. We required in all 16,000 boys for the open lines. We had at the beginning of August 12,400, if my memory serves me right, and what we require is the balance of 3,600.

7,562. I understand Mr. Price to make a statement with regard to a larger number than that running into something like 60,000?—I think you are confusing Mr. Price's figures with regard to new construction. I am not dealing with new construction, with which I have nothing to do. Perhaps I might explain the difference to the Commission. Under my department as Chief Resident Engineer of the open lines, I deal with all maintenance of the existing line, and I deal with all new works carried out on the open lines, that is to say any new building that may be required, new sidings, extensions of lines parallel with the existing lines, such as Braamfontein to Krugersdorp, are dealt with by my department, but if it is a question of a new line starting away from the existing line, and going off independently altogether, that is a new line, and is dealt with by an entirely separate department, such, for instance, as the new line to Vereeniging. That is the distinction. I am only in a position to give any figures as regards open lines.

7,563. You are only in a position to give figures as to the open lines?—That is so, and I am not in a position to give figures as regards new construction unless on the present open lines.

7,564. My impression was that in giving a figure of something like 60,000, Mr. Price was not referring to new lines, but was quoting, I thought, from the Maintenance Department, that to keep the line in an ordinary reasonable safe condition so many natives would be required?—9,200, yes.

7,565. But to improve it as it ought to be improved, and make it as good a road as formerly he required a further number, I do not remember what?—Yes, the figures were 9,200 required in

all. Of that I require about 4,700 for the actual maintenance, and the balance of 4,500 is required for these special new works which are necessary in order to get the railway up to the standard, and in order to deal with the traffic which is coming on, as the traffic grows.

7,566. You heard the question put to Mr. Price as to the comparison of natives per mile opened in this Colony and in other parts of South Africa?—Yes.

7,567. Do you agree in the main with the reasons he gave that at present you should have a larger number per mile opened than obtains elsewhere?—Yes. I have not the figures for Natal and Cape Colony before me, as I did not know the point was to be raised, and I am doubtful if our figures will be found much higher if you subtract the very large number required for new works on open lines. From the figures you will see we ask for 9,200 for my department. Half of these boys are for new works on open lines, and only half are for actual strict maintenance purposes.

7,568. That is a reason for the larger number being employed in this Colony on your open lines which I do not think Mr. Price gave us yesterday?—I do not think myself, although it is, of course, well known to him, that he brought the point out in his evidence yesterday.

7,569. Then, can you give us a separate figure for the number of natives employed on the C.S.A.R. in connection with the difference between maintaining the present lines and new sidings and other works, etc.?—Yes, certainly.

7,570. What is that figure?—The total I require for that purpose is about 4,500 boys—that is for all new works, all works carried out on the open lines. If you calculate all such works as new sidings, doubling the line anywhere, the provision of new station buildings, provision of further goods sheds, improved water supplies, and generally every sort of work associated with the line in order to keep it up to the standard, and that it should improve in the same proportion as the traffic may improve—with reference to that very large expenditure, I think it is well known that for four years there has practically been no capital expenditure at all on open lines, and in the ordinary course of events a large capital expenditure every year in order to keep the lines up to the standard is necessary, but, in addition to that, the traffic has grown to a most enormous extent, and that should have involved a very much heavier capital expenditure to put the capacity of the line on a level with the traffic it had to deal with. None of that expenditure took place, and as the result at the present moment, in regard to capital expenditure on new works, the railways are very much behind. The class of expenditure I refer to is, for instance, doubling of the line where traffic has become so heavy that the single line will no longer take it—the provision of engine-sheds. We have not had sufficient engines to carry the traffic,

and have had to get extra ones, which involves new sheds being put up. I give these merely as examples.

7,571. Do you wish to suggest to the Commission that the ordinary capital expenditure which should have been spread over four years you are crowding into the present year?—Oh, no. We are much behind, but we are not crowding it into one year. We are endeavouring to do in this year the most urgent parts; for instance, as regards quarters in order to house our staff satisfactorily, we shall have to go to an expenditure of not less than 1½ millions, that is a round figure, because it has not been necessary to go into exact figures. In the present year it is not contemplated to spend more than £300,000, probably not so much.

7,572. In the figures put before us by Mr. Price as to the number of natives per mile employed in the Cape Colony and Natal, I presume that would also include natives employed on the work you have described?—I take it that they would, but I do not know it, but also that their work would be nothing like so heavy in proportion to their mileage as ours, because they have been going on steadily for many years, whereas this railway, as I say, has had no work done on it for four years.

7,573. Mr. Price gave us certain figures as to the comparative figures as to the cost and efficiency of native labour and white labour?—Yes.

7,574. Were the figures supplied by you or by the New Construction Department?—By me.

7,575. Is there anything you would like to say to the Commission in this connection, or shall I ask you first: Have you experience in other countries on railway construction?—Yes.

7,576. In what countries?—In Egypt.

7,577. Are you able to draw any comparison as to the value of the Egyptian labour as compared with our native labour here or white labour?—I should say that Egyptian labour is fully 50 per cent. better than our native labour. It is rather difficult to give an exact figure, but I do not think I am over the mark in saying 50 per cent. That is the Fellaheen, not the black, who is on the same level, or perhaps not quite so good as the native here.

7,578. Then as to comparing our black labour with white labour?—No, I have nothing to add to Mr. Price's statement at the present time.

7,579. Mr. WHITESIDE: What are the wages paid to the Fellaheen in Egypt?—Well, in the area in which I was working the men were mostly conscripts, and as such their wages were their military pay, but I think there were some who were not conscripts. I cannot remember very well now, but I think the wages in that country is about 5 piastres, or a shilling a day, but I cannot be certain.

7,580. What was the pay of the conscripts?—I think it was one piastre as far as I can remember, or 2d.

7,581. Did I understand you to say that they were 50 per cent. better?—That is my view of the Fellaheen.

7,582. Is there any considerable number who might be drafted for service here?—I do not think there is the remotest possibility of getting any.

7,583. Why?—Because men are very averse to leaving their own country even to go to the Sudan, which is close by and where the conditions of life are practically similar.

7,584. But is there not a considerable amount of risk in the Sudan?—No, I do not think so.

7,585. If we had the Cape-Cairo Railway in full operation, do you not think the high rate of wages would be an attraction?—My opinion is that it would not attract at all.

7,586. Mr. PHILIP: You are employing 12,400 boys?—Yes.

7,587. And you want an extra 3,000 or 4,000?—Yes, it is for the whole of the open lines and all the departments.

7,588. In the ordinary way, if the line were in good order, how many boys would you require to employ to keep the line in good order?—I

should like to say that I am only in a position to speak accurately as regards the Engineering Department. The numbers employed by all the Departments of the open lines are included in the 12,400. In the Engineering Department about three boys per mile are necessary for actual upkeep and maintenance, exclusive of new works.

7,590. How many boys have you in Johannesburg itself in the Traffic Department?—The total number of boys in this department on the 31st July was 2,058.

7,591. You have figures here? In one of Mr. Price's statements he gave 1,748 for the Transvaal?—As I have already explained, I am not really in a position to speak with assurance with regard to the traffic and other departments. I understand that the Commission itself wished an opinion as regards my own department. Anything else with me is only hearsay.

7,592. The Locomotion Department would come under your notice?—No, it would not.

7,593. Is the construction of the compounds done departmentally?—One is being carried out by contract near Braamfontein Station. I have another not far from that station, and a similar one at Germiston, which are practically complete.

7,594. Mr. EVANS: Reference was made just now to the proposal to import Fellaheen. Are you aware that Lord Cromer has been approached with a view to their importation here?—No, I am not.

7,595. Could you give us some idea of the comparative cost of, say, ballasting, or some class of railway work which would be let out by contract in Egypt and here? That is, I want to compare the cost of Fellaheen with Kaffirs?—I could give you figures, but I should hardly like to quote them now, I do not think they would be reliable.

7,596. Would the 50 per cent. increase in the cost of Kaffirs apply more particularly to contract work?—That 50 per cent. would also apply in the case of cost.

7,597. Yes; does it apply to cost as well as efficiency?—I should say it would do, undoubtedly, if anything the cost would be still higher.

7,598. Can you let the Commission have, later on, this comparison?—Yes, I think I can procure the figures you require.

7,599. At the Inter-Colonial Council there were two figures mentioned which differ rather materially from those supplied to us now. For instance, in maintenance the figure you have now given for July is 5,958, and at the Council the figure was given at 9,900 odd. Can you explain the difference?—No, I am afraid I cannot. I do not know the other figure. Was the figure given to represent the same thing exactly.

7,600. It was mentioned as maintenance?—Sometimes the term maintenance is applied to the whole of the open line departments.

7,601. There were two figures mentioned in the discussion—the Locomotive and the Maintenance Departments. For the former the figure given at the Inter-Colonial Council was 4,762, and the figure you give is 2,684?—Is it the loco. figure?

7,602. Yes?—Well, I am really not in a position to deal with the loco. figures.

7,603. Who would be able to deal with the Maintenance Department?—I can.

7,604. What is the highest number you have employed at any one time in that department?—I have at present employed, I should say, about 6,000; the number varies, of course, from day to day. Now we are going up slowly.

7,605. Is that about the highest you have had?—I have had more—7,500 or 8,000. I have not actually got the record of the maximum I have arrived at, but from the number that have fallen off in the last month or so, we must have had up to 8,000.

7,606. Would that include all the natives you employed directly and indirectly by contract?—The number employed by contract is very small; in fact at that time when I quote 8,000 I should say that the extra number employed by contractors would

not have exceeded 250—a total of 8,250. At the present time I reckon that the contractors working for me have got about 400 boys, not more.

7,607. That would be in addition to the 6,000 you have given?—Yes.

7,608. I see that on page 3 of this statement a provision of £20,000 is made for the general compound at Pretoria. Would that come in your department?—Yes.

7,609. Is that being constructed now?—No.

7,610. Can you tell us how many natives that would accommodate?—It is to accommodate 2,000 natives.

7,611. What would they be employed in chiefly?—In the Traffic Department, Loco. Department, Engineer's or Maintenance Departments, and the special departments, etc. It would be a general compound for the whole of the departments at Pretoria.

7,612. How many natives, roughly, have you here in Johannesburg?—I have not got the figures for the town itself. The railway is divided into certain districts, and I have only the figures for those districts. In the Johannesburg district on the 1st August I was employing 1,555 boys, but that includes the open lines from Volksrust to here, and Klerksdorp to here, and also from Pretoria and Vereeniging.

7,613. What I would like to get at is for how many have you to provide compound space in Johannesburg?—I would say considerably over 2,000.

7,614. What do your compounds hold now?—They will hold now, including new compounds, 2,100 or 2,200. These figures are not absolutely exact. I can give you exact figures, but that is within a few, but the compound can actually hold more if required, because we can put more boys in as we give them accommodation on a rather liberal scale.

7,615. The total requirements now of what you describe as open lines is 16,000?—That is so.

7,616. Have you made any estimate as to the number you will require in the future in two or three years hence?—Yes, I have made that estimate, and I have it here. I estimate that at the end of three years, provided that the whole programme of new construction proposed is carried out and that those lines are handed over as completed to the open lines or my department, that at the end of three years, I shall require in my Engineering Department 16,288 boys.

7,617. As compared with 6,000?—Not as compared with 9,274.

7,618. Very nearly double?—Yes. I do not know whether the figures are clear. The figure of 6,000 is what we actually have. The 9,274 is what I desire in order to carry out the work satisfactorily and make progress. I have a return of new work sanctioned, but which cannot be proceeded with on account of scarcity of native labour.

7,619. Will you hand it in?—Yes.

#### RETURN OF NEW WORKS WHICH CANNOT BE PROCEEDED WITH FOR WANT OF NATIVE LABOUR.

##### REVENUE ACCOUNT.

Item No.	Nature of Work.	Place.	Remarks.
2.	26 Engine Ashpits.	1. Witbank. 1. Pretoria. 2. Bronkhorst Spruit. 1. Springs. 2. Germiston. 19. Various Stations.	
11	Lengthening Platform, New Goods Shed, Clerks' and Checkers' Offices.	Springfontein.	
15	Institute and Recreation Ground.	Pretoria.	
16	Do. do.	Johannesburg.	
17	Do. do.	Volksrust. Standerton. Kroonstad. Potchefstroom. Waterval Onder. Springfontein. Komatie Poort. Springs.	
37	Loops, Dead-end, and Signal Interlocking.	Irene.	
41	Fencing Maintenance Stores.	Braamfontein.	

##### CAPITAL ACCOUNT.

Item No.	Nature of Work.	Place.	Remarks.
—	Extension of Central Stores, Yard Accommodation.	Germiston.	
17	New Head-quarter Stores Offices.	Germiston.	
22	Doubling Line, Bloemfontein Station to Tempe Station.	Bloemfontein.	
—	Tempe Station, Waiting, Goods, Lamp Rooms, Latrines.		
23	New Station.	Between Zandspruit and Paardekop.	
29	4 Additional Stations.	Pretoria—Germiston.	
27	New Station.	Fortuna.	
31	General Improvements to Water Supply.	Transvaal and O. R. C.	
—	Metalling Coal Yard.	Braamfontein.	

CAPITAL ACCOUNT—*continued.*

Item No.	Nature of Work.	Place.	Remarks.
—	Metalling Goods Yard.	Pretoria.	
35	New Erecting Shop (Pits and Flooring only).	Pretoria.	
36	New Telegraph Station.	Hoffontein.	
39	Subway.	Germiston.	
42	New Crossing Loops.	Komati Poort to Waterval Onder.	
43	Strengthening Rack.	Waterval Boven to Waterval Onder.	
47	Running Shed, &c.	Pretoria.	
50	New Siding.	Oberholzer.	
52	Extension to Yard.	Bloemfontein.	
55	Telegraph Station Loop.	Denver.	
56	Converting Hospital Siding into Crossing Station.	Between Koodoospoort and Pretoria.	
66	Duplication of Line.	Bramfontein—Krugersdorp.	Delayed.
69	Forwarding Sites and Sidings.	Bloemfontein.	
71	3 Additional Dead Ends, Parallel to Main Line.	Pretoria, West End.	
75	Relaying 420 miles of Main Line with 80 lb. rails.	O. R. C. and Low Veldt.	Much delayed.
—	Rest Rooms, Kroonstad.	Kroonstad and Randfontein.	
84	Additional Sidings.	Balmoral.	
100	Fencing Workshops.	Pretoria.	
101	General Native Compound.	Pretoria.	
106	Alterations to Yard, New Goods Shed, and 60 ft. Turntable.	Witbank.	
134	Pumper's House, House for Station-master.	Roodekop.	
135	Foreman's House.	Meyerton.	
137	Station-master's House, Foreman's House.	Koodoospoort.	
138	Quarters for Employees.	Pretoria.	
142	Quarters for Employees:— Barracks—28 rooms. Barracks—24 rooms. 8 Blocks Semi-detached Houses. 60 Double Storied Houses.	Bloemfontein.	In part.
146	Staff Quarters. Employees' Quarters:— Barracks—46 rooms. 20 Quarters.	Germiston.	
152	Station-master's House. Foreman's House.	Olifantsfontein.	
153	Station-master's House.	Kaalfontein.	
154	Station-master's House:— 6 Single Rooms.	Zuurfontein.	
155	Station-master's House.	Rietfontein.	
156	Station-master's House:— 2 Single Rooms and Kitchen. 1 Hut for Natives.	Jeppes.	
157	Station-master's House.	Irene.	
158	Do.	Kroomdraai.	
159	Foreman's House.	Paardekop.	
160	Do.	Platrand.	
161	Do.	Val.	
165	1 Married Staff House. 8 Blocks Married Quarters. 3 Blocks Semi-detached Quarters.	Waterval Boven.	
166	6 Artisans' Houses. 3 Blocks Semi-detached Quarters. 1 Block—22 rooms.	Waterval Onder.	In part.
167	Married Quarters for Ganger, P.W. Inspector's House.	Nelspruit.	
168	Ganger's House.	Oorsprong.	
169	Do.	Louw's Creek.	
170	Do.	Barberton Branch, 4½ miles.	
172	Station-master's House, Foreman's House ...	Waterval North.	
173	Do. do. ...	Haman's Kraal.	
175	Additional Quarters.	General.	

7,620. What are the sub-divisions of it? Is it possible to summarise it? Hand it in, of course, but give us the summary?—I have not got the value of the works here; it gives the number of natives to be employed. I have simply given the list of works to be carried out on the railway during the current year, and noted on this return these works which cannot be proceeded with on account of the absence of labour. That is what this return represents. It is my intention to show that we have very grave difficulties in proceeding with our programme.

7,621. The CHAIRMAN: I do not think it is of much value to us in that form.

7,622. Mr. EVANS: I take it that from a public point of view it is of considerable interest. The public will be able to judge what is being delayed on account of the lack of labour. Now the estimates you have just given of requirements in three years, that applies only to your department?—Yes, the Engineering Department of open lines.

7,623. That is what is described in this return as maintenance?—Yes, that is so.

7,624. So you require in three years 16,288?—That is provided that the whole of the programme of new constructions as at present proposed is carried through.

7,625. And you only have now about 6,000?—That is all I have. I have also figures of our requirements at the end of five years if you wish them.

7,626. Dealing with three years. Can you give us some idea of requirements of other departments, or shall we get them from some of the witnesses?—I have here the requirements at the end of three years for the whole of the Open Lines Departments; it would be 23,700, including, of course, the requirements of the Engineer's Department, to which I have just referred.

7,627. That would mean 7,500 for the other departments?—That is so.

7,628. You stated that you had an estimate of the number required in five years?—Yes, 19,403.

7,629. That is for your department?—That is for the Engineering Department, and the total figure is 28,403. These figures are based, of course, on the proviso that I made just now in regard to the present programme of construction being carried out and lines handed over to the Open Lines Department.

7,630. Can you give us any idea as to how long natives remain in the service, on an average?—With the railway?

7,631. Yes, in your department?—Well, the great bulk of our recruited boys go at the termination of their six months' period. The great bulk go then. I have a few boys who stay year in and year out. They are far the most valuable boys we get. They settle on the line and stop there; some have been there since before the war.

7,632. Can you tell us, roughly, what percentage of the whole of the boys are under any contract form?—Well, the voluntary boys I get on the railway amount to about 200 a month for my own department, not more.

7,633. About 20 per cent. of your monthly requirements or more?—It would form barely 20 per cent.

7,634. Have you any figures as to the average monthly wastage? I asked the question of Mr. Price yesterday, but he had no figures?—I estimate the average monthly wastage of my department at approximately 1,000, or a very little more. In one month we may lose scarcely any boys, because none were recruited six months before, but, on the other hand, in any month coming six months after a period when we have received a large number of recruits, we may lose thousands of boys, as happened in July. We had very extensive recruiting in December and January, and the great bulk of these natives went out at the end of June and July, and that is what has put us in the present difficulty.

7,635. Have you had any returns made in your department as to the sources from which you get your labour?—I know the source exactly.

7,636. How many of the total number of boys come up from the Cape Colony, how many from Basutoland and Portuguese East Africa or the Northern Transvaal and so on?—No, I have not kept such a return, but the figures are at my disposal as regards most of the boys, but I know in the case of boys recruited the source from which they were recruited; for instance, I know that the Transvaal boys come from such and such a district, and of the W.N.L.A. boys the great bulk came from Cape Colony.

7,637. Would it be possible to get such a return without much trouble?—I think so, yes.

7,638. What I suggest is that taking the total number that you have in the employ of the railway at present as 12,000 odd, how many of these are from the Northern Transvaal, Portuguese East Africa, and so forth?—I do not think any are from Portuguese East Africa.

7,639. You might have had some recruited in Barberton and on the Delagoa Bay line—voluntary boys?—Yes.

7,640. Mr. TAINTON: This letter was handed in by Mr. Price yesterday. It states in the second paragraph that your comparison between the cost of white and native labour has been based upon earth bank work?—Yes.

7,641. Suppose you take the cost of construction to be, say £10,000 per mile, what proportion of the cost would be represented by labour?—I should say, roughly—I have not the figures exactly on that point—about one-third labour and two-thirds material, possibly not so much as one-third labour.

7,642. Consequently on a basis of £10,000 per mile the labour cost would be something like £3,000?—I might say that I have not looked into the question with a view to speaking to the Commission on the construction of new lines which is not in my province.

7,643. I want to get at the proportion of the amount spent per mile which is accounted for by the cost of labour?—I think Captain Pritchard can give you these figures more accurately than I can, because they deal with the construction mile by mile. We have nothing of that sort.

7,644. You see you made a comparison of cost here on the third page, and I want to get at some working figure based on the cost per mile as to how this comparison would work out. I take it from your reply that the cost would be something over £3,000?—I have not got these figures definitely; Captain Pritchard tells me that he has them.

7,645. Referring to the third page, taking the comparison of cost per cubic yard, the relative cost of white as compared with native labour works out at about five to two?—That is so.

7,646. Consequently if the cost of construction and labour per mile were about one-third, as you stated just now, the difference in employing native and white labour would not be very great per mile of construction?—Of course the proportionate difference would be reduced, that is obvious, but the actual difference would remain the same, but adding the total cost of material on both sides you would reduce the proportion very much.

7,647. If we take one-third as our basis for comparison, white labour would cost £3,000 and native labour £1,200?—Oh, no, no; that is taking the comparison entirely wrong. I take one-third wholly native labour, and for white labour I think that the proportion would be probably 50 per cent. Do you follow me?

7,648. Yes, but even on that basis the difference between the two would amount to £2,000 or £3,000 per mile, not more as regards the actual cost of labour?—Yes, it would be so, if the initial assumption is correct. As I say, I am not in a position to deal accurately with the question, as I have not got the figures.

7,649. It is rather important. Taking their figures and yours, it seemed to me that the difference between the two costs or classes of labour was not very great, and therefore the difference upon any given hundred miles would not be so very large, and it might therefore be a question for consideration whether it is not advantageous to employ white labour in place of black on construction, and I thought from this comparison you have given us that we should be able to get at these figures. Do you know anything of the figures given by Mr. Price, relating to the cost of the new Rand line along the reef?—No.

7,650. On a native labour basis it was estimated to cost £39,000 with native labour, whereas the estimated final cost with white labour is over £80,000?—Yes, that is the Braamfontein-Krugersdorp line.

7,651. What mileage is covered by that cost?—20 miles.

7,652. That then would bear out the inference that the difference between the two costs is something about £2,000 a mile?—Yes, that is so.

7,653. Consequently if we take that rough figure for 100 miles the difference between cost of native labour and white labour would be something like £200,000 on 100 miles?—Yes.

7,654. In your opinion, assuming that the country was prepared to pay the additional cost, would it be desirable to employ white labour on railway lines?—I think it is primarily a matter of cost. It is idle to pretend that white labour (navvy) is easier to work or that it requires less supervision in looking after than native labour, but as far as an engineer is concerned it is primarily a matter of cost.

7,655. Then the Railway Department looks at this question entirely from the point of relative cost of the two classes of labour?—That is my point as an engineer. Yes, I should like to say with regard to these figures that this comparison was not made for this Commission. It was made some months ago, and the desire was that the benefit of any doubt should be given to the white man as against native labour. You will see from the comparison of working capacity that under agreement the white navy will do six cubic yards and the native under agreement will do four cubic yards. That is to say the white navy will do under agreement 50 per cent. more than the native, but that has not been borne out, I am sorry to say, by experience.

7,656. I was about to ask you where you got these data to make this comparison relating to the navy. Are they based upon actual experience in this country or taken upon his work in other countries?—They were taken on the experience that we gained in the first month the navvies were out here.

7,657. Then they are really based upon work done by white men in South Africa?—We took this in view, but as a matter of fact these figures are too favourable with regard to work which the navy will do in South Africa.

7,658. How do you get the figures then? You stated that they are too favourable. Are they then merely an estimate?—No, they are not an estimate.

7,659. Then upon what are they based?—Are they based upon actual figures?—They are based upon actual figures at the time (May) as regards cost of white navy and native labour respectively. As regards capacity for work during the first month, the white navvies averaged between five and six yards per diem, and it was estimated that they would average six yards when they had settled down to the work, consequently six yards was adopted as their capacity.

7,660. They have not kept it up?—No, in fact my experience during the last month has been that the natives do as much as the white men.

7,661. Of course it is important if you have got actual figures showing that. I think you ought to supplement this statement?—This statement is

submitted which was prepared some months ago, as you will see by the date, and not for this Commission in any way.

7,662. This Commission cannot get at the relative cost of the two classes of labour, if these figures are not quite reliable?—I do not think that these figures are quite reliable. I think a report could be prepared now which would approximate more nearly than these figures do, to the actual results of our experience. I do not think there is anything in these figures which I would wish to alter except the comparison of working capacity which I myself called your attention to.

7,663. Would it involve too much pressure or entail much labour to send us an amended estimate?—No.

7,664. Well, perhaps you will do so?—Yes.

7,665. Mr. Price was called away yesterday, and I would therefore put one or two questions to you which probably should have been answered by him. I would be glad if you would help me in the matter. Can you give us the approximate total of the yearly earnings of the railway lines of the Transvaal at present?—No, I am afraid I cannot give you these figures.

7,666. Are you not acquainted with the figures published lately giving the revenue of the department?—Only very generally, Mr. Tainton.

7,667. The total earnings are between £5,000,000 and £6,000,000, are they not?—I believe those are the figures.

7,668. Do you know anything of the Cape and Natal earnings?—No. I have read their annual reports, and so on, but I am not in a position to give any explanation upon them.

7,669. Do you know the earnings of the railways before the war?—I do not.

7,670. Is it within your knowledge that the earnings to-day are very much greater than they were before the war?—I understand so, yes. That is what I have always heard.

7,671. Have you any knowledge upon the point of the present comparative earnings of the Cape and Natal lines compared with the period before the war?—No, I have not, it is not a subject which comes before me at all, as a matter of fact.

7,672. But it is rather important in connection with our enquiry, because it is not difficult to show, I think, from the actual figures that the actual earnings at present may be regarded as quite abnormal, and not in any way a guide to the normal trade of the country. In other words, you are making money out of a period of inflation. That is a question closely connected with the subject of labour. I therefore want some figures generally; I am sorry that you are not able to give them to me?—Mr. Price would, of course, have given you all those figures.

7,673. Mr. WHITESIDE: The boys employed in your department, are they employed on contract?—A greater part of them are engaged on six months' contract.

7,674. Mr. Price tells us that, speaking of railways generally, they would be glad to take boys on a monthly contract if they would come along. Is your department willing to do it?—I understood Mr. Price to say that the position was so desperate that for temporary relief of the position they would take boys on almost any terms. Personally I should be very averse, as far as my department is concerned, to take on the boys on monthly contract, unless it proved absolutely impossible to obtain them otherwise.

7,675. So at present you would rather do without boys than take them on on monthly contract?—No, that is not my position.

7,676. Are the officers of your department aware, that is speaking generally all over the C.S.A.R., that you are willing to take boys on these terms?—Voluntary boys, I should like to say, are not taken on on any contract. We are always ready to take on voluntary boys. Every permanent

way inspector, every ganger, every officer throughout the line, has instructions to take on all voluntary boys who offer for work and whose papers and passes are in order.

7,677. When were these instructions given?—These instructions have existed to my knowledge for 18 months, and how long before I cannot say.

7,678. That is sufficient. I think that I understand you to say that there is a slight increase in the number of boys coming forward. Is that the case recently?—That is the case to an appreciable extent. During the month of August we have had so far about 1,000 recruits.

7,679. These will be net gain?—The bulk of them will be gain. A heavy loss occurred in the latter end of June and in July, and these boys we are now getting in by special arrangement made with the Witwatersrand Native Labour Association for recruiting boys.

7,680. Mr. EVANS: Would it be possible to bring the statements comparing the relative working capacity and cost of and nature of English navvies up to date, and let the Commission have a copy?

7,681. The CHAIRMAN: He has promised to do so?—Yes, I will send it in.

7,682. You remember, Mr. Price stated yesterday that owing to the loss of natives during June and July, July especially, you were obliged to dismiss a large number of white artisans?—Yes, the figure was 654.

7,683. Your loss in natives between June and July, according to figures put in, was 3,505. The number employed in June was 15,910, and in July 12,402; the difference being 3,505. Do I understand as a consequence of the loss of the number of natives, you had to dismiss that number of artisans?—Yes.

7,684. That makes it approximately about one artisan for rather more than five natives employed?—Yes.

7,685. Is not that an exceptionally large number to have to dismiss on that ground? Is there any explanation of it?—No, I do not think it is exceptional.

7,686. It occurred to me that an explanation of that might be that you retained the services of a large number of artisans hoping the shortage would be made up and then finding it was not made up you had to dismiss them?—We did retain them up to the last moment at considerable loss to the railway, but the falling off did not begin severely—did not make itself felt severely—until after the 1st of June, and these figures deal only with after the 1st of June. As a matter of fact we did, in most cases, try to retain men as long as there was a chance of employment at all. It was only when we found we absolutely could not get boys to work that we had to discharge them.

7,687. Do you remember Mr. Price saying that if you got a sufficient supply of native labour, always up to your requirements, you could employ 1,000 artisans?—I think so; yes.

7,688. Over and above these you are now employing?—I think the figures are substantially correct: 900 to 1,000.

7,689. Captain PRITCHARD: R.E., D.S.O., called, sworn, and examined.

7,690. The CHAIRMAN: I understand you are the engineer in charge of construction?—No, I am assistant to the Chief Engineer, who is suffering from influenza and unable to come.

7,691. His name is?—Mr. Wall.

7,692. You are his assistant?—Yes.

7,693. Is there any statement you would like to make to the Commission as to the number of natives you are now employing and what you require?—I have five copies of a return which gives the information.

7,694. Will you tell us the heading of it?—“Natives at work on new construction on 8th August, 1903.”

7,695. Witness then handed in the following statement:—

*Natives at work on New Construction on the 8th August, 1903.*

Where Employed.	Departmentally.	Contractors.
Workshops, Vereeniging ... ..	21	1
Springs-Eastwards, No. 1 Division ...	38	62
Klerksdorp-Fourteen Streams, No. 1 Division ... ..	13	—
Rand Mines Railway ... ..	153	430
Johannesburg-Vereeniging Railway ...	6	133
Harrismith-Bethlehem Railway ... ..	260	68
Bloemfontein-Modderpoort Railway ...	181	2,145
Springfontein-Jagersfontein Railway ...	22	9
New Construction Stores ... ..	186	—
Survey ... ..	100	—
Head Office ... ..	10	—
Total ... ..	1,000	2,818

*Natives Required for Contracts Let and not included in above Statement.*

Harrismith-Bethlehem Railway ...	750
Johannesburg-Vereeniging Railway ...	600

*Natives Required for Contracts not yet Let.*

Springfontein-Jagersfontein Railway ...	750
300 Miles Contract ... ..	3,000
Springs-Eastward Railway ... ..	200
N.C. Stores for off-loading P.W. Material, etc. ... ..	150
Platelaying on Bloemfontein-Modderpoort and Springs-Eastward Railway, and Building of Stations, etc. ... ..	700
	6,150

Working, week ending 8/8/03—	
Departmentally ... ..	1,000
With Contractors ... ..	2,848
	3,848

Grand total ... .. 9,908

This provides no labour for following authorised railway, which will have to remain in abeyance indefinitely:—

Witbank-Springs Railway.  
Maseru Railway.  
Wepener Railway.  
Kroonstad-Vierfontein Railway.

Contractors are not allowed to recruit in Portuguese East Africa nor in the Transvaal north of the latitude of Pretoria.

7,696. Do you know whether the railway construction contemplated in this figure of practically 10,000 natives covers all the railways authorised by the Inter-Colonial Council on which there was to be spent in round figures five millions?—Yes, it does.

7,697. It covers all that?—Yes, all except those lines at the bottom. Those at the bottom were all approved except the Witbank-Springs. They voted the money for the Kroonstad-Vierfontein line, but we do not propose to take it up unless we get more labour. The Kroonstad-Vierfontein line is the only one in the programme not provided for.

7,698. Then the Kroonstad line is included in the five millions?—Yes, it is included in the estimated five millions. The other three are not included. The Council approved of the Wepener Railway if we can get the money. The Witbank-Springs was brought up since the Conference, but I believe there is some talk of it going on. It is not absolutely settled. We have not made any arrangements for it.

7,699. Have you any hope of getting the number of natives required, or any views regarding it. You are employing 3,848?—That is so.

7,700. You put a statement before us shewing that you have let fresh contracts necessitating a further 1,350 natives?—Yes.

7,701. In addition to that you want the difference between 3,848 and 9,998? Have you any hope of getting these?—Well, we have advertised these contracts, all of them. We have had plenty of contractors applying for the conditions, and so on. For the Springfontein-Jagersfontein Railway we have had 19 tenders, and for the Springs-Eastwards Railway about 11 tenders. It appears to me that contractors are prepared to bind themselves to get these natives.

7,702. What is the condition of these tenders with regard to the natives?—We passed on to the contractors the conditions which the Government imposed, and asked them to tender on these conditions. These conditions were that in each contract we state the number of natives put down here. The contractor must bind himself not to employ more than that number of natives, and not to recruit in Portuguese East Africa and in the Transvaal north of the latitude of Pretoria. I may mention that there is one exception, and it is the only exception. It was let in November last, before any of these conditions were thought of, the Rand Mines Railway. We let a contract for the completion of the line, without the above conditions.

7,703. That is called the South Line here?—Not the one to Vereeniging, but the one to the south of the mines already in existence there. The contractor is employing 430 boys, and I believe he gets most of them from Portuguese East Africa. We cannot cancel the contract, and, besides which, the railway is entirely for the mines, with sidings to run into the mines. We have not taken steps to cancel the contract. In other contracts the position is that the Government tells us to put in the condition that the contractors must not employ natives from Portuguese East Africa, or the territory north of the latitude of Pretoria. They can recruit in Rhodesia if they like.

7,704. I suppose, then, it is within your knowledge that in addition to the natives contracted for, the mere labour of actually carrying out the works of these contracts, there is a considerable addition to the native labour in the way of servants to the men employed as well as the servants of tradesmen supplying food?—We should come down upon him if he exceeded the number.

7,705. You do not understand me. Supposing 10 or 20 men have a mess and employ a number of native boys that have nothing to do with the contractor?—Yes, but our engineer has instructions to keep the number of men down to the contract.

7,706. Suppose neighbouring tradesmen are supplying them?—That is another matter.

7,707. And if they employed a considerable number of natives that would not come in the contract at all?—I do not know anything about that. I should not think it was very much.

7,708. Mr. GOCH: Your wants immediately are 6,150?—We have not yet tried to get them. We let this contract for the Harrismith-Bethlehem Railway about a fortnight ago; the Johannesburg and Vereeniging Railway has been in hand about a month, and it was let on 8th August. I believe they have got 400 boys.

7,709. Will you get this 6,150, do you think?—We shall see very shortly. The contractors do not seem to be in any anxiety about it.

7,710. You think they can get labour?—They do not seem to have any anxiety about the matter.

7,711. Mr. DONALDSON: If the contractors get these 6,000 boys, you think they will be depleting somewhere else?—I find the present contractors are getting the boys from Basutoland and Cape Colony. I suppose Cape Colony is suffering, but I do not suppose Basutoland natives would go elsewhere. They might have gone to the remounts. I think they would have gone to the neighbourhood of Basutoland, but I do not think from what the native labour agents tell me they would have come here.

7,712. But it is your opinion that if they were not employed on these railways they would be working somewhere else, if not here, consequently there is

a shortage somewhere?—I think it is very doubtful if they would be working elsewhere. It is entirely a matter of opinion.

7,713. You think that that class of work is so attractive that natives will not work elsewhere unless they get the work?—I think it is established that the native does like railway work.

7,714. Do you give it as your opinion if these works were not carried on the natives that might be employed there would not work at all?—No, I think some of them would not work at all. For instance, on the Modderpoort line and Harrismith-Bethlehem Railway there is not the least trouble in getting natives, and I think some of these would not be induced to go further.

7,715. Is it not owing to your position and not to a big labour supply?—Yes.

7,716. Do you suppose that the natives who go out to work where the railways are so close at hand, would go somewhere else to work?—I think a great many of them would go somewhere else to work, but I think that many would not.

7,717. Mr. EVANS: In these contracts are any conditions made as to the maximum rates of pay which the contractor can give the natives?—No.

7,718. Then what is to prevent a contractor paying a little higher than other employers and getting as many boys as he likes?—There is nothing to prevent him from doing that, provided that the boys have not come from the prohibited districts.

7,719. Have you any idea from what parts of South Africa the contractors propose to draw their supply?—No. Two or three of them have come in to ask if there was any objection to importing from Natal, and locally recruiting South African Indians, and some of them have asked if they were allowed to recruit in Zululand.

7,720. What is there to prevent these contractors drawing boys from the mines here?—The contracts state that they cannot employ a boy either recruited from or those who have lived in the Portuguese East Africa or the Transvaal north of the latitude of Pretoria. And I understand that the majority of your mine natives come from there, so the contractors would not be able to get these boys.

7,721. But supposing he recruits boys in Johannesburg. Is there anything to prevent him recruiting boys in Johannesburg?—No, so long as he conforms to the native pass regulations and does not take the boys from the prohibited districts.

7,722. And so by giving a little higher pay he could take natives from the mines?—Provided they did not come from Portuguese East Africa or the Transvaal north of Pretoria.

7,723. Any Cape Colony native or any other natives that happened to be on the mines could be taken?—Provided he keeps within the letter of the law. I do not know what the law is.

7,724. Does it not strike you that you are creating a system very similar to what existed before the war with free touts all over the mines stealing natives?—The thing is this: We had certain conditions imposed by the Government. We followed these conditions exactly; we have not made any more. The Government and the Inter-Colonial Council made conditions under which we could work, and we simply passed those to the contractors and asked them to tender.

7,725. But you have expressed the opinion that you do not think the contractors have any difficulty in getting boys?—I base that on the fact that I do not think that they have any anxiety about signing contracts, and also they get boys for railways that you cannot get for other work.

7,726. Do not you think it is quite natural that they should have no anxiety seeing that they have these fields to draw upon?—Well, I have never considered the question. As long as the contractors produce boys in accordance with the contract, that is all.

7,727. Have you any personal experience of South African natives?—Yes. I have worked with them for about three years; rather more.

7,728. Where would that be?—I was repairing railways during the war.

7,729. You said just now that natives would come to the railway and would not go to the mines?—No, I said some of them.

7,730. What natives are you referring to?—I was talking to a labour agent from Basutoland of the difficulties of getting natives for the Transvaal, and he thought he might get some for the railways.

7,731. Mr. Price told us yesterday that your recruiters had failed to get enough for you in Basutoland?—Not new construction.

7,732. Is there any difference in new construction or open railway work, so far as the native is concerned?—Yes, on maintenance we are paying 60s. per month of 30 working days. I know contractors pay more than that.

7,733. Pay more than that?—I am sure they pay more.

7,734. So the inducement is really the pay?—I suppose so. The thing is this, if they can get the same pay for railways and for some other employment, I think they prefer to go to the railways.

7,735. And of course they prefer to go to that particular department of the railway which pays best?—Yes. Of course contractors are cutting their rates pretty low to cut each other out, and they cannot afford to pay heavily. For instance, we get rates at 11d. per cubic yard; in one case 10d., and I do not think a contractor can afford to pay more than £3 and make a profit.

7,736. Suppose he pays £3 10s., what difference would it make per cubic yard—you say he has contracted at per cubic yard?—I suppose a native would move five cubic yards per day, there are 30 working days in a month, that gives 150 cubic yards. You add another 10s. for 30 working days, gives rather less than 1d. per cubic yard when paying 10s. more per month.

7,737. So it would pay him to pay 10s. more, and get an ample supply of labour, so as to go steadily on with the work?—I do not think so, because they have to cut their rates pretty low. I do not know what margin they are allowing themselves, but a 1d. per cubic yard is a lot out of 11d.

7,738. But how was it that there was no condition made as to pay?—Because we thought we had tied them up sufficiently. They accepted the conditions given to us by the Government, and no condition of that sort was made.

7,739. Do you consider you have really tied them up?—Yes.

7,740. Does it not strike you that they are free to recruit all our mine boys who are time-expired; that they are free to offer a little more than we are paying, and so take them away?—Yes, if they have not come from Portuguese East Africa or north of Pretoria.

7,741. But if they came from there are they likely to be asked this question?—Our engineers will see to that.

7,742. Then as to boys that have been here for three or four years and that happen originally to come from those parts, will your engineers prevent the contractors from employing them?—Certainly, if they found out that the contractors were employing boys who belong to any of the tribes mentioned in those districts, they would report the contractor.

7,743. But they are free to take from the mines all local boys, all Cape Colony boys, and all Western Transvaal boys?—There is nothing in the contract preventing them from doing it so long as they keep within the law, and the conditions already stated.

7,744. What do you estimate the total number necessary for all your requirements on the lines?—10,000.

7,745. But Mr. Price mentioned 60,000 yesterday?—That was an ideal figure, on the assumption that all the railways projected would be begun at every point where it was possible to begin and executed as rapidly and therefore as economically

as possible. We were asked by your Commission to state what we wanted, and we replied that we should like to get 60,000, but we can only get 10,000, but 60,000 is an ideal figure and we would not complain if we got 40,000; we could make good progress.

7,746. If you got 60,000 you could employ them all?—Yes, I think so, on earthworks.

7,747. From an economical point of view would it be more advantageous than having 40,000?—Yes. Because it would be done much quicker, the supervision charges would expire quicker, and so on.

7,748. For what length of period would you require them if you had 60,000?—If we had 60,000 we could carry out the programme laid down in two years.

7,749. Have you on new construction employed white unskilled labourers at all?—Yes, we have 500 navvies on the Springs-Ermelo Railway who have only just arrived. The first batch of 263 arrived on 19th June and 231 on the 22nd July, so that the last lot have just been one month at work.

7,750. Did you have any difficulty in getting them?—They were recruited in England and sent out. I do not know whether they had any difficulty in England in getting them.

7,751. Have you any figures or estimates made out as to what the comparative cost is likely to be?—Yes, I have. What I am going to base my estimates on are figures given by the Chief Resident Engineer. He has had white labour about six months. We are keeping careful statistics, but they are only about three weeks old, so that we take the Chief Resident Engineer's figures as he has had more experience than we have.

7,752. The CHAIRMAN: His experience is of the first lot?—It is about 500. We have had 500 here about one month. I see he states that white labour is two-and-a-half times as expensive as native labour. Well, in order to get the very lowest estimate of the difference we took it at two-and-a-quarter times, because we got rather more straightforward work. He has work on open lines and has to wait for trains, whereas we have straightforward work, and I find on looking up the estimates the three main things affected by wages are earthworks, platelaying and ballasting, although masonry and buildings take a good deal. The earthwork on ordinary lines cost about £1,200 per mile; platelaying and ballasting, excluding train charges, which is common to either kind of labour, is £500, that is £1,700; subtract for tools, etc., per mile £200; wages per mile are then £1,500; multiply by 2½, result £3,375, the difference being £1,875 per mile, and then add for building, masonry and everything else, £225, I think it would be fair to put it at £2,100 per mile, that is estimating white labour to be 2½ times as expensive as native labour.

7,753. I do not quite understand your previous sentence about deductions for building?—I mean that some natives will be employed on buildings and so on, the majority of the wages, however, is paid out for earthworks, platelaying and ballasting, a certain amount of wages will be paid out for building stations and masonry and erecting girders, etc., which is mainly done by white skilled labour. The unskilled labour, white or black, comes on earthworks, platelaying and ballasting, therefore I put £2,100 per mile as a low estimate of the difference between native and white unskilled labour, that is multiplying the figures by 2½; the Chief Resident Engineer puts his figures at 2½. I see he now says this morning that he thinks this ought to be multiplied by more than 2½. We take it at 2½ times—that white unskilled labour, is 2½ times as expensive as native labour and the cost per mile is increased by £2,100.

7,754. Mr. EVANS: So that adding £2,100 means increasing the cost by 40 per cent.?—Yes, I suppose that is so.

7,755. Do you mean on construction of the line?—Yes.

7,756. So that on the £5,000 you estimate to be the cost of the line you have to add £2,000, making it £7,000?—You add £2,100 and that comes to £7,450 or £7,500 roughly.

7,757. So that you increase it by 40 per cent.?—Yes, I suppose that is so.

7,758. Mr. PHILIP: How many miles of new construction are you doing departmentally?—None, departmentally. Oh, yes, we are doing Springs eastward with these white navvies. The only portion we are doing departmentally is the portion being done by white labour. That is the extent of 70 miles.

7,759. In this statement of yours on the 8th of August you have 1,000 boys employed on construction departmentally?—Yes, but what we use boys departmentally for is mainly for off-loading stores at all the different railway heads and loading them up and despatching them, and also we have to maintain a certain amount of line. As soon as it is safe for traffic to run on the line we let it run, but we do not hand the line over to the Maintenance Department until it is absolutely safe. Therefore we are maintaining a certain number of lines.

7,760. Then a number of these boys really ought to be on maintenance?—Yes, some of them.

7,761. Can you give me the mileage of the contracts you have already given out?—Yes, it is 244 miles, including the mileage of line on which the white navvies are working.

7,762. How long will these take to construct?—It is rather hard to say, we shall do a bit of each line. Some will be finished quicker than others.

7,763. Have they sufficient boys on this 244 miles now?—Yes.

7,764. That is this 2,048 will be sufficient for these lines?—No, you see the Harrismith-Bethlehem line, which requires 750, and the Johannesburg-Vereeniging line, which requires 600. Contracts which were let a fortnight ago were not included, so that for contracts which have been let the number required is 5,190.

7,765. Were these contracts let on the same terms as the 300 miles for which you are advertising for tenders now?—No.

7,766. Have all tenders this condition as regards recruiting and the number of boys employed per mile?—In regard to this 300 miles of railway we were told to make every endeavour to use machinery and therefore the contractors are tied down to 10 boys per mile, and asked to quote what machinery they propose to use.

7,767. What will that be in the shape of—steam ploughs, I suppose?—Ploughs, scoops, and steam navvies. We have one steam navy working out at Springs now.

7,768. What progress will they make using only 10 boys per mile?—I expect they are going to get white labour. Some of them may perhaps be thinking of importing labour?—I do not know.

7,769. But with 10 boys per mile what progress will they make?—I do not think they will make much with 10 natives per mile only, but I am expecting them to supplement with white labour and machinery.

7,770. How long will it take 10 boys to do a mile of earthwork?—You see it is like this. We give them 10 boys per mile, calculated on the whole length. They may have 1,000 boys at work on one mile.

7,771. And how long would it take 10 boys to do a mile of earthwork?—I think you ought to ask me how many thousand.

7,772. You are only to have 10 on a mile?—No, you can have 1,000 on a mile, but not more than a certain number on a whole length of line.

7,773. On what length of line are these contracts let out?—Not less than 100 miles, so as to make it worth a man's while to import machinery, and, if necessary, have white labour.

7,774. These new contracts, have you fixed a time limit for completion?—Yes, we have fixed it rather too short. We shall have to give way on that.

7,775. You would not care to mention the time?—Nine months from the date of signing the contract, that is the earthwork and masonry, not the plate-laying.

7,776. There are heavy penalties for non-compliance within the time, are there not?—Yes, but we shall have to give way. We shall have to advertise the fact. I should like to advertise the fact now. We may be lenient on the time.

7,777. The CHAIRMAN: It will bring in more contracts?—Yes.

7,778. Mr. QUINN: May I point out that the witness is advertising it now, in view of the fact that the Press are present.

7,779. The CHAIRMAN: Yes, I do not know if the witness is aware that reporters are present?—Yes, I am aware. That is why I made the statement.

7,780. Mr. PHILIP: By whom were these tenders accepted, by a Committee?—Yes, there is a Tender Board.

7,781. Mr. BRINK: In the statement you have just handed in, I do not see any mention of the Krugersdorp-Rustenburg railway?—It is in the 300 mile contract.

7,782. Mr. TAINTON: What is the total mileage approved of for new railways?—737 miles approved by the Inter-Colonial Conference, for which the Government is going to pay. There is another 300 miles from which private companies are prepared to put up the money.

7,783. What was the estimated cost of the 730 miles?—It was estimated at £5,000,000.

7,784. And what does it work out at per mile? £6,900. That includes £1,100 for rolling stock and extension of workshops. About £5,800 for construction.

7,785. This estimate of 60,000 boys, does that apply to the 730 miles?—No, that would apply to the 730, plus the 300. That would be about 1,000 miles.

7,786. Plus the 300?—Yes.

7,787. Then leaving out the 300 miles, you require about 40,000 boys for 730 miles?—We shall be satisfied with 40,000 boys. We would get on very well. I think we would be satisfied with 40,000 boys for the thousand miles. We could do very well with them.

7,788. You say on that basis you expect to complete the programme in two years. How long would it take you to complete the 730 miles with 10,000 boys?—I think we ought to be able to turn out 200 miles a year. Only on condition that we could get these contracts accepted for these 300 miles. If the contractors will fall in with this arrangement, I will be able to tell you better next week, as tenders come in up to the last of the month.

7,789. If you do 200 miles a year, it will take you a little more than three years?—Three-and-a-half years, about, to finish the 730 miles. It would take about five years to finish the thousand.

7,790. Leave out the 300?—We have got the others under construction, or we shall have if these tenders are accepted.

7,791. I understand you now, that with this limited labour supply it will take you three years?—Three-and-a-half years—we are going to use machinery.

7,792. The difference is one year?—One-and-a-half years, and it is entirely relying on this being a successful experiment.

7,793. What is the experiment?—Carrying out these conditions of employing machinery and only 10 boys per mile. It may add to the cost, but I do not know yet. The contractors may put a higher rate on.

7,794. Your estimate of the difference between the cost of native labour and white labour was, I think, £2,200 a mile?—£2,100.

7,795. What would that work out at on the total of 730 miles?—A million and a half, £1,547,000.

7,796. Roughly, the difference in the case of this authorised programme of 730 miles, the difference in the cost of native and white labour on the programme, will be  $1\frac{1}{2}$  millions in favour of native labour?—Yes, that is a very low estimate. I think I may say that if we were going to ask the Inter-Colonial Council for money to make these lines with white labour. I think we should certainly ask for another  $2\frac{1}{2}$  millions.

7,797. Have you any reasons for that higher estimate?—I have based the estimate of £2,100 per mile on the figures of the Chief Resident Engineer, and he has this morning raised those figures, and besides that we have got to allow for the fact that we have not got accurate statistics yet, but we shall have them in three or four months' time, and it is possible that the more accurate statistics may turn out worse than what the Chief Resident Engineer said this morning, so that in asking for money we should have to allow ourselves a margin.

7,798. Why do you think that some contractors are likely to import white labour?—Because they spoke to us about it. They wanted to know the conditions and all sorts of things. I think that railways can be done cheaper by white labour by contractors than by Government.

7,799. What was your answer to that question which the contractors put to you about introducing coolies from Natal?—The answer was that as far as we knew there was no law against it, except that they had to pay £3 at the border per head. As it was a question of policy, it was referred to the High Commissioner. We have had no reply from the High Commissioner.

7,800. Mr. WHITESIDE: Will you tell us who is the contractor for the Rand Mines' Railway, who is employing these 430 boys?—Mr. Wilson.

7,801. You told us, I think, that he got these boys from the East Coast?—He told me so.

7,802. Mr. QUINN: Who is the contractor on the Vereeniging line?—Messrs. Royce and Co.

7,803. How many natives have they got now?—I do not know what they have this morning, but I think that they have about 400. They had, according to this return, on the 8th August, 133.

7,804. Where are they recruiting these natives?—I have been told that they have been got from the neighbourhood of Queenstown.

7,805. Any suggestion that they have been "jumped" from the mines in face of the evidence is unfounded?—Yes. As far as I know, I do not know of any case of boys being taken from the mines.

7,806. Do you not know that it is a fact that the contractor on this line got his boys in a few days without any trouble from a district where the Witwatersrand Native Labour Association had been recruiting for years, the Queenstown district?—Yes, but I only know it from hearsay. I asked the engineer where the contractor was getting his boys, and he said he understood from Queenstown.

7,807. I know it for a fact. Do you know that in Queenstown the W.N.L.A. have had an agent for some time, one of their best men?—I do not know that.

7,808. So that there is no foundation whatever for the insinuation, as far as you know, that these boys have been taken from the mines?—No, I do not know any circumstances to warrant it.

7,809. You quoted a price that the contractor was getting. How does that compare with your departmental charges for similar work?—We are not doing any work departmentally except with white labour, and, as I say, the statistics we have with regard to that are not at present reliable.

7,810. Mr. EVANS: Can you let us have the exact terms of the contracts as far as they refer to native labour?—Yes, I have not got them here, but I could send it round.

7,811. Do you know what Mr. Royce pays his boys?—No, I do not.

7,812. Are you getting any return from these contractors of the places where they recruit?—No, we are not doing that.

7,813. How are you going to see that the contract is carried out as far as the sources of supply are concerned?—We have a divisional engineer and two assistant engineers, and four inspectors for every 70 miles, and we rely upon them reporting to us, and I think the W.N.L.A. will let us know.

7,814. Yes, but how will the W.N.L.A. be able to control the contractors?—Well, they will soon find out if the contractor is getting any boys from where he should not. I think we shall hear of it very quickly.

7,815. Have you heard anything of that kind from the W.N.L.A.?—No.

7,816. What makes you conclude that you would hear?—Because it is entirely to their interests to let us know. Any of these competing labour agents know what every other labour agent is doing.

7,817. Will you send in this extract from the contract as far as it refers to native labour?—Yes.

Mr. H. MORTIMER ZEFFERTT, called, sworn and examined.

7,818. The CHAIRMAN: Mr. Zeffertt, you are connected with the White League, are you not?—Yes; before I proceed I should like to read you a letter or a copy of a letter.

7,819. From whom and to whom?—From myself to your Commission, showing to you that I have come here as an unwilling witness. With your permission I should like to read it.

"23rd July. Having laid your letter of the 18th July and my reply of the 21st instant before the Executive Council of the "White League," I now beg to state I am advised to decline to give evidence as a protest against the constitutions of the Commission, also in consequence of the scope of the Commission, not including, as understood, 'the ways and means of procuring natives.' This as anticipated would have involved a searching enquiry into the proceedings of the W.N.L. Association, Ltd.—to all intents and purposes a huge monopoly sanctioned by the Government, the said private company controlling the native labour supply to the Transvaal. The League holds the said private company to be responsible for the number of boys on the mines not more rapidly increasing, so therefore kindly advise the Chairman and members of your Commission as to the purport of this letter."

7,820. Do you wish to hand in that letter?—You have the original. I have only a copy of it.

7,821. Yes, all right. Do you hold any position in connection with the White League, any official position of any kind?—Only as member of the Executive Council.

7,822. I understand it is the view taken generally by the League that there is an ample supply of labour to be had for the mining, agricultural and general industries of this country?—Well, we look upon it in the light that this is a white man's country and we want, before resorting to extremes, to find out whether we can get sufficient native labour.

7,823. Will you answer the question? Am I right in assuming that it is the view taken generally by the members of the League that there is an ample supply of native labour for the general needs of this country?—Yes.

7,824. Did you state publicly that there were 250,000 men available, native men?—In what respect? Where did you get that report?

7,825. I am getting it from a newspaper report?—In what paper?

7,826. Well, I think I am quoting from the "Star," but I think it was reported in both newspapers of the same date in the middle of July. Is that a correct report?—I cannot help what creeps into the Press. There have been a great many mistakes, especially lately in connection with our Association.

7,827. I ask you, did you make a public statement that there was an available supply of 250,000?—Not that I am aware of; not to that extreme.

7,828. Did you make any statement as to the numbers available?—I might have at some meeting; I mentioned the fact that natives were offered to the W.N.L.A.

7,829. That is not the question. What date was the meeting you are referring to?—The 14th July. I think you are referring to the meeting we had at the Masonic Hall, Fordsburg.

7,830. I think so, yes. Did you mention any numbers as being available at the meeting?—I cannot think for the moment.

7,831. You did not say there were 250,000 available?—No.

7,832. You make no statement as to numbers?—I did make a statement. I cannot say for the moment. I have brought no papers with me. As I tell you I have come here as an unwilling witness.

7,833. That has no bearing on the question I am putting to you. You do not remember the figures you gave?—I cannot remember the exact amount.

7,834. But you did make a statement as to a certain amount?—Yes, I did.

7,835. And you cannot remember the figures you gave? Now, in making the statement, what was it based on?—The general opinion of the members of our Association that there is a plentiful supply of natives, and I take it that the people who are living in the country are the best authorities, that is to say, if they have lived any length of time here, and especially if they have been in touch with the natives, they are perfectly aware that the country is teeming with natives, and I suppose that is the reliance on which that statement was made.

7,836. How long have you lived in the country?—About 15 years. The best part of that time I have had a good deal to do with natives. I have some in contact a good deal with natives.

7,837. Have you employed large numbers yourself?—No, I have not employed them personally.

7,838. Have you ever been engaged in recruiting natives?—Never been a recruiting agent in my life. I have been an agent for people who have recruited.

7,839. Previous to the war?—No, I have had to do with natives north of Rhodesia and in Rhodesia, but since I have been here I have been acting for people who have offered natives and been refused.

7,840. Since the war, then, you have been the agent for persons who have offered natives?—Yes.

7,841. Can you tell us who those persons are?—I am not at liberty. I believe the W.N.L.A. would know.

7,842. You know yourself, of course?—Yes, I know.

7,843. And you are not at liberty to mention the persons for whom you have acted as agent in offering labour?—No, for the simple reason that I may want to use these people at some future date. It might endanger them to have their names brought forward at present.

7,844. Have you not mentioned publicly that you were agent for Mr. Franks of Pondoland?—I acted for him for some time.

7,845. Are you representing him now?—No.

7,846. Did he offer you any natives?—Yes.

7,847. Any large number?—500 monthly.

7,848. Did you place any of these?—No, not one.

7,849. How was that?—I offered them to the W.N.L.A. I may point out that the Association asked Mr. Franks to come up in connection with the natives.

7,850. Did you offer these natives to the Association?—I did.

7,851. Did they refuse to take them?—Yes.

7,852. Why?—They gave no reason at all, after keeping the man waiting for some considerable time. Then Mr. Franks asked me to act for him in the matter.

7,853. Did you offer them to anyone else besides the Association?—I believe I communicated with Mr. Lionel Curtis. It was with the Town Clerk at all events.

7,854. You communicated with the Town Council?—Asking whether they could do with some natives. I have not the papers here. They asked me how many I could supply monthly, and how much they would cost to deliver at Vrededorp. I believe that was the reply I got. I went up there.

7,855. Why did you tell them?—The communication was sent to Mr. Franks through him saying that he would be able to supply them with 500 a month. I believe I called on Mr. Curtis.

7,856. They did not refuse to take them from you?—I cannot think for the moment. I have no records.

7,857. Did not the Municipality tell you that they were already in communication with Mr. Franks?—I do not think so. If they had they must have been communicating by letter. I mentioned Mr. Franks' name to them.

7,858. Are you sure Mr. Franks did not communicate with them direct before you intervened?—Oh, yes, Mr. Franks was up here offering natives.

7,859. Before you offered natives to the Municipality on behalf of Mr. Franks they were already in communication with him?—Oh, no. Mr. Franks offered natives up here, and he could not do anything, and he had to go back to Tongaland, and he then asked me to act for him in the matter.

7,860. Have you offered natives to anyone else?—I believe so.

7,861. Have you placed any natives here for Mr. Franks at all?—I have not placed one.

7,862. He has never sent you any?—No.

7,863. Does it not strike you as rather odd, that although there is a great demand for natives here, and that Mr. Franks could supply you with 500 per month, you are not able to place a single one?—The obstacle is the Witwatersrand Native Labour Association.

7,864. Why is that?—There were other natives offered some time ago from Central Africa by a friend of Mr. Franks.

7,865. Why should that be an obstacle? If the Municipality, the railway and other employers want natives, why have you not been able to place this 500 per month?—I can give you no reply, sir.

7,866. You cannot give any reply?—No.

7,867. Are you aware that Mr. Franks is practically employed by the W.N.L.A. now?—Well, I thought something of that sort would have happened, but I am not aware of it. I have heard nothing definite. It seemed very strange.

7,868. You do not know that he has been employed by them for some months?—No.

7,869. You do not know that he has failed to supply them with a single native?—No.

7,870. Mr. QUINN: What is the date of the letter you sent in to the secretary?—I have two letters in connection with this matter, one dated August 21st, the one I have just read, and my last letter dealing with the constitution of the Commission was dated July 24th. I have a copy of it as well.

7,871. Have you received copies of these letters, Mr. Chairman?

The CHAIRMAN: The letters have been received.

WITNESS: The letter of July 24th was pointing out, if you will remember, the proceedings of the Association. I do not know whether you wish me to read that. These are the two principal letters and I should like to impress on you that they

are the cause of my not putting in an appearance before. In connection with that letter, I particularly pointed out the stand the Executive Council took in connection with the W.N.L.A.

7,872. Mr. QUINN: What I want to get, Mr. Chairman—I think we all want to get it—is one single concrete case where the Native Labour Association have been offered boys, and on insufficient grounds have refused them. We have never had that yet. I must press that point. Can you tell us, Mr. Zeffertt, of any single instance where boys were offered to the W.N.L.A. and were refused without sufficient reason or without any reason?—Well, it is a strange thing that that subject cropped up only yesterday in talking to a gentleman from the East Coast. He was distinctly told that they would not take natives.

7,873. You have referred to a particular case in reply to the Chairman. A certain number were offered by you I understand?—500 monthly.

7,874. What reason did they give for refusing?—They gave no reason—I think that it was Mr. Macfarlane—yes, they did give a reason. They said they had their own agents and they could not very well take these natives. I then asked them what they meant by dilly-dallying with me, sending for me, and also keeping Mr. Franks a considerable time. They said, "Well, we cannot help it. We have our own agents, and cannot employ these boys."

7,875. That is a clear answer. Did they write you that, or tell it you?—No, it took place there.

7,876. Can you give us any other instance? It is no use telling us what someone else said to you. I want to get hold of particular instances, and I am sure the Commission does too, where someone has come along and offered boys and been positively refused. You have given us one. Can you give us any other like that?—Well, I take it that the department I am connected with will go into these things themselves.

7,877. Can you give us any other instance?—No, I cannot at present.

7,878. Mr. TAINTON: I would like you to explain more fully why you are unwilling to come and give evidence before the Commission?—That is the stand the members of our Association take up, and that is our feeling in respect to the matter.

7,879. You took part in the discussion, I suppose?—No, all the letters I received I laid before the Executive Council, and at the meeting they themselves decided what should be done and instructed me accordingly.

7,880. Then I understand that the ground of your refusal to give evidence is that you consider the Commission biased in character. Is that so?—I cannot answer.

7,881. Well, I sympathise with your position, and I understand that it is based upon certain reasons. I want to get at those reasons. I take it that a body of reasonable men like the White League would not take up that attitude without having some good grounds for it. That is just what I want to get at. Will you tell us why they have taken up that position?—I take it that my reply to your communications is quite sufficient answer to that question.

7,882. I understand that communication to mean that the League is of opinion that the Commission is biased. Assuming that that opinion is correct, would it not have been a very fair opportunity for the League to appear here and expose the hollow character of the Commission?—We have taken a different stand altogether, and I can tell you more about the Association, if you like, if that is what you are driving at. The Association is simply and purely formed for the purpose of keeping this country for the white inhabitants and the natives of this country. We have carefully gone into the reports that have been published in the Press, and we are of opinion that we are not quite satisfied. We are determined, as members of this Association, to do our utmost to find out the ways and means of procuring natives instead of finding out the amount of natives there are in the country, and that is what the Association is doing to-day.

7,883. Well, surely you had a good opportunity by giving evidence before this Commission of telling the public of your means of obtaining natives?—I believe a deputation waited upon His Excellency the High Commissioner some little time ago, and it was then understood that the gentlemen representing different Associations would stop all agitation while the Commission was sitting. So far the White League have fulfilled their obligations.

7,884. But what has this Commission to do with any programme of agitation which may be carried on by independent bodies?—It was an understanding entered into between the gentlemen of the deputation and the High Commissioner.

The Commission adjourned for lunch until 2.30 p.m.

7,885. Mr. TAINTON: I think you were telling us before we adjourned, Mr. Zeffertt, the reasons for your unwillingness to give evidence. Will you please go on with your answer in that respect?—I think I have fairly pointed out in my letters of July 24th and August 21st the reasons you wish to know.

7,886. I understand, then, that your reason as given in that letter is that you did not wish to give evidence because you considered the Commission likely to be biased in its judgment?—Acting on instructions from our Executive Council, of which I am a member, I wrote you stating fully, I believe, our views.

7,887. One of the reasons given in that resolution which you read is that four of the members of this Commission were also members of the Labour Importation Association. Is that so?—Yes, that is so.

7,888. Do you mind giving the names of these four members?—I think I have them here. I wish it to be clearly understood that this is acting on the instructions of the Executive Council.

7,889. Are you giving this evidence in an official capacity as representative of the League?—I am. I believe these gentlemen are connected with the society—Messrs. Goch, Daniels, Donaldson, and Philip.

7,890. Is Mr. Fursey, who was appointed a member of this Commission, a member of your League?—He may be a member of the League, but he is not a member of the Executive Council.

7,891. Is Mr. Whiteside a member?—Not that I am aware of.

7,892. Do you know that Mr. Perrow, a member of this Commission, is also a member of your League?—I could not say, I do not know.

7,893. Would you be surprised to hear that three of the members of this Commission have been or are members of the White League, whilst another is the President of the African League?—I should be surprised, and I would like to know the names.

7,894. I understand that Mr. Perrow has been or is a member of the League. Mr. Whiteside is, I understand, connected with it. I must withdraw Mr. Whiteside's name, as he states he is not a member. Mr. Quinn is, I think, a member of the African League, and I do not know what position Mr. Fursey occupies. Why I mentioned these names is this, that according to your Executive four of the members of this Commission are likely to be biased in that they were members of a partisan body, which was formed before this Commission was formed. Do you still think there is much validity in that contention now that you are aware that other members of this Commission are members of other partisan bodies?—I have already answered that I am not aware the gentlemen you refer to are members of the League. Mr. Quinn I do not know, and I believe Mr. Perrow is a member, but I do not know whether they are all connected with the White League.

7,895. Leave out the actual number. We do not want to prove four against four, but is it not

correct that members have been selected by the Government from other partisan bodies than the Labour Importation Association?—I have already answered.

7,896. I want you to answer the question. Is it not a fact?—I suppose they have been selected as they are all gentlemen connected in public affairs and well known. I have pointed out to you that the White League have already taken this step which they have done, and I am instructed to give you that as my answer.

7,897. You have not answered my question?—Well, I am sorry.

7,898. You say that the Executive of the League has taken up this attitude publicly because four of the members have been appointed from one partisan body and they therefore refuse to give the public any assistance whatever in elucidating this problem. Now I put it to you that that contention does not seem well grounded in that other members of the Commission are also members of partisan bodies. I want you to justify the position which your Council has taken up in this matter. Of course if you tell me that you are not prepared to answer, I must accept that, but I think in fairness to us and the public generally it is your duty as a representative of the League to give us a full explanation of your reasons for making that statement or your grounds for making it?—Well, I will answer you in the same terms as I have written. I have pointed out before that the gentlemen whose names I have mentioned are connected with an Association that has already taken part in an agitation while this Commission is sitting. That is the exception we take.

7,899. You take further exception on the ground that an agitation has been going on while this Commission has been sitting?—Yes.

7,900. You say the resolution taken was the answer to a letter sent by your secretary and dated August 21st. Was that resolution taken as a consequence and as a result of that letter?—Yes.

7,901. Then the League has taken up this attitude subsequently to the request made to you to come and give evidence?—It has been taken up some time ago on other grounds. I am referring to the last letter.

7,902. Will you give us the other grounds?—Yes, in my letter dated 24th July: "As a protest against the constitution of the Commission, also in consequence of the scope of the Commission, not including, as understood, the ways and means of procuring natives. This, as anticipated, would involve a searching enquiry into the proceedings of the Witwatersrand Native Labour Association, Ltd., to all intents and purposes a huge monopoly sanctioned by the Government, the State provided company controlling the native supply of the Transvaal."

7,903. What is the date of that?—July 24th.

7,904. How long had the Commission been sitting at that time?—Some time, I believe.

7,905. Did your League follow the sittings of the Commission either through the Press or by attendance here?—I could not say, but through the Press, I take it.

7,906. Are you aware that that letter is based upon the erroneous impression that the reference to this Commission does not include an enquiry into the ways and methods of the Rand Labour Association?—I received a reply to that letter.

7,907. No, I want you to answer my question. Are you aware that the reason you have just advanced is based upon a misreading or a misunderstanding of the reference under which this Commission is constituted, and that as a matter of fact at the time that letter was written or before that letter was written the proceedings of this very Labour organisation had been most searchingly examined and scrutinised?—Before the Commission?

7,908. Yes?—Then there is some mistake. I have the reply to that letter stating—

7,909. No. I want you to meet this point before you go on?—But they are not aware that the Witwatersrand Native Labour Association, Ltd., was giving evidence before I sent that letter.

7,910. Was no member of your League or Executive aware of that?—That I am not aware of.

7,911. Then am I to understand that the proceedings of a public body against whose constitution you have protested have been passed without the slightest examination by any member of your Executive?—I do not know.

7,912. Have you any other explanation for the attitude which your League has taken up with reference to this matter? I ask because the grounds you have given as to the partisan character of the Commission do not seem well founded. Now the argument applies to both sides. The other ground of objection, that this Commission did not include an enquiry into the methods of the Rand Labour Association, is based upon a misunderstanding or want of knowledge. These are the two reasons you have advanced. They do not seem to be sufficient to justify the attitude your League has taken up, and I ask whether you can give us another reason?—I can give you no further information.

7,913. Do you say that in your official capacity you can give us no further information?—Not on that point.

7,914. The CHAIRMAN: Might I point out you are dealing with two or three Associations, and you are referring to the Witwatersrand Native Labour Association as the Labour Association. Might I request you to use proper names.

7,915. Mr. TAINTON: I will make that correction. When I refer to the Labour Association, I mean the Witwatersrand Native Labour Association. Is that the Association referred to in your protest?—Yes, they will publicly give a statement to this Commission of what they know and what they think should be done to settle it.

7,916. Is that not a reasonable position for them to take up?—I could not say.

7,917. Mr. PHILIP: Mr. Zeffertt, I suppose you saw the original advertisement with reference to the appointment of this Labour Commission?—I did.

7,918. In that advertisement one of the enquiries we have to make is the special conditions, if any, affecting the labour supply as to (a) what amount of labour is necessary for the requirements of agricultural, mining and other industries in the Transvaal, and (b) to ascertain how far it is possible to obtain an adequate supply of labour to meet such requirements from Central and Southern Africa. Now I presume the methods of the W.N.L.A. would come under that paragraph, would it not?—Well, it appears to have done so.

7,919. And you could have stated your case or your Society could have stated their case under this clause?—We have no case at all to state.

7,920. You say you have no case?—We have a programme laid out, and we are going on that programme. We are simply an Association formed, not alone in connection with the native labour, but with other matters that affect the white race.

7,921. I understand that your Association was formed so as to keep this a white man's country?—Just so.

7,922. And yet you will not come forward and help us in any way to show us that we can keep this a white man's country?—Is that a question?

7,923. Yes, that is a question?—Well, I think that my letters are sufficient answers to it. I am placed in such a position that I do not know which way to answer that. We have prepared no statement whatever.

7,924. There was another point you mentioned. You consider that your League was taking steps, independent steps, I understand, to ascertain the facts in connection with this labour question. Have you any objection to telling us what steps are being taken to carry out that resolution?—I can give you

no information; none whatever. I found, on referring to what the Chairman asked me this morning in connection with Mr. Franks, who offered the natives, when I returned to my office in town that a wire was only recently sent me by Mr. Franks offering me natives, so that I cannot understand how the W.N.L.A. has engaged him. I have a wire in my possession dated the 10th July from Franks, Mount Prere, to Zeffert, Johannesburg: "Will recruit natives at once; fix up agreement," so it seems very strange that the W.N.L.A. have secured the services of Mr. Franks, and that he has been unable to supply them natives. I find another wire from Mr. Franks on the 25th August offering a party of 200 boys provided licences can be obtained for them.

7,925. But the point we are dealing with at this moment is the action taken by the League to investigate this matter. You state that you could give me no information. Does that mean that you have no information?—No, I have no information at all.

7,926. You do not know what is being done?—No.

7,927. Is nothing being done?—I believe so, but I am not sure, as I have been away from the Association for the last month.

7,928. Do you think that the League, if they were invited, would tell this Commission how to overcome this difficulty, or what active steps they would take to overcome it?—I could not tell you; I do not know.

7,929. I ask because, with every wish to be impartial, I do not quite understand the attitude taken up by your League. Surely they wish to see this matter settled on a satisfactory basis. What do you consider would be the best means to get the labour to the Rand at the present time or for the Transvaal?—Personally, I consider that free recruiting should be allowed.

7,930. Do you think if we had free recruiters we would get any more boys than we do now?—I am positive of it. The mere fact of people communicating and offering natives and not being allowed to bring them up here is quite sufficient.

7,931. They are not allowed. Is that the only proof you have—the instance of Mr. Franks?—Oh, no.

7,932. Have you other proofs?—I have.

7,933. Will you state them, please?—Yes, I have a wire here from Delagoa Bay. It is in Portuguese, but I will read it in English, "With two licences you may count on a minimum of 200 boys per month."

7,934. That is the number of boys you are able to supply immediately?—The party who received this wire offered them to the Labour Association, and he was told, so he informs me, although he has handed these over to me, you can get the party himself if you like.

7,935. Who is the party?—Mr. Haymen.

7,936. His Christian name?—I could not tell you.

7,937. Can you give us his address?—P.O. Box 6519.

7,938. What does he tell you?—That he offered them to the Labour Association, and they told him the same thing, that they have their own representatives.

7,939. Have you any other instances?—Yes, I received a communication asking me to find out what the W.N.L.A. has done in connection with the offer of boys by Mr. Collins, of Central Africa. I have not the letters here, and it is some considerable time ago.

7,940. Were they offered to the W.N.L.A.?—Yes, but not through me.

7,941. And they also declined them?—I could not tell you. The letter I received from my principal was to enquire why the Labour Association had not taken the natives offered to them by Mr. Collins, of Central Africa.

7,942. Can you tell us who offered these boys to the W.N.L.A.?—You ask me if I know of any cases, and I am telling you just what has come within my own observation.

7,943. Can you give us any date?—I have not any papers here, and I am just giving particulars as I know them. There are others, but I cannot for the moment recollect.

7,944. You say here, "this, as anticipated, would involve a searching enquiry into the proceedings of the W.N.L.A." I think we have had rather a searching enquiry, and so far any complaints that have been made the W.N.L.A. have proved there were really no grounds for them at all, and had you watched the proceedings you would have been able to come forward and state your case, and if you had any proofs against the W.N.L.A. you could have proved them?—Perhaps.

7,945. Mr. EVANS: Do you employ any natives yourself?—Only what I want for my own business purposes. I have four.

7,946. Did you get them from the W.N.L.A.?—No, I have one who has been with me through the war.

7,947. Have you engaged any since the war?—Yes, I have.

7,948. You state in your letter that the Association have got a monopoly. How did you manage to employ these natives?—Well, it is very easy. The Municipality, it seems, provided boys and gets us a sufficient number into town. I take it, when I mentioned a monopoly, I considered there was a huge monopoly in securing natives for the mines. There are always a good many boys living about the town, a tremendous amount.

7,949. What I want to know is where this monopoly comes in, if you and others are free to go and employ natives as you like?—I take it I am wrong in securing the natives without the consent of this Native Association, at least it seems so.

7,950. Is it your opinion that that is the law?—No. A native brings his pass to me, he wants work, and I consider that I am entitled to engage him.

7,951. Is not every employer in Johannesburg absolutely free to recruit natives anywhere he likes?—No, I do not believe that you are allowed to bring natives into the country. In the Transvaal I dare say that you are allowed to recruit as many boys as you want, but I take it that this is a Commission to enquire into securing natives from outside the Transvaal and not inside it.

7,952. No, this is a Commission to enquire into the needs of the Transvaal and how to supply that need, either here in the Transvaal or anywhere else?—The monopoly I am alluding to is securing natives from outside the Transvaal.

7,953. It is a pity you did not state that in your letter. Where do you say this monopoly applies?—It is a monopoly granted to the W.N.L.A. which has been in existence for some time.

7,954. Created by whom?—Created and sanctioned by the Government.

7,955. Do you seriously believe that the Government would really grant a monopoly to anyone here of that nature?—I should be very pleased to learn that they are not giving a monopoly.

7,956. Is it not the case that every employer of labour, whether a mining company or a railway contractor, or any employer of labour in Johannesburg, is absolutely free to recruit anywhere and as he likes independent of the Association?—I have never known that to be so.

7,957. Do you not think that you ought to enquire into these things before making such statements?—I am here in my official capacity.

7,958. Well, in your official capacity do you not think you ought to enquire?—We have made enquiries, and, as I pointed out, natives have been offered and have been refused by the Association.

7,959. You have given one instance of natives being offered and refused. Who did you negotiate with?—What do you mean?

7,960. You gave in answer to Mr. Quinn this morning, one instance of natives being offered and refused?—Yes.

7,961. Well, who did you negotiate with?—I offered them to Mr. Macfarlane, of the W.N.L.A.

7,962. When was that?—Some time back, but I have no papers here.

7,963. Did you have correspondence in the newspapers over that subject?—I did.

7,964. Did you see the letter signed by the Acting Secretary of the Association in the "Star" on June the 13th?—I did, and I replied to it.

7,965. I should like your explanation for the benefit of this Commission. It is stated in that letter that you merely professed to be acting as agent for Mr. Franks, who had been in direct communication with the Association before you appeared on the scene?—Yes, that is what the W.N.L.A. said.

7,966. Do you deny that statement?—I do not know what arrangements were entered into between Mr. Franks, and the W.N.L.A. before that, but I do not know that during Mr. Franks' visit here he appointed me his agent.

7,967. Did he tell you anything about his relations with the Association?—No, he said he had offered natives and that they were to negotiate with me, and he had referred them to me.

7,968. Do you know that he has been in the employ of the Association since?—It comes as a surprise to me if he has. It seems very strange, seeing I have a wire here only recently offering natives again, so why he should be employed by the W.N.L.A. when he has wired to outside people offering natives I fail to understand.

7,969. You have just informed the Commission that you read this letter in the "Star," and in this letter it is specifically stated as a matter of fact that "the District Manager made an agreement with Mr. Franks after some discussion practically on the terms which he asked, but I regret to say that, so far, he has not been able to recruit more than a small number of boys." This has been a public statement now for a good long time, since June 13th?—You are referring to the letter of the Association?

7,970. Yes. How is it that Mr. Franks has not contradicted this?—I could not say. I have recently received letters offering natives, and in fact in one letter he points out that he cannot understand why the W.N.L.A. will not engage natives.

7,971. Now, as a business man, do you not think that the Association acted wisely in dealing direct with the recruiter instead of through a middleman?—That is what they should have done.

7,972. Is not that exactly what they are doing?—Yes, but the position Mr. Franks was placed in at the time was such as to necessitate his having an agent. He already had a considerable number of natives employed up here by the Municipality and these boys had to pay certain moneys due to him, and he had to have an agent here to receive these moneys, and therefore appointed me his agent.

7,973. You have just told us that he told you nothing of his relations with the Association?—That is so.

7,974. Surely he did not appoint you his agent to represent him with the Labour Association?—He appointed me to secure contracts for him and enter into any agreements.

7,975. But if he intended you to act for him in his dealings with the Association, do you not think he would have told you the nature of his agreements and negotiations with them?—I should have thought so, but strange things have been done lately.

7,976. Have you made a special study of this labour question?—Well, as an ordinary business man should do in coming in contact as I have done with people who have had a lot to do with natives.

7,977. Now how many natives do you think are available for work in South Africa?—Well, I suppose there must be over 200 millions in South Africa; but I do not say they are all available.

7,978. How many?—200 millions in South Africa.

7,979. In the whole of South Africa?—I should think so. I have not studied that, and I wish I could give you a direct answer, but you must bear in mind that in the country north there is a great quantity of natives, and I consider in reading your reports you have not had proper information from that part. I notice in one statement a gentleman came a considerable distance to tell you that they wanted all natives for the mines in his district, mines numbering 33 to 40, and I doubt whether there are three mines in that district.

7,980. Now in your efforts to recruit natives in Johannesburg, did you recruit natives in large numbers?—I am not a recruiting agent. I have never undertaken anything in the shape of recruiting natives. I have simply acted as an agent for a recruiter.

7,981. Well, in that capacity what has been the result of your efforts?—Nil, unfortunately.

7,982. Mr. DONALDSON: In your letter of 21st August, Mr. Zeffertt, you say that you do not give evidence voluntarily, as a protest against four members of the Asiatic Labour Association being appointed to the Commission. Would you please give me the names of these four members of this Commission?—I think that I have already given them to you; they are Mr. Goch, Mr. Daniels, Mr. Philip and yourself.

7,983. What reason have you for saying that I am a member of that Association?—I notice that you are connected with the Labour Importation Association.

7,984. Do you know it?—Yes, I notice you are connected with it.

7,985. In what way?—I believe you are a member of it, are you not?

7,986. I am not?—You are a member of the Asiatic Importation Association.

7,987. Mr. TAINTON: I think the witness or the Executive Council of this League has made a mistake, and has perhaps intended my name to appear instead of that of Mr. Donaldson. I was placed upon the Committee of the Labour Importation Association during my absence, and when I found I had been appointed a member of this Commission I at once resigned.

WITNESS: I am very sorry, Mr. Donaldson, to have mentioned your name.

7,988. Mr. DONALDSON: Are you surprised to know that I never have belonged to the Association?—I am sorry, and I probably mixed the names. As I told you, I wrote to your Secretary to the effect that I have been indisposed for some time, and have been away from these public matters. I am here in an official position, and have not these papers before me, and have probably mixed your names up. I am sorry if I have hurt your feelings.

7,989. Do you withdraw that statement about my name?—Certainly.

7,990. Mr. PERROW: Mr. Zeffertt, I suppose you are acquainted with the fact that we are short of native labour on the Rand?—Oh, yes, that is generally understood.

7,991. Did you make a remark some time ago that you could get 25,000 good mine boys for the Rand?—I may have made the statement. What statement are you referring to. I have made several statements.

7,992. This one was made three or four weeks ago?—Do you mean that I made the statement to you?

7,993. No, at a meeting?—I believe I did mention something about the number of natives that could be supplied, but I forget the number for the moment.

7,994. Will you tell the Commission in which way you can get these natives?—I consider that we should go in for free recruiting, of course, under certain restrictions. The ways and means of getting natives to-day are such that if an independent man was to come along with two or three hundred natives he is debarred from doing business with them. I want you to particularly understand that in dealing with this question I am no recruiting agent. That is my opinion, and it is also the opinion of men who have corresponded with us. They are prepared to supply natives, and yet they cannot bring them up here on account of this Labour Association.

7,995. Did you mention, Mr. Zeffertt, that you could get 25,000?—I may have done.

7,996. Perhaps that would be by free recruiting?—I should think you would get a good deal more than that by free recruiting.

7,997. The CHAIRMAN: You read a telegram you had received from Mr. Franks on 13th July offering a certain number of natives?—Yes.

7,998. Have you had any other telegrams from Mr. Franks offering natives?—I have not.

7,999. Would it surprise you to learn that quite a number of people in Johannesburg have had telegrams from Mr. Franks offering natives?—Yes, I would be surprised.

8,000. If I told you I had telegrams a few months ago offering natives would you believe it?—It shows his anxiety to supply you with natives.

8,001. If I also told you I had financed him a good deal to help him to send forward natives, would you be surprised?—No, because I have done the same myself.

8,002. You have done the same yourself. Would it surprise you to learn that I have never received a single native from him?—Yes, that might be so, but still he is well known and has supplied natives both to the Labour Association and the Municipality.

8,003. Since the war?—No, previous to the war, and he has boys here now.

8,004. He has not supplied any since the war?—No.

8,005. And does it not strike you there must be something wrong when there are numerous persons here requiring natives, railway contractors, and the Municipality, and Mr. Franks is able to supply 500 a month and he has an agent on his behalf who is able to interview persons for him, and yet since the war no one has received natives from him?—I know it to be a fact that boys were waiting to be entrained.

8,006. How do you know?—We have sent down and made enquiries and Mr. Franks has repeatedly asked when can we take delivery.

8,007. Have you been down?—Not personally; I sent a man down.

8,008. Did he count the number of boys waiting to come to the Rand?—There were a good many boys.

8,009. How many?—About 200.

8,010. This man reported this to you?—No, in this case the news I got was that there was a quantity of boys, and I was not sure whether he was telling the truth, so I made enquiries.

8,011. Mr. TAINTON: Why did they not forward these boys from the railroad?—He could not make any arrangements with the Association.

8,012. Was an advance of money required before the boys were forthcoming?—I do not know, not as far as we were concerned.

8,013. Then what prevented you from bringing these boys up or Mr. Franks from forwarding them?—He had not made any arrangements with the Association after he had got them together.

8,014. The CHAIRMAN: What about the Municipality? Are you aware that the Municipality arranged with Mr. Franks to take a certain number of boys, advance the railway fares and pay him so much per head?—No, but I know he has supplied boys previous to the war.

8,015. Previous to the war we are not dealing with.

Thank you, Mr. Zeffertt.

NICOLAAS JACOBUS BREYTENBACH, called, sworn and examined.

The witness gave his evidence in Dutch through an interpreter.

8,016. The CHAIRMAN: You are Mr. N. J. Breytenbach?—Yes.

8,017. You live in the district of Ermelo?—Yes.

8,018. Have you before you a statement headed "Statement of Mr. N. J. Breytenbach"?—Yes.

8,019. Do you hand this in as your evidence-in-chief?—Yes.

8,020. The statement was as follows:—

I reside in the district of Ermelo, and have done so for the last 39 years. Besides having a knowledge of this district, I am thoroughly acquainted with Swaziland, as it has been my custom to spend the winters in that country since 1883.

The character of the natives of the districts with which I am acquainted is independent. They work just sufficiently to keep themselves going; in fact, they have no inclination to work, and since they have not many wants to supply, it becomes a matter of great difficulty to induce them to take up employment. The work that they prefer, however, is agricultural, both stock and farms; they have a great objection to working on the mines. Their diet consists of Kaffir corn, meat, pumpkin, ground nuts, etc.

To those natives who are employed on my farm, I pay an average wage of 30s. per month, together with the use of the farm to cultivate sufficient to meet their requirements and the raising of stock. Those natives, however, who have to be engaged from outside sources receive as much as £3 per month, but it is a matter of the utmost difficulty to obtain outside labour. The physique of the natives of these districts is good and they have no special ailments. Their aptitude is to herd stock.

My firm opinion is, that the greatest encouragement for the natives to turn out to work would be that every native who could produce a certificate showing that he had worked six months for an employer should have 50 per cent. of his taxes remitted; then again those who worked for nine months should have a further 25 per cent. remitted. This would have an excellent effect, since the natives know that the hut tax is an imposition, and they would appreciate a reduction of the same far more than an increase of wages.

Some of the boys who have been employed by me were in the Government service from the beginning of the war, and these boys grumble and say that although they have been serving the State for a very long period they are nevertheless taxed to the same extent as those who never did any service. This, they contend, is a great grievance.

Regarding the approximate numbers available, the whole of the native population of the district of Ermelo is, according to the returns available at the local Magistrate's office, 3,020. It is estimated that the number of able-bodied men between the ages of 16 and 45 is 2,500. The number of white farmers in the district above the age of 16 is 1,000; according to these figures, therefore, each farmer can only obtain 2½ boys to do the work of his farm. Then again, there is the amount of labour required for public works.

In Carolina district the total native population is 2,066; the number of able-bodied men between the ages of 16 and 45 is approximately 1,500. The number of white farmers above the age of 16 is 615, thus giving an average of 2½ boys per farmer.

I should like to point out that the white men working on the local public works receive 5s. per day without rations, which brings their wages to about 3s. 6d. per diem; the natives receive 2s. per day with rations.

The calling of the greater number of white people in the district is agriculture, and, in my opinion, the least number of natives required by each farmer is six.

8,021. You have lived for the last 39 years in the district?—Yes.

8,022. You have also been in the habit of spending the winter in Swaziland?—Yes.

8,023. You know that the purpose of this Commission is to enquire into the labour needs of the agricultural, mining and other industries of the country?—Yes.

8,024. And also to enquire what the available supply of labour is?—Yes.

8,025. Are you employing many natives yourself?—Yes.

8,026. How many do you employ on your farm?—Together with my sons who are on their own I employ about 50.

8,027. Where do you get your supply from?—From Kaffirs living on my property.

8,028. On what terms do these Kaffirs work for you?—Previous to the war they worked for being allowed to live on my farm, and if I had special work I used to pay them specially for it. Since the war I pay them 1s. per day.

8,029. What consideration did they get previous to the war for the work they did?—According to the nature of the work, from 1s. to 4s. per day. For shearing sheep I used to pay 1d. per sheep and some sheared so many that they made 4s. per day.

8,030. I understand that they got free run for their cattle and a certain amount of ground to cultivate?—Yes, as much as they required.

8,031. Will you tell us what the average number of natives employed by the farmers is in your

absolutely no Kaffirs; some large farmers have 15 to 20; some only one or two.

8,032. We have been told that the average number of natives required per farm is something between six and ten for every farm?—The farmer who farms on a large scale and has a lot of work would manage with 10.

8,033. But what I want to arrive at is whether you think that on the average, six, eight or ten Kaffirs would be a fair average number for the ordinary farmer?—Yes.

8,034. Which figure would you say?—Ten.

8,035. Is there any scarcity of labour in your district at present?—Yes, on account of there being so much work, so much building going on and public works and repatriation. That is why we have not sufficient.

8,036. Then previous to the war did farmers in your district have a sufficient supply?—Yes.

8,037. Was that supply derived from natives living on the farms or did they get natives in from outside?—Some came from Swaziland.

8,038. Do they not get any natives from Swaziland now?—There are at the present moment Kaffirs from Swaziland in the district working on public works.

8,039. Do you know of any large numbers?—At present there are 200 employed on public works in Ermelo.

8,040. In the whole district?—No, only in the town of Ermelo.

8,041. And how many in the whole district?—That I cannot say.

8,042. Do you think it would be possible to get a considerable number of natives from Swaziland to work here?—On the Rand?

8,043. Yes?—No, I do not think so.

8,044. Do you think it would be possible to get any number of Swazis to work in your district?—Yes.

8,045. More than are working now?—Yes.

8,046. If there is a scarcity of labour in the district at present, why do you not get these Swazis out to work?—Because the people are poor and cannot pay.

8,047. The farmers are poor?—Yes.

8,048. Mr. GOCH: What is your idea of the remedy as to how the farmers should be supplied with Kaffirs?—I think it would encourage Kaffirs to come out and work if on production of a certificate that they have worked for six to eight months out of the year, a reduction could be made in the taxes.

8,049. Do you mean Kaffirs living on private farms?—Living on Government ground and private farms.

8,050. Kaffirs living on private farms are not taxed, are they?—Yes, the same as the others.

8,051. How much is it?—£2 for each wife.

8,052. For each hut?—No, each wife. The tax is £2 for an unmarried Kaffir, and when he is married he pays £2 extra for each extra wife.

8,053. You said you thought 10 Kaffirs to a farm would be a fair proportion to be allowed?—Yes, one farm with another.

8,054. A great many farms are held jointly by a number of owners?—Yes.

8,055. Do you mean to each owner cultivating a piece of land on a farm 10 Kaffirs should be allowed?—Yes, he could manage with less than 10.

8,056. It is a common thing that farms are held by three to five owners and more?—In our district not so much. The majority are owned by one man with one or two sons.

8,057. That would make a division of three in your district?—Yes, more or less.

8,058. You are acquainted with other districts where it is very much larger?—Yes, Carolina, adjoining Ermelo.

8,059. So if we have to deal with the Kaffir labour on the farms we have to take into consideration the sub-divisions. It is not so much per farm but so much per each sub-division?—Yes, the persons living on the farm.

8,060. Do you attach any importance to the Squatters' Law being enforced?—It was good in this way, that if a Kaffir living on Crown lands could prove he had been working on a farm, he only had to pay 12s. 6d. instead of £2.

8,061. That is a Kaffir living in a location?—Yes.

8,062. So the principle you suggested has been in operation?—Yes.

8,063. And you found that to work well?—Yes.

8,064. Mr. FORBES: Is there much demand for farm produce in your neighbourhood?—There is a great demand, but it is very difficult to transport the produce.

8,065. What does it cost to send produce to Johannesburg?—From Wonderfontein we always used to pay £5 for 110 bags, but I think it is a little cheaper now, and that is the nearest station in our direction.

8,066. And then from Wonderfontein to here?—What I have quoted you was the charge by rail, and we paid 4s. per bag from the farm to Wonderfontein, i.e., from the farms nearest to the line, but farms further away paid more.

8,067. At present there is rather a small demand, is there not, and if the farmers in your district all grew some produce, there would be no market for it there?—We could sell it if we sent it up to Johannesburg.

8,068. Yes; but there is no local market?—We depend upon Johannesburg.

8,069. Mr. BRINK: You think it was a mistake going away from the old system to make a native

produce some certificate for having worked, and now to make them pay the same as natives who do nothing?—Yes. I think so as on account of the polygamy of the Kaffirs they need not work and can easily find the money.

8,070. Do you think it would be advisable to go back to that old system?—Yes, I think so.

8,071. You were just saying that the farms in the district you lived in were not so much sub-divided as in the other districts of the Transvaal?—Yes.

8,072. That is the Ermelo district or Carolina?—In both Ermelo and Carolina.

8,073. I quite agree with you, but in the part I come from farms are sub-divided into 30 or 40 portions. In the whole district of Carolina there are only 188 farms—it is a very small district—and I read from your statement that in the Carolina district the native population is 2,066; the number of able-bodied men between the ages of 16 and 45 is approximately 1,900. The number of white farmers above the age of 16 is 615, thus giving an average of 2½ boys per farmer." I want to show you that in Carolina where you only have 188 farms, the proportion of owners is just over three?—Yes, I just gave it more or less.

8,074. You are quite right. Then, I find in the Ermelo district there are 270 farms?—Yes.

8,075. And in your statement the number of white farmers in that district above the age of 16 is 1,000?—Including the inhabitants of the town.

8,076. So you have got 1,000 farmers on 270 farms?—They are not all on their own. Some live with their fathers in the same house.

8,077. But each have got a plot of ground which they work?—Yes, they all work.

8,078. You will see what I am coming to just now. We have in the Transvaal 11,600 farms, and numbers of these farms are unoccupied?—Yes.

8,079. That is less than half, and I want to get more or less the number of natives required for agricultural purposes for the farmers?—I can only speak as to my district.

8,080. If we take the districts you are acquainted with, Ermelo and Carolina, we get a considerably larger proportion than is given here by Sir Godfrey Lagden or by Mr. Edwards yesterday. Mr. Edwards yesterday stated he would put on an average for 5,000 occupied farms 10 labourers for each farm. I believe Sir Godfrey Lagden said he thought the total number of natives required would be 60,000. You do not think those figures are exaggerated?—No, I do not think they are exaggerated.

8,081. If anything, will they be under the mark?—Yes.

8,082. I only want to get at the numbers?—I think it is too few, in this respect, that a Kaffir does not work continuously all the year through, and you must always have boys to relieve them.

8,083. I quite agree with you. You said that as far as Ermelo and Carolina are concerned native labour is difficult to obtain?—Yes.

8,084. And the rate of pay at the present moment is too high for a farmer?—Yes, too high.

8,085. Now, at the present rate of pay on the mines, do you think the farmer will ever be able to get sufficient labour to work these farms?—No, decidedly not.

8,086. Mr. TAINTON: The last answer was to the effect that you did not think native labour could be obtained by the farmers. Have you any suggestion to make by which that want could be remedied?—Yes, the suggestion made at the Bloemfontein Conference, and if they keep to that, I think the supply of labour will be sufficient.

8,087. What suggestion do you refer to?—The suggestion to import Chinese under certain restrictions and a certain contract, and when they are finished with to send them back again.

The CHAIRMAN: That answer is not within the reference of this Commission. Ask the witness to confine himself to Central and Southern Africa.

8,088. Mr. TAINTON: Suppose we leave that remedy out for the moment, have you any other suggestion which would come within the scope of this Commission's reference to South Africa and Central Africa?—I cannot make any suggestions, because I think that is a matter which remains for the Commission to decide.

8,089. The duty of the Commission will be to summarise the evidence of the witnesses who have appeared before it and we have received from various sources various suggestions. Now you are a man who has been in touch with the natives for a long time?—Yes.

8,090. You know them well, and therefore we would be glad if you would tell us whether you have any suggestion or scheme likely either to improve the supply or meet the difficulty entirely?—I have already suggested that it would be much better if we could go back to the old system and compel the native to work, making a reduction on taxes if he can prove he has done a certain amount of work.

8,091. We have had suggestions of that kind in general terms. General Cronje told us we must compel the Kaffir to work, but I want you to tell us or give us some practical scheme as to how we could do it?—A law might be passed compelling every Kaffir to work six months of the year, and then when he pays his taxes, it would appear from his certificate whether he has worked or not, and the taxes should be decreased to the men who have worked and to those who have not worked they should be increased. This would create a sort of jealousy or rivalry between Kaffirs who have not worked and Kaffirs who have worked when the former saw that the latter paid less.

8,092. When you say the average should work for six months, I suppose you mean work for white people?—Yes.

8,093. Is that suggestion approved of by any considerable section of the farmers, or is it merely your own opinion?—The question was asked me what suggestion should be made to increase the labour supply. I have been Field-Cornet for nine years before the Squatters' Law was enforced, and also during that time, and I noticed a great improvement owing to that Law.

8,094. My question was whether that was merely your opinion?—No, it is not my opinion only, but the general opinion of my district.

8,095. How does the Squatters' Law work out in practice?—It worked very well, excepting in one respect, and that was a farmer was not allowed to have more than five Kaffirs on his farm. This worked partly against the farmers and Kaffirs, too, because sometimes families had to be divided and put on other farms, and that was the only objection.

8,096. Who divided the families?—The law was that every man could only get five families, and they had to be split up.

8,097. Where did the natives come from who were placed upon private farms?—The majority were brought in by people who came from Swaziland and also from Mapochsland.

8,098. What do you mean by "they were brought in"?—With the farmers who trekked into these countries. The Kaffirs became acquainted with them and subsequently trekked into the high veld.

8,099. Did the natives agree with that law, and did it not in some cases make them dissatisfied?—Do you mean in the earlier days?

8,100. No; I mean when the law was passed?—They were dissatisfied with the division of their families, but beyond that they were satisfied, and a farmer was allowed to keep five Kaffirs on each farm for every transfer that he had, and if he had, say, five transfers, he could keep all the Kaffirs allowed him on one farm.

8,101. Did that make the natives more satisfied?—Yes.

8,102. Supposing they did not wish to remain on the farm and wanted to go away, how did the law deal with that?—They gave three months' notice, and when that had expired, they obtained a pass from the Assistant Native Commissioner, and were at liberty to go.

8,103. Where did they go to then?—Then they went to another farm.

8,104. Were they allowed to go upon Government land or locations?—Yes, I think they could go where they chose.

8,105. Did that law give the farmers as much labour as they required?—No, because there were not sufficient Kaffirs in the districts.

8,106. If all the Kaffirs were taken and placed on farms to work the farms, where would the mines get natives from?—That I do not know.

8,107. I suppose they would have to adopt your suggestion and introduce foreign labour?—That is my opinion.

8,108. What other arrangements were usually made with the native when he came on the farm in that way?—They came on to the farm and got as much ground as they wanted to till, and the owner used to enclose the land with wire fences. The Kaffirs who had no oxen to plough with used the oxen of the owners, and then they had to work for living on the ground. If there were special work they were paid for it, work such as building.

8,109. Did the Kaffir receive the produce of that land?—Yes, they used the produce themselves and sold the surplus.

8,110. I suppose in that way they made a good deal of money?—At the present moment some of the Kaffirs living on my farm have sold as many as 25 bags of mealies at 50s. per bag.

8,111. You suggest that we should return to the Squatters' Law?—Yes.

8,112. But it seems to me from your description of its operation that it would place all the natives on farms and leave nothing for outside industries, that is one result. Another result is this, that it gives the natives land from which they make in many cases large amounts of money. Now if the natives can make money as you say from £37 to £40 per year from their ground, I should think they would not work at all?—I say that there should be some compulsion on them to work.

8,113. But even that does not meet the difficulty. If all the Kaffirs are on the farms whom

do you wish to compel to work?—It is like this, the farmer cannot keep on his farm a lot of Kaffirs if they go to work on the mines and only leave their women and children. Where would the benefit be to the farmer?

8,114. Then would it be correct to describe this scheme as essentially one to provide labour for the mines irrespective of the other industries of the country?—Yes, I am only speaking for the country.

8,115. To take another side of the question, do you think it a good thing for a white man to live in that way on the labour of the black man?—How do you mean, by giving them ground?

8,116. I understood from you that these people work for the farmer and make money for him because they give him their labour free?—I did not say they worked for nothing. I said they had to do light work, but for special work we have to pay up to 4s. per day. Again the farmer does not get his ground for nothing, and if he gave the Kaffir as much grazing ground as he requires and as much land to till as he requires for the labour the Kaffir gives, then he certainly does not work for nothing.

8,117. But does it not relieve the white man to a great extent from the need to work?—Oh, no, the Kaffir never works alone, and if you do not stand with him and work with him he does absolutely nothing.

8,118. I think there is a mistake in the third paragraph of your statement as to the estimated number of able-bodied men between the ages of 16 and 45. The number given is 2,500 out of a total population of 3,020. This proportion seems to require some explanation?—I got these numbers from the Resident Magistrate at Ermelo. It is written in his own handwriting on the 31st of last month.

8,119. Of course if one-half of the population is females, as is likely, there cannot be so many able-bodied men?—I have the statement from the Magistrate; shall I read it?

8,120. No, I just wanted to call your attention to the discrepancy.

8,121. The CHAIRMAN: The Commission is very much obliged to you for coming so far and giving your evidence.

The public sitting of the Commission was adjourned until Tuesday morning at 10.30.

## TWENTIETH DAY.

*Tuesday, 1st September, 1903.*

### THE COMMISSION MET AT 10.30. A.M.

Mr. WILLIAM GRANT, called, sworn and examined.

8,122. The CHAIRMAN: Have you before you a printed document headed "Statement of Evidence by William Grant to the Members of the Transvaal Labour Commission"?—Yes.

8,123. Do you hand that in as your evidence-in-chief?—Yes.

8,124. Statement of evidence by William Grant to the members of the "Transvaal Labour Commission."

Speaking generally, I am familiar with all the South African tribes, but am more intimately acquainted with Swaziland, Zululand, Natal and the

Transvaal. I have also visited certain districts of the Cape Colony.

My connection with Johannesburg dates from the end of 1890. On the threatened outbreak of hostilities I left for Natal on the 1st October, 1899, returning in March, 1902.

My attention was at once arrested by the dominating topic—viz., the then existing conditions of native labour and the depressing effect being steadily produced. My opinion on the position was asked by many men directly concerned in mining, and no inconsiderable number of responsible natives waited on me for the purpose of seeking my advice and informing me of their grievances.

After some months of careful observation and thought, in the month of January last I committed my opinions to paper, which I entitled "Remarks on the Native Labour Problem," and of which the following is a copy:—

#### REMARKS ON THE NATIVE LABOUR PROBLEM.

The deficient supply of natives and the disorganised condition of the labour market generally ever since the termination of hostilities have brought into existence quite an army of "experts," who in their attempts at elucidation have really only succeeded in obscuring the real issue. The loss and disappointment suffered by thousands of Europeans, due to existing conditions, is doubtless answerable for the general interest which has been aroused.

Instead, however, of a concentrated effort to arrive at, first, the real cause of the mischief, and then to seek for the remedy, writers have introduced into the discussion well nigh every question relating to the domestic, social and political status of the native, past, present and future, with no small admixture of hypocritical sophistry. After a careful perusal of the many diverse opinions so freely expressed, I confess to have been strikingly reminded of the late Max Müller's epigram, which he applied to the bi-metallic question, viz., "Wrens find prey where eagles fear to perch."

The following are among the subjects which have been called upon to do service in the effort to throw light upon the one vital question which may be said to be of almost universal interest: "The cause of the deficient supply of native labour, and what is the remedy?"

I refer to the questions of polygamy, lobola, taxation, land tenure, tribal institutions, education, and many others which need not now be mentioned. I am quite ready to admit that each one of the subjects I have named constitutes a text for the most interesting discussion between men possessing the necessary knowledge and information, and who could, therefore, intelligently deal with them from the standpoint of practical experience. A discussion of this nature would not only interest the general public in questions which are of a complex nature, and more or less obscure, but would help to remove many of the erroneous impressions which obtain, mainly based on prejudice and ignorance.

My present contention is that it is irrelevant to the one pressing and immediate question to introduce such varying problems. It carries the discussion into vague and undefined limits, and overlays the true issue with matter altogether extraneous.

To all those who have closely observed the position since the British occupation of the Transvaal it has long been obvious that the dominating principle which has influenced the action of the heads of the mining industry in regard to native labour is that of centralisation. The "Articles of Association of the Witwatersrand Native Labour Association" conclusively prove that the object aimed at was the establishment of a "Labour Trust" in the full American sense of that expression, and this was to be exploited by the controllers of the Association under terms and conditions considered by them necessary in the interests of its members. This statement is further emphasised by the contents of a letter dated October 22nd, 1900, issued to the several subscribing companies by the firm of H. Eckstein and Co.

The originators of this plan apparently considered that three conditions only were necessary to achieve the success of their object, viz.:

1. Close combination amongst themselves.
2. Employment of unlimited capital.
3. Support of the British Government.

These conditions having been secured, it was assumed that natives would mildly accept the tariff

of wages decided upon, and acquiesce in all other arrangements suggested by their employers for their acceptance.

From a practical standpoint it is difficult to understand the ideas which so influenced the minds of the promoters as to justify any expectation of success, for a mere superficial knowledge of natives and the attendant circumstances would have served to predict the failure which has been so completely realised.

On the termination of hostilities the following facts clearly presented themselves for recognition, viz.:-

1. There remained on the Rand only about 15,000 to 18,000 natives available for employment.

2. The total number of natives required to bring the mines up to their full producing capacity were an additional 80,000 to 100,000 men.

3. Many thousands in the employ of the military had during the campaign been paid for their services upon an unnecessarily lavish scale, which led to the accumulation of funds in their possession, and largely conduced to raising the standard of wages throughout the Continent.

4. The complete disorganisation of the labour market, and the demoralisation which invariably connects with war, setting up, not only with natives, but Europeans also, an aversion from steady and continuous labour.

5. The favourable and abundant crops which had been reaped all through the country outside the areas of warlike operations, an ample supply of food even in normal times always—as is natural—tending to diminish the supply of labour.

Surely it was not too much to expect that any intelligent person, properly qualified to reorganise the labour supply for the mines, would have paid due regard to these separate factors, instead of which they appear to have been completely ignored—the law of "Supply and Demand" was set aside—the native side of the question has been similarly treated, and, according to numerous native statements, freedom of contract has been comparatively denied, and attempts have been made to bring him under what can only be described as constructive coercion.

It was generally accepted that the termination of hostilities would immediately give a considerable impetus to the construction of public works, and all industrial operations, involving the employment of natives upon a largely increased scale, and yet, in defiance of the circumstances I have but imperfectly described, the controllers of the mining industry considered such a time opportune for attempting the reduction of wages from 30 per cent. to 50 per cent.—the Administrator himself being no better advised than to countenance and support by the weight of his position such an extraordinary operation, which was opposed to every principle of common sense.

Toward the end of the year 1900 the rumour was freely circulated through the country that the rate of pay on the mines would, for the future, be 1s. per diem; natives at first met the statement with a smile, and refused to believe it. Europeans were repeatedly questioned as to the truth of the rumour, and as the statement was invariably confirmed, natives as a body determined under such circumstances to avoid the Rand. The effect of this ill-judged action was to comparatively stop the return of natives and alienate them from a field of labour where they were pressingly required. This naturally disappointed the hopes of those who had innocently attempted to treat them as "children," and proved that after all they were not quite as obedient as they should be. It was imagined by some of the responsible men in control that the rate of wages had nothing whatever to do with the shortage, and that labour on the Rand was sufficiently attractive to blind a native to the difference between 60s. and 30s. per month; thus every conceivable excuse and explanation—except the right one—were freely resorted to, to account for the deficient supply. At last the folly of the position began to be apparent, and under the influence of

partial enlightenment, "piecework" was introduced; this enabled a considerable number to augment their previously diminished wages. Matters thus stood up to the last arrival of the Colonial Secretary in January last, and it was a singular coincidence that on the morning of the day following a meeting of mine managers, etc., in the Chamber of Mines, who were addressed by Mr. Chamberlain, the tariff of wages which was in force before the war was revised and re-published, and all Government and labour officials were deputed in hot haste to disseminate this piece of information throughout the Continent, including Portuguese territories. And now it may be asked, what is the result of all this incapacity and blundering? The answer is to be found in consequences already realised. The originators of the now-abandoned scheme must accept, in conjunction with the Government, who have so loyally supported them, the entire responsibility which attaches to the failure of their operations. The resumption and development of the mining industry has been materially retarded. About one-half of the existing stamps remain idle, the output of gold being correspondingly reduced. No inconsiderable number of Europeans have been deprived of employment, and a general depression has been set up which the adoption of more sagacious measures would have very largely, if not entirely prevented. The position of the native has been materially strengthened, and the vantage ground he has gained he will not be slow to utilise to his own advantage. The futile attempt to reduce wages below an equitable level will undoubtedly lead to a demand in the near future for a higher rate of pay than ever previously obtained, and the unpalatable truth has been demonstrated that the native is, after all, master of the position; instead of black being dependent on white, white is dependent on black, the coveted position being thus completely reversed. Many have not been slow to hurl at the head of the native a variety of epithets in his efforts to obtain a fair return for his labour, and have placed to his debit the consequences of existing conditions. He has been compared to the worthless of our own colour—"loafers" and "tramps"—men who will not work, and who should therefore have meted out to them all the pains and penalties which attach to such a class. All this fluid nonsense can be dismissed at its true value, for not a genuine point of comparison exists. The wants of a native are simple and few, consequently are easily satisfied. Owing to the iron rule to which for centuries he has been subjected, he is naturally law-abiding. He assents to and complies with the law under which he now lives. He pays willingly and peacefully all legal taxation, he provides for himself and family all necessary requirements, he never solicits or receives charity at the hands of Europeans, and as concerns his debts, he never pleads the "Statute of limitations." These at all events rank among some of the qualities which attach to the gratuitously abused native.

After this incomplete analysis of the position, and which the prejudiced may designate destructive criticism, the reader may fairly ask what course, under the circumstances, should the mining houses and the authorities have adopted?

My reply is as follows:—

Upon the conclusion of hostilities, and as soon after the declaration of peace as the condition of the country warranted, the Government should have been solicited to send responsible European messengers, duly accredited, to every important chief throughout the Continent, informing him that peace had been concluded, that the mines would at once resume work, and requesting him to encourage the coming out of his men to labour. The question of wages should have been left untouched, and would have been a matter of free contract—on the arrival of the natives—between the men and their employer. To avoid undue competition among the managers an understanding could have been arrived at upon a fair basis of remuneration, so securing approaching uniformity of pay for the different classes of work. Had such a course been followed, there is every reason to

believe that long ere this the demands of the mines would have been fully met. A request by the Government to the Portuguese authorities to disseminate a similar message among the East Coast natives, in their territory, would doubtless have been readily complied with. Having regard to the existing scale of wages through the Continent, any reduction upon pre-war rates could not have been expected. The mines, however, having first obtained a full supply of natives, a practical reduction of cost might have been secured by steadily eliminating non-effective men who refused to accept a lower rate of pay, retaining the more efficient. While, therefore, our legitimate and what may be termed home sources of supply have not been seriously and intelligently dealt with, many thousands of pounds and months of precious time have been fruitlessly expended in efforts to recruit from barren sources.

The suggestion to supply the alleged deficiency from Central Africa I view with grave misgivings. The radical change in regard to climate and diet has been referred to by different authorities, and I see nothing to warrant a belief in permanent beneficial results from the introduction of a people alien in habits and language to the South African tribes.

Moreover, the principle of engaging men at a distance who are entirely ignorant of local conditions, and below the current rate of wages paid locally, contains no element of satisfaction or permanence. A considerable outlay will be involved in cost of transmission from and to their homes. The mines cannot be directly recouped this expenditure, and will doubtless feel justified in enforcing a low scale of wages.

Sir Harry Johnstone, in a letter to "The Times," I observe, mentions a minimum wage of 20s. per month, and that of this amount, or I presume any advanced rate agreed upon, only 10 per cent. be paid during term of service, the balance being paid on completion of term of contract.

Now, assuming that contracts are concluded even on the basis of 30s. per month, can it be reasonably expected—having regard to existing labour conditions on the Rand—that these men will remain contented and yield a cheerful service? I unhesitatingly say "No." Not a month will elapse after their arrival before they discover that thousands of natives in and around Johannesburg draw from £3 10s. to £6 per month, and I maintain that it is in direct conflict with human nature and common sense to expect them to remain contented. The inevitable result will be discontentment, and service rendered under such circumstances must to a great extent be valueless. Any attempt to enforce conditions of contract by law can but produce irritation and provide a permanent supply of inmates for our gaols. I have no intention of entering the fields of prophecy or indulging in any fanciful calculations of the possible labour requirements of five years hence. But let a knowledge of native mind and character be honestly and intelligently applied with a reasonable measure of common sense. Abandon all ideas of creating a labour monopoly, for all such attempts will prove impracticable and futile, for they will fail to establish confidence in the native mind, and only arouse suspicion of coercion. Establish, in suitable centres through the country, stations, in charge of carefully selected Europeans possessing a knowledge of the language, and with tact and judgment in the handling of men. At these stations receive all natives who voluntarily offer themselves for service on the Rand, provide facilities for travelling under proper protection, improve as far as possible conditions of existence at the mines as concerning housing, sanitation and diet. Assure just and fair treatment during the period of service, including the payment of an equitable rate of wages, and I feel confident that under these conditions the full requirements of the mining industry can be met from the population of the Transvaal and adjacent territories. The actions and blunders of the past year, instead of attracting, have distinctly alienated

natives, and no proof whatever has been afforded that the number of men required cannot be made available provided conditions of service are satisfactory, not to the employer only, but also to the employee.

As concerns the facts above stated and the principles of action adopted by the controllers of labour operations, supported as they have been by the Government, I confirm to-day the opinions and conclusions formed many months ago, and of which incontestable proof can be given.

The idea of constituting a labour monopoly is by no means novel, for I find in a report submitted to the Chamber of Mines as far back as 1896, I remarked, *inter alia* :

"To attempt a monopoly by legislation is unpractical and futile—but to practically secure a monopoly by means of good organization and combined effort on the part of all concerned can to a great extent be achieved. The proper basis of this is to establish confidence in the native mind, first by giving facilities and protection when travelling, and secondly, by just and fair treatment during the period of service."

Setting aside for a moment the labour required for fresh developments, and confining my remarks to the mines as they existed before the war, it is obvious that upon the reorganisation of labour 80,000 to 100,000 would have sufficed to put the whole of the erected stamps in operation. The primary and pressing consideration was supply. But what happened? Towards the end of 1900 it was decided that wages should be reduced to 1s. per day. This fact immediately after was freely circulated throughout the Continent, and, as it became known, natives at once decided upon boycotting the Rand, the result being that many thousands sought employment in other directions. Thus the primary essential necessary to resumption of work, *viz.*, supply of labour, was placed in a position subordinate to the attempted reduction of wages.

In dealing with the present position, which may be taken as the result of past action and in considering measures of a preventative and curative nature, it may not be altogether unwise to give some attention to an analysis of the cause of the mischief.

In my opinion, it is beyond question that the abortive attempt to reduce wages is responsible for the deficient supply of natives, and, should it be considered that the practical results insufficiently demonstrate the truth of this fact, then I commend to the incredulous a careful perusal of the "Blue Book on Native Affairs," issued by the Cape Government for the current year. With the view of making my contention perfectly clear, I may state that the combined reports of Civil Commissioners, Inspectors of Locations, and Resident Magistrate appear to establish the following:—

1. Throughout the Cape Colony there is an increasing disposition on the part of natives to turn out for labour, in some cases the number of passes issued for 1902 creating a record.

2. A growing aversion from entering into contracts with labour agents, and a decided preference for retaining complete freedom of action as to labour, locality and terms of engagement.

3. An increased dislike to labour on the Rand, shown by the insignificant number of passes issued, the principal reason, which in some instances is distinctly alleged, being the "reduction of wages." Taking three districts, which in past years were sources of considerable supply, the aggregate passes issued numbered 16,983, while out of this number only 125 were issued for the Transvaal. In the Transkei during the year 1898 a total of 61,034 passes were issued. Of this number 18,302 were for the Transvaal. During the year 1902 a total of 66,695 were issued, being an appreciable increase of 5,091. But out of this increased total only 3,799 were issued for the Transvaal. The Chief Magistrate, W. E. Stanford—probably the most experienced official on native affairs in the Cape

Government—states the reason to be "Due to news spread of the reductions in wages at the Rand."

It is in my opinion, therefore, clear that the course adopted shattered the confidence of the native, with the result that, when every effort should have been directed to make labour attractive, many thousands were deterred and alienated from the Rand, where their labour would have materially helped to invert the present position.

But scant consideration appears to have been displayed in connection with prejudices, ideas and general characteristics of the native. Instead of being allowed complete freedom of action as to selection of employer, natives have been allotted—in pursuance of adopted rules—to places against their will; this, not unnaturally, has been construed by the native as an act of coercion, and at once sows the seed of discontent.

Another factor in the question may not be unworthy of consideration. A native attaches very considerable importance to "personality," and invariably refuses his confidence to all whom he knows to be without the necessary qualifications to command it. "Confidence"—which is the keystone to all successful negotiations with natives—is slow to achieve; but if when achieved is once destroyed, is well nigh impossible to re-establish.

While confining my remarks mainly to the one important industry of the country—*viz.*, mining—with the view to giving a practical effect and application to my opinions, I am quite sensible of the fact that the enquiry under consideration of the Commission covers broader ground, and includes all industrial and agricultural operations. It will, however, I think, be found that the principles I advocate are capable of general application.

As concerns mining—and my remark particularly applies to mines of deeper levels—the fact will have to be faced that among natives generally there is a growing dislike to labour in the mines. They more clearly than ever realise and discuss the arduous nature of the work and the liability to sickness, accident and death. This tends in the direction of a demand in the near future for increased wages, and points to the necessity for stimulated energy on the part of the controlling houses to see that all the conditions of labour are made as reasonably attractive as possible.

The suggestion to re-introduce the supply of liquor—under any conditions whatever—I most strongly denounce, for it constitutes the basis of everything to be deprecated by every thoughtful man. It is, however, I think, worth consideration whether the Kimberley system of issuing rations of pure Kafir beer might not be adopted with advantage. Were the suggestion acted on, careful supervision would require to be exercised in connection with the brewing and issue, which would require to be done on each mine. On no account should the beverage be introduced from any outside source, or it would be used as a medium for covering deleterious additions.

Although I am deeply impressed with the importance of the subject under the consideration of the Commission, affecting, as it does, every individual in South Africa, I am not inclined to unduly lengthen this statement, though I am quite prepared to fully elucidate any point raised by any member, and generally to give all information in my power on any question desired by the Commission.

In conclusion, I trust it will not be considered superfluous if I mention, for the information of such members of the Commission who may not be conversant with the length and variety of my experience in connection with South African natives, a few leading incidents relating to my past career which may be held to impart authority for such opinions as I entertain, based, as they are, upon travel, personal contact and study.

Prior to the year 1856, I had spent some time in Zululand, where I acquired a deep interest in, and some considerable knowledge of, the language.

In December of that year a contest for the succession occurred between two sons of the then reigning King, Umpanda, viz., Cetshwayo and Umbulasi. I was in the country at the time, and for many days prior to the outbreak was a visitor at the headquarters of Umbulasi, who offered me 500 head of selected oxen to take command of his army, which I declined.

For many years subsequently I was largely engaged in the cultivation of sugar in Natal, during which time I employed many thousands of natives.

I took a deep interest in the British invasion of Zululand in 1879, and after the Sandhswana disaster was asked by General Lord Chelmsford to accept the position of Head of his Intelligence Department, which existing circumstances prevented my doing. I rendered, however, such service as was in my power, and received the cordial thanks of the General, and Major (now General) Sir William Butler, who was in charge of the base—both verbally and in writing.

In the month of October, 1881, I was asked by the then High Commissioner—the late Lord Rosemead—to take charge of Cetshwayo and party then about to proceed to England, with a view of facilitating the re-settlement of Zululand. Prior engagements of a pressing nature, however, prevented my accepting the position.

In November, 1881, being then in England, at the request of the then Colonial Secretary—the late Earl Kimberley—I waited upon him at the Colonial Office, and spent considerable time in dealing fully with the Zulu question. The proposals I made of settlement were fully approved by Earl Kimberley; but (to use his own words) the “exigencies of party” prevented their full acceptance by the Government.

Upon the restoration of Cetshwayo to Zululand I received several requests to go to his assistance in a political capacity, and in May, 1883, I accepted the position of “Adviser and Counsellor to the Zulu nation.” I continued in this capacity up to the death of Cetshwayo and for some time subsequently, when, owing to the disintegration of the nation and consequent altered conditions, I retired.

In 1886 I proceeded to Swaziland, and was then requested by the King—Umbandine—and his prime minister—Sandhswan—to accept a similar position to that I occupied in Zululand. I declined the proposal.

At the end of 1890 I came to the Transvaal as representative of Messrs. Nobel's interests in connection with the Dynamite Concession.

In 1893 I was appointed Native Labour Commissioner to the Witwatersrand Chamber of Mines, and up to the early part of 1897 was occupied in initiating and organising a supply of native labour for the mines. Early in 1894 I made a tour through the native locations in the country, and interviewed 22 of the prominent chiefs with their headmen.

In 1896—Earl Grey then being Administrator of Rhodesia—I was asked by the Attorney-General to state the terms upon which I was prepared to accept control of native affairs in that country. This I declined to do, in consequence of the appointment I then held. Subsequently I was requested by the same authority to prepare a code of native law; but, as this would have involved residence in the country for some time, I was compelled to decline the proposal.

A copy of a letter I attach, written by the late Sir T. Shepstone, speaks for itself. The concluding paragraph bears independent testimony to my qualifications, and by a gentleman who it is almost superfluous to say was accepted as the highest authority in South Africa on all native subjects.

WILLIAM GRANT.

Johannesburg,  
August 24, 1903,

(Copy of letter written by the late Sir T. Shepstone,  
K.C.M.G.)

Pictormaritzburg,

December 14th, 1892.

Dear Sir,—You ask me whether from my knowledge of you I should judge you to be fit for the office of Native Commissioner, the duties and objects of which are described in the monthly report of the Executive Committee of the Chamber of Mines in the “Star” of the 5th instant.

First, let me say it is a very difficult task to undertake; few could understand its duties, and still more difficult would it be to find those who could undertake them with any chance of success.

Success cannot be attained in a day: it must depend entirely upon *achieving* confidence; that is a process, but upon the success of that process depends the success of the whole scheme. There is no “Royal Road” to it, no short cut, but when once *achieved* it is the surest of foundations.

The first appointee will have the most difficult task. If he succeeds it will be an easy one to his successors; it cannot, however, but be uphill work to you.

Companies are apt to expect immediate results, and representative bodies are frequently unreasonable in their expectations, and may tire of their experiments before they have had a chance of being tried.

You will have to take all this into account. The idea and the object of the appointment are excellent, and I only hope it will have fair play.

In my opinion there could not be found a more capable man than you to initiate so desirable a system. You know from long experience the weak and the strong points of the native character, you are a perfect master of their language and modes of thought, and you have exceptional ability to apply all this. So if you are appointed and do not succeed I shall be able to attribute your failure to one of two things only—one, that you would not try (which is absurd); the other, that your employers would not let you try, which, under the circumstances, is, I think, not quite impossible.

Believe me,

Very faithfully yours,

(Signed) T. SHEPSTONE.

William Grant, Esq.,  
P.O. Box 182.

Johannesburg.

8,125. The CHAIRMAN: You have a very extensive acquaintance with several of the native tribes of South Africa?—I have.

8,126. Principally, Swazis, Zulus, and Natal natives?—Yes, also Transvaal natives.

8,127. You know the reference to this Commission?—Yes, I have an idea.

8,128. The main references are as to the requirements of the different industries in the Colony and the available supply in Central and Southern Africa to supply these requirements. I take it your evidence will be mainly on the question of supply?—Yes, Mr. Chairman. I take it you deal with the entire subject, and I should prefer dealing with it from its initial stages since the termination of hostilities.

8,129. Yes, but what I mean is, that the evidence you will be able to give us will deal mainly with the supply of labour for the requirements as distinct from the requirements themselves?—As to the supply of labour I have not particularly addressed my attention to that point.

8,130. We anticipate getting from other witnesses—we have already had some information from the railways—full information as to the numbers of natives required?—I take it the supply of labour would rest particularly upon reliable statistics as to the amount of that labour and no reliable statistics as far as I can ascertain are really obtainable. There are conjectures and opinions by those familiar with the country, but these opinions vary very much, and as far as it is known to me there is

no reliable data. The most reliable data, of course, would be the returns from the different provinces in connection with the collection of taxes as indicating the number of able-bodied men capable of taking service, but then as to the division of that labour, the proportion in one direction or another, that is a very difficult question to determine. In fact, I know of no one who would pretend to determine it upon anything like accurate lines.

8,131. Of course the Commission has to take what information they can get from the people best able to approximate as nearly as possible the available supply in the different territories?—Yes.

8,132. You are well acquainted with Swaziland?—Yes.

8,133. Have you any knowledge as to the native population in Swaziland?—No, in Swaziland I have no accurate knowledge. I do not propose to give conjectures, because I think you have had enough of these already. There are all sorts of conjectures which can be given, and as I said opinions vary very much as to the numbers of men available for labour, but I take it evidence of that nature is after all unsatisfactory and not reliable, and I think that question might be more thoroughly and accurately gone into by the exhaustion of statistics which may be available from the different Governments. Further information on that point, if you wished it, I should certainly have pleasure in addressing myself to you and would at a later date hand it in to the Commission.

8,134. You do not know the approximate population of Swaziland?—No, I would not venture an opinion.

8,135. Do you know whether there are any large number of Swazis working outside their own country?—Not what I would call a large number.

8,136. Have you any idea?—No.

8,137. Have you any idea as to whether the Transvaal may look to Swaziland to get any number of natives?—A certain proportion certainly would come. The Swazis are not keen on underground work; of course they are serviceable for surface work, and as long as surface work can be filled up by men who do not accept underground work, they constitute a relief in the supply. *i.e.*, they relieve from the surface men who perhaps have no particular objection to underground work.

8,138. I was not thinking only of mines when I put the question to you, but I was thinking of the other industries of the country?—I address myself to mines particularly, that being the one leading question concerning the country. If the labour, as far as the mines are concerned, was a settled point, other things would settle themselves. I look upon the mining question as really the nave of the labour wheel. That is my estimate of the position.

8,139. Of course there are other industries in the country that require quantities of labour?—Undoubtedly.

8,140. And the evidence we had last week indicates that they can do with very nearly as many as the mines may be able to get?—Yes.

8,141. You cannot tell us whether you think there is any appreciable number of natives to be had in Swaziland for labour in the Transvaal apart from mines in the near future?—I should not justify your looking to a large supply of labour to the Transvaal from Swaziland, having regard to the developments which will probably in the near future take place in Swaziland and the neighbourhood of Swaziland, because natives as a rule, if they can obtain equally profitable employment near their homes, prefer doing so to going a distance. Natives are like that. It is a question of profitable employment, and if they can obtain such near home they will do so.

8,142. You are also well acquainted with Zululand?—Yes.

8,143. You spent some time there, I think?—Yes, I have had considerable acquaintance with it.

8,144. We have had the population given to us as about a quarter of a million?—Well, I should say that

is an excessive estimate. I have before me the latest statistics regarding it, and I should certainly not put the entire population of Zululand at more than 200,000. It is impossible to define the proportion of males and females, because I notice in the returns of the different magistracies of the different districts in Zululand, that some return the proportion of males and females and some do not, consequently their returns are not uniform, which I think is a pity.

8,145. I suppose it is within your knowledge that Zulus turn out in considerable numbers to work?—Yes.

8,146. A large number take service in Natal?—Yes. And before the war a considerable number then came to the Transvaal for employment and were on the mines. I knew considerable numbers were on the mines prior to the war.

8,147. Have you any idea how many come from Zululand to work here now?—I should say scarcely any. I notice that the number of passes issued for the last year for Zulus coming to the Transvaal was practically nil. No appreciable number at all.

8,148. Speaking of native territories generally, have you arrived at any figure of the usual number of able-bodied men in any given population, available for work?—I have not; I have the data available and with the devotion of a little time to it I could prepare what you want, but to a very great extent the factor I have gone on as much as possible in coming to this conclusion was that you would rather deal with absolute facts and conclusions; things absolutely established, rather than conjecture.

8,149. You know that according to Natal law we are not allowed to recruit Zulus?—I understand that, Mr. Chairman.

8,150. If we had permission to recruit in Zululand, do you think we should get an appreciable number of Zulus to work in the Transvaal?—I think, assuming that your conditions of labour here in the Transvaal were favourable and acceptable to the Zulu, I think it very likely that a considerable number might be prevailed upon to accept service here. But the whole thing hinges upon the attractiveness of labour, the organisation, and the responsible heads. These are the leading features in connection with the employment of natives.

8,151. You know the Natal natives well?—I am quite familiar with them.

8,152. Have you figures shewing the native population of Natal?—I think about 600,000 to 700,000.

8,153. Did any large number of Natal natives come here prior to the war?—Yes, a considerable number; many thousands.

8,154. Are there many here now?—I should say not; comparatively few. I should say certainly not one-tenth of the number that were here before the war.

8,155. Given permission to recruit there, and given the conditions you have just described to make it attractive, do you think you could get an appreciable number from there?—I think so. You must understand that the whole conditions of labour throughout the Continent have undergone a very material change since the termination of hostilities. There is no real point of comparison between labour to-day and labour before the war. The demands to-day are far in excess of what they have ever been in the history of the country. The wages to-day are fixed at a much higher standard than they have ever been within my knowledge. I am not speaking particularly of mining, but of the general industries of the country right through. I have referred to this in my evidence-in-chief when the standard of wages has been raised by the lavish expenditure of the military in connection with the war and the effect remains; the standard must be considered much higher than at any period before the war. Natives throughout the country are demanding a higher rate of wages than they ever have previously.

8,156. Do you think there is a very large amount of work being done in Natal? Would not

the demand for labour there prevent them coming here, even assuming the conditions you speak of?—It would, undoubtedly.

8,157. And would diminish the number coming from a distance?—Undoubtedly.

8,158. With regard to native residents in the Transvaal, is your acquaintance with them as complete as with the Natal and Zululand natives?—I have been acquainted equally with them. I have been right through the country and through the whole of the locations.

8,159. The figures given by Sir Godfrey Lagden indicated the native population in the Transvaal as exceeding 600,000?—Yes, I should say so, roughly, from the estimates of the previous Government, that the estimate of Sir Godfrey Lagden was about correct, or between 600,000 or 700,000.

8,160. In your evidence you apparently wish to indicate that the measures taken to get labour for the mines since the war do not quite meet with your approval?—They do not and never have done.

8,161. You mean before the war as well?—It applies to both occasions, but I am talking particularly since the war. Prior to the war the question was played with and treated in an indifferent manner. Subsequent to the war, I maintain, wrong principles have been adopted which I am prepared to prove. The facts as existing to-day clearly demonstrate that, and by that I mean that the characteristics and prejudices of the natives have been wholly set aside and ignored. That, coupled with the reduction in wages which was sent through the country immediately on the issue of the Articles of Association of the Native Labour Association, tended to alienate labour from the Rand. And the conditions of the labour ever since the termination of hostilities clearly proves the truth of my assertion. If you require proof in detail of my assertions that the native prejudices and characteristics were disregarded, I am prepared to furnish them from the documents here before me.

8,162. You think that the failure to get a large number of natives in the mines can be traced to offering 1s. or 1s. 2d. a day wage?—I have not a doubt in my own mind that the complete disorganisation of the labour market as concerning mining is entirely due to misconception of the position by the controlling houses.

8,163. Yes, in your statement you lay great stress upon this question of wages?—I do.

8,164. And you speak of the efforts of the Labour Association to get labour as being a failure?—Distinctly; for the reason that the native side of the question has been ignored.

8,165. I was going to ask you this question. We have it in evidence that the increase per month has been something like double what it ever was before the war in the natives working on the mines?—This is since the raising of the wages. That is since there have been other measures. To come now to the very inception of the organisation of the thing, it is perfectly clear to any man possessing a knowledge of the natives that the principles upon which this organisation was started were clearly in opposition to the fixed prejudices and ideas of the natives. Consequently the whole thing acted, as it became known, as a deterrent to labour and completely disorganised the labour market, as concerning the mines.

8,166. Will you tell us briefly, apart from this question of wages, what you mean by ignoring native prejudices?—I mean, in the first place, direct interference between employer and employee. Here is one case. In clause 10 of the Articles of Association it says: "With regard to natives who hold unpaid tickets issued by their late employers, the Board of Management will collect from former employers and pay to natives the amounts due on tickets in cases where natives are allotted to, or become employees of other employers subject to due notification." There are two principles in that one clause which are distinctly antagonistic to the

native. The first contemplates severing his connection with his previous employer. In the next place there is a distinct interference between the employer and employee in connection with the question of wages. A boy returns to his mine with 100 tickets. He goes to his employer and says, "There are my tickets; give me my money." The employer says, "No, I cannot give you the money; you must go to the Native Labour Association and they will pay you."

8,167. What is the effect upon the native?—It is the first step to destroying his confidence between the employer and employee. He says, "You gave me these and I come to you for the money. You tell me to go to the hills for my money. I do not know these people. I know you. You gave me these tickets."

8,168. That quotation does not bear out the interpretation you put upon it?—Undoubtedly.

8,169. I get an impression from your answer that the manager of a mine where a native had gone to work would say to him, "You must go to someone else for your money"?—The Board of Management will collect from former employers, so that an employer owing a certain amount to a native for wages due prior to the war, that money is collected from him and paid to the native. That is what the clause distinctly implies. These two principles are in direct antagonism to the prejudices and feelings of the native. This fact, coupled with the reduction of wages, which I maintain was done in the face of common sense, affords a full explanation of the position which has occurred in connection with the impoverishment of native labour on these fields? That is my contention.

8,170. The second point you made was on this question of native prejudice?—Interference as between employer and employee.

8,171. I understand you to mean that natives should be allowed to choose the mine on which they would work?—Distinctly, that is already dealt with in the document.

8,172. You are aware that when the mining industry was re-established during the war permission had to be got from the military as to mines allowed to start. That permission could only be got with considerable difficulty?—I am aware of it.

8,173. And it was necessary to bring natives to be allocated to such mines, as were allowed to start work?—I am aware of that. I am not talking about the conditions enforced upon the industry; I am talking about the principles which were laid down at the inception of this Association, which distinctly and clearly show what was in the mind of the author, who was responsible. That is my contention.

8,174. Now, do you mean to say that it is your opinion, Mr. Grant, that if the handling of this question of labour for the mines had been on different lines, we should have been able to have abundant labour?—I have no hesitation in saying so, none whatever. I give it to you on my honest conviction. My opinion is this, that the outcome to-day—to put it in clear and concise language—is the absolute result either of ignorance or design. I go as far as that.

8,175. You have told us that the demand for labour in the whole of South Africa is greater to-day than at any other time in the history of the country?—Admittedly. The demand for labour to-day is phenomenal, and I take it that with the works in contemplation, the demand for labour can only be described as phenomenal. New conditions have been set up, and will be in the near future, in connection with the demand for labour, which are entirely foreign to any previous conditions.

8,176. How do you reconcile the two opinions?—What different opinions?

8,177. You say that you are not prepared to give us any definite figures as to the available supply at different places. It must only be conjecture?—Not at this moment, not without investigation.

8,178. And you also say that under certain conditions, we could have had all the labour required?—

I think so, because of the fact of what transpired just three years ago this very month. Immediately these conditions were determined—and I may tell you this, ls. a day went through the country like wild fire—I was consulted by scores of natives from Zululand and Natal as to the truth of the statements.

8,179. Yes, but what I would like you to answer is, if there is this very great demand for labour and if the only industry which put this condition in force, which you speak of, the mining industry is not alone in experiencing shortage?—But the demand—I am looking at it from a prospective point of view—the actual demand to-day, and the immediate prospective demand for labour is undoubtedly very large; abnormal, in fact, phenomenal.

8,180. Has there not been a large demand for the last 12 months?—There has, but nothing like so large as it will be, because works in all directions are in contemplation and not yet working for which there will be large demands for labour.

8,181. Is it not fair to assume that if the conditions obtaining on the mines as to work are not attractive to the native, that he will find employment in other directions; in other words, has there been a surplus?—You have only to take the returns for the whole of the districts and compare them with the number of natives that came from the district before the war to satisfy yourself.

8,182. That is not my question. My question is, have not those natives worked elsewhere?—No. Thousands have not. Thousands in the Transvaal to-day have not worked elsewhere, and they still remain in the Transvaal. The natives that come to the Rand from the Transvaal, Basutoland, Zululand and Swaziland since the war have been comparatively nil, the returns shew that. We may take the Government passes or the actual arrivals on the Rand here and you will find that the numbers shew a great paucity, a great falling away compared with the natives which came from those different directions prior to the war.

8,183. That is not disputed, but have they not found work elsewhere?—Many have not, some of them have.

8,184. Is it your opinion that natives who require work and who would, if they could, have preferred to go to the mines rather than go somewhere else, have remained at home and have not worked at all?—Many of them have.

8,185. An appreciable number?—Yes.

8,186. Can you give us any figures with regard to this question?—No. I am guided more in my opinion from the official returns of passes and from the number of these men who have come to the mining centres since the war.

8,187. That is not my point. Have not these natives been working elsewhere nearer home?—Some may have, but a large population, I maintain, have not.

8,188. Can you give us some idea as to the special conditions as to numbers available to-day?—I have not visited them since the new conditions.

8,189. You are only going on impression?—I am only giving you the information I have, based upon the information which I mentioned—the returns of passes and the actual arrivals on the Rand; that is all.

8,190. I am not dealing with the Rand. The question I want to ask is whether those natives who used to come to the mines have not, owing to the greater demand for labour near their own countries, found work?—Some of them have, but in my opinion a large proportion have not.

8,191. With regard to the future, can you offer any suggestion as to how the natives in the three countries referred to—Swaziland, Zululand and Natal—can be obtained?—I thought my evidence-in-chief sufficiently indicates my opinion upon that point, particularly having regard to the increased demand which exists throughout this Continent for native labour. It is apparent, I think, to anyone knowing the conditions that unless labour is made attractive on the Rand and unless such conditions are employed as

will satisfy the requirements of the natives it cannot be expected that natives will come to the Rand. Where a native can satisfy his requirements by obtaining labour quite as congenial or more congenial to him than on the Rand if it be possible near his home he will do so. Moreover, as I say in my evidence-in-chief, it must be remembered that mining is not so attractive to the native as it was, and that position is a serious one in connection to mining. The native more than ever realises to-day the arduous nature of the work, to use an expression I have used in my evidence-in-chief, and his liability to accident and death is very much more than it was 10 years ago since my acquaintance with the Rand.

8,192. Well, now will you say what is the first step to take to make the Rand mines more attractive?—I think that I have sufficiently indicated my ideas, and I think that my statement practically answers your question. Of course, I have my own ideas as to what I think will prove most acceptable to the natives. The leading feature is a greater study of the characteristics and prejudices of the natives. Another thing is the importance the native attaches to personality. That is another feature quite ignored in the whole of these arrangements. Personality to the native is a very very strong influence indeed, and one to be utilised, that is if it is intended to make the position as attractive as possible to the native.

8,193. You made a suggestion that the important chiefs should be interviewed?—Yes.

8,194. I understand that that has been done?—I do not know. I made a note on that point which I will read. It bears more on the permanent nature of the good effect to be produced. "Much good might be accomplished were a system adopted of a visit to the chiefs and headmen by a man possessing a knowledge of native language and character and who, in virtue of his qualifications, could establish confidence in the native mind. Any existing grievances would be discussed in a friendly way, required explanations could be given, and at the same time prominence attached to any existing conditions likely to prove attractive. This suggestion, I would consider, is calculated to produce the most beneficial results; it would gratify the chief by recognising his position and influence, generate increased interest in the whole question, and constitute the means of acquiring information which could not fail to be most useful." It is useless sending a man to the mines in charge of natives in whom they have no confidence. A native is a most difficult creature to deal with, very difficult, and it is only after many years' knowledge of them that you begin to understand his peculiarities, and the strength of his prejudices. The key-stone to the whole position is this: establish confidence in the native mind. That can be done only by a knowledge of his prejudices and a determination to meet them in accordance with the precepts of common sense, and what is practical.

8,195. Protection should be given to the natives, on the way to the mines?—The arrangements, I understand, have been very much improved with regard to natives travelling by railway. The old drawbacks were, I suppose, largely due to the derangement of affairs, and will be remedied later on. Natives to the number of 30 to 45 in batches are huddled into trucks in a manner that is not very acceptable to them, and they avoid it where they can.

8,196. I think that you have given us your experience prior to the war of the difficulties experienced in the natives getting to the country?—Yes; very great. Then I was met with every possible obstruction in the whole thing—then the systematic robbery of the natives was practised.

8,197. Do you not think that the increase of wages should ere this have been felt?—Yes, that has been shown, I think, by the increase in the number that have come forward, but the destruction of the native confidence is a very simple process, while its reconstruction is one of the most difficult things in creation. When the natives settle down to the idea that their wages are to be a shilling

a day it is a very difficult idea to uproot, and only time will efface that impression. I do not hesitate to tell you that the native has now an impression most adverse and inimical to the best interests of the country.

8,198. Mr. QUINN: Mr. Grant, is it within your knowledge before the war, in 1897, for instance, an attempt was made by the mining people to materially reduce the wages of natives?—Yes, I may tell you that during 1896 the supply of labour was fully equal to the demand. I remember on one or two occasions that in my office there was not a single application for labour, and I was approached by the Mine Managers' Association and asked to advise a reduction in wages. That I declined to do. I said: "No; the question of wages is not within my province. I leave that entirely to you. I decline to take any responsibility." They then asked for my opinion, and I said that it was a matter for them to judge. They were in daily contact with the natives, and could better judge of the possibility of their accepting the reduction. There were two occasions on which I was approached and asked to advise a reduction.

8,199. Then, if you had taken the bait, the probability is that it would have gone forward with all the authority of your name behind it?—Well, I declined to take any responsibility where I had no power; and, as I had no power in the matter, I declined to accept the responsibility. The point in my mind was that, in the event of the thing being bungled by men unfamiliar with the natives, the responsibility would be thrown on me. It would be: "That is the result of your recommendation." I declined to take the responsibility.

8,200. Then, when we on this Commission are told, as we have been told more than once, that the mining industry never had sufficient labour, that is not true?—I should certainly not confirm the truthfulness of that statement. Certain mines are always short.

8,201. There have been times when you were in charge of the native labour when you had no applications for boys at all?—Absolutely not a single application, as a reference to the reports of the Chamber of Mines will show.

8,202. On page 5 of your report you say: "The idea of constituting a labour monopoly, etc.," also "to admit of the monopoly by legislation is impracticable and futile." May I ask what drew from you this report? It appears to me, reading it as it appears here, that you have been asked to make the report. Some complaints may have been made to you?—This is a reply to a report that was before me at the time, but a large proportion of my papers have been lost during the war, and it is not now in my possession, nor have I any copy of it. It was distinctly written in reply to a report submitted to me, and what I said there was perfectly correct. It is not an unfair idea of this question of a monopoly.

8,203. Would it be fair for us to assume that the idea of attempting to collar the native labour market is not a new one by any means?—Certainly not; and the principle I would say is more active to-day in connection with more recent proposals than it ever was before.

8,204. When you were informed that it is only recently that this concession has been wrung from the Witwatersrand Native Labour Association of the boys not being compulsorily sent to any mines, you were of opinion that it would be detrimental?—I am aware of very many cases where natives have been diverted from the mines to which they wished to be sent, and allotted to mines to which they did not wish to go, and the mischief that results from a system of that sort can scarcely be calculated.

8,205. Do you know anything of the treatment natives received on the compounds before the war and since; the kind of food they get?—When I first came in contact with this system the treatment was far from desirable. During my term of office many improvements were made, and so far as the testimony received from natives is concerned I believe that conditions to-day are better than they have

ever been, but at the same time I may state that it is a known fact that a very large supply of mealie meal is sent to this market which is practically unfit for use, and of which the natives complain. They say it is rotten meal. I believe that generally conditions are very much more favourable to natives than they have ever been before, but they are capable, I have no doubt, of still further improvement.

8,206. From your very extensive knowledge of natives, is it your opinion that as time goes on their wants and requirements increase?—Undoubtedly.

8,207. To any considerable extent?—There will be a general and steady progress.

8,208. Is it true, as we have been told several times, that the natives' character is to go to a field of labour and earn sufficient to meet a pressing want, and then go away. Is that your opinion?—Undoubtedly their wants are growing and their necessities are growing in consequence in every part of the country.

8,209. You have given to us your opinion already, that had it not been for a clumsy, senseless treatment of the native question, the chances are, that the mines would certainly have been in the condition in which they were before the war, if not in a better?—I can only repeat that if an intelligent common-sense principle had been applied to the re-organisation of labour, and the question of labour left to capable managers, my belief is that large numbers of stamps on these fields would have been dropping many months ago.

8,210. Mr. WHITESIDE: Kindly look at page 2 of your evidence. You refer to a letter issued to several subscribing companies by the firm of Eckstein and Co. Can you give us any idea of the contents of that letter?—Well, really, it was a kind of prospectus, and I presume it was in connection with the Association and registered in Pretoria, but in regard to this document attached, they were forwarded to me by a friend and my opinion asked on them. There are some clauses in this which may be described as peculiar, and I should say that from a native standpoint, and I want you to understand it from me as much as possible, you are getting the native side of the question, and any questions you may put to me I shall be pleased to answer, because this phase of the question has been too much lost sight of. One statement here is that "the mining groups have all agreed that no form of voluntary labour of any kind is to be recognised. Boys not recruited by the Association but coming into the country of their own free will are not to be engaged by any mining company to whom they may apply, as the companies will have bound themselves to take their supply of labour from one channel only—the Association. Any voluntary boys must, therefore, if they wish to work on the Witwatersrand, apply to the central compound of the Association, and they will then be sent to the mines to which they wish to go, provided that this mine has not its average number, as compared with other mines, otherwise they will be distributed to such mines as have not their full average. Should the boys not wish to go to such mines, they are at liberty to return home, or to seek work in other districts, but they will obtain no employment on the Witwatersrand mines." Here is a rule, absolutely contrary to the fixed idea of the native, that he will be allowed to go to the mine he wishes to work in. "They will obtain no employment on the Witwatersrand mines." I may use strong language in this respect. A more fatuous document I never read, and the principles there laid down are of the most damning nature as concerns the labour supply.

8,211. Can we have that document handed in?

The CHAIRMAN: Do you wish to put it in?—I can furnish you with a copy of it. It is a prospectus or a covering letter, and as such I presume it is registered.

The document was then handed in.

8,212. Witwatersrand Native Labour Association, Ltd.

Messrs. Eckstein and Co. write, 22nd October, 1900:—

We send herewith a copy of the Articles of Association and Schedule of Regulations which have now been fully approved of by all the mining groups represented at Cape Town.

1. It is intended that the capital of the Association is to be a comparatively small one, probably in the neighbourhood of £50,000. The bulk of the cash requirements will be furnished by the deposit of 5s. for each native included in the Company's full complement of boys.

2. The full complement of each company will be determined by the Board of Management, and in regard to crushing companies will probably be on the lines indicated in the Schedule of Regulations. In the case of developing mines the full complement will probably in the first instance be determined by the average number of boys actually employed during a number of normal months in 1899.

3. The mining groups have all agreed that no form of voluntary labour of any kind is to be recognised. Boys not recruited by the Association but coming into the country of their own free will are not to be engaged by any mining company to whom they may apply, as the companies will have bound themselves to take their supply of labour from the one channel only, *i.e.*, the Association. Any voluntary boys must therefore, if they wish to work on the Witwatersrand, apply to the central compound of the Association; they will then be sent to the mine to which they wish to go, provided that this mine has not its average number as compared with other mines, otherwise they will be distributed to such mines as have not the full average. Should the boys not wish to go to such mines, they are at liberty to return home or to seek work in other districts, but they will obtain no employment on the Witwatersrand mines. It is to be hoped that this arrangement will effectively put an end to all underhand dealings on the part of compound managers and to the very existence of unauthorised labour touts. We must add that we understand that a new law is about to be passed relating to the restriction of unauthorised touts and touting. We lay great stress upon the importance of the agreement on the part of the mining companies to obtain their labour through one channel only, as this course should do away with all the unfortunate competition which has existed in former days.

4. Owing to the very exceptional condition of affairs that will exist on the goldfields when work is re-started, it has been arranged that the mining groups shall have the right to concentrate boys on any mines which they wish specially to push ahead. For instance, the Consolidated Goldfields will be anxious to concentrate work at first on their gold-producing mines at the expense of some of the deep level properties which will then require a little attention.

Your Directors will understand that it was well to allow this, as, after all, the gold-producing companies will be the most important for the first few months. But this arrangement is not to last indefinitely. It will be cancelled as soon as it is considered convenient, and then we shall fall back on the strict lines that each company can only have the normal average of the full complement; nothing more. You will notice in the Articles of Association that the Board of Management of the new Association has a right to penalise each company for any infraction of the rules to the extent of the whole deposit of 5s. per head on each native for every offence. To give an example: Suppose a company, with a normal complement of 2,000 boys, which has joined the Association, were to be found recruiting on its account and smuggling boys into its compound, its deposit of 5s. on 2,000 boys, namely, £500, will be forfeited, and must be replaced by the company before any fresh batches of natives are allotted to it by the Association. The penalty is doubtless a severe one, but it need have no terrors for any honest management.

We must add that Government House is fully aware of the formation of this Association, and has approved of its proposed course of action. Mr. G. A. Goodwin, the Acting Manager of the Rand Mines, Ltd., who has just arrived in Cape Town from Johannesburg, has accepted the position of Manager, and preparations are now being made for a thorough organisation for the work before us. Although we already have the general approval of your Directors, we shall be glad if you will kindly send us another telegram at their earliest convenience.

We ourselves are satisfied that if work is carried on on the lines now laid down the benefits to the gold mining industry must be enormous, and we shall strongly recommend every company with which we are connected to join this Association. We are now, in fact, together with all the other mining groups represented at Cape Town, giving provisional guarantees on behalf of all companies to the effect that they will join and be also advanced certain funds to cover initial expenditure.

8,213. Mr. WHITESIDE: You said there were one or two clauses to be described as peculiar. Have you covered the ground of these peculiar clauses, or are there others?—I do not know that I need go further into the document, but the movement spread by it is this: "We are going to do what we like with the natives, and the natives will have to bow down to one condition, and if they do not they may go where they please." This is a fair paraphrase of this document: "We are going to have natives on our conditions, and, if they do not accept them, they can go." This is the principle on which this question has been treated.

8,214. Do you think that sufficient time has elapsed for natives to think that wages have been restored? I understand that they are recruited on a six months' contract?—On a six or twelve months' contract, mostly on a six months' contract.

8,215. And wages were increased in February last. Have we had sufficient time yet to feel the effect of that?—They have had sufficient time to feel it, but the influence has not begun to spread, and will not do so until men actually return to their kraals and show the actual money.

8,216. Now there can be no appreciable number of boys returned already to spread this convincing news?—I should say not.

8,217. Mr. TAINTON: You came on the mines in 1893?—I was appointed Native Labour Commissioner in 1893. Yes.

8,218. You stated just now that on a number of occasions the labour supply was ample for the demands. Can you give us any date when that was true?—I can by making reference give you the actual dates, but it was during 1896.

8,219. Did you have any labour surplus before that time?—I do not think there was much surplus. No, I think that, so far as I remember, without reference, that 1896 was the year in which the mines were fully supplied with labour. As I remarked, certain mines were never fully supplied, because if they got labour one day they lost it the next, but I am speaking of mines on which the conditions were satisfactory, but some mines are always in want of labour and always will be.

8,220. We have been told by General Cronje that the Boer Government assisted the mines by compelling the chiefs to turn out their men. Did you assist?—I do not think I can confirm the statement. At one time the arrangements with the chiefs were always satisfactory, but afterwards I was met with the statement that the Native Commissioners always collected a certain sum for the number of natives leaving their districts. That principle I always resisted, and refused to have anything to do with, and I twice resigned my position on that account, when my Committee resolved to adopt that principle.

8,221. What principle was that?—The principle of paying the Native Commissioner. I said, "If this principle of paying the Native Commissioners commences, where is it going to end? It must

extend to subordinate officers, because after all the Native Commissioner is not the man who comes into immediate contact with the natives." The Field-comrads and every clerk in his office, everyone in fact, would be demanding a fee of some sort or another, or obstacles would have been raised. Consequently, I absolutely refused to have anything to do with it.

8,222. Were you present at a meeting of the chiefs of the Northern Transvaal in 1895 when the assistance of the chiefs was requested?—A meeting convened by the Government?

8,223. Were you present at a meeting of chiefs in the Northern Transvaal in 1895 when this question was raised?—No, I discussed it, of course, in going through the country in 1894 with all the chiefs. I came in contact with some 20 in number and with thousands of natives too—large gatherings of natives. I was not present at any meeting convened by the Government.

8,224. Was there any request made by the Chamber of Mines to the Government to assist in this matter?—Repeated applications were made seeking the assistance of the Government in one way or another, but mainly making complaints against the treatment of natives—for instance, boys on returning would go to a Boer's farm to get perhaps a bottle filled with water and be made to pay 1s. for it. Then as regards their passes—their legal passes were frequently taken from them, and torn up, and a scrap of dirty paper employed on which something was written. I have handled a number of these. In addition to the legal pass which the native had paid for, and which was torn up, a shilling or half-a-crown would be demanded for what was said to be a "proper" pass.

8,225. These methods were prevalent?—These and others of a similar character. These things occupied no small amount of my time in those days.

8,226. Was there any request made by the Chamber of Mines to the Government to assist the mines in overcoming the shortage of labour?—Constant applications were made to the Government to render assistance.

8,227. Do you remember any action taken by the Government in consequence of that request at the end of 1895?—No, no extraordinary action. Letters I think—in fact, I know—were addressed by the Superintendent of Natives to the Native Commissioners in the districts, but then these letters would be received and courteously replied to, and there would never be anything done.

8,228. Is it not within your memory that the Government actually had a large meeting of the chiefs in the Northern Transvaal?—I have no knowledge of the details of that at all. I have no recollection of that at all.

8,229. You did not know that the Native Commissioners were instructed to render assistance?—Yes, I have seen the written instructions issued from the office, but the issuing of instructions and the carrying out of them are two different things. Instructions were issued, but they were never carried out. The barrier always was the demand of 10s. to £1 per head; that was the demand of the Native Commissioners right through the country to offer their interests in the turning out of labour. That I always objected to and never would consent to, and during my whole term of office not a single sixpence was ever paid by me to any of these men in connection with the turning out of labour.

8,230. Or by any of your officials?—It was never paid through me.

8,231. When did you leave the Chamber's service?—In the early part of 1897.

8,232. Did you read the statements made to the Industrial Commission in 1897 by leaders like Mr. Abu, to the effect that Native Commissioner received money before they would send boys down—insisted on receiving money?—I am aware that individual mines paid them. That was done, but it was never done by the Chamber of Mines in a corporate capacity—within my knowledge. I know

also of instance where considerable sums were paid the chiefs for turning out natives, and valuable presents given. I remember one case where a wagon and team of bullocks was given.

8,233. Did you ever give any presents yourself?—In my travels, one or two presents in the shape of a few good rugs, or something like that, but nothing of much value.

8,234. Do you know when this practice obtained of paying Native Commissioners?—I think that if you go into the origin of things that you will have a great deal to do. It is a custom with them.

8,235. You say that a number of mines did pay the native chiefs. Can you tell us when that practice began?—I cannot tell you when it began: I know that it was pretty continuous.

8,236. You found it in force during your term of office?—Oh, yes, it was very much in force when I took office, and continued in force. It was one of the things I had to contend against.

8,237. How had you to contend against it?—It was opposed to my principles of work, and of course damaged my work in that way. I was taunted with it by these men saying, "We receive so and so from so and so—why do you not pay us?" The Native Commissioners came to my office and paid private visits to each member of the Native Labour Committee, and they got a considerable way in satisfying the members of the Committee that it was desirable that they should be paid a certain sum per head. Very soon after entering my office, they said, "We find you are the objection to our being paid, and if you recommend it your Committee will do it." My reply was, "I think you must have misunderstood them." I got word of them in that manner, but they were quite under the impression.

8,238. That it was a practice extensively carried on?—Undoubtedly it was.

8,239. Why did the mines pay these sums?—They thought they secured advantages over other mines by doing it, and securing labour which they would not otherwise get, I presume that was the reason.

8,240. Then the labour supply was short?—It may have been so far as they were concerned. Probably it was.

8,241. In other words, during your term of office, whilst you were in control of this matter, a practice obtained under which the Boer officials of the country were systematically bribed to obtain labour?—By certain mines—not by all.

8,242. That is three years after you took office?—Two years after I took office.

8,243. How do you explain that fact?—The fact can speak for itself. There were certain people who were always ready to bribe them, and always ready to think they could get some advantage over any other company. In spite of all remonstrances on my part there were certain men who continued to do it. I could name both mines and chiefs, but I prefer not.

8,244. The practical point is that naturally these people would not pay these large sums unless they were obliged to. It seems to bear upon the efficiency of the Chamber of Mines' Labour Department in that it was necessary to carry out this system of bribery at a time when the Chamber of Mines' official organisation existed. It pointed to a shortage of labour, is not that so?—The facts speak for themselves, Mr. Tainton.

8,245. How do you account, then, for the fact that three years after you took office the labour supply on the mines was short?—Three years after I took office! I have just told you the reverse. I have told you that during 1896—I was appointed towards the end of 1893—my office was on more than one occasion actually without a single application for labour.

8,246. Well, I am going upon your statement in regard to these Boer officials. I gather from your statement and from the evidence given before the Industrial Commission, that this was more or less a common practice, and it seems to me to point

to a shortage of labour. I want you to explain that shortage because it goes to show that the working of the Chamber of Mines' Labour Department was not successful?—It would be difficult to explain the principles or ideas which influence individual managers of mines with regard to the labour question. It is a very difficult question. My remarks are general. They do not apply to individuals. What I say is quite correct, that I know of individuals who constantly feed chiefs for the supply of labour. Certain mines in that way secured a continuous supply of labour from a particular chief; they considered that that labour was more efficient, and undoubtedly it was. These boys came and went from the same chief, but that was not general.

8,247. You claim, then, that during your term of office this labour question had been settled?—I would rather not express an opinion on that question. I would rather leave the facts to speak for themselves.

8,248. Will you give us the facts? When was this surplus you speak of?—I have a distinct recollection, in fact I have a note written in July, 1896, "Reported that mines all full; not a single application for labour." The fact remains, and you will find it among the records of the Chamber, and I do not think it is necessary for me to occupy the time of this Commission in matters which can be easily verified from official documents. You will find it recorded that it was seriously entertained to make a reduction in wages, and common-sense would indicate that a reduction of wages was not likely to be contemplated if there was a deficiency of labour. The fact proves the supply of labour to have been ample; otherwise, a reduction of wages would not have been contemplated.

8,249. There was a surplus then in the middle of 1896. Was there a surplus at any other time?—I do not know; I cannot tell you.

8,250. Cannot you recollect?—Not from memory.

8,251. Do you know that at the end of 1895 the supply was short?—I do not remember. I cannot recollect these things. They are matters of record, and it can be easily verified. I know this, that there was a very great deficiency when I took office, and I know that it was no small effort then to obtain an increase of the supply. I remember that well enough, but I cannot give you details of all that concerns the supply at that time without referring to the documents.

8,252. You see you were in control of this matter for four years. I think your statement is confirmed by the records of the Chamber of Mines, that there was a surplus at the end of 1896, but, glancing through those records, it seemed to me that that was the only time that there was a surplus?—It may have been.

8,253. That is why I wanted you to give us some other date?—You must remember this, that at the time I took office the number of natives was less by one-half than when I left office.

8,254. What was the number employed when you took office?—I cannot tell you these things from memory. I think somewhere about 30,000 or 32,000.

8,255. And when you left office what was the number employed?—I should say pretty nearly double that, anyway.

8,256. Say 70,000?—Of course there was steady progression at that time, as everyone knows, the demand was steadily increasing.

8,257. I think there were about 70,000 in 1896 or 1897?—Well, that would confirm what I say—about double the number it was when I entered office.

8,258. Do you know what proportion of these boys were Portuguese boys?—No. I cannot without reference give you the exact proportion, but they were in nothing like the proportion they are to-day. The proportion of East Coast boys is considerably more to-day than it was then.

8,259. Do you mean the proportion or the number?—The proportion and the numbers, too.

8,260. I see Mr. Goldman stated in his evidence before the Industrial Commission that about half the boys engaged in 1897 were Portuguese boys; would that be the approximate figure?—I should have said rather under that—rather less—but he may be about right. Perhaps he spoke with reference to figures, and I have no figures by me.

8,261. What fields were you recruiting in at that time?—A large number came from the Transvaal. A large number of Basutos were here.

8,262. What other fields?—A considerable number of Natal and Zulus boys were here, but I never actually recruited beyond sending a messenger in Natal or Zululand—beyond communications with certain chiefs. There were no recruiters.

8,263. Was Cape Colony open to you?—I completed arrangements in 1896, but the arrangements made with the Premier were never put in operation so far as I was concerned. I left before the active practical part set in.

8,264. But I think I am correct in saying that Colonial boys were coming up during your term of office?—Yes, they were, but at one time they were absolutely objected to; they were absolutely refused by mine managers.

8,265. But recruiting was carried on in the Cape Colony?—There was no recruiting.

8,266. Not by the Chamber of Mines, but by agents?—Yes, agents recruited there certainly.

8,267. The native population of the Transvaal, Swaziland, Natal, Basutoland and the Transkei is, roughly, about 2½ millions. There was a total of about 70,000 boys and about one-half were from Portuguese territory. Now that goes to show that you obtained a number of about 30,000 to 35,000 from that population. Do you think that is a high figure, a high proportion?—From what population do you refer to?

8,268. Transvaal, 600,000; Swaziland 60,000; Natal and Zululand, 750,000 (I think it is considerably more); Basutoland at that time, 230,000; and Cape Colony we will put at 750,000—it is really a good deal more—that is, roughly, 2½ millions. The figures you give us show that from that population you were drawing about 35,000 labourers. Do you think that is an exceptional result?—No, I should say not.

8,269. Do you think it could be much improved upon?—Well, I should say since that time much greater numbers have been drawn from these fields than that.

8,270. I am dealing with your period of work. The point is this. You put a statement in here and that statement is backed by your authority as Commissioner for a long period of the Chamber of Mines?—It is backed by my general knowledge and experience.

8,271. And also by the fact that you were an official of the Chamber of Mines for a long period. I want to get at the practical results of your work for the Chamber of Mines?—Well, the records will give you that accurately. I cannot give you them from memory, and I have no records here. I am dealing with the question in as broad a way as I can upon certain principles. I have not confined my examination to details connected with my past work on things of that sort.

8,272. These things are very important. You were in practical control of the position for a number of years. You increased the supply from 30,000 to about 70,000. One-half of that total was drawn from Portuguese territory, which left you with a total of some 30,000 or 35,000 drawn from the remaining portions of South Africa, the native population of which is, approximately, 2½ millions. I ask you whether you consider the work good work and whether it represents a fair average of the working population of the countries in which you were operating?—I cannot express an opinion on that point at all. I confine myself simply to the number of boys who came from these directions. I cannot tell what it represents.

8,273. It has such a practical important bearing on the subject?—I cannot tell you whether 30,000 men coming from four or five different districts represents a fair proportion of the labour of those districts. The facts speak for themselves. If you say about half the number, about 30,000 came from these districts, there is a fact.

8,274. I think that it has already been shown that during the greater portion of this period when you were in office that there was a shortage of labour. You were doubtless doing your best to overcome the shortage, therefore I ask you whether you consider this result of 30,000 odd represents a fair maximum result of labour to be obtained from these territories?—If you will pardon my saying it, I cannot grasp the practical point of your question.

8,275. The practical point is this: The total population of these territories was two and a half millions, and your organisation succeeded in inducing one in eighty of the population to come out to work. Now does that proportion hold good to-day?—I cannot tell you what proportion holds good to-day.

8,276. You see this Commission has got a difficult and rather important task?—I quite agree with you.

8,277. We find that there is a very large native population, but unfortunately everyone says that there is no labour—with one or two exceptions. Now it is important to get at a working figure so that we can ascertain the proportion of the native population which will go out to work. If we take the figures, they come out approximately 1 in 80 or 1 in 90. I ask you, as a practical man in touch with the question, is that a fair proportion?—I must point out to you that none of the conditions that obtained under the late Government previous to the war can be applied to the position to-day, and any estimates based upon the results obtained before the war are wholly inapplicable to the position to-day. There is really no point of comparison whatever.

8,278. Will you amplify that reply, because it is an important point?—I mean to say that under the late Government every possible obstacle operated to keep the natives from coming. There was the ill-treatment in travelling; there was the robbery that went on in many cases—gross robbery, where the boys were stripped of every sixpence. There was every interference with them; their legal vaccination pass was in many cases taken from them and torn up and another pass given them. A clasp knife was taken from the Boer's pocket, the arm scratched and some milk or glycerine put upon it. One or two shillings was taken from them in this way. That was the sort of thing which existed right throughout the country before the war.

8,279. Do you think these things affected the labour supply to any considerable extent?—Undoubtedly they did.

8,280. Then their removal should have improved the labour supply?—Undoubtedly. The conditions of the organisation are more favourable than they have ever been in the country before, because you know everyone is in sympathy with the organisation, which they were clean out of sympathy with under the late Government.

8,281. Then your estimate is really based upon the opinion that these improved conditions will affect the labour supply?—Undoubtedly. I think that improved conditions and the right handling of the question upon common-sense principles will certainly conduce to an increased supply. Every condition is much more favourable now than it was in the old days.

8,282. Your opinion is not based upon actual experience or upon what you ascertained during your period of office, but upon an estimate that the removal of these grievances will affect the supply?—Distinctly. I know what the native objects to, and if you have that objection removed he is gratified, and when you gratify him you are more likely to get out of him what you want.

8,283. Would you then attribute the comparatively small result obtained under your administration to the existence of these particular drawbacks?—I do not know why you designate as small the results obtained under my administration.

8,284. I understood from what you said just now that there was only one period when the labour supply was ample?—You must remember, as I remarked just now, there was a progressive monthly increase of natives required at the time.

8,285. And you also consider, then, this proportion which I have given you—roughly, about 1 in 80—a very satisfactory one. Is that so?—I should not express any opinion upon it, whether it was or not. These were the actual figures obtained. I would rather deal with them as facts rather than express any opinion as to whether they were satisfactory or otherwise.

8,286. I want to get at the factors or the causes which give you a large supply from a section of Portuguese territory and a very small supply from other sections of South Africa. Can you throw any light upon the anomaly?—Well, during my term of office the whole subject, I may say, with two or three exceptions, was treated as though it were immaterial and of very trifling importance. The difficulties and opposition I had to contend against were well-nigh insuperable. I was induced to do everything from the fact that the Portuguese boys are the best mining boys, and these were the boys who were most agreeable naturally to the mining men. Boys from every other direction were not liked in any way whatever, and in my own case were absolutely refused. I remember in one case we had 1,000 boys available for distribution, and not one of the managers would accept one of them. These were Cape Colony boys. I had no direct organisation then. I was simply in correspondence with the authorities, and keeping in touch with one or two of the principal chiefs. My organisation was quite outside the Transvaal. It was then on the East Coast owing to the fact that these boys made the best mining boys, and were most desired by the mine managers.

8,287. But free recruiting was going on throughout the country and in the other districts?—Yes.

8,288. You say that free recruiting was very successful. You could not tell us what proportion was obtained by free recruiters out of the total number of natives on the Rand?—No, I could not tell you. With regard to some of these men the results were satisfactory enough, but with others of them the results were more unsatisfactory, because promises were held out to the boys which were not fulfilled, and dissatisfaction was the consequence.

8,289. I understand that side by side with the official organisation of the Chamber free recruiting was carried on throughout the country?—There was.

8,290. Did the voluntary recruiting assist the labour supply to some extent?—To some extent.

8,291. Let us take the Portuguese territory. Can you explain the anomaly I referred to just now? I do not think you have answered that point, viz., that a very large proportion of the natives were obtained from Portuguese territory, in spite of the drawbacks which might have very seriously affected the supply. Can you throw any light upon that point?—What point?

8,292. During the time you were employed in that territory you had no direct control of the actual recruiting operations, yet the result was very large. Can you explain it?—No. The only organisation I had was my own organisation unsupported at that time by Government in any shape or form whatever, subject of course to suit conditions as they were laid down.

8,293. Free recruiting was carried on there also?—Outside my organisation free recruiting was carried on there at the same time.

8,294. Then you have no explanation of the circumstances that a very considerable proportion of the male population of the Portuguese territory came down to work?—Except that they made no

objection to the work. The conditions are considered favourable and there are additional inducements in the shape of providing food and shelter and seeing to them on the road which led to a larger number coming out than probably would have done. At that time drink was given to them. It was an inducement to them. They are very familiar with it in Portuguese territory, but beyond that I know no other reason.

8,295. Then you have no explanation of the fact that in British territory the proportion of natives coming out to work is comparatively small, while in Portuguese territory it is much larger?—One thing is that in British territory there is an increased number of employers which you do not get in Portuguese territory. Portuguese territory, barring just the coast line, is practically a native settlement. They are really the population of the Portuguese territory, they are the natives and at that time, of course, the openings for employment were not very numerous. I mean to say the number actually employed at Delagoa Bay was very small compared with what it is to-day, and their wants were of a very limited nature. All their works in the interior of the country were very limited and employed a very small number of boys. The consequence was that when they want anything more outside what they are able to produce at their own homes, then of necessity they have to go to a distance to obtain work. Beyond that I know of no other condition.

8,296. I take your answer to mean that the demands of the employers in British territory are very much larger than in Portuguese territory?—Undoubtedly, because of the increased number of the white population in British territories, occupied by Europeans. The Portuguese territories are not; they are practically native territories.

8,297. Do you think, then, that the British native works pretty much to the same extent as the Portuguese native?—I should say that the proportion is not less.

8,298. Not less?—I should say not.

8,299. What class of labour is mostly favoured by the native of British territory?—It depends very much on the class of native. The classes are now becoming numerous. The different classes prefer different sorts of labour. The so-called educated natives prefer positions in offices and that sort of thing.

8,300. Do you know Natal?—Yes, I do, there is a very large native population there.

8,301. Has the labour market of that Colony been fully supplied with labour?—I should say fairly supplied of late. I have not been in that part for some time, but during my time there it was largely supplied. There was no dearth of labour.

8,302. Do you know, then, the causes which brought about the introduction of Asiatics into that country?—Yes, there was a distinct cause for that. It was the unreliability of labour at a time when crops must be got in within a given time, or at least that was the foundation of it.

8,303. Is that unreliability a characteristic of the African native?—Undoubtedly, you do not get the same continuous labour from the native as from an indentured Indian. The Indians were originally imported for sugar for the reason that the sugar crops, to be taken advantage of, must be got in within a very limited period, and so far as the native is concerned no reliance can be placed upon his labour at perhaps the very time when necessity may require it. That was really the base of the introduction of Indians into Natal.

8,304. That unreliability which is characteristic of the Natal native, is it not true of the whole of native labour?—The whole labour in the country.

8,305. Then do you think the labour supply is apt to rise and fall?—It is always liable to fluctuations. Sometimes very considerable fluctuations.

8,306. Can you indicate any of the causes bringing about the fluctuations?—It is characteristic of the people.

8,307. There are few things happen in this world without a cause?—Naturally, and this cause is the natural characteristic of the people.

8,308. Can you tell me of your own knowledge of natives what causes this, or rather what makes the supply fluctuate in this way?—There is an aversion in natives to long continuous labour. That is my experience of them throughout the Continent. It does not matter to what tribe they belong. The natives who are more willing to enter into long contracts are East Coast natives. They are more disposed because they are naturally a more docile people. The manhood has been knocked out of them for several generations by the Zulus, and now they are a tractable race. As concerns other races, I could not tell you; I know that they have a very strong objection to long contracts; they have no desire to enter into them. No one who has the confidence of the native will seek to make a long contract with him. The consequence is that if the native is asked to make a long contract he is always suspicious of the nature of man who asks him to do so. That is the theory he works upon. If I wished to engage 20 natives I should not dream of asking them to enter into a contract. I should engage them and arrange to pay so much per month. Probably many people would ask them to agree to a six, nine or ten months' contract. They would say "No."

8,309. During your long life among the natives have you not come across any of the causes which bring about this fluctuation in the labour supply?—No, I do not know that this fluctuation, certainly so far as the native is concerned, may be unjustified—I think it is—but fluctuations of labour are pretty consistent throughout the world. I grant that as far as the native is concerned, I think his aversion to continuous labour is perhaps stronger than it is in more highly civilised people, but I think a great reason, so far as the native is concerned, is that he is only just merging from semi-savage life.

8,310. Do you think his objection to continuous labour is stronger than amongst civilised people?—Yes, I should say it was.

8,311. You think it is?—Yes, I do. The native considers 12 months a very long term for engagement. I do not think any of them are particularly fond of work, and even when a native is inclined to remain what you may call a long term of service, say 6 or 12 months, at the end of that 12 months he will say, "I am tired."

8,312. But I think other races work continuously because the pressure is continuous?—Possibly.

8,313. In the case of the native I understand from your reply that the pressure is not continuous. Can you tell us what the circumstances are which enable him to come at intervals in that way into the native labour market and work spasmodically?—Well, there is a great deal that is human about the native. When he has worked long enough to satisfy his wants he thinks it desirable to have a rest.

8,314. What are his wants?—They are very limited.

8,315. Can you tell us what they are, roughly?—What particular details would you like me to mention?

8,316. Well, the white man wants a house, groceries, and a great many things. What does the native want?—Well, he wants a supply of food that is congenial to him, and that he can very easily get.

8,317. What beyond his food?—Well, he wants a complete suit of clothes, and he wants one or two warm blankets. His wants are extremely limited.

8,318. Do you find many natives require clothes?—Yes, they like a suit of clothes. I except the East Coast boys, but taking the whole of the Cape Colony boys, the Zulus of Natal; the Swazis not so much because they are left to themselves, but the Basutos are very partial to clothing.

8,319. How do you connect this particular necessary with the labour supply?—In what way?

8,320. Well, you said the labour supply was not continuous, that it was affected by natives' wants?—No, subject to considerable fluctuations,

8,321. You mentioned there among the wants, clothes and blankets. How does the particular demand for these articles affect the labour supply?—I should say it is a distinct reason or cause of fluctuations. Fluctuations of a people whose wants are limited and easily satisfied are of necessity bound to be greater than with people whose wants are greater and not so easily satisfied.

8,322. Then you would attribute the comparatively small working proportion of natives in South Africa to the fact that their wants are limited?—Undoubtedly it is one of the operating causes.

8,323. I see you mention in your statement on page 3, No. 5, the factors at work as follows:—"The favourable and abundant crops which have been reaped all through the country, outside the area of warlike operations, an ample supply of food, even in normal times always—as is natural—tending to diminish the supply of labour." This answer of yours is bearing out that particular statement?—Distinctly; there are not an appreciable number of men in the world who work for the love of the thing. A man usually works to gratify his wants and then any particular fancies he has. His wants satisfied, he is entitled to a rest, and, as these wants are limited, I should assign that as a distinct cause of the fluctuations which you get in native labour. But, as I said just now, the fluctuations are not limited to the natives. You will find them in India. Even in mining in India the labour supply fluctuates, even with their millions of men around. There are similar fluctuations on the coffee plantations in India.

8,324. I want to ask your opinion about one or two statements made by the Resident Magistrates in Natal in the Native Blue Book in 1902. Mr. Frank E. Foxton, Magistrate of the Ixopo District, under the heading of labour, says:—"Within the division there is a great scarcity of labour, as natives prefer to go to the mines where they receive higher wages, which enables them to remain longer in their kraals." I gather from what you say your experience does not confirm that statement, does it; that they go to the mines?—Certainly not; but it confirms the statement I made as to the gratification of their wants. It refers to the greater pay they get at the mines, and consequently to the more rapid gratification of their wants. Does he give any return of the number of passes issued for the Transvaal, or is that just an expression of opinion?

8,325. Not under this heading of labour. That is all he says.—He has not given the number of passes?

8,326. No, not this particular magistrate; but I will read the others as they come. Mr. Foxton goes on to say:—"The departures to work on the gold fields are increasing rapidly, and the pay they receive at the mines does not seem to be lower than £3 10s. per month, and many receive twice this amount." I think you confirm that?—I think it is a mistake of his.

8,327. Higher wages enable them to rest longer at their kraals?—Distinctly.

8,328. Do you think this is an explanation of the scarcity of labour which he refers to?—One of the operating causes undoubtedly of the fluctuation of labour.

8,329. I take the next division. Mr. Thos. Maxwell, Magistrate of the Umsinga Division, says:—"The number of natives who left this division for work beyond the borders of the Colony is shown vide outward passes at 532." That goes to show that the population of labourers going outside to work is comparatively small, 532 out of a total population of 2,455.

8,330. The CHAIRMAN: Outside this Colony? Mr. TAINTON: Outside his magisterial division.

The WITNESS: You will find for the last two or three years that applies throughout the whole of the Colony.

8,331. Mr. TAINTON: What is that?—The small number who go out. In a few words, I have got the contents of the last Blue Book issued by the Cape Government, a copy of it was sent to me by the authorities down there.

8,332. I will come to that. I am first taking these statements of the Natal Magistrates. I am not selecting them. I am just reading them straight on. Mr. J. J. Jackson, of the Mapumulo District, says:—"There have been no cases of small-pox or other infectious disease. The natives appear to be happy and contented, but they do not seem to improve as far as any desire to work is concerned. The high rate of wages earned at the front and elsewhere during the year had not had a beneficial effect upon them, either socially or morally." I read that because I want to know what your experience is with regard to Natal natives, whether you notice any very great increase in their working output or in their capacity or in their desire to work?—I think the desire for work right through the whole country as concerning the native is greater to-day than I have ever known it.

8,333. At this particular moment?—Yes, from the position to-day, I should say certainly that the inclination to work, and the proportion of natives turning out for work, is larger to-day than it has been in the past. Speaking of Natal, the requirements are very steadily on the increase, as they spend sums of money to-day that they would never have dreamt of spending ten years ago, to go no farther back than that. You go through the country and see the number of ploughs and houses and implements of different sorts which many of the people have and everything in other directions, pointing to a distinct advance. Of course in certain districts men are not so advanced. It is more prominent in some districts than in others, but speaking generally the advance undoubtedly is very considerable during the past few years. That is an advance in the requirements of natives, and I think that the inclination to work on the part of the natives is quite as strong, if not stronger, than it has ever been. I should say stronger.

8,334. What do you base that conclusion upon?—Simply that their wants and necessities have so multiplied that labour is necessary in order to gratify them.

8,335. You have no actual experience of them coming out in large numbers? What I want to get at is this: Is it only an inference or statement, or is it an observation from facts?—It is an inference derived from observation of actual facts.

8,336. You think because their wants are larger they do more work?—It is because they have to work. They cannot satisfy their wants unless they do.

8,337. Do you think then that a solution of this question of the labour supply is dependent upon this gradual increase in the native wants?—No, I should not say that entirely; it is a contributing cause undoubtedly. The more the native wants the more work he is likely to put in in order to gratify his wants.

8,338. Have you got any rough idea of what the annual demand of the native population is per head for, say, European goods?—No, I have not gone into it.

8,339. It would vary very much in different tribes?—Yes, in different tribes and in different districts. Take the natives of Swaziland, for instance; their requirements would be a very different platform to the requirements of many districts in Zululand and Natal.

8,340. What native tribes do you think would turn out to work from year to year?—I cannot say.

8,341. From your knowledge of their present conditions, what native tribes are likely to be more industrious owing to the operations of these causes you just mentioned?—I think it applies generally through the whole Continent and the whole of the native districts. I think I should apply the principle generally.

8,342. Can you mention any particular tribes where this factor is at work more actively than in others?—Does it work more actively in the more highly civilised natives? We know, for instance, that the requirements of the Basutos are very much more advanced than the requirements of the Swazis and their expenditure on their personal wants is greater than that of the Swazi or in many districts of Zululand. In certain portions of Zululand they have advanced very much materially, their requirements have increased very much.

8,343. Would you agree that Basutoland is a native community whose wants are above the average of South African natives?—Speaking generally and taking the whole tribe right through, I should say yes. I should say they are among the most advanced at all events.

8,344. Is it then an inference from that that other tribes like the Swazis, who are not so advanced as the Basutos, will not turn out to work so readily?—It is just a question. Their wants are speedily multiplying. You cannot produce a marked alteration in 24 hours or even in a week or month or year. It is a matter of steady progress.

8,345. How long have you known the natives?—The last half century.

8,346. In that interval—a long time—do you think there has been any very great advance amongst them if we take these wants of theirs, these wants for European manufactures as a basis?—A tremendous increase undoubtedly; very marked. You need not go back more than 10 years to show that the change in the native world is very marked.

8,347. Do you think that is one of the causes which is gradually acting upon the labour supply and making it improve. that advance we have spoken of?—I think it is an operating cause undoubtedly.

8,348. I will continue to go on with the statements of the magistrates in Natal. Mr. T. R. Bennett, magistrate of the Klip River district, says: "Some farmers who have labourers, tenants being under agreement to supply labour, are unable to get them to work, and in many cases have imported Indian labour. The number of natives who left this Colony to seek work under passes from this office is 274." Will you throw any light upon this phrase that "some farmers who have labourers, tenants being under agreement to supply labour, are unable to get them to work." Can you throw any light upon that?—I should say it indicates distinctly a want of proper control of the employer over the employed.

8,349. Is it not the practice in Natal to hire out land to natives in return for labour?—A very large proportion of the Natal native population is on private lands.

8,350. Can you give us any idea of the proportion?—You will find it in that volume (Natal Blue Book) you have, at the end. A very considerable proportion. I was amazed when I saw it. It was very much higher than I thought.

8,351. The natives who are on private lands, do they obtain land from the farmers?—The arrangements are different, some arrange to pay so much, some arrange to render service, some arrange for the ploughing of a certain acreage; there are all sorts of arrangements and they pay according to the terms of the arrangement. Some decline to enter into any conditions, others arrange for the payment of rent, and rent is fixed at £2, £3 or £4 per annum in proportion to the price of land that may be allotted to them with certain grazing rights. Their arrangements are very various and between one private individual and another. They are by no means general.

8,352. Is it because the Government land is not sufficient for native requirements that this movement takes place on to private land?—Many of them prefer isolation, I was going to say, but many of them prefer to pay an extra price to be on private land rather than continue in a location, they would rather go out of the location and pay an extra price

and get a few acres of land allotted to them. Others again prefer the locations and object to private lands.

8,353. Do they cultivate to any great extent upon these lands in Natal?—Yes. In a way cultivation is more or less crude; some cultivate freely and others again do not.

8,354. Do you find any great advance amongst them in this particular?—There is a steady advance going on undoubtedly. That, I think, bears also on the question of polygamy which is distinctly diminishing, particularly in Natal and Zululand.

8,355. Does the Natal native produce grain to any considerable extent?—Some produce for the markets, some for their own consumption and for selling a surplus to men of their own kind. Some of them go in largely for a variety of produce to meet European requirements and supply the Maritzburg and Durban markets. But the great bulk of them just grow for their own requirements, retaining just a surplus for perhaps an adjoining storekeeper or for disposal amongst their own people.

8,356. And does the sale of this produce provide them with sufficient money for their requirements?—In many cases, yes; all their requirements.

8,357. Do you find that natives in proximity to markets—urban markets—cultivate for the market?—Oh, yes, undoubtedly. I have a knowledge of a considerable number of them.

8,358. I would like you to give us the benefit of your experience upon this statement. The next Magistrate in the Umgeni Division, where Mr. Leonard is the Acting Magistrate, states: "There are a great number of males about the locations, but I find a great difficulty in getting them to obey the orders of their chiefs when called out for public work on the roads. When the young men are called out the first thing they do is to run off to a European to whom they engage themselves, or pretend they are working and are only at their kraals for a holiday." Can you throw any light on that paragraph?—It is quite natural they object to being coerced, whether it is by Government or anybody else, and when these demands come for them to supply the labour for public roads, which the Magistrates have to comply with, the younger men who perhaps have their own arrangements concluded, they say, "No, we do not want to go," and they visit a European and get from the European—in some cases perhaps they pay for it—a note saying they are under engagement and have come home on leave. These are dodges which the natives resort to.

8,359. I suppose one effect of that is to increase the labour pass returns?—It is not unlikely. They have a great objection to this road work. They do not care about it. It often happens that they are called out at a time when they have been out some few months, and they do not like when they come back expecting to rest, to be turned out by the Magistrate to put in another six months in the interests of the Magistrate.

8,360. Are they compelled in Natal to turn out for public roads?—Yes. A native chief has to turn out so many men. They are engaged and paid £1 a month. Each chief has to turn out a certain number of men in proportion to the number of his tribe.

8,361. The general tenour of these extracts I may say are confirmed by others, and they go to show that native labour is scarce in Natal?—Yes.

8,362. Do you think it is an exceptional scarcity or the normal condition?—I should not say it is the normal condition.

8,363. Do you think that labour in Natal is plentiful?—I should say so.

8,364. And you would not confirm the general observations of Magistrates as recorded here?—Of course a Magistrate records what occurs in his own little petty district. In many of these districts there are very, very few Europeans, so that really you cannot draw any conclusion from a dis-

tract. From a place like that you cannot draw any general conclusions as concerning the question of labour.

8,365. The reports from Natal are confirmed by the Cape Blue Book of 1903. In the summary on page 7 under the head of "Labour Supply" it states that there was an excess over the previous year's figures in the number of natives who went out to labour?—I think the refrain of the Blue Book for the current year for Cape Colony is that a more general interest is aroused throughout the country in connection with labour on the part of the natives and that a larger proportion have been turned out than in any previous year, in some districts. In fact, a record has been established in the number of passes issued.

8,366. The reference on page 7 is that this number would no doubt have been considerably increased but for the fact that the majority of labourers had for some time previously been employed by the military authorities at abnormally high wages, rendering them independent from the necessity for work for a considerable time. The report states:—"It is clear that this feeling is gradually wearing off as the number of applicants for passes has increased considerably of late, no doubt as a result of that shortage of foodstuffs." Now there are two points there. The one is that this last sentence confirms your idea as to the influence of foodstuffs upon the labour market. The other is that a number of natives had been working for the military authorities at high wages, and that also had affected the supply. Is that your opinion also?—Oh, undoubtedly. I think that contact with the military right through the country has been most pernicious from every standpoint—I do not mean only the high wages. The familiarity that has been existing between the natives and the thousands of privates has been most detrimental. The effect of it will be lasting in many instances; there is no doubt of it.

8,367. Do you mean in a social way?—In every way. Of course the immediate effect as regards money derived from the military will wear off, but there are other things that will be lasting.

8,368. That would go to show that these high wages have a tendency to keep the natives in their kraals. Is that so?—Naturally. These men, as I say in my statement-in-chief, have been paid on a lavishly high scale. It has raised the standard of wages all over the country. It has undoubtedly had a strong tendency in that direction.

8,369. It has had an indirect reflex action upon the labour supply?—Yes, undoubtedly. Ask a native who has once received £3 a month to accept 30s., and in Zululand a boy with a ring on his head would say, "Would you ask me to take my ring off and throw it on the ground and become a woman?"

8,370. He has a great objection to a low rate of wages?—Oh, yes.

8,371. The Chief Inspector also summarises the position. He says on page 38, "The demand for native labour is greatly in excess of the supply or rather the demand is greater than is obtainable. We have natives in their thousands, but the difficulty is to get them to work at all, and when working, to work continuously." I think from what you have already said you are prepared to acquiesce in that opinion?—Yes, but whose report are you referring to.

8,372. The Chief Inspector of Native Locations for 1902, page 38?—Cape Colony? Mr. Stanford you refer to.

8,373. No, not Stanford. It does not give the man's name. Do you agree with the opinion?—What opinion does he express?

8,374. He says, "We have natives in thousands, but the difficulty is to get them to work at all, and when working to work continuously." I think that agrees with what you have stated?—Yes, certainly, the latter part. The conditions may be different in different districts. It is impossible to apply

general principles to particular districts. There may be certain circumstances connected with a district. I do not know what they are.

8,375. I think the Inspector is summarising the whole. Well, it appears from these Blue Books that there has been a considerable scarcity—in such territories as Natal and Cape Colony. How would you explain that? Can you give us any reasons for that scarcity?—No, except, as I have said, and I think I have shewn that the demand right through the country for labour is very much larger; in fact, one might almost describe it as a revolution in the labour market, that is having regard to the contemplated expansion of industries. And you will find that right through Cape Colony, even in the small districts where development and progressive works are in contemplation, in each one of these districts they say, "Our demands must increase and will increase." So they will undoubtedly.

8,376. But is it within your knowledge at all as to what causes affect the labour supply in these two territories? Do you know at all what is the explanation of the shortage?—You mean the Cape and Natal?

8,377. Yes. What is the explanation of the shortage?—I have not gone into the question to determine what the explanation of the shortage of supply of labour in Natal is, or Cape Colony. I am simply guided by facts recorded by officials. That is all.

8,378. Would it not be a reasonable inference that the causes that affect the labour market in Natal and Cape Colony also affect the labour market on the Rand?—The circumstances, of course, are wholly different, the conditions are wholly different. The conditions of labour in Natal and on the Rand are not at all identical.

8,379. You think, then, that the Rand labour market would be independent of the factors affecting Natal and the Cape?—The class of natives that would come to the Rand for labour is not the class of labour which would seek employment in the towns of Natal.

8,380. Would you amplify that reply?—Well, the raw class of natives would be the natives that would seek employment on the Rand, excepting, of course, certain specific boys who come up to houses to people who engage them in Natal, or who were known to them in Natal. As far as Natal boys are concerned, the bulk of them prefer work in houses, stores, stables and that class of work. They do not as a rule select mines.

8,381. Am I to understand you then that Natal and Cape Colony, owing to the preference of boys for this superior class of labour, are to be ruled out to some extent from the mining labour supply?—There are a certain number of boys in Cape Colony that would be of the class I have referred to as connected with Natal, and there would be a certain number in Natal of the same class, but they would be a small proportion. It would not be the general manner of natives. For instance, take the Transkei natives, they are not of the class referred to.

8,382. Do you expect them to go to the mines?—I should say so. I should look upon the Transkei, certainly, as a very promising source of supply.

The Commission adjourned for lunch.

8,383. We were dealing, I think, with Natal and Cape Colony, and the preference, according to your statement of the raw native for certain classes of work?—Yes.

8,384. Accepting that principle, that the raw native prefers the rougher class of work, where would you advise us to pay more attention to recruiting: what particular districts?—Well, I should say to the districts which up to now have given you the least supply; for instance, the Transvaal. A very inadequate and very disproportionate supply has been obtained from the Transvaal. Then there is the Transkei and Cape Colony. I think a very disproportionate number has reached the Rand

from there, and a very condensed synopsis of the Cape Blue Book of 1903 will, I think, give you clear proof of what I say, I will just go through this. It will not take more than a minute. These are just condensed remarks from Magistrates and Native Commissioners, right through the Cape Colony. I have noted the pages here, so that if you wish to keep a record of the pages you can. Page 5. "Prefer employment at Colonial ports, rather than at mining centres." Page 6. "Prefer Kimberley and River Diggings to gold mines." Page 7. "Averse to agents. Prefer liberty of action, and freedom of contract." Page 11. Albany District. "Out of a total of 8,053 passes, only 4 issued for the Transvaal." Page 13. Alexandria. "No passes issued for the Transvaal." Barkly West Division. "All natives go to Kimberley." Bathurst. "Now wages are higher, natives may go the Transvaal." Page 16. "A spirit of readiness for work prevails."

8,385. Whose report is that?—I have not the names of the magistrates here, but I give you the page. Herschell Division. "Out of 5,000 passes, only 50 for the Transvaal." Page 45. Another Division, Herschell District: "4,050 passes issued, only 25 for the Transvaal." Page 47. W. E. Stanford; the Transkei. In 1898 the total passes, 61,034, and for the Transvaal, 18,302. In 1902, total passes, 66,695, showing a considerable increase in the total passes issued, but for the Transvaal only 3,799, as against 18,302 in 1898. Page 49. "Natives prefer to find work without assistance from the native labour agent." Page 50 confirms the aversion to labour agents and contract. Page 62. "Averse from entering into agreements." These are the reports of separate magistrates. Page 56. The Resident Magistrate advises the abolition of licensed agents. Natives prefer free contracts. Page 59. "Natives turn out for work more readily than in previous years." Page 60. "Natives prefer going to labour centres and making their own contracts, and avoiding agents." Page 63. "Natives going out this year have broken the record." Page 69. "Number for employment increasing, but growing dislike to labour agents." Page 82. "Rooted objection to binding themselves by contract." Page 93. "The supply for Kimberley is reported full. The supply for the whole year of 1902 and a portion of 1903 was good. At one season it was threatened to be swamped with labour, and 15 compounds contained 10,000 natives." That is a resumé of the Cape report for 1903, the last Blue Book issued by the Cape Government.

8,386. Do these extracts apply to the Transkei or to the whole country?—You see there are direct figures from Mr. Stanford in connection with the Transkei.

8,387. Will you refer to page 98 of the same Blue Book?—I have not read the book.

8,388. You will find there that the return of natives who obtained passes to proceed to various centres in search of employment gives the total in 1902 for all territories as 66,714?—From the Transkei? Yes; 66,695 are the figures, I think.

8,389. On page 47. Mr. Stanford, reporting on the whole subject, says that the approximate native population is 800,000, and taking 1 in 8 as a fair average 100,000 is arrived at as the approximate number of adult males capable of manual labour?—Yes.

8,390. The return of passes shows that out of that total number over 66,000 went out to work. Should you say that that was a large average?—No; I should not say it was a large average, and I should say that 100,000 out of 800,000 would certainly not be a large average of the absolutely able-bodied working men there.

8,391. What proportion would you give us for the able-bodied working population?—Well, I have not considered it minutely, but I should give, I think, a higher proportion than that.

8,392. Then you do not think that two-thirds of this official estimate is a high estimate?—Two-thirds of the 100,000? I should say myself that

100,000 out of a population of 800,000 would be a small proportion to give as the number available for labour, having regard to this fact that a very large proportion of very young boys now turn out for labour. I mean to say boys that were retained at home to look after calves and goats are now sent out.

8,393. Then you do not agree with this general estimate, made by Mr. Stanford in the Blue Book from which you have quoted?—I would not question his figures without going into the matter minutely. I look upon Mr. Stanford as a cautious and experienced man. I would not question his figures. I am simply expressing an opinion. I have not gone into the question.

8,394. I understand your opinion does not agree?—I should say myself just "prima facie," without having gone into the subject, that the proportion he names is not a high proportion.

8,395. Assume for the moment that we take this figure of 100,000 as the working population, would you then be prepared to agree that two-thirds is a high average?—You mean to be out at work at one time.

8,396. Out at labour; I do not mean at one time?—Because, if there were only 100,000 available, I should say then, certainly, that that number to be out at work at one time would be a high proportion, because it must be remembered that Cape Colony boys will not work as long as the East Coast boys. They look upon three or four months' labour as satisfying their requirements. You have great difficulty in inducing the Cape Colony boys to enter into an agreement for six months. He has a distinct objection to it, and that is proved by the general reports from the magistrates right through—their aversion to contracts.

8,397. Taking these figures which I have now called to your attention, are you still of opinion that the mining labour organisation can obtain a large proportion of natives from the Transkeian territory?—I think a very much larger proportion than has hitherto been obtained.

8,398. In that respect you do not agree with the statements here as to the number of able-bodied men available, and it is upon that you base your calculation, I take it?—These reports distinctly set out facts. Here are a specific number of passes issued, and the discrimination is made in regard to Transvaal passes. Well, it is a distinct and accurate, I take it, reflex of the amount of labour that has been drawn from the territory for the past year, which can be read to be, I should say, not more than a sixth of what might be drawn from there. You see you have actually passes issued for the Transvaal in 1898 of 18,302, as against in 1902, 3,799.

8,399. But if we accept for the moment this estimate and two-thirds is a high average, you would only increase the average by drawing labour from other industries. Is not that so?—I do not know. I have not gone into the question as to what proportion of the labour coming to the mines would be drawn from other industries.

8,400. Do you think that that is a probable effect if we accept these figures. You see there are 66,000 out of an estimated available supply of 100,000. A very small proportion of these go to the Transvaal. Can you increase the average for the Transvaal without drawing labour away from other industries?—Of course, I have not gone into the question of the requirements of other industries, but 18,302 natives came to the Transvaal. I am not conversant with the proportion, or if any were drawn from other sources. The point is that in 1898 that number came to the Transvaal and in 1902 only about a sixth of that number came.

8,401. In 1898 I think you were no longer in the service of the Chamber of Mines?—No.

8,402. You left the previous year?—Yes, the early part of 1897.

8,403. That figure would go to shew that a considerable proportion of the labour supply came from the Cape Colony?—Well, that is if the return of passes is correct.

8,404. You had not at that time started your organisation there?—No, I had not; I had simply interviewed the Premier. I had several interviews with him on the question, and received the promise of his support, and was placed directly in communication with the District Magistrates, the details of which I left to my successor.

8,405. Then by what channel did those 18,000 men come into the Transvaal?—I really could not tell you.

8,406. What was your attitude with regard to what is known as free recruiting?—Free recruiting?

8,407. Yes, touting?—I was absolutely and directly opposed to it. That is, indiscriminate free recruiting I was absolutely opposed to.

8,408. What were your reasons for that?—Simply to prevent the abuse of natives and the breach of promises which were made to them by irresponsible men who only had one object in recruiting, which was to get £1 or 30s. a head from the mines. Their interest after that ceased and in order to secure a number of men, any sort of promise was made. The natives were absolutely deceived and the whole principle was so radically wrong, destroying every particle of confidence in the native mind regarding this place as a labour centre.

8,409. What system would you advocate as opposed to that?—One of organisation distinctly.

8,410. What would be the effect of that organisation?—If an assurance were given to the natives, it would be carried out. But in so far as the native himself was concerned I should permit the most complete freedom as to the choice of an employer, and so on, and other details.

8,411. Do you agree then with the principle that it is desirable to organise the labour supply, in order to get the best results?—Organisation is undoubtedly desirable.

8,412. To have the organisation, you must have single control, must you not?—Yes, undoubtedly, you must have a head.

8,413. Then I take it the system would be followed out of distributing natives to the various mines?—Distinctly, having strict regard to the one point, that no native is forced to accept employment where he himself did not select to go. On the arrival of every gang of boys, they were always questioned on that point. "Do you wish to go to a particular mine?" or "Were you employed before on the Rand?" If the native had been employed before, he was never interfered with, but allowed to choose where he should work. To interfere with a native's wishes in that way was absolutely to erect a barrier to progress and to destroy the confidence of the native.

8,414. But did you not tell us that certain mines would always be short of labour under that system?—Yes. Under any system some mines would be short.

8,415. Why?—Failure in control. Just as some ladies are always changing their servants, exactly on the same principle.

8,416. Then this organisation would not give a full supply to all the mines?—Not to mines of the class I refer to. I may say that I would not apply that as a general remark. I said certain mines. There were certain mines and certain managers I came into contact with during my experience, that were always short of labour.

8,417. You read from a prospectus—I think you called it—in which something had been said about "voluntary labour." What interpretation do you place on that word "voluntary"?—Well I should put my interpretation upon it. Others might put a more severe interpretation upon it. The interpretation I put upon it—the interpretation I have used in my evidence, is constructive coercion. That

document read by Englishmen who are not familiar with the circumstances would be construed into slavery, nothing more or less than absolute coercion.

8,418. You would not interpret the word in the sense in which it is now used by the railway authorities to mean natives engaged outside of any labour organisation?—That is their intention there evidently, although it was not expressed.

8,419. That is the intention?—I should say that the intention is to concentrate in one source the whole of the labour so that boys returning to a manager who had employed them before would be sent to the organisation, under existing arrangements and that manager would not be allowed to engage the natives. He would have to instruct them to go to the central depot. That is wholly destructive of the confidence of the natives and a great deterrent to the supply of labour.

8,420. Then the word "voluntary" merely means boys offering outside the particular organisation controlling the labour?—I cannot tell you what was in the mind of the writer. I have only to deal with expressions as I find them, and the usual interpretation put upon English words, and the word used in that sense, has an extremely ugly significance.

8,421. What significance would you put upon it?—That of coercion.

8,422. Would you read the paragraph again?—"Mining groups have all agreed that no form of voluntary labour on any account is to be recognised."

8,423. Now, as I say, taking the fact that the boys offering in the Railway Department, offering their services outside any labour organisation, are termed voluntary boys, what would be your reading of the meaning of that sentence?—Assuming, what did you say?

8,424. In the Railway Department boys who offer their services outside of the labour organisations are termed voluntary boys. Having that fact in mind, what meaning would you attach to the word voluntary there?—That there is a principle of coercing of natives into one channel, that they are not allowed free action. That is the most favourable construction you can put upon it.

8,425. Do you not think that the term might be used as meaning boys who are offering themselves voluntarily outside of the W.N.L.A.?—Undoubtedly it means that, and it also means that that class of labour is not to be engaged.

8,426. But where does the sense of coercion or the implication of coercion come in?—In that a native is not allowed to follow his instincts. For instance, a native before he seeks employment generally asks a few questions, he satisfies himself as to the character of his employer, the nature of the work and the treatment to be expected. Having selected his employer he offers his service, and under these rules, however eager the boy may be to work, he cannot enter except through one prescribed channel, consequently his voluntary action is distinctly interfered with.

8,427. But I understood you to say that you were in favour of organising the labour supply through that channel?—Yes, but having distinct deference to the wishes and ideas of the natives without any form of coercion. For instance, any manager would be at perfect liberty to engage all the natives that offered without distinction between them and those that come through the W.N.L.A. There is a vital difference between the two principles.

8,428. But I understood from what you stated just now that you objected to the principle of free recruiting, that the better principle was a central organisation dealing with the whole labour supply?—Yes, but that does not necessarily interfere with the employment of natives who offer their services. Naturally a manager who is in favour with the natives has no occasion to trouble any organisation to procure natives on his behalf. Certain managers can always keep their compounds supplied without any difficulty.

8,429. Were you not thoroughly opposed during your term of office to this system of touting?—Distinctly I was, but I hold that voluntary offers of labour and indiscriminate touting are two different things.

8,430. I was trying to get at the idea of coercion which you attach to that particular phrase? As far as I understand from your explanation, it simply means boys who offer their services outside the recognised labour channel?—Yes. I may, for instance, be a mine manager, and 100 boys, all of whom I know, come to me for employment. I say to them, "I want you, but I am not at liberty to engage you. I have entered into an arrangement by which you must go to the Labour Association, and from there be allotted to me or to another mine." That is the point; I do not know that I can put it any clearer than that.

8,431. Did you not draw the Pass Law containing a considerable number of restrictions on the action of natives with the object of bringing them under the control of officials?—I cannot tell you now, because I have not examined the Pass Law lately, but I drew the first Pass Law here. That was the first thing I addressed myself to. After the law was sketched out by myself, it was legally drawn up by Mr. Dumat and then submitted to my Committee, who approved it without alteration, and then to the Mine Managers' Association, who also approved it without any alteration. What the law is to-day I cannot tell you, because I have not examined it.

8,432. The Pass Law placed certain restrictions on the free movements of natives about the country? It was directed to bringing natives to the Rand by a certain recognised channel?—Yes, by a legal process, and under the law whenever a native starts wandering about the country he should be in possession of a legal pass.

8,433. Then may I read in the meaning of the word "voluntary" as used in the prospectus, that it meant that the mines objected to boys coming and offering themselves to the mine managers, and wished them to come through the Labour Association. Is that the meaning of the word?—I do not know that that is the meaning of the word, but it is a condition that they have agreed to. That is what subscribing companies have agreed to.

8,434. Do you think from the standpoint of control of the labour supply that this is unreasonable?—Certainly I do, most strongly. I think that every form of voluntary action should be distinctly encouraged. I mean to say that putting it on the lowest platform, that of inducing and protecting labour, apart from any phase connected with the principle of coercion. I say that the most favourable position in which you can place a question of this nature is to make it as voluntary and free as possible. Interfere as little as possible with the natives' own wishes and actions.

8,435. Well, you must forgive me, but I do not quite see how that view tallies or agrees with your previously expressed view, that you prefer to have the labour supply controlled by one Association. It seems to me that where you have organisation you must have direction?—An Association for facilitating the natives coming to the Rand, for protecting them and seeing that they are properly treated, is a very different thing from what I have illustrated just now. Where they are seeking employment and are refused, although the manager is specially in want of natives.

8,436. Perhaps we shall get at it presently. I do not see how that interferes with the labour supply. Supposing that a boy goes to an employer and he is told that in order to preserve certain formalities he must come from a particular manager or a particular Association or head of department. If the employer chooses to take up that position, what influence has it on the labour supply?—Of course if you take up the position that there is no difference between the discouragement and encouragement of labour as regards its effect on the supply, then you are perfectly correct, because I

maintain that it is a distinct discouragement, whereas from the other point of view it is a distinct encouragement.

8,437. And you think that the action of sending boys away has in it some element of discouragement?—I am thinking more of people at a distance and not those out here who know the inwardness of things, who would be able to reconcile it in some way by saying, "Oh, it is part of a system for the benefit of the labour supply," but outsiders would put just one construction on it, and consider it a little more severe than the term I have used of constructive coercion. The construction that I suppose they would put on it is that it is a barrier to the freedom of action of a native to be avoided in every possible way.

8,438. I am dealing with the meaning you place on the word. I understand you to say that outsiders would place a somewhat severe meaning on it?—Certainly, but I have done my best to correct the impression.

8,439. Then the term you used about it this morning, in reply to a member of the Commission, is not quite in agreement with your opinion, for I think your meaning was that you thought there was a suspicion of coercion in the word?—Yes, I consider it is direct coercion. I put it in the mildest form of English words that I could adopt at the moment. I called it constructive coercion. How would you describe it? What English term would you use?

8,440. I do not know. It appears to me that the employer is at liberty to make use of any channel he chooses?—I am not talking about the employer. If an employer enters into an agreement, he is entitled to carry it out. I am speaking from the point of view of the native, and the result of coercion on the native mind. If natives ask a man for work they desire to take the man's service, and if they are told by the employer that he cannot engage them although he wants them, "I am under an agreement not to take on any natives except through the W.N.L.A., and there you must go," then I say that those boys if they want to labour are coerced. It may be a mild form, but boys are interfered with, and it discourages the natives and interferes with the supply of labour.

8,441. Then we are to take that as your idea of coercion?—Yes. I have tried to give you a clear idea.

8,442. I am sorry to have kept you so long?—Oh, you have not got to the fringe of it yet.

8,443. Would you point out in your statement the particular paragraphs or sentences which you would recommend to the attention of the Commission as embodying your practical proposals for the meeting of the labour difficulty?—I think if you will pardon my saying so, they are sufficiently indicated in the statement I have submitted.

8,444. Would you point out any particular paragraph or sentence?—Well, in the first place, I clearly indicate what in my humble judgment, I consider should have been done on the termination of hostilities.

8,445. Where is that?—On page 4, beginning, "My reply is as follows—"

8,446. The whole of that paragraph?—Yes, the whole of it.

8,447. You say that if agents had been sent to the chiefs throughout South Africa and the boys collected and if wages had remained as before, then in your opinion the demand for labour would have been met?—My opinion is this, that if an agent proceeded under the sanction of the Government or the Chamber of Mines, to interview the chiefs and acquaint them fully with the condition of things without reference to wages, leaving the wages question to be subsequently dealt with, then I do not hesitate to tell you that months ago every stump connected with these fields would have been in operation.

8,448. Have you any other practical suggestion to refer us to? I understand you think that if the chiefs had been interviewed we would have settled

the question?—There is one question which I referred to this morning with which I have not dealt, that is when the agent is conversing with natives, to which I attach great importance, and that is personality. A native attaches great influence to personality, and to place a man in a position of responsible native control who is absolutely innocent of all that appertains to natives is not calculated to improve the supply.

8,449. But apart from your suggestions regarding the chiefs, what other suggestion is there in your statement?—There is a portion of a paragraph on page 5 (vide page 469), the latter portion, "But let a knowledge of native mind and character be honestly and intelligently applied with a reasonable measure of common sense."

8,450. Yes, that is a very excellent principle and it is well put, but can you tell us how it is to be carried out in practice?—That must be left to the discretion of those empowered to carry it out.

8,451. In your term of office you put these principles into practice?—I tried to, but not with very much success, I admit.

8,452. To what do you attribute your want of success?—I told you this morning that no point of comparison existed between conditions then and now. I pointed out some of the obstacles that were placed in my way; I could go into elaborate details that would keep you here for a week, but I do not think you would thank me for it.

8,453. But I understand from you that the labour question could have been remedied, and that your remedy would have been to send a message to the chiefs. I must say that I have not seen any other practical suggestion in this statement of yours. I should be glad if you would point it out to me?—No reply.

8,454. Mr. BRINK: In answer to a question put this morning as to the number of natives coming here as compared with the pre-war numbers, you said something of the Boers making the natives pay 1s. for a bottle of water. That surely is exceptional? I hope it is; it came absolutely under my own observation.

8,455. I do not know whether you are well acquainted with the Boer character or not?—Yes, fairly well.

8,456. Do you know that a native is very cute? That if they had to pay 1s. for a bottle of water, they would not go back to that farm in the day time, but would certainly go back during the night?—Yes, oh yes, I just gave you that as an illustration of the impediments that the boys met with in going through the country.

8,457. Yes, it was so amusing?—Yes, it amused me when I came across it.

8,458. You say that you are well acquainted with the Boers, you have travelled a good deal among them?—I represented the Zulus when they went and annexed the new republic.

8,459. I am not talking about those people who went fighting into Zululand, but have you travelled amongst the Boers and lived on their farms?—Oh, yes, I have met many Boers on their farms and been well treated and received hospitality.

8,460. You have heard a lot about the New Republic business?—I simply gave that instance as an illustration of one of the obstructions that the boys met with in travelling to and fro.

8,461. That was surely an exceptional case?—I think it was. It was the only one to come under my notice.

8,462. Mr. PHILIP: You were at one time a sugar planter?—Yes, I was.

8,463. You employed thousands of natives?—Yes.

8,464. Were they a success?—Yes. One drawback was the unreliability of them, which compelled me to employ Indians.

8,465. And the same result was experienced by other farmers?—Yes, there were constant fluctuations.

8,466. And the consequence is that to-day you have in Natal some 80,000 Indians?—Yes, I expect so, from 70,000 to 80,000.

8,467. And numbers of farmers have turned Kaffirs off their farms in order to get Indian labour?—They have. You see if you have no labour to depend upon when a crop must come off within a certain period, the loss is at once apparent.

8,468. You said that you considered that there was a sufficiency of labour in Natal, but later on you agreed with the opinion of the Inspector of Natives that there was not sufficient labour?—I have not been in direct contact with Natal for some years. I visited it lately, and had conversation with the officials and natives, but that is all.

8,469. You were appointed Native Commissioner in 1893?—Yes.

8,470. How many boys were there on the mines then?—I cannot say. About 32,000, I think.

8,471. And when you gave up the appointment?—I think about double the number, but I cannot tell you accurately from memory. The record will give it.

8,472. You also make a statement that you put down the shortage of labour at present on the mines as being owing to the action of the W.N.L.A. in reducing wages?—Undoubtedly, I think that is the one main cause, but there are other things as well.

8,473. Are you aware that during the months that the wages were low, from March to December, 1902, when the war was not even over during part of the time, that 37,671 boys were recruited under the low rate of wages, while it took you about four years to increase the number from 30,000 to 70,000? Do you not think it very good work for the W.N.L.A. to increase the number by 37,000 at such a time when there were all the drawbacks you have mentioned?—I am not questioning the results that have been produced by the W.N.L.A. I am questioning the principles of its action.

8,474. Do you think it would have been possible to recruit more during that period?—I cannot tell you.

8,475. You said that the natives were well-to-do, spoilt by the military and overpaid, and that therefore it was more difficult to get labour than before, and yet you blame the W.N.L.A. for their methods and say it is owing to their methods that we have not got sufficient boys?—I maintain that the reduction of wages was utterly opposed to the existing conditions, because the wages rate throughout the country had considerably advanced at that time, and how could it have been expected by anyone possessing any knowledge of natives that they would accept 1s. per diem as mining boys?

8,476. Previous to the increasing of the wages we recruited 3,706 per month on the average, and since the increase of the wages up to July we have only recruited at the rate of 3,575, so that recruiting under the low rate of wages was larger than it was under the increased rate?—Yes.

8,477. Then you still maintain it was owing to the reduction in the wages?—I confirm the opinion I have already expressed.

8,478. Notwithstanding these figures?—Yes.

8,479. You made a statement to the Chairman when he called your attention to these figures that this increase in recruiting had occurred since the wages had been raised, but as a matter of fact it has not been since the wages have been raised as there were a larger number recruited before they were raised than since?—The actual number recruited while the wages were low is no objection to my statement that an increased number would have been recruited had wages not been lowered.

8,480. Where was that increased number to come from?—From the sources where they came from before the war; then there were boys enough on the Rand to work all the mills and stamps.

8,481. There were before the war 98,000 boys on the mines, but to-day we have probably doubled

the number engaged in work in the town outside the mines?—I should say more; but not quite double.

8,482. We have double the number according to the Native Pass Office. Then do you know that they have more than double the number of boys on the railways at present?—Yes, there are many more on the railways now.

8,483. And do you know that the military engage a large number, and that many are engaged on public works, and so on?—Yes.

8,484. Where are we to get all that increased labour from?—I have not visited these different districts, and I can only deal with the official statistics.

8,485. Can you tell us how many available natives there were for work in the Transvaal before the war—available for work?—No; but I know this, that a considerable number of Transvaal natives to-day are not out at work, and a considerable number that were previously on the mines are not on the mines to-day.

8,486. Have you any reasons for their not being on the mines?—They are probably engaged on other labour, but I cannot say. I only know the fact that they are not on the mines.

8,487. Do the farmers require any labour in the Transvaal?—I presume they do. They have a very great deal of what they require on their own farms; they did have before the war, but of course I cannot answer for the conditions since the war.

8,488. Would you think five boys on each farm sufficient?—Of what dimensions?

8,489. Say, an average farm of 3,000 morgen?—No; that would be a very small portion to allow.

8,490. Well, there are at least 6,000 occupied farms in the Transvaal. Would you think 30,000 boys a large number for these farms?—No, certainly not. I should say five would be a moderate allowance. There are a great number of farms with only one or two, some with six or eight, and a very few with ten, but I should say five would be a fair average.

8,491. Sir Godfrey Lagden gives us the number of natives in the Transvaal at about 600,000, and on the basis that one-fourth of these natives are males over the age of fifteen we have got 150,000 in the whole of the Transvaal. From these you have to take off a large percentage who stay to look after their stock, and so on, and so you have probably 120,000 in the whole of the Transvaal available for work. At present there are, say, 30,000 of these working on farms and 30,000 working at labour centres?—What labour centres will absorb 30,000 boys?

8,492. Pretoria alone has nearly 13,000 natives.—Are they Transvaal natives?

8,493. Chiefly.—Of course there are a very large proportion of the natives occupied in this town who are not Transvaal natives, and there are a very large proportion here who came up originally to the mines, and have left the mines and have taken service in town, but the demands of the town to-day are some thousands in excess of what they were.

8,494. Do you think, taking these figures into consideration, it is likely we shall be able to get many more boys in the Transvaal?—The figures you assume I have no guarantee for, and I do not know whether they are right or wrong. It is simply assumption.

8,495. Do you think we could get a large number of boys in the Transvaal?—I should certainly say that very many more boys than are at present on the Rand could be got from the Transvaal. That is my impression. Of course I know, prior to the war, Transvaal boys particularly, were very favourable to the mines, and a very considerable supply was obtained from the Northern Transvaal.

8,496. Referring to your remarks about the number of natives you had here at the time when you

were Native Commissioner, I see in 1895 you mentioned that there was a considerable number of boys to be had, and at the time you had an ample supply?—Yes.

8,497. On the 19th February you mentioned that the present supply of labour may be described as abundant, and better than has been obtained for a considerable time. However, shortly after that it was decided to reduce wages or make an attempt to do so, and I see that in the course of an interview you had with a representative of "The Star" you said:—"It is for the Mine Managers to take their own measures. The power to give effect to the reduction rests entirely with them, and everything depends upon the most loyal combination among themselves. It is obvious, therefore, that I cannot take the responsibility of advising the adoption of a course which it is beyond my province to control. It would suffice for the purpose if, say, from 30 to 40 of the principal companies determined on the reduction, and if among that number an honourable understanding can be secured, no insurmountable difficulty need arise." So that you were not averse to a reduction of wages at that time?—No, not at all. Do not, please, draw conclusions from anything I may say that I am in favour of advancing wages.

8,498. But at that time you were in favour of reducing wages if it could be accomplished?—Yes, certainly, because I considered wages high for the class of labour obtainable; but then it is by comparison that one judges these things, and when you have gentlemen coming forward and saying that native labour is two and a half times cheaper than white labour then it cannot be called dear labour.

8,499. I understood one of the reasons of our being unable to get labour was that the wages of native labour was reduced?—At that time there was no sort of combination among mine managers, but each fought for his own end, so much so, that boys were purloined from one compound to another.

8,500. That interview with the "Star" reporter took place on the 9th of April, 1895, and I see on the 7th of May you were already short of boys again. You then enter into the question of touting. You say that a large number of companies employed Europeans at considerable expense. These, accompanied by native runners, were despatched to the several labour districts, and after an absence of from one to two months the bulk of them returned to report their complete failure. Later on you say "I cannot refrain from again decrying the system of touting as pernicious to the last degree, and highly detrimental to the permanent interests of the companies. The competition between companies is distinctly conducive to the forcing up of wages." You do, however, object to touting?—Yes.

8,501. With reference to that clause you read out of that letter, giving incidents of boys being sent to the different mines and the quotation from the Articles of Association of the Witwatersrand Native Labour Association, I see there is some reference to it here in 1895. In a letter written by yourself on 29th May to Mr. Tainton, you say that the wishes of the natives regarding any preference they may have for a given mine will, as far as possible, be at all times respected, so that even in those days you wished to send the natives where you liked to send them?—Wherever they had a preference for any given mine they were invariably sent to it.

8,502. As far as possible, I suppose?—No, there was no as far as possible introduced in the working of that.

8,503. Then you go on to say, "Prior to allotment all necessary explanations will be made to the natives and in the event of any difference arising between the natives and their employer, they can always, through one of their responsible men, report to me and secure my intervention"?—Yes.

8,504. Do you not think that if natives were engaged for shorter periods we would be able to get more of them? You are distinctly aware of the fact, you say, that they are averse to long contracts?—Yes.

8,505. And yet you advise that contracts should be made for six months. You say, "It is desirable that the term of service be not less than six months; any extension of that term to be perfectly open on both sides"?—Yes.

8,506. Then you have changed your opinion since that time?—Yes. This statement of evidence of mine is a production of to-day, and it is no use attempting to draw comparisons between conditions before the war and conditions since the war. Natives, I find, are distinctly averse to contracts, and I throw that suggestion out as a fact to be recognised.

8,507. And as long ago as 1895 you admit that the treatment of natives was distinctly better than it had been in the compounds?—Yes, a great improvement occurred during my term of office in the treatment of natives. At one time I had natives repeatedly coming into my office showing me damaged shins and wounds over the head. That, if not absolutely stopped, was very largely put an end to. The miners appeared to lose their tempers and strike the natives with the first thing that came to hand, and I think the treatment of natives has gone on steadily improving, as I said this morning.

8,508. I see you are quite against the importation of Central African boys, as you do not think we can get any supply from there?—I laid down here in my statement general principles in regard to all labour. These are principles that have passed under my own knowledge, and with which I have had to deal over and over again as regards Indians, natives and Europeans.

8,509. You think that the radical change in regard to climate and diet is against beneficial results and that they will die in large numbers?—Yes, I think so.

8,510. You do not think it wise to bring the boys from there?—Not in certain seasons of the year. I have set out my reasons pretty fully in the statement and in the opinions I advanced. Of course when that was written no steps whatever had been taken in regard to Central African boys. Now a certain experience has been got from actual contact. That experience will speak for itself. I believe there has been a good deal of sickness and a considerable number of deaths, which would be likely to be produced by bringing them from a latitude of that sort to the Rand, particularly in the winter months. After acclimatisation, I daresay they would become familiar with the conditions here, but it is a question of acclimatising them.

8,511. Then a little further on you say that upon the re-organisation of labour 80,000 to 100,000 men would have sufficed to put the whole erected stamp in operation. Do you know that the wants of this place are very considerably increased?—Yes, undoubtedly they have, but that number was in excess of the number that were working in the mills and stamps erected before the war, and during which period of service the reserves of ore were very considerable.

8,512. We have had in our evidence before us that 145,000 boys are required for the gold mines alone to-day?—That may be for work that may have been in contemplation, but it was not in progress before the war.

8,513. Then to drop all the stamps to-day, not counting the coal mines and the working of the railways, which will require a very large number of men, we require, as I say, 145,000 boys?—Yes.

8,514. With reference to the number of boys from the Cape Colony having decreased, you are aware that a very large amount of labour is used in the Cape Colony in excess of what was required before the war?—Undoubtedly.

8,515. Very large numbers go to Capetown, Port Elizabeth, and East London Docks to-day?—Undoubtedly.

8,516. And of course they get very much higher wages than they would get up here. Do you think it likely that boys would come up here at the present rate of wages when they can get that wage now in their own Colony?—Certainly not.

8,517. Then we cannot expect to get many up here?—No, I say that is distinctly a deterring influence.

8,518. Mr. EVANS: You refer on page 2 of this statement to the contents of a letter dated October 22, 1900, issued to the several subscribing companies by the firm of H. Eckstein and Co. Do you know to how many companies this letter was issued?—I could not tell you, but I presume to all subscribing companies.

8,519. Can you tell me the name of any one company to whom it was issued?—No.

8,520. How did you get a copy of this letter?—A copy was sent me by a gentleman connected with the Rand who has big interests here, and he asked me if I would be good enough to carefully peruse these documents and give him my opinion on them.

8,521. Was the letter signed?—Do you mean this letter of 22nd October, 1900?

8,522. Yes?—This was sent me as a copy just as you see it now.

8,523. Who was it signed by?—It is not signed.

8,524. Is it a complete copy of the whole letter?—Yes, it was given to me as a complete copy.

8,525. Are you certain that such a letter was ever written by Eckstein and Co.?—I trust to the honour and truthfulness of the gentleman who handed it to me, and I have no reason whatever for doubting his bona-fides in the matter.

8,526. Can you give the name of a single company to whom it was sent?—No.

8,527. Would you be surprised to hear that that was a confidential letter sent to Maritzburg?—It was not confidential as given to me.

8,528. Would you also be surprised to hear that it was not addressed to the subscribing companies?—I have no information other than this letter. Both these documents were submitted to me for my opinion, and I gave my opinion.

8,529. Could you tell us who submitted it to you?—I could, but I do not know that I am at liberty to do so.

8,530. Well, it is not very difficult to know, because I have a copy of the letter here and I know to whom it was sent. You see you have stated that this was addressed to the several subscribing companies?—I take it from the terms of the prospectus.

8,531. Why, what is there in the terms of the prospectus?—This sets out the reasons for companies joining the Association and the inducements offered.

8,532. It was written at a given time to a gentleman in Maritzburg, and is there anything in it to show that it is a circular letter?—I should distinctly say so.

8,533. Well, let us hear it?—I take it this accompanied the Articles of Association.

8,534. It was sent to one person?—There is nothing here to indicate that it was addressed to one person.

8,535. Have you seen it published anywhere?—I have not.

8,536. Is there any reference to the terms of that letter in the Articles of Association of the Witwatersrand Native Labour Association?—Certainly there are the principles of organisation.

8,537. But does the letter really agree with the Articles of Association?—There is an argument used here to induce subscribers to it. "We ourselves are satisfied that if work is carried on on the lines now laid down the benefits to the gold mining industry must be enormous, and we shall strongly recommend every company with which we are connected to join this Association. We are now, in fact, together with all the other mining groups represented in Cape Town, giving provisional guarantees on behalf of all companies to the effect that they will join and be also advanced certain funds to cover initial expenditure."

8,538. Is there anything in that which would indicate that it was addressed to any other person?—No.

8,539. Do you think it is likely, if there had been such a circular letter addressed to such a large number of companies, it would have got into the Press?—You know, Mr. Evans, that there is a very great deal issued which does not get into the Press. I need not tell you that.

8,540. But you yourself got it from one gentleman?—Certainly.

8,541. And you do not know of any other copies in existence?—I have not seen or asked for any other copies. I have made no enquiries as to it. All I asked was, "Do you wish me to return these documents?" and was told, "If they are of any interest to you, keep them."

8,542. Have you any guarantee that that is a correct copy?—No guarantee at all except that they were sent me by a gentleman I have known for a considerable time, a gentleman whom I greatly respect, and whose honour I would absolutely rely upon. I may tell you it was not sent to me in any confidential way, nor was any reference made to its being confidential or private, or anything of that kind; or I need not tell you the letter would not have been here to-day.

8,543. Were the three conditions you mention here mentioned in that letter?—What three conditions?

8,544. Close combination amongst themselves, employment of unlimited capital, and support of the British Government?—Yes, that is the spirit of the letter.

8,545. Would you kindly read what parts of that letter argue in favour of the argument of unlimited capital?—When a man talks of £50,000 as a small amount and when one knows—

8,546. Please read the portion out?—"It is intended that the capital of the Association is to be a comparatively small one, probably in the neighbourhood of £50,000. The bulk of the cash requirements will be furnished by the deposit of 5s. for each native included in the company's full complement of boys;" and I take it if that does not meet the requirements of the company, further levies are made on the companies for subscriptions, which I believe have absolutely been made.

8,547. Do you know what the capital of the company is now?—I do not. I have not made any enquiries beyond the documents placed in my hands.

8,548. Would you call a capital of £32,000 an unlimited capital?—Certainly not, except that I know that at the back of it was an unlimited amount if the £32,000 were expended.

8,549. Yes, but you are quoting this here, the employment of unlimited capital, and implying that it is a part of that letter, whereas it is not in the letter?—Then I have got a wrong impression. These two documents came to me together, and I naturally connected the one with the other.

8,550. Is there any reference in that letter to the support of the British Government?—Not except in a letter covering the Articles of Association. Of course, Mr. Evans, if you tell me that this was a confidential communication, it is the first time I have heard it. I had not the remotest idea that it was a confidential communication, and no such indication was given to me from the gentleman who sent me these documents, and I treated it as a matter concerning generally the native labour subject as pertaining to the Chamber of Mines.

8,551. You did not think it necessary to ask the gentleman who supplied it to you for his consent to your making it public?—No, because I had full permission to do with it what I pleased.

8,552. You had permission from him?—Yes, undoubtedly.

8,553. Then, that alters the matter?—It was given me, and I particularly asked that question,

and permission was given to retain the documents and make any use of them I thought fit in the general interests.

8,554. You say that the originators of this plan apparently considered that three conditions only were necessary to achieve the success of their object. On what grounds do you allege that?—Facts.

8,555. What facts?—What has absolutely transpired. I do not call that conjecture, because at the time I wrote that I was perfectly well aware that the wages were to be reduced or had been reduced to 1s. per day. That news had permeated the whole native world.

8,556. The reduction of wages is not one of the conditions which you mention here?—No, but it confirms the paragraph you read after that, "It was asked that natives would mildly accept the tariff or wages decided upon, and acquiesce in all other arrangements suggested by their employers." The letter comes immediately afterwards.

8,557. Then these three conditions are purely your own interpretation, and they are not in any documents?—Not at all. This is simply my evidence, the expression of my own opinion.

8,558. You are not basing it on this letter or on any other document?—Certainly not; I am basing it mainly on actual contact with natives.

8,559. Now, when was this letter from which you have quoted written?—Which letter do you refer to?

8,560. The letter from which you have quoted and which was said to be a letter written by H. Eckstein and Co.?—I cannot tell you.

8,561. What is the date given to you?—The 22nd of October is the date on this document, but not my date.

8,562. What year?—1900. It was written a long time before the end of the war, while the Articles of Association were dated, if I remember rightly, September, 1900.

8,563. Now, at that time I suppose you are aware that only certain producing companies were allowed to start by the military?—Yes.

8,564. At the time that letter was written?—Yes, I am aware that certain companies at first were only allowed to start by the sanction of the military.

8,565. Now, you describe this arrangement of recruiting voluntary boys in central compounds as fatuous. In what other way could you arrange for all voluntary boys to go to the producing mines that were allowed to work?—I do not quite understand you.

8,566. You object to voluntary boys having to be recruited in a central compound. Considering that only a limited number of producing mines were allowed to start work I do not see in what way you could have arranged for all the voluntary boys to go to these producing mines other than by a central compound?—That was not written as a reply to any special conditions temporarily set up by the military.

8,567. Could you show me anything confirming that in the Articles of Association?—I take that as applying generally as to the principle upon which the operations were conducted.

8,568. But on what do you base your conclusion. I should very much like to see that?—I am quoting now from clause 7, which is as follows:—"No member shall employ any but white labour except through the agency of the company, and in particular, no member shall employ any labour agent either within or without the Transvaal, nor shall any member engage or employ natives who have been engaged or recruited by any such agent." That points directly to the concentration in one compound creating the evils which I mentioned in reply to Mr. Tainton.

8,569. Is not the object of that clause simply to prohibit the use of agents or touts?—I should say

not. It does not so express it. It is inclusive of it, but it certainly embodies the other portion of my reply.

8,570. How?—Go to Clause 8. It is as follows:—“Members agree to give up all arrangements which may at the time of their becoming members be existing for the return to or employment of natives in their service.”

8,571. That is all arrangements with touts and agents?—No, “all arrangements which may at the time of their becoming members be existing, etc.” How does that apply to touts? Touts are not mentioned. I should read that clause in this way. If I, as an employer, had a private engagement with say 500, 1,000 or 1,500 boys to come to my property, then, after I had signed these Articles of Association those boys would have to go to the general compound, and I should not be allowed to employ them.

8,572. Have you verified that by enquiring at any of the mines here?—Several instances have come under my observation. There were two mines from which the military commandeered many boys who had been collected at considerable expense by the mines. They were taken away under guarantee that they were to return these boys, but, as a matter of fact, they were not returned, but sent to the Central Compound. Another instance came under my knowledge, where an engagement had been made for the employment of 200 boys. The employer having failed to secure labour from the Association engaged these boys outside of it, but the 200 were unable to be supplied to him on account of the Association refusing permission.

8,573. Would you describe these 200 as voluntary boys?—They entered into an arrangement voluntarily with a certain individual to come to a certain employer here.

8,574. Would you not describe that as through an agent or tout?—He was not a tout, but simply came up as a conductor to protect all these boys, and when they arrived on the Rand the whole party was arrested. The forty boys who were engaged were sent to the compound, and I do not know what became of the conductor.

8,575. What is the difference between a conductor and a tout?—A conductor may not be a tout, and a tout may not be a conductor.

8,576. Would you be surprised to hear that the mines have, ever since the end of the war, been at liberty to take on any boys that offered themselves to them direct, and the only thing they have to do is to report to the Association?—I do not know what the recent arrangements are.

8,577. I am talking of since the end of the war, because you have got on to the track of an arrangement which was in existence prior to the end of the war. You have got hold of a private letter and taken that as an existing arrangement, which it is not.—Am I to understand from you that since the termination of the war managers have been free to engage any natives outside the Association?

8,578. No, not by means of a tout or agent, but if the native comes voluntarily to the mine and offers himself for work, the mine manager takes him on and reports to the Association.—And pays a certain amount?

8,579. Yes, I take it he does pay a certain amount to the Association.—I do not know how long that has been in operation, but I do know of instances where the managers have absolutely refused, in virtue of their agreement with the Association to engage boys direct, and have sent them to the Association.

8,580. Could you give me a recent instance?—Not within the last month or two. I could not call it very recent, but it is not so very long ago either. I can give you a very recent case showing the obstructions raised with reference to this question, and I give it as holding out or impressing the natives with the idea of freedom in connection with this matter. The case came to my

knowledge of a contributing member of the Association who considered the property he represented was entitled to a certain number of boys, about 150 or 200. Failing to get this from the Association, he gave notice to the Association that he must make his own private arrangements. He did so, and secured the number of natives he wished, and not wishing to disturb the arrangements of the Association he applied to them for a licence. It was absolutely refused, and the arrangements he made to secure these boys entirely fell through, and he did not obtain the labour which he had absolutely agreed to receive.

8,581. Supposing every company did that; would it not break up the whole organisation?—Yes, but if the company lays down rules and cannot supply the natives under these rules and obstructs all effort, what on earth is one to consider? You would not consider these conditions as likely to increase the supply of the labour fields.

8,582. If you are to allow private effort and the employment of agents outside the Association, then you break up the organisation?—But here was a man wishing to comply with the conditions of the Association and went to them for a licence which was absolutely refused.

8,583. He went after he had already broken his undertaking with the Association?—The boys were outside the limits of the Colony.

8,584. But they had been engaged?—Yes, he had entered into an engagement for the delivery of these boys. I am just giving you the facts, and I received them from a gentleman whose word you can absolutely rely on.

8,585. But supposing every company did that, there would be an end to the Association, an end to every organised authority, I take it?—During the whole time of my office I had to listen to this, “If you cannot give me boys I must do what I can to get them.”

8,586. Does it not strike you that it is a great improvement to have got over that?—Distinctly, I am the strongest advocate for organisation.

8,587. If you are an advocate for organisation, I cannot see where your objection to the present Association comes in?—I am not objecting to the Association, but I am objecting to certain principles which have been adopted by the Association.

8,588. You said in your paper that the dominating principle which has influenced the heads of the mining industry in regard to native labour is that of centralisation?—That, I think, is clearly proved both in the practice and in the spirit of the documents themselves. As an independent witness I would hold that to be absolutely proved.

8,589. What is proved?—The idea of centralisation through a given source.

8,590. Is that not what you were working for?—Yes, up to a certain point, and within limits, but not against the wishes of a native.

8,591. Seeing that this idea of yours that voluntary boys should not be taken at the mines is a wrong one, and that the mines have been free to take them for a long time, I do not see where your objection come in?—My objection, I think I clearly explained, is where the freedom of boys is interfered with in any way whatever. I hold that to be prejudicial to the labour supply.

8,592. Well, where is the freedom of the boys interfered with under existing conditions?—I gave an illustration just now. You heard what I said.

8,593. You mean in the case of a company engaging 200 boys?—No, a boy applies to the manager for employment, and he says, “No, I am unable to employ you, as I have undertaken that all my supply shall come through the Association.”

8,594. Is that a recent occurrence?—Yes.

8,595. I am not aware of such an arrangement, and I do not see anything in the Articles of Association?—Numerous instances have been given me where managers have refused to engage boys, and the Articles of Association absolutely stipulate that they shall not.

8,596. It stipulates, "You shall not employ agents or touts," but it does not stipulate, "You shall not engage voluntary boys"?—Your contention is that part of this letter does not apply to the circumstances to-day, but only to the special conditions under the military.

8,597. Certainly?—I understand the point of difference, and I need not tell you that no point of difference is shewn here. There is no statement here whatever as shewing that these conditions are to apply only under the enforcement of Martial Law. I think that, taking these two documents together, no one could help, as I did, connecting this letter with the Articles of Association. This statement here, "We must add that Government House is fully aware of the formation of this Association." is a direct reference to the Association without any reference to any special conditions said to be enforced under the military, and is a proof of this course of action.

8,598. Yes, but being a private letter, written at a certain time, it would apply just at that moment?—I would say that if that letter had been meant to apply to special conditions, such as Martial Law conditions, there would have been some reference to it in that communication, and it would not have been connected with the Articles of Association. That, of course, is simply an opinion.

8,599. Have you anything to back your opinion from the Articles of Association?—No, except the wording of the document itself.

8,600. Is any manager on these fields acquainted with the document?—I have not asked anything about it.

8,601. Do you think anyone is acquainted with the document except the agent who gave it to you, and possibly one or two others?—I see that this document states, "Mr. G. A. Goodwin, Acting Manager of the Rand Mines, Limited, who has just arrived in Cape Town from Johannesburg, has accepted the position of manager." It clearly points to the work of the Association undoubtedly and there is no reservation here whatsoever as applied to any particular conditions, such as the military authorities. I do not see that there is anything to maintain your contention in this letter.

8,602. Would you not take the time that letter was written into consideration?—Yes, the one is dated September and the other October.

8,603. But it was written long before the end of the war?—I cannot tell you when it was written. The one is dated September, 1900, and the other is dated October, 1900.

8,604. On the 19th January, 1895, did you advise as follows to the Chamber of Mines: "The obstacles retarding the progress of organisation are numerous and formidable?" Then you gave several of them and the third is that only a small minority of the mine managers manifested any support of the Chamber's efforts. The majority have ever been completely lukewarm or directly hostile. The dominating feature has been adverse criticism unredeemed by any practical suggestion. Added to these there has been an absence of all cohesive or combined efforts and resolutions proposed by the Association have been violated or ignored. The fourth states the apparent difficulty companies find in truly appreciating the pernicious effects of the touting system which continues to be largely countenanced and supported?—Yes, I confirm that now, and give you that as my opinion now. Touting was so rampant then that when I went to the north and was sending down good big gangs every few days, positively representatives of mines contributing to the Association were waylaying gangs of boys being sent down by me from Pietpotgietersrust and were diverting them to their own mines. That was the nature of the assistance I got from mine managers at that time, and in 1896 when I went to Delagoa Bay to make favourable arrangements with the Government I found on examination there were no less than three representatives of groups working in absolute opposition to me, two of these groups being supporters of the Association. Added to

that there was one private individual, so from four sources I was met with the most direct opposition, money being freely used in trying to upset me in obtaining from the Portuguese authorities what they chose to call a privilege licence. These are facts. Two or three representatives of these groups were contributors and gentlemen sitting on my own Committee, and I found on investigation that was the nature of the support I was receiving from my own Committee.

8,605. What was the nature of the arrangement made?—It was what they call a privilege licence. I wanted to secure the support of the Government to get rid of the abuse and ill-treatment and robbery the natives were subjected to in coming out to work, mainly from touts.

8,606. One of the witnesses here from Komati Poort describes this arrangement that you made as a monopoly?—No, it was not a monopoly.

8,607. In what way did it differ from the present arrangement?—It was not a monopoly in any sense of the word. I secured, in the interest of the Chamber certain support from Government officials throughout the country, and a document which a prominent member stated if it had been in my own private name he could tell me where I could get a cheque for £5,000 for it.

8,608. Then it had a considerable value?—It had in those days.

8,609. There was, after all, some privilege connected with it?—One gentleman a member of the Executive, I give him credit for saying in a general meeting of the Chamber of Mines, that he had attempted to obtain such privileges as I had obtained from the Government and had failed. He made that statement in public.

8,610. Had you anything to do with the formation of the Association of the Rand Native Labour supply?—Nothing whatever.

8,611. Then, when you left the Chamber of Mines you had nothing to do with the Association?—No, I think I left after the first meeting.

8,612. You secured the arrangement with the Portuguese authorities under which this Association was formed?—I do not know whether they formed the Association under that arrangement or not. I know nothing of what transpired after I left. I know that I brought back some documents which were understood to convey certain distinct advantages in connection with the organisation of labour, but when I left that was the end of the matter as far as I was concerned. I did not follow the thing up, and I do not know to what extent they utilised the arrangement I made.

8,613. In all your recommendations to the Chamber you strongly advised combined action and recruiting through one source?—I condemn indiscriminate touting, and I do to-day. I think it detrimental to the interests of the mines in every possible way, and opens the door to all kinds of abuses. I think you will find that I have been consistent in that from the beginning right through. I have been consistent in my condemnation of indiscriminate and, what might be called, free touting.

8,614. I think that very often in your recommendations you did condemn recruiting by individual companies or groups.—You see, as a rule, the companies purchase these boys from touts, and they do not recruit themselves direct.

8,615. In a letter addressed to the Chamber of Mines, dated the 16th March, 1896, you say: "I am desirous of particularly calling the attention of the Executive Committee to one of the disastrous effects of the pernicious action of individual companies in sending their separate agents indiscriminately through the country for the purpose of obtaining natives, as well as to the mischievous and ruinous process of purchasing natives from irresponsible touts, who are growing rich out of what I can only describe as a reckless and useless expenditure of companies' money."—That is quite right, Mr. Evans. There were a

few of the mines who had a sort of standing arrangement with certain touts who they considered served them faithfully and did not charge them too high a price for their labour. There were also a few mines who had an assistant compound manager who used to go out and try to obtain labour. Sometimes the compound manager would go out, and that very frequently happened. At the Robinson Mine Mr. Duncan would go and get a certain amount of labour from a certain chief, and of course that labour was more efficient, as the boys leaving were replaced by other boys, from the same chief, who had worked in the mine before. That, of course, was one thing, but indiscriminate touting is what I have always absolutely condemned, and what I condemn to-day.

8,616. In this letter you go on to say: "During the past two years I have repeatedly pointed out that such action tends to completely nullify the efforts of this department and frustrates all attempts of organisation of the labour supply."—I take your argument, then, was in favour of all recruiting being done through your department?—Not so much recruiting up to certain points, but familiarising the natives with the work, and removing all possible obstruction to the natives coming to the Rand. My contention always was to have the road as clear as possible for them to come and go as they please. That was the main-spring of my argument always in connection with native labour, and that is the principle I would always pursue in regard to native labour. Some of these managers thought if they could only see me go at the head of 600 natives up Commissioner Street I would be the greatest hero they ever saw, but that was not my idea. My idea was to remove all obstruction. In many cases I did not see any direct result, but I was pegging away all the time to remove obstructions to natives coming and going.

8,617. You are arguing here in favour of combined action?—Undoubtedly. No big undertaking, I need hardly point out, can be conducted without organisation.

8,618. There is a letter here, dated 10th of September, 1896, in which you report the result of your visit to Lourenco Marques, and say that: "After several interviews with the Governor I obtained on behalf of the Chamber the following privileges," which you then enumerated. The first is to organise and emigrate natives from any part of Portuguese territory; second is the right to arrest any European or native similarly engaged who is not in the employ of the department, or possessing any direct authority in writing from the Government of Lourenco Marques. That is correct: is it not?—All that will be correct.

8,619. Does the present arrangement in any way differ from this?—My plan of operation was to establish at certain points, which I think will be very likely enumerated in that report, stations which would be placed in charge of a responsible European, and connected with these stations would be two, three, or four men. I think about ten or twelve would cover the whole number of natives I had employed. Certainly fifteen would be the outside number during my operations there as against the number of runners, which I believe now are something like 1,500. Then my idea was to satisfy the natives in coming and going to the Rand that they would be in every way protected. That they would be given food at these stations, and forwarded under proper safeguard, and entrusted and sent to the Rand under proper protection.

8,620. Is that not precisely what is being done now?—I do not know. I have not enquired. My information now is mainly derived from natives who come to me bringing complaints and asking my assistance, and I may tell you in regard to that that a native came to me recently in the usual way complaining, and I asked him what was his trouble. He began enumerating his grievances, and I told him that I was in no official position now, and I advised him where to go in order to make his complaints. Then he

started talking of the arrangements under the Portuguese Government in connection with this very labour question, and he distinctly told me that the process there was one which could only be described as coercion in this way. He told me orders were issued by subordinate officials under the Portuguese Government for a certain number of men to be taken out of each district, and he said that they were compelled to turn out these men. I said, "If you refuse to turn them out what then?" "Oh, we are severely punished. Do you see the army of small boys on the Rand to-day, and what do you think they are here for? They are turned out in lieu of men, and their heads count as the heads of men. That is why you have such a proportion of umfaans here." His statement to me very much corroborated what you had given in evidence here a few days ago. One of your witnesses, Mr. Edwards, spoke of one instance in which the Portuguese authorities put a chief in prison and kept him there until he produced the boys demanded. He stated he was sure of his information, and the statement of this native to me confirms what he said.

8,621. What is your idea of the effect of that upon the supply?—The permanent effect will be distinctly bad.

8,622. But does it enable the industry to get temporarily a larger number of natives?—I think so, because the punishment under the Portuguese for any disobedience of orders issued by a Portuguese official is very drastic, very severe indeed.

8,623. Supposing that arrangement to exist, do you think we have, as a result, had a great many more natives here than would otherwise be the case?—I think a principle of that spirit in perpetuity, is bound to act prejudicially on your supply.

8,624. But I ask as to the results recently obtained? Has the number been increased owing to that particular arrangement?—I do not know, of course, and I will not vouch for the truth of this statement. I only give you the details of the conversation I had with the native.

8,625. It seems to indicate in any case that every possible effort is being made to get natives?—Yes, because the native with the Portuguese is a very valuable asset, and he makes out of him all he possibly can.

8,626. In your opinion we are doing the best in Portuguese territory that we possibly can?—I could not tell you.

8,627. But I mean arguing from these facts?—What I say is that a temporary measure like these coercive steps alleged to be taken would increase your supply for the present, but they certainly will not permanently. You must remember that the position of a native in Portuguese territory and a native under the British Government is as diverse as darkness from light.

8,628. Now in your arrangements you fixed the passport payment at 12s. 6d.?—It was 21s. 6d. to 22s. 6d.

8,629. You stated to the Chamber, "for passports I find still 18s. 6d. is charged. This I succeeded in getting reduced to 12s. 6d., which amount I have undertaken shall be paid down for every native coming in, but it would mean that this amount, however, plus 20s. for railway fare, the natives will readily agree to refund"?—At that time they would.

8,630. Now, you also appointed Mr. Fritz Wirth as your representative there?—Yes.

8,631. So in some measure you are responsible for the existing arrangement?—I am responsible for what I do, and I remember I did my best on that occasion to try and persuade the Government that a charge of 2s. 6d. for each passport would be quite sufficient, instead of 12s. 6d., but I failed to convince them. I tried to point out that they should rather give every inducement to the natives to come out, but they rather believed in having the bird in hand and getting on the spot all they could.

I understand 12s. 6d. is the amount they claim now, and then they penalise the native again on returning and so on.

8,632. Why did you go to Portuguese territory?—The managers practically drove me there. Portuguese labour was the labour they all desired on the Rand and every other class of labour at that time was absolutely objected to, and in many cases totally refused. Some of the managers would have nothing to do with Cape Colony boys; others would have nothing to do with Zulus or Natal boys, and said they were no good except for surface work, and they did not want surface boys.

8,633. In a report dated June 6th, 1896, that you wrote to the Chamber of Mines, you say, "It is beyond question that no adequate supply of voluntary labour can be obtained from the various districts of the South African Republic and recourse must be had to outside sources"?—Certainly, that is outside sources, meaning in all directions immediately available, such as Basutoland, Cape Colony, Zululand, Swaziland and Natal. That is what I mean by outside sources there. No other sources, of course, were ever asked about or contemplated at that time.

8,634. The source which you developed the most was Portuguese?—Yes, for that one reason that they were considered the best mining boys.

8,635. Now, in your opinion is it in the interests of South Africa that we here in this industry should be almost entirely dependent for its existence on the goodwill of a foreign Government?—No, unless you can induce a foreign Government to carry out its engagements and make engagements suitable to your own requirements, which I am perfectly certain you will have great difficulty in doing.

8,636. Do you not think by drawing your labour from one source you are making them pretty well masters of the situation?—I do not know where the question of masters of the situation comes in. If you want labour you must have it, and you must take the best means of getting it, that is very certain.

8,637. In another report you state, "that the supply even under the most favourable of circumstances available is wholly inadequate, and, although the introduction of large numbers of men from adjacent territories is perfectly practicable, the men are pronounced as unsuitable for mining"?—That is true, and I mean by that underground boys.

8,638. How do you reconcile these statements with the statement you have got in your evidence here, "I feel confident under these conditions the full requirements of the mining industry can be met from the population of the Transvaal and the adjacent territories"?—Yes, of course, I did not exclude Portuguese territory. I included Portuguese territory in that remark, and I call Portuguese territory an adjacent territory to the Transvaal. Do you not agree with me?

8,639. Oh, yes, I agree with you, but what do you base this conclusion on? Have you made any estimates of your own?—I have not.

8,640. Then how do you arrive at this conclusion?—By my previous experience and contact with natives and the general knowledge I have of the whole subject.

8,641. Unless you have some figures I do not quite see how you can draw that conclusion from your previous experience. Your conclusion is that the full requirements of the mining industry could be met from the population of the Transvaal and adjacent territories. Have you any figures as to these requirements?—I know what the requirements are to-day. Part of my evidence to-day I wrote in January last.

8,642. It does not say so?—Oh, I think so. I beg your pardon if it does not. I said, after some months of careful observation and thought, in the month of January last I committed my opinion to paper. I need not tell you circumstances have

altered very much, and, as all sorts of developments are contemplated, the idea of the increase of labour required is extending every day.

8,643. But with the knowledge you have now, are you still of that opinion?—I say that, taking into consideration the whole of the circumstances right through the country there will be the greatest difficulty; the increased requirements of the Rand—because I look forward to very great developments in all directions, not only as immediately connected with the Rand, but with railway constructions, public works, and so on.

8,644. Do you think these requirements could be met?—I should say not, unless there was a material change in the native world throughout the Continent.

8,645. Mr. DONALDSON: Do you know whether of all the natives employed here during the war a very great proportion were Portuguese natives?—Yes.

8,646. Have you any idea of the period they usually spend here. We were told that the period some remained was from two to three years?—I should say on the average you could scarcely take it less than 18 months, and certainly you would be perfectly safe in putting it at a year.

8,647. The evidence of the late Portuguese Curator was that they stayed on an average three years?—I think that is slightly over-estimated. I should say an average of 18 months. I would go as far as that, but not three years. Certain men would stay double that time, but they would be very few and would be men who have no homes and men perhaps living at the kraal of a friend and not married men with families. These men remain on here, spending the proceeds of their labour mostly in drink and other ways, and remain here year after year. Taking the average applying to self-respecting natives, I should say 18 months.

8,648. Have you any idea what the average stay of these Portuguese boys is now?—I could not tell you.

8,649. It seems to be generally admitted by witnesses who have given evidence here that it is a good deal shorter than before the war?—The whole tendency is in that direction.

8,650. Do you think it is possible that their being able to get a supply of liquor before the war had anything to do with their longer stay here?—Undoubtedly, because a native would not contemplate returning unless he had a certain sum, and if he spent money freely during the time of employment, naturally that amount would diminish and he would remain on longer.

8,651. Do you think if some system was inaugurated by which the natives could get liquor under proper control it would be of advantage?—I am opposed to the re-introduction of liquor supply to natives under any condition whatever.

8,652. But do you think if there were laws brought in by which the native would be able to get liquor under proper control it would tend to lengthen his period of service?—I think it would be a distinct inducement to a large number to come here.

8,653. And do you think they would stay longer?—Undoubtedly, but that is leaving out of account the fact of the demoralising effect and all that sort of thing. I leave these considerations out of account.

8,654. But do you think the actual supply would certainly increase?—Yes.

8,655. And that they would stay longer?—Yes, because a great number of Portuguese boys are perfectly familiar with the fiery "Arrak."

8,656. You mentioned in a previous part of your evidence that some manager before the war refused absolutely to take Colonial boys?—Absolutely.

8,657. These boys as a rule do not care about working underground?—Many do not, but there is a great deal in the management of natives. A great many of these natives, to begin with, who

refuse to go underground, after a little management can be induced to go underground, but the aversion is steadily increasing on the part of the boys owing to the increased depths of the mines.

8,658. You mentioned that 1,000 boys were refused by several mines?—Yes.

8,659. Do you know whether these natives were prepared to work underground or not?—A proportion would, but a large proportion would not have consented to go underground.

8,660. Do you think there might be any connection between the large number not wishing to go underground and the refusal of them by the mine managers?—I think the one would distinctly influence the other. The East Coast boys went underground in a peaceable way, and gave less trouble, and naturally that was the boy most in favour on the mines. The other day a gang of natives came to me, one of their leaders came with a retinue behind him, and complained of certain grievances, and I told him where to go to report the matter. This leader told me that they attempted to force upon him a contract for 12 months, whereas in Delagoa Bay they were engaged under a contract for six months. My point is, and I can see, that the whole tendency is to shorten their period of contract.

8,661. Is this so amongst many natives?—Yes, they are getting more and more averse to long contracts, which is corroborated certainly by the statements of the official Blue Book of Cape Colony.

8,662. I see in your evidence-in-chief that you anticipate within a few months natives will demand considerably increased wages?—I think so, the tendency is in that direction, and is simply the outcome of what I believe to be an increased disinclination to accept work on the mines. That feeling has distinctly grown, and of course a reason for that is that many can obtain labour much nearer their own homes, and more congenial to their feelings and ideas at equally good wages.

8,663. Is it your opinion that to secure an adequate supply of native labour within a very few months the mines will have to give a material increase in pay?—I think the tendency in the near future you will find will be to steadily increase the wages, and also increased aversion amongst the natives to accept service on the mines, and particularly as the depths increase.

8,664. Mr. QUINN: Mr. Grant, just a word or two about the figures put to you by Mr. Philip. It is pointed out to you that the results of recruiting for the last few months of 1902, before the wages had been increased to something like the old standard, were much greater than the following six months, when the wages had been increased?—Yes.

8,665. Did it not occur to you that that might be accounted for by the fact that previous to that period, the period of the first six months, when the recruiting was so heavy there was no labour here at all, and therefore a large number of boys were waiting to come back to work?—Undoubtedly.

8,666. And the moment there was an opportunity of going back, they flocked back?—That is so.

8,667. And that would probably be the answer?—As a matter of fact that would be so.

8,668. Now, Mr. Evans asked your opinion as to the wisdom or unwisdom of the industry here being dependent upon the goodwill of a foreign Government, referring, I think, to the Portuguese?—Yes.

8,669. Suppose we had to make a choice of being dependent upon the goodwill of the Portuguese Government, or, say, the Italian Government, or the Chinese Government, which in your opinion would be the lesser evil?—I should take the evil nearer home, the one I could more readily contend against. I should not want to go to China if I could deal with it here.

8,670. Now coming to this letter which seems to have upset the frying-pan into the fire?—I hope no letter I brought here has done that.

8,671. I am taking its importance from the amount of attention which my friend, Mr. Evans, paid to it. Does not the policy which has been adopted by the W.N.L.A., together with the Articles of Association of that body, prove that letter, whoever wrote it, or rather the policy suggested in it, has been carried out in the main?—I think I pointed out that.

8,672. I want that emphasised?—Yes, I will emphasise it. What do you wish me to say, and I will say it.

8,673. The figures given to you as being the requirements by some of the learned gentlemen on the other side of the table as 145,000, and some other number for the railways, you have not examined these numbers?—I have not.

8,674. And if they told you they wanted 245,000?—If they were truthful I would not be able to question it. It may not, however, be a matter of truth, but a matter of opinion.

8,675. What I mean is, you have not examined these figures?—Certainly not, and I object to being committed to figures I have not examined, and I further object to deal with conjectures.

8,676. Mr. TAINTON: I just want to ask you a question or two arising out of one or two replies which you gave Mr. Evans. You said, I think, that a native had called upon you and had told you that a certain measure of compulsion was exercised by the Portuguese Government authorities?—Yes. I think the murder of two recruiters recently would rather indicate that these recruiters were not acceptable men among the natives.

8,677. One of the results of that pressure was to turn out an army of young lads?—Yes, an undue proportion of young lads, their heads counting like heads of older men. That was the reason assigned by the native to me.

8,678. Is that the first native story of that character of which you have heard in the period of your residence on the Rand?—I heard that about two months ago.

8,679. Is that the only native story of that character you have heard?—No, it is not, but this native brought a good number of boys with him, I think about 18 or 20, though I did not count them.

8,680. Can you mention any other similar cases?—No, but I may tell you that is the native impression. I do not vouch for the correctness of it, but I was surprised when I saw the statement of Europeans confirming that.

8,681. What statement do you refer to?—The quotation from the evidence of Mr. Edwards.

8,682. But this does not arise in connection with your statement. The experience of Mr. Edwards was gained before the war. Have you any information or knowledge which would confirm Mr. Edwards' statement as to these practices obtaining before the war?—No.

8,683. Mr. Edwards' statement is positive as to what happened before the war?—Well, it at least partly corroborates the statement of this native of what happened since the war. I do not accept this statement as true. I do not accept an unsupported statement from a native as true, unless corroborated by other proof. I am simply telling you the conversation of the native because that chief may have been put in prison for refusing to turn out natives for the Government. The Government there ordered out natives, and in the event of their not turning out the chiefs are very severely punished and very heavily fined. Their fining generally consists, of course, of labour. Most fines are paid by labour on public works and military works.

8,684. Upon what data do you make that statement about the Portuguese natives paying in labour?—That I know it as a fact to be so.

8,685. When did you first become acquainted with that fact?—I could not tell you. It is so long ago

that I have forgotten it. It is, however, an established fact. Ask anyone acquainted with Portuguese territory and you will find what I say is correct. I have discussed it with Reuben Beningfield and others, who are very familiar with it.

8,686. What is the general tenor of their evidence?—They pay them a certain amount and order out a number of natives, but the boys as a rule complain that they get no pay at all. I suppose it is on the same principle as the Natal Government, where they order out natives for Government works, but, of course, they are paid, I think, £1 per month. I am not sure whether the Portuguese authorities pay their natives or not.

8,687. Do you wish the Commission to understand that this native story is only one of many stories pointing to the use of compulsion on the part of the Portuguese Government or is it merely an isolated statement to which we can attach no importance?—Altogether I was inclined to believe in the truth of the statement by the fact that such a large proportion of young boys had been sent up during the war and then he told me, pointing to them, "Do you not see these boys that come here," that was conclusive proof in his mind of the truth of his statement, that they were coerced into sending out a certain number of boys and, as able-bodied men declined to come, these young boys were sent out as substitutes.

8,688. Then you do not take it that these young boys indicate that the supply of able-bodied men

are exhausted?—Certainly not. They were disinclined, for some reason or other, to come, that is all.

8,689. The Portuguese methods press more heavily on the umfaans, therefore?—I think they are all pretty well umfaans under the Portuguese Government, and they are made to do what they are told.

8,690. Mr. EVANS: Referring to Mr. Quinn's questions as to the industry being dependent upon a foreign Government for labour supply. Don't you think it wise to distribute your risks in a matter of this sort?—It depends upon what space comes between your risks.

8,691. I mean it is better to be dependent upon several Governments than upon one?—If you cannot get satisfaction out of one Government it is, of course, better to multiply them.

8,692. The CHAIRMAN: Mr. Grant, the Commission is very much obliged to you indeed for coming to give us such lengthy and valuable evidence?—I am very glad to have rendered you any assistance in my power. I have a number of notes which I have not touched yet, and which I would not mind putting into consecutive form and sending in to you.

8,693. We shall be very much obliged if you will do so?—I shall.

The Commission then adjourned until Thursday, 3rd inst., at 10.30 a.m.

## TWENTY-FIRST DAY.

*Thursday, 3rd September, 1903.*

THE COMMISSION SAT AT 10.30 A.M.

Mr. P. J. D. ERASMUS, called, sworn, and examined (through a Dutch interpreter):—

8,694. The CHAIRMAN: Have you before you a document headed "Statement of Mr. P. J. D. Erasmus?"—Yes.

8,695. Do you wish to hand that in as your evidence-in-chief?—Yes.

8,696. The statement was as follows:—

At your request, I beg to furnish you with a very brief statement of matters which I consider of the greatest importance.

I have resided in the sub-district of Bethal for fully 25 years, and never in all my life have I experienced the same difficulties in securing native labour as I am now experiencing. I venture to say that unless some drastic measures are passed it will go from bad to worse.

The labour question is the most important question concerning the welfare of our district and Colony. The greater majority of the inhabitants here are without servants of any description whatsoever, and even those who have Kaffirs complain bitterly of the reluctance on the part of such coloured fraternity to work. Somehow or other, there does not appear to be sufficient force in the law to compel them to work. Prior to the war, this district could not altogether boast of a copious supply of Kaffirs. During the war a number were removed to stations by the British, and of these few have returned. I am afraid that in the majority of cases, too much leniency is exhibited towards the native, which creates a most unfavourable and lasting impression. Of these natives so removed, the greater number have not returned, and are enjoying a life of luxury and freedom in

the various repatriation depots, who would do better by engaging poor whites. Exorbitant wages and sumptuous rations are given in these depots, and very little do these employees do for their money. This is a great reason why Kaffirs flock to these depots, and leave their masters in the lurch.

The usual work prior to the war was that of a general labourer, e.g., herding cattle, shearing, and raising crops, for which a wage of from 10s. to 20s. was paid. A labourer got his daily food, and was assisted with land, cattle and farming implements to sow for himself and family free.

I am persuaded that in many cases the Squatters' Law is not enforced, whereas if this were done, it would counteract the wholesale swarming of Kaffirs on farms of individuals who could do without them, but do not worry about the welfare of other farmers.

8,697. Mr. Erasmus, you have lived in the district of Bethal for a long time, I understand?—Yes.

8,698. Are you a farmer?—Yes.

8,699. Did you hold any official position under the late Government?—No, not previous to the war.

8,700. Do you hold any position now?—No.

8,701. What is the size of your farm?—I am living on my father's farm, the size of which is 2,500 morgen.

8,702. How many natives are employed on it?—There are no Kaffirs on the farm.

8,703. Do you cultivate any ground?—Yes, that is how we make our living at present.

8,704. How many acres do you cultivate?—About 50 to 60 acres.

8,705. And do you do it with white labour?—Yes, the greater portion. This year I have had to employ white labour. We did manage to find Kaffirs occasionally, but it was very seldom we had a boy.

8,706. How many Kaffirs would you employ if they were available on your farm?—I should think I could do the work of my farm with at least six Kaffirs.

8,707. And cultivate 60 acres of ground?—Yes.

8,708. Can you tell us what the average number of Kaffirs would be which each farmer in your district would employ?—I should say about six Kaffirs would be the average.

8,709. Had you the same difficulty in getting labour before the war?—No, before the war, although we were farming then with stock and required a good number of Kaffirs, we never had the same difficulty.

8,710. How do you explain the scarcity of Kaffirs now?—I should say that at present there is no necessity to compel Kaffirs to work; nothing to drive them out.

8,711. Are they well off?—Naturally they are well off.

8,712. But are there any special reasons why they should be well off now?—The reason is that during the war the Kaffirs received good wages from the military, and the stock that was taken away by the military they have been compensated for, so at present they do not require to work.

8,713. You say you think some drastic measures should be adopted to compel them to work?—Yes, I think so; if not direct then indirect measures should be employed to compel them to work.

8,714. Will you tell us what measures you suggest?—I should think the Squatters' Law should be enforced so that those farms on which there are more Kaffirs than there should be, could be forced to hand them over to other farms where they are required. Care should be exercised also that locations are not too much extended giving Kaffirs so much ground to till that they are enabled in one year out of the sale of their produce to make enough to pay their taxes for from eight to ten years.

8,715. Have you any other suggestions to make?—I do not know whether this suggestion is the very best, but I think it would be a good thing if a law could be passed compelling natives to wear clothes, and thus spending more money and increasing their wants. At present there is nothing to compel them to wear clothes, so they can live very cheaply.

8,716. You recommend that the Squatters' Law should be enforced; are there then some farmers in your district who have plenty of Kaffirs?—Yes, there are some instances—not many, as Kaffirs generally are scarce—in which farmers have more Kaffirs than they require.

8,717. Can you explain how you manage to cultivate 50 acres, when one witness has told us that to cultivate 25 acres he employed something like 20 boys?—I compute an acre as about half a morgen. This year with four white men I very easily cultivated 20 acres.

8,718. I understood you to say you were cultivating 50 acres?—We sowed 50 acres, but on account of the frost and several other reasons the oats were not a success, and it was not necessary to reap them.

8,719. What wages did you pay the white men?—2s. 6d. per day.

8,720. Did you feed them?—No, they found themselves.

8,721. When you can find Kaffirs to work on your farm what wages do you pay them?—I only obtained one Kaffir, and that for one month only, I paid him £1 10s. and gave him food.

8,722. Mr. GOCH: What is your idea about enforcing the Squatters' Law? Supposing it is enforced, you would be entitled to five families on your farm?—Yes.

8,723. On what conditions would you accept these five families on your farm?—I would accept them on the same conditions as previously. It was customary to allow them to have as much land to till as they liked, and for that they used to do the ordinary work about the farm. For special work we had to pay them extra.

8,724. I understand that system broke down because when these Kaffirs were required to do special work they did not do it?—That was on account of the want of an agreement. If Kaffirs come on to a farm there should be an agreement. Everything depends upon an agreement.

8,725. Then, in addition to the Squatters' Law, you want a Pass Law to apply to these Kaffirs to contract them to go to you as master?—Naturally, I think that very necessary.

8,726. Then if you live on your farm do you want them contracted to you for the whole year round?—When they go on to a farm the period which they want to live on a farm must be agreed upon.

8,727. The Squatters' Law does not contemplate them living there only for a part of the year, but contemplates them living there as a fixed residence?—Certainly, the longer the period of residence the better, but in many instances they only work for a certain time.

8,728. But under the Squatters' Law what you want is not possible?—It is all the better if they live there for their whole life.

8,729. Yes, but it involves this difficulty; if you want to employ them as master under a contract then you must pay them wages for the whole year round?—That could be adjusted according to the amount of land they are allowed to till. You would not give them land to till and then pay them.

8,730. I think it will have to be altered, because if that broke down, could you see your way to employ six men at £1 10s. per month all the year round?—Yes, I see my way clear to do that if the Kaffirs are only given sufficient land to till to keep their relations merely in food, but not to allow them to till so much that they could sell produce.

8,731. Will this plan be a fair adjustment of the difficulty? I am going to suggest a plan to you. That the Kaffirs should go on your farm and get from you a fixed piece of land. They would not be allowed to roam about your farm and plough where they liked, but you are to allot them a certain fixed piece of land, but they must understand that the land must be theirs as tenants and that for that land they must pay you a certain rental, and that the only basis upon which they could be on the land would be a rent which would be stipulated for under the law. Then, in addition, to enable them to pay that rent, you must employ them for a certain fixed monthly wage. How does that plan strike you?—It depends upon circumstances. It might be that that certain piece of land would produce more than the amount of the payment that the Kaffir has to pay back. It might be that I had to give the Kaffir such a piece of ground that it would be sufficient for him to work for the master for the produce he gets out of the ground. A certain piece of ground must be a certain small piece.

8,732. The certain piece of ground is what the Kaffir gets to work for his family. He has to pay rent for that, a rent that should be fairly adjusted by the Government between Kaffir and owner. That being settled, you could employ the Kaffir for your farm work, but must pay him wages for that?—Is the Kaffir, then, to be bound to work for the whole year?

8,733. Well, that is a point. I do not think it would be fair to insist upon the Kaffir working the whole year for you, having satisfied the period

of labour. For a certain number of months in the year the Kaffir should be free to labour elsewhere if he likes. Do you approve of this?—I approve of that, if the amount, which the owner has to pay the Kaffir, is reasonable.

8,734. Oh, certainly, of course. I do not think that any law could fix the rate of wages, but where labour is equally distributed over the farms in that way there will be less competition amongst the farmers and a reasonable rate of wages could, no doubt, be agreed upon as satisfactory. Do you agree with that, and would it be a fair adjustment of the difficulty?—Yes.

8,735. Then you speak about locations. Is that a great trouble now everywhere? That comes of the facilities given on locations to the Kaffirs who are too independent to seek for work?—Doubtless, where the Kaffir has the right to till as much ground as he likes, he can make so much out of the produce that he is independent and need not work.

8,736. What is your idea about these locations and the privileges there? Should the Kaffirs be placed on a rental for the land?—I do not think the rental should be fixed, but an enquiry should be made to try and make it so that the Kaffirs do not have more ground to till than is absolutely necessary for them to make a living and feed themselves, but not enough to be able to sell the produce.

8,737. Then you would probably favour the locations being laid out in allotments of certain sizes to each family instead of as now being allowed to plough wherever they liked and as much as they liked. Is that it?—Yes, I favour that.

8,738. Do you think that that will induce Kaffirs to go away from the locations to seek for work?—Yes, I certainly think that.

8,739. Then your suggestion about a law compelling them to wear clothes. What is in your mind as to what they should be compelled to wear as a minimum?—The ordinary dress. They should be properly dressed with trousers, shirt, waistcoat, and hat.

8,740. Yes, and the women folk?—I cannot say. I am not quite clear as to what should be done, but I think it should be tried on the men first, and, if it works well, then see if something cannot be done to get the women dressed.

8,741. It is not a bad idea, I think, but of course you should give us a clear idea as to what you want. There are laws everywhere in civilised countries that people should be decently clothed, and there should be such a law here, but to assist the Commission you should give us an idea as to the minimum to be insisted upon?—Well, I should say the minimum would be a shirt, trousers and coat.

8,742. Supposing the Squatters' Law were enforced with these conditions, that for a certain period of the year they should work for the owner of the farm for a certain wage, how many months would an owner require these men to work for him?—At least six months.

8,743. That would satisfy all his demands on them?—It would be sufficient for the ordinary requirements. Should you want Kaffirs specially, you should make arrangements with them.

8,744. But you must bear in mind that I do not think the law will ever allow the farmer to have a special claim on these people. The farmers will have to settle what period in the year they will require these Kaffirs and that must be a consecutive period. They cannot say, "I want him for four months at the beginning of the year or the end of the year," but he must settle in his mind how long he will require them to work on the farm?—It is difficult to say consecutively, because when you have finished sowing you do not require the Kaffirs again for a little while till you want to reap. I do not mean six consecutive months, but that is the period required.

8,745. Well, say he wants them to work for two periods in the year?—Yes, I should say, three months for sowing and then three months again for the reaping.

8,746. And in the intervals the Kaffir could work where he liked, but at these particular times they want the Kaffir on the farms?—Yes.

8,747. Mr. EVANS: What are the periods when the farmers are mostly in want of boys?—In the sowing time from October to the end of January, and in the reaping time in May, June and July.

8,748. Now, supposing that labour was plentiful, how many boys would you require on your farm in both periods?—It depends on the wages. If I could obtain labour cheap, I could do with ten boys, but on account of the high wages I do with as few as I can.

8,749. You mentioned that a wage of 10s. to 20s. was paid for the usual work of herding cattle, shearing and raising crops. Now, supposing the wage was 15s., how many natives could you employ? I would certainly employ from eight to ten Kaffirs at 15s.

8,750. On your farm?—Yes.

8,751. Would that mean keeping them as well?—Yes, keeping them as well.

8,752. You recommend the application of the Squatters' Law. Do you advise limiting the acreage of land that a native can cultivate on a farm?—Do you mean make it less?

8,753. Limiting it?—Yes, decidedly, I am in favour of a limit.

8,754. By law?—Yes, by law, as I think that the law would make a fair adjustment.

8,755. Do you think that the number allowed by the Squatters' Law is sufficient to supply labour for the farms?—The usual five families?

8,756. Yes?—Generally, I do not think that five families would be sufficient, but the farms would be able to hire extra labour.

8,757. Now, how do you propose to get the extra labour? What policy should the Government adopt, so as to enable the farmers to get the extra labour?—I think that my suggestion with regard to the locations would go a long way to meet the case. If the amount of ground to be tilled by the Kaffirs were to be limited, they would be compelled to seek employment elsewhere, either on the farms or on the mines.

8,758. Then would you be in favour of breaking up the locations?—No, I would not say that the locations should be broken up, as there are too many Kaffirs. There would not be room enough for them to live on the farms if all the locations were broken up. The locations could well be kept, but not so extensively that they could make a living out of them.

8,759. Then would you be in favour of, or opposed to any further locations being created?—I am opposed to it.

8,760. And you are in favour of a tendency to limit the present locations. Is that correct?—Yes.

8,761. How would you deal with the natives squatting on Government land?—Is this intended in connection with Kaffirs living on the ground without paying rental?

8,762. What I mean is that we have had several witnesses here, who have told us that since the change in the hut-tax to £2 for those living on private farms, the Kaffirs have left the farms and gone on to Government lands?—I am under the impression that the Kaffirs are living there rent free. My opinion is that they should pay rent or that the tax should be doubled.

8,763. But would you allow them to squat on Government land without having a prior understanding with the authorities?—Decidedly not. They should have some arrangement with the Government.

8,764. What conditions do you consider should be imposed on Kaffirs wishing to squat on Government lands?—Do you mean what rent should be paid?

8,765. Well, rent and any other conditions?—I think they should be compelled to return to the

location or compelled to pay just as the Kaffirs living on private farms, and they should not be allowed to herd together.

8,766. They should not be allowed at all on Government land or be compelled to pay on Government land?—I think they should not be allowed on Government ground at all. For whom would they work then?

8,767. Then how would you deal with all the Kaffirs now settled on Government ground and who are cultivating it without the consent of Government or paying any rent?—By allowing them to live on Government land you make an indirect expansion of the location system, and they should be compelled to pay rental for the period that they have been living there without the consent of Government and then turned off.

8,768. Or continue to pay a rent, I suppose?—I am more in favour of their being turned off altogether than their staying on and paying a rental.

8,769. Mr. PHILIP: Is your farm divided?—No.

8,770. Are there any more families living there?—My father is not living on that farm, but my brother and myself.

8,771. If you had the boys, could you cultivate a much larger portion of the farm?—Naturally. It just depends on the labour.

8,772. I notice that you say that hardly any farmers in the district have any servants at all at present?—Yes.

8,773. And that the Kaffirs are idling away their time at repatriation camps?—Yes, that is also true.

8,774. Are the camps still in existence?—Yes.

8,775. Are there any in your district?—Yes.

8,776. And is there a large population of Kaffirs in them?—Yes, many more than are required.

8,777. I see you recognise that the ground on locations given to Kaffirs should be limited?—Yes.

8,778. And that they be not allowed to squat on Government ground?—Yes.

8,779. Do you not think that if such a law were enforced that a great many natives would emigrate?—No, decidedly I do not think so.

8,780. Mr. FORBES: Bethal is a good agricultural district, is it not?—Yes.

8,781. How far is it from a market?—The nearest market is Standerton, but we are hoping to have a market at Bethal on account of the railway passing through it.

8,782. Consequently, if you had a better supply of labour, you could cultivate a great deal more land?—Certainly.

8,783. You mentioned six, but I think you meant that you could just get along with that lot?—Yes, I can just manage to get along with six, but in a little while I should require more.

8,784. Is there much stock in the country now?—No.

8,785. Do you find that when you want the Kaffir most the Kaffir wants to put his own crops in?—Yes, that is my experience.

8,786. I think you said that you would like Kaffirs for two months when you are putting your crops in?—Yes, from October to the end of December.

8,787. That would include hoeing, and all then?—Yes.

8,788. You spoke of what enforcing the Squatters' Law would do. Have you any place in your mind as to where the natives would come from?—In my district?

8,789. Anywhere?—Yes, from Middelburg, and Pretoria districts, which all join Bethal district, and are overstocked with Kaffirs.

8,790. On Government lands?—Yes, Crown lands, as well as private lands.

8,791. Mr. BRINK: Is not Bethal the smallest district in the Colony of the Transvaal?—Yes, I think so.

8,792. I see that we have only 135 farms in the whole of the district?—I do not know.

8,793. What I want to find out is this, are there, say, 155 farmers working in the whole of that district?—Decidedly not. Naturally there are three or four times as many Boers.

8,794. I just wanted to get at the numbers. Would it not give them 600 or 700 farmers? Would you not estimate the actual number of farmers at 700 or more?—Yes, decidedly.

8,795. What I want to get is the average of labour required for the farming community of the Transvaal. You give us about 700 or 800 farmers. What is your idea of the average number of boys required by each farm? I want a fair average?—I think an average of six Kaffirs to every farmer would be at present sufficient.

8,796. Then for Bethal you would want 1,200 labourers to 135 farms, that is giving 700 farmers to six—I will make it five boys each—say 3,500 keeping down the farmers to 700, you will require 3,500 labourers in Bethal district alone?—Yes, that number is certainly required.

8,797. That is 3,500 labourers to 135 farms?—Yes, but you must take into consideration that the district is very thickly populated. I do not think that there is another district in the Colony so thickly populated.

8,798. There are 11,600 farms in this Colony. Numbers of these farms are not occupied. We will take it that 5,000 of these farms are occupied?—Yes, I think so.

8,799. Is that an underestimate?—Yes, I think it is.

8,800. If we give ten labourers to each of these 5,000 farms, we get a total of 50,000 labourers?—Yes.

8,801. Would you think this a large number or an underestimate?—I do not think it is a large total; it is rather an underestimate.

8,802. We find that the smallest district in the Colony will take 3,500?—Yes.

8,803. So that at that rate I shall be more than 100 per cent. under the total?—Yes.

8,804. Have they got any locations in the Bethal district?—No.

8,805. Where do they draw their labour supply from?—Formerly we used to get it from the Pretoria and Middelburg districts.

8,806. But we have evidence that these same Pretoria and Middelburg districts are complaining about the scarcity of labour?—That may be. It may be that the Kaffirs do not want to work, but these are districts which have locations.

8,807. Before the war the Squatters' Law was not enforced in this district?—Not properly. More or less.

8,808. An attempt was made at it?—Yes.

8,809. Did it answer well?—Yes, I must say it answered well.

8,810. That is giving each farmer five families?—Not each farmer.

8,811. Are you aware that there is also a provision in the law leaving it to the discretion of the Native Commissioner to give every farmer more families. Are you aware of that?—No, I do not know that.

8,812. Well, there was a provision like that; that means that the Volksraad at the time estimated that the very smallest farmer should have five natives or five families?—Yes.

8,813. And that is your opinion, too? Anything like a farm wants at least five labourers?—Do you mean even if he had no land, even if he just lived on the ground?

8,814. I am speaking of the minimum number required by the farmer who has a transfer of his farm?—Decidedly. The minimum is five or six.

8,815. Generally an arrangement is made between a farmer that has natives living on his farm and these natives—it is a very old rule—that they should work two days a week for him?—Yes.

8,816. And that would leave him four days out of the week free?—Yes.

8,817. Is it your idea that that idea could be improved upon by making the boy work, as you put it, for six months in the year. My own idea is that four months or two months at a time, instead of two days a week. That would leave him three months to go anywhere else to earn money?—I decidedly think it would be an improvement, though I cannot agree as concerns four months. If a farmer does any work at all on his farm he could not do with less than six months.

8,818. Two days out of the week, and give him one-third of the year; that would be four months. But we will not quarrel about it. That would give the natives an opportunity to go out and earn money to pay his taxes and buy clothes and other necessaries?—Yes. I distinctly think it is an improvement. But if a boy is asked to do two days' work he cannot obtain work the other four.

8,819. Do you think when a boy has worked for three months consecutively that he has a larger period to go and look for work on the Rand or elsewhere?—Yes.

8,820. From my experience of natives I know that that is one of their complaints. In the Bethal district, at the present moment, are they well supplied with labour?—No, decidedly not.

8,821. Not even if they are willing to pay what is for a farmer a very high rate of wages?—No.

8,822. Mr. PERROW: How long have you been short of native labour?—Since I returned to my home after peace was declared I have never had sufficient labour.

8,823. For this white labour I think you mentioned 2s. 6d. per day?—Yes.

8,824. How many hours did the white man work on your farm at 2s. 6d. a day?—They worked the whole day, though, not as is customary with the Boers, from early morning, a little after sunrise to sunset.

8,825. It was a good deal cheaper to employ white labour than to employ the native?—In my district this is the case at present.

8,826-7. Mr. WHITESIDE: In the last paragraph of your statement you say: "I am persuaded that in many cases the Squatters' Law was not enforced, whereas if this was done it would counteract the wholesale swarming of Kaffirs on farms of individuals who can do without them, but do not worry about the welfare of farmers." Do you mean by that that there are farms in your district that had got more than a sufficient number of natives?—Yes.

8,828. What wages could you afford to pay natives on your farm?—Do you mean Kaffirs who are employed without giving them land to till?

8,829. It has been stated before this Commission that farmers can afford to pay up to £2 10s. to £3 per month for labour on the farms?—I would not go so far as £3 per month. I think that it would be difficult to give that. I could afford to pay £2 10s.

8,830. Did you have any difficulty in getting white men at 2s. 6d. per day without food?—When I hired men I had no difficulty in obtaining them.

8,831. And they are still in your employment?—No.

8,832. I suppose they have retired on a competency. Do you think 2s. 6d. a fair wage to pay a white man when you admit you could afford to pay £2 10s. per month to Kaffirs with food?—No, I considered at the time I had got them cheap. At all events it is all they asked me.

8,833. I see. The law of supply and demand? You have told us that the Kaffirs are well off at the present time. Is this a temporary state of affairs?—Yes, naturally it is a temporary circumstance. I do not think it will continue.

8,834. Thus, if the Kaffirs are well off at the present time, temporarily well off, is it not reasonable to assume that in the near future they will be compelled to go out to work again?—Yes, naturally. I think they will be compelled in the near future to work more than they do at the present time.

8,835. What are the usual terms under which Kaffirs are engaged by farmers in your district?—Do you mean Kaffirs living on the farms, or Kaffirs not living on the farms?

8,836. Yes, Kaffirs living on the farms?—The conditions were, when the owner of the farms required the services of the Kaffir in connection with sowing or reaping, then the native had to go and assist. In consideration of that he lived on the ground. When the farmer required him specially for some other labour in connection with the farm, he paid the native extra.

8,837. Did the Kaffir pay rent?—No.

8,838. Is it a usual condition in the district that they do not pay rent?—There are exceptions. Sometimes there are Kaffirs whom you engage to work from time to time paying them about £1 a month and giving them their food.

8,839. Yes, but what I want to get at is, are there no instances known in the district of natives squatting on farms and paying rent, besides giving service?—No.

8,840. Did I understand you aright when you said that if locations are broken up there would be too many Kaffirs for the farms, more than sufficient?—Yes.

8,841. What was your experience before the war? Did you have sufficient labour?—Yes.

8,842. Therefore, as you have already told us, the present shortage in the supply is temporary owing to the Kaffirs being better off through the high wages from the military, and there is therefore every possibility that they will in the near future get back to that position of the pre-war days?—Yes.

8,843. Mr. GOCH: The last answer given by you, I take it, does not mean that we have only to wait a little while and things will right themselves?—It would be a bit risky to just wait on. What I meant was that the Kaffirs have now been used to living on their own, and so I do not see that the only thing we should do is to wait for them to become poor or worse off.

Mr. J. J. VAN STADEN, called, sworn and examined.

8,844. The CHAIRMAN: Where do you live?—At Waterberg.

8,845. Are you a farmer?—Yes.

8,846. Do you cultivate your farm?—Yes.

8,847. What is the size of it?—I have an eighth portion of a farm.

8,848. And what is the size of that one-eighth portion?—It has not been actually surveyed. It is still undivided.

8,849. Is it an eighth portion of a 3,000 morgen farm?—No, it is an eighth portion of a 5,000 morgen farm. No, the whole portion is only 3,700 morgen. I cannot say positively; it has slipped my memory.

8,850. How many acres do you cultivate?—It is difficult to say. I have my own lands over and above what my bywoners use, and I used to put in ten bags more, that is oats and corn.

8,851. That would be about 40 morgen, would it not?—No, I have never enquired how much a morgen is.

8,852. Have you any Kaffirs living on your farm?—Not at present. They used to live there.

8,853. How many Kaffirs do you employ?—I used to have five or six grown-up Kaffirs and their children too.

8,854. Before the war?—Yes.

8,855. How many Kaffirs do you employ now?—The farmer Kaffirs are still working for me, but they do not belong to me any more.

8,856. You are using five or six Kaffirs now?—Well, I have to say that at present I am not employing any on account of the number that are in the Government service.

8,857. Why will they not work for you in preference to working for the Government?—Because I have not food to give them. It is very difficult for me to manage.

8,858. Did you have any difficulty in getting all the Kaffirs you wanted before the war?—No, I got plenty then. Well, not plenty, but I got sufficient for the work.

8,859. Mr. BRINK: What about the thickly populated districts? You know there are a lot of natives there?—Yes.

8,860. Many more than sufficient to meet the agricultural requirements?—I should think there are about 1,000 Kaffirs for each farm.

8,861. How many locations are there in the Waterberg district?—I cannot say that for certain at present.

8,862. There are a good few?—Large Kaffir chiefs, kings, there are four in the Waterberg district.

8,863. And there are a great many petty chiefs?—Yes.

8,864. And they live in Government locations?—Yes, the large chiefs.

8,865. And the petty chiefs?—Some of them live on companies' property, and some on farms, and some on Crown land.

8,866. And according to your opinion that is a mistake?—No, not exactly.

8,867. Are you against the Squatters' Law?—No, I am not exactly against it, but in my opinion it is not exactly the thing that will make the Kaffirs in my district work—make them serviceable.

8,868. Can you suggest anything better to this Commission that we can lay before the Government?—I would not say better, but I can give you a plan.

8,869. Will you give it to us?—If the Native Commissioner or some competent person could go to these chiefs, but especially the Native Commissioner, if this official would go round and explain to these chiefs that it is absolutely for their benefit to work, and that they ought to work, I think that it would have a good effect.

8,870. You mean that the Native Commissioners should go to their chiefs and tell them that it would be good for the natives to work, good for their health?—I mean there must be some order.

8,871. Yes, but what kind of order?—I mean that they must be compelled. The case is that the majority of the Kaffirs there are still in a very wild state; they must be tamed.

8,872. It will be good for the Kaffir when he is compelled to work? It will make him a civilised man. Is that so?—Yes, it will be good. The Kaffir is like a horse. No horse in the wild state would want to come to the stable of his own accord. You must first catch him, and tame him, and break him in.

8,873. We all know that the Waterberg is very thickly populated. Have you any idea about the native population?—The law used to be that when a fieldcornet had 3,000 natives living in his district he was appointed an Under Native Commissioner. There were two fieldcornets appointed Under Native Commissioners, that would mean 6,000 Kaffirs. Besides this, the farmer had the big native chiefs directly under him; that would be another 4,000, so altogether I think that there must be about 10,000 Kaffirs in the Waterberg district.

8,874. That is the total population according to your idea?—Yes, according to my opinion.

8,875. How many able-bodied men would there be out of 10,000?—That is just what I mean. There are 10,000 able-bodied men—I am only speaking of men, not of women and children.

8,876. That would be a population more or less of 50,000?—It is quite possible. It is a very large district. The people are very numerous.

8,877. Can you give us any idea how many farmers there are in the Waterberg district?—I do not think there are more than 800, if there are so many.

8,878. And their requirements would be on an average?—I am only speaking of the average number. Some of them require more, some less. My opinion is that about five would be sufficient. But you must understand some would be able to manage with two.

8,879. And therefore for the present requirements of the agricultural community of the Waterberg district you require about 4,000 labourers?—Yes.

8,880. And you have a surplus population of about 6,000, making up the 10,000? Have you any idea how many natives leave the Waterberg district to seek employment elsewhere?—I cannot say exactly. Since the war I have not been going about the district much. A large number of natives pass my farm. I should think about 100 a month pass down south in this direction. There are 104 Kaffirs working on my farm on road making.

8,881. I suppose there are other ways for natives to come south, other than passing your farm? They need not necessarily pass your farm?—No, there are many other roads, and there is also the railway from Pietersburg. There are many roads; I am only speaking of the one passing my farm.

8,882. What is your idea as to whether there will be more than 800 farmers in the near future in the Waterberg district?—I do not think so. The drought has been very heavy and water is scarce.

8,883. I am not speaking of abnormal circumstances, but if we have our regular rains again?—No, I do not think so, because the Waterberg district is never taken into consideration much.

8,884. I see it is said you have in the Waterberg district 2,000 farms?—Yes, I believe that I am acquainted with the district, but the majority of it is dry country, bush country, the greater portion of the Waterberg is mountains and bushveld.

8,885. Surely there are some facilities for irrigation works, damming up some of the rivers? Have you any facilities for irrigation works in your district?—All the farms occupied at present have water furrows.

8,886. Yes, but are there no large rivers they could utilise? I do not say individual schemes, but Government irrigation schemes?—Yes, there are two large rivers, but even they have not got plenty of water when it is a dry season.

8,887. Mr. FORBES: Is there very much stock in the Waterberg district at present?—No, not much.

8,888. Consequently the farmer has to depend upon cultivation for his income?—Yes.

8,889. Is there a market for all you can grow?—We bring it to Pretoria and Johannesburg.

8,890. Is there no railway near?—Yes, there is the train from Nylstroom.

8,891. Then the cultivation you can do is simply a matter of labour supply?—Not at present. What is mostly required now is manure and water. The soil is very poor and requires a great deal of manure.

8,892. Is it not a good agricultural district, then?—Yes, it is good if it is manured.

8,893. Mr. EVANS: You referred to natives being employed by the Government. Are there a large number being employed by the Government?

—I do not know every place. There are other places where they work for the Government, but on my farm there are 104 at work.

8,894. What are they doing?—Working on the road.

8,895. What are they paid?—£2 per month.

8,896. Are they also fed?—Yes.

8,897. What is your opinion of £2 per month for Kaffirs in that district?—For the farmers it is too much; the farmer cannot pay it.

8,898. How long has this been going on?—Since May they have been working there.

8,899. Why are the Government paying them such a high rate of wage, do you know?—I do not know that.

8,900. Could they not have got enough labour at a lower rate in that district?—I cannot say. That is the wage they have been offered, and on that the Kaffirs came. The supply is always sufficient, but it is very difficult work. They are doing a day's hard work.

8,901. What is the work they are doing?—Excavating the road through the mountains; excavating gravel and putting it on to Scotch carts, also making furrows.

8,902. Are any white men employed on that road?—I am not quite certain, but I think about 300.

8,903. Where does this road lead to?—From Nylstroom. It is the road that is being made across two mountains towards the Crocodile River.

8,904. Are they making a new road or simply repairing an old one?—It is the old path, but the greater portion of it is being made anew. Where it used to go crooked, they are now making it straight.

8,905. What is the opinion of the farmers about this? Do they consider that the employment by the Government at such high rates of wages is depriving them of labour?—No, not at present, because it is very difficult work. They have to work from 7 in the morning till 5 at night. There is always an overseer watching them and it is very hard work they are doing, so I do not hear people say they consider the wages paid are too much, on that account.

8,906. And it is not considered that the action of the Government in employing these men is depriving the farmers of labour?—Not at present, because there is the famine amongst the Kaffirs and the whites, and every class has to work now to live.

8,907. A previous witness told us that he thought too much leniency is being exhibited by the authorities towards the natives?—You mean general leniency, but this is very hard work. I am not partial to the Kaffir, but I do not think they are treated over leniently.

8,908. You have no reason to complain of the leniency shown towards the men?—No, not as far as I know.

8,909. What would you consider fair wages for a Kaffir on a farm?—The usual custom used to be that the Kaffir worked for the owner of the farm just for living on the farm. I do not think they ought to be paid anything if they live on the farm, and if they have as much land as they like, and chop down trees.

8,910. Are you in favour of allowing them to have as much land as they like to till on the farm?—No.

8,911. Would you limit the acreage which a Kaffir is allowed to cultivate?—I should limit it so that he could grow sufficient food.

8,912. What policy would you recommend regarding Kaffirs who are squatting on Government land?—I should recommend that they should get a certain amount of land to till, and if the Government required labourers, as they always do, they should get them to work.

8,913. Would you allow them to go on Government land as they liked, or would you recommend, as previous witnesses did, that they should get the consent of the authorities?—My recommendation is that a Kaffir should not be allowed to trek from anywhere, whether from private farmers or locations, without the consent of the Government.

8,914. Would you discourage squatting on Government land?—I would be decidedly against it if it were to draw Kaffirs from the farmers.

8,915. Mr. PERROW: What do you think is a fair price for a boy working on a farm?—£1 per month.

8,916. That is the average?—Yes, it is the average. There are certain seasons when the farmer can afford to pay more.

8,917. If you offered the Kaffirs £2 10s. a month do you think you could get sufficient native labour for your farms?—It depends on the holder of the farm. He might get sufficient, and he might not.

Mr. E. S. GROGAN was called, sworn, and examined.

8,918. The CHAIRMAN: Have you before you a statement headed "Evidence of Mr. Ewart Grogan"?—Yes.

8,919. Do you hand that in as your evidence-in-chief?—Yes.

8,920. I herewith beg to submit such evidence as I believe may be of assistance to you in your enquiry.

I may state, in introduction, that my actual experience of Africa and its inhabitants has been spread over a period of time amounting in the aggregate to nearly five years. Every part of the Continent that I have visited has been selected for some specific purpose.

The main drift of my intentions has been to study the necessary lines along which the development of the Continent will probably evolve. I need not point out that the available labour supply is one of the most important factors in such development. It goes without saying, therefore, that it is a matter to which I have given special attention, and I may add that I have visited Brazil and the Southern States of North America for the express purpose of seeing whether my conclusions are borne out by the actual experience of history. Further, I have had the advantage of meeting in the course of my travels almost all the prominent African explorers of the day. I mention these few points to indicate that my expressions of opinion are based on careful study and are not mere reflex actions of the mind, such as are evident in much of the information provided by men who have visited various parts of the country for purposes other than the study of the local economics, and whose interests in the various problems has often been aroused only after they have left.

For convenience, I will put my evidence under two heads:—

#### I. General considerations.

#### II. Specific areas and their component tribes.

I. General Considerations.—The range of my studies is embraced by what I may term a flying survey of the centre of the Continent from Cape Town to Cairo and the East Coast from the Somali Coast to Durban. I have come in contact with almost all the tribes embraced in this sphere, either "in loco" or as members of various caravans. Naturally, my knowledge of them varies enormously, but for the purposes of your enquiry I can with confidence deduce certain broad generalities of enormous importance.

(a) I am convinced that all expressions of opinion as to numbers of inhabitants are worthless, unless based on an actual census or some quasi-scientific method of calculation, for the following reasons:—

(1) The populations of even the comparatively settled portions of Africa are constantly shifting.

(2) The ordinary traveller is forced to follow the existing lines of communication, which are the

native paths from village to village, or waterways, which always concentrate native populations. These aggregations are no criterion of the balance of the country.

(3) The tendency of natives to collect for the purpose of investigating a traveller is very deceptive.

I would venture to suggest, therefore, that, to assist your estimates of population, you should allocate all tribes to one of the following stages:—

- (1) The nomadic horde.
- (2) The pastoral solely.
- (3) The pastoral cum-agricultural.
- (4) The agricultural.
- (5) The commercial.

For tribes in the first three of these stages the land has a limited carrying capacity, fixed naturally by the nature of the land. By taking some sort of arbitrary ratio of type of native to area of land, based on the mean of a variety of estimates from competent observers, it should be possible to roughly fix the maximum possible population of the inhabited areas.

My own estimates of the maximum carrying capacity of the land of Africa taken as a whole would be for the nomadic horde stage:—

- (1) Open or light bushveld—1 to 10 square miles.
- (2) Forest—1 to 5 square miles.
- (3) Swamp—1 to 1 square mile.

The pastoral stage 1 to 1 square mile.

The pastoral cum-agricultural stage, 2 to 1 square mile.

The agricultural, dependent on proportion of good land, always remembering that natives are excellent judges and will only work the best.

The commercial.—Commercial centres are very limited.

For practical purposes we can eliminate all those people who come under (1) and (2), viz., nomadic hordes and pastoral peoples.

(b) In many of the Central African and Northern African tribes caste is highly developed. This is especially conspicuous in those regions which have been affected by the ebb and flow of Arab, Galla, Nilotic and Zulu waves of migration. We can similarly eliminate the members of the dominant castes.

(c) Many tribes can be described as predatory, that is, they depend on their neighbours to supplement the shortcomings of their own production. As types, I would suggest the Angoni, Awemba, Masai, Matabele and Dinkas. It is almost impossible to induce this type to undertake work less dignified than Shikar, policing or military.

(d) Enormous areas of the Continent are desert and uninhabited, while vast areas have been depopulated by roving cannibal tribes, African Napoleons of the type of Kabarrega of Unyoro, Arab slavers and the myrmidons of Belgian philanthropy.

(e) A considerable proportion of Central Africa may be described as the "banana belt," that is to say, the staple diet of the people is the banana. It would seem that the digestive organs of the banana-feeding type become atrophied, as a change to a grain diet invariably causes acute dysentery. Examples: (1) The experience of the attempt to introduce Baganda canoes on the Nile, loss of 90 odd per cent.; (2) the experience of my Ruanda men; (3) the mortality among Baganda carriers crossing the Athi plains.

(f) The demand for labour locally through the greater portion of Africa is very considerable. From Bohr on the Nile down to practically the Zambesi, there are scarcely any working animals; it follows that everything has to be carried by natives. For instance, the maintenance of six officials and two white traders at Ujiji necessitates

an enormous number of carriers; over and above this there are the trade goods of a large Arab and Swahili trading community.

Throughout Central and Northern Africa there is an enormous volume of trade, entailing the coming and going of tens of thousands of carriers. The annual wastage of carriers by death cannot be less than 10 per cent. I have seen no part of Africa where there was not a perennial shortage of labour. (Sir Alfred Sharpe told me a few weeks ago that there is now a surplus in B.C.A.).

Personally, I always had the greatest difficulty in supplying my modest requirements, except at Ujiji, where the Germans gave me every possible facility. Examples: (1) Delay of Mohun's expedition on Tanganyika Plateau and failure to construct telegraph; (2) my delay at the same place; (3) attempt to construct road across plateau; (4) Uganda Railway; (5) Railway from Boma to Stanley Falls; (6) Nile boat transport.

(g) Work, I take it, is the child of necessity, and in all niggerdom there is no necessity worthy of the name. There is no nether millstone in the economics of the African native's sphere in life. His problem is easier than that of an English factory-hand with a seat in the country, because his wants are less. With the exception of the very few districts such as Basutoland, where the population seems to be pressing on the local means of subsistence, the native has no need to work. Excepting under British and German rule, there are various checks on population which have deferred such pressure on the means of subsistence.

Small needs, warmth and facility of production have combined to produce a creature more indolent even than the South Sea Islander. The cultivation of additional wants and restriction of available land are the only possible influences which will make the negro a worker; and as to wants, drink seems to be the only one that persists. The taste for gorgeous blankets, panamas, striped trousers and spats is rapidly satiated. As a result, the nigger of the Southern States, after all his 300 years' contact with civilisation, is in the bulk still the same pleasing gentleman who shoulders ladies from Commissioner Street (I had nearly said) pavements. This indolence, the product of countless ages, cannot be eradicated except by indefinitely sustained necessity of action. To this the nigger prefers death, as witness the Belgian massacres in the Congo.

(h) As to the influence of taxation on labour supply (a) in most cases taxation can be met by sale of surplus produce; (b) under heavy taxation those who live near the border cross over to where taxes are lighter or are not easily collected; (c) the tendency will be to raise the wage and thus reflect it on the white employer.

(i) I believe that the sole way by which the native can be made to feel taxation and induced thereby to come into the labour market is by being prohibited from squatting on land unoccupied by whites and confined to locations, where the tribe collectively pay taxation based on the unimproved value of their location. If this were done, the native would be forced to work reasonably hard, while it would be optional for him to confine his attentions to his land or go into the open market. The farmer's interests would be served by making the farmer himself pay (say) £1 per family up to three families, £2 from three to six, and £4 from six to ten, allowing him to make what terms he could with the families, who would pay no taxation direct, and only allowing such an arrangement where there was personal residence on the part of the white. Under some such scheme, the tribal entity would be maintained (most important), every native would be forced to work and at the same time there would be a minimum of interference with their personal liberties, while the problem of the farmer would be solved.

Further, the natives in their locations should be subjected to all the liabilities of the white man, such as excise on the production of intoxicating drink (the payment could be compounded on basis of population or area cultivated for beer-making).

Fencing, Dipping, Elimination of Cattle Diseases, etc.—I believe strongly in making them collectively responsible for all dues, and think that the tendency to individualise communistic peoples is disastrous to their welfare.

(j) I am sure that there will be very general opposition to the exportation of labour throughout Africa. Even under existing primitive conditions of development there is no general surplus, and the tendency of exportation will be to rapidly raise wages throughout Africa to a point which will seriously handicap, if not effectually stop, any general development of the Continent. The highest rate of wage ever paid rapidly becomes the minimum, and there is practically no downward fluctuation, because the native is so fortunately placed that he can always hold back his "goods." He can wait with a vengeance. Thus any decrease of wage would immediately check supply, while an increase would not augment the supply in gross, though it would, of course, divert a certain proportion from other less advantageous openings. We must always remember that "curiosity" is the native's main incentive to work. If he has not "got it in his head to work," no figure offers any additional incentive. But, I repeat, a decrease on the customary wage will immediately drive the idea of work out of his head.

There is, however, a certain small floating portion of the native population, depatriated, who are more or less subservient to the action of the law of supply and demand.

(k) Many of the Central African tribes are seriously afflicted with the following transmissible diseases:—

(1) Syphilis.—In my Tanganyika caravan of 150 there were at one time 64 cases.

(2) Leprosy.—On Chiperoni there are entire villages of lepers.

(3) Elephantiasis.

(4) Beri beri.

(5) Guinea worm.

I am certain that the mortality among tribes who have been used to a climate without extremes will succumb very rapidly to the damp cold of the Rand summer and suggest that all experiments be made during the dry cold of winter.

To summarise: It must be borne in mind that South Africa is the least civilised portion of the inhabited parts of the Continent as far as the natives are concerned.

The volume of trade among the Central and Northern African tribes is very considerable, and this necessitates the constant employment of very large numbers of men.

Large areas of forest, salt desert, marsh and thorn scrub are only inhabited by pigmies and tribes such as the Wandorobbo. Practically we can eliminate the military, pastoral, hunting and fishing tribes, and all the Arabs, Nilotics and Gallas.

The requirements of other administered parts of Africa are considerable, and the demand everywhere exceeds the supply.

Climatic and food conditions render the successful employment of a large proportion of the population improbable.

The cost of collection in the far interior and of transport will be enormous.

The tendency of the native wage will be to increase without any possibility of relapse.

The physical effectiveness of the tribes who live elsewhere than on the highlands is very small, and as one approaches the rich, well-watered and luxuriant lands of the interior this becomes very remarkable.

No permanent effect can be obtained by existing methods of taxation.

The population of Central Africa is surprisingly small, and the mass of population appears to be concentrated on the east and north-west of the Continent.

#### SPECIFIC AREAS AND COMPONENT TRIBES.

I can give information about the following tribes with which I came into close contact:—

Pungwe District:—Gungunyana, Gorongoza, Makombi, Sena.

Zambesi and Nyassaland.—Wakunda, Wanganja, Asiska, Angonis, Yaos, Atonga, Wankonde, Wa Haha.

Tanganyika Plateau and Congo Sources.—Awemba, Mambwe.

Tanganyika Basin.—Manyena, Wanyamvesi, Warundi.

Kivu Basin.—Waruanda (Watusi, Wahutu), Batwa, Maleka, Apemen, Bunyabungu, Wanyabinga.

Albert Nyanza Basin.—Watoro, Wanyoro, Baganda, Balegga, Wanyabuga, Semliki, Wakoba, Lures.

Nile Basin.—Shulis, Madis, Baris, Dinkas, Woatsch, Nuers, Shilluks.

Somalis.—I can also give evidence on the batch of Wakunda and Senas recently remitted by Mr. Nourse. I went and spoke to them and know their villages.

8,921. You state here that you have in the aggregate some five years' experience of South Africa?—Of all Africa.

8,922. All Africa?—Yes.

8,923. You have visited a great many parts of it?—Yes.

8,924. And in visiting these parts of it you have generally, or always had, some specific purpose in view?—Yes.

8,925. You have travelled, I understand, on one occasion from the Cape to Cairo?—Yes.

8,926. Overland?—Yes.

8,927. On foot, I suppose?—When I could not help it.

8,928. How long did that take you?—It took me just over three years.

8,929. You knew the late Mr. Rhodes, I think?—Yes.

8,930. Intimately?—In a way. I did not know him very long, and I did not see him very often; but in some points I knew him intimately.

8,931. Did you know his views as to the population of Central South Africa?—He imagined it was very dense.

8,932. He thought it was very dense?—Yes.

8,933. Was that opinion shared by people you knew at that time whom you met at that time?—Before I went through the country?

8,934. Yes?—I think there was a prevailing impression that the population in Central Africa was dense. I think that was largely due to the particular lines of approach of explorers into the country, who followed mostly the Congo River. The majority who approached Central Africa either went up the Congo River or one of its tributaries, or they went from the East Coast, which is the main trade route for all the Eastern trade—the Oriental trade from Zanzibar; and, naturally, any one passing on either of these two routes would find two of the most densely populated portions of Africa. I do not think it was the general impression amongst hunting explorers of Africa that the population was dense. I know I have talked constantly with Mr. Selous and Mr. Coryndon, and they have always remarked on the extraordinary sparseness of the population of the greater portion of Africa as they know it. Speaking generally I mean to say.

8,935. What was your object in this journey you took, Mr. Grogan?—Well, it was mainly to see whether Mr. Rhodes' scheme was a fros. or not. There was a very sharp division of opinion on that point at home. A lot of people said it was spoo and others said it was practicable. I thought I should like to see.

8,936. What do you mean when you speak of Mr. Rhodes' scheme?—His scheme of making a line of communication through the centre of Africa. It really was not a scheme, but that was the cloak under which he developed his scheme. His scheme, as I take it, was one of the developments of the whole of Africa, and the concentration as far as possible of the strategic points in British hands. In order to attract public attention, which was necessary to carry out his scheme, he propounded the idea of a trans-continental railway which in itself is of course absurd, as he very well knew.

8,937. As a result of that walk through the country, Mr. Grogan, you were brought, during that period of three years, into touch with very many of the native tribes of Central Africa?—Yes. The tendency of the tribes of Central Africa is to cover a very large area of ground. You get tribes like the Ruanda covering an enormous area of country, and although they are divided into sub-tribes their characteristics are the same.

8,938. I take it you are not able to form any reliable opinion as to the population of Central Africa?—Absolutely impossible, excepting so far as concerns the general impression that is left on my mind. My general impression of Africa as a whole is that it is a very sparsely populated country indeed as compared with other countries.

8,939. Yes. How then do you account for the opinion which Mr. Rhodes held, and which others have held, as to the denseness of the population?—I think it was largely due to the writings of Stanley and Baker and others who have visited certain portions. And, naturally, in describing the scientific side of the question, as many did, they devoted a great portion of their remarks to peoples and tribes. My point is that if a man discusses in, say 20 or 30 pages, a village where he has been, and where there may be a large conglomeration of natives it would leave the impression on the mind of the reader that the country is swarming with population, as it did on my own mind before I saw for myself. This was one of the points I wanted to ascertain. I wanted to see in Africa what the population was approximately, to get some rough idea as to whether this enormous number of natives which Mr. Rhodes counted upon was available. It was one of his main arguments in favour of his railway. Whether he really thought it or not I do not know. Anyhow, he told me that what I told him surprised him very much, because he thought that Africa was very much more densely populated towards the interior than I led him to suppose it was.

8,940. I think you state in your memorandum that the impression about a dense population might be created by the curiosity of the natives who flocked to see Europeans?—Certainly.

8,941. And there are other reasons?—Yes. The average man travelling in Central Africa goes for some purpose, probably trade, or the intention to get to some more remote point, to get to that country or to move through that country he has to move along what one may call the lines of communication of the country, usually from village to village. It is the only way he can get food, and probably the only way in which he can get water, guides and general information. So that it does not give him any criterion of what there is on either side of his particular track. The probability is that his track is the most densely-populated portion of the country. Rivers and water-ways of any kind tend to concentrate population. They are the only lines of approach.

8,942. Then in what way did your observations or your object differ from those of the persons you have just described to enable you to arrive, as you seem to think, at a more accurate or just view?—I do not claim that at all. But nearly all the time I was in the country I was hunting, and to go hunting you must avoid with the greatest care the centres of population. You keep off the main lines of approach if you want to get any game, or you only use them to get from one point to another, or

use them as headquarters and strike off into the country round about. Similarly when you are making a survey of the country, a rough survey, a flying survey, as I was doing, you have to cover a very large area of country, irrespective of population, because you want to get your essential points.

8,943. Then you wish the Commission to understand that the general conclusions you draw as to the absence of a dense population are conclusions which hunters have also drawn?—Certainly; the majority of men that I know, who are acquainted with the particular parts that I speak of, and other parts remote from civilised Africa, their general opinion, as I have always gauged it, is that Africa is a very sparsely-populated country. It must of necessity be, because of the nature of the methods of existence of many tribes. For instance, purely nomadic tribes, such as the pigmies and the Wanderobbo, who live by hunting, must have enormous areas of country to support them. Similarly the pastoral folk, but of course in a lesser degree.

8,944. Then your experience leads you to lay down the dictum that unless one can get an actual census of a tribe or people, guesses on the population are very unreliable?—I say guesses are very unreliable indeed, unless they relate to a very small area where a man could make practically a mental census. But from passing along a single track in a country the size of Europe, to give an estimate of the population is absolutely impossible, unless it is based on some sort of principle or method such as the carrying capacity of the land, and so on. A mere guess from what you have seen would certainly be very foolish and carry no weight whatever.

8,945. You would advise the Commission, then, to receive all such statements with considerable reserve?—Certainly; unless you can strike a right average from the opinions of a very large number. If a very large number expressed an opinion on that point it would afford some indication, then.

8,946. You state that there is a considerable demand in most of these countries for labour for their own purposes?—Yes.

8,947. You point out that the native in Central Africa, at least where there are rivers, is the beast of burden?—A very large percentage of the entire population of Africa are slaves and in slavery to-day.

8,948. I was thinking more of the actual work that they do apart from the condition of slavery or otherwise?—You mean that owing to the absence of animals or any artificial method of transport the native has to do everything?

8,949. Yes?—All over Central Africa, owing to the existence of the tsetse fly, all along the coast and rivers there are no animals of burden at all. In German East Africa, for instance, I do not suppose that away from the coast there are 500 donkeys, and they certainly have been introduced in very recent times. The Arabs used to bring a few to ride on but they used to lose them very fast. They used to bring them up from the coast and lose them, and next time they went down they would bring more. They are never used for general purposes of transport because they do not exist.

8,950. Then all transport is done by natives?—All done by natives, except on the lakes, where, of course, they have dhows and shipping. But, owing to the absence of waterways and absence of animals there is an enormous drain on the population to carry out the ordinary requirements of the country. Nearly the whole of Central Africa and Northern Africa has a very complete system of commerce, which has existed for hundreds of years, something which we cannot understand down here at all, something quite distinct. Before the advent of the white man, I take it, there was no inter-tribal trade to speak of. It is now the basis of all life up in Central Africa. As an example of that I may say that the lingua franca of the East Coast, the Swahili, which is the trade language of the Coast of Central Africa is understood in nearly every village throughout Central Africa, and a man who speaks

Swahili can go from the Zambesi to the Nile and to the mouth of the Congo with that one language. That will give a very clear indication of the enormous ramifications of Central African commerce.

8,951. What does that commerce chiefly consist of?—Well, it has all been organised by the Arabs, the half-breed Arabs, the Swahili who settled down amongst the population and played one tribe off against another until they got sufficient power to slave raid. They captured the slaves, and with these slaves they took the ivory and rubber and a few other products of Central Africa down to the coast and sold the slaves and the products with them. Then they came back empty-handed, or with a few guns, and started again. There has been a continual drain on the whole of Central Africa for centuries of a very large portion of the male population.

8,952. We have had it in evidence here that there is a very considerable population in Central Africa available for importation to the Rand. Do you agree with that view?—Are you speaking of Central Africa or British Central Africa?

8,953. British Central Africa is the district I was speaking of?—That is only a very small portion of Central Africa.

8,954. I am thinking now of the evidence given by Mr. Ross (v. pp. 16-20)?—Yes, that is British Central Africa, or Nyassaland. When I went through the country there was no labour to be had; that is to say, what labour there was was in use. All the labour that was available was in use, and there was a demand for twice as much, because a large amount of transport was done by natives, and there were a lot of coffee plantations developing in these districts, which also created a very large demand for labour, and there were big expeditions from Nyassa to Tanganyika carrying telegraph stuff. One went the same time as I did. These also required a large number of natives, and could not get them. Since then conditions have to some extent changed, I think, owing to the better organisation of the country, and inducing the natives by taxation and other means to come out and work. Sir Alfred Sharpe told me the other day when he was down here, there was an actual surplus of labour there now. I believe that it is attributable to the fact that a large number of these coffee plantations have gone out of cultivation owing to some pest—wire-worm or root-worm, or something of that kind. That would account for a temporary difference. The natives get into a certain channel, coming down at certain times to avoid taxation. They come down in increasing numbers from year to year, and having got down to this country considerable distances from their kraals they find there is no labour for them because of this check to the main industry of the country. I imagine that, as soon as they begin to build their railway any surplus labour they may have there will be rapidly absorbed until they have built the railway, and then it will relieve the situation, because it will relieve the carriers on the line, although if it tends to increase trade, as I presume it will, it will increase the demand for carriers away from the rail. So that very likely the position will be about the same.

8,955. Then from your knowledge of British Central Africa, do you think we can look to that country for a number of years for any considerable supply of labour for the Rand?—From what I saw when I was there I should be very much surprised, but as I say the conditions may be very materially altered since I was up there. There was another factor at work. Even in my time natives were swarming over from Portuguese into British territory and the result was you were getting an intense aggregation of native population within a limited area. Once you get that the native is bound to go out to work to supplement the living which access to the land gives him.

8,956. Dealing with other parts of Central Africa beyond the British sphere, do you think from your experience that we may look to that country for any appreciable supply of labour for the Rand?—Well,

that is a very broad question. The subject has so many contingencies. I should say that suggesting that we could get permission to drain all Africa for our own needs in face of united opposition of the rest of the Continent, which we should certainly have to contend with—supposing that the native lives when he comes down here, and supposing that he would come—supposing that he is satisfied when he does come, and supposing that he can be induced to stop away from his kraal longer than a year, because it would take three months at least to get him here and three months to get him back, so that you will have to keep him at least two years for him to be of any use—supposing this, I should say that in ten years' time, with the expenditure of several millions of money, because it would be very expensive to form an organisation in these portions of Africa, owing to the enormous cost of living for a white man, and enormous difficulties of transport, you might possibly get 30,000 labourers. That is a mere venture, of course, a mere guess—I would not undertake to do it on any terms myself, and I do not think for one moment that you would possibly get more even with the most perfect organisation and unlimited expenditure. The mere fact of sending men there to organise the thing would dislocate the whole supply of the country at once by the additional requirements which would be caused.

8,957. You mean as carriers?—For the men that you sent. A small expedition like mine was sufficient to demoralise the whole district with regard to labour supply.

8,958. How many men did you employ as carriers?—The maximum I employed was 150—that was on the Tanganyika—and the minimum was two.

8,959. I suppose it is the larger figure which would disorganise the labour supply?—No, because there the Germans simply turned the men out and said, "You have got to go." In the particular part where I got these natives, you have got what I may call a nomadic type. They are liberated Arab slaves in many cases, half-castes, Manyema and Wanyamwesi, who have been carriers for generations, and who are now liberated from slavery, and therefore thrown on their own resources with no land of their own and no tribe. They are regular carriers and live by carrying. They go down to the coast, and, if they survive the journey, then they spend their money on drink, and then they go back again, and, if they again survive the journey, they mess about the country again until their money is gone. So they go on until the end; they never settle.

8,960. You know that Chambers of Commerce in one or two Central African places, and missionaries, have opposed strongly the emigration of natives from these parts to work here?—Yes.

8,961. The Chambers of Commerce have declared, I think, that they have not sufficient for their own purposes?—Yes.

8,962. Does that agree with your experience?—I should say so, certainly. The coffee planters in British Central Africa, when I was there, told me that a rise of 1s. in wages would wreck every coffee plantation from one end of British Central Africa to the other. Therefore they are justified in objecting very strongly to any exportation of labour, because if you bring 1,000 natives from British Central Africa down here, and you pay them anything like the local wages within the year you would certainly have doubled the wage in British Central Africa, and you will wreck every coffee plantation in the place.

8,963. Then I take it that even supposing we can get labour from British Central Africa, the health of the natives will be a serious matter?—You give certain illustrations on page 3 referring to what to you were well known examples of the effect of removing these banana-feeding or fruit-feeding natives to a country where they are obliged to subsist on grain? What were the experiments you refer to?—The first was an attempt of the Uganda Administration to organise a system

of transport on the Nile, for which purpose they collected a lot of Bagandas to work there. The difference in altitude was about 1,500 feet, and as soon as you get down on to the Nile the banana disappears entirely. This was when I was there, and the man in charge told me that he had lost 90 per cent, of these Bagandas from dysentery. I suppose they would be there for about two months, perhaps less, and while I was there the balance of them died from acute dysentery. There was no means of checking it at all. The second point was a similar thing. I took a few men myself from Ruanda country down to the Nile, and they all died in the same way. When I say all it is not quite correct, because two of them were killed by mosquitoes; the others died of dysentery. The third case is the old caravan route over the Athi Plain from Mombassa to Kampala in Uganda. I have never been there myself—I am speaking from hearsay—but the men who pass over the old caravan route always describe it as being white with skulls of carriers who have died on the way. Of course it is not all due to this cause, because there are frequent droughts and other things, but it is always understood in that country that as soon as you take an M'Ganda down to the plain where he cannot get bananas he dies of dysentery.

8,964. Sir Godfrey Lagden, in his evidence, said he disagreed with the theory that any native from South or Central Africa would not be expected reasonably to withstand the cold winters here. You do not share that view, I take it?—It is not the cold winters, I think. So far as my experience goes in caravans and so on, where one goes through all sorts of climates and to all degrees of altitude, I have never lost my natives from the effect of dry cold. When I have lost natives, and I have lost considerable numbers at one time or another, it has been during hot weather, when you suddenly get very cold storms, sometimes accompanied by hail. I have seen natives lie down on the road and die within ten minutes in spite of every effort—unless you kick them about and keep them running round all the time they will die. I have lost a great many natives in that way from hailstones and driving rain coming in the middle of the ordinary hot weather. I have never lost men from dry cold, and I have gone to a height of 10,000 or 11,000 feet for a fortnight at a time, and been short of supplies and had no blankets, but I have never lost one. I have had no trouble at all.

8,965. Then dry cold does not very much affect them?—Not so far as my experience goes.

8,966. You have some experience, I understand, of Portuguese East Africa?—Yes, I was hunting there twice, about six months and nine months.

8,967. Do you know that we draw from Portuguese East Africa south of latitude 22 degrees the bulk of our labour for the mines?—Yes, that is the part I do not know. I know north of latitude 22 degrees from the big Sabi River up to the Zambesi. Portion of the country I know very well indeed; other portions I have only hurried through.

8,968. You have no idea of the population of the country, I suppose?—I cannot give any sort of figure. I can only say I know there are only three large agglomerations of natives. A very large area is unpopulated altogether. For instance, one north of Beira, there is a district there between the letters "S" and "E" of Portuguese on maps. You see there is a range of hills to the west, the Gorongozo mountains—practically speaking from the foot hills of the range of mountains almost to the coast there is no population at all. There are little villages here and there with three or four fishermen and there are a few men who live by hunting the buffaloes—a sort of Wanderobbo—that is a general term. It is not a term of a specific kind. They are the eastern edition of pygmy, and correspond to the bushmen of South Africa in type. All the country, if populated at all, is populated by nomadic fishermen, practically a negligible quantity, not one to twenty square miles.

8,969. Do you know any other part?—When you get into the hills you have a much denser population. You have got here people who are a very powerful people and have chased the Portuguese away several times when they have attacked them with Maxims. Then again you go further north and the next agglomeration of natives is in Makombi's country—to the north-west. They have a large population there in a very small area. When you get away from them you get again into the bush country where there is nobody at all, or these open swamps with a few nomadic fishermen, practically no settled population at all. It has never been safe for natives to this day to live in isolated kraals about the country. They live in big kraals where they can protect themselves, or else they do not live at all.

8,970. We hold certain evidence put before us as to the population north of latitude 22 in Portuguese East Africa based, we are informed, on the hut tax collection?—They mean nothing to me. For this reason, when I was hunting last in this country on the river which runs down through this particular part, the river Urema, there are two Portuguese districts there, and I took out a licence, as I imagined for the whole country, but presumably I had not got it for the right district, and so the Portuguese officials and a few policemen chased me all over the country to run me in for not having a licence. Whenever the natives informed me these Portuguese were anywhere near me, I crossed the river, and was as safe as if I had been in London—safer, because there was no extradition treaty, and they dare not cross the river.

8,971. You mean the Portuguese dare not cross?—They dare not cross. As soon as I got into Gorongozo's country, the Portuguese dare not cross the river.

8,972. Then the Portuguese had very little control over these territories you speak of?—Very little indeed. They exercise a certain amount of control within a ten-mile radius of any stations they may have. It may be anything. Up further north again, on Chiperoni, you may ask the natives there about the Portuguese, and they say, "Who are the Portuguese?" They do not know them.

8,973. But if the officials are able to show the collection of considerable hut tax as the basis of population, would it not be fair to assume that the population largely exceeded these figures?—It depends very largely upon how the hut tax is collected. These are rather delicate points and points it is difficult to get actual facts about, which you can swear to, because a large amount of it is native information which at the best is very unreliable. It is only by sifting it and taking the corn out of it, so to speak, that you can get any idea of the situation. But my idea, for what it is worth, is—and the way in which the hut tax is mainly collected in Portuguese East Africa—I am speaking of four or five years ago—is as follows:—Generally speaking, they took the people who lived in the immediate vicinity of the settlement, drove them in and forced them to work on Government works, such as roads and so on. They also forced them to pay sums of money, whatever they might have got, and they called that the hut tax. That is my impression from what I have seen, and from what the natives have told me, and my figures, based upon the collection of the Portuguese hut tax, suggest nothing to me except, perhaps, that their influence is growing.

8,974. Knowing something of the territory north of 22 degrees and the character of the natives living there, do you think that we can look to get any appreciable supply of labour from that territory to work here?—I should say certainly, in that district, because a very large proportion of the Shangaan tribe live there, and I always understood that the Shangaans came down to work in good numbers. You surprise me when you tell me that you do not get a large supply north of latitude 22 degrees.

8,975. The evidence given to us was that for 12 months ending June, I think it was, the recruiters north of latitude 22 degrees got between 900 to

1,000 natives?—I think in the natural course a large number of Shangaans must come down and be enlisted south of 22 degrees because I have always understood that a very considerable proportion—I am subject to correction—of natives working on the mines are Shangaans, and the Shangaan country is north of 22 degrees.

8,976. Now, leaving out the Shangaans, we were informed that within a certain number of years we might expect to get 60,000 or 70,000 natives from north of 22 degrees. Knowing the character of the natives, as you do, do you confirm a statement like that?—I cannot venture to make any statement of figures at all. It seems absolutely impossible to me, knowing the country as I do, because, as I say, there are only three considerable centres of population in that country—that are known. There may be others which I do not know, but I believe I am correct in saying there are only three very big centres of population, and in addition there is considerable development going on in that country itself. There is a considerable requirement for the upkeep of the Beira railway, to begin with, and also very considerable requirements for the town of Beira, and the plantations on the Busi River and the Pungwe River, which are increasing very materially. Then, in addition to that, on the Zambesi itself there is considerable development going on now in the sugar plantations. The sugar industry was a proved success when I was there, and I have reason to believe that since then it has developed very considerably, and will develop to a large extent in the immediate future. Then there is a part of Chinde and one or two other smaller ports whose requirements are considerable. There is also the cocoa-nut industry developing on the coast, to say nothing of mining in the vicinity at Macequece and Penhalonga and so on. I do not see where 60,000 natives can possibly come from in that country, I should think the figure very excessive, unless it was based on some very accurate figures, and I do not know what it would be based on.

8,977. It was based on this, Mr. Grogan. Previous to the war there were 80,000 Portuguese natives working on the Rand, or, to speak properly, in the Transvaal, which is practically the same thing. There are now working in the labour district of the Transvaal something like 55,000 Portuguese natives. The witness of whom I am speaking, Mr. Mello Breyner, said we would not only get up to the 80,000 from south of latitude 22 degrees during the next two or three years, but we should ultimately get 110,000 south of latitude 22. Then being asked about the country north of latitude 22, he said by starting a stream of emigration from that country for a number of years, we should gradually get a permanent proportion up to 60,000 or 70,000. That was the estimate given us based upon some considerable knowledge of Portuguese territory?—I know that when I was there, before I started my journey, it took me a month to get 30. That was to hunt, and the natives will always go hunting if they possibly can, for the sake of gorging themselves with meat, yet it took me a month to get 30. As I say, a large proportion of that country is not populated at all. I do not know whether Mr. Mello Breyner has travelled much through this country, or stayed at the stations at the main centres, but if he had hunted over that country I do not think he would say that he could get as many as that or anything like it. Of course, as I said, the native population is very deceptive, and it is quite likely that I may not have seen all the centres of population, although I know that I have seen three main centres. There may be others that I have not seen, and never heard of, and which he may know, but if his figures are based on Portuguese statistics they are very unreliable.

8,978. Mr. GOCH: Will you define on the map where the country is where the Shangaans come from?—I have always understood that it lies round the Busi River which runs into Beira Bay. I have had Shangaans boys in that country. They told me that their chief kraals were over the Busi River, in that district round about there. I have

been told about the head waters of the Busi River, but I have only crossed it once in the lower reaches. So that I imagine that a considerable portion of the boys, who are gathered south of 22 degrees, really live north of latitude 22 degrees if they are Shangaans.

8,979. On page 4 of your statement you refer to certain examples to prove the scarcity of labour. Will you illustrate these examples a little more. What is the first?—The first one is an expedition sent by the Government of the Belgians to endeavour to construct a telegraph line from the west coast of Tanganyika down to, I think, the Stanley Falls or some point on the Congo. I happened to meet the agent in charge on the way up, and we journeyed up together a great portion of the way. I do not know what his plans were exactly, but I imagine he must have had about 1,500 loads of goods with him altogether, speaking at a venture. It took him, to my knowledge, five months to get that material carried 200 miles, and then afterwards, when he eventually transferred his material to Tanganyika and got to his base of operations, I think he was there for a year, and finally having made every possible effort with the assistance of the Belgians, whose methods are rather strenuous, he could not construct his telegraph line. Finally his camp was raided by the inhabitants and destroyed, and that was the end of the telegraph construction.

8,980. He failed through want of labour?—Yes.

8,981. In a district supposed to be very thickly populated?—Yes. I mention under number 3 that the same thing happened in the attempt to construct a road across the plateau. I believe they required, they told me I think, 10,000 boys to make a really good road from Nyassa to Tanganyika, because Mr. Rhodes was going to put his steamer on the lake, and they wanted to facilitate the getting of the steamer across the plateau, but they never got the natives and never constructed the road, although for four or five years they have endeavoured to secure sufficient labour but could not.

8,982. And the railway from Boma to Stanley Falls?—There natives were imported to construct that. I believe a certain amount of labour was provided by the British Government from the Gold Coast or Sierra Leone, and I rather believe that further labour was imported, but that I am not quite sure of. In any case they could not do it with local labour, although the Congo, of course, is one of the most densely-populated districts.

8,983. The same, I believe, applies to the Uganda railway?—Yes.

8,984. There they employed Indians?—Yes. I saw Mr. George Pauling the other day; he tendered for the construction of that railway at two million pounds less than it cost the Government to build it, and I asked him where he would have drawn his labour for that work from, and he told me from the Portuguese coast in the district of Inhambane. He knew that field because he constructed the Pungwe line, and the natives knew him and his people, and Mr. Pauling told me that was the only possible portion of Africa where he could possibly draw a labour supply from.

8,985. On page 5 (vide page 527) you give your ideas as to how to deal with the natives. Under section (i) you state, "I believe that the sole way by which the natives can be made to feel taxation and induced thereby to come into the labour market is by being prohibited from squatting on land occupied by whites and confined to locations where the tribe collectively pay taxation based on the unimproved value of their location." What is the idea of the unimproved value you would make as a basis to put a tax upon?—I should assess the land allocated to them by the current market price subject to revision from time to time, and charge them on that value, because by that means you would strike at the root of the matter.

8,986. To apply that policy to the conditions in the Transvaal would you take the present lands which are used in native locations and deal with it in that way?—Yes, as a general principle.

8,987. It would rather perpetuate the tribal system and the headship of chiefs?—It would certainly perpetuate that, at least, I hope so.

8,988. You do not think that is a disadvantage, and would tend to the advance of civilisation?—I think it the greatest possible advantage. I think as soon as you disturb the power of the chiefs you destroy the tribe as a tangible object and the components of the tribe, as far as I have seen in native administration, but of course as civilisation encroaches upon these people that will tend to advance them, but as a general principle in dealing with the raw Kaffir you can deal with him through his own natural chief better than with the individual.

8,989. You mean you can get less in a crowd?—Absolutely beyond control. You can never locate the individual, no matter what he does. You have exactly the same principle to-day in this country down in the Middelburg District, where I am farming. The S.A.C. have great difficulty in catching Kaffirs and have never caught one of mine, although they have a very complete organisation with a large country full of white men, but if a Kaffir steals something from a farm and disappears, you never catch him again. Set off against that I would instance to you a case in point near Tanganyika where the Germans are dealing with the natives, and where their policy is to support the power of the individual chiefs so that they have not a heterogeneous mob to deal with, but generally play one chief off against the other. Some of my natives ran away from me when I was six days from the nearest Government Station. I sent a runner to inform the German official. He was there alone, and within three days he caught the whole lot of them, although they were trying to get round through the mountainous part at the back of his station in order to get lost in the Ujiji District.

8,990. We have had evidence given before us supporting the view that if locations were done away with and the natives were distributed over the farms under the Squatters' Law, it would tend to supply farms with labour and probably leave a surplus for the mines. This policy you evidently do not approve of?—With that it would amount to practically the same thing as selling natives to the farms. I mean it would be a very arbitrary proceeding to take six natives by the scruff of the neck and throw them on to one farm, and take another six and throw them on to another farm. It would be tantamount to tying them hand and foot and giving them over to the farms.

8,991. I do not know that it involves quite all that?—It would seem so to me.

8,992. That is your opinion? Applying the underlying principle of your suggestion here, the native could have an interest in the land and be taxed on the basis of its unimproved value. Would that apply exactly to the principle to take five families and place them each on a farm and give them land for which they pay rental?—You mean to have a fixed principle by which natives could own land all over the country?

8,993. No, I suggest a law should be made so that the farmer should set aside a portion of his land for native families to live upon with a fixed tenure and rental charged, which would be equivalent to your taxation on the basis of the unimproved value?—I would be in a way, but with this difference that under my scheme what, I believe, the result would be that what I call the floating portion of the population of natives, who on account of not belonging to any distinct grade does not want to live in his pristine condition, is to be in the position by which he has got to go and compete with others like himself, amongst farmers as to whether they will take him on to work. It is a question of an open contract. If a farmer has land and natives choose him, he has a better chance of getting reasonable terms than when he goes round the country, as he does to-day, begging natives to come and squat on his

farm. You get the first offer made by the native, which is a very important difference indeed.

8,994. You develop the idea of the location then, rather than checking it?—I think that by this means the location principle would be automatically disposed of by the general advance of the country. As the country developed so the land would become very valuable, and so the natives as a group would be less able to live upon it, less able to pay taxes and would be either forced further back into the low country or broken up and forced into the market.

8,995. Your idea is that the farmer should pay for families if allowed to squat on his farm, and you give a scale of prices, viz., one pound per family up to three families?—These are merely suggestions, my idea being that the farmer does pay, as I know to my cost. He, however, does not know that he pays them in the majority of cases, but he pays indirectly. If you increase native taxes the farmer has to pay the difference, whereas in this way the farmer knows that he does pay and will, therefore, be more careful not to have any more natives squatting on his land than he actually requires, with the result that there is a more equitable distribution of natives. More would be forced out to try and get access to the land.

8,955A. Your suggestion would mean that a farmer wanting ten families on his farm would have to pay £25 per year?—They in return pay rent for land that they occupy; there is nothing to prevent a farmer, supposing he wants to cultivate a lot of ground, engaging 200 or 300 natives and paying them a wage, but this simply applies to the principle of squatting, which practically means that they have free access to free land as every native wants to.

8,996. You would by this means abolish squatting?—Promiscuous squatting. I think a certain amount is beneficial to the farming industry, and I think it a great advantage to a farmer to have a certain reasonable amount of natives he can call upon to do odd jobs, in continuity.

8,997. There are times when a man wants many more Kaffirs than another, and he can get them from the squatters. The application of your principle, then, would act automatically in distributing natives over the land?—Yes, for land occupied by white men at least I should hope it would.

8,998. It would involve taking them by the scruff of the neck?—No. They would be under the gradual pressure of economics instead of the arbitrary decision of the local magistrate.

8,999. You state on the first page of your statement that the main drift of your contentions has been to study the necessary lines along which the development of the continent will probably devolve?—Yes.

9,000. Have you made up your mind after your experience as to what lines that development might take?—In the gross, yes.

9,001. Can you give us some idea?—Would it come under the scope of this inquiry?

9,002. It is rather intimately connected with native labour, but if it is too large a question I will not press it?—It depends entirely; you would take the ports you have as a base of your development and the line of development will follow along the line of the least resistance from these ports to what is proved the most valuable area in the vicinity, and out of that you evolve a general scheme as to the development of the country, which Mr. Rhodes did in his so-called Cape to Cairo railway. I do not believe for a moment he expected to put it through in his lifetime, or in my time, but it was sufficient to give the general public an idea of what the complete result would be. As he has pointed out, over and over again, he had no idea of competing with sea carriage. It would be absurd, but by gradually tapping the original area of the country to the nearest outlet, you would gradually evolve a through line which would eventually be your Cape to Cairo railway.

9,003. At any rate, from your statement, it seems to me you are prepared to abandon the idea

that the development of the continent can at all depend upon the native labour available?—I do not say that at all. I would say that the native labour is a very valuable level in starting the development, but I hope in time we shall evolve from the native labour question to white labour, but we have to go through a variety of processes first; it is only the abnormal decisions you meet with in this country that make native labour cheaper than other labour; it is in food and rent, and certainly not in efficiency.

9,004. Are you under the necessity to conclude that other labour is necessary for this continent than what is found within it?—Certainly, at this particular point we have arrived at now, in my opinion it seems essential. The native labour up to date has been a very useful assistance, and we should not have got so far as we have without it.

9,005. There are abnormal developments all over which you think that native labour now fails to meet?—Nowhere in Africa, that I know of, if I eliminate British Central Africa, where, on the authority of Sir A. Sharpe, there is a temporary surplus, is there sufficient labour to-day for the demand. There is a cry of "Give me labour!" from one end to the other, through the length and breadth of Africa.

9,006. Mr. EVANS: Did you hear Mr. Breyner's evidence, or have you read it?—I heard a portion of it, and I think I have read it all.

9,007. It was referred to just now by the Chairman. Mr. Breyner stated in his evidence (v. p. 38) that the official statistics gave a "number of 363,036 adults from 15 to 50 years old in the district directly administered by the Government, that is Lourenco Marques, Gazaland, Inhambane, Mozambique, and the Crown lands of the district of Quillimane." Then he went on to state that "The administration of the other part of the province belongs to three companies: Mozambique, Nyassa, and Zambesi Companies." And he arrived at a total figure of from 700,000 to 800,000 men between the ages of 15 and 50 by doubling the population of the southern portion. It was not on the basis of hut-tax that he estimated the northern part. Do you consider from your knowledge that that is a reliable way of arriving at the population of the northern portion as to the possible number of labourers that might be available?—In my opinion they are absolutely unreliable.

9,008. Do you consider as to native population statistics that they are any test of the quantity of labour available?—Certainly not; take the population of the Southern States of the U.S.A.

9,009. Is that a negro population?—Yes. The negro population is extraordinarily dense, and they have to import foreign labour for their plantations.

9,010. Did you hear Mr. Courtney Acutt's evidence?—I do not think I have.

9,011. He informed us that Kaffir labour was of such an unreliable character that no one in Natal would think of sowing or planting anything if they had to reap their crops by means of Kaffir labour?—As far as I am aware, that holds good all the world over, with perhaps certain exceptions, such as Mississippi. There, now, I am given to understand, is a process of change going on on account of the unreliability of the negro, and instead of large plantations there are small ones which are being worked by individuals, who sell the produce to the manufacturers in order to avoid that risk in the unreliability of labour. It is always a maxim among Americans that negro labour is the most expensive in the world. When I was over in the Hawaiian Islands they had a lot of trouble with their labour because they had come under the American Constitution, and of course under the American Constitution you can no longer contract labour. The result was that all the sugar planters were in a state of despair. They could no longer rely on Chinese or Japanese, because these men came over under contract. They were all right until they came over without a contract, when they took their fare, said "Thank you," smiled and walked away.

They came to the conclusion after that there was only one line open to them, and that was the importation of negroes.

9,012. From Africa?—No; from the West Indian Isles; but as everybody said, that is the very last resource. It is the worst, most inefficient, and most expensive labour you can get anywhere, but you must have something. Chinese, of course, are not allowed to go in at all. The Japs were allowed in, but they are of no use as they are not to be relied upon.

9,013. Do you know of any instances of employers coming to Africa for free labour?—I have never heard of such a case.

9,014. Do you know of a contrary case, of any employers in Africa going elsewhere?—Oh, yes, it was done on the Uganda railway, and is talked of as an absolute necessity all over the continent.

9,015. Have you any knowledge of Somaliland?—No; I know something of the Somalis, as I have had 30 or 40 of them in my employ at one time, but I have never been in their country.

9,016. Do you think they would make good miners?—I could not imagine so. Those I had could only do two things, which was to clean a gun and ride a donkey, and they did them both very badly. I took them with me and thought they would be useful as Shikarries, but I sacked the whole lot as of no use; they could not do anything.

9,017. Have you ever heard of their being miners and doing any manual labour anywhere?—Of course, the term Somali is used with a certain amount of latitude. I am speaking of the true Somali; he is a pastoral individual, and walks about the country with camels, etc., but there are a lot of natives in Aden called Somalis who are not Somalis at all. The true Somali is a purely pastoral native and makes a very fair valet.

9,018. On page 5 (vide page 526) of your evidence you say: "The cultivation of additional wants and the restriction of available land are the only possible influences which will make the negro a worker"?—Yes.

9,019. Have you anything further to say on that point beyond what you have already said as to how you would encourage the cultivation of a native's wants?—I think that is a difficult thing to do, as it comes by slow degrees naturally, but it is a difficult thing to cultivate, except in the case of drink which takes a very short time. Take the country near the Zambesi, where the Portuguese have been nearly 300 years. There the additional wants of the natives are possibly a Panama hat and drink, but nothing else. The average native who has been under the influence of the Portuguese for 300 years is no different to the native in the Zoutpansberg, except that he wears a Panama hat when he comes anywhere near a trading quarter. That is the limit of respectability after a growth of 300 years.

9,020. Then your other point is the restriction of available land. How could we do that in this country; what would you advise?—I think by my suggestion here of taxing them on the land they use and basing taxation on the value of the land. I contend it is an iniquitous system to-day by which you tax the native who may be grazing 1,000 head of cattle at rather less than the native working on the mines. I only suggest that he should have to pay on the same footing as white men in that respect. If I went to the Government and applied for leave to go over the country with 1,000 head of stock I should not be allowed to do it on payment of £2 per annum.

9,021. Do you think the native would be amenable to come out to work as a result of that?—I think the tendency would be that the chiefs would drive the young men out to work in order to bring out a portion of the sum total of taxation required. At the same time it would tend to limit the accumulation of stock in the hands of the native and would prevent squatting.

9,022. You do not agree with Mr. Taber's recommendation of breaking up tribal organisation?

—I cannot see any argument in favour of that because from what I have seen of this country wherever it has been done it has resulted in disaster and wherever it has not been done it has been successful. The only people who have ever handled the natives really successfully in this country have been the Arabs and the Arabs always maintain the power of the chief. They never allowed it to go too far and spread over too big a population, but they maintained the prestige of each individual chief, and played off one chief against the other, with the result that they always have had the native absolutely under control, and the native prefers to go with an Arab to anybody else.

9,023. Then the system which the Belgians have adopted on the Congo differs materially from the Arab system?—Very materially, because it has not been done with the knowledge of the native that the Arab possesses. The system of the Belgians was to go out and say to them that they wanted so much ivory and rubber, and if it was not forthcoming to cut the hands of the natives off. Arabs, of course, never did anything of that sort. They were not so foolish.

9,024. Do you consider this policy of exhausting Africa for labourers for the Rand industry a wise one in the interests of the white people in this country?—Do you mean in this portion of this country or the whole of the continent?

9,025. No, the policy that is being carried out now of exhausting Africa in order to get labourers for this industry?—Do you mean whether it could be advantageous to the people or the whole of Africa?

9,026. The whole of South Africa?—The whole of the country covered by the part from which you draw the natives.

9,027. No, not the interests of white people where you get natives from, but the country you bring them to, *i.e.*, this country and South Africa?—I take it if you can get them and they are economical, it is distinctly to the advantage of the community as a whole, because it enables them to carry on developments. They may not be able to carry on without it, but I should question the advantage if it would lead to the native settling there, and in that case I should certainly say "no," but it would be contrary to the advantage of the white men in this country to bring natives down here and settle them in the country.

9,028. What are your views as to the effect of the presence of the native on the white worker?—Very disastrous.

9,029. Have you any instance to give in support of that opinion?—Oh, yes, I think the whole world, practically speaking, is an example; wherever the white man has come into constant contact with black he has undoubtedly deteriorated. You see it is a fact in the Southern States of America that you meet there the most charming gentlemen in the world, but incapable of carrying anything to completion. You find the same in a marked degree in Brazil, and the same thing in the West Indian Islands. Take the case of Portugal itself, which has certainly deteriorated owing to the large amount of negro blood it brought into its own midst.

9,030. You attribute the dislike of the white man to work to the presence of the negro, for instance, in the Southern States?—I would not say that exactly, because to-day white men from the North are going down and developing the Southern States, and working side by side to a very great extent with the negro, but the man who is brought up with the natives very strongly objects in the Southern States to work with them in exactly the same sphere as the native works. Of course that does not hold in some cases. It certainly holds with all the Southern people to a great extent, but you do not find the same thing amongst the Latin races. There does not seem to be the same antagonism.

9,031. You mean that there is not the same antagonism to the native amongst the Latin races?—

No, not the same aversion amongst Latin races that there is amongst the Northern races of Europe.

9,032. Do you know of any instance in Africa of white men doing unskilled work for any length of time?—No, certainly not. Unskilled work is rather an elastic term, and certainly I do not see any tendency in the white man of this country to work very hard.

9,033. Mr. PHILIP: You speak of the enormous trade of Eastern and Central Africa. What part is it that trade finds its way to?—I do not mean enormous in monetary value, but enormous in the amount of activity it involves, for this reason, it is conducted in so primitive a manner. You might put the whole of the produce of Tanganyika into half-a-dozen trains with the assistance of perhaps 20 white men, but to-day you have got many thousands of natives swarming down that road and back again. That is what I mean by enormous.

9,034. That is what I wanted to arrive at. The volume of trade is very small. For instance, there is precious little ivory exported now?—Yes, perhaps with our ideas of trade it is trifling.

9,035. As to these coffee plantations, can you tell me what the production is?—I do not know what it is now, nor what it was at the time I was there.

9,036. It never exceeded 1,000 tons?—I should not think so.

9,037. So they never could employ a very large number of natives?—Well, 1,000 tons means at least 4,000 men engaged in carrying it.

9,038. I am talking now of the employment required on the plantations?—They require a considerable number, because their work is so inefficient.

9,039. And have they any difficulty in getting labour there?—In my time it was a constant cry that they could not get labour, and there was a tendency to check the increase of the area of land put under cultivation for that reason.

9,040. And natives naturally, I suppose, are as averse to work there as they are here?—Quite so.

9,041. I think your reference to the South American Republics as to the deterioration of white men in their contact with the blacks there is owing to the white races there being of the Latin races, and I think you will find that wherever the Latin races go amongst natives they do deteriorate, but you do not find this to be the case with Northern races?—No.

9,042. And therefore you do not find deterioration amongst the Northern races?—I do not mean that in its worst sense.

9,043. But you do not find it in any sense?—I mean in efficiency.

9,044. Take this country where Boers have now been working for 150 or 200 years with the natives, the only deterioration that has taken place has been in education, where they have been far removed from the means of education, but otherwise they have not deteriorated?—I do not mean that they have deteriorated physically.

9,045. They have not deteriorated either physically or mentally?—No, I say in efficiency. I should not imagine that the Boer was what you would call an efficient man as compared, say, with the New Zealand Colonist.

9,046. Do you think that the deterioration in efficiency has been caused by slave-holding?—Very likely.

9,047. And it is the same thing in the Southern States to-day?—There is no doubt about that, but that feeling, although it is not actual slavery, that the native ought to be a slave, has exactly the same effect.

9,048. You say that whenever you have visited parts of the continent you have done it for some specific purpose. From what I understood you to say, your specific purpose in visiting Africa was

to prove that this Cape to Cairo railway was "spooft"?—Oh, no, but to satisfy myself it was feasible.

9,049. I think you used the expression that you came out because people at home were not aware whether it was "spooft" or whether it really could be carried into effect?—A large number of people at home thought it was "spooft."

9,050. And Mr. Rhodes himself considered it was "spooft"?—That I do not know.

9,051. I think I understood you to say that he did?—That rather wants modifying. What I meant to say is that he used the expression Cape to Cairo railway as a catch word, and he only did so to interest the people, although he never thought of completing a direct line from the Cape to Cairo right away from these rivers and lakes. The first idea was to get the backbone to the country which would command the various radiating lines through different parts, and for convenience sake he talked about the Cape to Cairo railway.

9,052. Then I take it your specific purpose was curiosity to see if that railway could be accomplished?—Quite so.

9,053. Were you sent by anyone or did you go on your own account?—On my own account.

9,054. That was merely a matter of curiosity. I believe you started on your walk from Beira?—I did not walk.

9,055. At any rate you went from Beira?—I originally went from Cape Town and went up to Matabeleland when I thought the war was coming on after the Jameson Raid. I came out with the idea of volunteering, but it did not come off, so I went up to Matabeleland, and then the idea occurred to me, and I took an interest in the country, and went down to the coast with the idea of seeing British Central Africa.

9,056. You started from Beira?—Yes, when I came out again, but I went home first. When I came out the second time I went to Beira and went up to Mashonaland, and when I came back I went up the Portuguese Coast across the river following the track up the Lake Nyassa and then Lake Tanganyika, and eventually I got to the head waters of the Nile.

9,057. You simply followed the ordinary route the whole way up?—Yes, but I made several side expeditions, such as down to the headquarters of the Chambesi, and I mapped in all this country where the volcanoes are, but of course I did not wander from coast to coast.

9,058. I ask you this because you make some statements about the population of the country, and I think your figures are rather exaggerated, the figures you put down as the estimate of the population?—I merely suggest these figures.

9,059. You put down population in bushveld, as one to ten square miles, and pastoral and agricultural population at two to a square mile?—Yes.

9,060. Now we have an agricultural and pastoral population in Basutoland, and the whole of that country is 10,000 square miles in area. The population there is about 300,000 roughly, an average of 27 to the square mile?—But with what result. The Basutos are largely depending upon us for their livelihood; they are not only an agricultural and pastoral country, but also a commercial country, and they sell their surplus produce. They go out to work, and a large number of them live out of the country on outside resources and take money back with them to their country.

9,061. We also have it in evidence that the population of Natal and Zululand is 750,000 to 800,000 natives, and they have an area of about 20,000 square miles?—Yes.

9,062. It shows that your figures are pure guess-work?—Are you referring to the agricultural people?

9,063. Yes, agricultural and pastoral. They only go in for sufficient agriculture for their own special wants, that is all, and do no work if they can help it; in fact in Natal to-day they draw supplies of labour from India and Pondoland. Then you

mention the scarcity of population in hunting districts. Is it not a fact that large game go away from the presence of man, and that you have to follow the game?—How do you mean?

9,064. You do not find that large animals live in a densely-populated country and they will always get away from their hunters, and we always find in South Africa that as the population spreads north, so the game goes north?—Certainly.

9,065. So you have to go to a sparsely-populated part of the country in order to get game?—You do not follow my point. In the case of a hunter, a man who lives entirely by hunting, like the Baganda and Balagga people, who live entirely from tracking game and that sort of thing, they must have a very large area of country to support them.

9,066. I was not referring to that, I was referring to a part of Portuguese East Africa. You mentioned the country under the Portuguese inhabited by the Gorongoza?—Yes.

9,067. You state that this country is very densely populated, but between the Gorongoza country and the East there are hardly any people at all?—Yes.

9,068. You went shooting and naturally you would not go to a country where there were many people?—I do not follow your point.

9,069. I think you are overdoing it in trying to prove your case?—What case?

9,070. That there is a scarcity of labour and so forth?—I simply suggest here that you must ask a large number of different people in order to get some sort of figure, taking the average of their opinions as to a certain strip of land which they may know. I say that is the only basis upon which you can go to give any sort of estimate of what the population is in order to be at all reliable. I cannot follow what you mean.

9,071. You told us that that country is sparsely populated?—Of course they are not a hunting tribe there, and they do not worry about game at all. If you ask me about these people, they live in the Gorongoza hills and live by agriculture, perhaps 20 to 100 to a square mile, but if you ask me again of certain portions of East Africa then there is the Makombi who live there and live entirely on the game. What I say is that if you know the type of people who live in a country, then you can get a sort of rough idea of what the population might possibly be.

9,072. In the Nile Basin there is a large population?—I believe so.

9,073. Is there any possibility of getting labour from there?—I do not know anything about it; they did not get anything in Egypt or the Sudan.

9,074. At any rate the conclusions you have arrived at are that it is impossible for us to get labour from Africa?—I think so.

9,075. Have you been farming any length of time here?—No.

9,076. How many boys do you employ on your farm?—As many as I can get, but I cannot get any. I get them in this way. That they come to me for a month and take my £3 or £3 10s. in order to pay their fare to Johannesburg and then disappear. That is the only reason why they come to me.

9,077. Do you believe in retaining the tribal system?—I think so, when you are dealing with raw Kaffirs, even if you maintain it as far as you possibly can. I do not mean to shut them up in locations and put a fence around them or anything of that sort, but I mean in dealing with the natives, deal with them as far as possible through chiefs they know and recognise, until by the slow process, the increase of population, and contact, you will get them disintegrated.

9,078. I ask you that because in the Cape Colony, where the tribal system has been broken up, the natives have been inclined to adopt more civilised ways and work better than anywhere else in South Africa?—There, of course, you have had contact with white people for a very long time, which is the modification I suggest on my proposal,

9,079. Mr. BRINK: How long have you been farming in the Middelburg district?—Not very long—about nine months.

9,080. Have you any idea of the native population in Middelburg district?—I have a very good idea of what it is in the Repatriation yard, but I do not know what it is in the vicinity.

9,081. Have you any idea as to how many farmers there are?—I cannot give any figures. There are quite a considerable number, and the majority of farms on the high veld are occupied to-day.

9,082. Do you know how many farms there are in the Middelburg district?—No.

9,083. How are these farms occupied?—The majority of farms, including farms belonging to companies, are occupied. I occupy one and all sorts of people occupy them, but I should say that the majority of farms are occupied in some way.

9,084. By one farmer to a farm?—I should say so on the high veld, but I do not know as to the low veld.

9,085. How many farms are there on the high veld in the Middelburg district?—I do not know.

9,086. If you have been farming nine months in that one district, you must have got some idea, seeing that by only travelling through Central Africa you form an idea very quickly. If you have been nine months in that one district you ought to have a much better idea of that one district than you could have gained by hunting in Central Africa?—I did not go on counting the farms, but they could be had from the Government map.

9,087. I have been 35 years in the Transvaal, and I know the number of the farms; there are 502 in the Middelburg district, and then you have a lot of small plots and ground we call small farms, bringing the total up to 803. I wanted to find from you the native population and the number of farmers?—I suppose you can get that also from Government statistics, but I do not know.

9,088. You were speaking just now about the floating population and the tribal system?—Yes.

9,089. Have you read the Squatters' Law?—No, I have never read it, but I have had portions of it explained to me.

9,090. According to my reading of the Squatters' Law, I believe it was really not aimed at the tribal system, but at this floating population?—That is what I have always understood.

9,091. Do you think that is a good system?—Certainly, from what I know of the Squatters' Law—I do not pretend to know it accurately. My impression is the general tendency of it should certainly be very good.

9,092. The tendency, according to my reading, was either to drive the Kaffirs to their own chiefs in the locations, and those that had no chiefs to bring them to the farmer, for the advantage of the farmer and for their own good?—That is my impression.

9,093. There was no idea of taking six families by the scruff of the neck and throwing them on one farm?—I was not referring to the Squatters' Law when I said that to Mr. Goch.

9,094. I only wished to explain the Squatters' Law, and I think, conscientiously, it is the very best thing that could be done to-day?—I do not know the exact details and my ideas are mainly based from what I have derived from others.

9,095. Do you know how many locations there are in the Middelburg district? I think you have only one?—I believe so.

9,096. You do not, however, know much about the Middelburg district?—I know very little about the Transvaal.

9,097. Mr. TAINTON: I gather from your replies, Mr. Grogan, to the other members of the Commission that a proportion of Portuguese East Africa is practically under independent chiefs. Now tell us roughly, what proportion is so independent?

—It is very difficult to define. There is, of course, a sort of undefinable influence of the Portuguese through the country, and when a man goes with 20 policemen around the district he has a temporary influence, but I know of a certain portion which when I was there—it may have materially altered since—but at that time it could not be said in any way to be under Portuguese influence to any considerable extent. For instance, the Portuguese have gone to Gorongoza and levied a hut-tax; they did try the first time I was there to collect it, but Gorongoza got them in the open and drove them away.

9,098. What is the area over which he exercises authority, is it large?—Yes, very considerable. His influence spreads over all the country round about, but his actual centre of population is not very large.

9,099. Have you been to Mozambique, the capital of Mozambique Province?—Yes.

9,100. Do you know anything of the extent of the Portuguese influence in that district?—When I was there it spread about 10 miles inland. I was also in the Hinterland of Mozambique on one occasion, and the natives denied to me any knowledge of the Portuguese. Of course, that was their way of expressing it. There was a settlement not far off, and a gunboat on the river, but the Portuguese could not get into the hills.

9,101. The denial was merely the native way of saying that the Portuguese were not their masters?—Yes.

9,102. Do you know of any other independent chief like Gorongoza?—Yes, Makombi.

9,103. Where is he?—I saw that the Portuguese sent an expedition against him not very long ago, and was told that they smashed him, and again I was told that the expedition was smashed, but anyhow they did not send an expedition, and, whether successful or not, he was absolutely independent when I was there. He would not have any white people in his country to speak of. I went through a portion of it once on a shooting expedition, and he asked me what I was doing, and I told him I was just hunting, and then he asked me who I was and when I told him I was an Englishman, he told me I could go on.

9,104. You could not give us, roughly, an idea of the area of country which is either independent or partially independent?—Well, the Portuguese influence is certainly fairly clearly defined within 60 or 100 miles from Beira with the exception of Gorongoza sphere. I am speaking now of four years ago, and I believe that they have now a considerable amount of influence near the Melssetter border. They had several settlements and strengthened their holdings there. They control the river up to the Zambesi valley very thoroughly, and in the vicinity of those small ports, such as Inhambane, Chinde and others and beyond that I should say their influence is very slight indeed. I do not mean to say that they cannot go and collect hut taxes, because they do, but they cannot go at any time. For instance, they made a law that natives should pay a tax if they make this palm wine in order to stop them destroying the palm trees, but they cannot enforce it even within 30 miles of Beira, and they do not enforce it.

9,105. I understand that they have considerable difficulty in collecting Government taxes, and as a result of that difficulty they farm out portions of their territory to private persons?—I have always understood so.

9,106. Did you come in contact with these private owners of leasehold on the Zambesi?—Yes. All the land along the Zambesi basin is held on that "Prazo" tenure. I came into contact with several of the "Prazo" holders. The impression I have is that they have powers of life and death inside their "Prazo." They own the natives body and soul. I do not know what the actual legal position is, but the practice I do know is that no great care is exercised in the selection of those persons to whom these lands are leased. The only care they took at that

time was that the holders should not be British citizens and whether it is so to-day or not I do not know.

9,107. Are these men Portuguese of any standing or position?—Locally, yes, but the majority of them that I have seen are half castes, or even more, mixtures of all kinds.

9,108. These collect Government taxes?—I take it they have to pay a fixed figure for their "Prazo" and make what they can out of it. They have absolute power within their own "Prazo."

9,109. So that the method of estimating the population from hut tax is extremely rough and ready?—Very, I should say.

9,110. You said, I think, in reply to Mr. Brink, that you had been nine months in the Middelburg district, and had not formed any clear idea of the population there. Do you think that travellers passing through African territories would be able to get any accurate idea of the population of the district through which they pass?—Not in figures. I made it particularly clear in that respect that I could not possibly give any sort of estimate, I could give a rough estimate of certain portions, but an estimate of the countryside I do not see how anybody could make that without some basis on which to make it.

9,111. The estimates of Portuguese officials sitting in their office and calculating the population in independent or dependent native territories is likely to be an exceedingly rough and ready estimate?—That I should think.

9,112. Would that question of mine which I have just put to you describe what has happened in the case of the Portuguese estimate of the population in their territory?—I would not go as far as to say that, because you must remember that the Portuguese have been in their country for a very long time, and there have been constantly amongst them men who have extraordinary good men at their work, and to this day there are a great many officials who travel about the land, and are very efficient men who cover a very large amount of country.

9,113. Are they at liberty to travel in these independent native territories?—Well, it depends upon what they want, and it depends very largely on individuality. The individual Portuguese very often are tolerated in districts where others would not be, the same as always happens. Individual influence goes a long way, as in my case were the Gorongoza had no objection to my going anywhere I liked in his country.

9,114. I was speaking of Portuguese. Are they at liberty to travel through native districts there?—Yes, large areas, unless they go to levy taxes, or do anything the natives object to, or go to get the men for Government works, in which case the natives are apt to disappear from the vicinity for the time being, or even go to the other extreme.

9,115. Now, in part of your statement, you deprecate the forming of these estimates of the population, such as Mr. Breyner's data, and I think on the second page you attempt to give the Commission some definite rule by which the population of Central Africa may be estimated. You mention there five types or classes into which you divide the natives?—Yes, nomadic and so on.

9,116. Could you give us some idea of the proportionate numbers under these various heads? Another way of putting it would be what area of the country there is occupied by these various classes?—That is why I suggested these figures. It has been estimated that the population of Africa is 400,000,000, and I wanted, by suggesting some basis, to show how utterly fallacious this must be. You take all Northern Africa, the greater portion of which is inhabited by nomadic people. A large portion of the population are engaged in the trading caravans, but generally speaking it is occupied by purely pastoral people, like the Gorobbas and Somalis, who live in very arid country away from water, and they must have enormous tracts of country in order to support their herds,

9,117. I quite understand your point. I say that the Northern part is materially inhabited by nomadic people until you get to the west, but this I cannot speak about, but there, I believe, you have intense aggratations of people highly developed as far as commerce and agriculture goes, there you have a dense population the same as in the strip of Portuguese Territory on the coast, where you have people dependent on agriculture and commerce under the best possible conditions, but if you take the whole of Central Africa I should say, speaking very roughly, one half of it, or more, to include the Congo Basin, is dense forest or dry plains, which carry very little population. The agricultural population live, of course, on the water-ways, and the forest only carries pigmies.

9,118. You say that the agricultural population live only on the waterways?—Yes, speaking as a general principle.

9,119. We are under considerable difficulty in applying your classification, and I could recognise the great objection there is to these rough estimates made by people passing through the country because as you have just told us, you have been nine months in one of the Transvaal districts, and have no idea of the population there, but assuming we accepted this rough classification of yours, could you give us no data which would enable us to make it of some practical use, so that we could get at the population of the country?—I could classify all these tribes more or less under the different headings. I say that the majority of the population of Central Africa, certainly the largest areas, are populated by the first two of my list, and then where you get the rivers and lakes you generally get fertile alluvial land, and very often accumulation of natives who live by agriculture, and therefore you have there a much more dense population. Wherever you have plenty of water there you have a denser population, but, generally speaking, in Central Africa, there are enormous areas where you have forests inhabited only by pigmies, dry salt plains with a few fishermen living under exactly similar conditions to what I understand the Bushmen lived in South Africa.

9,120. Are we to understand that a great portion of Central Africa may be classed as arid and almost desolate?—Oh, no, because you have got the dense tropical forest of the Congo Basin, which is, to all intents and purposes, the same thing.

9,121. How do you mean the same thing?—I mean as far as its carrying power is concerned.

9,122. Do you mean as far as population is concerned?—Yes, no one could live in the forest except the pigmies. In some cases, where chased by the Belgians, natives have made clearings into the forest, but, generally speaking, the whole mass of the forest is uninhabited, except by pigmies, and this applies to the whole basin of the Congo.

9,123. You never attempted to frame an estimate yourself based upon this classification of yours?—No, because I am not at all satisfied with these figures I have suggested, unless I can get an average of 30 or 40 opinions, but I am quite satisfied in my own mind that the estimates of a population of Africa are hopelessly excessive, because I do not think the land can carry, under the methods of the natives, anything like the population suggested. In Central Africa there are large areas of exceedingly fertile land, which has not a living soul on it, as they have been absolutely swept clean away by raiding cannibals, Arab slave raiders, and the Belgians. Whole districts have been depopulated, and the process has been going on for centuries.

9,124. Do you mean that the depopulation of the central districts has been going on for centuries? Can we get a rough method of comparison in this way? You know South Africa south of the Zambesi, and you say that the population north of the Zambesi is so considerably less per square mile than south of the Zambesi.—I think if you eliminated the West Coast and the district of Lake Chad, where the population is very dense, and eliminated the Portuguese Coast, I should say, striking a general average, except the Soudan, that the population is not very large, the same as the population was here before

the white people came and stopped them killing one another off. I should say that the population down here now is probably denser than the average population of the whole of Africa. For this reason that we have removed the natural checks on increase of population, and that more people live to-day than before the white man came.

9,125. I wish to get at your observations passing over the country as you did. Would you say, speaking generally, that the population is less than, or more than, the average native population of South Africa?—I could not make a comparison, because I know Africa south of the Zambesi so very little, with the exception of Rhodesia, as when I was there the place was in a state of war, but from what I saw of kraals in Rhodesia I should say the population of Rhodesia was infinitely more dense than the average population of South Africa, if you include all the forest country and the dry country together, but where the settled parts of Central Africa are, I should say the population is about the same as Rhodesia was when I was up there.

9,126. Then we may take it, if you compare Rhodesia, which you know, with the population of Central Africa, the native population of Rhodesia is denser than in Central Africa?—Very much more dense. If you take the bulk of it, supposing you include the Kalahara desert and all that desert country, and through all that, with the desert part of Rhodesia, I should say you have a reasonably fair comparison with the bulk of South Africa up to the Sudan.

9,127. And these estimates of population which appear in year books, and other books of that class, you would consider that figures must be accepted with much caution and reserve?—The aggregate figures certainly. Of course there are specific cases like Sierra Leone where the people know accurately what the population is, but when you say 400,000,000 in Africa it is based on nothing.

9,128. I am afraid we shall have some difficulty in estimating the population of Africa. For all practical purposes, then, we can eliminate these

people who come under the nomadic pastoral qualifications. We do not eliminate them?—I think the experience of everyone has gone to show that the negro, who is a pastoralist, is usually the dominant class. It is the dominant class that have secured capital, and are most averse to work of a particular type. They do not mind what they consider respectable work, but any hard manual labour is derogatory to their dignity. By a long process, of course, you can to a certain extent wipe them out. But that is a question of immediate contact. The Dinkas would not dream of carrying anything for me, even a spear; they are a pastoral fighting people and stand in the same relation to the northern races as the Zulus did down here before the white man came.

9,129. They form a sort of native aristocracy?—Yes.

9,130. Well, then, that leaves three other classes. You say that the commercial class is very limited?—Yes.

9,131. Can you give us any idea of the proportion we have to strike out for the pastoral, what number?—That again, of course, is changing, because in the last few years the cattle of the whole country have been swept off, and what effect that will have on these people it is difficult to say. There is one tribe, the Masai, living in German and British East Africa, who were a fighting dominant race and who lived on their cattle, but, having lost their cattle, they are breaking up and settling on the land, and their ferocity is gone. It has made a different people of them. They go now and work as police boys in Uganda, but whether they will take to manual labour or not it is impossible to say. Straited circumstances may, of course, force them to do so.

9,132. The CHAIRMAN: As it is impossible to finish the witness to-night, I suggest we adjourn.

Mr. TAINTON: I have not quite finished yet

The CHAIRMAN: The public sitting of the Commission is adjourned till 10.30 to-morrow morning.

## TWENTY-SECOND DAY

*Friday, 4th September, 1903.*

THE COMMISSION SAT AT 10.30 A.M.

Mr. GROGAN'S examination was resumed.

9,133. Mr. TAINTON: We were dealing yesterday with the classification of the natives appearing on page 2 (vide page 526) of your original statement. I was trying, I think, to arrive at some basis which would enable us to calculate approximately the population of Central Africa from these points which you have brought forward. The general tenor of your replies was, I think, to deprecate the making of any estimates of the population of these savage districts, when the people are scattered over large areas and very little is known about them. You said that in your opinion the population north of the Zambesi was less dense than it was in Rhodesia. I would like to bring to your notice that the area of South Africa, if we take south of the Zambesi, and exclude German South-West Africa, is just about 2,000,000 square miles, and the actual population in that area was, so far as we can judge, something less than 6,000,000. Consequently we get an average rate of population per square mile for Southern Africa of about three, rather less than more. Having that before you, do you still adhere to your estimate that the population north of the Zambesi is less dense than that?—What I said was north of the Zambesi. I mean

north so far as, we will say, the Nile, and eliminating the West Coast and this particular portion north of the Zambesi in the Portuguese Territory. Eliminating the coast-line, and taking the interior portions, it is a fair comparison, but if you include the coast-line except the West Coast, which I do not know anything about, I should say that the probabilities are that the population is more or less on the same ratio because south of the Zambesi you have a very large area of desert, of bush land, and a considerable area of comparatively rich coast land. So it would approximate closely to what you find in Central Africa. There you have the same proportion of desert, but you have a very large area of exceedingly dense forest which carries practically no population except on the water lines.

9,134. You see, if we take that as an approximate estimate we have to delete a considerable portion of Central Africa belonging to foreign Powers. That leaves us with a very small population in British Territory. For example, if you take the tract east of the Luapula River, south of Tanganyika, and take that district generally known as British Central Africa, you would get a population in that tract of about 60,000 or 70,000 people, because this area is approximately 200,000 square

miles?—Yes, but there are abnormal circumstances in British Central Africa, because you have in one particular locality in the British sphere a concentration of natives from surrounding spheres. It is quite an abnormal state of things.

9,135. There has been a concentration?—There has. They were going over by thousands while I was there, crossing the river to the British sphere. When I was there, about 100 miles inland in the Portuguese territory, a place quite unknown to white men, several of the chiefs came to me and asked me whether they could go over into the British sphere. I said there was nothing to prevent them, and I advised them to go over at night. It was nothing to do with me. Large numbers came, and I believe it is going on even to-day. They are being drawn from the Portuguese territory to the British side, to British Central Africa.

9,136. Sir Harry Johnstone pointed out, in 1894, something to that effect, but the quotation is this: "A large proportion of British Central Africa has of late years been entirely depopulated, almost entirely by the slave trade." Do you think since that time there has been an emigration into the country?—An enormous increase in population. But he speaks to a great extent of German side of Nyassa. My point is that in British Central Africa proper there has been an extraordinary concentration of native population during the last few years. It is abnormal.

9,137. Do you think that that would greatly affect this rough estimate we have?—Not in the least; because where British Central Africa has gained other countries have lost. But you take the figures of British Central Africa which I dare say can be got approximately now, because the country is well administered, and they would be able to get an estimate of the population, but that would not show the average carrying capacity of Africa, because the circumstances, the conditions there, are abnormal to-day.

9,138. What is the special condition that has attracted population?—To avoid what they considered the impositions of the Portuguese the natives are swarming into the British sphere. They prefer the British tax to the Portuguese methods of taxation, compulsory labour, and so on. These are the objections that they allege. You have had a similar thing to some extent going on in the north, on the German border. Originally the natives left our country and crossed over the border into the German territory because we imposed a shooting licence, and they resented it, so they went over to the German sphere. Then the Germans, seeing this concentration of natives immediately imposed a local hut tax, and the natives came back again and they are still going back.

9,139. That would go to show that the tribes are not attached to any one particular section of the country, but are nomadic?—The nomadic instinct is very strong throughout the tribes to-day. There is no particular affection for a district that I ever noticed. I should not say it was a feature of the native.

9,140. Is the average Central African native of a low type?—Well, all except the dominant caste. There is always a clearly defined caste. You get sometimes two, three, and even four quite distinct groups of humanity all living together, part and parcel of the same cosmos, but curiously distinct. All the lower groups are slaves to-day—in fact slaves. They are usually of an exceedingly low type, more like monkeys than men.

9,141. What proportion of the total population would belong to that lower group?—I should say, roughly speaking, that probably 9 in 10. I am thinking in particular of the Ruanda country, the country round Lake Kivu. There you have the Wachuset and Watusi. The former are obviously aboriginals; the latter are not. The real aboriginal is the pigmy. Wherever there is forest there you will find the pigmy, who is the real aboriginal, and there the Whatun, who are the Bantu, or what represents the people we have here. They undoubtedly mix with the pigmy type; and on top of them all, although part of the same

society, you have the Batusi, who are the landed proprietors, do no work, and take precedence. I should say, in their case, it is difficult to estimate, because in different districts the proportion of Batusi vary very much, I should say one in ten, at the outside figure.

9,142. Does that apply also to the district around Lake Nyassa?—It does amongst the Awemba, and amongst the Angoni and the Atonga. They are the people who are like the Zulus.

9,143. They are of a higher race, are they not?—Yes, and there again caste is very clearly defined. They have amalgamated with the others, have interbred with them, but at the same time they themselves have remained pure, if you follow what I mean. The chief, for instance, will have one wife and many concubines. A child of the wife, who is of his own caste, is the only one that is recognised. Thus you have got a race elevated to a certain extent by these people who settled amongst them, but you have caste very clearly defined to-day.

9,144. Yes, it is a duplication of what occurred in Southern Rhodesia when the Zulus went there?—Exactly.

9,145. Do you think that this lower caste would make good working men?—They make good carriers in many cases, not in all cases by any means. The Central Africans very often do make good carriers, because it has been bred into them for endless generations. They will carry a 60lb. load all day without complaining, but he will probably require three or four men to put a load on his shoulders or his head. They are absolutely useless for any other work that I have ever put them to. In digging a trench, or cutting down trees, or trying to make a passage across a swamp, they are useless, they are not used to it.

9,146. Did you come into contact with any evidence of cannibalism?—Yes, cannibalism exists throughout Central Africa to-day, but under two forms. One is a sort of fetish, and in the other, the Congo Basin cannibalism, human flesh is recognised as the choicest possible form of diet. Hordes of men are kept and fattened for the purpose, and it is an article of commerce throughout all the markets of the Congo Basin. Human flesh is sold just the same as fish or anything else. They are brought there alive, usually their legs are broken to prevent them getting away while they are being fattened, and then they are marked off, sold, killed and cut up. Sometimes the flesh is kipped and preserved. It is only in the Congo Basin, so far as I know, that real cannibalism exists, but round Lake Nyassa and many other districts cannibalism is a sort of fetish practised among the tribes. There are mysterious or secret societies that practice cannibalism, and they are generally very much feared and despised by the general community. Also you will find amongst many tribes that, when they fight, they will eat the livers of their enemies, and so on. But that has no material effect upon the population. In the Congo Basin it is real cannibalism that is practised, and it has an enormous effect upon the population. I have seen a whole section of a tribe wiped out in a few months by the inroads of the cannibals from the Congo proper. They followed in after some of the Belgian troops and wiped the country out. In one case there were only 60 survivors.

9,147. And the cannibalism which exists in other part of Africa is part of a religious rite?—Very largely.

9,148. Similar to what obtained on the West Coast among the Negroes there?—Yes.

9,149. It would be rather a serious matter for an unpopular compound manager to have those natives here?—There is always a tendency for that sort of mysticism to break out amongst these people. It is a sort of Mahdism. It takes all sorts of grotesque forms, and it often takes the form of cannibalism.

9,150. I understand from a remark made by Sir Percy Fitzpatrick the other day, that you dealt with this labour question in your book.

Can you give me, briefly, what the conclusion was, as expressed in that book?—I was discussing the prospects of the railway, and I ventured to join issue with Mr. Rhodes on one of his arguments in favour of this railway, which was to the effect that it would tap what he called "the teeming millions" of Central Africa, and I pointed out that so far as I had seen Central Africa, the teeming millions did not exist, because in these days there were not sufficient for local requirements. Take the Nyassa-Tanganyika plateau white population. When I first went it was eight, and when I left the other end it was two, the other six having died. This is to show that the white population was very small, and yet there were not sufficient natives for the requirements of the white population on the Tanganyika plateau at that time.

9,151. And what did you say then in this book that you controverted the view that there was a large population there?—Yes. I pointed out that Africa as a whole is, I believe, very sparsely populated and that we could not count upon any large supply or continuous supply, of labour from Central Africa. Apart from the expression of the practicability of the scheme, the fact that they do not exist in any quantities preclude the possibility to my mind.

9,152. You mentioned slavery? Has that been a factor in decreasing or diminishing the population?—Not slavery, certainly, but slave raiding did to an enormous extent. I draw a very sharp line between the two. Slavery exists practically from one end of Africa to the other. It is the normal status I should say of nine-tenths of the population. But slave raiding is very different in its result. They were collected by Arabs to carry produce down to the coast and then sold for what they would fetch. The tendency of that was to practically annihilate the population over enormous areas of territory. The usual method of procedure was to play one tribe off against another. The Arab would come in and settle with one tribe and make friends with them and gradually edge them on to attack their neighbours. When he was successful in doing that the Arab called in his friends and they just clipped in between and collared the lot. Everybody they got was carried off to carry produce from the depôts down to the coast. The average mortality of every caravan that went to the coast across the dry country could not have been less than 30 per cent. I should say not less, at the least.

9,153. Did you come across any evidence of the mortality?—Yes. The whole shores of the Tanganyika are quite covered with signs. From the shore to Ujiji, which is about one mile above the lake, the long sandy foreshore between is dotted with skulls to-day, although the Germans have been in occupation for years, and it has been stopped. Still, the skulls are there, a silent testimony from one end of Lake Tanganyika to the other of what has happened in the past.

9,154. Then it is reasonable, taking these conditions into consideration, to say that the population of this Central district is considerably less than that of Southern Africa, where the natives have enjoyed equality for the past half century?—Certainly, I think so, because I myself know whole districts that have been absolutely depopulated, and the process is going on to-day all over the country, not to the same extent, of course, but tribes fighting against tribes, cannibals marching out and securing everything they can find. Similar tactics are rampant in Central Africa and so on. There are many causes which are depopulating areas to-day, but in a very modified form compared with what it was 10 years ago.

9,155. Then apart from the industrial aspect of the proposal to introduce these native into Southern Africa, do you think it would be advisable, looking at it more as a social problem?—It is very difficult to say what the result would be, but they certainly could not be beneficial. I meant the natives of Central Africa who would be probably obtained would be somewhat of the floating population of Central Africa; that is to say, the outcasts of the

Arab slaves, the liberated slaves of Tippu Tib's fraternity. These are the only people who would probably be counted upon at all from Central Africa. They are the only people conceivable of bringing here, and these people, of course, are steeped in every conceivable villainy and vice in the world. There are no means of communication except from Uganda; I mean from the Victoria Nyanza.

9,156. What is the average time taken by a native to travel from Central Africa to the coast?—There are two main trade routes, from Ujiji to Bagamoyo; that is Stanley's route, and the other from Kampala to Mombassa. That is because of the railway there. By the other route the average time is from three to six months. I should think it would be impossible to do it in less than three months.

9,157. Any attempt then to establish recruiting agencies in Central Africa would really mean opening up and establishing means of communication first?—It would be enormously costly otherwise. The mere sending of anybody there would cost an enormous sum of money. It is a very expensive thing to get to Lake Tanganyika.

9,158. Can you give me any idea of the cost of carriage of 100lbs. weight of goods?—The cost of carriage to Tanganyika was £150 a ton. I believe I am right in saying it has now come down to £70. That is the conveyance of clothing, beads or wire to the southern end of Lake Tanganyika. I believe it is about £70 per ton now, though I speak subject to correction. What it cost me exactly was about £100 a ton to the southern end of Tanganyika. It cost more than that because I had to throw half of it away owing to my inability to get labour to take it across. What I actually got through, I should say, cost me £100 a ton.

9,159. I see on page 5 (vide page 516) you state that the native of Central Africa is very indolent?—Yes.

9,160. You seem to think that that indolence is really a sort of natural product resulting from evolution, is that so?—I think it is the result of his environment perpetuated, ingrained in him by a tremendous period of time.

9,161. Rather difficult to remedy by Act of Parliament or Act of an Inter-Colonial Council?—There are two people who have attempted to remedy it. One is the Arab, and his method was to get a long chain and put it securely round the gentleman's neck and then ride alongside with a big pistol and a whip, and hammer him till he died. The Belgians' method is rather different. They give them a fixed task to accomplish, and if it is not carried out the Belgians burn their villages and cut off their hands. Both methods are comparatively unsuccessful.

9,162. I suppose you think most methods like that of taxation would be of very little effect?—You cannot tax the native in the long run. It is impossible while you give him unlimited access to land.

9,163. I see you refer to that point also on page 5 (vide page 516) the question of land. Have you worked out at all the practical details of your suggestion?—I have only confined myself to general tendencies. I merely make a rough suggestion, an outline on a scientific basis. The actual details of course would only be supplied by men of a much more accurate knowledge of this country than I have.

9,164. You see if you take a practical example from conditions existing now, I am afraid the tax would not amount to very much, because it is doubtful whether the capital value of native land, these locations, is more than, say, about 10s. an acre, and if you tax that, even to the extent of 10 per cent. a year, it would only be 1s. an acre, and at present the hut tax.—The important point to my mind is not only the amount of the tax, but its incidence.

9,165. Will you explain?—I take it in this way. It really is a tax without importance from a native who is getting the free use of a farm. There are many natives squatting on farms who pay nothing at all and are also provided with cattle by the Repatriation Department, have ploughing on contract done for them, and so on. The incidence of a £2 tax on that gentleman is nothing at all, the probability is that he hears that they are coming to collect this £2 and he walks away into the next district and does not pay it at all, but even if he does pay it, it is only a trifle when compared with the advantages he is enjoying, whereas if you have a large collection of natives settled on exceedingly poor land and a drought comes on and spoils the crops, then if the £2 is collected it would fall very heavily on these natives, and they would have to do something to earn that £2. The present system falls so unequally on the natives that to my mind it is very inequitable, and the result is that the natives, or the majority of them, succeed in shifting the burden of the tax in one way or another on to their employer.

9,166. But is that not the case in the majority of instances of locations? It means a higher rate of wages?—In the case of the native, certainly it does, unless you put the tax on the land. It must come out of the land, and, if he cannot get it out, he must go into the labour market and get it there.

9,167. Mr. WHITESIDE: Have you visited the Uganda Protectorate?—Yes, not Uganda proper, but the Uganda Protectorate.

9,168. Have you visited British East Africa?—No, except that British East Africa and the Uganda Protectorate are practically the same, except that it appears to be convenient to have two administrations.

9,169. How would you describe the people of the Protectorate generally?—They are highly civilised compared with the average population of Africa, the reason of that has never been clearly laid down.

9,170. Are they of good physique?—No, not generally. All those that I know are the Watoro and Unyoro. They are the same breed, but they have not come under the same civilising influences.

9,171. Is the population numerous?—The population of the Watoro is practically non-existent. It was wiped out by Kabarega, who depopulated the whole of Watoro.

9,172. So you do not think there is any number who can be induced to emigrate to these parts?—Certainly none from Watoro, and I can say very, very few, from Unyoro, from there the population is very sparse.

9,173. When were you there?—I was hunting round the mountains of the Moon for four or five months.

9,174. Do you know Mr. Macfarlane, one of the joint managers of the W.N.L.A.?—Yes.

9,175. And Mr. Nourse?—Yes.

9,176. Would you consider these gentlemen authorities on this particular district equal to yourself on Uganda Protectorate?—I do not know whether they have been there or for how long. I should say that they are not such good authorities as I am on the Watoro and Unyoro, because I think, in fact I know, that they have never been there, and a very large portion of the country has been visited by me alone. As regards the Uganda Protectorate, however, I should say that they are a better authority than I am.

9,177. They say speaking of the Mozambique district for one?—the Mozambique?

9,178. Yes, I am coming to the other later. They say: "The country, however, is one with a large and important labour supply, which must be developed with great care and patience." I am quoting

from a report submitted to the Chamber of Mines on the 2nd April. "Suitable men are now in the country, and although the results so far have been meagre, and can only be looked upon as a beginning, there is every reason to be hopeful that this very large territory will afford satisfactory supplies later on." Further on: "Having in view the possibility of obtaining labour from these territories in which the local demand for labour is small, Mr. Macfarlane visited these countries in September last, and spent some two months in investigating the conditions for obtaining a labour supply. In the British East Africa Protectorate there are several populous tribes, the people of which would be suitable and would be emigrated." Also: "The native population in the Uganda Protectorate is very numerous, the people generally are of good physique, and intelligent." You do not agree to that?—I certainly do not. I do not disagree with it in truth, but I am certain I should not describe the population of the Uganda Protectorate as very numerous, because I know very large portions of it which have no people at all. They are inhabited solely by elephants, who cannot live in a densely populated country. It is the greatest resort of elephants in the whole of Africa, which proves that the population must be exceedingly sparse.

9,179. You were there in 1900, and you acknowledge these gentlemen to be of equal authority to yourself?—No, I do not.

9,180. But on the districts of which I have quoted, and on which they report on the 2nd April, 1903?—If their report applies to the country I refer to, the inhabitants must be a sort of bacteria, for they were not there when I visited the country. Why, if they were there, were they not employed on the Uganda Railway? Did they sit on the hilltops and watch the Coones do it?

9,181. Mr. QUINN: Yesterday you described Mr. Breyner's evidence as 'absolutely unreliable'?—Oh, no.

9,182. These were the words you used, I think?—No, I think not.

9,183. If those words appear in the verbatim report you do not adhere to them?—I have not Mr. Breyner's figures before me, but what I imagine I said was to the effect that I was informed that his estimate was formed by the simple expedient of doubling what he thought he knew; and I was asked if I thought that was a reliable way of estimating a native population. I said no, and if I applied that method to the districts with which I am acquainted, I should find myself very many thousands out.

9,184. I wrote your answer down, and in reply, I think, to Mr. Evans, in regard to the estimated population of those districts in Mr. Breyner's opinion, you used the words that you considered the figures given absolutely unreliable?—The exact figures that he gave.

9,185. Yes, he made an estimate?—I was asked whether I thought that estimate, which I believe was between 700,000 and 800,000, was unreliable. I do certainly.

9,186. On page 2 (vide page 515) of your evidence you say that all expressions of opinion as to the number of inhabitants are worthless? I suppose that applies to your own estimate?—I do not make any.

9,187. But yesterday you did nothing else?—No.

9,188. You gave an estimate of 30,000 as being in a few years the number we might hope to get?—It was not an estimate of population.

9,189. It was boys available for work?—No. Boys that you could get.

9,190. Well, you used the figure?—I was asked to fix a sort of vague idea. It was not reliable nor an accurate figure, and was based on the difficulty everyone has, and which I should myself have, in getting labour.

9,191. I was only trying to show that you have given any number of figures?—I have given no figures except that one.

9,192. I quite understand the worthlessness of it, but I want to show that you have been doing exactly the thing that you call worthless?—No. There is every possible difference between an estimate of population and an estimate of the people who will work. Take any one district as an example. I cannot give you any fixed idea as to the number of inhabitants, but I can give you a very fair idea of the number of men who will labour.

9,193. But would not the number of men available for labour be dependent in some degree upon the population?—Not necessarily at all.

9,194. In some degree it must?—Well, you cannot get more men to labour than the total of the population, that is obvious.

9,195. I do not mean to say that one tribe would work as much as another, man for man, but it must be based in some degree on the population?—Only to that extent.

9,196. Well, whether you estimate the number that in your opinion might be available for work down here, or whether you calculate the population, in either case, the general remarks you make that expressions of opinion as to numbers are unreliable must apply?—No, I gave you no figures. The point I make is this. Suppose you take a tribe like the Dinkas who are believed, on what grounds I cannot now say, to be able to put four millions of fighting men into the field, very numerous tribes covering an enormous part of Africa. You could not get one man from that tribe for labour. Population is no indication whatever.

9,197. But, on the other hand, you describe a number of tribes a large proportion of which work. The one would balance the other. The whole result of your evidence, so far as the labour supply is concerned, is based on opinions which, when they are given by other people, you describe as absolutely unreliable?—No, I do not use figures. None of my evidence is based on figures, only numbers are the vaguest possible suggestions by which you can get a very rough estimate.

9,198. I am not questioning your right to be considered an authority on this question, but whenever you have been brought to the point to give a number it has been an estimate pure and simple, unsupported by anything but your own experience? I have never given an estimate except that one very vague figure; that figure is based on nothing beyond my having seen the country and tried to get labour.

9,199. Mr. EVANS: Is this a correct report of the question referred to by Mr. Quinn? I asked you, "Did you hear Mr. Breyner's evidence, or have you read it?" In reply, you said, "I have heard a portion of it, and I think I have read it all." Then I said, "Mr. Breyner stated that the official statistics given were for the southern territory." I went on to say, "Then he went on to state that there were districts north of latitude 22 and he arrived at a total figure of from 700,000 to 800,000 men between the ages of 15 and 50 by doubling the population of the southern portion. It was not on the basis of the hut tax that he estimated the population of the northern portion, but by simply doubling the population of the southern." Do you think that is a reliable way of arriving at the population of the northern portion? That was my question?—Yes.

9,200. You replied, "In my opinion they are absolutely unreliable." That was the question, whether it was a fair way of arriving at the figure by simply doubling the population of the southern portion.

9,201. Mr. QUINN: I do not wish it to be understood that I discredit anything that Mr. Grogan has said. I am perfectly certain that Mr. Grogan is incapable of misleading us or that he would, in supporting any view, say anything of that kind. I

only want to establish one thing, that what he describes as worthless estimates, on that basis more or less he has given his evidence as regards numbers. He has been forced into it two or three times, every Commissioner has wanted a definite number, and he has been forced to give one which he himself calls absolutely unreliable. I do not wish to minimise his evidence?—I only wish to show that in the only place where I have committed myself to figures at all I have based it on something definite. For example, we none of us know how many natives there are south of the Zambesi, but we know to a man how many we can get to labour for us.

Mr. QUINN: Oh, no, we do not.

9,202. The CHAIRMAN: The question simply was, Whether it was a reliable way of getting at the population.

Mr. QUINN: I do not suppose he (Mr. Grogan) wishes to charge Mr. Breyner with being unreliable either. You have the evidence, and can take your choice.

9,203. The CHAIRMAN: Is there any other point you would like to mention, Mr. Grogan?—No, thanks.

9,204. The Commission is very much obliged to you for your evidence.

SIR GODFREY LAGDEN, recalled, duly sworn, and examined.

9,205. Have you before you a document headed "A Memorandum"?—Yes, I have it.

9,206. Then have you a further statement marked "Schedule," enumerating documents that you are now handing in to the Commission?—Yes.

9,207. Have you a letter dated August 7th, from Dr. Irvine, addressed to your Secretary?—Yes.

9,208. Have you a schedule headed "Labour Agents' Licences in Force"?—Yes.

9,209. Have you a further one headed "Native Mortality on Mines in Johannesburg," etc.?—Yes.

9,210. And further, "Mortality Among Natives Employed Other than on the Mines"?—Yes.

9,211. Then the "Mortality Among Natives in Johannesburg," etc.?—Yes.

9,212. And a "Return Showing the Number of Natives Employed Other than on Agriculture"?—Yes.

9,213. "The Number of Men Employed in Pretoria District"?—Yes.

9,214. Memorandum regarding population statistics?—Yes.

9,215. And for the C.S.A.R. Repatriation, outside and inside labour districts?—Yes.

9,216. Do you hand them in as your evidence-in-chief?—Yes, they have arisen out of my previous examination, at which you asked me to produce these statistics.

9,217. Have you any documents dated September 3rd, and a circular addressed by you on the 20th January to various administrations?—Yes.

9,218. And a memorandum to attach to the report on the Mortality?—Yes.

9,219. And a memorandum by the Executive Committee of the Chamber of Mines?—Yes.

9,220. And the Report of the Commission of Doctors on the mortality among natives in the mines of the Witwatersrand?—Yes.

9,221. You had these in also as additional evidence-in-chief?—Yes.

9,222. In the course of my evidence on the 30th July I stated that I would be glad to furnish the Commission with further information concerning certain questions which had arisen during my cross-examination.

This information is now laid before the Commission under a covering schedule. For convenience of reference the documents are numbered consecutively and I shall refer to them in their numerical order.

(1) Question 1,758. Particulars concerning the existence of malaria on the mines were furnished to the Commission on the 20th instant in a report by Dr. Irvine.

(2) Question 1,764. The number of current recruiters' licences is shown in the return forwarded to the Commission on the 5th instant.

(3) Question 1,785. Further returns as to the mortality amongst natives on the Witwatersrand, showing the death-rate per thousand per annum, are now submitted separately as follows:—

- (a) On the mines exclusively within the proclaimed labour districts.
- (b) Other than on the mines within the same districts.
- (c) Within the whole area of the labour districts, including mines and other than mines.

(4) Question 1,788. Number of Natives in the Pretoria District. The required explanation is contained in the memorandum enclosed.

(5) Question 1,810. Number of natives on the railways. This appears in the statement.

(6) Question 1,820. Population statistics. I hoped to lay before the Commission a revised Blue Print concerning the native population of the Transvaal. Upon further investigation, I find that there is so little variation in the figures already supplied that the previous estimate, dated the 24th July, may be accepted as approximately correct.

(7) Question 1,871. Basutoland Statistics. As I believe that the Resident Commissioner for Basutoland has already supplied the Commission with the required data, I presume that there is now no necessity for me to furnish these statistics.

(8) Question 1,911. Report by the mine doctors on mortality amongst natives on the Rand. A copy of this report is now put in.

(9) Question 1,941. Pretoria population statistics. This question is answered by Number (4) dealing with question No. 1,788.

(Signed) Sir GODFREY LAGDEN,  
Commissioner for Native Affairs.

Johannesburg, 1st September, 1903.

#### SCHEDULE.

1. Report by Dr. Irvine concerning existence of malaria on mines.

2. Number of Recruiters' Licences current.

3. Returns as to mortality amongst natives on the Witwatersrand.

- (a) On the mines exclusively within the proclaimed labour districts.
- (b) Other than on the mines within the same districts.

(c) Within the whole area of the labour districts.

4. Number of natives in the Pretoria District.

5. Number of natives on the railways.

6. Population Statistics. (No enclosure.)

7. Basutoland Statistics. (No enclosure.)

8. Report by the mine doctors on mortality amongst natives on the Rand.

9. Pretoria population Statistics. (No enclosure.)

Crown Reef Gold Mining Co.,  
Johannesburg,  
August 7th, 1903.

W. WINDHAM, Esq., Secretary for Native Affairs.

Sir,—I have received your letter of 5th August, conveying a request from Sir Godfrey Lagden for

me to give my opinion as to the cause of the number of cases of malaria amongst natives employed on the mines, and I beg to submit the following reply:—

1. I do not find that malaria is a cause of high mortality amongst the natives on the mines. For the period of six months, from November, 1902, to April, 1903, only 36 deaths in all occurred from this cause, and these were out of a total of 1,541 deaths amongst an average monthly number of native employees of 53,364. The percentage of the total mortality directly due to malaria was thus not more than 2.3 per cent., a figure which is relatively insignificant.

For the months of May and June, 1903 there were respectively 14 (3.2 per cent.) and 17 (3.4 per cent.) deaths due directly to malaria, out of a total number of deaths of 431 and 492 for these months. I find that the majority of those for June (10 out of 17) occurred at the New Heriot Gold Mining Company amongst a gang of newly-arrived East Coast boys who came from north of Beira. Such an experience, however, is I think quite exceptional.

2. With regard to the amount of sickness from malaria amongst the natives on the mines, severe causes are not in my experience very frequent. Mild cases incapacitating the boys from work for two to five days are common enough, but I have little doubt that such cases are sometimes confused with cases of influenza, a disease which has recently been extremely prevalent on the Rand amongst whites, and which affects natives also. This confusion is almost unavoidable, as the symptoms of mild malaria and of some cases of influenza are very similar. But even taking mild malaria and influenza together, they are not a serious cause of prolonged stoppage of work as far as my experience goes.

3. With regard to causation, it is recognised that malaria does not arise "de novo" in this district. The exceptions to this statement are so very few as to be negligible. But the natives in the low country and in the Portuguese territory live in a highly malarious region, and it is a mistake to suppose that the natives of malarious districts have any immunity from the disease. For example, in Lagos deaths from malarial fever made up in 1900, one-fourth of the total mortality, and this was in an indigenous community. The majority of these deaths from malaria occurred in infants and young children.

We may assume it as certain that a considerable proportion of East Coast boys harbour malarial parasites in their blood. The change to the more rigorous climate of the Rand, especially during the winter season, is quite sufficient to render the latent infection active, and induce an attack of malaria in those who have been previously affected.

4. It must, however, be recognised that natives, who are in this way affected with and reduced by chronic malaria, are "ipso facto" more likely to be attacked by pneumonia and other acute diseases, and accordingly malarial infection, no doubt, plays a further, but indirect part in swelling the lists of mortality.

Putting all this briefly, I should say: relatively unimportant (2 to 4 per cent.), and it is not a frequent cause of serious sickness. Slight attacks are common enough, but some of these may be confused with influenza, and in either case are not a serious cause of prolonged stoppage of work. The disease, practically speaking, does not arise "de novo" on the Rand, the cases which do occur are recurrences in natives of malarial districts who have contracted the infection there. Finally, we must recognise that chronic malaria may be an indirect cause of death by predisposing those affected by it to other acute diseases.

I am, etc.,

(Signed) LOUIS G. IRVINE.

#### MEMORANDUM POPULATION STATISTICS.

The number of men noted as "available not now at work" under column 11 of the Blue Print, includes all those able-bodied men who have actually been to work during the year, but are now at home.

It may be stated that a majority of the men included in this column have been at work from all the districts of the Transvaal.

Department of Native Affairs,  
3rd September, 1903.

#### MEMORANDUM.

I have observed that it is stated in the evidence given by Mr. Grant and one or two others whose opinions are valuable, that it would have been desirable if the natives had been informed by responsible European messengers of the re-opening of the mines and encouraged to come out to work.

Immediately after the conclusion of peace I assembled all the Native Commissioners and sent them out to all parts of the country. They were all men of wide experience with natives. My instructions were that they were to go out and devote some considerable time traversing the whole country in order that the natives might gain confidence. They were instructed to inform natives that the war was over, that peace prevailed, and that there was now nothing to prevent their coming out to work freely, which they were to be encouraged to do by all possible means.

It would have been useless at that time for me to have gone personally, because thousands of natives were scattered over the country in Refugee Camps, and during the course of repatriation the most practical plan was to send reliable officers to go and live amongst them.

The instructions I gave were carried out to the letter, and there were no natives in the country who were not informed and encouraged in the sense suggested. Then when the change in rate of wages occurred I at once caused them to be informed through accredited and responsible officers; and I also informed all the territories in South Africa in terms of circular letter, which I think it may be useful if I now put in.

It will be seen that I asked that the Magistrates in the various territories might be specially instructed to make it known to all natives within their jurisdiction. I received replies saying that this had been done throughout the Cape, Natal, Basutoland and Bechuanaland.

It has been stated also that advantage would have accrued if provision had been made for a supply of rations of Kaffir beer, to which natives at home are so much accustomed. Perhaps it is not generally known that in the Liquor Law, No. 32, which was passed last year, particular provision was made for this. Whilst being strongly opposed to the use and abuse of spiritous liquors, I have all along recognised that it might be desirable to issue rations of Kaffir beer for medical purposes, and this has been very largely, if not universally, adopted on the mines.

(Sgd.) G. Y. LAGDEN,  
Commissioner for Native Affairs.

No. 78/03.

Papers N.A. 163/03.  
Department of Native Affairs,  
Johannesburg,  
23rd January, 1903.

Sir,—I have the honour to enclose copy of a letter dated 16th January, addressed to this Department by the Witwatersrand Native Labour Association, and copy of a communication dated the 20th January, from the Chamber of Mines, stating that the rate of native wages on the mines has been increased to the amount which was paid before the war.

Under this arrangement it is calculated that the minimum wage per month will in future be 45s. instead of 30s.; in addition to which it will be open to all natives to earn a further sum by piecework if they are competent to do so.

In connection with the wage question, I may remark that the 30s. rate was fixed during the war in consequence of military orders, first by the late Transvaal Government, and, secondly, by the British under Martial Law.

It was determined by the mining authorities to continue the 30s. rate. This was indirectly calculated to benefit agriculture by establishing a useful standard of wage for natives employed on farms where they are badly wanted throughout this and other territories; but circumstances have apparently proved that it has been the means of deterring many from going to the mines and has not had the expected effect of keeping the rate down throughout the country.

17133

I venture to ask if you will be good enough to cause the change in the rate of pay to be made known to the Magistrates with a view of its being notified as widely as possible to the natives in your territory.

I shall be glad if at the same time the following information could be circulated:—

1. Government Inspectors have been appointed whose duties are to see that no natives are detained on the mines beyond their contract time and that they are paid the full amount for which they have contracted.

2. That considerable improvement has been made during the past year in the matter of hospital treatment, sanitation and general conditions; that changes of diet have been introduced with a view to check the disease of scurvy which formerly prevailed to a large extent; that vegetables and lime juice, etc., are regularly issued, and that it is generally contemplated to issue a ration of Kaffir beer, which is considered to be an antidote against scurvy.

3. That Government is concerned to bring about improvement in all reasonable ways of the general conditions of natives working in the mines, and the mining companies have shown an earnest desire to respond.

4. That a Government Agency has been established at Johannesburg and other centres for the purpose of receiving deposits of wages earned by natives, and remitting the same to their families in all parts of British South Africa.

I have the honour to be,  
Sir,  
Your obedient Servant,  
(Sgd.) G. Y. LAGDEN,  
Commissioner for Native Affairs.

(The above was addressed to the Governments of the Cape Colony, Natal, Orange River Colony, Rhodesia, Basutoland, Bechuanaland and to all Native Commissioners in the Transvaal.)

#### MEMORANDUM.

To accompany Report on Mortality amongst Natives employed on the Mines, dated 6th June, 1903.

This Medical Report was the outcome of a Conference convened by the Commissioner for Native Affairs on February 13th, 1903, at which were present representatives of the Chamber of Mines and the greater number of doctors then employed as mine doctors by the industry.

At this Conference it was determined to appoint a Sub-Committee of medical men to consider the whole question of the incidence of diseases and the causes of mortality amongst the natives employed on the mines at the Witwatersrand, and to bring up a report with recommendations.

(Sgd.) G. V LAGDEN,  
Commissioner for Native Affairs.  
Johannesburg,  
2nd September, 1903.

#### MEMORANDUM.

By the Executive Committee of the Transvaal Chamber of Mines on the subject of a "Report to the Commissioner for Native Affairs on the mortality amongst natives on the Mines of the Witwatersrand, compiled by a Committee of Medical Officers of mines."

The Executive of the Chamber has carefully considered the report of the Committee of Mine Doctors made to the Commissioner for Native Affairs on the subject of mortality amongst natives on the Mines of the Witwatersrand, and has dis-

2 B 2

ussed the various points raised and recommendations contained in the report with the Commissioner for Native Affairs and members of the Committee of Mine Doctors.

1. The hygienic conditions prevailing amongst natives on the mines have occupied the attention for many months past of both the Government and the Boards of Directors of Mining Companies, and the Executive believes that the recommendations contained in the attached report of the Committee of Medical Officers have already been practically adopted. Precautionary measures have been taken against the exposure of natives to extremes of temperature, whether in respect of natives arriving from warm latitudes or natives that have been for some time working on the mines.

The attention of the Department of Native Affairs was drawn to the fact that the immediate vaccination of the more weakly of the newly-arrived natives at the Pass Offices produced an injurious effect upon their health, and the Commissioner for Native Affairs agreed to the postponement meantime of the vaccination of natives arriving in a more or less impoverished condition, stipulating, however, that the Medical Officers of the mines should receive instructions to vaccinate all such natives so soon as the state of their health would admit of the operation.

2. Special provision has been made by companies for the clothing of boys employed in cold weather on cyanide and other works under conditions where blankets cannot be worn, and the Witwatersrand Native Labour Association has made satisfactory arrangements regarding clothing of new arrivals whilst on their journey to the mines.

3. The recommendations contained in the report with respect to change houses have been carried into effect wherever practicable.

4. Sanitation and Water Supply.—Provision has been made under Article 146, Section XV., of the new Mines and Works Regulations with regard to sanitation, and a circular has been issued drawing attention of managers to the danger arising from the insanitary condition of old and disused workings, and advising them to take steps for the cleansing and disinfecting of such places.

The Executive Committee understands that arrangements have been made in most cases for a pure water supply underground.

5. Open Stoves.—Companies have been recommended to adopt a new stove of cylindrical shape, perforated with large holes, with a cast-iron plate on top, and with an iron chimney to carry off the fumes. This pattern of stove has been in use on the East Rand Proprietary Mines for some time past. It is hoped that the introduction of these stoves will conduce to an improved ventilation.

6. Diet.—The Executive Committee cordially approves of the suggested alterations contained in the report of the mine doctors, and would strongly recommend the companies, should the natives be found amenable, to adopt the schedule appended to the Committee of Doctors' Report in all cases. The Executive also considers that it would be well to divide the supply of food into two meals daily. It may be remarked, in connection with diet, that the death-rate from scurvy has now been very considerably reduced.

7. Housing of Natives.—It is well-known that the natives prefer a crowded room, and, however much air-space is provided, insist upon huddling together. The Executive Committee recommends provision being made in compounds for 150 cubic feet of air-space per man, calculated on the basis of the number of natives on the companies' registers.

The adoption of cement or asphalt floors would be found very expensive for the older companies,

but the recommendation might be adopted in the case of new compounds. Floors of brick or some hard substance that can easily be flushed out are recommended in the case of companies whose compounds are already erected, and it is understood this provision meets with the approval of the Committee of Medical Officers.

8. Hospitals.—The attention of Mine Managers is directed to the proposals contained in the report of the Medical Officers with regard to hospitals.

The Executive Committee of the Chamber also recommends that natives of a superior class should be introduced from Basutoland and the Transkei as hospital attendants, and distributed amongst the mining groups. The Commissioner for Native Affairs has kindly offered to assist in obtaining this class of attendant, and doubtless the Mining Companies will be glad to avail themselves of the offer. It is considered they would be more suitable than members of the Army Medical Corps, as suggested in the alternative proposal of the Committee of Mine Doctors.

9. Accident Assurance.—This matter is under the consideration of the Chamber of Mines and the Native Affairs Department.

10. The Executive acknowledges the reasonable spirit in which the report of the Committee of Medical Officers is framed, and observes with great satisfaction that, as stated by the doctors themselves, all the improvements suggested by them are already in use on some of the Mines on the Rand.

In conclusion, the Executive Committee of the Chamber desires to express its sense of the courtesy and consideration shown by the Commissioner for Native Affairs throughout the conferences and correspondence on this important subject.

Transvaal Chamber of Mines,  
Johannesburg, September 3rd, 1903.

#### REPORT ON THE MORTALITY AMONG NATIVES EMPLOYED ON THE MINES OF THE WITWATERSRAND.

To the Commissioner for Native Affairs, Transvaal.

Sir,—In accordance with the verbal instructions which we received at a Conference held between the Commissioner for Native Affairs, representatives of the Transvaal Chamber of Mines, and certain of the medical officers of the mines, on February 13th, 1903, which instructions were subsequently further defined by the Commissioner for Native Affairs in a subsequent interview, we have since that date been occupied in the investigation of the incidence of disease and the mortality amongst the natives employed on the mines of the Witwatersrand.

In this investigation we have been somewhat delayed by the lack of sufficient data, for, although the mortality returns of the Native Affairs Department afforded us detailed information regarding the causes of death amongst natives from the beginning of November, 1902, we did not consider that any period of less than six months could give an adequate basis from which to draw reliable conclusions. This basis we now have, and, in addition to the mortality returns referred to, we have compiled monthly sickness reports for the various compounds with which we are personally connected.

For the information afforded by the mortality returns, and for other data relative to our investigation, we have to thank the Commissioner for Native Affairs, who, through his department, has supplied us with much valuable material.

#### I.—INTRODUCTORY CONSIDERATIONS.

The basis of our report consists, therefore, in the mortality returns for the six months ending April 30th, 1903.

These we have summarised, and their results appear in the accompanying table:—

TABLE SHEWING CAUSES OF DEATH OF NATIVES ON MINES OF WITWATERSRAND  
NOVEMBER, 1902—APRIL, 1903.

Disease.	Nov., 1902.	Dec.	Jan., 1903.	Feb.	March.	April.	Totals.	Percentage of Total Mortality.
(a) Pneumonia ... ..	86	81	78	64	76	108	493	32
Phthisis ... ..	25	29	17	15	18	23	127	8·2

(f) Other Diseases ... ..	29	28	24	19	16	23	139	9·
(g) Accidents ... ..	10	21	14	11	18	12	86	5·5
Monthly Totals ... ..	250	326	253	208	235	269	1,541	Total of all Deaths.
Number of Natives employed for each Month ... ..	46,710	48,542	49,761	56,288	57,022	62,265	53,864	Average number of Natives em- ployed per month.
Death-rate from all causes calculated as an Annual Death-rate ... ..								57·7 per 1,000.
Death-rate from sickness alone ... ..								54·5 „

From this table it appears that the total death rate, calculated on the basis of the average number of natives employed per month, would, when rendered as an annual death rate, be 57·7 per 1,000. Curiously enough, it appears that the death rate amongst the natives employed in the Kimberley compounds is practically identical, namely, 57·2 per 1,000 for the year 1902. We do not say that the mortality amongst the natives of the Rand cannot be reduced; we believe, and will try to show that it can, but it is certainly apparent that the natives on the Rand show a mortality no higher than that obtaining in other mining districts in South Africa. If deductions be made for accidents, leaving the death rates from sickness alone, the figures are in each case again identical, being 54·5 per 1,000 for the Rand, and 54·8 per 1,000 for the Kimberley compounds.

When we pass from the total death rate to its individual components, we find that the diseases which mainly contribute to it are the following:

1. Pneumonia, phthisis and other respiratory diseases, accounting for 41·7 per cent. of all deaths. Of these pneumonia alone is answerable for 32 per cent. of the total death rate, and is of all the individual diseases by far the highest contributing factor.

2. Enteric fever, dysentery and other diarrhoeal diseases, which together cause 20·5 per cent. of the total deaths; of these dysentery is the largest individual contributor (12 per cent.).

3. Scurvy, which has during these six months accounted for a total of 12 per cent. of the deaths.

4. Meningitis (cerebro-spinal meningitis), accounting for 7·9 per cent., and

5. Malaria, which is answerable for 2·3 per cent.

All other diseases taken together only contribute a further 9 per cent., and of these we have not thought it necessary to give more detailed information.

From information obtained we find that, amongst the natives employed on the C.S.A. Railways, the incidence of scurvy and pneumonia has also been very considerable; whilst, amongst the natives employed in the various Kimberley compounds, pneumonia is very prevalent and extremely fatal. The average daily population of the Kimberley compounds during 1902 was 8,681. There occurred in that period 1,186 cases of pneumonia, with 373 deaths, out of a total mortality of 497, forming a percentage of no less than 75 per cent. It is extremely interesting to note that cerebro-spinal meningitis, a disease which is prevalent on the Rand, and which competent observers believe is in its causation closely allied to pneumonia, is scarcely represented at all in the Kimberley death rate.

Scurvy has also been noticeable in the Kimberley compounds, but it has not there contributed in such a high degree to the mortality as it has on the Rand.

Now scurvy is a dietetic disease, and therefore mortality from this cause should in theory be entirely preventable. Indeed, the returns of the past six months show a steady decline in the death-rate from this disease, owing to the attention of the mining companies having been directed to the necessity of improving the diet of the natives. During the month of April only two deaths occurred on the Rand from scurvy.

The mortality from pneumonia can certainly be reduced, but it cannot be altogether eliminated, for the natives are peculiarly susceptible to this disease, and the conditions of mining work favour its incidence. The same may be said of the allied disease of meningitis, and of the "diarrhoeal diseases"—enteric fever, dysentery, and diarrhoea.

We believe, however, that should the recommendations which we shall advance later on be adopted, the mortality amongst mining natives could be reduced to 40 per 1,000, or even lower. To attain this result, several innovations are necessary, and it is especially important that those charged with

the medical and general care of the compounds should try to gain the full confidence of the natives, who are particularly prone to conceal their diseases, until in many cases treatment is too late to be of any value.

The monthly "sickness reports" which we have personally compiled, go to confirm and extend the information outlined above, and they bring out the additional fact of the decided preponderance of disease of all kinds amongst underground as compared with surface workers.

We shall now proceed to consider in greater detail the individual diseases, which we have found to be important factors in the native mortality.

## II.—PNEUMONIA AND THE RESPIRATORY DISEASES.

Pneumonia, as we have seen, contributes to the total mortality the highest proportion of any individual disease, accounting for no less than 32 per cent. of all the deaths amongst the natives on the mines. Pneumonia is a "specific disease"; it is due, that is to say, to the attack of a definite micro-organism, the "pneumococcus," to which South African natives seem to be peculiarly susceptible.

Indeed, not only are the cases of pneumonia which occur amongst the natives on the Rand due to this specific agent, but there is reason to believe that many or most of the cases of cerebro-spinal meningitis which occur in the compounds arise from the same cause.

The suggestion that these two diseases, pneumonia and meningitis, are, on the Rand, produced by the same micro-organism, was first definitely formulated in a paper published by Drs. Brodie, Rogers, and Hamilton, of Johannesburg, in 1898. They described cases of acute rhinitis (nasal catarrh) and meningitis, which bacteriological investigation showed to be pneumococcal in origin. There is no doubt that cases, similar to those which they described, still occur in all the districts of the Rand, and that they show an extremely high case-mortality. Indeed, so far as the returns under our consideration go, the disease is at present on the increase. It has been observed, too, amongst white underground workers.

In our experience, meningitis mainly occurs amongst underground boys, a fact which suggests that the underground workings have become a habitat of the infective agent.

The precautions to be taken against the spread of meningitis are practically those to be taken for the prevention of pneumonia, which we may now proceed to consider.

While the pneumococcus is the direct and active agent in the causation of pneumonia, there are also other definite causes which determine its attack. Of these exposure to cold is the chief, and the cause is rendered all the more efficacious if the strength is otherwise reduced by insufficient food or excessive work, and by the fact that many of the natives come direct to the Rand, often scantily clad and in poor condition, from warmer districts, where extreme ranges of temperature do not occur. Underground workers are also very liable to contract a chill on coming out of the warm underground workings to the surface. Hence we find that the incidence of pneumonia is most marked during the cold months of the year, at which season precautions against it are especially necessary, particularly in regard to boys arriving during these months from warmer climates; such boys show an extreme liability to attack.

These precautions should consist—

1.—In the provision of a suitable dietary, the details of which we shall discuss later. We shall now refer merely to one particular matter in regard to diet, in reference to the prevention of pneumonia, namely, the provision of a suitable soup-kitchen at or near the entrance of the compounds, at which meat soup, together with some cheap form

of biscuit (such as the army biscuit), should be served in the morning to each boy of the up-coming and down-going underground shifts, and to the surface boys. This system is already in vogue on several of the mines on the Rand, and has proved beneficial.

2.—During the cold season (from April to September) the recognised recruiting agency should be required to issue two blankets to each boy on starting for the Rand, who may not be possessed of them, and during the warm season one blanket. The possession of a blanket should be made compulsory on the part of the boys. In the instance of one mine within our knowledge, there was a high incidence of, and mortality from, pneumonia during the months of June and July of last year, particularly amongst a batch of newly-arrived and ill-clad East Coast boys, who, nevertheless, refused to accept the offer of the company to supply them with blankets in advance. This is far from being an isolated experience.

For all surface boys, many of whom work in exposed situations, e.g., on tailing heaps or slimes dumps, and who cannot from the nature of their employment wear blankets when at work, a woollen sweater and a pair of strong trousers should be provided. A large number of cases of pneumonia occurs amongst cyanide boys, and this provision would secure their being sufficiently clad.

The cost of the blankets and clothing might be deducted from the boy's pay in the course of the performance of his contract.

3.—Together with the soup-kitchen there should be a change-house for the natives at the headgears, with provision for them to leave their blankets there when going underground. The mere fact of having such a change-house would greatly reduce the risk of chill to the mine boys on coming to the surface.

4.—It is important that the boys should not be kept waiting for any long period in the cold, for the purpose of having their time tickets marked or of being paid. An excellent system of time-keeping preventing any such exposure is in vogue at the Treasury G.M. Co.

5.—We cannot approve of the present system of having earth floors merely in the compound huts. These cannot but form ready receptacles for infected sputum, and provides a dangerous means of perpetuating the incidence of pneumonia, meningitis and of other infectious diseases. It is impossible to render the earth floors clean. We should, therefore, strongly recommend that all future compound huts should be constructed with impervious floors.

Bunks should be of moveable wooden planks set in fixed iron frames; these bunks may be conveniently arranged in two tiers.

In all compound huts stoves should be provided with iron flues to carry off the fumes, in place of the rough open coke stoves at present in general use. The fumes caused by the combustion of coke are, in the absence of ventilation, most dangerous, and therefore proper means for their escape should be provided. The inhalation of these fumes will certainly predispose to respiratory diseases.

Regarding the cubic space to be provided per head in the compound huts, we find that the full complement of boys does not at any time (except on Saturday night and Sunday) occupy the huts. Consequently we are of opinion that, if impervious floors and stoves, with suitable chimneys, are provided, an allowance of 150 cubic feet for each boy of the total complement of the hut would be sufficient for purposes of health.

With regard to other diseases of the respiratory group, ordinary tubercular phthisis is not uncommon in the compounds, and contributed its quota to the death rate. It is present, however, in the districts from which recruits for the mines are obtained, and we believe that most of the cases found on the Rand are imported. Provision should

521

be made for the detection of the condition amongst recruits, and for the return of affected natives by the companies to the recruiting agencies, within a specified time after their arrival.

So-called "miners' phthisis" is sometimes seen amongst the natives, in boys who have been engaged in underground work over considerable periods. The improvements in the conditions of mining, which are looked for as the result of the Commission on Miners' Phthisis, will no doubt go as far as possible towards avoiding risks from this source.

### III.—ENTERIC FEVER, DYSENTERY AND DIARRHOEAL DISEASES.

Enteric fever does not show an excessive incidence in the compounds, and the natives seem to enjoy a relative immunity from this disease. The total contribution of enteric fever to the death rate is 5.5 per cent. Dysentery, which also, like enteric, is due to an infective agent, is responsible for more than double the number of deaths.

Both diseases are more prevalent during the summer months, and amongst underground boys, due in the latter case to the faecal contamination of the workings and of the underground water. In this connection we may cite a small epidemic of enteric fever, affecting 11 white underground workers, on one of the mines of the Rand a few months ago, which ceased at once when the underground water was made inaccessible to the men.

For any diminution of the incidence of this group of diseases we must look, therefore (in addition to the general question of a trustworthy water supply to the compounds), to improved underground sanitation. Towards this we should urge the following recommendations:—

1. In every mine, on each level, near the shaft, two sanitary buckets should be provided, one for white men, and one for natives. The automatic earth closet would be the best form of convenience. The buckets should be removed and replaced nightly. Use of these buckets should be made imperative on white men, and so far as possible each white man in charge of a gang of Kaffirs should be made responsible for their use of the buckets also.

2. The gross habit of using disused workings in place of latrines should be absolutely forbidden and its practice rendered penal.

3. Underground water should not be used for drinking purposes.

In connection with underground sanitation, officials should be appointed, subordinate to the Medical Officers of Health for the Witwatersrand and the Municipality, whose duty it should be to periodically inspect the sanitary condition of the mines by personal visit. So far as we know no such system exists at present, nor does such inspection appear to form part of the practice of the mining inspectors.

### IV.—SCURVY.

We consider that too much stress has been laid by some on scurvy as a main cause of mortality amongst the natives, for, even if deaths from scurvy could be entirely eliminated, the death rate would still be high.

At the same time it is very evident that during the past six months scurvy has been an important cause of mortality, and coincidentally, of course, of extensive sickness and consequent incapacity for work. Scurvy, however, is a preventable disease, and it is now declining, and we trust that for the future it will not bulk largely in the sickness or mortality returns.

In regard to causation, scurvy is a dietetic disease. It is due, that is, to insufficient variety in

food, and particularly to a deficiency of fresh meat and vegetables, and also to indifferent quality of the food, especially to decomposition changes. Tainted meat has been shown to be in itself a cause of scurvy, and in all districts where maize (mealies) forms the staple food, disease due to partial decomposition or disease of the maize, also frequently appears. In those parts of Europe, for example, where maize forms the staple food of the peasantry, a disease named "pellagra" is common; it is closely allied to scurvy and yields to the same treatment.

On the Rand, also, we have traced a relation between outbreaks of scurvy on individual mines and defective quality of the mealies supplied. On one mine, in particular, where there was at the time no case of scurvy, there appeared during March of this year 31 typical cases of the disease, and the mealies consumed during that month were found, on investigation, to be tainted and "musty." When other and sound mealie meal was substituted, the disease disappeared.

The disease which has been described as scurvy conforms in the vast majority of cases to the classical descriptions of that disease. One of its most obvious and common features consists in the swelling of the gums, which is often extreme, the gums bleed readily, and the breath is foul. This local condition, however, is merely indicative of the general tendency in scurvy to haemorrhagic and serous effusions, which frequently take the form of infiltration of the muscles, especially of those of the legs. Haemorrhage also may occur into the stomach or into the bowel, giving rise in the former case to vomiting of blood, and in the latter to symptoms simulating dysentery, and very fatal. We have observed not uncommonly also haemorrhage into the joints, especially the knees. Thus there is in scurvy a profound change in the blood, which is the chief pathological factor in the disease. Its result is seen in the effusions of blood in various parts, and in the exudations in the muscles and gums which we have mentioned, and in a condition of anaemia of all the tissues. Those affected by scurvy bear injuries very badly, and we have seen cases where injuries, in themselves relatively insignificant, have proved fatal owing to this cause, while the most trivial abrasions of the skin may give rise in scorbutic patients to severe ulceration.

Mild cases of scurvy are readily cured by the provision of a generous diet of meat and fresh vegetables; old-standing cases are much more intractable, but the case of mortality is, under treatment, relatively low. The affection of the legs may give rise, especially if neglected, to a pseudo-paralytic condition, which has been ascribed to other diseases.

Cases which appear to conform more to the classical descriptions of "pellagra" are sometimes observed.

The question has also been raised whether some or many of the cases described as scurvy on the Rand, may not in reality be cases of "beri-beri." There is, however, no evidence that this disease arises "de novo" on the Rand, and, although a few possible imported cases may be seen from time to time, we have no hesitation in saying, from a wide experience, that the vast majority of cases, described under the name "scurvy," are characteristic examples of this disease. Some of the members of our Committee have had previous experience of beri-beri in other parts of the world, but they have met with no cases of this disease upon the Rand.

We have taken some pains to find out whether scurvy is prevalent amongst boys arriving on the mines, and a certain proportion are so affected, but the majority of the cases have unquestionably contracted the disease upon the mines. The recent prevalence of the disease is partly the heritage of the war, due in part to the fact that the natives who remained on the Rand during the war were for the most part poorly fed, and to the further fact that a sufficient supply of South African mealies

has not since been obtainable, owing to the disturbance of the normal South African output by the recent hostilities.

We regard scurvy, therefore, as a dietetic disease, and its prevention must be looked for in an adequate scale of diet for the natives. The question of the condition of the native as regards manner of housing and overcrowding is, so far as this disease is concerned, of less importance.

#### V.—DIET OF NATIVES.

We would accordingly offer the following suggestions regarding the diet of mining natives, and we would first lay down the principle, that the mining companies, which contract to feed and house the natives in their employment, should provide a diet sufficient to maintain them in a condition of working efficiency, independently of any additions to their diet which the natives may make themselves. The system of allowing the natives to feed themselves, adopted in Kimberley, is by no means satisfactory, from the point of view of the prevention of scurvy, for in the Kimberley compounds, scurvy, although not a cause of great mortality, shows a considerable incidence especially amongst boys who have been three months or more in the compounds.

The provision of an adequate diet is a matter of the simplest commercial economy, in that it not only reduces the incidence of disease in every form, and of scurvy and pneumonia in particular, but it secures the maximum output of efficient labour from those who are at work.

The source of the energy of human work lies solely in food, and to ignore this fact, by the supply of an insufficient diet, is a most short-sighted form of economy, for which the penalty is inevitably exacted in the form of bad labour, excessive sickness and an undue mortality.

We would, therefore, concentrate our attention on the question, What is a suitable dietary for the native workers?

Mealies form the staple food of the natives of South Africa, to which various additions are made in the different districts. For this reason it is desirable to maintain mealies as the basis of any proposed dietary, especially as mealie meal is particularly rich in fat, is rich also in nitrogenous elements, and is highly nutritious, resembling oats in its nutritive value.

But while we agree that mealie meal should form the basis, the attempt to render it the only element of the diet will inevitably perpetuate the incidence of scurvy amongst the workers, as has been abundantly proved by the local experience of the past two years, and by the facts which we have cited, of the incidence of disease, allied to scurvy in other parts of the world, where maize forms the staple diet. If imperfectly cooked—and steam seems to be the best method of cooking—or, if at all decomposed or diseased, mealies as we have seen may give rise to serious disturbances of health.

Additions to this diet, therefore, become necessary, in order to provide that variety in the food, which is essential in order to provide the worker with a sufficiency of the necessary chemical components of an adequate dietary in proteids, carbohydrates, fats and salts. Before proceeding to discuss these necessary additions we would call attention to certain facts regarding the available mealie supply. Hitherto the output of South African mealies has not been equal to the local demand, and as a consequence the difference has been made good by the importation of American and European mealies. Further, we have learned from inquiry that the mealie crop throughout South Africa has this year been a very poor one, owing to climatic influences, so that importation will still be necessary.

An extension of the mealie-growing area in South Africa is, therefore, necessary, if the local supply is

in the future to be equal to the local demand. There is no reason, however, why, if this be done, South Africa should not be economically self-sufficient in this respect, except, of course, during bad years, for the factors adversely influencing surface crops in South Africa—drought, frosts, locusts, etc., are, of course, many and variable.

We have had our attention drawn to the fact that American mealies have been in some cases shown to produce outbreaks of scurvy, which disappeared when a change was made to South African mealies. It seems an obvious inference, therefore, that steps should be taken to render the South African output sufficient for the needs of the country. Even so, however, the greatest care should be exercised to see that the mealies are sound. Only one crop of mealies is grown during the year. Green mealies can be obtained from December to May, and ripe mealies for grinding from April to December.

With regard to the additions to the mealie meal basis, rendered necessary by the considerations we have advanced, we may discuss the following:

1. Meat.—We consider that 3lbs. of meat per week should be supplied to each boy in the compounds throughout the year. Of this 1lb. should be issued to the boys in the compounds twice a week, while the additional 1 lb. should be used for the preparation of the soup, which we have recommended should be supplied in the morning to all boys.

Fresh meat should, where possible, be supplied, as it has a higher antiscorbutic value. Tainted meat, so far as being a remedy against scurvy, is an active cause of that disease, and frozen meat is more liable to be tainted, or become so, than fresh meat. Where practicable, the meat should be slaughtered on the spot, so as to procure the additional advantage of obtaining the blood, which the natives readily consume.

A system of inspection of the meat issued by such butchers as may contract to supply the compounds should be instituted, and there should be stringent regulation and inspection of the meat and other foodstuffs supplied by the occupiers of any eating-houses who may be allowed to cater for natives on or near the mines.

2. Fresh Vegetables.—Along with the 1lb. of meat issued twice a week to each boy in the compounds, half a pound of fresh vegetables should be provided (also twice a week).

An additional 1 lb. of fresh vegetables per boy per week should be provided for the manufacture of the morning soup.

Root crops can be obtained in the Transvaal in good quantity throughout the year, although larger quantities can be obtained during the summer than during the winter months.

Of these we may mention:—Potatoes, sweet potatoes, onions, cabbage, pumpkins, lettuce, turnips, and carrots.

During the summer months, marrows, yams, and peas and beans can also be obtained, and an equivalent quantity of peas, beans, and lentils might be used (say once a week) as a substitute for the mealie meal, and to relieve the monotony of the diet, but it must be noted that the anti-scorbutic value of the leguminosae is not high. Should the local mealie crop fail in any year, it would be better to make good the deficiency by an additional supply of vegetables, than to do so by too exclusive a reliance on imported mealies. In the fruit season cheap peaches can also readily be obtained.

3. Biscuits.—The army biscuit is cheap, palatable and nutritious. Two should be issued per boy per day along with the soup, as previously recommended. The approximate weight of the biscuit is 2½ ozs.

4. Sugar in some form is a necessary constituent of all diets. Treacle is, perhaps, the cheapest and most convenient form in which it can be obtained, and, in some of the compounds on the Rand, treacle is added to the mealie meal and cooked up with it; it is appreciated by the natives. We should recommend its use in the quantity of 1lb. per boy per week.

5. Salt.— $\frac{1}{2}$ oz. of common salt should be allowed per boy per day.

These, then, are the components which we recommend should form the routine diet of the natives. They may be tabulated thus:—

Mealie Meal.—The present ration is roughly 2lbs. per day. We should recommend once a week, where practicable, the substitution of pease-meal, beans, or lentils.

Meat.—2lbs. per week, plus 1lb. per week of soup meat, the soup to be issued daily.

Fresh Vegetables.—1lb. per week, plus 1lb. per week of soup vegetables, for use with the soup meat.

Biscuit.—2 $\frac{1}{2}$ lb. per week (at the rate of two army biscuits per day).

Treacle.—1lb. per week.

Salt.— $\frac{3}{4}$ oz. per week.

Coffee might, during the summer months only be substituted for the soup, but not during the winter months.

Kaffir beer with the above diet would not be a necessary constituent of the dietary. It is, however, a useful addition, as it is a beverage to which the natives are accustomed, and it possesses an anti-scorbutic value. It is, however, rather costly. Should it be issued, it should be in the form and of the strength known to the Basutos as "leting."

A suggested schedule of meal-hours in the compounds forms an addendum to this report.

#### VI.—MALARIA.

A certain proportion of the mortality is caused by malaria, but as these cases are practically all imported, and do not arise in any number "de novo" on the Rand, we need not discuss the incidence of this disease in detail. Malaria is particularly liable to break out amongst boys who have recently arrived from warmer climates, and who have previously contracted the disease there.

#### VII.—MISCELLANEOUS SUGGESTIONS AND RECOMMENDATIONS.

We offer, in conclusion, some general suggestions and recommendations which bear more or less directly upon the health of the natives:—

1.—In addition to the question of the routine supply of blankets to the natives by the official recruiting agencies, to which we have already referred, we would urge that the Government should seriously consider the advisability of directing that parties of natives arriving during the cold season from warmer climates should be retained in a central compound for a period of two weeks before being distributed to the mines. In this compound the natives would be well fed, and would be so far acclimatised, before being subjected to the necessary exposures of mining work.

2.—The Medical Officers of the various mines should have the power to return to the Native Labour Association any boys arriving incapacitated for work by chronic disease or physical defect, within a week of their arrival on the mine. A special certificate should be required in all such cases.

3.—All natives reporting sick should be compounded in a hospital enclosure distinct from the general compound. This enclosure should contain:—

i. A native hospital, with an allowance of 25 beds per 1,000 native employees, for acute cases. A good type of such a hospital is that recently erected by the Bonanza G.M. Co. In this every boy on admission is bathed, sheds his rags and blankets, and is provided with hospital clothing and blankets which are retained on his dismissal. The results of this system are extremely satisfactory.

ii. A separate hut with impermeable floor and iron-frame bunks for convalescent cases, or minor cases not requiring hospital treatment.

iii. The usual conveniences, and a hut for the native attendant, with provision for hospital cooking.

4.—Diet for Natives in Hospital.—Extra articles of diet should be allowed for natives in the compound hospitals, on order from the Medical Officers. e.g., coffee, bread, flour, rice, and condensed milk.

5.—Disinfection.—In the hospital enclosure, provision should be made for the disinfection and washing of the clothing and blankets used by the patients.

In the case of all infective diseases, under which term we include pneumonia, meningitis, enteric fever, and dysentery, the following rules should be observed:—

i. Should the patient have worn hospital clothing and blankets during his illness, these should be properly disinfected and washed, before being again used.

ii. The private clothing and blankets of the patient, if the case prove fatal, should be destroyed, and in the event of the patient's recovery, should be properly disinfected and washed, before the boy is allowed to return to the compound.

Until such time as the compound huts are constructed with impervious floors, it is impossible to find any simple method for their disinfection which would be at all satisfactory.

6. Isolation of Dangerous Infectious Diseases (such as small-pox) is already provided for under the mining regulations. This provision should be scrupulously carried out.

7. We should strongly urge upon the Chamber of Mines to institute a corps of hospital attendants. Cape boys for this purpose are more cleanly, intelligent, and reliable than Kaffirs.

These boys, after six months' training by the medical officers of the mines, should be granted certificates, signed on behalf of the Chamber of Mines by one of the medical officers of the companies, and the possession of such a certificate should entitle the boy to a higher scale of pay, e.g., £6 or £7 a month with quarters.

By these means an efficient corps of hospital attendants might gradually be created, who would prove of the utmost value. The system generally in vogue at present of reliance on practically unskilled natives to look after the sick boys is quite unsatisfactory.

In larger compounds, where there are assistant compound managers, an alternative plan might be preferred, namely, to carefully select a number of retired N.C.O.'s or men of the Royal Army Medical Corps, some of whom are now in South Africa, and to appoint these men as assistant compound managers, with charge, under the medical officers, of the compound hospitals, and with defined duties in the administration of the compounds also.

8. Hospital Returns.—We should recommend that, in order to secure a uniform system of returns of sickness from the compound hospitals, from which reliable statistics could be readily constructed, the following forms should be adopted:—

i. Hospital Book, to be kept by the compound officials, and constituting a record of all admissions.

and discharges. The following items should be noted:—

- Date of admission.
- Boy's number.
- Boy's name.
- Tribe to which the boy belongs.
- Department of the mine in which he is working.
- Nature of disease or injury.
- Treatment.
- Date of discharge or death.
- Total number of boys incapacitated by sickness or injury for each day.

If such a record were kept it would be a simple matter to construct the second form, namely:—

ii. Monthly Medical Report of Health of Natives, for which the Medical Officers of the companies should be responsible. We append such a form:—

#### SUGGESTED FORM OF MONTHLY REPORT.

1. Number of cases incapacitated by sickness or accident on last day of preceding month, e.g., 15.

2. Number of cases admitted during current month, viz.:—

—	Under-ground.	Surface.	Deaths.		Remarks.
			U.	S.	
a. Pneumonia ..	2	—	1	—	
Phthisis ..	—	—	—	—	
Other respiratory diseases..	4	—	—	—	
b. Meningitis ..	—	—	—	—	
c. Enteric Fever ..	—	—	—	—	
Dysentery ..	4	—	1	—	
Other diarrhoeal diseases..	3	—	—	—	
d. Scurvy ..	—	—	—	—	
e. Malaria ..	3	1	—	—	
f. Other diseases ..	21	6	—	—	
g. Accidents ..	8	3	—	—	
Total admissions } 53, viz.: ..	45	10	2	—	

3. No. of deaths—2.

4. No. of discharges—51.

5. No. remaining sick on last day of current month—17.

6. Average number of cases incapacitated per day—19.4.

7. Average number of natives in company's employment during the month—

(a) Underground—

(b) Surface—

8. The last matter to which we desire to draw attention is not directly concerned with the mortality of mining natives, but, as its importance has been frequently impressed on us as medical officers of the mines, we have ventured to refer to it here.

We refer to the absence of any system of insurance of the natives against accidents arising out of their employment. Under present conditions, natives, who have suffered permanent disablement, are either retained as pensioners by the companies, or are discharged to their homes, the matter of compensation being entirely at the discretion of the companies. We consider it very advisable that a regular system of insurance with a recognised scale of compensation for defined degrees of disablement, should be instituted. At present the mining

companies pay 2s. per month per boy to the Pass Office, and, if 1½d. or 2d. out of that 2s. were thereafter set aside as an insurance fund, it would amply meet all requirements, and would prove a great boon to a considerable number of disabled natives.

We are, Sir, your obedient servants,

L. G. IRVINE.

D. MACAULAY.

J. S. MORTON.

E. POLLAK.

A. WAFF.

C. J. LYONS.

#### ADDENDUM.

#### SUGGESTED SCHEDULE OF MEAL HOURS IN COMPOUNDS.

—	5 a.m.	12 noon.	5 to 6 p.m.
Underground Day Shift	Mealie Meal and Treacle, plus Soup and Biscuits.	—	Mealie Meal and Treacle (full meal).
Underground Night Shift and Surface Boys.	Soup and Biscuits.	Mealie Meal and Treacle (full meal).	Mealie Meal and Treacle (full meal).

‡ On Wednesdays and Saturdays at 12 to 1, 1 lb. meat and ½ lb. vegetables to be issued to each boy.

\* The day shift goes down at 6 a.m., and comes up from 4 to 5 p.m.

† The night shift goes down at 6 p.m., and comes up from 4 to 5 a.m.

‡ The Saturday day shift is from 6 a.m. to 1 p.m.; the Saturday night shift from 2 to 10 p.m.

9,223. The CHAIRMAN: In the document handed in as giving particulars of sickness from malaria on the mines, and which you furnish to the Commission, refers to number 1,758?—Yes. One of the members of the Commission asked me to account for the large proportion of sickness and death from malaria. My reply was that it was a matter for a doctor to give, and I would ask the Chairman of this Committee to furnish the information, which he very kindly did in this form.

9,224. Yes, the question should be 1,758. Now with regard to 1,764. You hand in a return showing current recruiters' licences?—Yes.

9,225. That shews the total number of recruiters to be 110?—Yes, on the 1st of August.

9,226. Have there not been a very much larger number of licences issued in previous months, or is that a normal figure?—I have not the figures before me, and I could scarcely state a comparative number, but I could get them.

9,227. There are only six licences issued to the Transvaal outside the W.N.L.A., the railways, and other public departments?—That is in the Transvaal.

9,228. There are a number of collieries and other companies in addition to that. Outside of public works and public departments, there are a total, I think, of 21 recruiters. Can you say whether there has been a larger number of recruiters at any time?—I cannot say from memory. I could get you the information.

9,229. With regard to the death rate figures, which you supply in reply to question 1,785. There is an apparent discrepancy in the figures which I should like you to explain. The native mortality on the mines in Krugersdorp, Johannesburg, Germiston, Boksburg and Springs from November, 1902, to July, 1903, is stated on

page 3a, I see. The average total rate per 1,000 living per annum is given as 70.6. Now in the printed report of the doctors on the first page they give it as 57.7. Can you explain that?—You will observe that it is for a quite different period. Theirs was brought up to April, and you cannot form any comparison between the two. Since the doctors wrote their report there has been a very bad epidemic of influenza which has struck a good many mines hard.

9,230. During the interval?—Yes, that accounts for a great deal of the increased mortality.

9,231. In reply to question 1,820, you promised to bring up to date your diagram which we call the blue print. You give an explanation why you have not done that. Do you want to add anything to that explanation? You say that there is very little variation in the figures supplied as a provisional estimate?—You will remember my stating, when I handed in these (the blue prints) that we had hurried them forward to the best of our ability (some two or three months probably before their time) in order to meet your wishes in the matter and give you a certain basis of information. I then said there were one or two districts which we had not got full information about; through no fault of our own, the returns had not come in, and there were certain enquiries still outstanding. I said that within a few weeks of that time we might possibly get them in, and slightly modify the general returns. We have enquired since that date, and we find that there is practically very little to alter so far as we know.

9,232. Then with regard to the districts which were then not complete, we shall have to take a similar proportion of males and females?—Yes, you may assume the proportions I have given are correct. That was my object in trying to get a revision—to place before you as nearly as possible the correct details.

9,233. Your total of natives working on the railway on the 31st July is 13,730. That does not quite tally with the figures supplied to us by the Railway Department themselves. They gave us rather less than that, I think?—I think we got these figures from the Railway Department themselves. You should really have asked them, but you asked me, and I endeavoured to get them for you.

9,234. Your statement of the number of natives in the labour district employed by the Repatriation Department gives 1,163, and in the outside labour districts, 5,963. You do not happen to know, perhaps, how long this large number are likely to be employed?—My information is that they are shutting down the department as fast as they reasonably can, so that will be a vanishing quantity.

9,235. The figures are given as on the 30th June?—Yes, these figures are supplied to us. I have no knowledge as to whether they are correct or not.

9,236. In your memorandum of the 3rd September, you referred to evidence having been given before the Commission as to the desirability of responsible officers being sent among the native chiefs informing them of the re-opening of the mines?—Yes.

9,237. You appear to have done that very thoroughly?—Yes, very thoroughly. From the first moment that hostilities ceased, I collected together the whole of the staff which I intended to throw into the districts. I conferred with them very carefully for several days, and then threw them out all over the country with instructions to go to all the native people everywhere, sit down amongst them, restore confidence in them, tell them that the roads were safe, that justice would be administered, and the war had ceased, and there was no confusion in the country, and that it was open for them and desirable for them

to come out and work, at the same time telling them all the facilities that were afforded for those who wished to go to work, and all the works, so far as I knew, to which they could go. I made a strong point with them to be thorough in this matter, and my officers, instead of sitting down, moved about all over the country for several months, and they never ceased until they had informed all the natives of the exact state of the country. You will allow me to say in connection with this it ought to be remembered that large numbers of natives had been moved into refugee-camps all along on the railway line, and these had to be gradually repatriated. It took several months to do—I daresay six months or more, perhaps nine months, before they were moved out of these camps and got back to their old domiciles. That was a very laborious matter indeed, but no labour was spared in doing it.

9,238. Then in addition to endeavouring to reach the natives in the Transvaal you took some action with regard to other territories in South Africa?—I did so.

9,239. On similar lines?—Yes. You will observe I asked every Government to get the Magistrates, who in most cases are responsible for the natives, to make communications to the natives.

9,240. But that does not cover Portuguese territory. Was any action taken with regard to the natives there, either through your Department or through the Government?—Of course I had no jurisdiction in the Portuguese territory. There was a "modus vivendi" with them, and it was not practicable for me to communicate officially with the Portuguese. But I saw the agent of the Portuguese Government stationed in Johannesburg, and I saw personally the immigration officer stationed at Lourenco Marques. I spoke to the Governor-General myself, and the High Commissioner, who alone can communicate with the Portuguese in these matters, did inform them. It was beyond my power to do so personally, because that is not the method in which communication is carried on between my Department and the Portuguese Government. They certainly were informed in so far as they could be informed, remembering that the Portuguese have not got the system common to British South Africa of having Magistrates and Native Commissioners stationed amongst native population.

9,241. Mr. QUINN: What date did you first send out these Commissioners?—They left very shortly after the conclusion of peace; I think peace was concluded in June. I think they left the same month. Of course it will be understood that I could not collect a body of men months before waiting to go out. I could not send them out through the country during the war, because it was not safe; but, directly peace was signed, I summoned them from various parts of South Africa where they had been selected purposely, because they knew the native habits, customs and laws. I got them here and conferred with them, and I think then almost within a month they were on the move.

9,242. Would these officers be instructed by you to state to the natives with whom they came in contact that the wages on the mines had been reduced from the pre-war standard?—I certainly did not tell any of my officers to inform the natives that the wages had been reduced, the fact being that during the war under the old Transvaal Government the rate of wages was laid down by President Kruger. Then, when Martial Law prevailed here under the British Government, there were orders issued by the military authorities that not more than a certain wage should be paid. That system prevailed for a year or more prior to the cessation of hostilities, and naturally I supposed the natives were aware that there had been by military law a reduction in the rate of wages on the mines.

9,243. If they were questioned, I take it that the native Commissioners whom you sent out to spread the news that the fields were open for work, one of the questions which would frequently be asked would be: "What are the wages?" and they would be bound to give some reply?—I have no doubt every Native Commissioner was spoken to occasionally by natives, and by certain headmen with regard to rate of wages; and I believe, no doubt, they would tell them that the rate was 30s. But I have had nothing to do with the recruiting of natives. It is not our business, so those details would not come before us. The question might have been raised by any individual and would have been answered in that sense.

9,244. My point is that these men whom you sent out with commendable promptitude to spread the news that the work was here for them would also spread the news that the rate of pay had been reduced from £3 to practically 30s.?—I did not instruct them to speak about wages. They did not know what the real rate was. It was stated to me, for instance, at that time, that, although the nominal rate was 30s., nearly all boys who were worth anything at all were getting more. I am not aware that any of the Native Commissioners—certainly not myself—even committed himself to the statement that the wage was 30s., because I have always been given to understand that those who could earn it got more.

9,245. I think you have already stated that it is more than likely that these gentlemen would be asked about the wage. What answer would they give?—They would say the minimum rates—that is the phrase which has always been used—was £1 10s., for a raw hand or a young fellow. I think that that is the reply if the question was asked. One of them actually asked me, and that was my answer.

9,246. And what was the maximum? They would want to know that, I take it. I know how inquisitive they are?—I have never arrived at that myself, so that I cannot answer it. It is a very difficult thing to define that.

9,247. Do not you think that the sending out of these gentlemen would have the effect of spreading amongst the natives the fact that the minimum wage was reduced to 30s.?—No, I think that if that was spread it would be spread by those who went out to recruit labour.

9,248. If your men were asked, as no doubt they would be, they would be told then?—They would be asked rather as a Court of Appeal. In case the labour agent who went there to recruit labour said it was so-and-so, they might have gone to the Government officer for confirmation, and the officer would have said: "Yes, we are informed that is correct."

9,249. Do not you think your men would be out before the recruiters?—No, the recruiters had found their way out before into parts of the country. A great effort was being made long before peace was signed, to get labour here from all parts of South Africa. Several parties came up from Portuguese territory before peace was signed under military protection, and also from the Zoutpansberg, and from Lydenburg.

9,250. You made a reference in the statement you have just put in to Mr. Grant and one or two others whose opinions you say are valuable. You regard Mr. Grant as being a gentleman who might be accepted by this Commission as an authority on native affairs?—My answer is, I should think there are very few men in the Transvaal or South Africa who have a wider knowledge of the native question than Mr. Grant. I do not say the economical question, because I do not know, but the native question. Of purely native questions, I should say he had a very wide knowledge indeed.

9,251. Referring to page 1 of the printed report; the report as to the mortality amongst natives employed on mines on the Rand (v. p. 557). When you were here last the figures put in were made to appear as though the death rate was something like 33 per 1,000 per annum. I see this question is settled by this report put in now. The death rate from all causes is 57 per 1,000?—These figures are from a technical report of the medical officers, which deals with a different period to mine, and it is difficult to make any comparison between the two.

9,252. That report is for a period commencing in November, 1902, and brought up to April, 1903, and for that period the death rate given here by this Medical Commission, who I think we may take it knew their business, was 57 per thousand?—Yes.

9,253. So that the figure that was suggested to-day was wrong?—You remember that one member of the Commission supplied you with facts and figures to make it appear that the rate was 32?—I remember one member of the Commission produced figures which may, in his opinion, reduce it.

9,254. We may take this, then, for the period at any rate, as being authentic?—I presume the doctors in making their report had authentic information on which they based it.

9,255. From that date, Sir Godfrey, the death-rate, owing to this epidemic of influenza, became very much higher?—So that we may leave the higher death-rate out and take these five months as being a fair summary of the death-rate, especially as it compares with Kimberley?—I think you may take the figures as given in the medical report as reliable. That is only my opinion, of course.

9,256. Amongst the papers you handed in, there is one memorandum from the Chamber of Mines, I take it, to the mine managers. It is dated September 3rd. Can you tell us whether that has been sent out yet, or whether this September 3rd was just a date put on it because it was handed in on that date. It is headed: "Memorandum by the Executive Committee of the Transvaal Chamber of Mines on the subject of a report from the Commissioner of Native Affairs," and so on. Was that sent out before the 3rd September?—My own opinion is that this is their views by way of preface to the report of the Medical Committee. The report was handed in on June 6th, and you would think this was drawn up immediately—about the same date. It bears the date September 3rd possibly because it was handed in about that date?—No, that is quite a wrong view to take. It was handed in on June 6th. I considered the matter with a great deal of care. I sent for the Medical Committee and conferred with them on a variety of points. After that I met a deputation from the Chamber of Mines, as I had done in the first instance when the Committee was being formulated. I had conferred and gone into it with the medical men before sending in the report to the Chamber of Mines.

9,257. This is the Medical Report you refer to now?—This is the Medical Report I refer to. I was going to say the Chamber of Mines did not consider the matter fairly until I had transmitted it to them, after going through these preliminaries. That would certainly have been some time in July. I know that since that time a great deal of consideration has been given to the subject, because on several occasions I have been asked to give opinions, and to give further information. I should think that if it was dated September 2nd that it was probably put forth for the first time on that date. At the same time I happen to be aware of the fact that a great many of the recommendations were in course of being carried out from the day those recommendations were known.

9,258. Is your department represented in the compounds? Have you inspectors there?—We have inspectors for all the mines. The mines are grouped, and I have inspectors for each little group of mines.

9,259. Would these men have the right to examine the food stuffs?—Yes.

9,260. And report to you?—Yes, and they do it.

9,261. We got some figures, Sir Godfrey, from the Resident Commissioner of Basutoland relating to the value of the imports of European goods over a series of years. You will find those figures on the first page of the report. I understand the figures and the year have to be corrected to this extent that the financial year dealt with there ended on the 31st of March?—No, the 30th June.

9,262. But the figures, I understand from the Commissioner, were made up to the 31st of March in order to allow the statistics to be incorporated in the financial year of the Cape Colony?—Yes, the 30th of June is the financial year, but for statistical purposes the year's Customs, it was calculated as from the 1st of April to the 31st March, so that during the three months, March to June, these returns might be prepared ready to incorporate in the 30th of June financial accounts.

9,263. I see in your annual report for 1894-5 on page 10, under the head of "Trade and Commerce," you say that dutiable goods imported into Basutoland for the year ended the 31st of December, 1894, amounted to £68,674, being £29,326 less than in 1893. Adding that figure £29,326 to £68,674, you get the value of imports for 1893 as £98,000 as a round figure. You go on to say in the report, "The serious decline in the volume of imports compared with the previous year is no doubt due to the severe depression in trade from which the country has been suffering, and the consequent fall in the prices of all agricultural produce." In your annual report of 1895-6, on page 11, after noting that there has been an increase, you say, "The increase in the amount of imports is due to the high price which the Basutos have to realise for their produce during the past year. On page 12 of the annual report, 1896-7, after noting the figures, "There has thus been, notwithstanding restrictions, a very considerable increase in the amount of imports which may perhaps be partly accounted for by the desire of the traders to stock their stores before transport should become altogether unprocureable, and partly by the augmented purchasing power of the Basutos on account of the good prices obtained for their produce." I do not wish to detain you, but similar expressions of opinion occur in the other reports. Is it fair to infer from these expressions of opinions that the purchasing power of the Basuto people is in your judgment closely connected with their agricultural output?—Oh, certainly, because they depend almost entirely for their wealth upon their agricultural output.

9,264. I think when you were a Commissioner you encouraged the production of agricultural produce as far as possible, the production of grain and cereals?—Yes, certainly. Of course it was greatly to the advantage of the country to put forth as much as possible because it gave them greater spending power. It meant the more came in, and the more they can be induced to turn over money and spend it, the more they would get accustomed to working for it and improving. It was all a stage of development.

9,265. Look at Mr. Sloley's figures on that page and remember that from the previous year from 1893 the value of imports was £98,000. You will note that there has been, there is, very little evidence of a steady increase in the yearly value of imports. The only exceptional increase is in the year 1901-2, and that is explained on page 5 of the Commissioner's report for that year in which he says, "The presence of many

European refugees occasioned the import of unusual quantities of dutiable goods and the peace and security prevailing in Basutoland?—Yes.

9,266. If, then, you leave out these last two or three years as exceptional years likely to be affected by the condition of the country and the fact that the war was raging, it does not appear that there is any considerable increase in the value of the imports. Can you give any explanation of that comparative failure in the increase of that purchasing power?—Yes, but I differ from you in that respect. If you had been able to go back a little further—I am afraid there are no figures to lay before you on that subject—you would find that the value of imports 20 years before was very insignificant. Since that time they have increased a great deal. Each year was governed entirely in the matter of imports by the output of produce. If, for instance, there was a bad season as there was in 1885, which was one of the worst ever known in South Africa, when there was starvation in the country, no man was able to sell his grain and no man was able to buy blankets and other things, blankets and ploughs and saddles which are the great things they purchase, and they preferred to use their old ones till better days. Then came a tremendous crop in 1886, when mealies, which had been worth a fat ox for a bag a year before were sold at 2s. 6d. The Government had as much as 30,000 bags of mealies in lieu of money for taxes. They had not got money and the traders would not buy the mealies. They said, "If we buy your grain we cannot sell it, it is not worth anything to us." So that the year's imports were governed always by the output of produce and these years which show fluctuations are cases in point. But there has been a gradual rise if you take decades from 1883 to 1893 and from 1893 to 1903. That is the way, I think, you ought to measure it, not year by year.

9,267. Then, in order to get a fair view of the progressive increase, it is necessary to take one or two decades?—Yes.

9,268. There was another question which stood over from the previous examination in connection with the figures of the Pretoria district. You will remember that a very small proportion of the natives outside the municipal limits were shown to be at work?—Yes.

9,269. Have you any explanation which will account for that?—I think I actually explained it. The number noted as available, not now at work, includes all those able-bodied men who have actually been to work during the year, but are now at home. It may be stated that the majority of the men included in this column have been at work for all the districts in the Transvaal. When I was here before the question was asked, and I was not at that moment able to give you the exact answer because there were very voluminous returns, and I asked you to allow me a little time to consider. Travelling round the country I made it my business to enquire into this, and I got exactly the same answer that in that column were included a large number of men who had been at work already during the past 12 months.

9,270. Then to what column must we refer in order to get the total number of those engaged during the year? Which column will give that?—The number at work? Column "R."

9,271. Well, you see there is only 420 given as the total for the Pretoria district, while the adult males not now at work are given as 5,240. I wanted to get at some cause for the discrepancy between the number of men available and the number who were actually at work in that particular district?—You will remember my stating that this number of men had worked during the year. These figures are compiled from passes actually issued outside the central district of Pretoria, all these natives can find labour in the district. They did not

go out and get passes at all. They all worked at home in their own district. They were not like the natives in the Zoutpansberg and Lydenburg districts, who came up and got passes for the mines. I doubt if any number are worth putting down as coming up from Pretoria district to the mines.

9,272. But still do not these figures go to show that in that particular district 13 out of every 14 men available were at home?—I should think the explanation of it is that they were all working on farms or for the military, of which we had no record at the time. When these figures were framed the actual number at work was 420; roughly, that means that 13 out of every 14 were not at work at that moment.

9,273. Can you give us any explanation of the great disparity in the figures? It is rather an important point, you see, because here we have an urban district, in fact it is the capital of the country, and in its immediate neighbourhood you have got some 13 idle men to one industrious man, and I wanted to get at the reasons?—I am quite certain there is an explanation, and I will give it you. Of course, it is impossible for me to carry, to get into my head, and carry there the details of every sub-district in the Transvaal, but I will make it my business to find out the answer and let you know. It requires an answer. I am certain that there is an explanation.

9,274. Do you think that the proximity of the markets and the facilities for disposing of their produce may be one of the factors in that?—I doubt it. My own opinion is that the men have really been at work on some farm or another; I will find that out.

9,275. I understand you have been visiting the various native districts in the country?—Yes.

9,276. Have you come to any conclusion which would be valuable to the Commission in considering this labour problem, any conclusions I mean from your observations during your recent tour which would be valuable to the Commission?—I presume you mean with regard to the labour supply. I have come to the conclusion that the numbers of men who have been out at work as given in the returns are approximately correct, and that no numbers very largely in excess of those who have already gone out to work are available in the Transvaal.

9,277. Then the extension of agencies with the object of bringing a few more labourers from the Transvaal districts are not likely to be attended with much result?—I think they have plenty of agencies in the country. I very much doubt if more agents would mean more men. They would probably be overlapping.

9,278. We have had a good deal of evidence from various witnesses who recommend that one of the solutions of the labour difficulty would be found in enforcing what is known as the Plakkers' Wet of the old Boer Government under which five families of natives were distributed on each separate farm. Can you give any opinion as to the value of that law in its effect on the labour supply?—These families were not placed, they were allowed by law on the farms, five on each farm. It appears almost from the evidence of farmers that the opinions of people who have lived in the country for a long time that the number of five families is not sufficient for a man who is carrying on any serious work on the farm; so that no conclusions should be based actually on the number five. There are a great number of farmers in the country where there are more than five families, and more than the farmer actually requires. If the natives were removed by law from these farms, what I think would be the result would be that other farmers who are short of labour, who are in want of labour, would reap the benefit, and I doubt very much whether it

would affect the supply of labour coming to the mines in any appreciable degree.

9,279. Do you think it would increase the agricultural supply?—A redistribution is bound to do some good to agriculture.

9,280. I think I am correct in saying that a number of farmers have large locations of natives upon their land?—Yes.

9,281. Do you think it would be desirable to break these up?—I do. I think it is unwholesome for the country that farms should be used in that way.

9,282. Do you mean that it is unwholesome in its effect upon the native, or upon the white man?—No, it is economically unwholesome, I mean. The farmer is apt to say, in many instances, to the natives on his farm, "Well, I want to employ you all. I do not want you to go away. If he has got 20 or 30 families, he says, "Now I want so many of you to work Monday, so many on Tuesday, and so on right through the week. That prevents those natives circulating their labour throughout the country. The natives complained to me as I went round the country that this is one of the difficulties under which they suffer. They said, "You tell us to go out to work, and advise us to do so, and we want to do so, but here we are, we are settled on a farm, and the farmer will not let us go. He makes us work one day in the week or two days in the week, as the case may be. That prevents us from putting in any continuous foreign labour. We should like during a portion of the year to go out to work for three or six months to the mines or elsewhere to earn money to pay our taxes, and other things, but we are tied to this farm, and if we remonstrate the farmer says we must leave altogether. Well, if we go we have no place to go to and build our huts. What are we to do? This is our difficulty." This was laid before me time after time as I went round, and it is one of the things that influences me in thinking that no greater number of native families should be allowed on a farm than are required for the farm.

9,283. What do you think would be a fair average for the cultivation of an ordinary farm?—So much depends on the size of the farm, the disposition of it, and man who owns it, and what he is doing there and the enterprise he is showing. Taking the ordinary agricultural farmer of this country who does not cultivate very much arable land, but rears a good deal of stock, I should think that seven or eight families would be the most that most farmers would want. That is a full-sized farm of from 3,000 to 4,000 morgen.

9,284. What do you think is the number of the average family?—The average number in a family?

9,285. Yes?—Well, there is the man and his wife, and generally the children run to four or five—seven in all.

9,286. That would mean 40 to 50 natives on the farm?—Men, women and children, yes.

9,287. Coming back now to the difficulties which these natives raised, which you have just mentioned, have you any suggestions to meet the difficulty. I mean the difficulty that they are kept on the land by the farmer and cannot go out to work?—Yes, I told them that the best thing they could do was to have proper agreements with the farmers by which they undertook to give the farmer what was due to him, whether in labour or otherwise, and that the farmer should allow them to do their work in continuous periods, on the farm, so as to free a certain number and let them go away. I told them that if they wanted to make such agreement, we would assist

them to do so. I saw several farmers, some indeed attended the meetings I held with the natives. They came up to me and said, "We see this difficulty, we have recognised it for a long time, and we are quite prepared to make amicable arrangements with the natives by the help of the Native Commissioners which will free them for a certain period and let them go away and work." These men who have sufficient natives on their farms can do it. Of course the man who has only four or five on his farm cannot make an agreement of that sort, because he wants them all the time.

9,288. Is there any considerable portion of the population of the Transvaal which is under the necessity to live on these private farms owing to the want of Government ground?—Yes, a good many.

9,289. I take it, then, that a considerable number of natives must go to the farmers, they are compelled to do and negotiate with them for land to live upon?—Yes.

9,290. If you prevented the occupation of these private farms by these natives the effect of it then would be to make these surplus natives homeless and tend to throw them into the labour market? If the farmer is prevented by law from leasing private farms to the natives the effect of that would be to throw the surplus number of natives into the labour market?—No, to throw them out of the country. A man cannot go with his wife and children and his goods and chattels on to the labour market. He must have a dumping-ground. Every rabbit has got a warren where he can live and burrow and breed, and every native must have a warren too. If you will not let him have a warren in this country, then you force him into a country where he can get it. There are such countries around us; that will not force him into the labour market.

9,291. I asked the question because we were told by a witness from Cape Colony that the effect of the Glen Grey Act, which, as you know, is intended to create a system of individual tenure would be to create a considerable surplus of landless natives, and these men being homeless would be compelled to go and labour.—That is one of the underlying principles of the Glen Grey Act.

9,292. From your reply to me just now, I take it that you would not approve of such legislation in this country, displacing the native from the land and dragging him into the labour market?—It tends to throw him into another country. By giving him a little land, upon which he can build and live, he may earn a little by produce, but he must earn money from another source. That source is labour.

9,293. Mr. BRINK: I see, Sir Godfrey, your department in this Colony is divided into six divisions: Northern, north-western, western, central, south-eastern, and so on?—They are only my own divisions.

9,294. I want to get at the number of natives for agricultural purposes, and I will start with the western division because I am more or less personally interested in it. I see in that district, Rustenburg, Potchefstroom, and about there, they have a total of 20,795 natives?—Men.

9,295. Yes, I am speaking of labourers. Out of that total I find that 14,800 went out to seek employment?—Yes, during the year.

9,296. That is a very large percentage? I know that is a very large percentage. We know to our sorrow, Sir Godfrey, that too many of our natives unfortunately come up here to work at these high prices?—Will you allow me to say that it was a line of tremendous military communication? The theatre of operations was very much over that part of the map. These natives were constantly in the employ of the military service. I think that

accounts very largely for that. No doubt the land did suffer, although during the war the farmers could not do much. I dare say the natives, having got used to that kind of work, at high wages, were reluctant to go back to the farms again.

9,297. What I really wished to point out is this. We have in this district, the western part, 2,103 farms, in Rustenburg, Zeerust, Potchefstroom, and Lichtenburg?—Do you mean farms or sub-divided farms?

9,298. No; registered farms. Some of these farms are sub-divided. I know of one sub-divided into 40 plots, where they really require from 200 to 300 natives. What I wish to say is this. We have 2,103 farms, which really require all the natives in the western part of the Transvaal, all the 20,795, purely for agricultural purposes, if not to-day, in the very near future?—Yes.

9,299. So, from this part, the Western Transvaal, there will be absolutely no spare labour for the Witwatersrand, where they pay higher wages than the agricultural community can afford?—I understand that that would be so.

9,300. Will you let me ask about these farms? Are they occupied?—Oh, no; I take the numbers of farms. They are not all occupied; but we all know that the farms are split up, and when I say we have 2,103 farms, I must add that we have absolutely between 5,000 and 6,000 farmers in our division alone.

9,301. Now, taking the central division: Pretoria—Haman's Kraal, of course, is in Pretoria district—Heidelberg, and Krugersdorp, there we have a population of 15,000 natives, and we have in that district 1,050, so that really the population there is not sufficient for the demands upon the agricultural population, leaving a large town like Pretoria out of it?—A thousand farms and 15,000 natives. How many would you allow to a farm? The farms are very much sub-divided.

9,302. I am taking the average that we have taken of five per farm?—If there are a thousand farms and you allow ten each, that would be 10,000, and you have got 15,000 men.

9,303. That is, leaving Heidelberg, Krugersdorp and Pretoria out of it. There is absolutely not a spare native there. It would be the same with the south-east. I only want to show that the native population of the Transvaal is just about enough for agricultural purposes in the near future. These figures help you to arrive at a conclusion?—Yes.

9,304. Mr. FORBES: On this chart you give the population of the Transvaal at 578,666?—Yes.

9,305. And you reckon that about one-tenth will be available for labour?—Yes, for foreign labour.

9,306. That will be 57,866 available?—If you will remember in my evidence I said there were one or two returns which have not been made to me, and that I estimated that the population might be not less than 620,000, so you ought to divide 620,000 and not 578,000.

9,307. There are now at work 55,477?—Yes.

9,308. We have had in evidence, I think from yourself, that the town of Johannesburg requires some 40,000 to 45,000 natives?—Yes.

9,309. I think we may take the maximum figure as it is a growing demand. And in these papers you have put in now there is an item of natives employed in the municipality of Pretoria in local industries?—Yes.

9,310. That is 11,846?—Yes.

9,311. Consequently these two places Johannesburg and Pretoria require 56,846 between the two, practically all the available labour in the Transvaal?

-- That labour in Johannesburg and Pretoria which you speak of is very largely supplied from other parts of South Africa by men who do not go to the mines, Zulus and natives from Natal and Basutoland.

9,312. Exactly, but the two places would require all the labour of the Transvaal? You wish to put it in that way. They require a number equivalent to the available labour of the Transvaal?—That is so.

The Commission then adjourned till 2.30 p.m.

9,313. WITNESS: Will you allow me to say something. During the luncheon interval my attention was called to a leading article in the "Leader" newspaper a day or two ago, from which I see it was stated by an officer of the Railway Department that contractors for new railways may recruit labour in Johannesburg. I did not notice this before, but I wish to take the earliest opportunity of saying that the law on the point is very clear. Section 11 of the Labour Agents' Regulations reads: "No labour agent shall be entitled to exercise the rights granted to him under his licence on any public road or thoroughfare or within any public diggings or labour district." The only thing I can say now is that I shall at once make enquiries as to the meaning of the statement. The statement may have been made, and may not have been quite clear, so I should not like to offer any opinion on the statement, but shall make it my business to make enquiries as to the meaning of it.

9,314. Mr. EVANS: On that point, supposing a contractor down at Vereeniging, for instance, offers 70s. per month for boys, is there anything to prevent time-expired natives from here going down there?—The procedure is that if a native has worked his time and got a properly discharged passport, he is then a free agent. He goes to the passport office, and asks leave to work for other employers. He has a certain number of days to look for it, and if during that time he finds other employment, whether with a contractor or other master, he is at liberty to take on service with that person.

9,315. With regard, then, to railway contractors. It would appear that they are perfectly at liberty to recruit boys from the Rand as long as they are just outside the Rand labour district. Is that the law?—Yes, not being on a public road or public thoroughfare.

9,316. I mean as long as they are just outside the Rand labour district, and not on a public road or public thoroughfare?—Yes, that is the law.

9,317. I was examining Captain Pritchard on the matter, and I do not think they brought out the point quite clear. The point is this. They have let out these contracts, and the contractor is at liberty to pay anything he likes. Supposing a contractor wants to take boys on at Vereeniging and allows it to be known on the Rand that he is doing so, is it not likely that a considerable number of boys will go there from the Rand if he is paying very much higher wages than is being paid here?—Naturally, if the labour is attractive. If they have served their time, and their passport is properly discharged, there is nothing to prevent them going.

9,318. You say they are at liberty to go?—Yes, to go home or go to their work.

9,319. And does the law provide any punishment for any boy that may be going round the compounds announcing the fact that employment is to be had at 70s. at Vereeniging?—It depends upon the spirit in which it is done. If it is done with the design of inducing boys to leave their present employers, then it is punishable.

9,320. Is that your reading?—It is the exact reading, and I am sorry I have not the law here.

9,321. I read the law, and I take it that unless they are actually recruiting you could not punish a boy doing that?—The clause reads something to this effect: "Whoever shall by any means, whether in writing or verbally, seduce or tend to seduce, persuade or attempt to persuade, any boy to leave the service of his master in his lawful employ shall be punishable."

9,322. Of course that would apply if they were trying to take boys under contract, but I am referring to time-expired boys?—You mean making the communication.

9,323. Yes, simply announcing the fact?—And the time-expired boys being within the labour district.

9,324. Yes, simply announcing the fact to time-expired boys?—Well, after discharge they are allowed their freedom to a certain extent. They are allowed to seek work during intervals of five or six days after having performed their last work, and got a properly discharged pass, and would be free agents. It would be open to anyone to say to them, "If you are in want of work, I can give you work on coal mines or any other work."

9,325. What is your opinion on that matter? Supposing a contractor does offer considerably higher wages for boys somewhere on the new line that is to be constructed between here and Vereeniging. Do you think he would draw his boys from the Rand?—If the boys believed in him or his agents, I daresay some number might be induced to go.

9,326. That was the point, I do not think the "Leader" got it quite clearly, which I made with Captain Pritchard, that they are letting out contracts without any limit as to pay, so that a man who pays sufficiently high wages can always get a plentiful supply of labour?—He is bound to attract labour for high wages. Vereeniging is a labour district, so that any man who is carrying on the business of recruiting there would be acting contrary to the law.

9,327. Yes, Yes, but is the district in between a labour district?—There is an open district in between.

9,328. On this railway?—Yes.

9,329. I undertsand. Have you heard that the Vereeniging Collieries have practically lost all their boys owing to these contractors?—No, I did not hear it; but I can quite believe it.

9,330. You have heard Mr. Grant's statement I believe?—Yes, I read it in the newspaper.

9,331. He alleges in that statement that the abortive attempt to reduce wages is responsible for the deficient supply of labour, and then he makes the following statement. I will quote you his exact words. You will find it on page 3 (v. p. 478) of his statement near the bottom. It is as follows: Now it may be asked what is the result of all this, incapacity and blundering. The answer is to be found in the consequence already realised. The originators of the now abandoned scheme must accept, in conjunction with the Government who have so loyally supported them, the entire responsibility which attaches to the failure of their operations." I should like to ask you whether there is any justification for that statement as far as the Government is concerned?—What is the meaning of "the failure of their operations?"

9,332. He states repeatedly in his paper that the abortive attempt to reduce wages is responsible for the failure, and I take it he makes the Government and the mining industry jointly responsible for that abortive attempt?—I do not.

at all concur in the views that it was a failure. The number of natives recruited by the Native Labour Association, to which I believe he is referring to here, within the 12 months, was a most remarkable thing. I have said, not before this Commission, but in my annual report, it took something like 12 years to build up a supply of 98,000 natives here. During something like 12 months the Native Labour Association recruited something over 100,000, so that I fail to concur that it was a failure. I think it was remarkable how many native were collected in the time.

9,333. Quite so. In another part he asserts that as the result of the reduction of wages natives as a body determined to avoid the Rand. Have you ever heard of any such joint action amongst the natives?—Amongst natives as a body, certainly not. Allow me to say that it has been stated in the Cape Colony, that is the only place I have heard it, that the Cape Colony natives did not care to come here because of the low wages. But that was at a time when they were getting extraordinary high wages in the Cape Colony itself. That is the only instance I have heard of.

9,334. And I take it there was a shortage of labour in the Cape Colony at that time?—In some part of Cape Colony, yes.

9,335. Then you will find on page 3 he alleges that freedom of contract had been comparatively denied the native, and attempts had been made to bring him under, what can only be described as constructive coercion. Do you know of any facts confirming Mr. Grant's view that there has been no freedom of contract, and that they have been coerced in that way?—I do not quite understand what he refers to. The natives are perfectly at liberty to make their own contracts all over the country. It may be that he means that in the early days under the Native Labour Association, when I believe some number of the boys who were recruited were not given any option, they were sent to certain mines without being consulted. Subsequently, when it came to the notice of the Government and the Chamber of Mines, measures were taken so that any native who wished to go to a particular mine should be allowed to do so. That, I believe, is the spirit in which the distribution is carried out to-day with all natives who say they want to go to one particular mine, and, if it is at all possible, they are sent there. I suppose Mr. Grant referred to that period when natives were not given the option.

9,336. Yesterday a witness informed us that there was a famine in the Waterberg district, and that the Government were employing Kaffirs on relief works at the rate of £2 per month with food. Can you tell us to what extent this has been done?—If true, it is something that has happened since I have been travelling through the country. It is news to me, and I know nothing about it.

9,337. He was a farmer from the Waterberg district, and he stated there was a famine there, and the Government had relief works, and that on his own farm 104 natives were employed constructing a road and were paid at the rate of £2 per month and food?—Nothing is known about this in the Native Affairs Department. What may be done by the Resident Magistrate or the Public Works Department I cannot say. There is certainly no information in my department in connection with any famine.

9,338. Would you consider £2 per month as a rate of pay for natives in their own district as an extraordinary rate as a relief measure?—It depends upon whether they get any food.

9,339. They get food as well?—I certainly think when natives work quite close to their own homes and are fed that 30s. per month is ample.

9,340. Do you know any instances at all of natives being employed on relief works?—None, and if there had been a famine and distress I

certainly should know about it. I certainly should have been responsible for the relief works if they had been carried on, but I imagine there is an error on the part of the gentleman who gave the evidence.

9,341. Of course, he was talking of his own farm, and of what he had seen?—I still think there is an error, and probably they are boys employed by the Public Works Department. It may be that these boys up there are short of food and have said so, and he interpreted that as relief work.

9,342. In the return which you have given showing the number of natives on the railway on 21st July, you give the total as 13,730. Do you know whether this includes natives employed by contractors working for the railways?—I do not think it does, but these railway returns have been furnished to me and I am not responsible for them, and I am afraid I cannot explain them. I should very much doubt whether they had included private contractors.

9,343. You have handed in a return showing the number of recruiting agents in the Transvaal. Have you in your department any statistics showing the number recruited by these various agents?—No.

9,344. Is there any means by which we can get at the results?—Are you referring to those recruited by the Native Labour Association?

9,345. I refer to return No. 2. The Native Labour Association, of course, issue returns?—There is the C.S.A.R., the Public Works Department, the Royal Engineers, and the Army Service Corps, the S.A.C. and the Repatriation, but I have absolutely no means of knowing how many they recruit.

9,346. I suppose there is no means of getting that information except from each individual employer of labour?—Yes. They are free agents, and I have no business to ask them any question, and I have no occasion to do so. What we do know is, when they are recruited for this labour district, then they are brought to account when they reach here.

9,347. Mr. FORBES: Railways require 13,730 labourers?—The number on the railways actually employed on a certain date is what I have put in that statement.

9,348. And the mines at present are 75,000 short of the 145,000?—I do not know the number.

9,349. 145,000 are required for the mines at present, and they have only got 75,000?—That I do not know.

9,350. They are 75,000 short. As to agricultural requirements there are 11,600 farms, and we will say less than one-fourth are occupied, say, 2,500 at ten men each, which would give 25,000 for agriculture. Railway construction in the near future would require certainly 60,000, giving altogether 173,730 short of immediate requirements. You have no hope of supplying that from your department?—No.

9,351. Or the Transvaal?—No.

9,352. Then they will have to be supplied from outside sources?—Naturally.

9,353. Mr. PHILIP: I have only one question: Do Railways and Public Works Departments take out passes for their natives?—They are doing so now.

9,354. Then you will have a check on them as to what number they employ?—Yes.

9,355. Mr. GOCH: Sir Godfrey, you have a statement here of outside labour districts, being a return of natives employed on 30th June, 1903. You give the names of nearly all the towns in the Transvaal?—Yes.

9,356. And the total gives 5,963 natives employed in these different towns, does that mean districts or towns only?—Manifestly towns.

9,357. It does not apply to farms?—Which one are you speaking of. Repatriation?

9,358. Yes?—We asked the Repatriation Department to give us a full return of all natives employed by them, and this is their return. Of course, I cannot explain very much of what they mean by it, but they say in these depots which are set forth, they have a number of 5,963.

9,359. They are merely for temporary purposes, and the Repatriation Department is nearly finished with its work?—I have been given to understand that it is what is called shutting down.

9,360. In this letter addressed to you by the Colonial Secretary of the Orange River Colony and to the Cape Colony and Natal, dated 23rd January, 1903, I wish to draw your attention to paragraph 4. In the previous paragraph you explain that the rate of wages, 30s. per month had been fixed by the military authorities of the late Transvaal Government, and subsequently by the British? The mining authorities determined to continue that rate?—Yes.

9,361. And then you suggest what appears to your mind to be their motive for doing so. You say this was indirectly calculated to benefit agriculture by establishing a useful standard of wage for natives employed on farms where they are badly wanted through this and other territories. The mines have been very greatly blamed, as you know, for having reduced wages. It does not appear as if they formed the idea but continued what was then in existence?—Yes.

9,362. And they appear to have had, as one of their motives, to try and help agriculture by reducing wages on the mines?—It may have been their motive, and if so it was a very good motive. You will see I have worded it in this way, "This was indirectly calculated," not by the Chamber of Mines, but calculated in the abstract. I am really addressing the Government when I say this, and it may be my own impression, but I believe it was also theirs, and I believe all men interested in the welfare of the country would take that view.

9,363. I know, of course, personally, that that was one of the things which weighed at the time, but seeing it was stated here, I should like to have it emphasized. It was not quite such a selfish thing as has been generally imputed, but they had the wish to serve the country, too?—I think that a very fair deduction to make. When this matter was under discussion during the war in 1900, it was put to me again and again by people interested in the Transvaal and South Africa, that it was to be urgently hoped that wages would not rise above the 30s. rate, and the mining people shared that view in company with the rest of South Africa.

9,364. Mr. WHITESIDE: Sir Godfrey, you were told by Mr. Forbes that the mines were short of 75,000 for their immediate requirements. Do you agree with that view?—I am afraid it is a technical question which I cannot answer, because I do not know what the requirements of the mines are.

9,365. He also told us, or rather in his question to you he put it, that we were short of something like 25,000 boys for the farms. Can you speak with any degree of authority as to whether that is correct?—As to the exact number I could not say, but what I do know is that in many parts of the country, especially in the high veld, the farmers are complaining very much for want of labour.

9,366. But you are unable to say whether that figure of 25,000 is a correct estimate or not?—I could not say that, because I do not know it.

9,367. Does the same answer apply to Mr. Forbes' statement that they required 6,500 for the railways?—As far as my knowledge goes, I cannot say what the railways want, but as a matter of what I have read in the report and conferences that have taken place on railway matters, I think they want even more than that.

9,368. Then the figures Mr. Forbes gives of 173,000, which is the number required to satisfy immediate requirements, there are really no accurate estimates which could be formed as to whether that is true or not?—There are none in my possession.

9,369. Mr. BRINK: Mr. Forbes, in estimating the total number of boys required on farms, states that 25,000 natives are wanted for farming purposes. I do not know anything about the demands of the railways or the mines, but I will simply deal with farming in which I am interested. Mr. Forbes states the farming industry is 25,000 natives short of the requirements, and I really believe Mr. Forbes is out to the extent of 25,000 as to what the farming community require. I consider the number is more like 70,000 than 25,000. He did not say that the farming community was short of 25,000 boys, but that that was the actual number required. Do you not think that figure is much too little?—If there are 11,000 farms in the country, and if seven boys were allowed, it would mean 77,000 boys or more required, probably more, because of the sub-divisions of each farm; but then these farms are not all occupied, and then supposing half of them are occupied they would still require between 40,000 and 50,000 for the farms. I should think 25,000 for farming operations a very small estimate indeed.

9,370. My impression as a farmer is that Mr. Forbes was very much under the mark in his estimate. If we have 5,000 farms occupied and numbers of these farms are sub-divided into many parts?—Yes, and according to the law each sub-divided farm has the right to five families.

9,371. I do not know anything about the mines and railways, but I am absolutely sure Mr. Forbes is about 100 per cent. below the mark in his estimate of farming requirements. That is what I wish to bring out.

9,372. The CHAIRMAN: Can you tell us with any degree of accuracy the number of natives now employed in the Johannesburg district?—Do you mean purely the Johannesburg district as apart from the rest of the Witwatersrand?

9,373. Yes, could you tell us the boundaries of Johannesburg in your sub-division?—The boundaries are laid down, but I have not got them here. I think it is Langlaagte on the west and the Treasury on the east.

9,374. How many boys are employed altogether in that district?—With a view to this question being asked, I requested that some figures should be supplied to me. They are as follows: Natives carrying passports on the mines, 23,450; natives carrying passports elsewhere, 32,585; employed on the C.S.A.R. and P.W.D., 5,169, giving a total in the Johannesburg district of 61,674.

9,375. Can you make any comparison between that number and the number in the same district before the war?—It is quite hopeless for me to give you any reliable information whatever as to statistics before the war. We have sought for them, in vain and have always been embarrassed by the want of any records for information on the subject. I cannot even give you any useful conjectures on the subject. There were certain officers of the late Government who were engaged in this work and who could tell us nothing at all, and there is no book of any description which we can scrutinise and find out.

9,376. You state, in reply to one of the Commission, that your inspectors examined into the quality of the food supply to natives on the mines?—Yes.

9,377. Can you tell us what reports have been made lately, as to whether the food is of uniform quality or what the reports are?—I should tell you that this particular matter of examination of the food supply does not belong to my Department at all. It belongs to the Public Health Department, but I have found that the Public Health Department have not been attending to the matter in the way I consider it ought to be attended to, and consequently I instructed my inspectors to go into it. Extending over many months now, I have been in communication with the various mines, particularly those where the food was bad and where there was much sickness arising from bad food. In order to find out about this, I instructed my inspectors to examine the food and to examine the system of cooking and to generally go into the question. Facilities were afforded them for doing so. Some months ago, or I will go back a year, some of the mines were in the habit of taking on any food for natives that they could get, any thing offered on the market in the shape of meal was taken. That was the old system. To-day I believe there is not a single mine that does not subject food bought for the mine boys to very severe tests, and I had very much doubt if there is a bag of bad meal knowingly used for the purpose of native food on any of the mines to-day. There has been a remarkable change in this respect.

9,378. Mr. QUINN: Do you know, Sir Godfrey, where the present supply of mealies is being taken from for the natives in the compounds?—I believe it is being largely got now from America.

9,379. You are not aware that during the last few months a large quantity has been brought up from Delagoa Bay of very questionable quality?—You mean Delagoa grown mealies?

9,380. Yes, you have no reports of that fact?—I have frequently heard of large lots coming up and being condemned from several directions. I did hear of several lots coming up from Delagoa Bay, and I frequently heard it had come here and been cast.

9,381. I have got evidence on that which will be brought before the Commission later on, but I was wondering whether you had any reports lately because this meal has been used lately?—Used or brought up?

9,382. It has been brought up and used. You are not aware of it?—I am not aware that bad meal has been used on the mines to-day. Of course it requires an expert to detect anything unless manifestly bad. What I meant to convey was that the food which is now issued to the natives on the mines is subjected to a very severe test.

9,383. Mr. PHILIP: I see, according to these enclosures under your cover of 1st September, you gave us the natives employed in the Repatriation Department as 1,163. That is the last sheet you have on that question?—I think that is in the labour districts.

9,384. That is not outside labour districts. Your figures are outside labour districts for the Repatriation Department, 5,968?—Yes.

9,385. Then you have on the railways 13,730?—Yes.

9,386. The next figure is the Municipality of Pretoria, 11,846?—Yes.

9,387. The next one is the number of natives employed in the central division in local industry other than agricultural, excluding the Municipality of Pretoria, 5,351?—Yes.

9,388. Then you have in your mortality sheet for Johannesburg and the various mines the natives employed in July, 1903, at 119,290?—Yes.

9,389. These figures total 157,348 natives employed on the 21st of July?—In the whole of the Transvaal?

9,390. Yes, outside of farms and agriculture?—Have you added the figures up?

9,391. Yes, exclusive of agriculture?—Yes. Let me be quite clear. Do you want to arrive at the total number of natives working in the Transvaal as far as we know and including labour districts?

9,392. Yes, that includes labour districts; this 119,000 are in labour districts?—I think I should like, before committing myself to any confirmation of your figures, to go into them myself.

9,393. These are simply the figures you have given us. There may be others, for instance, Lydenburg, Barberton and other districts to be added on, these are the figures in these sheets you have given us?—Yes, I will go into the matter.

9,394. The CHAIRMAN: Sir Godfrey, is there anything else you would like to say before you leave in reply to any questions? Have you given us all the information you have that would be of interest to the Commission?—I think I have given you all the information I can which you have asked me, and I do not know that I have anything to volunteer. But in the course of these answers I have stated opinions and facts, and I cannot for the moment think of anything else that would be of additional use to you. There were one or two questions that arose before lunch. Some member of the Commission asked what number of labour agents licences had been issued. Although 110 is the correct number to-day, I was asked how many had been issued during the year. Well, from January 1st, 1902, to 4th September, 1903, the number issued is 275, showing that a good many men have got the number of men they wanted after their licences have terminated and they have retired, while others have taken up licences afterwards. It is rather, therefore, a considerable number more than it appears from this morning's return of 110. Another question that was raised just before we went to lunch was about the 30s. rate of pay. I think it was Mr. Quinn who asked me the question about the 30s. rate of pay before the war.

9,395. Mr. QUINN: Not before the war?—As compared with what it was before the war. Of course it is to be remembered that although they got 40s. to 45s. before the war, a good many deductions were made, i.e., a boy was called upon to pay all expenses of his getting up here, the expenses of touting, and he had to pay for his monthly pass; in other words, he had a great many deductions made, and there was no limit to these deductions. Now the whole spirit of our early legislation upon this matter was that whatever a boy was promised to get, he should get all that money, and that no deductions should be made of any sort unless it was done lawfully, that he had been sentenced and punished, so that the natives of this country felt that from the very first whatever they were entitled to they were going to get, and whatever was deducted they go to a Court and have put right. I do think that is a feature to be taken into consideration in making a comparison between the 30s. rate after the war and the rate before the war. In the one case there is security, and in the other case there is no security. I thought I would like to mention that.

9,396. Mr. QUINN: Mr. Chairman, I should like to have a little more explanation about that. I think it is a very important point.

9,397. The CHAIRMAN: Very well. As soon as Sir Godfrey is finished on that point?—I am finished on that point.

9,398. Mr. QUINN: It is not quite clear, Mr. Chairman. Do I understand, Sir Godfrey, that you mean the natives wages were subject to certain deductions by the mining people?—Do you mean before the war?

9,399. Yes, what kind of deductions were made?—Well, deductions from their wages on account of the expense of getting them up. There were deductions, I do not know by whom, I was not here, and there are no records to show, but the fact remains that every man who was here before the war that I ever met would always say, "We went up there to work, but we never got any pay for the first month." I asked why, and they said, "Well, it was taken to pay our expenses coming up, touting, fees, and what not." That was the common answer given to me, and I think it is a very general opinion that a certain number of deductions were made then which are not made now.

9,400. Have you got the figures paid in wages, the gross amount, or rather the average amount, I should say, before the war, and average monthly pay now?—I have always understood that the rate before the war was 45s. per month.

9,401. It was much more than that. We will get the figures from someone else, but I only wanted to be clear about these reductions which were made. Evidence with regard to the wages we will get from the mining people?—I cannot give you chapter and verse for these deductions. I have not any doubt whatever in my mind that deductions were made. Then another question was asked me about the payment of this 30s., whether it was rigidly adhered to after the war. Now I was not paymaster, and I cannot say, but what I have always been given to understand, and have believed to be true, was that it was absolutely newcomers, raw hands, and small boys who only got the 30s. rate, and that men who could work and did work always got more than 30s. Of course I have not examined every boy in the country, and I have examined no books, but I have heard it time after time from natives. I have said, "What are your wages," and they say, "We are supposed to get 30s., but we have made a little more." It was quite a common expression.

9,402. Do you know what they were contracted for?—The minimum of 30s. was the terms of the contract, and they were not bound to pay them more. I do not think there is anything else, Mr. Chairman.

9,403. The CHAIRMAN: The Commission is very much obliged to you, Sir Godfrey, for appearing the second time, and giving so much valuable information.

Mr. RUPERT JAMES, called, sworn, and examined.

9,404. The CHAIRMAN: Have you before you a statement headed "The West African Experience of Mr. Rupert James, late Police Magistrate and Registration Officer for Emigrants from Sierra Leone"?—Yes.

9,405. Do you hand that in as your evidence-in-chief?—Yes.

9,406. The statement was as follows:—

WEST AFRICAN EXPERIENCE OF MR. R. JAMES, LATE POLICE MAGISTRATE AND REGISTRATION OFFICER FOR EMIGRANTS FROM SIERRA LEONE.

I went to the Gold Coast as District Commissioner in the year 1893. Between that year and the year 1894, whilst I was at Elmina, labourers were being recruited for service on the Congo, the Niger, and Portuguese and Spanish posses-

sions. These labourers were registered before me, and the employers entered into a bond with the Gold Coast Government providing for payment of wages, repatriation, etc., etc. It struck me as very curious that at the time this emigration was proceeding, labour was being imported by agents for their factories and for the few coffee estates which were then being established. The labour so imported was from the Kroo Coast.

Both emigration and immigration were on a very small scale. The immigrants were brought in by private employers of labour without reference to the Government. This very extraordinary proceeding explains itself in the following manner: the inhabitants of the Gold Coast were most averse to steady continuous labour; they looked on agricultural labour as only fit for women and slaves.

The emigrants emigrated on the promise of a high wage and in the hope of "doing" the employer in some way; he never intended to give a fair day's work in return for a fair wage. The Kroo men were willing to work, as they, contrary to most West African tribes, maintain their women.

The area of the Gold Coast was about 70,000 square miles, with an estimated population of 1,500,000. There was little attempt at the cultivation of the soil; vast tracts of country lay desolate, consisting of forest and swamp. At that time there were some gold mines at work, and I remember mine managers complaining of want of labour. That the Gold Coast is still suffering from the want of an industrious labouring population is borne out by the fact that 12 months ago, when the railway was being laid from Secondi, most strenuous efforts were made by the Governor of the Gold Coast to obtain labourers from Sierra Leone. Owing to his pressing and urgency, the Secretary of State permitted 1,000 labourers being recruited from Sierra Leone for service on the Gold Coast. Now it is evident that the Gold Coast has insufficient labour for its own work of development. Whilst I was on the Gold Coast, the exports consisted of the yield of the forest, which was transported to the coast by slave labour.

Sierra Leone.—In 1895 I proceeded to Sierra Leone, where, among other offices, I filled that of Police Magistrate and Registration Officer for Emigrants. I found that emigrants were being eagerly sought for from the Congo and all parts of the coast. They were wanted on the Congo for railway construction. The Congo Government were unable to construct their railways without labour from outside, and what was the quality of this labour so eagerly sought for? It consisted of runaway slaves, who "shied" at the light labour exacted from them by their masters in Sierra Leone. Perhaps two days' work per week for the benefit of the chief—the remainder of the week they were free. Many of these so-called slaves had two or more wives, a cottage to himself, and a patch of ground.

At this time Sierra Leone was self-supporting as regards its food supply, but also only exported the food of the forest. There was no attempt at agriculture, stock raising or any other industry. Palm nuts and rubber were gathered in the forest and transported to the coast by slave labour. Vast tracts of fertile, well-watered land lay barren and desolate, and the population over an area of 30,000 square miles was under a million.

This emigration was stopped in 1901 on the arrival of Sir Charles King Harman as Governor, who found that the country had ceased to be self-supporting and that Rangoon rice was being imported via Liverpool. Emigration from Sierra Leone seems only to have arisen as a sort of temporary means of relief to runaway slaves, who chafed at the light restraint of their chiefs or owners.

Sierra Leone never possessed a surplus population, and there also I found that labour was considered degrading, only the work of women and slaves.

Even if a supply of labour were available from the West Coast, I think mine owners would be making a sorry bargain. Even if the wages were 6d. per day, I doubt if that 6d. would be earned.

As regards the Kroo Coast, Kroomen are not available in sufficient numbers, and they would not enter into contracts for longer than a year. They obtain high wages as stevedores, sometimes as much as 5s. per day—£3 per month easily—but they would never consent to leaving their wives for long periods.

Again, their number is too limited. They are hardly sufficient for the requirements of the West Coast trade. The Kroo Coast belongs chiefly to Liberia, a negro Republic run on the same lines as the United States of America. In 1897 I visited that country as part of the civilian staff of Sir Frederick Cardew, then Governor of Sierra Leone. I found a fine, well-watered country lying waste owing to the insufficiency of labour and also to want of capital, white men being unwilling to invest money in a country where white men were not eligible to hold freehold property. By liberal bribery of the black President, he might allow 2,000 or 3,000 Kroomen to be recruited, but that would be the extent of the supply procurable, and they would not leave their country if they understood that they were leaving for over a year.

The Liberian citizen is the descendant of American slaves and looks with horror on all kinds of labour.

The only labourer in Liberia is the Krooman, who hates the citizen.

Emigrants for Panama.—Some time in 1897, on pressure from the Foreign Office, a shipment of 500 or 600 emigrants was allowed to proceed to the Panama Canal works. The survivors were returned within six months in a moribund condition, showing that even if the West Coast of Africa had a surplus population, the climatic conditions of the Transvaal would have to be reckoned with. In Sierra Leone the temperature was generally 87 and upwards, Fahrenheit—damp, moist heat. I have heard negroes complain in that atmosphere of being cold; what would they say on arrival here?

In conclusion, during the seven years I was in Sierra Leone, I found that labour was being sought there for all the West African Possessions, both British and foreign, and that emigration was stopped owing to its injurious effects on that Colony's industrial development, by Sir Charles King Harman.

9,407. How long have you resided in the West Coast?—I went there in 1893, and I left there on the 7th of November last year.

9,408. About nine years altogether?—Yes.

9,409. You had to do with the emigration of natives from that part of the country?—Well, in my capacity as District Commissioner it was, and subsequently as Police Magistrate it was part of my duty to register such persons as were engaged for service outside the Colony.

9,410. Do you find any large number leaving the Gold Coast to work elsewhere?—Well, there are not a great many people to leave. In the first place, the Gold Coast is a very sparsely inhabited country. There are not 25 inhabitants to the square mile; but when I was District Commissioner at Elmina, in the year 1894, I remember persons being brought before me for registration for service on the Congo or Fernando Po, or some place out of the Colony, but there were not a very large number. I think there were more than a couple of thousand brought, or, taking it altogether, it struck me as very peculiar that while I was registering people to go abroad in this very sparse country that the agents of trading stations, which are there called factories, were importing Kroo men to work in the factories or on their plantations.

9,411. What was the explanation of that anomaly?—As far as I could gather from these various traders, factory agents, the natives of the

coast were not willing to work. In order to get their business done satisfactorily they imported these Kroo men. Of course each Kroo man imported cost about £3 or £4 per head, and therefore I gathered the impression, at any rate, that the natives of the coast were unwilling workers, and were not desirable workers, as the factories and the agents would naturally try to get the cheapest labour.

9,412. You do not think, then, we should look to the Gold Coast for any reliable labour supply for this place?—I do not think so. When I was there all the persons in the industrial enterprises whom I met with were all complaining of the want of labour, and especially the managers of gold mines. There were some gold mines started on the West Coast of Africa, and they complained very much of the want of labour. I left the Gold Coast in 1894, and that the labour prospects have not improved there is very evident, because in 1901 or 1902, while I was in Sierra Leone as Police Magistrate and Registration Officer for emigrants, railway construction was started on the Gold Coast, and the Governor of the Gold Coast was at his wits' end to get labour there to start this railway. He telegraphed to the Governor of Sierra Leone imploring him to allow some of his people to go there to aid in railway construction, but the Governor of Sierra Leone found that all the people to be obtained at Sierra Leone were required for Government purposes or for local requirements, and he would not sanction any people going. Then I know that the Governor of the Gold Coast telegraphed to the Secretary of State and said that it was totally impossible to go on with the railway, and it would have to stand over unless the Governor of Sierra Leone sanctioned a few men being sent from there. After a great deal of pressure and correspondence, I think 1,000 men were allowed to go from Sierra Leone. That shows that, seven years after I left, when they came to construct railways, labour prospects were no better on the Gold Coast.

9,413. What other parts of West Africa do you know?—Well, when I left the Gold Coast I went to Sierra Leone, and when I went there I found a country consisting of about 30,000 square miles of well-watered country, and apparently very fertile, and only a population, I should say of 500,000, but at the most between 500,000 and 800,000. Some of the official returns put it down as 500,000, and there I discovered that although there were only about 25 inhabitants to the square mile there was a regular scramble going on in the neighbouring colonies to try and get people from Sierra Leone to labour in these adjoining colonies. This was especially the case in the Congo Free States, which at the time was constructing its railways, and they were at their wits' end to get labour. They sent to Sierra Leone, and I know that their recruiters were offering as much as from £3 to £4 per head of bounty to every workman they could get. Not only the Congo Free States, but all the neighbouring colonies whenever they wanted to start an industrial enterprise sent to Sierra Leone.

9,414. Did they get any number?—At the outside they never got more than 3,000 to 4,000 a year, because I should not think there were more than 90,000 able-bodied males in Sierra Leone. That would be a very large estimate because, as I said before, the population is certainly under 800,000. It struck me as very peculiar that this emigration should be permitted, but anyhow it went on in a small way until the arrival of Sir Charles King Harman as Governor, in 1900. He found the country was being depopulated, and that the industrial enterprises, such as they were, were at a standstill, or getting to a standstill, on account of the want of labour, while on the railway construction which was being proceeded with wages had very nearly doubled in consequence of this emigration; he accordingly telegraphed to the Secretary of State strongly advising that this emigration should

be stopped, and it was stopped, and the only men who were sent out after that were the 1,000 sent at the urgent request of the Governor of the Gold Coast. When I went to Sierra Leone, when this emigration was first started, the country was self-supporting. The aborigines lived on the rice they cultivated, and when I left, seven years after this emigration had been going on, the country had ceased to be self-supporting. Rice had become double in price, along with all other food products, and that was why Sir Charles King Harman prohibited all emigration.

9,415. It was owing to the scarcity of labour that the price of foodstuffs increased?—Yes, because there were no people left in the place.

9,416. Do you know Liberia at all?—Yes, I went there in 1893.

9,417. Did you live there any time?—No, I went there twice. The first time when Sir F. Cardew was Consul-General for Liberia. That is a country pretty much in the same position, perhaps more backward even than Sierra Leone, a country with about 50,000 square miles of territory, and a population estimated at 1,500,000. That is only an estimate, because the Liberian Government exercises very little real control over the country at a distance beyond ten miles from the coast. The people are divided into five different tribes. One of these tribes is the Kroo tribe.

9,418. It has been stated to us in evidence that if the Government of Liberia gave permission a very large number, from 20,000 to 50,000, might be got from there?—No, 2,000 to 3,000, I think.

9,419. I am not speaking of your evidence, but what a former witness told us. Do you agree with that statement?—No, I think it is a wild statement. I was going to tell you there are five tribes who inhabit Liberia, and the chief of these tribes, of whom we know anything at all, is the Kroo tribe, who are on the coast. If the estimated population of Liberia is 1,500,000, which is a fairly correct estimate, I should not think there are altogether more than 400,000 Kroo boys. Out of that 400,000, supposing there were, which I doubt, 30,000 to 40,000 able-bodied men, these 30,000 or 40,000 are all employed along the coast, from the Congo right up to Dakkal, French Senegal. The Kroo boys are sought for their labour, and always find ready employment on the West Coast of Africa. I do not think there are altogether 50,000 of them who, supposing for the sake of argument there were 80,000, I should say more than three-fourths would be employed on the West Coast of Africa; and as regards the inhabitants of the Liberian interior, as I say, the Liberian Government possesses no control over them. Liberians are afraid to venture into their own hinterland, but of course, from what I know of the present Governor, I do not think he would have any objection to anybody trying to get as many of his subjects as they like provided they gave him £1 per head; but then, of course, the difficulty would be in getting these subjects because the Liberian Government possesses very little control there.

9,420. Do you know Nigeria?—I have never been there, but I know a great many people from there.

9,421. It has been stated that a very large number of natives may be got from Nigeria?—My opinion is you could not get a very large number from Nigeria, and that opinion is given weight to by a despatch which I saw from Sir Alfred Jones, the High Commissioner, in which he says Nigeria requires all its own inhabitants, and from my reading on the subject I should think in a country which has less than 13 inhabitants to a square mile they want all their people for themselves, but of course I know nothing personally of Nigeria, and it

is only what I have read. I have met a great many of the officials at Sierra Leone, which is a sort of meeting-place for all the English officials of the coast, although Sierra Leone is looked upon as white man's grave, the white men from lower down the coast come up there to recruit their health. Consequently I saw most of the leading officials from all the neighbouring colonies, and I know the consensus of opinion when they were discussing the labour question was that industrial enterprise generally all over the country was suffering from want of labour. The industrial enterprises are, of course, very small at present in that part of the world, but people are afraid to make them bigger, because there is such a difficulty in getting the negro to work steadily and continuously, and this makes people afraid to embark capital largely. If each country of which I have been speaking had a large population, something like 250 or 400 to the square mile, all these different people would be more or less forced to work by moral circumstances, but all these countries are so sparsely inhabited that capitalists are afraid to embark capital very far, as after laying out large sums of money in cultivation there would be no labourers to reap their crops. That has happened to several persons within my experience. I know in Sierra Leone, when I left in 1902, there had been a coffee estate, laid out at an enormous expense by an English company, which had been in the market for weeks and weeks and nobody would touch it, simply because there was no certainty of getting labourers at a reasonable price to pick the coffee. I know one agent, a friend of my own, who has laid out the whole of his fortune in a coffee estate in Sierra Leone; he has lost his fortune through two causes, the price of coffee having gone down, and the high wages having to be paid for the picking of this coffee. The minimum wage for which a native will work even in Sierra Leone is 8d. per day, that does not seem to be very high to people accustomed to Johannesburg wages, but I do not think any of these negroes who charge 8d. per day for their services ever do more than 1½d. worth of work per day. When I first went to Sierra Leone I bought a little estate of about 27 acres within a mile of town and that 27 acres could have supplied the whole town as a market garden, but I found, whenever I pressed a native to work, he ran away. I could get any number of labourers at 8d. per day if I was contented to allow them to do 1½d. worth of work, and agriculture on these lines would not pay. Right through my experience has been that people are afraid to embark their capital upon native labour. Before I conclude allow me to mention that Sir Alfred Jones, of Liverpool, tried to start a pine plantation in Sierra Leone about 10 years ago. It is very curious, and he must have had no confidence in the African labour at all, because in starting this pine plantation he went to this emigration centre of Sierra Leone and imported Chinese to work his farm. I do not remember the number of Chinese he imported, because I was not there at the time, but when I arrived there all the Chinese had died or run away except two, as the climate was too bad for them. This shows that Sir Alfred Jones, although he made a fortune on the West Coast of Africa, when he came to start a plantation, did not rely on negro labour himself, but went to China. I may say that the pine plantation was a failure. I spoke to Sir Alfred Jones about it, and, as far as I could gather from him, he did not intend to embark any more capital in agriculture on the West Coast, and thought the shipping business quite good enough.

9,422. Mr. PHILIP: We have heard from some witnesses that the West Coast was very densely populated. Your experience does not bear that out?—My experience is that in no part of the West Coast of Africa are there more than 25 inhabitants to the square mile.

9,423. You do not know of any part thickly populated?—No.

9,424. You do not know of any part where a large amount of agriculture is carried on?—I know of no place where the natives cultivate more than is sufficient for their own maintenance.

9,425. And you do not know any portion of the West Coast of Africa we can rely upon for labour?—Certainly not. I wish to mention that the Congo Free State, in their desperate attempt to obtain labour for the railways, actually went to the little island of Barbadoes, which, I think, only measures 20 miles by 16, and I believe they got 200 from there, but they were not satisfactory.

9,426. Mr. TAINTON: Do you know when the railway from S . . . . . to Wassa was begun on the West Coast?—I think it was started about two or three years ago.

9,427. Do you know whether it is completed to Wassa?—No, I cannot tell you.

9,428. Do you know the distance between the two points?—I should think the distance would be between 100 and 150 miles.

9,429. Can you give any explanation why these Kroo men are so different to the other West African natives?—Yes, I can. You see the Kroo men inhabit the sea coast of Liberia. They have a stretch of coast about 300 miles long; from the earliest days when trade ships went to Africa these ships always touched at Kroo ports. When I say ports, I mean stations, and the Kroo men, of course, got to know the white people, and used to assist in the navigation of vessels and got to know the ways of Europeans. The Kroo men are blue tattooed right down the middle of their noses in order to distinguish them from the slaves, because in those days there was a considerable slave trade, and they used to tattoo themselves in order to be different to the rest of the inhabitants who might be kidnapped as slaves. They are more or less always engaged in shipping. It is a regular practice of all British men-of-war, as soon as they arrive on the West Coast of Africa, to immediately ship a large number of Kroo men as sailors and deck hands. The white men leave all that work to the Kroo men, who dress like sailors and mix on terms of perfect equality with the sailors. I notice that the same applies to German, French and Portuguese men-of-war immediately they arrive on the West Coast of Africa. These Kroo men are also largely employed as fore-men and as stevedores.

9,430. Mr. WHITESIDE: I observe you were late Police Magistrate and Registration Officer for Emigrants in Sierra Leone. Would you tell the Commission where you are now domiciled. Are you domiciled on the Rand, or merely paying a visit?—No, I concluded my connection with the Government service of the West Coast on the 19th of March of this year, and retired on a pension.

9,431. You are living on the Rand now?—Yes.

9,432. You quoted the experience of Sir Alfred Jones in pine planting?—Yes.

9,433. He was very sceptical about African labour?—Apparently.

9,434. Would you rather amplify his experience as regards imported labour?—Apparently he did not think the African natives of much good, and he imported a certain number of Chinamen. I may say he was not the only man who thought of Chinese for labour, because I know it has been discussed on the West Coast of Africa, and from the time I have been there, whenever there was a shortage of labour for any purpose they spoke of China, but the expense was a deterrent. Sir Alfred Jones is one of the richest men on the West Coast, and the only man who could afford to import them. He brought these

Chinamen, but they died from the effects of the climate.

9,435. Was there anything else besides the climate?—No, nothing else. Pines grow wild on the West Coast of Africa, but Sir Alfred Jones wanted to cultivate a finer kind of pine, and I know he spent a great deal of money in this pine plantation, and I am certain, indeed I know, he sold it for about one-tenth of its cost.

9,436. So his experience of imported labour was not satisfactory?—No, on account of the climatic conditions. It was not that the Chinamen would not work. They worked as long as they were alive, and, after all, I do not see that the Chinaman should be expected to live in Sierra Leone, considering that even horses cannot live there. I know that the Governor's wife imported a donkey for her own use, and the donkey died within two weeks.

9,437. You have told us that the population is very sparse on the West Coast?—Yes.

9,438. I think you said it was 25 to the square mile?—I should say that was about the maximum.

9,439. Would you tell us what you describe as a dense population?—What I call a dense population, is the population of the United Kingdom, where there are about 400 to the square mile. France, for instance, is not so densely populated and has only 200 to the square mile. The most densely populated place in the world I have been in is the Island of Barbadoes, which has 10,000 square miles of territory, and on it live 180,000 people, that is the most densely populated place in the world.

9,440. The CHAIRMAN: Mr. James, I am sorry you have had to come here several times before we could take your evidence, and I have to thank you for the interesting and valuable evidence you have given us?—Before I conclude, I did not draw attention in my report, because I quite forgot it. I cannot particularise an instance, but what I said just now was quite correct, what persons engaged in any enterprise on the West Coast of Africa have thought of Chinamen also as a source of labour supply, and I know that Sir William Maxwell, when he went to the Gold Coast as Governor, took his own staff of servants with him from Singapore, evidently not trusting to the Africans.

9,441. The CHAIRMAN submitted the following statement:—

FURTHER STATEMENT FROM MR. T. R. PRICE, GENERAL MANAGER, C.S.A.R.

Referring to the statement made to me whilst I had the pleasure of giving evidence before the Labour Commission on Wednesday last to the effect that Mr. Liefeldt, Resident Magistrate at Willowvale, had represented that a large amount of native labour was obtainable in his district, I desire to state that I communicated by telegraph with that gentleman, and also with Mr. Cumming, Secretary to the Native Affairs Department at Cape Town, through whom I had been able, whilst General Manager of the Cape Government Railways, to obtain a supply of native labour from time to time.

I enclose, for the information of the Commission, copy of the telegram sent to Mr. Liefeldt, and copy of the Acting Magistrate's (Willowvale) reply, which has just reached me.

To comply with the conditions on which it is stated the natives of the Willowvale district will consent to come and work, provided the report which they receive from the deputation to enquire into grievances and complaints of natives from these territories employed in the Transvaal prove satisfactory, would mean adding to the cost of working the Central South African Railways by

from £160,000 to £200,000 per annum under existing conditions, with the prospect of still further increasing the cost as the railways extend and more natives are required to be employed.

Copy of telegram from General Manager, C.S.A.R., Johannesburg, to Liefeldt, R.M., Willowvale, C.C.

When giving evidence before Native Labour Commission here yesterday, was informed that you would be able to supply boys for these railways. As this Department is in position to take immediately from 2,000 to 3,000 natives, Native Labour Association proposes, with your concurrence, sending agent to see you: terms of service, six months: contract wages, 50s. per month and food. Kindly wire whether you acquiesce.

---

Copy of telegram from Acting Magistrate, Willowvale, to General Manager, C.S.A.R., Johannesburg.

248, August 27.—Your 27 following received from Mr. Liefeldt. Begins. Please inform General Manager that General Council have decided to send deputation to enquire into grievances and complaints of natives from these territories employed in Transvaal, and until return of deputation visit of agent from Native Labour Association would be premature. that I distinctly in my evidence stated that natives would not contract for six months nor accept a wage of 50s.; after return of deputation, and provided their report satisfactory, the agent may succeed in getting boys for three months at £4 per month. Ends.

The CHAIRMAN: The public sitting of the Commission will now adjourn until Tuesday morning, at 10.30.

---

TWENTY-THIRD DAY.

*Tuesday, 8th September 1903.*

THE COMMISSION MET AT 10.30 A.M.

Mr. J. N. DE JONGH, called, sworn, and examined.

9,442. The CHAIRMAN: You appear, Mr. de Jongh, on behalf of the Transvaal Chamber of Mines?—Yes.

9,443. Have you before you a document headed: "Report to the Chairman and Members of the Labour Commission," and signed by Mr. Laugerman and nine members of the Executive Committee of the Chamber of Mines?—Yes.

9,444. And have you also certain reports and annexures prepared by certain sub-committees, viz.: Sub-Committee on Supply and Finance, Sub-Committee on Agriculture in certain South African Territories, Sub-Committee on Labour Employed on and required by Public Works, Municipalities, and some public companies or bodies such as railways, waterworks, etc.: further Sub-Committee's Report on the Labour Requirements for Mining of South Africa at the present time and five years hence, and a further document being a descriptive and statistical statement of the gold-mining industry of the Witwatersrand, being an annexure to the Report of the Chamber of Mines, 1902, together with the exhibits therein mentioned; have you all these before you?—Yes, these are annexures to the statement of the Chamber of Mines.

9,445. The statements were as follows:—

REPORT.

The Chairman and Members,  
Labour Commission,  
Johannesburg.

GENTLEMEN,

On behalf of the Transvaal Chamber of Mines, we have the honour to submit to you the following statement:—

(1.) Immediately upon the appointment of the Labour Commission by His Excellency the Lieutenant-Governor, in terms of Government Notice No. 674 of 1903, the Chamber procured the appointment of various Committees, with the object of obtaining reliable data, and submitting these to the Commission, together with statements showing the position of the Chamber and the Mining Industries which it represents in regard to the matters referred to the Commission for inquiry.

(2.) The names of the gentlemen constituting the Committees are shown in the reports received from them and forming annexures to this communication. They represent leading mining, financial, and other interests in this country and elsewhere.

(3.) Upon the appointment of the Committees, forms of returns were despatched to various Governments, Public Bodies, Companies, Industrial Concerns and Institutions, with a view to eliciting information. Fuller information concerning the Governments and Bodies approached will be found in the annexures to this statement.

(4.) Owing to the extent of the field to be covered, the comparatively short period of time at the disposal of the Committees, the difficulty of obtaining precise statistics on certain points, for the reason that in many instances these are not kept or obtainable, it has not been possible for the Committees to make as complete statements as the Chamber might have hoped, nor has it been possible to submit to you this statement at an earlier date.

a 30718.

A good deal of accurate information, however, has been obtained, and this has been tabulated in the annexures submitted.

In cases where precise figures were not obtainable, statements have been based upon the most reliable data founded on certain evidence and experience which has been accessible.

(5.) We have the honour to enclose herewith the following reports and annexures, prepared by the various Sub-Committees above referred to:—

(A) A report from the Sub-Committee on supply and finance. This report deals with the sources in Africa from which labour can be obtained, the population, numbers available for labour and the financial aspect of the question so far as the working of the mines is concerned, and the loss resulting from the non-working of certain mines owing to the shortage in the supply of the necessary unskilled labour.

(B) Agriculture in certain South African territories.

(C) The labour employed on and required by Public Works, Municipalities and semi-public Companies or Bodies, such as Railways, Waterworks, etc.

(D) Mining, including the labour requirements for mines of South Africa at the present time and five years hence, the possibilities or otherwise of the use of unskilled white labour in mines, including statements upon the excessive cost of unskilled white labour where used in certain mines, such as the Crown Reef, East Rand, New Goch, Lancaster and Geduld Proprietary.

In addition we attach the following:—

(E) A descriptive and statistical statement of the Gold Mining Industry of the Witwatersrand, being annexure to the 13th Report of the Transvaal Chamber of Mines for the year 1902, together with the exhibits therein mentioned. This descriptive and statistical statement was prepared at the instance of the Chamber by the leading Engineers of the Transvaal, whose names are mentioned in the statement, and for submission to the Right Honourable Joseph Chamberlain, His Majesty's Principal Secretary of State for the Colonies, during his recent visit to the Transvaal.

(6.) We beg to request that these annexures may be considered inserted in this statement and as forming part thereof. We will take the various branches of the subjects dealt with seriatim, viz.:—

(A) WHAT ARE THE SOURCES OF AFRICAN SUPPLY AVAILABLE, AND WHAT NUMBER OF LABOURERS CAN BE DRAWN FROM THOSE SOURCES?

The Annexure "A" deals with this question. It will be seen from the particulars therein given and from the map attached, that only certain of the African territories are open to recruiting. Every effort has been made by the Chamber, or on its behalf, to procure the throwing open of certain further African territories, but after long negotiations the result has been either direct failure or unsatisfactory.

(7.) In the territories which are open to recruiting there is a total population of 4,672,231. This number includes able-bodied males between the ages of 15 and 40, suitable for work and who would leave

C e

their districts at any given time to a total of 233,611 To this number must be added ... 2,000 being the number which may be recruited from German South-West Africa and British Central Africa (1,000 each), giving an available total of ... 235,611

Out of this number the wants of the Mining and other Industries of the Transvaal and elsewhere in South Africa have to be supplied, and we will endeavour to show how this number is absorbed.

According to the best information obtainable, they are employed:—

1. In mining districts and labour areas in the Transvaal, as per Sir Godfrey Lagden's evidence	134,110
<i>LESS.</i> Employed on farms in such districts	4,075
	130,035
2. In mining in the Cape Colony	14,835
3. In mining in the Orange River Colony	4,245
4. In Public Works	71,935

*LESS.*

Natal Government Railways	14,000
Natal Public Works Department	2,800
Johannesburg Light and Power	250
Johannesburg Scavenging	1,392
Johannesburg Town Engineer	621
Durban Harbour Board	1,250
Dundee	30
Pietermaritzburg	1,010
Rand Central Electric Works	196
Durban Borough Engineer	572
Salisbury Municipality	156
Bulawayo	200
	20,477
	49,458
	198,573

Leaving a balance to be accounted for of	37,038
	235,611

This leaves a balance of 37,038, but against this we have to count:—

1. The number employed by the Public Works Departments of Pretoria and the Cape Colony, which are not included in the above returns.

2. The number employed in domestic service and private manufactures outside the Transvaal mining areas, for which full returns have been given. In the larger towns, at any rate, these natives are largely drawn from the "floating labour supply."

Taking these two demands into consideration, it appears to us that even now the available supply of floating labour in South Africa is fully or almost fully utilised, if that supply is calculated on the basis set forth by Sir Godfrey Lagden. At most there may be a reserve of 10,000 to 20,000 which has not yet been drawn out, but even this seems very doubtful.

(8.) The figures from which the above total of 235,611 is derived, do not include the natives in the territories of the Nyassa Company and the Zambesia Company, nor do they include the population of the British Central African Protectorate, except the 1,000 above mentioned. The population of these territories taken together is 2,715,180. Negotiations with these Companies, to allow recruiting in their territories, are not concluded, but have advanced to a certain stage. We cannot apply to this population Sir Godfrey Lagden's method of calculating the floating labour supply available, and for the following reasons:—

1. In South Africa the country has been settled and administered for many years. There has been a volume of trade. The native throughout the country has come into contact with the white man, has learnt new habits, acquired new tastes and new wants, and become accustomed to regard industrial labour as the means of supplying them.

2. In Central Africa, on the other hand, a small part of the country is under actual administration. The greater part of it is unexplored and absolutely uninhabited by white men. There is no trade, except on the coast and around one or two centres. A great proportion of the natives have never seen a white man and have no notion of the meaning of industrial work.

3. Under these circumstances, it is idle to hope for an immediate large emigration of labourers, unless force were used, and that is out of the question. There is no motive to take them from their homes. They do not feel in most cases the want of money, for they have little or no opportunity for spending it. Until they have acquired wants beyond bare subsistence, and the habit of working in order to supply them, they will not form an important source of labour. They may do so in

(b) WHAT IS THE PRESENT DEMAND FOR LABOUR, EXCLUSIVE OF AGRICULTURE, IN SOUTH AFRICA, AND WHAT WILL THAT DEMAND BE IN THE NEAR FUTURE,—SAY WITHIN THE NEXT FIVE YEARS?

The following tabular statement partly deals with this question:

	Now Employed.	Now Required.	Required 5 years hence.
MINING.			
Cape Colony Mines	14,835	15,976	20,576
Orange River Colony Mines	4,245	8,490	21,225 (in two years).
Transvaal Mines:—			
Witwatersrand	59,078	129,588	368,637
Other districts, Gold	3,020	12,250	12,250*
"    Coal	7,772	12,088	25,200
"    Diamonds	753	753†	753*
Public Works, as per Annexure "C"	49,430	113,104†	143,468†
Transvaal—			
Other than Mines and Public Works	58,465	58,465*	58,465*
	197,598	350,714	650,574

\* No Estimates given. † Including 61,000 and 72,700 respectively for Central South African Railway requirements.

time—but this change in their habits is not one which can be brought about suddenly. It can only come about gradually, and it must be a number of years before any considerable results are achieved.

(9.) In the meantime, and pending the development of these and possible other African sources of supply in the more or less distant future, the progress of the mining industry is being stifled for want of the necessary unskilled labour, and is, in common with the country and its inhabitants generally, suffering enormous losses to which a limit must be put. The figures submitted to you will give you only an indication of what these losses are. (See previous page.)

From this tabular statement the following are excluded, viz. :—

Public Works Departments, Pretoria and Cape Colony, domestic service Cape Colony and Orange River Colony, Agriculture, and, as in all other statements, all requirements of Rhodesia and Natal.

It will be seen, therefore, that the labour situation as far as can be ascertained is as follows :—

(a) Total available for work outside their districts - - -	235,611
(b) Total required to-day - - -	350,714
(c) Shortage to-day - - -	115,103
(d) Requirements five years hence - - -	650,574

To (b), (c), and (d) must be added the requirements not enumerated or included in the above tabular statement.

In making the above estimates only those industries have been taken into account whose labour requirements could with some degree of precision be forecasted. It is evident that when their wants are approximately satisfied other associated industries will be established whose labour requirements will be great, but no attempt has been made to estimate either their precise nature or extent.

(10.) Annexure "A" deals with the question of the ordinary natural increase in the labour population of South Africa, and this increase has been put at the liberal figure of 2 per cent. per annum.

It is evident, therefore, that in a sparsely populated country like Africa the ordinary rate of increase cannot even approximately keep pace with the large demands on the labour supply which will inevitably become necessary when not only the many mines and the future industries of the country are developed, but when its great tracts of uninhabited land have to be cultivated.

(c) WHAT IS THE POSITION OF, AND WHAT IS THE PROBLEM WHICH THE MINING INDUSTRY HAS TO SOLVE?

(11.) In the Annexure "E" attached to this statement it is set forth in detail, that in the Goldfields of the Witwatersrand with which only we propose to deal directly, there is present a huge body of low grade ore. This low grade ore again can be divided into various classes of richness, but the average of the ore worked so far has been 41'9" d. per ton on 33,828,692 tons crushed since these fields were started, and up to 31st October 1899.

The problem before the mining industry is how to extract that value at a cost which will leave a sufficient margin of profit.

(12.) The industry has no fluctuations in value of the article produced to deal with, inasmuch as the value of every ounce of gold produced is a fixed figure which does not vary. It is known beforehand, therefore, to what extent one can pay for the labour, material, &c., required in the production in order to leave such a reasonable margin of profit as will justify working operations, and will induce the investor to find the required working capital. Beyond this margin the industry cannot go, and still keep alive.

(13.) Since the establishment of the Mining Industry in the Transvaal, it has been the constant endeavour on the part of its controllers to reduce working costs with the object that the very extensive gold deposits of low grade known to exist in the Transvaal and at present unworkable, might be

worked. These low grade deposits constitute by far the greater bulk of the probably workable ore contents of the country, because it is evident that in this, as well as in all other countries in the world, the low grade ore bodies are far larger and more permanent than those of higher grade. The policy, or rather necessity, under the present circumstances of being limited to the working only of the richer ore deposits is not a sound one, and means must be found in the future to remedy that necessity if the mining life of this country is to have its proper duration. This aspect of the question is fully dealt with in the Annexure "E." That annexure also deals with the question of the rate of wages paid to labourers on these fields.

(14.) Seventy-nine crushing companies treating 33,828,692 tons and divided into six groups,

1 of 11,
3 of 12,
1 of 13, and
1 of 19 have been taken.

The lowest sum paid in dividends per ton crushed amounted in one group to 4'5d. and the highest to 27'10" d., the average being 10'7" d.

It is pointed out on page 21 of this annexure that if unskilled white labour is to be employed at a wage of 12/- per day, and granting that each such labourer were to do double the amount of work at present done by the native unskilled labourers on these fields, the cost of production would be increased by 16/1 per ton. The effect upon the seventy-nine Companies referred to, as far as the payment of dividends is concerned, would be as follows :—

13 formerly paying 4'5d. dividend per ton crushed would lose 9'8" d. per ton crushed.
12 formerly paying 9'1d. dividend per ton crushed would lose 9'3" d. per ton crushed.
12 formerly paying 7'10" d. dividend per ton crushed would lose 2'2" d. per ton crushed.
11 formerly paying 7'6" d. dividend per ton crushed would lose 2'6" d. per ton crushed.
19 formerly paying 11'2" d. dividend per ton would then pay 1'1" d. per ton crushed.
12 formerly paying 27'10" d. dividend per ton would then pay 17'9" d. per ton crushed ;

or, in other words, out of 79 companies formerly working at a profit, 48 would be working at a loss, and the profits of the remaining 31 would be very materially reduced.

(15.) This calculation is based upon the assumption that each white labourer employed would be able to do twice as much work as the native, but that this assumption is entirely erroneous, and, of course, merely used for the purposes of illustration, is proved by the statement made on page 21, as follows, viz. :—

"As a mere muscular machine the best developed native, when he has remained long enough at the mines to be thoroughly trained, is the equal of the white man."

(16.) The Annexure "D" deals fully with the question of employment of white unskilled labour on the mines, and gives the results upon the cost of production by such employment in the 'Crown Reef', East Rand Group, George Goch, Lancaster and Geduld Proprietary Mines. The figures show that at the present rate of wages paid to whites in this country, or even on the basis of a very considerable reduction therein, it is economically impossible with unskilled white labour profitably to work the Gold Mines of the Witwatersrand, and, therefore, the more economically impossible to think of profitably working the huge bodies of low grade gold-bearing rock at present perforce lying entirely untouched.

(17.) This statement is borne out by the evidence given before your Commission on behalf of the Central South African Railways, showing that the employment of unskilled whites on construction increases the capital expended by over £2,000 sterling per mile.

Certain figures are given in this annexure shewing:—

- (a) The number of stamps actually at work in July, 1903 - - - 3,725  
 (b) The number erected and which would work were sufficient labour forthcoming - - - 7,145  
 (c) The additional number which would be erected, say, within the next five years if labour were obtainable - 11,120

(18.) The indirect loss, owing to the stagnation and delay in development and expansion generally, which the country suffers by reason of the present state of affairs, is sufficient to warrant most serious consideration. In July, 1903, 3,725 stamps were working, crushing 523,897 tons, yielding a return of 242,070 ounces of fine gold, of a value of £1,023,250, being at the rate of £12,339,000 per annum. Were labour forthcoming an additional 3,420 stamps, or nearly double the number, would be crushing, and these stamps would, it is estimated, treat 5,573,232 tons per annum, producing a further sum of about £11,000,000 sterling.

(19.) The typical case of a company given in Annexure "A" shows a loss of no less a sum than £122,873 sterling per annum through the deferring of crushing operations. But for the present stagnation an additional sum of £1,985,463 sterling would be paid per year in salaries and wages to white men, and a further sum of £2,191,536 sterling per annum to the mercantile community and coal companies in the form of trade accounts. The details connected with these figures are to be found in the Annexure "A," and they illustrate the vast extent of the direct loss which the industry and the community is suffering by reason of the present shortage in the labour supply.

(20.) It is necessary, in conclusion, to define the position of the Transvaal Chamber of Mines, and that position is as indicated in what is set forth above.

In effect it is this:—

(a) That for the proper working and development of the mineral fields and of the present and future industries of this country large numbers of unskilled labourers are required.

(b) That in order to enable these fields and industries to be profitably worked it is necessary that those labourers should be found at a rate of pay not beyond a certain limit.

(c) That the rate of pay is at the present time already so high that it operates against low-grade propositions being profitably worked.

(d) That all the information submitted to the Chamber shows that the want of unskilled labour is felt not only in the Transvaal but throughout the whole of South Africa.

(e) That the present recruiting fields of African native labour are almost or quite exhausted, and that new fields are either not open or cannot be developed for a period of years.

(f) That under the present conditions and cost of living the use of white unskilled labour is economically impossible.

(21.) We are convinced, therefore, that there is no other solution than to allow the importation of suitable unskilled labour from all available sources.

We have the honour to be,  
Gentlemen,

Your obedient Servants,

Signed on behalf of the Transvaal Chamber of Mines,

J. W. S. LANGERMAN,  
Vice-President.

### ANNEXURE "A."

27th August 1903.

To the Chairman,  
Sub-Committee on Labour,  
Transvaal Chamber of Mines.

Sir,

I. In accordance with the instructions given by your Committee we have made careful inquiries into the question of supply of Native Labour and as to how the present shortage of Labour affects the Gold Mining Industry financially.

II. As regards the question of supply, your Sub-Committee approached the Authorities through the Office of the Lieut.-Governor of the Transvaal in the following territories:—Cape Colony, Natal, Orange River Colony, Rhodesia, German South-West Africa, British Central Africa, Bechuanaland, Uganda Protectorate, Portuguese East Africa and Basutoland, these territories embracing the scope of the inquiry of the Labour Commission appointed by the Government.

III. The time placed at your Sub-Committee's disposal has been too short to enable them to receive replies from all the territories mentioned, but in every instance the figures quoted in this report are either those supplied by the Governments in response to your Sub-Committee's request or else they have been taken from the last official reports obtainable.

IV. Your Sub-Committee sought information from the various Governments on the following points:—

- The total Native Population.
- Estimated Number of Males.
- Estimated Number of Males between the ages of 18 and 35 years.
- Percentage of increase of population during the last 5 years.
- Estimated percentage of increase during the next 5 years.
- Principal articles of Diet.
- Percentage of Native Males available for work.
- What proportion of Natives do not seek work away from home after period of employment outside their own districts owing to accumulated savings.

V. Your Committee find from the figures obtained that the total estimated Native Population of the territories within the scope of the Commission's enquiry is 13,597,691, as follows:—

SOUTH AFRICA.	Source of Information.
Cape Colony (including British Bechuanaland)	1,652,036 Government 30/6/03.
Natal	791,010 Blue Book, 1902.
Orange River Colony	129,787 A/g Col. Sec. 2/3/03.
Southern Rhodesia	563,271 Native Com.'s, 1903.
German South-West Africa	300,000 Tel. from Cons. Genl.
Bechuanaland Protectorate	147,000 Resd. Com. 11/8/03.
Swaziland	60,000 Sir Godfrey Lagden's estimate.
Basutoland	262,561 Resdt. Com. 12/8/03.
Transvaal	605,666 Sir G. Lagden.
Portuguese East Africa Southern Provinces	1,815,180 Calculated on Breyner & Wirth's official figures.
<b>Total</b>	<b>6,326,511</b>

CENTRAL AFRICA.		Source of Information.	
Northern Rhodesia	556,500	Major Coryndon and Statesman's Year-book.	
British Central Africa about	900,000	Statesman's Year-book, 1903.	
Uganda Protectorate	4,000,000	Do.	do.
Portuguese East Africa Northern Provinces	1,815,180		
	<u>7,271,180</u>		
Total for South Africa	6,326,511		
Grand Total	<u>13,597,691</u>		

#### VI. In Natal recruiting is prohibited by law.

As regards Rhodesia, negotiations have been pending for a considerable time but have not yet led to any result, and recruiting is therefore impossible in these territories.

In German South-West Africa and in British Central Africa, recruiting of 1,000 natives only in each territory has been sanctioned.

As regards Portuguese East Africa, the evidence given before the Commission by Mr. Breyner shows that the population of the southern half and of the northern half can be taken to be about equal. In the northern half recruiting is impossible owing to arrangements having not yet been completed with the Chartered Companies, and even after such arrangements have been made, it has been stated that the gradual building up of a constant supply from this part will take at least from five to seven years.

We have therefore to deduct from the total of	13,597,691
Natal	791,010
Rhodesia	1,119,271
German South-West Africa	300,000
British Central Africa	900,000
Uganda	4,000,000
Portuguese East Africa, Northern half	1,815,180
	<u>8,925,461</u>
	<u>4,672,230</u>

Thus it will be seen in the areas open for recruiting there is an estimated total native population of 4,672,230.

The Chart attached, marked Annexure "A," has been prepared to show the sources from which labour is available.

VII. Sir Godfrey Lagden in his evidence before the Commission stated that in his opinion out of 1,000 souls in any district of the Transvaal only 100 would represent the number of able-bodied men who would leave the district for work. Your Committee consider 10 per cent. to be a high estimate, and their opinion is borne out by the official figures given for Germany—Census 1900—showing a total population of 56,345,013. The war footing of the German Army is 3,975,000, and this figure includes every available able-bodied male between the ages of 18 and 45, representing 7.05 per cent. of the entire population.

VIII. From the few official returns sent in—see Annexure "B"—it will be seen that the figures supplied gave only an average of 13.2 per cent. of the able-bodied males between the ages of 18 and 35 years as available for work outside their districts, or about only 2.6 per cent. of the total population.

IX. Your Sub-Committee, however, decided to adopt Sir Godfrey Lagden's estimate of 10 per cent.

of the entire population as being able-bodied males who would leave their districts for work—thus with a population of 4,672,230 we arrive at the number of 467,223 as available, but Sir Godfrey adds that only one-half would be working at one time. We have, therefore, 233,611 available for the requirements of all outside industries.\*

To this figure must be added 1,000 which the Gold Mining Industry is to be allowed to recruit from German South-West Africa and 1,000 from British Central Africa, and we thus arrive at a total of 235,611.

X. In reply to your Sub-Committee's inquiry as to what proportion of natives do not seek work away from home after period of employment outside their own district owing to accumulated savings, no statistics have been sent in, but the Resident Commissioner of Bechuanaland reports as follows:—

"Probably 75 per cent. do not seek re-employment. The primary object in going out to work is to accumulate enough money to acquire stock and to settle down at home, and as long as savings last, or if the return from such savings by investment in stock proves sufficiently profitable to enable the native to live without working, he will assuredly do so."

The Resident Commissioner of Basutoland, replying to the same question, says, "Not many."

XI. The returns as to the estimated increase in the native population are as follows:—

Cape Government, 6 per cent. per annum as the probable percentage of increase in the Transkeian territories.†

1 per cent. per annum in the Colony proper.

4 " " Griqualand West.‡

4 " " British Bechuanaland.‡

The Resident Commissioner of Basutoland states that the probable percentage of increase during the last five years is 9 per cent.

The Resident Commissioner of Bechuanaland replies:—

"There are no statistics whatever from which this can be ascertained, but the Bechuana tribes are probably increasing at a steady though slow rate."

XII. The average annual increase in the population of 14 of the most important countries in Europe is 0.755 per cent., and we consider that 2 per cent. per annum is a liberal estimate for the native population of South Africa.

XIII. On the question of food your Sub-Committee has received the following replies:—

From the Cape Government:—

Transkeian Territories.—Mealies, Kaffir Corn, and Pastoral Products.

Colony Proper.—Mealies, Kaffir Corn, Pastoral Products, and fair quantity of Sugar and Coffee.

Griqualand West.—Mealies, Kaffir Corn, and Pastoral Products.

From the Resident Commissioner, Basutoland.—Mealies and Kaffir Corn in form of Bread, Porridge, and Native Beer, Wheat in form of Bread and Meat.

From the Resident Commissioner, Bechuanaland.—Kaffir Corn, Mealies, Pumpkins, Beans, Makatans (dried and sliced Water Melons), Milk and Meat rarely except among the few richer natives.

\* Note.—The Industries of Natal and Rhodesia are excluded, though as a fact both these countries in addition to reserving their whole labour supply for themselves recruit labour in other countries.

† Note.—Your Sub-Committee cannot accept this figure, as the Blue Books show the increase from 1898 to 1901 for Tembuland, Transkei, Pondoland, St. John's and East Griqualand to be 2.23 per cent.

‡ These figures appear to your Committee to be too high.

Your Sub-Committee have been furnished with a statement of the kind and quality of food given to the boys by the Rand Mines Subsidiary Companies:—

Mealie meal, about 2 lbs. per boy, per day  
 Beans, about 1 lb. per boy, per week  
 Coffee, about 1 pint, daily  
 Meat, about 1½ lbs. per boy, per week  
 Kaffir Beer, about four pints per boy, per week  
 Rice to Mozambique and Quilimane Boys, about 1 lb. daily in lieu of Mealie Meal.  
 Meat and Vegetables served out in form of Soup, about once a week.  
 Lime Juice issued when required.

XIV. As regards Finance, your Sub-Committee beg to report as follows:—

The Chamber of Mines returns for July, 1903, show that 3,725 stamps were being worked by 51 Companies (the Witwatersrand G.M. Co., though contributing to the output, did not crush during that month) on the Witwatersrand. There are further erected, as per Exhibit 2 attached to the Report of the Sub-Committee on Mining, 3,420 stamps, which at present cannot work. These stamps would be in operation if labour were forthcoming.

Working in July, 1903	-	-	3,725
Erected, but idle	-	-	3,420
			<u>7,145</u>

XV. The average duty per stamp is given in the Chamber of Mines returns for July, 1903, at 4·90 tons per diem. For nine months of 1899 the average duty per stamp was 4·80.

XVI. It is therefore fair to assume that 4·85 tons can be considered at the present time to be a fair average duty per stamp per diem. It must, however, be remembered that the stamps now being erected and contemplated will have a considerably higher duty per diem, and that the average will thereby be increased in the future.

XVII. The stamps thus standing idle, viz., 3,420, would be able to crush 16,587 tons per diem.

Experience has shown that the average running time per month can be taken to be 28 days.

Thus the stamps lying idle are capable of crushing 464,436 tons per month, or 5,573,232 tons per annum.

XVIII. Taking the average yield of the Witwatersrand at 40s., and taking the working costs at 25s., we arrive at a working profit of 15s. per ton, which, on 5,573,232 tons, would amount to £4,179,924 per annum.

NOTE.—*Exhibit 4* of the Chamberlain Report gives the average yield at 41s. 9½d.

*Exhibit 18* of the Chamberlain Report gives the cost of 36 Companies for 1898 at 23s. 10d., and returns received from 38 Companies for the quarter ending 30th June, 1903, show costs at 24s. 9½d.

XIX. From a calculation made for 18 companies for December, 1902, it appears that out of working profits estimated at £2,194,000, £1,596,000, or about 70 per cent., would be available for distribution in dividends. On this basis, out of the £4,179,924, £2,924,947 would be distributed in dividends, and this is the annual loss in dividends which we estimate the industry is suffering, on the basis of the present stamping power and without allowing for losses which are being incurred through delay in erecting further stamps, which is referred to later.

XX. Exhibit 13 of the Chamberlain Report details the percentages of the various items comprised under working costs for 1898 for producing mines. Salaries and wages to white men account for approximately 28½ per cent.; Native Labour, including food and cost of introduction, for approximately

25 per cent., or a total of 53½ per cent., and supplies for the balance.

XXI. On the basis of 25s. taken above, this 53½ per cent. amounts to 13½ shillings per ton, or £3,727,099 for 5,573,232 tons.

The 28½ per cent. paid out in salaries and wages to white men would amount to £1,985,463. Exhibit 12 of the Chamberlain Report shows that the average wage per man per annum was £353 15s. 4d. On this basis approximately 5,612 more skilled white workers could be employed by the Companies owning the 3,420 stamps above referred to which are now standing idle.

XXII. Figures given for one important group of mines show that in the nine months during which operations were carried on in the year 1899 an average of 1,120 stamps were dropped, and that the local accounts, inclusive of coal, averaged £59,812 sterling monthly, or £53 8s. per stamp.

For the six months ending 30th June 1903 the same group of companies dropped an average of 800 stamps, and averaged in local trade accounts, inclusive of coal, £44,036 per month, or £55 10s. per stamp.

On the lower basis the 3,420 stamps standing idle represent £182,628 which would be spent monthly among local merchants and coal companies by the Mining Companies, or £2,191,536 per annum.

XXIII. Returns have been received from only 34 Companies formed which had not reached the producing stage on the 30th June 1903, comprising 9,081 reef-bearing claims and containing an estimated mill tonnage of 308,000,000 tons. These 34 Companies do not, in our opinion, comprise more than 75 per cent. of Companies in the same condition.

For all these Companies the necessary Capital for equipment and development has either wholly or in part already been provided.

From careful investigation we have found that, given proper labour conditions, at least 25 Companies on the Witwatersrand would immediately either start or resume operations of shaft-sinking or development and equipment.

The stamps proposed to be erected and the time it will take to reach the producing stage are dealt with in the Engineers' Section of the Report.

To emphasise our point as to the actual loss being incurred, the following example has been worked out:—

	Per Month.	Per Year.
	Tons.	Tons.
Capacity of present mill, 100 stamps	13,580	162,960
Actually crushed in July 1903, 60 stamps	8,148	97,776
Deferred tonnage	5,432	65,184
Additional stamps contemplated in two years after labour supply will permit starting necessary development	-	100 stamps
Crushing capacity per year of stamps contemplated	-	200,000 tons
Life, based on full labour supply June 30th 1904, and stamps contemplated	-	16 years.
		s. d.
Profit per ton with full labour supply and stamps contemplated	-	17 6
Profit per ton with full labour supply and stamps now erected	-	15 0
Profit per ton with present labour supply and stamps now operating	-	11 6

711  
467

Yearly loss of profits due to present conditions :

(a) On deferred tonnage of stamps erected :—	
65,184 tons at 15s. profit	£48,888
Present value, after discounting 15 years @ 5 per cent.	22,395
Present loss	£26,493
(b) On tonnage now crushed, to extra costs, 97,776 tons at 3s. 6d.	17,110
(c) On deferred tonnage of stamps as contemplated :—	
200,000 tons @ 17s. 6d. profit	£175,000
162,960 tons @ 2s. 6d. extra profit	20,370
Total profits to be earned three years hence	195,370
Value of same discounted 13 years @ 5 per cent.	103,600
Loss three years hence	£91,770
Present value of loss after discounting three years @ 5 per cent.	79,270
Total present loss per annum	£122,873

Similar circulations based on actual conditions at one of the medium high-grade mines, show a total loss of £243,800 per annum ; and, in the case of a group of lower-grade mines representing 350 stamps, the loss figures out at £700,500 per annum.

These examples show the great loss suffered by the industry through having to defer crushing a large tonnage, which could be crushed by stamps now erected, or in contemplation, but which it is necessary to defer for a period equivalent to the life of the mine, calculated in the one case from the present, and in the other case from such time as the contemplated stamps may be assumed to go into operation.

The loss in the latter case must be regarded as a real loss in every case where the stamps contemplated are dependent on a certain amount of development work now being delayed through lack of labour.

ANNEXURE " B."

SUB-COMMITTEE ON LABOUR REQUIREMENTS FOR AGRICULTURE, ETC.

Robinson Bank Buildings,  
Johannesburg,  
24th August, 1903.

To the Chairman of the  
Supervisory Committee of the  
Chamber of Mines on Labour Supply.

Sir,

Your Committee have to report that immediately after their appointment steps were taken to draw up a series of questions, which were forthwith despatched to the various Administrations of South Africa.

We regret to state, however, that the responses to the urgent enquiries, made through the Lieutenant-Governor, have been unsatisfactory, the information given being in every case incomplete. This, we feel sure, was due to the non-existence of the necessary statistical information, and in no way to any unwillingness on the part of the Administration to furnish us with such information.

Such particulars which, through the courtesy of the various Governments, your Committee were able to obtain are detailed below :—

NATAL.

The total Indian population of Natal is stated to be 79,777, of which 49,116 are males of all ages ; of this number, 11,693 are employed in agriculture, 380 in domestic service, and 2,216 are employed in commercial and industrial works, including offices, stores, building, and other trades, contractors' works, landing, shipping and forwarding agencies, and vehicular traffic other than railways, but not public works or mining.

With regard to the native and Indian labour employed in agriculture, the following information has been placed at our disposal by the Government of Natal :—

Total No. of Natives (Male) Employed.	Average Monthly Wage exclusive of Housing and Food.	Total Required.		
		At present.	3 years hence.	5 years hence.
Kaffirs - 14,545	30s. for Volunteer labour with food and quarters. 1s. a day for day labour with food. 12s. to 15s. where labour is supplied in lieu of Hut Tax.	20,900	23,000	26,500
Indians, mostly males 11,693	10s. a month for first year, and 1s. a month increase for next 5 years.	15,000	18,000	21,000
Total - 26,238		35,000	41,000	47,500

showing that the—

	Natives.	Indians.
Percentage of the number at present employed to present requirements is -	72.7	78.0
Percentage of increase on number at present employed for requirements three years hence -	58.1	53.9
Ditto five years hence -	82.1	79.5

We are informed that according to the Estimate of Population and Vital Statistics for the Colony for the year 1902, the total number of natives employed in domestic service was 47,120, but the Government is unable to state what proportion of each sex of these natives was so employed.

The average wage of male natives in domestic service in 1902 is given as 25s. per mensem, including housing and food.

Unfortunately, no figures are given with regard to natives employed in commercial and industrial pursuits, but from information received the average wage paid to certain classes of native labourers in 1902 is given as:—

Day labourers, without food, 2s. 6d. per diem.  
Waggon drivers, with food, 50s. per mensem.

#### BASUTOLAND.

Your Committee are aware that Mr. H. C. Sloley, the Resident Commissioner of Basutoland, has

already given evidence before the Labour Commission with reference to the population and to the supply that can be drawn from there, but we have been able to ascertain that the estimated number employed in domestic service is approximately 500, while 800 are engaged in commercial and industrial pursuits.

The average rate of pay of these boys ranges from £2 to £3 per month, exclusive of food and housing. Practically, the entire native population when not employed outside is engaged in agricultural and pastoral pursuits.

#### CAPE COLONY.

Such information as we have been able to obtain from the Cape Colony is based on the Census results of 1891, the total male coloured population being given as:—

Malays	-	-	6,713
Other Natives	-	-	149,457
Natives (Kaffirs)	-	-	415,201
			571,371

The following statement shows the numbers employed in industry and agriculture:—

	Malays.	Other Natives.	Natives (Kaffirs).	Totals.
Agriculture	—	59,436	264,165	323,601
Domestic	360	7,491	5,843	13,694
Commercial and Industrial, exclusive of Public Works, Mining and Railways	2,017	16,350	8,874	27,241
	2,377	83,277	278,882	364,536

It will thus be seen that the respective total coloured population, 35.4 per cent. of the Malay population, 55.7 per cent. other natives, and 67.1 per cent. of the native (Kaffir) population were engaged in industrial and agricultural works. The increase in population since 1891 would probably not affect the percentages engaged in the various callings, but it is reasonable to assume that the greater demand in the various branches is not met by the increase in population.

In forwarding these particulars, the Prime Minister expresses regret that in the absence of an actual enumeration, much of the data called for is not available.

The Committee regret that the information is of such an incomplete nature, as they feel quite certain that the requirements of the Cape Colony must always be a very important factor in the demand for cheap unskilled labour for agricultural and other purposes.

The Committee endeavoured to obtain information from one of the leading agricultural experts, namely, Mr. C. Mayer, of the Western Province Board of Horticulture, and, while he is unable to furnish any figures such as are required for the purposes of the Chamber, he states, *inter alia*, that:—

“The scarcity of labour experienced during the last few years was most acutely felt by the fruit industry, particularly during the picking season, so that in several individual cases tons and tons of fruit could not be handled, and consequently were lost.”

“I may add that scarcity of labour was, and is still, principally felt on farms near towns or villages, as a large number of the labourers are employed in brick-making and the building trade, whereas on outlying farms, where housing accommodation is provided, the labour supply has recently improved, but is still below normal.”

“There is no doubt in my mind that proportionately to the general progress of the country, involving the construction and building of railways and other public works, increasing farming operations, &c., the scarcity of labour will again increase in the near future, and the introduction of native labour may be useful, in fact necessary, to meet the requirements.”

We are informed by Mr. T. R. Price, General Manager of the Central South African Railways, and lately General Manager of the Cape Government Railways—and this confirms Mr. Mayer's opinion—that the Cape Colony is obliged to go outside of its borders to recruit natives for their own railway lines.

#### TRANSVAAL.

With regard to the Transvaal, in the present state of the country it appears to be impossible to obtain any reliable data as to the requirements of agriculture. Under the late Government every farmer was allowed to have five families living on his farm, but it is now considered probable, in view of the expansion of the agricultural and other industries, that the requirements will no doubt greatly increase.

Your Committee not unreasonably deduce that at least a higher number of able-bodied natives will be required by every farmer in this country if he is to carry on his operations satisfactorily. From what your Committee have learned from well-known farmers, the burden of their complaint is that they can get no assistance to carry on their work. Not only is labour scarce, but it is absolutely un-available.

#### BECHUANALAND.

There is practically no agriculture carried on outside the natives' tribal areas. Certain figures have been given, but as in every instance they have

been queried by the Resident Commissioner, they cannot be regarded as of any value.

Your Committee regrets that no information on the subject of the enquiry has been received from the Orange River Colony, German South-West Africa, Swaziland, Portuguese Territories, Rhodesia, British Central Africa, and the Uganda Protectorate.

Signed on behalf of the Committee,

(Signed) J. W. S. LANGERMAN,  
Chairman.

Other members of Committee: Messrs. S. C. Black, W. Bradford, H. R. Calvert, R. M. Catlin, D. Christopherson, W. H. Dawe, H. P. Fraser, W. G. Holford, J. Munro, A. J. Sharwood.

#### ANNEXURE "C."

Johannesburg,

24th August, 1903.

The Chairman and Members,  
Chamber of Mines Committee  
on Labour Supply.

Gentlemen,—The Sub-Committee appointed to enquire into the labour requirements of public works, municipalities and semi-public companies, such as railways, waterworks, etc., beg to report as follows:—

(1) Out of about 172 Forms of Enquiry issued to Municipalities, Waterworks Companies, Transport Companies, Railways, etc., etc., 70 have been returned duly completed, and 9 have been sent back blank, the information asked for not being obtainable.

(2) Of the remaining 93 Forms issued, practically 90 are of little importance, these having been sent to small Municipalities (61) and Steamship Companies' Agencies at the Coast Ports (29), whose requirements can be fairly estimated from the returns sent in by Towns or Agencies of similar size.

(3) On Annexure "A" to this Report will be found a list of 20 average size towns showing the coloured labour used before the war and now, together with their estimated requirements three and five years hence, which shows the various averages to be as follows:—

Average number of coloured labourers employed	
Before the War	44
At present time	83
Average estimated requirements—	
3 years hence	146
5 years hence	180

(4) The two returns received from Steamship Companies' Agencies show an average of 325 coloured labourers employed, with estimates of 425 as being the requirements three and five years hence; but, as the returns are from the larger lines, it has been thought best to take all Steamship Companies whose returns have not been received as employing an average of 83 natives, and accordingly the 90 returns above mentioned have all been so taken, and the totals in Annexure "E" have accordingly been increased by the total so arrived at.

The remaining returns, being those required from P.W.D., Pretoria; Beira and Mashonaland Railway; and Rhodesia Railways, are of such a nature that they cannot be fairly estimated, and your Committee have to request that, in the event of these returns, which have been promised, and which, owing to the large amount of labour involved in collecting the necessary information, have taken so much longer to compile, being received before your final evidence is tendered to the Government Commission of Enquiry, another set of figures may be allowed to be added to complete this report.

(5) From the figures already supplied (Annexure "B") it appears evident that the demand for labour

has greatly increased since the war, there being now employed on public works, railways, etc., 2,054 unskilled whites and 79,755 coloured labourers, as against 434 unskilled whites and 45,122 coloured labourers before the war.

The N.Z.A.S.M. (pro-war) figures are not available, and have been estimated at six natives per mile over 755 miles of open line, while the C.G.R. pre-war numbers (Annexure "B") have been based on the present average number of natives per open mile, viz., 4.3.

(6) In spite, however, of this large increase in numbers there is still a shortage of 66,141 natives for actual present requirements, while if all the public works, new railway lines, etc., which have been sanctioned and which are now temporarily abandoned for want of labour were to be proceeded with, the present requirements would be 2,400 unskilled whites, and 159,334 coloured workmen (Annexure "E").

(7) As regards the estimated number to be employed three and five years hence, in a great many instances the forms returned have left this question unanswered, and where an estimate has been made there is usually a qualifying remark to the effect that the figures given must not be taken as exact. However, in the majority of cases it is stated or implied that the numbers given are very conservative, and it is evident that the men responsible for the figures have preferred to keep well within the mark, and indeed it is often stated that, should things "go ahead" as it is hoped, the figures given will be greatly exceeded. However, it has been thought best to take an inside figure in every case of doubt, and, where estimates have had to be made, very slight—if any—increases have been made to the number of unskilled labourers employed at present.

(8) The totals of 2,069 unskilled whites and 175,830 coloured labourers as the estimated requirements at the end of three years, and of 3,152 unskilled whites and 177,346 coloured labourers as the estimated requirements five years hence (Annexure "E") can therefore be taken as exceedingly conservative, and these estimates will very probably be considerably exceeded in the event of the next three to five years being prosperous ones.

(9) It is unfortunate that so few figures are available as to the rates of pay obtaining in 1899, as it is difficult to arrive at a reliable result as to the difference in pay between pre-war and the present times.

From the returns received, however, it is evident that native pay has increased considerably, the actual results being:—

Increases (varying from 2s. per month to 32s. per month)	23
Decreases (varying from 11s. 2d. per month to 20s. per month)	4
No change	14
	46
No pre-war pay shown	24
	70

In other words, of returns giving both pre-war and present pay:

60.88 per cent. show an increase.

8.69 per cent. show a decrease.

30.43 per cent. show no change.

(10) Annexure "B" shows the comparative rates of pay obtaining in 1899 and 1903 in those places where returns show both rates, the average increase in present native pay being 1s. 8d. per month, or 20s. per annum, which, spread over the total of 15,895 boys now employed by these Corporations and Companies which have given both rates of pay, means an annual extra expenditure of £15,895, and if the number to be

employed, if available, by the 45 Companies and Corporations, whose figures are given in Column 2, of Annexure "B," is taken as the figure on which to reckon the extra expenditure, this will be found to be £34,677 per annum.

NOTE.—Natal Public Works Department using only requisitioned labour, and the native wages being merely nominal, this return of pay is not included in Annexure "B," but is shown in Annexure "D."

(11) Leaving the returns of the Capetown Harbour Board, Johannesburg Municipality, and Johannesburg Scavenging Department out of the question, however, the increase in monthly native pay on the remaining 42 returns comes out at 9s. 8d. per head, so without these important employers of labour in the Transvaal and Capetown, the monthly total extra expenditure would amount to over £13,757, or £165,087 per annum, if the total native labour wanted by these 42 Corporations and Public Bodies were now employed at present rates of pay. It is noteworthy, moreover, that those paying less wages than in 1899 are very short of labour, and the C.S.A.R. (whose rate of pay is considerably below the average—as per Annexure "B"), Capetown Harbour Board, and Johannesburg Municipality are between them short of 63,831 boys for actual immediate requirements.

(12) As there are few employers of unskilled white labour, and as it is, therefore, difficult to compare the results in such work with that of Kaffirs, very few public bodies have answered the Committee's questions as to this, but of the 15 who have answered, all state that the increased cost of white labour is not compensated for by increased efficiency, one Municipality (Bloemfontein) going so far as to say: "Unskilled white labour is about equal to good Kaffir labour, and does not compensate for extra wages paid," while the C.S.A.R. return states that the employment of unskilled whites on new construction increases the costs by £1,500 per mile, and that even if the best unskilled white labour were used the costs would still be increased by £1,100 per mile (Annexure "F").

(13) The Committee regret that, owing to the short time in which their enquiries had to be completed, it was found impossible to get full returns from all the Divisional Councils in the country, those Councils often employing as many

natives as the Municipalities. There are over 70 Divisional Councils in the Cape Colony alone, their work being to keep the roads, bridges, &c., outside the municipal boundaries in repair, and so they must have a considerable number of boys in their employ. However, it is hoped that the figures herein given will show conclusively enough that labour is scarce, and that even at the present high rates of pay it is impossible to procure it in sufficient quantity.

The following tables and diagrams are attached:—

Annexure "A."—List of 20 towns of average size, with labour used in 1899 and 1903, with estimate of labour to be used, if obtainable, three and five years hence, from which an average has been struck for the towns which have not rendered returns.

Annexure "B."—Comparative statement of pay, showing difference in wages paid in 1899 and 1903.

Annexure "C."—Diagram, illustrating "B."

Annexure "D."—Statement showing actual increases and decreases in pay in 1903 as compared with 1899.

Annexure "E."—Statement showing number of unskilled labourers employed before the war, number employed now, the extra number wanted for current requirements, the total number estimated as required to complete, within a reasonable time, works already sanctioned, and for current administration, with total number estimated as being required three and five years hence.

Annexure "F."—Statement showing the replies received in answer to the question: "Is increased cost of white labour compensated for by increased efficiency?"

 ... 12,282

The Natives to be employed by the 45 Corporations, &c., shown in Annexure B, Column 2, if they were available, amount to... 34,677  
 Less those who would be employed by the three Departments specified above ... 6,212  
 ... 28,465

JOHANNESBURG, 24th August, 1903.

## ANNEXURE "F."

## STATEMENT

Showing replies received in answer to the Question, "Is increased cost of White Labour compensated for by increased efficiency?"

No. of Return.	Name of Place.	Reply.
4	Delagoa Bay Development Corp., Ltd.	No.
6	General Electric Power Co.	No.
7	Potchefstroom	No.
12	Mafeking	No.
16	Tarkastad	No.
20	Kalk Bay	No.
34	C.S.A.R. Construction	Prefer whites to natives if funds were increased in proportion. Estimate whites increase costs by 1,500l. per mile. Best white labour would increase costs by 1,100l. per mile.
40	Pretoria Town Engineer	No.
42	Pretoria Municipality	No.
43	Heilbron	When available, natives are preferred.
48	Cape Town	Doubtful.
51	Bloemfontein	Unskilled white labour is about equal to good Kafir labour, and does not compensate for extra wages paid.
55	King William's Town	No.
63	C.S.A.R. Present Lines	No.
67	Cape Town Docks	No.

JOHANNESBURG,

24th August, 1903.

ANNEXURE D.  
REPORT OF SUB-COMMITTEE ON  
MINING.

The Chairman and Members,  
General Committee,  
Transvaal Chamber of Mines,  
Johannesburg.

1. In submitting the report of the Sub-Committee on Mining appointed by your Committee on the 6th July, 1903, with the following reference:—

- (a) To find out the labour requirements for mining of South Africa, at the present time and five years from now.
- (b) To report on the possibilities, or otherwise, of the use of unskilled white labour in mines.
- (c) To obtain all data and report specially upon the excessive cost of unskilled white labour on the following mines:—Crown Reef, Village Main Reef, East Rand Group, Vohuter, New Goch, Lancaster and Geduld Proprietary.

We beg to advise that for the purposes of accelerating the presentation of this report to your Committee and obtaining the most reliable local statistics and information, the following gentlemen were added to their number:—

- E. Hopper, representing Transvaal Gold Fields.  
J. R. Thom, representing Natal.  
F. H. Hatch, representing Orange River Colony.  
A. Williams, representing De Beers and Jagersfontein Mines.  
H. Hughes, representing Pilgrim's Rest.  
W. T. Pope, representing Barberton and District.  
J. W. Watts, representing Barberton and District.  
F. H. Garthwaite, representing Klerksdorp and district.  
S. C. Thomson, representing Witwatersrand, vice T. R. Leggett, resigned.

2. As soon as possible after their appointment the Sub-Committee met to discuss the best methods of obtaining the information required, and decided on the issuing of a series of forms, some of which were sent to every registered mining company in South Africa, and through the resident magistrates, to prospectors.

The great distances apart, and the out-of-the-way places from which it was essential that the Sub-Committee should endeavour to obtain information, have militated against the earlier presentation of this report, and accounts in part for the fact that all the information desired has not been obtained. The figures showing the labour requirements in the report, therefore, are based on returns already received and allowance made on the basis of these returns for such other companies or organisations as have not made returns, comprising three companies (600 stamps) and covering 10,200 natives; it therefore follows that the figures may be taken to approximate as closely as possible to the mining labour requirements of the present developed portions of South Africa, but necessarily neglect the potentialities of many as yet wholly or partially developed regions.

3. With regard to the various estimates of the numbers of natives employed before the war, discrepancies would appear to exist, and are for the most part attributable to the various interpretations placed on the word "Employed" by those compiling the returns.

4. The number most generally taken as representing the number of natives employed on the Witwatersrand before the war was 95,000. Mr. Webb, for his annual address for the South African Association of Engineers, went to some pains to obtain a more correct figure. He found that for 110 companies the total number of individuals in their employ was 111,697. The State Mining Engineer, in a speech before the Miners' Association, stated

that, after a careful investigation, he came to the conclusion that the total number employed by 150 gold and 7 coal companies in July, 1899, was 112,106 of whom 107,827 were employed on gold mines; of these 91,484 were at work, showing that, approximately, 15·1 per cent. were not working, being either sick or idle.

5. Col. No. 4, of Exhibit No. 2, gives 101,081 as the estimated number of natives that would be required on the Witwatersrand to drop all erected stamps, if the present condition of working is maintained, i.e., sorting less than their maximum profit would require, mining more than is being developed, mining in the wildest and most favourably situated stopes, stoping with rock drills where installed, milling from surface dump and using the present number of unskilled whites, Cape boys and coolies. Column 6, Exhibit No. 2, shows that 28,507 natives are required for development companies, making a total required under present conditions of 129,588.

6. The effect of sorting on the labour requirements is very great. It takes just as much labour to break, tram and shovel a ton of waste as it does to break, tram, and shovel a ton of ore. If, instead of milling this waste, you throw it away, the number of stamps is reduced in direct proportion to the amount of waste thrown out, and the number of boys employed per stamp is directly increased.

7. Column 5, in Exhibit No. 2, shows that 142,473 natives would be required to drop all the erected stamps under the most economic conditions—i.e., sorting up to the maximum profit obtainable by this means, developing as much as is mined, stoping all over the mine—only stoping with rock drills where the conditions are favourable, and replacing the unskilled white, Cape boy, and coolie by the native.

Column No. 7, Exhibit 2, shows that 30,227 natives are required by developing companies, making a total of 172,700 natives as being required to carry on operations under the best economic conditions.

8. It is estimated that in the three departments, stoping, shovelling down stopes and tramping underground, more than one half of the total number of natives are employed. It is in those three departments that the greatest amount of attention has been paid to the introduction of labour-saving appliances, and it is in the department of stoping that the greatest amount has been accomplished.

It is estimated that at least £1,250,000 have been spent on rock drill plants, including boilers, and that these rock drills take the place of 37,000 natives.

9. Exhibit No. 14 gives the number of rock drills employed before and since the war. In stopes specially favourable to their use, rock drills can break the rock cheaper than hand labour, but in the average stope of the Witwatersrand their use is not to be recommended for the following reasons:—

- (a) The increased cost of stoping, and the special capital expenditure for the necessary plant.
- (b) The increased quantity of country rock broken, and consequent necessity for increased sorting.
- (c) The increased difficulty of sorting, owing to the greater amount of fines caused by the heavier charges of explosives.

10. In regard to the removal of broken rock from the stopes to the ore chutes, a great many devices are being tried, such as self-acting incline planes, aerial railways, belt conveyors, shaking chutes, mouno rails. None of these so far have been generally adopted, although some of them are being successfully used in special cases. The substitution of mechanical means of underground tramping for natives has also occupied much attention; mules and tail haulages have been tried, small motor locomotives are ordered, and many acute mechanical brains all over the world are trying to solve the problem. The great difficulty is that in such a thin ore body in most cases there is not enough work concentrated on any given level to economically justify the capital expenditure necessary to put in the mechanical device.

11. Exhibit No. 8 is a diagram showing, for each month since the re-starting of work on the Witwatersrand, the number of tons crushed, stamps at work, value of gold recovered, whites and natives employed, and natives per 100 whites.

12. The estimate of the requirements of native labour for gold mining in five years from now has been based on the acceptance of the view that the gravity stamp will be retained for the purpose of crushing ore, and no allowance has been made for any crushing devices or change in metallurgical practice—which may at any moment be brought forward—that would materially increase the output of crushed rock; although allowance has in some cases been made for an increased efficiency of the gravity stamp. To exemplify the great increase in the effectiveness of stamp mills during late years, we beg to refer you to Exhibit No. 7, which shows that the crushing capacity per stamp has more than doubled since 1890 on the Witwatersrand.

13. Columns Nos. 3 and 8, Exhibit No. 2, show that five years hence 18,265 stamps will be erected. This is based on the assumption that properties still to be developed and worked will be given a life approximately the same as now obtains. The justification of such lives is, of course, based on the wish of the engineer to give to any property its maximum possible value. He therefore equips it with the greatest number of stamps it can carry in order to reduce its life, and thus enhance the value of the output. This matter leans to the financial side of the question, and will probably be treated by the Sub-Committee on Finance. We refrain, therefore, from dilating more on this point.

14. No allowance has likewise been made for any mechanical device or improved method of working that may be introduced and designed to save labour. Nor has any allowance been made for replacing any natives by unskilled white labourers. The annexed reports on the work of unskilled labourers on the Lancaster, Geduld, East Rand Proprietary, Crown Reef, New Goch, which have been prepared by the Consulting Engineers of these companies, show clearly that under the present conditions of scant white population, high cost of living, and the insuperable objection of the white man to put forth his best endeavours as a wage earner by manual labour in the presence of a black man, the use of unskilled white labourers is costly and unsatisfactory. In our opinion the means to be adopted to get the maximum number of contented white men workers on these fields is to limit the white labour to the performance of skilled work. These men would be trained artisans or foremen, and will continue to receive a high rate of wages. On this point we beg to call your attention to pages 14-16 of the statement made by the Committee of Consulting Engineers to Mr. Chamberlain.

15. Exhibit No. 4 is a map showing the mineral area of the Witwatersrand. The portion coloured red is the portion for which the requirements of labour in five years have been estimated: Blue, stamps at work; yellow, stamps erected. No attempt has been made to compute the number of natives that would be required on the Witwatersrand to work the enormous bodies of low grade ore that exist in the Main Reef Series, or in the parallel reefs that adjoin it.

16. The Wankie Coal Fields are only now being connected by rail with the Rhodesian Gold Fields, consequently it is not possible to estimate the effect of an ample and cheap supply of fuel to the Rhodesian Gold Mines, or their labour requirements.

17. Circulars were sent to each known Coal Mine in the Transvaal and Natal, and Exhibit No. 5 will show the present number of natives employed, and the estimated future number required.

Exhibit No. 5 also shows the progressive coal outputs of the Transvaal and Natal.

18. There is great difficulty attending any attempt to estimate the requirements of the Coal Mining Industries of the Transvaal, Rhodesia, and Natal. The two former will advance in proportion as the respective Gold Mining Industries push ahead, and

the latter will make great strides by the systematic development and encouragement of an export trade in coal, the possibilities of which are immense.

19. No estimate has been made of the labour required by possible mining industries, the deposits of which are known to exist in the Colonies, and are only waiting development. Such industries are, amongst others: Iron, Tin, Copper, Lead, Fire Clay, Zinc, &c.

20. As an example of the sudden and unexpected appearance of industries of possibly great magnitude, and which make great demands on the labour market, we refer you to Exhibit No. 6, which shows the progress of the Transvaal Diamond industry for the year ended July, 1903.

21. As a further rough indication of the mining possibilities of South Africa, we beg to refer you to Exhibit No. 9, which is a summary of nominal issued capital of companies of this Sub-Continent. This statement is compiled from the "Mining Manual" for 1902, and shows that the total nominal capital issued and unredeemed debentures was £211,967,217. Of this amount £77,078,663 was the issued capital of the Land and Finance Companies, and £134,888,554 purely Mining Companies. On the Witwatersrand 120 Companies have an issued nominal capital of £53,975,330, or about two-fifths of the total for South Africa. It is reasonable to suppose that a Mining Industry's demand for labour will bear some very rough proportion to its issued capital. We do not desire to press this point, we merely use it as an indication that the demand for labour on the Witwatersrand should not constitute a very large majority of the legitimate demand for labour in the Mining Industry of South Africa. In other words, comparing the large requirements of the Witwatersrand with those of the returns of other mining districts of South Africa, it shows that the enormous amount of capital invested in these districts is lying dormant, and the country remains as yet undeveloped, and has, therefore, made no call on the labour supply.

We can see no deterrent cause to the expansion of the Mining Industry except the shortage of labour. Capital has been provided in the past and will be forthcoming in the future; the carrying capacities of the railway can easily be increased in time; of coal there is an immense abundance; there is sufficient water in the country to meet all needs, provided it is rightly used and in our opinion it is quite feasible to obtain the requisite quantity of water by the time it is needed. The sole unfulfilled condition necessary to the expansion of this industry and increased prosperity of this country, is a supply of native labour. The total number required at present, and in five years, to work under the most economical conditions is as under:—

	At Present,	Five Years from now.
Witwatersrand Gold Companies, Exhibit No. 2.	172,700	368,637
Other Districts, Transvaal, Exhibit No. 10.	12,250	12,250*
Coal, Transvaal, Exhibit No. 5	12,088	25,200
Diamond, Other Mining, Transvaal, Exhibit No. 6.	753	753*
Coal, Natal, Exhibit No. 5	5,244	12,900
Cape Colony, Exhibit No. 11	15,976	20,576
Rhodesia, Exhibit No. 13	16,500	25,000†
Orange River Colony, Exhibit No. 12.	8,490	21,225†
	244,001	486,541

\* Estimates for five years hence not being obtainable, no expansion of the industry has been allowed for.

† This estimate is for two years hence.

We beg to remain, sirs,  
Yours faithfully,  
Sidney J. Jennings, Chairman.  
G. A. Denny.

EAST RAND PROPRIETARY MINES, LTD.  
 P.O. East Rand,  
 Transvaal,  
 22nd August, 1903.

The Chairman,  
 Sub-Committee of Consulting Engineers,  
 P.O. Box 1056 Johannesburg.

Sir,

In reference to the request of the Secretary of the Sub-Committee, dated August 4th, that I should obtain all data and report specially upon the excessive cost of white unskilled labour on East Rand Proprietary Mines, I beg herewith to submit the following:—The scarcity of native labour prevailing at the time peace was declared caused many Companies on the Rand and amongst them the East Rand Proprietary Mines to lend a willing ear to the representations of the Commander-in-Chief to the effect that employment should be found for the many volunteers about to be disbanded in this country, as also, for such regulars as were able to secure their discharge here and wished to do so. It was felt even then by the Companies that the employment on the Mines of unskilled white men in the place of Kaffirs would be a somewhat doubtful experiment. On the other hand, it was generally admitted that something must be done for those who had served their country during the war, and who, without assistance from the mines, would at the close of hostilities be left without visible means of support in a strange country. The East Rand Proprietary Mines were amongst the first to begin the experiment and early in June the first lot of volunteers arrived. They numbered 34 men and were, for the most part, drawn from Lovat's Scouts and the Yeomanry. On July 2nd, a further batch of 32 was received, drawn in great part from the same regiments. These men were almost without exception of good physique and of good character, and it may with truth be said of the earlier stages of the experiment that the men did themselves credit and that as far as the actual work was concerned the results were satisfactory. The men were keen and intelligent as compared with Kaffirs and as soon as they became accustomed to the work relieved the management of much anxiety and trouble.

In July, 1902, I drafted a Memorandum on the subject of "Kaffir, White and Chinese Labour," which I have much pleasure in attaching hereto and to which I draw your attention. I also wrote a letter on the 24th August, to the Chamber of Mines on the subject of "Labour on the Rand," which I likewise attach for your information.

It but remains for me now to summarize the results of the thirteen months under review, namely, from June, 1902, to June 30th, 1903. The volunteers did not stay long with us, but after having gained a certain proficiency, left us to seek better positions elsewhere. We filled their place with whatever offered, and the result has been a marked deterioration in the quality of the labour employed at low rates of pay. The men gave themselves up to drink, and the annoyance and the confusion immediately after pay day was so great that I decided to get rid of these men at the earliest possible opportunity, replacing them whenever I was able to by Kaffirs. At the present moment, therefore, we have comparatively few white labourers at work. The period under review naturally divides itself into two by reason of the change that has taken place in the pay of Kaffirs,

and likewise by reason of the increased cost of Kaffir labour, due to the improvement effected in food and accommodation. This increase in the cost of Kaffir labour dates, practically, from the 1st January, 1903. The first period, therefore, covers the last seven months of 1902, while the second period begins 1st January, and extends to the 30th June, 1903. During the total period, that is, from June, 1902, to 30th June, 1903, a total of 1,473 white labourers have passed through our books. The average number at work during the same period was 150·297. The men, therefore, remained in our employ on an average 1½ months. You will find appended a detailed statement for each mine in the Group, also for the D and A Joint Reduction Plant which shows the nature of the work the men have been engaged in, and the total number of shifts worked in each class; the total cost of this white labour and the cost per shift, as also the average wage earned per month. Following on this come the shifts and cost of some unskilled Kaffirs employed in the same class of work. The estimate then follows of the number of Kaffirs that would have been required to do the whole work had no whites been employed, and the cost of such Kaffir labour is likewise given. The number of natives displaced by the whites is then calculated, from which follows the efficiency of the white; that is, the average number of blacks that the white man displaced. The excess cost of white labour over black is then shown so that the loss incurred by the Company by reason of its having employed white labour instead of black can be calculated, the loss per ton milled is likewise given, then finally the ratio of the cost of white labour to that of black. The cost of the native shifts includes all expenses, that is, compound charges and Native Labour commission as well as wages. The East Rand Proprietary Mines sheet does not show the class of work done, because that work consisted largely of odd jobs, such as digging ditches, fencing, etc. The Company's sheets are summarised in Statements 1, 2 and 3. Statement (1) covering the period June to December 1902, Statement (2) the period January to June 1903, and Statement (3) the total period from June, 1902, to 30th June, 1903. It will be noted that the efficiency is very low. In the final summary covering the whole period it is given as 1·23, which means that on an average the white man has been able to do the work of 1·23 Kaffirs. In certain instances it has been higher, notably in the cases of stokers on the Comet Mine, where the efficiency is shown to have been 2·104, and in the case of surface trammers on the Angelo Mine, where it reached 3·232. These white men were on contract, and did their very best to reduce their own numbers so as to increase their own wages, payment being made on the number of trucks moved. The average cost of the native shift was 2s. 0·473d. during the first period, and 2s. 7·690d. during the second period. The average cost of a white shift was 9s. 5·004d. during the first period, and 10s. 1·977d. during the second period. During the first period white labour was 3·681 times as expensive as black, and during the second period 3·145 times. If we assume that before the war, when all unskilled labour was done by Kaffirs, the Kaffir labour amounted to 25 per cent. of the total cost, we find that were Kaffir labour to be entirely replaced by white labour the increase in costs during the first period would be about 67 per cent., and during the second period about 54 per cent. The average wage earned by the white labourer during the first period was £14 10s. 10·955d., and during the second period £15 6s. 7·6d., and for the whole thirteen months £14 19s. 11·6d. The loss imposed on the Company by reason of the employment of white labour in place of Kaffirs has amounted over the thirteen months to £20,380 19s. 0d., the loss per ton milled has averaged 10·49d.

It may be asked why white labour cannot be employed in this country to work the mines as successfully and economically as elsewhere, notably in the United States of North America, in Canada, and Australia. The reasons are easily given. They

are three: First and foremost, because the white workman in this country is entirely demoralised by the presence of the Kaffir. The efficiency of our so-called skilled labourers here is unquestionably very much lower than in the corresponding trades in other countries, and I attribute this entirely to the habit of giving these men Kaffirs to work with them. They expect the Kaffir to do work to which he is not accustomed, and, of course, he does it slowly, the result is that neither the Kaffir or the white man do very much. It is not necessary for me to dwell on this phase of the question, as the fact is well established that where an inferior race is at hand to do the drudgery the white man's efficiency gradually becomes impaired. The second reason is that we have no large number of labourers in the country, that is, men who are accustomed to toil with their hands and to work hard. It would probably take some years to build up such a class if the Kaffir were entirely eliminated; in his presence I doubt very much whether it is feasible at all. The third reason is the high cost of living in this country. I have shown that the average wage earned per month by an unskilled labourer has been, during the past thirteen months, as near as may be, £15, or 9s. 10d. per shift. I believe that the wages paid in California would probably average for drilling, shovelling, tramming, etc., in short, for mine work, about 10s. a day. Now, the cost of living here is probably from three to five times as great as it is in California, according to the status of the individual. How then can we expect good workmen to come here for the same wage as they can earn in a country where their expenses are, say, one-third of what they are here. In order to keep the costs where they are on the basis of Kaffir labour the white man must do the work of 3.145 Kaffirs. Men who can do that will not come here for a wage of 10s. per day as long as the cost of living remains where it is now. I am convinced, and I think my figures show conclusively that the substitution of white labour for Kaffir labour would mean an enormous increase in the working costs, an increase which many of our mines could not face. Assume that the average working costs on these fields are 25s. per ton crushed. If white labour in the place of Kaffir labour means a 50 per cent. increase in costs then all mines yielding a profit of 12s. 6d. or under would cease to show any profit at all. I have not figured it out, but it will be interesting to know how many dividend producers would be left, and what interest on the present market value of their shares they would return. White labour has been given a fair chance and has failed. There is no doubt in my mind at all that it offers no solution of our present labour difficulties.

I have the honour to be,

Sir,

Yours faithfully,

(Signed) FRED HILLMANN,  
General Manager.

Attached to this Report:—

Exhibits A, B, C, D, E, F, and G.

Memorandum on "Kaffir, White and Chinese Labour," July, 1902.

Letter to Secretary Chamber Mines, dated 24-8-'02.

MEMORANDUM RE KAFFIR AND CHEAP  
WHITE LABOUR.

July, 1902.

The present dearth or scarcity of natives on the mines is, in all probability, due to a combination of circumstances, some of which may lie within the control of the industry, while others may not. Whether a higher rate of wages to natives would produce the desired effect is an open question, and one that can only be proved by experiment. At the present moment 6,000 stamps, or thereabouts, are erected, and only await a sufficient labour supply to be put in active operation. The require-

ments of the Rand in native labour to keep these six thousand stamps going and do the necessary development and construction work may be put down at one hundred and twenty thousand boys. The programme which has been laid down for the future development of the Rand contemplates an extension of 100 per cent. within the next five or six years, while a further addition of some three to four thousand stamps may confidently be predicted within the next six to nine years. The requirements of the Rand to keep, say, sixteen thousand stamps going would be approximately 320,000 boys. This figure simply represents the demand that the Rand alone will make for natives in the future. If one adds to this the numbers required to satisfy the demands of other industries, which will receive an enormous impulse from the advent of the British in South Africa, and from the large influx of capital which is sure to follow the improved conditions and improved security consequent upon the British occupation, the total number of natives required throughout South Africa will, at the lowest estimate, be not less than 600,000 boys. The total native population of South Africa is approximately 6,000,000, and of this number only one-sixth will consist of able-bodied males between the ages of 15 and 35. The number then of blacks in South Africa capable of performing the work required of them does not exceed 1,330,000. It is quite clear that of this number only a comparatively small proportion will ever be available for the labour market, in so far as the black does not possess the incentive to work which is common to the more civilised and highly developed nations of the world. It is also clear that the supply would vary very considerably with the conditions existing at any particular time in the country. During years of great agricultural prosperity the supply would be much less than in years of drought, and consequent bad harvests. For the simple reason that the wants of the average native are but few and under normal conditions are easily supplied. The supply of labourers would, therefore, not be a constant one, but would vary, and the industry would never know exactly upon what numbers it could rely. It would take years to so develop and increase the wants of the native as to make him a constant and regular workman. He will in all probability for many years to come only work intermittently, that is, he will work one day and lie off the next, and he will always wish to return to his kraal after a short time, and when he has accumulated sufficient money for his immediate purposes. In the past history of the industry, the fact has been proved beyond dispute that the mines are for ever educating the Kaffir, who remains just about long enough to become educated and then departs, in a great many cases to return no more. Such conditions mean inefficient labour, and the Kaffir is distinctly inefficient, even at the rate of wages which he receives to-day.

The fact then may be taken as established that this great industry of the Rand is absolutely debarred from further expansion, from its legitimate expansion, if it is to depend for its labourers on the blacks in South Africa. It is, indeed, doubtful whether the production obtained before the war can be reached within the next few years with the help of the blacks alone, for the large amount of money spent in the country during the war, a comparatively large proportion of which found its way into the pockets of the Kaffir, together with the unusual crops which are now being harvested, are powerful factors in preventing the return of the native to the Rand, and it may be a very considerable time before normal conditions are again reached.

The industry cannot stand still. The high interests involved, the enormous outlay already incurred in development and magnificent equipment demand that the money so invested be made productive without further delay. How, then, is this to be accomplished?

There are two alternatives before the industry: The one to import white labourers from Europe to take the place of the Kaffir, the other to introduce Chinese or other coolie labour.

The introduction into this country of large numbers of white labourers, unskilled in mining work, and at a rate of pay seven times as great as that given to the Kaffir at the present moment, does not seem to give that assurance of success upon which the future prosperity of the country depends. It is true that in many parts of the world white labour is employed to advantage, and that in such places the cost per ton does not equal the figures reached here, but it must be remembered that the efficiency of white labour in these places is the outcome of years of effort, and of the fact that there no other form of labour is available. Here things are very different. It may be said, without injustice, that the whole white community of South Africa is in a sense demoralised by the presence of the Kaffir. White workers in this country have learnt to depend entirely upon the Kaffir for the performance of the more arduous portions of their work, with the result that the men themselves have become estranged from the habit of hard work. The artisans of this country are probably not more than one-third as efficient as they were in their own country before they came here, or as the artisans of other countries. It is quite clear that if workmen are to be imported from Europe the rate of wages which these workmen would receive here would not exceed 10s. per day. The better class of workmen in Europe would not come for that wage since they can probably earn nearly as much at home and know full well that 10s. a day in Johannesburg is barely, if at all, a living wage. The class that would come would be drawn very largely, no doubt, from the wastrels of Europe, and would consist largely of men who were unable to obtain employment there at any rate. The introduction of such a class into this country is in itself a menace to the prosperity of the country and to the peace of its inhabitants, and it is not a proposition which the mining industry could view with favour. As long as the Kaffir is present on the Rand, the white workers will seek to make use of him and will, as has already been amply proved, have their own utility impaired. Even should the Kaffir be eliminated entirely it would take years to make of these men the efficient workers that make the mines of other countries a success. In the meantime costs would go up enormously, and it is quite certain that many of the mines which were operated successfully, that is, at a profit, before the war, would, under the proposed conditions, work at a loss. The proof is easy. Many of the low grade mines on the Rand have made, under present conditions, a profit of 10s. per ton. If it be conceded that the average white labourer introduced from Europe would not be worth more than two Kaffirs, and this figure involves perhaps too high an estimate of his efficiency, the rate would at once be raised from 3s. 2d. to 10s. Taking a 100-stamp mill as an illustration, such a mill would crush approximately five hundred tons a day, or, say, 14,500 tons a month. To break this rock 24,167 holes, each three feet deep would have to be drilled per month, or say an average of 930 holes per day. Assuming that each white man would put down two holes, 465 white men would be required to break this rock by hand against 930 Kaffirs; 465 whites earning a wage of 10s. per day involves a total expenditure of, say, £232, to keep the mill going; 930 Kaffirs at 1s 7d. per day means a total expenditure of, say, £73. For a month the expenditure in the case of white men would be £6,032, and in the case of Kaffirs £1,898, being a difference in favour of the Kaffir of £4,134. On the basis of a monthly capacity of 14,500 tons, this difference would mean an increase in the mining costs alone of 5s. 8d. Be it remembered that this increase applies only to the actual cost of mining the ore. If to this be added the increased cost of other underground operations, such as tramping, shovelling, etc., and further, all surface operations, what will be left of the profit of 10s.?

#### REPORT ON USE OF WHITE LABOUR ON SHAFT SINKING AT NEW GOCH MINE.

The writer, in his capacity as Consulting Engineer to the New Goch Mine, recommended to that

company, in view of the shortness of native labourers, and the desirability of commencing an important shaft, that white labour exclusively should be employed on the work. It was fully realised that a great increase in cost would result by the employment of white men upon work ordinarily done by native labourers, but as an expedient it was deemed advisable to try the experiment, owing to the important bearing which the work in question had upon the company's future operations. Accordingly, in October, 1902, a start was made upon the sinking work, and hereunder some details of the operations are given.

**Angle of Shaft.**—The shaft is laid out at an angle of 65 degrees from the horizontal.

**Hours of Work.**—The day was divided into three shifts of eight hours each.

**Holes Drilled per Day per Man**—The work expected of each man was the same as that ordinarily obtained from the native hammer-boy, namely, after clearing the shaft, one hole sunk to a depth of 36 inches, working single-handed. In no case during the experiment did a man drill more than 36 inches, and the actual depth of holes ranged from 9 inches to 3 feet, whilst of the total holes drilled not more than 33 per cent. reached a depth of 36 inches.

**Division of Shifts.**—Each shift was arbitrarily divided into two portions, the first, occupying probably half the shift, being devoted to clearing up the shaft bottom, the second being that in which the work of drilling and blasting was performed.

**Rate of Pay.**—During October and November of 1902, the average rate of pay given was 10s. per shift; in December it was increased to 11s. per shift, the rate gradually advancing until in February and thenceforward until the suspension of operations, the rate was 15s. per shift.

**Footage Sunk.**—This must be divided into two periods. I would point out that the shaft in question was started from surface, and to a depth of 26 feet the sinking was all done by pick and shovel. From that depth onward, the rock required explosives for its dislodgement. A power hoist was ordered, but did not get in operation until the middle of February, and therefore the two periods referred to above might be called the windlass and power hoist periods, the former being in vogue during the sinking of 64½ feet, and the latter during the sinking of 116½ feet, at which aggregate depth the work was suspended.

The first period lasted from the first week in October until the 13th day of February, and the second from the 13th day of February until the 13th of April succeeding, so that the rate of sinking during the first period was, say, 4 feet per week, and during the latter, say, 14½ feet per week.

**Cost per Foot Sunk**—The cost per foot during the windlass period was £33 16s. 10d., and during the power hoist period £33 5s. 10d. The extraordinary cost of the first period is due to the cost of masonry work in connection with the shaft collar, and heavy initial pumping charges, and other items incidental to the starting of new work. The charge for the latter period is, however, a fair sinking charge, and is analysed as under:—

#### ANALYSIS OF COSTS ON 116 FEET SUNK.

	Total Cost.	Cost per Foot.
	£ s. d.	Shillings.
European labour - - -	2,642 17 3	455.66
Dynamite - - -	61 13 2	11.15
Fuze and Caps - - -	10 17 3	1.87
Candles - - -	20 11 7	3.54
Drill Steel - - -	42 15 5	7.37
Timber - - -	205 13 10	35.50
Rails and Points - - -	61 1 3	10.52
Piping - - -	92 16 10	16.09
Fuel - - -	103 12 8	17.86
Sundries - - -	175 6 9	30.22

## ANALYSIS OF COSTS, &amp;c.—cont.

	Total Cost.			Costs per Foot.
	£	s.	d.	Shillings.
Workshops - - -	335	12	3	57.86
Stables (Transport) - - -	30	4	1	5.20
Sundry Natives - - -	92	10	6	15.95
Total cost - - -	£3,878	12	10	£33 5 10

Average Number of Men Employed.—During the windlass period of sinking the average number of white men employed on the shaft work was as follows:—

7 men on surface, at windlass and tramming work.
7 men drilling.
1 Boss.
1 Timberman.
1 Carpenter.
1 Foreman.

Total 18 men.

After the erection of the power hoist the average number employed per day was 52, distributed as follows:—

Surface tramming - - -	2
Drilling and shovelling - - -	43
Timbermen - - -	3
Bosses - - -	3
Foreman - - -	1
Total - - -	52

Estimated Cost of Shaft Sinking with Native Labour.—If natives were available for sinking purposes, I estimate the cost as under, working 30 shifts per month:—

White labour—

Foreman - - -	£60	0	0	per month
3 Shift Bosses costing - - -	101	5	0	per month
3 Timbermen costing - - -	100	10	0	per month
1 Banksman costing - - -	22	10	0	per month
1 Carpenter costing - - -	30	0	0	per month
3 Engine Drivers - - -	90	0	0	per month
Total white cost - - -	£404	5	0	

Native Labour—

75 native drilling and shovelling, averaging 92/6.69 per month -	£360	13	1
6 natives tramming on surface, averaging 73/2.1 per month -	21	19	0
6 natives drill carriers, averaging 69/2.7 per month -	20	15	4
Total native labour costs -	£412	7	5

Total cost of white and native labour per month, say - - - - £820 0 0

With the force above enumerated I estimate that not less than 100 feet per month would be sunk in the shaft, and therefore the charges for other items would appear as upon that basis. For the purposes of this comparison, we will, however, accept the figure at per foot when working with white men as accurate, although it will be readily understood that most, if not all, the charges would be reduced were a greater monthly footage accomplished.

The items which will be brought over from the white workers period are below enumerated:

Dynamite - - -	11.15s.	per foot.
Fuse and Detonators - - -	1.87s.	per foot.
Candles - - -	3.54s.	per foot.
Drill Still - - -	7.37s.	per foot.
Timber - - -	35.50s.	per foot.
Rails - - -	10.52s.	per foot.
Piping - - -	16.00s.	per foot.
Fuel - - -	17.86s.	per foot.

Workshops - - -	57.86s.	per foot.
Sundries - - -	5.20s.	per foot.
Cost per foot - - -	166.87s.	

Cost of sinking 100 feet - £834 7 0

The estimated total cost per foot of shaft with the force enumerated is therefore—

White labour per month -	£404	5	0
Native labour per month -	412	7	5
Other items - - -	834	7	0

Total expenditure per month - - - - £1,650 19 5

Average cost per foot on 100 feet sunk, say - 16 10 2

Average cost of shafts sunk by whites say - 33 5 10

The estimated cost to sink by native labour, therefore, and allowing liberal margins in "other items," is only just 50 per cent. of the cost when white labour exclusively is used. Taking the increased expenditure in white labour as upon a depth of 2,000 feet, the company would expend £33,000 more for the shaft when sinking by white labour than when sinking by natives.

Reason for Suspension of Work.—The enormously increased cost of sinking this shaft by white labour exclusively, as compared to the cost of shaft sunk by native labour, was the chief reason for the abandonment of the experiment. Apart from the question of cost, however, the white workmen were a source of exceeding trouble. During the second period of the sinking, when there was an average of 45 men employed upon the operation of sinking and tramming, the actual average of new men taken on amounted to no less than 5 per day, so that in the space of nine days we practically changed all hands. The reasons for this were, firstly, that the average man when he had earned a few pounds grew tired of the work, and departed in the hope of finding some easier task; and, secondly, the undenyng fact that the work was really that usually performed by Kafirs exerted an influence upon the men, which sapped all interest and application, whilst the best men only regarded it as a makeshift to be tolerated only for a short period. The expense to the company of teaching new men each day was heavily reflected in the cost bill, and the difficulty of obtaining even a small percentage of reliable men, willing to labour continuously and assiduously, became more and more clear until the final decision to abandon the project was made.

It will, of course, be urged by some that in other countries the entire work is done, and done well and economically, by the exclusive use of white men, and the statement cannot be denied, but it should be remembered that in those countries, apart altogether from the difficulties of working free and servile races on the same platform, the wages rates generally are from 50 to 75 per cent. lower than the rates obtaining on these fields, consequent chiefly on a large population of white workers and resultant competition and stress for existence and on a low cost of living. If it be true, as stated in the Engineers' Report to Mr. Chamberlain, that it requires a sum of, say, 16s. per day for every day in the month to enable a man and average sized family to live on the Rand, then his necessary expenditure must be at least 9s. 6d. per day more than that of the average skilled miner in Ballarat who earns only 6s. 6d. per day for every day of the month, when he works an average of 26 shifts at 7s. 6d. per shift. If, therefore, the Witwatersrand Mines were to agree to pay an average of 15s. per day to white men for the replacement of natives, the net earning for a month of 26 working days would be £19 10s., and the earning for each day of the month—assuming 30 days per month—a sum of 13s. The first result of such a policy would be to shut down all but a few Mines on the Rand, and the second would be necessary expenditure of from £4 to £5 per month on the married workmen, a shortage on actual, so that both the industry and

the workmen would be beggared, to the advantage of none.

It has been shown in a previous paragraph in this statement that the work performed by the average man employed on the New Goch Shaft was considerably less than that usually performed by the native, therefore if the white and the native as muscular labourers are put on an equality, it rather favours the white man. In calculating, therefore, upon the replacement of natives by whites, the basis must be taken as 1 to 1, and on such a basis it is clearly economically impossible for the Witwatersrand as a whole to exist.

I do not deny the possibility of white ultimately being employed exclusively in the mines of this country, but that, in my opinion, can only eventuate when it is populated in some degree proportionate to its area. The growth of population must result in the development of resources other than gold, namely the mineral, agricultural and pastoral, and these re-acting on one another will eventually evolve a situation comparable to that of any other country peopled by a virile race, namely, plentiful and cheap production of the necessaries of life, and consequent low living cost. This evolution of conditions, however, is a process of time, and for the present neither helps nor interests us, and we are compelled to recognise that for the profitable working of the Witwatersrand Mines—which it should be borne in mind only yield 1oz. per ton of ore milled—some race other than whites—the individuals of which are content with comparatively low rates of wages—must be employed for the purely muscular work, relegating to the whites the higher branches of work, in which the coloured labourers cannot effectively compete against them.

EAST RAND PROPRIETARY MINES,  
LIMITED.

P.O. East Rand, Transvaal,  
29th August, 1902.

A. R. Goldring, Esq.,  
Secretary, Transvaal Chamber of Mines,  
P.O. Box 809, Johannesburg.

Dear Sir.—I beg to acknowledge receipt of your favour of the 20th August re labour supply for the mines, and I now have much pleasure in submitting my views on the points mentioned by you in your said letter, and which I understand are of special interest to your Committee.

1.—NATIVE LABOUR.

(1) Rates of Pay.—I am of opinion that the rate of pay for natives as fixed by the schedule recently adopted by the Chamber of Mines, and which has been in operation practically since work was resumed on these fields, is too low. The question of a reduction in the rate of pay to natives was discussed in Capetown, and it was then naturally felt that it would be desirable to effect a reduction, and no obstacles were then believed to exist. The Committee which took up this subject in Capetown was, of course, unable to foresee precisely what the conditions would be on the Rand after the war. I do not think that anyone in Capetown, and probably anywhere else realised at that time what an enormous demand for native labour there would be as the war drew towards its close and the process of reorganisation and re-establishment began. The present demand for native labour has never been equalled and probably never before in the history of the Rand have so many circumstances combined to reduce the supply as at the present time. I do not think that it is necessary for me to go fully into the causes of the increased demand for Native Labour. Everyone will admit that this increase actually exists. It is a fact that, of all the competitors for native labour, the Mining Industry, which in importance ranks first, offers the smallest inducement to natives to enter its employ. The native to-day is in possession of probably more money than he has ever had before and his position is further strengthened by

the excellent crops of the past season, so that he requires greater inducement to leave his kraal and come and work in the mines than ever before. He is master of the situation and is able to dictate terms to the industry and of other would-be employers, and, if the industry is to go on, his terms must be accepted until the conditions change or an extraneous source of supply shall be available. It is frequently stated that the rate of pay is a matter of indifference to the native, and that a higher rate would not induce him to come forward in increased numbers. I do not believe this to be the case. I find that natives are constantly leaving the service of the mines to engage elsewhere for higher rates than the mines are paying, and I beg to point out that the Chamber itself has recently admitted, in a letter addressed to the Director of Railways, that the rates paid by the railway constitute a serious obstacle to the recruiting of natives for the mines, and has asked the railway to reduce its rate to that paid by the mines. I do not think that the railway will readily accede to this proposition, for that organisation probably fully realises the necessity of keeping its work going whatever the necessary rate of pay may be, whilst endeavouring to reduce its costs in every possible way. I am informed that the railway is about to introduce a sweeping reduction in the pay of its white employees. At all events no one can state positively that an increase of pay will not bring back the natives until the experiment has been tried, and it is the imperative duty of the industry to leave no stone unturned in its effort to re-establish itself. When the number of natives in the employ of the mines shall have increased, so that the supply approximately equals the demand a reduction may be found possible. I do not think that it will ever be found possible to recruit sufficient natives to meet the demands of the whole of South Africa, and it will probably be necessary, later on, to import labour from other countries to carry on the work of the industry. Be that as it may, it is quite clear that as long as the supply does not equal the demand the native will be able to impose his own terms, and the industry must bow to the inevitable, and cannot possibly hope by legislation or any other means at its disposal to subvert the well-known laws of political economy, which teach that the rate of pay depends on the supply and demand.

I would suggest that the rate of pay to natives be increased at once to approximately what it was before the war, by which I mean that the rate of pay for a full day's work be so increased. There are certain cases where boys received before the war wages altogether out of proportion to the work done. Hammer boys, for instance, only worked four or five hours a day. I think that the introduction of piece-work would tend to correct this inconsistency.

(2) Food.—I believe that the present method of feeding natives on mealie meal exclusively, or nearly so, is open to many objections. In the first place, the diet is altogether too monotonous; it is lacking in the ingredients requisite for the maintenance of a hard-working individual, and it is responsible for the great prevalence of scurvy amongst the boys. I think that, while the staple food might continue to be mealies, a considerable allowance of fresh vegetables should be made, and then, if possible, peas, beans, lentils, and the like should be supplied to the Kaffirs. A certain amount of fat should also be given them to protect them against the cold of our winter, to which they are not accustomed, and which is, doubtless, responsible to a large extent for the high death rate.

Liquor.—I am strongly in favour of giving the boys a certain amount of liquor. The native craves for liquor, and will have it, and to deprive him of it entirely makes him dissatisfied, and opens the way for the illicit traffic which will be found very difficult, if not impossible, to control. The consumption of a reasonable amount of liquor by the Kaffir does him no harm, but, on the contrary, good. This is especially true of Kaffir beer, which, I am informed by medical men, contains the incipient

germs of vegetable life, and forms, therefore, a very strong preventive against scurvy. Of course a rigid control would be necessary, and I think that this control should be vested in the companies, and that a certain amount of liquor should be distributed to the Kaffirs daily, under the immediate supervision of the management.

Hours of Work.—The usual practice is a ten-hour day, but in the mills the boys work 12 hours, also in the boiler-houses. I think that 12 hours is too long a day in any case, and I think that where the work is continuous, that is, right through the week, Sundays inclusive, as is the case with mill work, an 8-hour day would be preferable, for in this case the boy is unable to get off on Sundays, which is a very important matter with the native. I am not sure that an 8-hour day would not be preferable in the mine itself, as a good boy could get down two holes in 8 hours and still leave time for blasting. On the other hand it might be found that this system reduced the time allowed for blasting and clearing away of smoke too much. On the whole I think that a 10-hour day for mine work, tramping underground, pump boys, skip boys, headgear boys, surface haulage boys, sorting and crusher boys could probably be retained to advantage, whilst boys working on jobs involving their attendance on Sundays, should have an 8-hour day, which would give them a long "lay-off" every third week.

Term of Engagement.—The longer the term of engagement can be made the better. The efficiency of the black labour on these fields does not depend so much on the inability of the Kaffir to learn as it does on his well-known desire to return home after a few months' work. Most Kaffirs can, if properly handled, learn almost anything in the way of routine work, but the curse of the industry lies, so far, in the fact that the mines are constantly breaking in new boys. A long engagement, therefore, is recognised by everybody as most desirable. In this connection, too, the boys should not be engaged by the calendar month, but for so many months, each month to be represented by a full ticket. The ticket should consist of 28 days, and when the boy has filled his ticket he shall be deemed to have worked one month. Such a precaution should prevent the departure of the boy at the end of a said time whether he has worked or not. It would furthermore do away with the departure of a whole gang at one time. I believe there is some difficulty with regard to this matter and that such a proposition would conflict with the law, but I think it most desirable to introduce the system I have mentioned, and presume that an alteration could be made in the existing law.

(3) Piecework.—The object of this work is, of course, to increase the efficiency of the worker by holding out to him inducements in the shape of increased pay for more work. As long as the Kaffirs are used on these mines, it should be the first aim of the industry to increase the efficiency of the native, and I think a system should be introduced, both on the surface and underground, by which a maximum amount of work could be got out of the native. In all cases task work or piece work is not possible, but wherever possible, piece work should be introduced, and the rate of pay for such piece work should be slightly higher than the wage paid for work by the day. Of course, the conditions vary in different mines, and it may be found difficult to arrange a uniform rate of pay for the work. For instance, a developing mine might readily arrange a rate for tramping underground or for tramping on each of its levels, because there would only be one point from which the rock would be taken, and the run, leaving out the gradual advance of the drive, therefore constant. In a producing mine the ore is taken from the chutes along the level, and the run consequently varies all the time. This should not constitute a serious obstacle to piece work, but it does mean that a certain amount of latitude must be allowed the manager in fixing the rate to be paid per track.

B. Surface.—I hardly think that it will be found possible to introduce piece work very largely on the

surface. In excavations and such work it could probably be done, but in the routine work of the mine, the work done by the boy depends not so much on his own effort as upon the quantity of work he gets to do. As the routine work largely consists of handling rock taken from the mine, the boys doing this work are called upon to handle all the mine produces. They are quite powerless to do more work than the mine gives them to do. I think, rather than introduce piece work on the surface, it would be better to arrange a rate of pay for green boys and for experienced boys. It might be found advisable, for instance, to fix a rate for all raw Kaffirs, and then to introduce that rate after a certain time if the boy's work is deserving of it.

## 2.—UNSKILLED WHITE LABOUR.

A. In the Transvaal.—I have no record of unskilled labour employed before the war. We did once or twice put on Boers at low rates, but it was found that they were disinclined to do really good work, and the arrangement, being unsatisfactory, was discontinued.

In June last, some 34 white men, mostly irregulars, were put to work at the rate of 5s. a day plus board, which then amounted to £6 10s. per month. In addition, they were to have a room supplied them free and a bed. On the 2nd of July a further batch of 32 or thereabouts was put to work. These men were placed in the Driefontein and Angelo Joint Battery, the Driefontein and Angelo Joint Crusher Station, the New Comet Battery, and in the New Comet Crusher Station. As far as the men themselves are concerned the result has not been unsatisfactory. The men are mostly of a good type, and seem inclined to work. They are respectable wholesome fellows, and in the majority of cases have undoubtedly done their best. They are, of course, more intelligent than the Kaffir, and learn the work more readily. Once accustomed to the work they make things much easier all round for the men in charge. They were inclined at first to work irregularly, that is, they would stay away for a day or two at a time and "lay-off" when it suited them. This we finally stopped by giving them to understand that they would be immediately discharged unless they provided some reasonable excuse, or, in the case of ill-health, a doctor's certificate. The men are now working fairly regularly, and, as already stated, the arrangement is satisfactory if viewed from the point of work alone and without reference to the increase in cost. I fully believe that in the course of time an efficient class of white labour could be built up in this country. White labour is employed exclusively in the mines of the United States and in other places, and the working costs prove that the labour is efficient and economical. It would, however, take a long time to procure efficient labour in this country. First and foremost, because of the presence of the Kaffir, who should be entirely eliminated from the working classes on the mines if white labour is to succeed. The Kaffir labour demoralises, above all things, the white man and impairs his efficiency. It is doubtful whether if Kaffirs be retained at all, a really efficient class of white labour could be built up. Again, great opposition is offered to the introduction of cheap white labour on the part of the skilled white labourers of the Rand, who think they see a menace to their own position, and not without reason. They themselves are inefficient as compared with the skilled labourers of other countries, and the introduction of a large number of white men anxious to better themselves, would unquestionably mean that the skilled labour on the Rand to-day would have to become more efficient in order to maintain its position. The various trades are, therefore, unanimous in their effort to prevent any reduction in the pay to white men or the introduction of white men to take the place of Kaffirs. Their attempts so far have not been altogether futile, as they have, to my knowledge, prevented numbers of men from accepting the 5s. rate. Another drawback is the

time it would take to build up this class of efficient white labour. At the present moment such labour must be termed very inefficient; indeed, so far, a white man cannot take the place of two Kaffirs. He is in many instances not equal to one Kaffir. With board at £6 per month the rate of pay figures out at 9s. 7d. a day, assuming the month to consist of 26 days. Add to this a charge of 10s. a month for a room, or, say, 4½d. a day, and the total rate is brought up to, say, 10s. per day. The cost of the Kaffir is at the present time about 1s. 7d. a day, including food and lodging. If it be conceded that in order to induce the native to come to work an increase in pay be necessary, and if we assume the rate for sake of comparison at 2s. 2d. per day, then the white man's pay is at least 4½ times as great as that of the Kaffir. In order, therefore, to make the white man as efficient as the Kaffir he must do 4½ times the work. This is hardly conceivable under any circumstances, or at all events not until a long period of training shall have elapsed. I think, too, that 10s. per day would not be sufficient to induce white labourers to come to this country in large numbers. The pay in the Western States of America is 2, 2½, and 3 dollars a day, but living there is vastly cheaper than it is here. Until, therefore, the conditions are so altered as to make living here very much cheaper than it is now, the white labourer in this country would be at a great disadvantage as compared with his confrere in the States. Again, 10s. is wholly insufficient for the support of a married man, and the would-be labourer at 10s. a day would either be a single man or would have to leave his family at home.

At the "D" and "A" Joint Mill 20 white men are required to do the work that was formerly done by 32 Kaffirs. In other words the expenditure on account of this labour is four times as great as it was when Kaffirs alone were employed. While 20 men are sufficient to do the work, we have on our books the names of 51 white men who have been employed in the mill since the 17th June, showing that the majority of the men have not stuck to the job.

At the "D" and "A" Crusher Station 17 white men are doing the work of 34 Kaffirs, or, in other words, the cost of labour is 3.16 times greater than it was when Kaffirs alone were employed.

At the Comet Crusher 11 white men are doing the work of 22 natives, or, one white man is doing the work of two natives, and the increase in the cost of white labour is the same as in the previous case.

In the Comet Mill 10 white men are doing the work of 14 Kaffirs, or one white man is equal to 1.4 Kaffirs, which shows that there the cost of labour is 4.51 times greater than it was when natives were employed.

At the Driefontein South Incline Shaft, 7 white men are doing the work of 12 Kaffirs, or one white man the work of 1.7 Kaffirs. The cost of labour there is 3.68 times greater than it was before.

At the Angelo No. 1 North Shaft 7 whites are employed to do the work of 11 Kaffirs, or 1 white is good for 1.6 Kaffirs, the cost of labour, therefore, being four times greater.

It will be seen, therefore, that if the work that is at present done by Kaffirs were to be done entirely by white men, the cost of the same would be three or four times as great. As native labour constituted before the war about 25 per cent. of the total costs, the employment of cheap white labour to replace the Kaffir would mean an increase in costs of 50 to 75 per cent.

B. Elsewhere.—I have no information with regard to unskilled white labour elsewhere than South Africa. The white labour employed in the mines of the Western States can hardly be termed unskilled, because, as a matter of fact, there is very little unskilled labour about a mine. Apart from tramping, shovelling, &c., some knowledge is required which can only be acquired after a certain amount of practice, but in the sense that all work

on the mines there is done by white labour I can say of my own knowledge that that white labour is very efficient. The question of cheap supplies enters so largely into the total costs that it is impossible without full details to state just what labour costs there per ton milled, but in the Utica Mill, in Calevaras County, California, where mining is carried on under the most difficult circumstances, that is, where every bit of open ground has to be timbered with heavy sticks, where pumping continues night and day from every opening, the costs, I am told, do not exceed 9s. a ton. I do consider that unskilled white labour can be secured in this country, and probably to advantage, provided the mines are willing to go through a period of high costs, which might extend over five or six years, during which time the labour would be in course of training for the work it is required to do. I only mean to say that such labour could be used advantageously after the period of training and building up of such a class of labourers was over, but I do not think that the mines can afford to wait that length of time, or to incur the increased costs during that time. I think, too, that in order to make a success of such an undertaking, it would be necessary to absolutely eliminate the black as a worker on the mines. I hardly know of anything that is now done by Kaffirs which could not be done by whites, but I firmly believe that as long as black labour is available in any form the white worker will not reach a state of great efficiency. Taking everything into consideration, therefore, I do not think that white labour could be imported with advantage to the mines. The sources from which such white labour could be drawn would, of course, be the overcrowded labour markets of Europe. No white man would come here from the Colonies or from America to work for ten shillings a day.

I think the first thing to do is to make a determined effort to get back the native in such numbers as may be possible, and, if it be found that sufficient natives are not available for the purposes of the industry, that then steps be taken to introduce the Chinamen under such laws and regulations as would safeguard the interests of the community, which he would otherwise menace.

I have the honour to be, dear sir,  
Yours faithfully,  
(Signed) FRED. HELLMANN.

Johannesburg.

Dear Sirs,

#### RE "WHITE UNSKILLED LABOUR."

In January, 1902, the great scarcity of Native Labour, and the Botha Mine being then unwatered, preparatory to a general resumption of extending the developing faces, I communicated with the burghers, who at that date were located in large numbers at the Burgher Refugee Camp in this district. These men were engaged as machine helpers, shovellers, trammers, etc., in fact, taking the place of natives who were employed at this work prior to the outbreak of hostilities in 1899.

The burghers showed a fair adaptability to mine work, in fact, greater than could reasonably have been anticipated from an agricultural community such as these men were drawn from.

With each power drill two white unskilled labourers were employed, or the same number as native helpers, these men being responsible to the rock-drill miner. The cost, in labour, in connection with running power drills with white unskilled labour as compared with native is 7s. 6d. per shift

as against 2s. 6d. for the Kaffir, or, say, an increase of 200 per cent. on this item.

We found that the same number of white helpers were required per drill as native helpers, viz., two to each drill operating, and our experience showed that it is impossible at present, without causing serious discontent, to place a greater number than two power drills to each certificated rock-drill miner or less than two helpers per drill.

**Tramming from Developing Faces.**—In removing the debris from the drives two burghers equal three natives, as more intelligence combined with superior strength is shown by them; these factors show a superiority over the native by 50 per cent. of work accomplished in this class of labour, but at an increased cost of wages of 100 per cent.

**Stope Shovelling.**—In shovelling to the boxes two unskilled whites have accomplished about the same amount of work per shift as would be done by three natives; the relative cost being 15s. as against 6s. 3d. for natives, or an increase of 140 per cent. on the actual cost of handling the broken rock.

**Hand Drilling in Stopes.**—This has not been introduced, as barely sufficient white unskilled labourers have been obtained to carry on work with the power drills. Everything points, however, to the fact that it would, even if labourers were available, be utterly impracticable through the greatly increased cost of labour, in breaking the reef to introduce such labour, as I am firmly convinced that the ordinary white labourers would accomplish but a very small footage per shift in excess of that obtained from the Kaffir. The increased cost to enable the white labourer to obtain a living wage would be 300 per cent. higher or not less than 2s. per foot drilled, could, in my opinion, be expected from them.

**General.**—In taking the experience gained in employing white unskilled labourers on this mine during a period of 18 months, the increased cost would, in placing them on the work mentioned above, be prohibitive, and my persistence in employing them has only been justified in pushing the development forward, whilst we had to contend against the enormous quantity of water met with in the Botha Mine. The working in small stopes by hand drilling with this class of labour where power drills cannot be employed, is altogether, in my opinion, impracticable through the increased cost of labour.

In conclusion I would say that the burghers employed in carrying on the said operations have given, after a short experience of the work, great satisfaction by their adaptability to the work required from them, and would compare with any similar class of unskilled white labour that I have seen at work in other countries.

Yours faithfully,  
(Sgd.)

General Manager.

The Central Geduld G.M.Co., Ltd.,  
P.O. Box 41, Springs,  
10th August, 1903.

M. Francke, Esq.,  
P.O. Box 1961,  
Johannesburg.

Dear Sir,

#### UNSKILLED WHITE LABOUR.

In reply to your letter of the 5th instant, requesting me to send you some data in connection with the work done by unskilled white labour lately here, I beg to state as follows:—

From the 15th of November, 1902, to April the 30th, 1903, I have employed here an average of 45 men, the largest number being 61 employed during February. The work done was in commencing three new fire-compartment shafts,

30 feet 2 inches by 8 feet 10 inches over timbers and sinking them to a depth not exceeding 110 feet.

The standard wage paid was ten shillings (10s.) per shift of 9½ hours, and tents were provided by the company.

They applied for employment on the property, and throughout the time I had no difficulty in maintaining the supply required, such as it was.

Ten shillings per shift is the usual rate paid in this district for this class of labour. They were of various nationalities, but principally Dutch and British.

I early discovered that the best results were obtained from the Dutch, the Britishers, as a rule, being of the unsettled class, who worked for a few days only, or, if a better type, only remained until he could better himself.

The Dutch were a hardy lot and turned out steady as long as they lasted; when broken in, I consider they did as much work as any white labourer would do on these mines.

Near the surface, where the work was principally "pick and shovel work" and soft ground, the most satisfactory comparisons were made to native labour, but below 40 feet, where the ground became harder and a little water was encountered, they then commenced leaving one or two at a time; in this way there was an average of 20 per cent. in vacancies to make up each month, which was a disadvantage, as almost all new arrivals had to be trained to drilling and many to pick and shovel work, which took from a week to a fortnight before his hands were hard and he became used to the work.

Throughout the period they were employed, all the hand drilling done in the shafts was double-handed, this being more economical than to accustom them to single-handed work, and in the "diabase" the average work rarely exceeded one hole, 2 feet 6 inches deep, per man.

In February last the best results were obtained; 40½ men sank 55 feet, their labour costing £7 8s. 2d. per foot, the ground sunk through being easy ground with only three thousand (3,000) gallons per 24 hours in the shaft.

The following month, in the same shaft, 34½ men sank 30 feet, costing £34 16s. 0d. per foot, the ground sunk through being diabase, the depth from 80 feet to 110 feet, and water not exceeding four thousand (4,000) gallons per 24 hours. The men worked in two shifts of 9½ hours each.

Where maximum speed is required in shaft sinking, double-hand drilling is a great disadvantage with unskilled labour, as so much more space is taken up and unduly limits the number of holes being drilled in the bottom simultaneously. Also for speedy work unskilled labour cannot be relied upon, as, whenever they are pushed by the foreman, especially in a wet shaft, or when difficulties are encountered, they are liable to leave at a moment's notice and when it is perhaps impossible to replace them.

In my case only in one shaft was there a little water, yet they were always coming and going here.

In conclusion, from my own experiences and those of my foremen in charge of the labourers, I can state that in pick and shovel work, and in soft ground, a white labourer's maximum work is equal to that of two (2) natives, but as soon as ordinary sinking or mining conditions occur they are not more than equal to the work of one Kaffir, who would be more reliable and under better control, and I would certainly prefer the Kaffir.

The difference in cost is three shillings per shift (3s.) for the native as against ten shillings (10s.) per shift for the white labourer.

The native cost being made up of two shillings (2s.) per shift wages and one shilling (1s.) per shift in feeding, recruiting and passes. The net saving

thus being seven shillings (7s.) per day in favour of the native.

I remain, yours faithfully,  
(Signed) N. B. WHITE,  
General Manager.

Engineering Department,  
H. Eckstein & Co.,  
P.O. Box 149,  
Tel. Address: "Eckstein."  
Johannesburg, South Africa,  
21st August, 1903.

The Secretary,  
Sub-Committee,  
Consulting Engineers.

Dear Sir,

*Re* THE EMPLOYMENT OF WHITE  
UNSKILLED LABOURERS ON THE  
CROWN REEF.

From June 1st, 1902, to June 30th, 1903, a total of 1,382 individual white labourers were employed on the Crown Reef. The average number employed per month was 168; an examination of the time-book shows that these men did not turn up with great regularity; and on the average each man worked about 40 shifts.

The men were chiefly employed underground, and the lads were employed on the sorting table. A large amount of re-timbering of caved levels was undertaken during this period, and the labourers were largely used on this work, where their keener appreciation of the danger attendant on the work made them less likely to get hurt than the ignorant Kaffir.

A total amount of £14,097 15s. was paid these men as wages, and an amount of £9,521 11s. 1d. was paid for food, making a total of £23,619 6s. 1d., or an average of 8-45 per shift.

The Manager estimates that an equal number of Kaffirs would have performed the work, and that the amount they would have cost for wages, food, compound expenses, etc., would have been £6,500. Thus these white labourers cost the company in wages and food £17,100 more than it would, had the work been done by Kaffirs. In addition, these men had to be housed, which cost for each room containing two men £47 8s. 0d.

The experiment of using white labourers on this mine has been costly and unsatisfactory. Not only has the company paid £17,100 more for the work done than it would have done had the labour been carried out by Kaffirs, but the men employed have not been permanently benefited. They looked upon this work as a makeshift to tide them over a tight place, and in but few instances put any zeal into it.

I beg to remain,  
Yours truly,  
(Signed) SIDNEY J. JENNINGS.

NATIVE LABOUR REQUIREMENTS FOR  
THE COAL INDUSTRY OF THE  
TRANSVAAL.

To arrive at an approximate estimate of the above requirements it is necessary to formulate some idea of the present and future coal consumption, not only on the Witwatersrand Gold Fields, but also on the railways in the Transvaal and neighbouring Colonies and also the requirements of the various engineering and brick works, householders, etc.

During July, 1903, 219,690 tons of coal were produced by the various coal mines in the Transvaal Colony.

To produce this coal, some 9,000 natives were employed. The actual number employed on the 20th August, 1903, by collieries (members of the Witwatersrand Native Labour Association) was 8,237, but there are several other collieries who are not members of the Association, so that the estimate of 9,000 natives for July is not excessive.

From these figures it will be seen that each native employed by the collieries produced 24·41 tons of coal per month.

Gold Mines.—The amount of coal consumed per stamp may be estimated at 18 tons.

In addition to this quantity the coal consumed by the developing mines must be taken into consideration. This amount may be estimated at one-third of the quantity consumed by milling mines.

In August, 1899, there were 6,320 stamps at work in the Transvaal.

The quantity of coal consumed by the gold mines of the Transvaal when the pre-war output is reached will therefore be—

Milling mines	-	112,500 tons per month.
Developing mines	-	37,500 tons per month.

150,000 tons per month.

Railways, etc.—The amount of Transvaal coal consumed by the various railways in the Transvaal and the neighbouring Colonies on the above basis may be estimated at 60,000 tons per month, while engineering and other works, householders, etc., will probably consume a further 60,000 tons per month.

The total quantity of coal produced in the Transvaal when the gold mines are in the same position as in August, 1899, may, therefore, be estimated at—

Mines	-	-	-	150,000
Railways	-	-	-	60,000
Other consumers	-	-	-	60,000
				<u>270,000</u>

Now at present one native produces 24·41 tons of coal per month; therefore, to produce 270,000 tons, 11,060 natives would be required.

Within three years it is estimated that at least 10,000 stamps will be at work; this will lead to more traffic on the railway—a larger population, more engineering, brick and other works, and consequently a proportionate increase in the consumption of coal.

The coal requirements of the Transvaal may therefore, three years hence, be estimated at 432,000 tons monthly.

Exportation of Coal.—The question of exporting coal to the neighbouring Colonies and over-sea must not be lost sight of.

In view of the new harbour works now being constructed at Lourenco Marques and the probability of a reduction in the down rates for coal, both over the C.G.R. and the C.S.A.R. lines, it seems fairly certain that the export trade will rapidly increase.

Only a very approximate estimate can be given, but it appears more than probable that within three years to come 60,000 tons of coal will be exported from the Transvaal monthly.

Thus within three years it may be estimated that some 492,000 tons of coal will be produced monthly in the Transvaal, for which 20,150 natives will be required.

It has been suggested that labour-saving appliances for the getting of coal will be introduced, and the number of natives employed at this work will be considerably reduced. These appliances will, however, only be used when, by doing so, a reduction in the cost of production can be attained.

From various calculations and experiments made, it is absolutely certain that no coal cutting or coal drilling plant will obtain this result.

In conclusion, it may be mentioned that there are known to be large deposits of various base metals in this Colony, which will undoubtedly be exploited at no very distant date, and, further, large quantities of coal and coke will be required for reduction and mining purposes.

It is impossible to give any estimate as to what the coal requirements under this head will be, but they will certainly be very large.

(Signed) EDWARD HOPPER,

9,446. The CHAIRMAN: Then each of these committee's report, I think, make reference to further annexures, which I need not go over in detail?—These are also attached.

9,447. Do you hand these in as your evidence-in-chief?—I hand them in as the statement of the Transvaal Chamber of Mines, and as my evidence. Of course, with regard to Annexures A, B, C, D, E, the different members of the Sub-Committees and engineers who prepared these statements will be ready to give evidence in more detail with regard to them if considered necessary.

9,448. More detail than you can probably give us?—Yes, there are technical matters and engineering questions involved. Witnesses will be forthcoming to deal with these.

9,449. I notice with regard to the report on the supply of Native Labour that you are Chairman of that Sub-Committee?—Yes, before going further I should like to make a few corrections in the statement of the Transvaal Chamber of Mines. This statement was prepared hurriedly, and when complete figures had not been received from certain of the Governments consulted. There is a slight variation in some of these figures, and I will hand in a corrected copy.

9,450. It might be convenient before anything further is done, if you intimated to us what the corrections are now?—(The witness made certain corrections in the figures originally printed.)

9,451. In preparing this statement the Chamber of Mines appears to have divided the work over certain sub-committees?—Yes.

9,452. The members of these sub-committees were not confined to members of the Executive Committee of the Chamber of Mines, I understand?—No, a large central committee was formed consisting of 30 members, and the assistance of competent persons outside the Executive Committee was called in.

9,453. You have not confined your inquiry to the requirements of the various industries of the Transvaal, but you apparently made inquiries practically all over South Africa?—We have endeavoured to deal with the whole Native Labour Question within the territories falling within the scope of this Commission. The ground covered is set out in detail in the Annexure "A" with accompanying map.

9,454. In referring to annexures, would you, as far as possible, mention what they are?—I give the lettering exactly as stated in the report. They are there marked as A, B, C, D, E.

9,455. I see, yes, that will do. What about Annexure "A"?—It covers territories falling within the scope of this Commission's inquiry, although within all those territories the Chamber of Mines has not got the right to recruit. The recruiting ground is also specified.

9,456. Then you state your information from these different territories is incomplete?—Well, in some cases we did not receive replies at all, but in other cases we have had to take the best information obtainable in the absence of precise data, which are not kept. We had to get the most reliable information we could. We have been very careful, and we can only give the result of our inquiry. We give the authority for the statements we make in each case.

9,457. You think the information you have as to numbers is reliable?—We think it is reliable; and we think further, that in making a computation of the numbers, the Chamber of Mines, if it has erred at all, has erred on the side of liberality. For instance, I would refer you to the figure 1,815,180, on page 2 of Annexure "A," dealing with Portuguese East Africa. We have since received information which puts that figure at 1,637,500.

9,458. You are referring to Annexure "A," page 2?—Yes, you will see it is computed 1,815,180 is the figure for Portuguese East Africa, for the southern provinces, and 1,815,180 for the northern

provinces; the two provinces are separate. The Governor-General of Mozambique puts that figure at 1,637,500, a difference of very nearly 200,000. I mention that figure to show that if we have made any error at all, we have preferred to over-state the number available rather than to under-state it.

9,459. Then, with regard to the supply of native labour available referred to on page 2 of your general statement, you have submitted a map, I think, showing the various territories in Central and Southern Africa covered by our inquiry?—Yes.

9,460. You have coloured that in different colours indicating the ground open to recruiting, the ground where recruiting is prohibited, the countries where recruiting is useless, countries where you are limited to 1,000 from each, and so on. Have you that before you?—Yes.

9,461. Then you go on to say that the net population, or rather the population in the countries in which you are recruiting is 4,672,231?—Yes.

9,462. And you say this includes able-bodied males between the ages of 15 and 40 suitable for work, and who would leave their districts at any given time; a total of 233,611?—Yes.

9,463. You add to that 2,000 which you are permitted to recruit from territories not open to recruiting, except for this special number, from German South-West Africa and British Central Africa, and make up a grand total which may be recruited of 235,611?—Yes.

9,464. Now, how do you arrive at the number available for work between the ages of 15 and 40 from these various countries?—We have taken the statement made by Sir Godfrey Lagden, which in our opinion has been to a certain extent confirmed by experience, and by other evidence to the effect that 10 per cent. of the total population would be available for work outside of their districts, and we have halved that, allowing that the natives come out to work, on an average, six months of the year. In some cases the period of labour outside their own districts is of course longer, and in other cases it is less. In Basutoland, for instance, there is a tendency to enter only into a three months' contract outside their own territory, and we have taken the general average on the basis of what Sir Godfrey Lagden stated and halved that total number of 467,223, which arrives at the figure of 233,611 as available at any given time.

9,465. You know South Africa pretty well yourself. Do not you think it is a small percentage of natives who will turn out to work; a total of 10 per cent.? Who would go away out of their districts?—I do not think so.

9,466. You think not?—No.

9,467. I suppose these figures depend very much on the length of time for which the natives work out of their districts?—Yes.

9,468. I suppose you are aware that the natives of Portuguese East Africa work for at least one year?—Yes, probably longer.

9,469. Do not you think that the fact that such a large number come from that district would throw your calculations out?—I do not think so. We have dealt not only with the South African natives but with the entire labour supply. We have calculated that a considerable number work in industries outside of the mining industries. The difficulty is in finding an exact figure. For instance, the Basuto natives reduce the East Coast average, so would the Transvaal natives, those who go out for short periods, and so on.

9,470. Would you refer now to the figures given at the bottom of page 2. You make certain deductions. In Item 4, Public Works, there is a total of 71,935. Then you proceed to deduct from that number the employees of the Government Railways, Johannesburg, Light and Power Department, etc., and deduct 22,477. Can you give us some explanation of the principle followed in making these deductions?—We have deducted these figures

because they are already included in Sir Godfrey Lagden's total given above. We deal first of all with the entire ground covered by this Commission's inquiry, and then we limit ourselves after that to the territories inside which we are allowed to recruit, so as to arrive at the labour supply available for our industries. The Johannesburg Scavenging Department is also excluded because the figure given by Sir Godfrey Lagden of 142,110 already allows for the number employed in the mining district with which we are dealing.

9,471. That is why you make these deductions?—Yes.

9,472. Well, then, of this grand total of 235,611 as being available for work from these territories, you proceed to show where they are absorbed, and make another total of 198,573, leaving a balance to be accounted for of 37,038. These you think are employed in other services outside these labour districts, and on the Public Works Department?—A certain number, we should not say all, but we think they are fairly accounted for. For instance, we excluded the Public Works Department of Pretoria and the Cape Colony, because, although we have asked for information from these departments, we have not received any reply. Then there are the number employed in domestic service outside the Transvaal mining area and so on, in respect to which we have not been able to get any definite information.

9,473. But, estimating your 10 per cent. figures as the number likely to turn out to be correct, you seem to arrive at the conclusion that there will still be a reserve of 10,000 to 20,000 natives?—Yes, that reserve may be varied to a greater or less degree as our figures may be incorrect, strictly incorrect as regards the average period during which the labour is given, but we do not think the variation would be very material.

9,474. You do not think that there may yet be a considerable number of natives likely to go out to work who have not yet regained that confidence in the conditions of the country, or of Johannesburg as to wages, and so on, which obtained before the war?—Well, I consider that the conditions obtaining here now are well known. Information spreads amongst natives perhaps more rapidly than one thinks, and my own opinion is that the natives are pretty well informed as to the conditions now obtaining both here and generally.

9,475. Certain witnesses have told us, referring especially to this question of the increased rate of pay now distributed, that only when a certain number of natives have returned to their own districts with the money actually in their hands, will the native not be very slow to believe that any change has come about?—Yes, but the benefit to us I do not think will be very considerable. I will give you as a set-off to that the case of Basutoland. It is perfectly well known throughout the whole of Basutoland that we are paying these increased rates, and have been paying them for a long time, and also that our methods of treatment of the natives have considerably improved, and yet, although this knowledge has been with them for quite a long time there has been no increase from Basutoland. On the contrary we get less labour.

9,476. You mean by that that the labour requirements of other parts of the country have absorbed them?—Yes, I mean that the labour requirements have increased beyond the pace at which the supply can meet them.

9,477. You refer to the territories of the Nyassaland and Zambesia Companies as well as the British Central Africa Protectorate, and state that the population of these territories is about 2,715,180 to-day?—Yes, with the figures we have now obtained the population would be less by about 400,000.

9,478. Well, now, do not you think we may look forward in the course of a year or two to a very large increase in the supply from these territories?

—We may, but it will take a very long time to develop that fully. It will take years.

9,479. Why?—Well, because we shall have to start an organisation, and commence recruiting in an entirely new field, and our own experience in Portuguese East Africa shows the length of time it has taken to work up to a certain point in those territories. We put the period at not less than from five to seven years to fully develop it.

9,480. Coming to the question of the demand, the requirements of the various industries, you put those down at a very high figure. Your returns go to show that 197,667 natives are employed outside their own districts?—Yes.

9,481. And you estimate the number required to day at 350,714?—Yes.

9,482. And that five years hence, dealing with the same industries still, there will be required 650,574 natives?—Yes, five years hence—the figure is, I may say, an estimate. The number now required is derived from precise figures given to us in a series of replies received from the various employers consulted, and which replies would be found in the Annexure "C" and in the reports. If you look at Annexure "C," with its annexures, and if you look at the engineers' statement "D," with its annexures 9, 10, 11, and 12, you will see exactly where we get these figures giving the total of 350,714. We asked each body or employer, and they told us that at that moment they could employ these numbers if they were forthcoming.

9,483. Then do you remember whether from any of these districts or industries any appreciable number of them indicated that they have sufficient for their present requirements?—We have received hardly any information showing that these employers have their full requirements. There was always a considerable percentage of shortage, a shortage in some cases running as high as 65 per cent.

9,484. In any special district?—No, generally. Our enquiries go to show that there is a considerable shortage all round.

9,485. That shortage is expressed in figures?—Yes, the difference between the totals employed and required.

9,486. Namely, 115,103?—Yes.

9,487. That is the shortage to-day in the British Colonies of South Africa?—Yes.

9,488. I take it that the witnesses to follow you will deal with the requirements and shortage more fully, of the mining industry?—Well, the Engineers, for instance, can substantiate the figures given in their statement and prove those figures. They have taken a tally of all the mines, etc., with which they are concerned, and they arrived at that total.

9,489. Dealing with the estimated requirements five years hence, do you think that the natural increase of population will in some measure supply that?—No, the population of the country is far too thin. We put the natural increase of population at 2 per cent. Even with three or four or 5 per cent. it could not, in my opinion, keep pace with the requirements of a large and rapidly developing country like this.

9,490. You mean, in short, that the requirements of the labour, the demand, would increase very much faster than the natural increase of the population?—Certainly. The pace at which new industries spring up in a country like this is extraordinary. It is a matter of common experience, you see it going on every day around you. You can take, for example, the number of natives employed around Johannesburg within the last twelve months and have an illustration there.

9,491. Certain witnesses have expressed the opinion to us that unskilled white labour might be substituted for native labour. There is a general impression abroad, I think, in some sections of the community that white labour might be used to a very much greater extent for unskilled work than it

is used at the present?—Do you mean on the mines?

9,492. Yes; I understand that a number of mines have experimented, and in some of the annexures the experience of mine managers is given?—The experiments extend over a long period. One commenced as far back as the sinking of the Crown Deep Shaft. The idea of using unskilled white labour is no new one; it has been constantly and repeatedly tried and has always failed.

9,493. You mean to say, it has been tried before the war?—Yes.

9,494. In your statement you give us an estimate of what the result would be as far as profits are concerned, on 79 crushing mines if unskilled white labour were substituted entirely for black labour?—Yes, at those prices.

9,495. You estimate the wage at 12s. per day?—Yes.

9,496. And you give at the top of page 6 a summary of what the result would be—I think you estimate a wage of 12s. per day and a duty from the white labour of double the duty given by the black?—Yes.

9,497. Would you summarise the effect of that?—It is summarised there; only one group of companies of the 79 could pay a reasonable profit.

9,498. And the remaining 67?—Of them, 48 would be running at a dead loss, of the others the dividends paid would be 1s. 1d. per ton crushed, which I consider a percentage wholly insufficient. No one would invest in a company paying that dividend.

9,499. Then you are evidently of opinion that the assumption that the white unskilled labour can do double the work of the black is incorrect?—Under certain conditions he does the same work, and under special conditions there may be an increase up to 50 per cent. The ratio may be 1 to 1.3 to 1 to 1.45, and then, I think, you stop.

9,500. Then, do you think, remembering the cost of living here that your other assumption of 12s. a day is a living wage to a man in this country?—Well, it only leaves a margin with which most white men to-day are not satisfied.

9,501. But, assuming the married state, would it leave a margin?—No, I do not think so. Of course, the question of margin depends on two things, first, what a man can live on, and secondly, what surplus, after paying his way, he is satisfied with, whether he is content to work at no margin at all or a very small margin. Our experience is that they are not contented with no margin. They want a good margin, and that margin is, of course, larger in the case of a single than in that of a married man.

9,502. But within your experience, do you think a married man can make a margin on 12s. a day?—It would have to be a very small margin; I doubt if there would be any. Probably a loss.

9,503. A sub-committee of which you were chairman deals with the question of the loss resulting from the hanging up of so many stamps?—Yes.

9,504. Your statement shows the number of stamps actually at work in July as being 3,725?—Yes.

9,505. You also show the number erected as being 7,145?—Yes, a difference of 3,420.

9,506. Do you wish to amplify the figures given here?—With regard to loss in a typical case of a company, that shows a loss of £122,873 through the stoppage of crushing. The full figures are given in annexure A on pages 9 and 10. There the whole calculation is given showing how that result is arrived at.

9,507. Is that a typical case of a company with a mill of 100 stamps?—That is the case of one company selected for the purpose. The loss would be reduced if another company of a lower grade were selected, but not materially. The loss shown is that of a particular mine, but it is quite a good example.

E 30718.

9,508. That is an example of a mine with 100 stamps?—At the present time hung up and which cannot crush for want of labour.

9,509. But does not your typical case refer to a mill which is crushing now with 60 stamps, but which might reasonably crush more?—It would crush with full capacity if it had labour.

9,510. Then you go on to give some figures as to what amount of money might be paid in salaries and wages to white men if the whole of these 7,145 stamps were crushing?—Yes.

9,511. What is the figure, then, Mr. Do Jongh?—£1,985,463 would be paid in wages and salaries to white men, and £2,191,536 to the mercantile community in the form of trade accounts.

9,512. Practically four millions of money might be circulated locally?—If they would work these extra stamps, which are now hung up idle—over four millions.

9,513. Mr. QUINN: The President of the Chamber of Mines is a member of this Commission?—Sir George Farrar? Yes.

9,514. He is away?—Yes.

9,515. Is the Vice-President here?—One of the Vice-Presidents is here.

9,516. Mr. Langerman?—Yes.

9,517. Are you a Vice-President?—No, I am member of the Executive Committee.

9,518. Can you tell us why the Vice-President did not come and give evidence?—I do not know. I was asked by the Executive to come here, and that is why I am here.

9,519. I have no doubt you will do as well, if not better?—It is not for me to say why I am here.

9,520. I was anxious to know, that's all?—Mr. Langerman has quite recently become a vice-president, but he is fully competent, notwithstanding.

9,521. Still, he is a full-fledged vice-president?—Yes, all vice-presidents are equal.

9,522. Would you mind turning to that paper marked "A"—your own particular report, I think it is?—Yes.

9,523. On page 2, under the heading of South Africa, you give us figures showing the populations and sources from which you get your information?—Yes.

9,524. 6,326,511. I will make allowance for that 200,000. Then the next column of figures is Central Africa. There is another set of figures with the sources from which they get them, perhaps not so reliable as the others, but I suppose the best obtainable. You give there a total of 7,271,180, or a total for South Africa of 13½ millions in round figures?—Yes.

9,525. Well, now, suppose we accept the modification from Portuguese East Africa, the Southern Provinces, and apply the same modification to the Northern Provinces, taking the figures you have supplied us as correct, that would give us something over 13 millions, would it not?—Yes, about 13 millions.

9,526. Now, will you please turn to the next page, page 3. At the top of the column in the middle of the page you wipe out Natal, 791,010. In the same column you wipe out also Rhodesia, 1,100,000?—Yes.

9,527. And you also wiped out Portuguese East Africa—the Northern Provinces?—Yes.

9,528. So then, from the thirteen millions you take away nearly nine millions?—Yes, nearly nine millions.

9,529. Just for the sake of argument, suppose you could recruit in these places, and were able eventually to get the same proportion as from the other parts, that is one in ten that would give you, instead of the figure you have given us of 400,000, a figure of more than twice as many?—Yes.

E c

9,530. Allowing for that big reduction of 400,000, and taking the whole of these districts as being available for your recruiters, supposing you could recruit, you could get nearly a million natives on your own basis?—There would be available twice the number, twice 467,000 odd.

9,531. Rather more than that, would it not be?—Yes.

9,532. Because out of your thirteen millions you take away nearly nine?—Yes.

9,533. So that there would be more than double?—There would probably be on these assumptions. Double that number available than we have dealt with.

9,534. More than double?—Yes, but one moment, please, before we leave that statement. That is all based on certain assumptions; but there are other conditions which are still to be proved. For instance, we have still to learn that the natives from all these territories are equally suitable as labourers to those which we have got from Southern Portuguese territories. Our information goes to prove the contrary. That is one factor which has to be taken into account. Another is the question of time. We may do a great deal in the next five years' time, or ten years' time, but in the meantime we cannot live. We are killed. What we want is not a remedy in seven years' time, or ten years' time, but a remedy now.

9,535. Oh, we know what you want.—Not within the next two years, or probably within our lifetime. We put a limit to it.

9,536. There are lots of other industries, I suppose, that cannot get what they want in the way of cheap labour, and have to put up with the best they can get?—Yes, but our position is that we want to go on trying to do the best possible, and within a certain reasonable limit of time it must be done.

9,537. Take Portuguese East Africa, the northern half. You said in reply to a question a little while ago, that you hope in the course of time we may get some fairly considerable number from there?—We shall get a fairly considerable number probably.

9,538. You quote in your statement Mr. Mello Breyner as an authority, with respect to certain districts at all events?—We have taken his statements, and we have since had them verified by the figures of the Portuguese Governor-General, which show that Mr. Breyner has overstated the numbers.

9,539. Did the agent who sent you the information state the sources from which he got it?—Yes.

9,540. What were they?—The sources were in the Governor-General's department at Mozambique.

9,541. What were the sources—did he give you the information?—That we cannot say. We do not know where the Governor-General got his information from, but we take it they are official authority of the highest kind.

9,542. Then his figures may be as valuable as Mr. Mello Breyner's?—I should say his figures were better, more reliable, probably more accurate than Mr. Breyner's.

9,543. Why?—Because of his position.

9,544. How long has he been in that office?—I cannot tell. He is merely a successor in office. The position has existed a long time, but the person who occupies it at a particular moment varies from time to time.

9,545. Mr. Mello Breyner, in reply to a question put to him in giving his evidence, stated that he thought he would probably be able to get at least 60,000 natives from these northern provinces within the next five years?—Five to seven years. I think we have taken Mr. Breyner's statement on that point to be fair as concerns time. Our own opinion is it will take probably longer, but we would sooner understate than overstate the case.

9,546. Mr. Breyner says that in a few years labour can be got there; 60,000 natives can be got there in about five or six years?—And we have taken his figures; but even five or six years we are not pre-

pared to wait. It is impossible for the industry to wait for even five or six years without labour supply.

9,547. Why cannot it?—Well, at our present rate of loss it will be ruinous.

9,548. But we do not accept these figures. I suppose you apply the same remarks to all these other territories which are excluded—Natal, Rhodesia, German South-West Africa, British Central Africa, and Uganda, and you put them all together, so that out of the number given, the possible existing supply that can be obtained—thirteen millions, roughly—you wipe out nine?—Yes, we deal only with fields where we can recruit now.

9,549. And you recruit in Portuguese East Africa?—The Southern Provinces.

9,550. And the Northern Provinces?—No.

9,551. Do you expect permission to recruit there shortly?—Yes, we expect permission to recruit there in certain of the territories.

9,552. That is almost assured, is it not?—Yes.

9,553. And yet you leave it out of all consideration?—Yes, we leave it out of consideration.

9,554. Do you expect permission to recruit in Rhodesia?—We may get permission there.

9,555. And you leave that out of consideration?—Yes.

9,556. Do you hope at some future date to get permission to recruit in Natal?—It is very doubtful.

9,557. But it is possible?—Possible.

9,558. But you wipe that out, too?—At the present time. It has not materialised yet.

9,559. British Central Africa you give us as 900,000. You wipe that out also?—Yes.

9,560. Are there any other places, any other possible recruiting grounds in Africa which you have considered, and not even thought it worth while to include in your statement—British Somaliland, for instance?—Oh, for that matter, there is the whole of Africa. The map shows the whole of Africa is open, but it is not open to us. We cannot get there. We have tried in all directions and failed. We have tried for many years.

9,561. I will give you an instance where someone else tried to get them for you, and you refused to take them. You seem well acquainted with the evidence given before the Commission so far?—Not very well. I have seen the reports in the newspapers.

9,562. And most unreliable they are.—Some of it we have quoted. For instance, we have quoted Sir Godfrey Lagden's evidence, which is official evidence. We have quoted from that.

9,563. Did an instance come under your notice either through this evidence given here or as a member of the Executive of the Chamber of Mines, where Mr. Hugo Brentano offered 20,000 natives from British Somaliland?—Yes.

9,564. You do not quote that here?—No.

9,565. And you refused to consider that offer, until Mr. Brentano put down a much bigger guarantee than he could do?—No, we did not refuse to consider the offer. On the contrary we went into that very carefully, and we satisfied ourselves that there was nothing in it, or very little indeed. So far as offers are concerned, we have had enough offers to supply the whole labour wants of the industry ten times over, but these offers have ended in smoke. One instance to illustrate what I mean. You had evidence given here not long ago by Mr. Liefeldt, who made certain statements that there was a quantity of labour in the Transkeian territories. The matter has since been investigated, and it is found that there is a certain quantity of labour there, but only at £4 and upon certain terms, which are entirely unacceptable. Our terms are limited, we cannot go beyond a certain point, and yet work profitably.

9,566. Would you mind turning to this document marked "C"—the third page. You are dealing with the question of railways particularly, and you say: "In spite of having this large increase in numbers"—that is, the large increase referred to in the previous page—"there is still a shortage of 66,141 natives for actual present requirements; while, if all the public works, new railway lines, &c., which have been sanctioned, and which are now temporarily abandoned for want of labour, were to be proceeded with, the present requirement would be 2,400 unskilled whites and 159,000 coloured workmen." Supposing we take that for a moment for granted for the railways—because after all, public works are a small proportion of this number—supposing these natives were all available for railway work, when would they be dispensed with, when they have finished the service?—Well, the statement made to the Chamber Committee by the Central South African Railway Administration was that they could use 60,000 natives per year for the next ten years to come.

9,567. Where was that statement made?—That statement was made in answer to an enquiry addressed to the department on behalf of these enquiring committees, which called forth that reply.

9,568. Have you put that correspondence in?—I have not got the reply here, but the statement is in the hands of the Chamber and can be produced. I think it has since been modified to a certain extent—but this is the reply which we got from the department.

9,569. Would you be prepared to admit, after the modifications you have since received that this figure is an outrageous one, and can be proved to be such—this figure of 159,000 which you give here?—Well, I do not think so.

9,570. It is no use our making cases worse than they are?—The Chamber of Mines can only deal with their own figures. Those, we say, are correct.

9,571. The Chamber of Mines has taken upon itself to produce these figures, and I submit if they use other people's figures they must be responsible for them, or at least produce them?—Well, we can only accept responsibility so far as embodying them in our statement is concerned. We give you the sources from which we have received the information. We should be very sorry to be responsible for figures given by the Railway Department, for instance.

9,572. I should think you would.—But they give us a figure, and their figure stands. We cannot go and alter their figure, and say, for instance, "Now, according to your returns you require 60,000 natives; we have put that down to 20,000," and so on.

9,573. But if you had reason to doubt the figures they gave to you, or think they were in any sense exaggerated, do you think it would be proper for you to accept them and bring them to this Commission?—We hope the figures are exaggerated, for our own sakes, and we may probably think so. But cutting their figures down is a different thing. If we did that we might, for example, cut down the population of Cape Colony. We got a return which places it at 1,500,000, and we might say, according to our opinion, it is only 750,000. But we cannot go upon these lines.

9,574. Do you know how many miles of new railway are projected for which these natives would be required?—Between 2,000 and 3,000 miles, I think.

9,575. Are you aware, Mr. de Jongh, in one contract which has been made, or proposed to be given out shortly, for the greatest length of railway which it is proposed to go on with for some time—300 miles—they have limited the number of natives which they can use to ten per mile? That is 3,000 natives?—Yes, but the limitation is probably the result of pressure, and that limitation, I have no doubt, would be at once removed if a fully sufficient supply of labour were forthcoming. Contractors would naturally proceed to work on the most economical lines, and that implies rapid construction with a full complement.

9,576. Are you aware that for that 300 miles of railway, the biggest length contemplated for some time, the railway people said themselves to a deputation of which you were a member, that only 3,000 natives would be allowed to be used?—Unfortunately, we have since been given double those numbers.

9,577. By whom?—The Lieutenant-Governor, Sir Arthur Lawley. At that deputation at which you were present, we flattered ourselves that the labour situation was not so very serious after all, but figures have since been given showing that it was much more serious than we thought it was.

9,578. That deputation went there under the impression—at least some of them did—that the railway people were seeking for 60,000 odd natives, and when they were told by the Commissioner of Railways that they were calling for 6,000, they were naturally somewhat surprised. Is that the case?—No, I do not think so. I think that the deputation went there simply to deal with an immediate demand made by the Government for certain labourers. We were given figures showing that if the Maintenance Department was filled up to its full requirements, and if the new lines under construction and urgently needed were proceeded with, something like 22,000 natives only would be required. The figures since given in writing by Sir Arthur Lawley, in reply to this deputation showed that the number, instead of being 22,000, is more like 26,000. These figures only dealt with immediate urgent requirements; they did not deal with the number of natives who would be wanted if their whole programme was proceeded with. That is the position we have to face.

9,579. I submit that these figures are absolutely unreliable as regards the railways. Will you please turn to page 6 of your chief statement, the report of the Chamber to the Chairman and members of the Commission. About the fifteenth paragraph, you state there: "As a mere muscular machine, the best developed native, when he remains long enough at the mines to be thoroughly trained, is the equal of the white man," and you confirmed that in an answer given a little while ago to the Chairman, that experience shows that one white man being equal to two natives is altogether too high an estimate to be put upon his services?—Yes.

9,580. Now, a little lower down in the same page you give us the number of stamps at work in July, and you give us the number estimated to be erected at 11,120, making 18,265 stamps at the end of five years?—Yes.

9,581. Now, I think, without referring to the papers, you may take it for granted that in all these papers the economic basis of working is laid down at 20 boys per stamp?—No.

9,582. Well, let us come to the figures?—We put down no fixed unit of native labourers as forming a fixed economic basis, because our position is this, that we want to endeavour to work with as few labourers as possible, skilled or unskilled. The fewer labourers we can work with the better is our result.

9,583. Please take that statement marked "D," the Report of the Sub-Committee on mining, page 3, paragraph 7. You say there: "Column 5, exhibit No. 2, shows that 142,473 natives would be required to drop all the erected stamps under the most economic conditions." Then you give an estimate showing that this economic basis means roughly 20 boys per stamp?—Yes, but we do not tie ourselves to that number. The number constantly varies; we endeavour to make it vary.

9,584. Turn to page 9 of the same statement, last page, Witwatersrand Gold Companies, exhibit No. 2. At present 172,700 five-years hence, 368,637 would be the requirements for 18,265 stamps. That is roughly 20 per stamp?—Yes.

9,585. So you lay down in these papers that the most economical basis for working would be 20 boys per stamp?—No, we do not lay down any figures. We say that, under our present conditions, an estimated number of 20 boys per stamp would be required.

9,586. Excuse me, you do not say that?—There is no fixed standard of economic conditions with regard to labour which you can apply which would be the same in the aggregation between one mine and another. For instance, on the Central Rand section, where you are working with wider reefs and wider stopes, and so on, you would probably require, in some cases, 10 boys per stamp, which number would be quite sufficient. As your stopes become wider or narrower, where your mining conditions differ, you may want, to work in a certain number of mines, 25 or 30 or 35 boys per stamp. There are constantly changing conditions; the conditions vary in the different properties worked.

9,587. I know that. I am not taking any particular mine. I am taking an average?—Our general average. Take, for instance, the Western Section, which is stated by some mining engineers to require 25 boys per stamp; others say 30, and may be you will find others who will say 35 are required. I could not say according to the conditions yet to be ascertained. The general run, according to our experience, so far, is 20 boys per stamp, and our constant endeavour is in the direction of economy. We want to try to reduce the number below 20 per stamp, and if we can by using mechanical appliances, and consequently more skilled white labourers, and so on, we shall do so. That is our position.

9,588. I am not disputing that. You have laid down here—you are not speaking of a section of the reef—that your requirements, under the most economical conditions for the whole of the Witwatersrand, is 20 boys per stamp?—Yes.

9,589. That is what I say, you have laid that down as being the best basis you can work upon. There is no getting beyond that. Here it is in black and white. Do you know of other countries where the gold mining industry is carried on, in addition to this country?—Yes.

9,590. And you are aware that Government statistics are published concerning these countries?—Yes.

9,591. Would you accept these Government statistics, say those of the Indian Government and the Australian Government as being reliable? For the sake of argument you would accept them?—I should say they are reliable. I have no reason to dispute their accuracy.

9,592. The statistics for Western Australia for 1901 show that five white men per stamp are sufficient to run the mines. The tonnage is not quite so much as yours, but nearly?—Yes.

9,593. And you have stated already that at the outside one unskilled white man, at the very best, might be equal to two natives? Under certain special conditions?—Yes.

9,594. I will give you the special conditions in your favour. What is the proportion of white men to your stamps now?—One in five to six per native.

9,595. Can you give me the figures. I have not got them myself; the proportion of white men per stamp. Is it two or more? Would two be a safe thing?—Yes, probably in the neighbourhood of two.

9,596. In addition to the two whites, would you continue to use the same proportion if you had as many natives as you wanted? Suppose you could get 20 boys per stamp, would you do without these white men?—It would be impossible to tell what you would do, as circumstances alter.

9,597. Quite so?—You would run your mine according to the circumstances of the day.

9,598. Would you do with less white men?—You may do with more.

9,599. What do you think; less or more, on the whole?—Probably more.

9,600. Probably more white men?—You may work more, you may be able to use more men. You do not know how the conditions would change.

There is one thing in connection with this statement you made about Western Australia. I do not accept your figures as a sound comparison at all, because you are now raising engineering questions which I am not very competent to speak about. Certain engineers are ready to give evidence, and will answer you on these technical matters. One point I can answer you to show you that your basis of comparison is a fallacy. I believe I am right in saying that the average duty per stamp in Australia is very considerably less than on these fields here, and therefore you would naturally require more men per stamp here than over there.

9,601. Can you give any figures proving that?—I, personally, cannot give you detailed figures, but I believe the general statement is correct. The engineers can give you statements upon the point.

9,602. We will get these by-and-bye. You think we may take it, for the sake of argument, that if we had as many natives as we wished that would give the same number of white men?—Allow me, the comparison is inexact. In regard to your point, it is admitted by us that the white man would do a certain percentage more work than the black man, so you cannot compare five whites in Australia to five natives here.

9,603. I am not assuming any such thing. I do not intend to make any such comparison. I know it would be nonsense. We may take it two white men per stamp would be still required. I do not admit it myself, but I accept it for the sake of argument. You say that under the very best conditions the very best skilled white man would be equal to two natives?—No, he would not equal two natives in general work. Under certain exceptional circumstances certain class of work the very best white man might equal two natives, but the general average is by no means two to one.

9,604. Will you give me the general average?—I cannot tell you.

9,605. May I take it as one and a half to one?—No, I do not think it would be so high as that.

9,606. Say one and a quarter?—Probably that, but to form a general average from particular kinds of work is impossible.

9,607. I do not want to take a particular kind of work. My question is a very plain one. I do not want to pin you down to any particular set of figures?—It is very difficult to form a general average. It is probably  $1\frac{1}{2}$  to  $1\frac{1}{2}$  at the outside.

9,608. Take the 20 natives as being equal to how many white men?—Thirteen to 15—say, 13.

9,609. When you require at that rate equal to 15 white men per stamp. That is my point of comparison in Western Australia. That is what it makes out on your own figures?—I am not admitting those figures.

9,610. Two white men and 20 natives are equal in your judgment to 15 white men in all?—At that rate you put 13 white men to 20 natives.

9,611. No, I would not. I want to get the comparison between the amount of labour required per stamp here, and in Australia?—In white men?

9,612. No, in labour in Australia; it is five white men per stamp?—In one case you compare a black here to a white man there; to enable me to grasp that comparison I should like you to make the comparison between white men and white men, and natives and natives.

9,613. But there are no natives there?—That is why the comparison is not on the same ground.

9,614. My point is this: You say that the unskilled white man, the class of man who has to do this work in Western Australia, would be equal only to  $1\frac{1}{2}$  natives, say  $1\frac{1}{2}$  if you like. If you take 20 natives, you have a labour efficiency equal to 13 men, with the two white men you have already got. That makes 15. You are asking for a labour efficiency equal to 15 white men per stamp. That is my point, if you want 20 boys per stamp?—Yes, it looks as if it works out at that; I could not tell you if it would

be so. I should like to add to that that this comparison is based upon the amount of work which white men would do here, and that is a point which requires to be tested in actual experience.

9,615. I admit the white men there do much more. I suppose we may take it that you are greatly interested in mining in other countries as well as this?—Yes.

9,616. Do you make any attempt to keep yourself posted with statistical literature in these other places?—No, so far as statistical mining literature is concerned, the engineers would be more competent to speak upon that point.

9,617. Do you know anything of the costs of working in India, for instance, the costs per ton?—No, I could not give you the precise information with regard to the mining in that country.

9,618. Do you know the cost of cheap black labour in India?—I should prefer the engineers to deal with that statement.

9,619. But they are dealt with in your statement. You go very thoroughly into finance. I mean the Committee did, of which you were chairman?—The cost of Indian labour in India?

9,620. You go into the costs of labour here, and give us an elaborate set of figures shewing what losses are being entailed. I am asking you, may I take it for granted that you take an interest in mining in other countries? Is it reasonable to ask if you know what mining costs in India?—I do not know.

9,621. You do not know what the cost per ton would work out at?—No.

9,622. Nor the wages paid?—These statements do go into the question of cost of labourers on Indian mines.

9,623. We are making a comparison. You are making certain statements which we want to show— which I think can be shown—are altogether extravagant?—It is of no interest to me except in an academic way, whether they pay them 5s. or 5d. per day. It does not affect me, it does not help me.

9,624. Amongst these papers are a number of reports dealing with the results of the attempts to use white labour. I have gone through them very carefully, and so far as they go they seem very convincing. But I missed two, and I thought I should find one there for the Wolhuter, which is mentioned at the end of the report?—It is not mentioned.

9,625. It is mentioned by name. That is why I mention it. I do not know if I have lost the report. Then the Village Main Reef is mentioned by name, and there is no report from that. They are both alluded to as places where cheap white labour was tried, but from neither of these mines have we a report giving the results. We get the results from the others. Turn to paragraph 5, section D. of the report of the Chamber of Mines to the Commission, you will find that the mines dealt with are the Crown Reef, East Rand, New Goch, Lancaster and Geduld Proprietary. These are the mines with which we deal.

9,626. I will show you a paper where others are reported on. Take the report of the Sub-Committee on Mining, marked "D," under No. 1, sub-section C, the reference to that committee "is to obtain all data and report specially upon the excessive cost of unskilled white labour on the following mines:—Crown Reef, Village Main Reef, East Rand Group, Wolhuter," and so on. Can you tell me why these reports of the Wolhuter and the Village Main Reef are not put in with the others?—I could not tell you why they were not forwarded.

9,627. Do you know whether this committee within whose references it lay, reported on these mines or not?—I could not tell you. I can only tell you that the papers, as they come in to us, have been forwarded to you.

9,628. Can you tell us why these two mines which in the public mind are the best examples of the use of white labour have been omitted?—I cannot tell you.

9,629. They are omitted, you admit that?—Yes, they are amongst the references to report upon.

9,630. Can the Commission ask that they may be supplied to this report?—Yes.

9,631. I should like these reports to be put in.

9,632. The CHAIRMAN: Will you give them, Mr. de Jongh?—I have not them.

9,633. But will you arrange with the Chamber of Mines to supply them?—I shall have to submit the question to the parties concerned.

9,634. Will you do that please?—Yes. I will.

9,635. Mr. QUINN: You spoke a little while ago of the limit which the mines were compelled to observe towards native wages?—With regard to all expenditure.

9,636. Particularly native wages I think we are dealing with. Can you tell us what imported labour is likely to cost you as against the amount paid to natives?—I cannot tell you.

9,637. But have not elaborate preparations been made to prepare for imported labour if it is found that it must be imported?—We are at the present moment in the enquiry stage.

9,638. And you do not know what it is going to cost?—Not definitely.

9,639. What is the idea indefinitely?—I could not tell you. I tell you we are in the enquiry stage. We are making enquiries.

9,640. Am I to understand that you have no idea what the cost of imported labour would be per day?—Within certain limits probably we have.

9,641. Can we have it within these limits?—Well, I do not know. The limit would probably be somewhere between 30s. and £5 per month; but that leads to nothing.

9,642. I do not want an answer that leads to nothing. I want an answer that leads to something?—Call it somewhere between 30s. and £5.

9,643. That is as far as you know yourself?—We do not know. As I say, we are in the enquiry stage.

9,644. Am I to understand that you are dealing with a problem, and that is the nearest you can get to the cost?—The position is this. We are making enquiries as to the sources from which we can get labour, and certain figures have been given as to the cost, but not being applied in practice they are theoretical figures. Even these figures would be subject to discussion and adjustment before anything definite is arrived at. It would be entirely misleading at the present time to give any figures at all.

9,645. Then your reply is this: That you know nothing nearer than between 30s. and £5 per month?—I can give you nothing definite, and therefore I will give you nothing at all. That is my position.

9,646. I see; I quite understand. You are a member of the Witwatersrand Native Labour Association?—Not of the Executive.

9,647. A member of the Executive?—No, I never have been.

9,648. Were you consulted when the Witwatersrand Native Labour Association was formed?—Yes.

9,649. What date was that?—It was during the war; I think I was first consulted in 1906. The idea was spoken of, I think, here for the first time in 1900, as to the necessity of the formation of an association. The thing took form at a later date; I believe in 1901.

9,650. Was it not formed in October, 1900?—May be. I cannot tell you the actual date of the formation, but it was either that or some time in 1901.

9,651. Can you tell us when the first meeting took place in Capetown?—No, I was not present, I was here.

9,652. Were your opinions asked? Were you consulted about the proposal here?—At that time, in Capetown, no. I was consulted in Johannesburg. The matter was first mentioned to me in June or July, 1900, probably June.

9,653. And did you agree with the proposal to make an attempt to reduce wages so much at one time?—Well, I was not consulted on the question of reduction of wages, but my own opinion was that at that particular moment, at any rate, a reduction was inopportune. But on the question of the necessity of reducing native wages, it is a fact that the native labourer to-day gets, or he got for a considerable time, wages which, in my opinion, were too high. Of that fact I am convinced. What the position of the Chamber of Mines is on that point is set forth in the memorandum. You can only, with your present scale of native wages, work certain of the more favoured and richer sections of the gold deposits in the country. You are limited to these, and that position is, in my opinion, entirely unsound.

9,654. You think the Chamber of Mines would be prepared to give this Commission a statement showing the number of natives on each mine per stamp before the war and now?—I could not say.

9,655. You are here representing the Chamber?—Yes.

9,656. Can you see any objection to that?—Personally I see no objection. I can submit the matter to the Executive of the Chamber.

9,657. I understand they are consumed with anxiety to make known every truth in all its details of the shortage of labour; therefore, they would give us every information that would lead us to some solution of the difficulty?—As to what information the Chamber of Mines may give, or as to what information may be pertinent to this enquiry I do not know. My position is that we have prepared certain statements which we have made as full as we possibly could, and I am submitting myself to cross-examination upon those statements. There is a good deal of information which I have not the least doubt the Chamber of Mines, or any other private person or concern would frankly refuse to give as not being public property.

9,658. But you know the Commission has power to insist upon seeing any books or documents you may possess?—That may be.

9,659. It is?—Well, I take it, it is for the Commission to say how that power may be used. There is a great deal of information in the possession of companies which is private. I do not say this information is, but my position is that you make a request for certain information. I can submit that request to the Executive of the Transvaal Chamber of Mines.

9,660. I should like, Mr. Chairman, to submit that the Transvaal Chamber of Mines be asked to prepare a statement of the number of boys employed per stamp along the whole of the reef before the war by the members of the Chamber of Mines, at all events, and now at the present time. I want to compare it with the demands being made now.

9,661. The CHAIRMAN: Will you note that, Mr. de Jongh?—I have made a note of it. I do not say that information will not be forthcoming, but I am not in a position to pledge the Chamber of Mines or any private companies to produce information which they may consider is private. I can only convey the request to the proper quarter.

9,662. Mr. QUINN: I do not ask for anything that would be unreasonable; these figures are published frequently in the newspapers, and it is only to get them together in a convenient form that I am asking. Is it within your knowledge, Mr. de Jongh, that many companies to-day are working with less than 10 boys per stamp, and making a very handsome profit?—Some companies may be able to work on that basis. I could not tell you whether it is less than ten. The numbers vary?

9,663. That was not quite the question?—I could not tell you whether there is a company in existence which works with less than 10. If they do they probably work because they cannot get the balance, or some branch of their work which should properly be carried on has to remain in abeyance. Perhaps

it is development, or some other branch of its operations.

9,664. If we get these statements we should be able to get the answer, and it would help us to a solution. The point is this: If they can work with less than 20 boys which they are asking for, or with 10, or whatever the number may be, and do proper development, and go on working at a reasonable profit, we should take up a certain position?—No, sir, that inference is entirely unsound, because I may have a particularly rich section in my mine, and I may be able to work with five or even four boys per stamp, and momentarily I may make good profits, but that is not a policy which the mining industry here can carry out in the working of these fields.

9,665. That was not what I meant?—We want to work the largest possible bulk of low grade ore, and in the working to use the necessary number of labourers consistent with proper economy. That is what we want.

9,666. It is a question of proper economy?—Entirely. It is the same in every commercial undertaking anywhere unless one is a prodigal.

9,667. There are undertakings to-day using partly white and partly coloured labour, doing very well indeed, who, if they could substitute much cheaper labour would make much bigger profits still, that is what you mean by most economic conditions, perhaps?—Well, it follows if one's working costs are lower probably your profits would be higher. It is a self-evident result.

9,668. Mr. WHITESIDE: Will you please turn to the last page of the report in sub-section B? It reads as follows: "That in order to enable these fields and industries to be properly worked it is necessary that these labourers should be found at a rate of pay not beyond a certain limit?"—Yes.

9,669. Will you tell us what that certain limit is?—The limit which will leave to the investor a reasonable and sufficient profit upon his investment.

9,670. Have you not framed any estimate at all as to what maximum you can afford to pay natives, speaking generally?—You cannot frame a limit because the value of your ore differs in each mine. One mine can work at a profit, possibly, by paying natives £5 per month. Another one would be working at a loss by paying him half that amount, and you cannot strike an average for the whole country.

9,671. Do you think there are any mines who can pay £5 to the natives?—Yes, by working on an artificial basis, by picking out the eyes of their mine and thus bringing up their grade, for example, from 10 dwts. to 20 dwts.

9,672. That is not my question. My question is as to ordinary mining lines. Are there any mines that can pay £5 a month?—Certainly not.

9,673. Are there any that can pay £4?—No. No mine would be justified in paying £4.

9,674. What would they be justified in paying?—They would be justified in paying so much as would leave them a proper margin of profit.

9,675. Then it comes down to this, that if a mine is paying £3 or £3 5s., that is, the best mines, they have reached their maximum?—Yes. You are assuming a situation where you would have a few mines, perhaps five or six mines, working to carry the whole country. I assume the necessity of working the largest possible bulk of the lowest possible workable ore.

9,676. How do you propose to remedy the present deficiency in native labour?—To remedy it?

9,677. Yes?—It is stated in the report.

9,678. Imported labour?—By finding labour wherever we can get it.

9,679. Well, the imported labour has got to work out at not more than £3 or £3 5s. per month in the best mines?—It may have to work out at that.

9,680. Do you expect to get it so that it will work out not to cost more to bring them here, and not pay them more than £3 a month?—Probably it would.

9,681. Do you expect better efficiency?—Well, what the result of our experience will be with regard to any particular imported labour remains to be proved, we hope for better efficiency in the same way that we hope for and work in the direction of reduced costs of production.

9,682. Yes. So that you would have to bring them here and pay them at a rate so that their cost will not work out more than £3 5s. per month at a maximum?—We can only afford to pay a certain limit. There is a limit to our paying capacity.

9,683. Can you tell us where the idea of the Native Labour Association was first formed? Was it in Johannesburg or at Capetown?—Well, it would be difficult to say. Probably in Capetown during the war.

9,684. Who was the originator of the idea?—I could not say. As far as my recollection of it goes personally, it started in the objection to the methods employed by the touts in the territories of various countries, and owing to the complaints which were made from time to time as to what these touts were doing in those territories. We were then compelled to form this Association, which would in a measure have the Government's sanction, and which would be one responsible body to which the different Governments and States could look.

9,685. Yes, it is a beautiful idea. I wanted to know who the originator was, because I think that gentleman should be immortalised?—That was the idea; who gave it actual shape I could not tell you.

9,686. Do you know when the first preliminary meeting took place?—I was not present at that meeting.

9,687. That is not the question. Do you know where it was?—No.

9,688. Consequently you are not able to say who was present?—No, I was in Johannesburg and was consulted.

9,689. Who consulted you?—I do, not remember. The matter was discussed by me with Mr. H. F. Strange, a member of the Executive at that time, with Major Goodwin of the Railway Pioneer Regiment, and several other men, who were either members of the Executive of the Chamber of Mines, or connected with it, and who happened to have come up to Johannesburg about the time of the British entry. The matter was discussed at the Rand Club; the office of the Chamber of Mines was then closed. Mr. Goldring came up soon afterwards, and the matter was further discussed with him. He was the Secretary of the Chamber of Mines. In that way it went on.

9,690. Can you suggest the name of any gentleman who could give us the full details of the inception and formation of the Association?—There are gentlemen who know all about it. I could not suggest any names.

9,691. I do not doubt that, I want to find out who these gentlemen are?—Personally I could not suggest to you particular names. I have given you all my knowledge on the subject.

9,692. How do the wages compare now, Mr. de Jongh, with the highest rate during the last 10 years?—I believe that they are higher to-day.

9,693. In 1894 they were 61s. 1d.; in 1895, 63s. 6d.; in 1896, 60s. 10d.; and to-day they are 54s. 4d.?—What are you quoting from?

9,694. Exhibit No. 1, "Native Wages"?—Well, the Engineers have prepared a statement; they will be prepared to analyse it for you. But, I believe that I am right in stating that these wages given in the years you have quoted were subject to deductions. There were certain deductions for passes, and so forth. I fancy that is the explanation, but I should advise you to examine the Engineers who prepared the statement, as to the analyses of the statements. For instance, there is a note here, "In all cases, in addition to wages paid, housing accommodation, hospital and medical attendance are provided by companies free of cost."

9,695. Will you refer to Exhibit No. 2, Mr. de Jongh? In the summing up of it he says that the

total requirements under present conditions are 129,588, which equals 18.136 per stamp; total requirements under best economic conditions, 172,700, equal to 24.170 per stamp. I think that if I remember right you denied that you required that number of natives?—No. I did not deny it. What I said in answer to that question was, that the number of native labourers required per stamp was a varying figure, and cannot be taken as a constant one.

9,696. Mr. BIRNK: You have a general knowledge of the country?—Yes.

9,697. I know you know a great number of our farming community?—Yes.

9,698. You very often come into contact with some of the progressive farmers? Do you ever hear them say that they have no labour?—Well, it was the constant cry; it has been the complaint in this country for years, since I have known it. Not only the shortage of labour, but also the high prices of labour.

9,699. At first I was not going to ask you a single question, but in answering some questions, it struck me that perhaps it would be just as well. There are some of these mines not working stamps to-day, but that is not the fault of the Directors?—No, the Directors are anxious to work if they can find the labour. It is to their interest.

9,700. You have told us that some of the mines can make mining pay by paying high wages and picking out the eyes of the mines. Can you understand a farmer having a large area of ground and also working a few rich spots?—He could do that, but it would be an entirely unsound position. You cannot make the agriculture of this county pay with the present rate of labour supply, and the present wages, unless you go in for extraordinarily heavy protection.

9,701. Very likely in the near future there will be some labour-saving implements discovered?—Well, some economy must be made both in mining and otherwise if this country is to be profitably worked at all.

9,702. In the meantime the farmer wants to feed his family and pay his debts. He will have to find labour?—Yes, that is his problem at the present moment.

9,703. Yes, that is his problem, and that is your problem on the mines?—We see no solution for it under present conditions here.

9,704. We had Sir Godfrey Lagden here the other day, and I find from him that you are drawing from my part of the country, from our district, 14,000 boys?—Yes, because we can pay higher wages than you can afford to pay.

9,705. You are getting these boys here to our detriment?—Exactly.

9,706. You do not think that the Kaffir when once he has received £2 and £3 will come to us and work for 30s.?—No, he would be less inclined to work for you than before. He will probably not work for you at all if he can avoid it. He is at no time imbued with a burning desire for labour for labour's sake.

9,707. Mr. FORBES: How do the high wages on the mines affect the general wages in the country?—They raised the standard of wages.

9,708. You were also asked what wages the richer mines could afford to pay and pay a dividend. Now, if they pay that maximum the lower grade ores could not compete with them at all?—No, they could not be worked. In fact, the higher wages they pay the less they make their own profits.

9,709. But the mines with a low grade of ore could not be worked?—As the position stands to-day the bulk of ore in this country cannot be touched on account of the cost of extraction, and that cost is made up of a number of items of which wages constitutes 53.44 per cent.

9,710. Mr. PHILIP: I think you have rather gone beyond your scope in making enquiries as to the requirements of adjoining Colonies, and so on. I do not think it comes within the scope of this

Commission. You seem only to have done it with a view to making deductions afterwards?—We did that to give us a general idea as to the whole question. It widened our horizon, and gave us some general information as bearing upon the whole labour situation in the country. That, of course, generally reflects upon us.

9,711. But the returns you have from these Colonies are far from complete?—On certain points they are far from complete.

9,712. I think, in Cape Colony in agriculture alone, there are a quarter of a million natives employed?—Agriculture we have excluded from our calculations, because we know that the majority of the agricultural labourers in districts work their own districts, and that it is the industrial labourers who come out of their own districts to work principally.

9,713. And the Cape Colony, far from being able to supply its own needs, is actually recruiting in Basutoland, is it not?—Yes, it is recruiting in Basutoland, and on account of the scarcity of labour there the cost of labour has constantly been going up.

9,714. Natal is not only importing Indians, but recruiting in Basutoland, is it not?—Yes.

9,715. They recruit pretty largely in Pondoland?—There was a movement even amongst the Western Province farmers at Worcester some little while ago to import Asiatic labour to supply their requirements. They are very short. They cannot find the ordinary farm labourer in sufficient numbers, notwithstanding that the wages have gone up from 9d. to something like 2s. 2d. a day.

9,716. I see in your statistics of population you have also taken in a lot of countries from which it is impossible to get any labour supply?—Yes.

9,717. For instance, you have done your best, have you not, to get labour from Uganda?—Yes.

9,718. You have been in communication with the Home Government with reference to it?—Yes. Also with regard to the whole of British West Africa. We have tried pretty well everywhere.

9,719. What have been the results from all these places?—Well, direct refusal.

9,720. We had been told by one or two witnesses that labour was forthcoming from Nigeria?—Well, with regard to British West African territories, we have met with blank refusal. In other territories, which we have excluded, these negotiations have been going on for years. They are now. In one case I could give you, the Nyassa Company, they look as if they are on the point of being completed now, after three years of negotiation.

9,721. Then we hear of 20,000 boys being offered you from Somaliland. You made enquiries from the British Commissioner there?—We made due enquiries from every source from which we thought we could get information, and we came to certain conclusions.

9,722. At the present time the only countries that you can recruit from are Portuguese East Africa, the southern portion of it, and Basutoland?—The countries marked pink on this map Annexure "A" to this Annexure of the 27th of August.

9,723. You have done your best to get labour from all other available parts of Africa without success, and your only hope now is that you may get it from these North-East Portuguese countries?—Yes; of course we will continue to try. We will not relax our efforts, because we must get labour from somewhere.

9,724. You have had a few boys from Central Africa, have you not?—Yes, the number there is a thousand.

9,725. Have they proved a success?—No, unfortunately not.

9,726. They did not stand the climate very well, did they?—No, I am afraid it looks as if the experiment from that quarter will be an entire failure.

9,727. You have now 3,420 stamps ready to drop, which you cannot drop at present?—Yes.

9,728. I suppose these companies are all prepared—I mean they have the working capital to go on

with their work—in case they get the boys?—Yes, the question of working capital is not the difficulty. There may be some companies who have not actually got the working capital, but if the labour were forthcoming the capital would be immediately found.

9,729. In addition there are other companies who are not working at all, but who would start if they only had the boys to do their development?—They cannot start.

9,730. In these figures you have given us of your requirements, you only give us the portions coloured pink as the portions to which the figures relate?—Yes, in our computation of what our requirements will be.

9,731. But there are other portions of the Rand, and other districts, for instance, all the West Rand country, including the Western Rand Estates and the farms containing that lot of property belonging to the Gold Fields where considerable discoveries have been made lately. Do you make any allowance for the labour required on these mines?—No.

9,732. None whatever?—None whatever. We have not taken into account industries which we know are ready to spring up at once.

9,733. And in the Heidelberg district, have you made allowance for new ventures, such as the Coronation?—No.

9,734. I understand something like 70,000 claims have been taken up at Heidelberg during the last couple of months or so, and you have made no allowance for these?—We have been very much on the safe side in making our estimates of the requirements for the future. In the Orange River Colony we have certain figures given us, and the engineers have dealt with companies which would work at once, but we have not gone into the very wide field of all these outside industries which would spring up.

9,735. With reference to one question put to you by one member of the Commission in regard to Australia, do you know the size of the stamps which are in use there?—I could not tell you the precise figures, but I am told the stamp there is at a very much lower duty than our stamps, and our policy is, and has been, to increase the duty of the stamp. It follows, as a matter of course, that the higher the duty per stamp, the more men you would require to feed the stamp under given conditions.

9,736. In Western Australia, especially, is it not true they do not go in for the cyanide treatment and sorting the ore as they do here?—I do not think so. My point is, that in order to arrive at a sound conclusion or basis of comparison, the conditions must be the same, and the basis of comparison as between Western Australia and ourselves is really fallacious, because the conditions differ.

9,737. You are a native of South Africa?—Yes.

The Commission adjourned till 2.30 p.m.

9,738. Mr. De JONGHE: Before proceeding with the evidence I should like to give you the information which Mr. Quinn asked for this morning. He is not here at the moment, and, with your permission, when he comes in, I should like to go back and fully reply to the points that he has raised.

9,739. The CHAIRMAN: Would it not facilitate cross-examination if you gave them now?—Well, one of the points Mr. Quinn raised was as to the maximum amount which the companies could pay in wages and yet work. I have made enquiries and ascertained that two companies, the Bonanza and the Ferreira, of neither of which companies I am a director, could work even if they pay as much as £5 a head for unskilled labour, but of course their profits would be enormously reduced. The next question that Mr. Quinn raised was with regard to the number of natives employed per company per stamp before the war and now, and he asked whether the Chamber of Mines could furnish a return of that nature. I have made enquiries, and am informed that the Chamber of Mines has not got the returns in detail. They would have to be obtained, if at all, by the Chamber approaching each individual company and asking for these figures, but I can give figures bearing on the subject. Before the war, according to the most accurate statement,

compiled and drawn up by Mr. Webb, there were 110,000 natives employed, and of these 20,000 were working for companies which had no stamps, purely developing non-crushing companies without stamps, leaving therefore 91,000. There were, roughly, 6,000 stamps crushing, giving an average of 15 boys per stamp, but at that time there was already a shortage in the labour. The position to-day is that the present crushing companies employ 13·7 boys per stamp as against 15. But they are also shorter than they ever were before and they get along with this lesser number for three reasons. First, they have no more; second, they do not do the same amount of development and suffer loss there; they do less sorting, and they devote their time and labour to the easiest portions of the mines. With regard to the third point, it was asked by Mr. Quinn why the returns dealing with the white labour experiments made at the Wolhuter and Village Main Reef mines were not given. He stated that in the public mind there was an impression that in these two mines the experiment had resulted successfully. As you will have seen from the reference which was submitted to the Sub-Committee which has compiled its report, the Wolhuter and the Village Main Reef were included for the purpose of investigation. The manager of one of these companies replied that he had no time to answer the questions put, and in the case of the other no reply has been received. That is the sole reason why these two companies are not included in the figures which were given. Then with regard to the C.S.A.R. requirements of 60,000, I wish later to hand in to you a copy of the replies which the Railway Administration gave and which will bear out the evidence which I gave this morning on the point, and the figures given in our records.

9,740. Mr. EVANS: Have you any knowledge of efforts made by railway contractors to secure native labour?—Yes.

9,741. Do you know of any mines that have lost natives—Kaffirs—as the results of these efforts?—Well, I would not particularise railway contractors. I would mention the case of a company with which I am concerned, and which suffers particularly from the inroads on its labour supply by other outside employers, contractors, railways and others, who pay higher rates of wages and can offer better inducements. I have certain figures here dealing with the case of a company which started on the 1st of September, a year ago, with a complement of 715 natives. During the year ending 1st September this year, exactly 12 months, that company recruited 1,380 natives, and yet its present complement is to-day 533 as against 715 a year ago, and the list of defections has therefore exceeded 100 a month. The cost to the company for this recruiting has been £3,871 4s. 1d., and the Secretary of the company, in reply to my enquiries, as to the reasons for this state of affairs, writes as follows:—"Down to the beginning of the present year a large proportion of the numbers who deserted found their way to Johannesburg. They came here to work for the higher wages paid in the town." He goes on to say—"In addition to those returning to their homes, a considerable number proceeded to Johannesburg, and to different railway stations along the line. Recently, we know that numbers of our discharged boys simply take their discharges, and proceed to the railway, where they are paid a higher rate of wages, and are allowed meat three times a week. Our compound manager went, on the 18th July, to a certain station on the line and found there 49 of our discharged boys, and on another visit he found 59 of our boys who had just been discharged. In addition to these I understand that a large number of our boys are employed on railway works on two parts of the railway. I do not think it is desirable to mention the name of the company, as it should not be published, but I have the letter here with the return, which I am prepared to show to members of the Commission individually and in confidence.

9,742. Captain Pritchard, of the C.S.A.R., when giving evidence, informed the Commission that the natives who worked on the railway would not work on the mines. What is your view on that point?—I do not agree with that statement; I think it is

incorrect to say they will not work. It is a matter of preference. The native would sooner work on the surface on a railway at a high rate of pay than he would work underground in a mine at a lower rate of pay. It is a question of competition between the railways and the mines under those conditions. I know at once where the native would prefer to go.

9,743. Yes. Captain Pritchard also told us that the railway contractors had no difficulty in getting boys, and that they could not take natives from the mines as most of the mine boys came from the Northern Transvaal, Portuguese territory. Does your experience confirm that?—Our experience is that the greater number of the boys came from Portuguese East Africa. For instance, before the war there was only a comparatively small number of East African boys working outside the mines. The number has been a steadily increasing one, and the number and proportion to-day are very much higher; and it comes down to this, that these outside employers of labour, such as the railway, outside employers, contractors, and others who can pay higher and offer better treatment and easier work always on the surface, are very serious competitors to us on the mines.

9,744. I take it, then, that in your opinion a railway contractor working on this line, say, between Johannesburg and the Vaal River, supposing he paid 10s. more a month would get all the labour he wanted from these fields?—He would take the labour from the nearest source.

9,745. Reference was made this morning to the possibility of getting 60,000 natives for the Rand in five or six years from the northern portion of Portuguese East Africa. Is it not a fact that that was merely a guess made by Mr. Breyner?—Yes.

9,746. Are you aware of any basis for that figure except Mr. Breyner's guess work?—We had no data to go upon. It was a conclusion or inference which he drew because he had obtained a certain number from the southern part. Whether the conclusion was a sound one the future of course only can show. To-day we have no precise data. There is nothing to go on.

9,747. Would it be in Mr. Breyner's interest, having regard to his position in this matter, to prove that the requirements of the Rand can be supplied from Portuguese territory?—I would not be prepared to impute motive to Mr. Breyner. I should prefer to say that I think he genuinely believes what he says. Whether his anticipations will be realised at all, or within what time, is a matter for time only to prove.

9,748. But still the fact is, I take it, that Mr. Breyner has a distinct interest in maintaining the entire dependence of those fields on this territory?—Generally his interest is that way.

9,749. Can you give the Commission any opinion as to the results of Mr. Grant's efforts when he was Labour Commissioner for the Chamber of Mines?—I cannot tell you, sir. My experience only goes back here directly as far as 1897, when I became a member of the Executive Committee of the Chamber of Mines, and from that time down to the present day we have always been short of labour, and the information which I have goes to show that only on one occasion, I think in 1895, and that for a comparatively short time, a couple of months, probably, was there a very small surplus of labour. Except for that one period there has been a shortage here pretty well all along.

9,750. Mr. Grant, in his evidence, informed the Commission that the labour position on the Rand to-day is the result of either ignorance or design on the part of the controllers of the industry. Do you know of any facts to justify Mr. Grant's statement?—Well, of course, the statement that our control has been an ignorant one, is a matter of opinion, but that there has been any design in the matter, it is the wildest invention to say. I take it that all the governing bodies of the mining industry here have but one object, and it is to develop the mines, and work them to the greatest and best advantage.

9,751. You have mentioned, I think, in Annexure "A," that the estimate of loss to shareholders, the annual loss which the shortage of labour imposes, amounts yearly to near three millions on the basis of the stamps erected only?—Yes.

9,752. Now, having regard to that loss, do you think it likely that the controllers would adopt such a suicidal policy as that suggested by Mr. Grant?—I think it stands to reason that it is impossible for one to have the chance of making millions and voluntarily deprive oneself of the opportunity.

9,753. In Annexure "A," you also state that 5,612 white men would be employed if the stamps erected were all working. Now, in your opinion, what addition would that mean to the white population on the Rand?—I should say not less than ten to one. That would mean an additional white population of 50,000. You have that experience in regard to Johannesburg. Before the war you had a white population of 125,000, say. I want to be within the limit. And you had in round numbers 11,000 working white men on the mines. This would give you a little over 11 per head, so that I can put the figure at ten and be on the right side.

9,754. Reference has been made to the formation of the W.N.L.A. Was there not a Rand Native Labour Association in existence before the war?—Yes.

9,755. Is not the present Association simply a continuation of the previous Association, with slight modifications?—It is, in a way. It is its successor, except in its powers. It has been enlarged and its scope extended, and certain privileges have been obtained by the present Association which the former one did not enjoy.

9,756. Do you think it would have been possible for the industry to have done as well as it has done without the Association?—I do not think so. I have not got the figures at my fingers' ends, as I am not a member of the governing body of the Association, but the returns show a very considerable improvement on the number recruited under the old system.

9,757. About free recruiting. What is your opinion? Could we have done so well?—I was always opposed to the free recruiting system for a number of reasons. The principal one is the abuses which crept into the old system, the misrepresentations indulged in with regard to the boys by the touts, whose sole object was to get the boys out at any cost and sell them at so much a head. That is what it came to. It was the custom of these touts to take the boys to a mine to take them away again as soon as they could, and sell them to another. It led to a number of abuses, which we were bound to stop, and which, if they had not been discontinued, would have a most serious effect on the labour supply in South Africa.

9,758. There was a comparison made this morning as to the number of white men per stamp here and in Western Australia. Now, in your opinion, is such a comparison of any value unless account is also taken of the character of the ore, and the thickness of the reef, and of whether the ore is got from a quarry or a deep level mine and so forth?—I replied, and I can only repeat, that the comparison becomes fallacious unless the fundamental conditions are, if not exactly the same, at any rate closely similar, but in Australia we know it is quartz mining as against Banket Reef here. We know that in some cases the mining there is practically quarrying, and we also know, although I am unable to give the exact figures, that the duty per stamp is considerably lower, and therefore you probably require fewer men and so on. The conditions of the two countries are very dissimilar. We also know that in Australia the working costs are very much higher than on the Rand, and that the yield per ton is consequently higher, because it has to be. In other words, it means, as far as the conditions under which they have to work, they cannot work ore except it is rich enough to produce very high working costs, plus a margin of profit. They cannot work a low grade proposition. This question is dealt with in Annexure "F."

9,759. The CHAIRMAN: Is that the statement handed to Mr. Chamberlain?—Yes. There you will find the mines of Australia, India, Venezuela, Mexico, and Canada, and you will find that the lowest value worked there is 49s. 6d., which is the Le Roi Mine, in Canada. Then there is the Waihi Gold Mine in New Zealand, 54s. 4d., and the Eloro in Mexico at 55s. 9d., and so on rising as high as 205s. 4d. That is due to the conditions under which they have to work.

9,760. Mr. DONALDSON: The principal source of your supply at present on the mines, Mr. de Jongh, is Portuguese territory?—Yes, Portuguese East Africa.

9,761. Do you find that natives from there stay as long as they did previous to the war?—I could not tell you precisely. I am afraid I cannot give you definite information on that point.

9,762. Several witnesses have given evidence to the effect that previous to the war the natives stayed from twice or three times as long as they stay now?—I should say generally, for the reasons I put to you just now that a large number are leaving to go to contractors and work about the town, so it would be a safe thing to say that they do not stay so long now, but what the difference in point of time between the pre-war conditions and now is I cannot exactly tell you.

9,763. Do you think their being able to get liquor before the war, and not being able to get it now, will have any influence?—Against that we would have to put the better food they got, the better housing, and the better treatment of the natives now. I do not know whether the fact that they cannot get liquor has any great influence bearing on the question.

9,764. Mr. GOCH: Mr. de Jongh, you say in your statement, on page 3, that there are now employed 198,573?—Yes.

9,765. On that you have made certain corrections?—Yes.

9,766. And you say the total number available is 235,611 in the country. This figure is subject to a correction, which you made, reducing the total number to 215,000; that is from the figures you got from the Governor-General?—Yes.

9,767. This number available, therefore, would be reduced proportionately, and stand now at 215,843?—Yes.

9,768. Then you show in detail how many you require to work the mines here and other mines which you give a list of on page 4 of your statement, amounting to 350,714?—Yes.

9,769. In this statement you have only taken 129,588 as the requirements of the Transvaal Mines?—Yes.

9,770. On Exhibit 2 you show that if you continue working on the present conditions that that is the number you would want, 129,588, but if you worked under normal conditions you would want 172,700?—Yes.

9,771. There is no reason, therefore, why you should put 129,586 in this statement?—We took that figure because in making a calculation as at to-day we thought it was the soundest to take the conditions of to-day.

9,772. But would it be sound to continue working as you do to-day?—No, the conditions would improve, but we thought that a sound method of computation in dealing with the position as at the present moment.

9,773. You are unnecessarily conservative against yourselves?—We prefer to be that.

9,774. To put yourselves in a proper position you will want 43,112 more really?—Yes.

9,775. There is no reason why you should not be put in that position?—Apparently not, but we have not taken that view in drawing up our statement for the reasons I have stated.

9,776. I should think you were entitled to be put into the best positions, are you not?—We prefer, as

I told you, to deal with the conditions as they are at the moment. The way we took it was that if 173,000 natives were put down on the mines to-day they would not find anything else than conditions of to-day and would have to work under these conditions, and, therefore, it is that we took the number 129,000.

9,777. But by the time you get your 173,000: which you want, you will have improved these conditions?—The supposition is that they are all here at this moment.

9,778. At any rate at one calculation?—Yes, as you have put it, another 43,000 is required.

9,779. You, therefore, require a total now of 393,826?—Yes.

9,780. Compare that with that which you have actually in employment to-day, you are short to-day of 194,925?—No, the shortage to-day is 115,000.

9,781. That is compared to the 235,000 which you have shown are available, but which is now reduced to 215,000, so it makes a difference there in your comparison which ought to be, I take it, as between the men you have employed to-day and the men you require, in order to give us a true indication of the position?—Yes, that would be in our favour further.

9,782. But that is the position you ought to show, and, therefore, instead of being 115,000 you are actually 194,925 short?—Yes, under that method of computation we are. Of course, in dealing with the shortage I would call your attention to this, in the statement under the heading "Demands for Labour" you will see the figures as to public works and diamonds are exactly the same for the number now employed and the number required five years hence; there is no estimate made as to the future requirements, the reason for that is that the parties here were circularised for information but did not give us that information, and we did not take it upon ourselves to make an estimate under these two headings; for diamond mines you would have to add a considerable number for possible requirements as well as the number now required.

9,783. For "Other than mines and public works" you also carry out the same figure, and that will largely increase the proportion?—It will increase the requirements.

9,784. So even if you put it at 194,000 you have a very conservative figure?—Yes, our figures are conservative.

9,785. You have already emphasised, I think, the position that by employing white labour the effect of that, by increasing cost, would be to throw 48 companies (on page 5 of your statement) out of work?—Yes.

9,786. They would be working at a loss?—Yes.

9,787. Leaving only 31 that could pay?—31 that would be working at a margin of profit.

9,788. Nineteen of them will struggle along at a margin of 1s. 1'5d. of profit per ton crushed?—Yes.

9,789. And only twelve of them will be possible paying propositions?—That is so.

9,790. In one of your exhibits, I think it is "D," you give the nominal capital of all the different companies; you deal with Gold Companies, Land and Finance Companies, Coal Companies, Diamond Mining Companies and others?—Yes, I believe 120 companies in all.

9,791. I am speaking now of these exhibits in which you have reviewed the whole situation, and this shows a total capital of £211,967,000; that is so, is it not?—Yes.

9,792. In the exhibits of the report of Mr. Chamberlain, No. 7, you show that there are 120 gold companies having an issued capital of fifty-three millions seventy-five thousand (£53,075,000) odd. The market value in December, 1902, is given £173,126,000?—Yes.

9,793. The line suggested, therefore, of working by means of white labour would, I suppose, mean the destruction of all that value, would it not?—

Yes, it would mean the destruction of almost all of it, and as to the balance which would be working on a margin of profits, that value would be very much decreased.

9,794. You have shown what we are doing at present, working with 3,725 stamps, and you have indicated that we can work, 7,145 if we had the labour. The stamps are erected and ready to drop?—Yes.

9,795. I suppose it would be fair to take the production on the basis of 40s. per ton, would it not, all round?—There would be for those stamps, at any rate a large proportion of them, sufficient ore of that value.

9,796. Mr. de Jongh, I think you show in one of your exhibits, the exhibit which you submitted to Mr. Chamberlain, the total number of tons crushed since the establishment of the Gold Fields of 33,128,000, and that worked out at an average of 41s. 9d. per ton. Have you any reason to believe that you have a less production than 40s. now?—We do not expect so, but the future policy must be to work lower grade ores.

9,797. I am now speaking of when the 7,000 stamps are all at work. Are they on low grade ore which would reduce the average so as to come below 40s.?—I do not think it would come below 40s.—and 40s. would be a fair comparison.

9,798. If you can then crush with 7,145 stamps and basing the crushing power of the total on what the 3,702 are now doing, you may say you will have twelve millions (12,000,000) tons crushed in a year?—Yes.

9,799. You put working cost at 25s. per ton?—Yes.

9,800. That would work out at 16,000,000 (sixteen millions) as the total local expenditure?—Yes.

9,801. Sixteen millions would be the local expenditure, and you will have eight millions of that as profit on production of twenty-four millions at 40s.?—Yes.

9,802. The working profit is in the ratio of about 15s. and 41s.?—Yes, that is how I come to eight millions.

9,803. But you also show that the profits earned are not all distributed, and that only 70 per cent. of that go in dividends?—Yes.

9,804. 30 per cent., therefore, will go where? How does it go?—In depreciation and matters of that sort.

9,805. It is locally absorbed?—Redemption interest and other charges which constitute the difference between gross profits and net profits, distributable profits.

9,806. If you could get your full number of stamps working, therefore, this community will have a basis for its commercial existence of sixteen millions (£16,000,000) working costs. 30 per cent. of the profits is absorbed in various other ways, which is £2,400,000 more than this community will have for its commercial life—a total of £18,400,000 to work upon. That is the position, is it not?—Yes, if we have 7,125 stamps working now.

9,807. That is how it would work out, is it not?—We work it out in paragraph 18. The additional 3,420 it is estimated would treat 5,573,232 tons, and would produce the further sum of about £11,000,000 sterling per annum. That would be the outcome. Now of each ton you would have a working profit of 15s., and you would have 70 per cent. of that distributed in dividends.

9,808. You are dealing only with the additional number of stamps, but taking the whole lot together, it would come out as I said?—Yes. The whole lot would give that result.

9,809. Mr. QUINN: Mr. Chairman, I would like to put two or three further questions to Mr. de Jongh which I omitted to put this morning?—Before you came in, Mr. Quinn, I informed the Chairman that I could supplement the information which you asked for this morning.

9,810. In connection with what?—Certain four points which you raised. I will mention them to you. The first one is, that you put a question to me as to the maximum monthly rate of pay which the companies here could pay for their labour and yet work.

9,811. I think that was Mr. Whiteside's question, but it does not matter?—I have ascertained since that there are two companies, of neither of which I am a director, the Bonanza and the Ferreira, which could work at a margin of profit by paying £5 per month per head for their unskilled labourers, but their margin of profit would, of course, be very small indeed.

9,812. You mean unskilled native labourers?—Yes. The next question you put, was whether a return could be furnished to the Commission showing how many natives each individual company employed before the war per stamp, and how many they employ now. Well, the Transvaal Chamber of Mines has not got the information. To get that information in detail it would mean that we would have to circularise every company and obtain it from them, but we have certain figures which will answer that question. The figures are those in the statement made by Mr. Webb, which is quoted in these annexures, to the effect that before the war there were 110,000 boys employed on the mines here. I am giving you round figures. Of these 110,000 boys 20,000 were in the service of companies which had not yet any stamps at all. You get, therefore, 90,000 for division amongst the companies with stamps. That would work out, on the basis of 6,000 stamps, at 15 natives per stamp, but even at that time the companies were short of labour, and could have employed more natives, presuming they could have got them. The position to-day is that of the present crushing companies, 38 which made returns, employ 13.7 per stamp, as against 15—a difference of 1.3, but they do that at the cost of shortness in development, less sorting and working wider stopes, and the position to-day still is that they are short of labour, and would employ more natives per stamp if they had them. The next question was why two of the companies, the Wolluter and the Village Main Reef, whose names are mentioned in this Annexure "D," and in regard to which companies there is an impression in the public mind that the white unskilled labour experiments there have been successful, these two particular companies have been excluded from the information given. I have looked into the matter, and I find that, as you say, it was our intention to have furnished these figures to the Commission. Circulars were sent out and application was made to these companies in common with the others, and the manager of one company replied to the Chamber of Mines' Committee that he had no time to go into the matter, and the manager of the other company did not reply at all. The last point is this question of the estimate of 60,000 boys given by the O.S.A.R. I propose to put in a copy of the reply which the Railway Administration gave to our enquiries on that subject, and which can bear out the evidence I gave this morning, and the figures I give in this annexure.

9,813. With regard to these two managers. Do managers as a rule, when asked to furnish reports, please themselves whether they send them or not to the Chamber of Mines?—I can only tell you in this case that is what has happened. Had we got the information we would have given it to you.

9,814. Both of these mines belong to some controlling group, do they not?—Yes.

9,815. From your knowledge of these groups do you think for a moment they would allow a manager who was asked by the Chamber of Mines to furnish important information to a Commission such as this, to send word back that they have no time?—That question of yours is almost a suggestion that the evidence has been suppressed, but what I tell you is that I have spoken to individual directors during the luncheon hour of the Wolluter and the Village Main Reef, and they tell me that no request for the information has come before their Boards. The directors, as a matter of fact, know nothing about

it. And they know nothing at all to have prevented the managers giving the information had they felt inclined to do so.

9,816. I do not mean to suggest what you say, that the information has been suppressed?—Well, or that we have kept it back from the Commission at all.

9,817. It does seem strange, I think it is reasonable to be surprised, that these two mines, which in the public mind, owing to what has been written by them in the papers as to the favourable use of white labour, that they have left that impression. It does seem strange, in neither case have we any report from them, while from all the other mines where white labour, judging by the reports sent in, has undoubtedly been unfavourable, we have reports. These two particular mines, which a good many people look upon as having carefully tried experiments more or less satisfactorily—although their names are mentioned—we have no reports from them?—I can tell you that during Mr. Chamberlain's visit, this question was partly dealt with, and it was then already demonstrated that the use of white labour on these two mines was not the favourable experiment that the public thought. That statement is proved by these engineers here, if you look at exhibit E. They represent the engineers of all groups practically in these fields, and they all come to the same conclusion, and that conclusion again is endorsed, or that result, rather, is endorsed by the engineers of the groups to-day.

9,818. Has it been endorsed by the managers of these particulars mines?—I am convinced that the statement made here was made after a due knowledge of the facts connected with the employment of unskilled white labour both by the Wolluter and the Village Main Reef.

9,819. That does not answer my question. That is getting round it. Does the manager—take the Village Main Reef—does he endorse that report?—I should say yes. I am not personally a director of any of these companies, but I should say he certainly does.

9,820. You have no knowledge that he has endorsed it?—I have no direct knowledge, but I believe he does so.

9,821. Do you think it would be possible for the Chamber of Mines to get, say, a report from the Wolluter and Village Main Reef with regard to their use of white labour?—The Commission can call for it, and I do not think there would be any objection. I believe some reports have been made on the subject, but not to the Chamber of Mines.

9,822. No, I am aware of that?—I believe the reports have been made to the companies.

9,823. They should be obtainable?—I daresay they are.

9,824. Will you turn to the report of the Subcommittee on Mining, marked "D," the Engineers' Report to the Chamber of Mines?—Yes.

9,825. At the bottom of page 2, paragraph 4, the third line, it says: "Mr. Webb, in his annual address to the South African Association of Engineers, went to some pains to obtain a more correct figure. He found that for 110 companies the whole number of individuals in their employ was 111,697. The State Mining Engineer, in a speech before the Miners' Association, stated "that after careful investigation he came to the conclusion that the whole number employed by 150 gold and seven coal companies in July 1899, was 112,106, of whom 107,827 were employed on gold mines. Of those 91,484 were at work," and so on, which confirms what you have said, that there were approximately 90,000 boys running 6,000 stamps prior to the war?—Yes.

9,826. Was there no complaint in those days about a shortage?—Yes.

9,827. In 1899?—Yes.

9,828. I understand you to say a few moments ago, in answer to Mr. Evans, that only once for a brief period of two months in 1895 has there really been sufficient labour here?—Yes, I believe that is so. My personal information begins only in January, 1897, when I came to reside in Johannesburg and

became a Member of the Executive Committee of the Chamber of Mines.

9,829. Do you remember the Industrial Commission?—Yes.

9,830. Do you know that before that Commission evidence was given by Sir Percy Fitzpatrick, Mr. Albu, and others, who stated that they had an ample supply of labour? That you find by reference to report?—I should like to see the evidence.

9,831. You will get it in the Report of the Commission, and so ample was the supply that they proposed to cut down wages considerably?—I should like to see that statement.

9,832. It has been read here, and is beyond question. You will find it in the Report of the Commission. Evidently you were not aware of that?—I did not know that that was so. I know it has been before the Commission. Have we got a copy of the report, Mr. Chairman?

9,833. The CHAIRMAN: Yes, I think so.

9,834. Mr. QUINN: I am quite prepared to let the point go, as we have had it before in evidence, and there is no question about it. The witness says he is not aware of it, but the facts are on record?—I am not aware of it.

9,835. So when you said that only for a period of two months was there enough labour, you were speaking without knowledge of this particular time?—I spoke from the year 1897, and stated that from my general recollection, there had been a shortage of labour ever since I came here.

9,836. Did you read Mr. Grant's evidence?—I read the newspaper reports.

9,837. Did it state in the newspaper that there were occasions, when he was in charge of the Rand Native Labour Department, that there was no demand for labour from his office whatever?—That may be so, as Mr. Grant was here before my time.

9,838. He stated that here as a matter of fact. You gave an estimate a few minutes ago, Mr. De Jongh, about the population of Johannesburg or on the Rand before the war of 125,000 roughly. Where did you get that figure from?—From certain estimates.

9,839. 125,000 whites?—Yes.

9,840. On the mines?—Oh, no, the whole Rand, including Johannesburg.

9,841. Where did you get this figure from? I mean, is it on record?—No. There are no precise figures on record. One goes by the best figures obtainable.

9,842. Then it is a guess?—No, it is not a guess, it is based on the returns of people carried out of the country at the time of the war by the railway service, and an estimate of a number of people who remained here. A certain considerable number remained behind, and that figure is the one arrived at in consequence. No definite census was taken, and where the census was taken it was not taken

very accurately, but I am satisfied that the figure is not very far wide of the mark.

9,843. In reply to another member of the Commission I understood you to express an opinion to the effect that you did not think the mines would have done so well in getting labour if they had not had the W.N.L.A.?—Yes.

9,844. Do you know that it has been the opinion of every witness whose opinion has been worth considering before this Commission—Mr. Grant, Sir Godfrey Lagden, and quite a number of others, that the one most likely thing to stop you getting labour was this reduction in wages?—Well, it may have acted against us, and I am quite prepared to admit it had a certain adverse influence.

9,845. What do you base your opinion on, then, that the W.N.L.A. has done better than you would have done without them?—I base my opinion upon the total number recruited.

9,846. Do you mean per month?—Yes, per monthly return, and a great point with us is that we have at any rate now a system which is free, if not entirely then, very largely free from the abuses of the former system, which were becoming intolerable.

9,847. I agree with that, and I am not finding fault with the statement, but what I object to is, that you have done better with this Association and its methods than you would otherwise have done, leaving out of consideration the fact that when the W.N.L.A. started recruiting the boys had all gone away, and thousands of natives were waiting the opportunity to come back?—Against that you have to put the adverse circumstances which you stated, that they began recruiting when wages had been reduced. The former system did not have that working against them.

9,848. On some of the mines you are giving Kaffir beer to the natives?—Yes.

9,849. On how many mines is that being done?—On a large number of mines.

9,850. Would you say on the majority?—Oh yes, quite. It is being done under Government regulations.

9,851. Mr. PHILIP: I would like Mr. Quinn to let us know in what part of Sir Godfrey Lagden's evidence he gives such evidence as to the reduction of the rate of wages?

Mr. QUINN: I shall furnish that to the Commission when the time comes. I am not a witness here to-day, I am here as a member of the Commission.

9,852. The CHAIRMAN: Have you got that further information you were to give us, Mr. De Jongh?—Yes, I have two statements here; the replies given by the C.S.A.R. on the questions submitted as to their labour.

9,853. You will hand these in?—Yes, I am prepared to hand them in, they are copies of the original statements.

9,854. Witness handed in the documents, which were as follows:—

SUB-COMMITTEE PUBLIC WORKS.—FORM 2.

C.S.A.R. NEW CONSTRUCTION.

## TRANSVAAL CHAMBER OF MINES.

## RETURN OF UNSKILLED LABOUR EMPLOYED.

	Unskilled Whites.	Natives.	Other Coloured Labour.
1. Maximum number employed before the war - - - -			
(a) Average wages paid per month (stating whether food and lodging were also provided) - -			
2. Number employed at present time -	{ 236 Burghers, 500 English Navvies.	{ Week ending 18/7/03. Departmentally, 656. Contractors, 2,167. }	Nil.
(a) Average wages now being paid per month (stating whether food and lodging are also provided)	{ Burghers on Contract. Navvies 5/- per day with food and tents. Cost of food £4 14s. per man per month.	{ £2 10s. to £3 per month, with food and tents.	
3. Number estimated as necessary for current requirements - - -	Nil	60,000	Nil.
4. Number estimated as required to complete, within a reasonable time, works already officially sanctioned, specifying under various headings the description of works to be undertaken :—			
(a)			
(b)			
(c)			
(d)			
(e)			
(f)			
(g)			
(h)			
(i)			
(j)			
(k)			
5. Estimated number required for administration :—	There are as many miles of projected lines as there are already sanctioned. <i>I see no prospect of reducing the demand for 10 years or more.</i>		
(a) At the end of 3 years - -			
(b) At the end of 5 years - -			
<i>N.B.—It is particularly requested that an answer be given to Question 5 (b).</i>			

SUI-COMMITTEE PUBLIC WORKS.—FORM 2.

C.S.A.R. NEW CONSTRUCTION.

## TRANSVAAL CHAMBER OF MINES.

## RETURN OF UNSKILLED LABOUR EMPLOYED.

	Unskilled Whites.	Natives.	Other Coloured Labour.
6. What proportion of unskilled white Labourers is employed doing work usually assigned to Natives when such are available? - - -	None at present. The employment of Natives is only experimental. If we could get the right kind of Natives I would prefer to employ them rather than Natives, provided, of course, that funds were increased in proportion.		
7. Is any increased cost of White unskilled Labourers compensated for by increased efficiency in any department? - - -	The test in the case of unskilled labour is cost. White unskilled labour of the best kind would cost about £1,100 per mile more than Natives. It is too early to say what the present Natives are costing but the increase will not be less than £1,500.		
8. Does the supply of Native labour fluctuate periodically? - - -	Yes.		
(a) If so, at what seasons? - - -	I am not in a position to furnish this information.		
(b) What are the reasons for such fluctuations? - - -			
9. Are recruiting agents employed, or do Natives seek work of their own accord? - - -	Recruiting agents are employed. Very few Natives offer their services.		
10. What taxes do Natives pay within the sphere of their employment? - -	2s. Stamp on their Pass.		
11. How long on an average do the Natives remain in service, taking from the date on which they are engaged to the date they leave for home? -	3½ months.		
12. What are the principal sources of supply of Natives? - - -	Basutoland and the eastern portion of Cape Colony.		
13. General Remarks - - -	A Native is a good worker, but as soon as he begins to know his employer and gets accustomed to the nature of the work, he leaves, and another Native has to be taught. The pay which has to be given in order to obtain the Native is much higher than he ought to expect, considering his lack of intelligence and the amount of work he turns out. The progress of New Construction is at present restricted by lack of labour.

(k)															
5. Estimated number required for administration:—	Orders have been, I understand, issued by the Inter-Colonial Council for the completion of the whole of the works referred to, by Juac, 1904, and the number of Natives here given, is that required to carry out such works. These works are absolutely necessary to the efficient maintenance and development of the Railway, to deal with the Traffic offering. They represent only a small portion, the most urgent, of the total works required on the Railway. For a detailed list of such works see the C.S.A.R. Budget Estimates, 1903-1904, as approved and published at the Inter-Colonial Council.

SUB-COMMITTEE PUBLIC WORKS.—FORM 2.

C.S.A.R.

## TRANSVAAL CHAMBER OF MINES.

## RETURN OF UNSKILLED LABOUR EMPLOYED.

	Unskilled Whites.	Natives.	Other Coloured Labour.
6. What proportion of unskilled white Labourers is employed doing work usually assigned to Natives when such are available? - - -	514 now employed.		
7. Is any increased cost of White unskilled Labourers compensated for by increased efficiency in any department? - - -	No.		
8. Does the supply of Native labour fluctuate periodically? - - -	Yes.		
(a) If so, at what seasons? - - -	Generally in the Autumn or Spring.		
(b) What are the reasons for such fluctuations? - - -	It is difficult to give definite reasons. Apparently it is chiefly at the times of sowing and reaping, while the extreme cold in winter deters a good many from coming to work at that season.		
9. Are recruiting agents employed, or do Natives seek work of their own accord? - - -	W.N.L.A. are chief source of supply. About 3,000 per annum may be taken as the number of volunteers.		
10. What taxes do Natives pay within the sphere of their employment? - - -	None.		
11. How long on an average do the Natives remain in service, taking from the date on which they are engaged to the date they leave for home? - - -	Four to six months.		
12. What are the principal sources of supply of Natives? - - -	N. Transvaal and Cape Colony, with a few from Basutoland, Natal and Zululand, but latter supply is small. A few have been received from W.N.L.A. from Bechuanaland.		
13. General remarks.			

The above figures do not include "New Construction."

9,855. Mr. WHITESIDE: In connection with this letter, Mr. de Jongh, which you handed in, can you tell us if the conditions that obtained here as regards the treatment of boys on the Rand mines obtained at this particular mine?—The conditions at that mine are better. Both mines of that company have been amongst the most favourite mines to which the natives went before the war. We have had a larger percentage of boys who have renewed their agreements. We have had a larger percentage of numbers who have remained there. There are boys working at these mines who have been working right straight on for nearly ten years, but it is in the country, and the conditions are particularly attractive to the natives.

9,856. Can you tell me the maximum rate of pay boys got on these particular mines?—The system there is largely piece-work. The boys get a certain amount for drilling per footage, and a certain amount for tramping, and so on. The boys can earn at that mine 65s.

9,857. Is it fairly common amongst them to earn that amount, or is it exceptional?—It is exceptional. Our experience is that the native does not work so very much on piece-work as he might after a certain point. If during his shift, for instance, he has made four holes, we will say that for illustration, these four holes would bring him in 65s. per month, and he could comfortably do five or six holes, he does not trouble doing any extra holes, but goes to the surface and does not work any more that day.

9,858. Do any considerable number of them earn £3 per month?—Yes, a very considerable number.

9,859. You have told us that their treatment is rather better, in fact the best treatment?—I will not say that, but that is so in the opinion of the natives.

9,860. It is a popular mine?—Yes.

9,861. This letter says: "Recently we know for a certainty that there have been numbers of our discharged boys who are simply taking their discharges from us to proceed to the railways, where they are paid a higher rate of wages, and are also allowed meat two or three times a week" ?—Yes.

9,862. Captain Pritchard told us that he does not think any contractor can afford to pay £3 and make a profit?—Yes.

9,863. Can you give us any reason why the boys show a preference for working on the railways?—We had the same reply given to us, to that deputation which waited upon the High Commissioner a little while ago. The statement was made there by Sir Percy Girouard, the Commissioner of Railways, that there could be no serious competition between the railways and the mines inasmuch as the railways do not pay any higher wages. We have since ascertained that that statement was not accurate, and, as I have told you before in dealing with that subject, another point that weighs with the native is the fact that he works entirely on the surface, and the work is perhaps more congenial to him than working in the mine.

9,864. Mr. PERROW: You mentioned that before the war you were employing 15 boys per stamp?—Yes.

9,865. But since the war you were only employing 13?—Yes, 13·7.

9,866. Are the boys doing more work to-day than they did before the war?—I could not really tell you; I believe so, but I could not tell you the exact difference in work. The Engineers Committee could give you all that information.

9,867. The boys must either be doing more work since the war, or else you are not working your mines fairly?—That is one answer, too. As I stated in my reply, we employ this number at the loss of a certain amount of development work, which ought to be done.

9,868. So when you have got an increase of natives it will take four additional boys per stamp to keep the mine in order, i.e., in the same condition as it was before the war?—Yes.

9,869. So, if you are losing two boys to-day for two years, you must have four boys to put your mines in the same condition as it was before the war?—I do not think you could reckon a fixed figure like that, but certainly more boys could be employed, and a considerable amount of development work, which probably ought to be done, would then be done if the complement of boys was full.

9,870. So, by-and-bye, if you keep this on for two or three years, and run your mills the same as you have been running them, your mines, of course, will not be fit to work in?—Generally speaking, we are going backwards to-day. We are not going forward, and in my opinion we are not standing still, but we are going backwards.

9,871. You are working your large reefs and leaving your small ones standing, is that it?—Yes, it amounts to that.

9,872. So that by-and-bye you will have to use timber in order to make these places safe to work your small reefs?—Yes, the condition of our mines is becoming more and more unsatisfactory.

9,873. Mr. FORBES: You were asked this morning to explain how it is that the mines are getting along so well now with the 10 boys per stamp, whereas before the war they required 16?—Yes.

9,874. Sir Percy Fitzpatrick, in answer to that question, said that now they were drawing upon their reserves?—They are not getting along so well.

9,875. He says that they draw upon their reserves, which, however, he stated are getting exhausted. Can you confirm that statement?—Yes, I can generally confirm it.

9,876. The CHAIRMAN: The Commission is very much obliged to you, Mr. de Jongh, for the evidence you have given. The next witness is Mr. Jennings.

Mr. SYDNEY JENNINGS, called, sworn, and examined:—

9,877. The CHAIRMAN: I think you were Chairman of the Committee of the Chamber of Mines to deal with what we call Annexure "D" to the general statement?—Yes, the Sub-Committee.

9,878. In addition to the local engineers you added to that Committee I see gentlemen representing mining industries in other parts of South Africa?—Yes.

9,879. Are you prepared to say that Sub-Committee represented, generally speaking, the South African Mining industries from an engineering point of view?—Yes.

9,880. The reference to that Sub-Committee was to find out the labour requirements for mining in South Africa at the present time and five years from now. To report on the possibilities or otherwise of unskilled white labour in mines, and to obtain all data and report specially upon the excessive cost of unskilled white labour on the mines which you proceed to enumerate?—Yes.

9,881. To get the information which you have compiled you have circularised, I understand, practically every mine in South Africa?—Every registered Mining Company in South Africa.

9,882. You went beyond that and endeavoured to reach prospectors, through the Resident Magistrates?—Yes.

9,883. Did you receive a very full reply to these queries?—From the prospectors we had no reply. We got information from the bulk of the mining companies which were at work; from those not at work we received no replies.

9,884. There is a suggestion in the second paragraph, on page 2, where you speak of companies not making returns, comprising three companies having 600 stamps?—Yes, that is on the Witwatersrand. We did not receive any estimate from these companies as to the number of natives that they would require. They stated the number of stamps they proposed working in the next five years, but did not state their estimated number of natives. We

estimate the number at 10,200 natives for 600 stamps.

9,885. I see, you take the average of the others?—No, we took less than the average, we took 17 per stamp.

9,886. Then you made some calculations, covering companies elsewhere that have not replied to your circular?—No, you will see that on the last page we state that for the other districts of the Transvaal an estimate for five years hence is 12,250, and no expansion of the industry has been allowed for, as estimates for five years hence are not obtainable.

9,887. You have allowed nothing, therefore, in these other districts of the Transvaal, for the requirements five years hence?—No.

9,888. Dealing with the number of natives employed before the war, I understand that Mr. Webb has given his special attention to this question.

9,889. Is he coming before us?—He will.

9,890. Have you given any special attention to the question yourself?—The Sub-Committee made an attempt to get some corroborative evidence, but many of the companies have lost their records, and a total was not obtainable. We also say that the State Mining Engineer made a great effort to find out the actual number employed, and we give his figures.

9,891. How does this difference arise between the computations of the figures before the war?—The great difference consists in the various interpretations placed on the word "employ." There are four methods in which you can make a return when you ask how many natives you employ. In the first place you can give the return of the actual number of natives on the company's books, excluding those employed by the contractors of the company; secondly, you can give the actual number of individuals on the company's books, including the number employed by the contractors; thirdly, you can take the total number of the shifts worked in the month and divide that total number, "including overtime and sundry work," by the number of working days in that month, and you can return that as the average number employed; and, fourthly, you can add to that number the total number of shifts worked by contractors' natives in the same way, divided by 25, and return that as the average number employed.

9,892. Then that method of reckoning the number of shifts would exclude the boys lying idle?—Exactly.

9,893. You suggest these, then, are the reasons why the figures vary as to the number?—Mr. Webb, in his attempts to get at the actual figure, found that was so, and there are a great many companies who use these four methods.

9,894. In their returns to the Chamber of Mines?—Yes.

9,895. I suppose your Sub-Committee was responsible in a great measure for the estimates of the total number of natives required for the mining industry at present?—Yes.

9,896. You have heard the questions put to the previous witness by Mr. Goch. I think, with regard to the discrepancy between the two figures put in. One figure is 129,000 as the number required at present, and in another part of the statement, assuming a larger number of boys per stamp, an additional number is given of 43,000?—It is on Exhibit 2 of the Sub-Committee's report which shows that the total number of natives required to run all the erected stamps 348 days under the present mining conditions is 129,588, and the present mining conditions are enumerated.

9,897. That is at the bottom of column 5?—Yes. That is, at the present time you are not developing as much as you crush. You are not sorting up to your maximum profit. You are running rock drills where hand labour in stopes would be preferable. You are choosing those stopes which are nearest to the shafts, most accessible and widest. In order to revert to a sounder economic basis to develop as much or more than you crush, to only use rock drills

where they are economically justifiable, to work your mine uniformly, to sort up to the maximum profitable point, we estimate you would require 172,700 boys.

9,898. What does that work out at—natives per stamp?—Excluding developing companies, which would require 30,227 boys, it works out at 20 per stamp, while including developing companies it works out at 24,170.

9,899. Then that 20 in your experience of the Witwatersrand is the ideally best economical position?—As an average figure it is.

9,900. It must, however, vary with different mines?—It varies enormously. You can see from the Government Engineer's return for the last month that in the Heidelberg district the average number employed, i.e., on the companies' books on the last day of July, was 29 boys per stamp dropped in the Heidelberg district.

9,901. That is a district where there is very little crushing?—Yes.

9,902. Your report deals with the question of labour-saving appliances?—Yes.

9,903. What has been the general attitude of the mining industry towards the adoption of such appliances?—The general attitude is one of eager adoption of any proved device. We show that at least one and a quarter millions sterling have been invested in rock drilling plant with their necessary boilers and these rock drills are taking the place of 37,000 natives. At the present time every device that promises to solve the problem of transporting the ore down the stope to the level is being tried. We are trying one method of transporting the ore along the drive, i.e., tail rope haulage, and we have under order small motor locomotives which will run in the drives, and will then be transferred from level to level by means of an incline skip. If there is a fair chance of any device proving economically justifiable, it is tried. As we say, the great difficulty is with the thinness of the reef. The amount of ore to be transported from any one spot is so small that it does not justify the large capital outlay necessary for any labour-saving device. In addition to these devices mentioned in the report, I would state that we have asked many good mechanical engineers to solve the problem of transporting tailings from the vats in which they are to the dump. We have at the present time before us several such devices which will be tried in the near future.

9,904. The question of a small rock drill to work any narrow stopes is one method which has been mentioned as a possible means of saving native labour very considerably?—We show that we have got rock drills in use at the present moment which will save 37,000 natives.

9,905. Are you at all sanguine that a smaller and lighter drill will yet be discovered or invented, which will enable you to work in narrow stopes?—I am not very sanguine.

9,906. Is there some mechanical difficulty about it?—If you get a small drill it breaks frequently and the cost of repairs is high. I have personally investigated two electric drills which were supposed to solve the problem, but in my estimation they have faults which would not justify us in using them.

9,907. In making your estimates of the labour required five years hence, I see on page 5, paragraph 12, you state that your estimate has been based on the acceptance of the view that the gravity stamp will be retained for the purpose of crushing ore, and no allowance has been made for any crushing devices or change in metallurgical practice. Do you think it possible changes may take place which will increase the amount of ore crushed?—Yes, exactly.

9,908. Are inventors at work on these devices?—Yes, I should say most of the engineers on the Rand at the present time are at work on the problem what might be called stage-crushing, to use the gravity stamps to crush ores, and then regrind a certain percentage of the ore. Inventors are a hopeful race, and they hold out all sorts of possibilities for these

devices. They will be tried in the near future, and we will be able to judge by actual results.

9,909. You argue apparently from the increased tons crushed per stamp during late years, that in all probability, that increase, or some proportion, will continue?—Yes, we state that allowances have in some cases been made for an increased efficiency of the gravity stamp. As you will see from the monthly returns of the Chamber of Mines, certain mines crushed 5·6 tons per stamp. In certain groups allowance has been made for an efficiency of 6 tons per stamp.

9,910. In your experience, Mr. Jennings, and your knowledge of other gold fields, is the tonnage per stamp crushed here exceeded anywhere?—Nowhere that I know of.

9,911. Is it approached on any gold field?—Nowhere, that I know of. In this connection, I would like to call your attention to some evidence given by Mr. Leggett before the Industrial Commission on the subject of comparative efficiency of stamps. On page 247 he says that the Sierra Buttes Mine has two mills of 50 and 60 stamps respectively, a total of 110 stamps, which he says is equivalent to about a 40-stamp mill on the Rand. He says the Plumas Eureka Mine, which has a 60-stamp mill, is equivalent to a 30-stamp mill on the Rand. The Plymouth Consolidated Mine has a 120-stamp mill which crushes 250 tons per day, which would be equivalent to a 50-stamp mill on the Rand.

9,912. Do you think Mr. Leggett was selecting examples of really up-to-date mills in other places?—He was selecting examples of cheap-working mills.

9,913. From your knowledge of other mining countries, Mr. Jennings, do you think the attitude adopted here towards labour-saving appliances is equal to the attention given in other places?—I think very much greater. In this connection, I would like to make a quotation from a book by Mr. A. G. Charleton, on Western Australia, the latest statistics I have been able to get on the subject of working in Western Australian Mines, where he quotes from the report of the State Mining Engineer that the number of tons of rock raised per man employed in 1900 in Western Australia was 76·99 tons per year; that in the year 1901 it was 93·87, as an average of the 19 gold fields of Western Australia. In the month of June we raised in the Witwatersrand area alone 564,505 tons and employed on these mines in the Witwatersrand area 7,886 whites and 41,895 coloured, including Cape boys, or a total of 49,781 employees above and below ground, raising at the rate of 136 tons per man employed per year. This included merely crushing mines. From my information I was unable to determine whether the mines in Western Australia included those which were not crushing. We found that the total number of tons raised per man employed per year on producing and non-producing mines on the Witwatersrand was 104 tons. This shows conclusively, seeing we are all agreed that the Kaffir is not superior to the white man, and in Western Australia they employ solely white men, and their labour must be on the average more efficient, that their mechanical devices are very much inferior to those employed here.

9,914. One section of your reference was the question of substitution of unskilled white labour for that of black?—Yes.

9,915. You have submitted certain reports from certain mines as to their experience?—Yes.

9,916. Will you sum up that experience, Mr. Jennings?—The best information is given you in this annexure report to Mr. Chamberlain, where it is shown, on pages 14 and 15, that if you use white labour alone, you will reduce the number of mines that could work at a profit to 12; you would diminish the necessity for Johannesburg, and the entire idea, with which we are all imbued, of advancing South Africa, would have to be abandoned. We show that the total return from the tonnage milled up to October, 1899, averaged 4s. 9·4d. per ton. That total return is very much less than the cost alone of the mines in Western

Australia, which averages about 72s. per ton. We show also that when you work a white man and a Kaffir side by side, as fellow-workmen, you demoralise the white man, and he very soon ceases to do work. When he comes out here at first he works fairly hard, but he soon feels degraded. The white men feel that they are doing work which is beneath them, and they do not do it. They shirk it. We have a very full report on white labour by Mr. Hellmann, who gives the matter great care. I myself, when the experiment was started in June of last year, was extremely desirous of seeing it successful. I had previously, in June, 1893, attempted to sink shafts with white labour alone, as Manager of the Crown Deep, but the expenses were extremely high. It has been tried several times since. On the Witwatersrand Main Reef and on the Crown Deep again we tried immediately before the war to work white men as trammers. The experience was not successful. We thought it was because the men we tried were not suitable as they had been too long in South Africa and were imbued with the distaste for hard manual work which most men who come out and see the Kaffir doing that acquire. When the irregular corps were disbanded in June, we thought that there was a chance for trying this experiment again with these men who would not be imbued with that sentiment, and who would work hard in order to settle down and help to make South Africa the great country we all hope to make it. Our hopes were disappointed. Personally, the experience of about four months taught me conclusively that white labour experiments were extremely costly, and that they did not do the men themselves good; that they did not improve; that they did not show any zeal to do their work well, or better themselves, and altogether it was expensive and unsatisfactory.

9,917. Speaking of that labour experiment, don't you think the class of white labour you got, namely, those disbanded from those irregular corps were not as good as you might get under ordinary conditions? I think it was notorious that recruiting for those irregular corps during the last few months of the war was done to a large extent amongst an undesirable class, such as those off cattle boats.—Mr. Hellmann shows that the first men he got from the Yeomanry were extremely good men, that they were fine fellows, but they soon left it for more congenial employment.

9,918. Assuming that to be correct, do you put the failure down in this country to the presence of the black?—Yes, to the presence of the black and to the scanty population of the country. There is no pressure of population seeking work. My experience of America—I was born in the Southern States—bears out the same result, that with the presence of the black the white man who does manual labour is called and looks and acts like poor mean white trash.

9,919. You were not surprised, then, at the result of the experiment because of your experience in the Southern States?—I was not surprised, but my hopes were very much dashed.

9,920. In estimating the number of stamps that might be at work five years hence, you have submitted a map printed in various colours?—That represents the stamps on the Witwatersrand alone, and does not include any other district. The Witwatersrand is here on this map, as it was the only one we had, and includes the area from Springs to Randfontein. The estimate of this Exhibit No. 2, includes a further area which you might call the Heidelberg district.

9,921. What do you call Exhibit No. 2?—It is these blue prints.

9,922. The Heidelberg district is beyond the ground covered by this map?—Yes.

9,923. The portion coloured red is the portion in which the requirements of labour in five years time is estimated?—It is coloured red, blue, and yellow. Blue show the companies that are crushing, yellow shows the companies with stamps erected, but who are not crushing, and red shows the area which we estimated in addition to these.

9,924. That red colour is mainly though not entirely deep mining?—There is some outcrop.

9,925. In the East there is some outcrop?—Yes.

9,926. The point you apparently wish to make in regard to low grade ores?—Yes.

9,927. Do I understand you have ignored these enormous bodies of low grade ore altogether for stamps working five years hence?—We state what we have done in the matter.

9,928. You mean page 6, at the bottom of the page?—Yes; we mean that no stamps have been calculated for the Main Reef itself. We are working at the present time the Main Reef with several companies, and it is possible that, if we could reduce the working expenses sufficiently, this reef will be worked very largely. No estimate has been made of the number of natives that would be required to work that reef. There are also parallel reefs to the main reef series in Johannesburg which are very low grade, somewhere about 4 penny-weights, at least many stretches of it are of that value. No attempt has been made to estimate the number of natives that would be required to work this. I would like to say, in this connection also, as you see on page 9, that we have made no estimate for the future requirements of the other districts of the Transvaal, like Lydenburg and Barberton, in five years from now. We have merely put in what they require at present.

9,929. You evidently anticipate, Mr. Jennings, some considerable development in Rhodesia?—Yes.

9,930. The connection of the Wankie Coal Fields with the railway may result in a development there which will increase their demands?—Very largely.

9,931. They have been paying very high prices for fuel?—We understand so. I, personally, do not know much about Rhodesia. I have never been there, and we merely go on what is told us of that country.

9,932. They have been burning wood, I believe?—Yes.

9,933. And oil?—Not to my knowledge.

9,934. You indicate, also, that mining development in this country may touch iron, which will necessitate a very large demand on the labour supply?—Yes, that iron ore exists in the Transvaal in large quantities is well known, and it merely requires a large population from which skilled labour can be drawn to establish the iron industry—skilled and unskilled labour.

9,935. You also refer to the demands of the diamond industry as a possible further demand on the labour supply?—Yes, you will notice we have put down in our summary on page 9 for the diamond mining industry only 753; that is the number they employed in June, and as we could get no one directly connected with diamond mining to give us an estimate of how many they would require in a given time, say five years, we put it down that they will have the same number, although we confidently expect it will be increased enormously.

9,936. You have put down, also, some considerable figures for the coal industry?—Yes.

9,937. Those figures, I presume, will be entirely dependent upon the progress of the mining industry generally?—Yes, Mr. Hopper, who will come before you, will give you details as to how these figures were arrived at.

9,938. Then, with regard to those enormous developments contemplated, have you no fear at all, even if given the labour for difficulties which would prevent the development of the country to the extent you figure upon?—I would like to say that, of course, our estimate of five years hence is based on the supposition that we have at the present time all the labour we require, and would continuously have that for five years. If that condition at present is not fulfilled, naturally the five years would have to be extended. As far as we see, there is no other difficulty. We state that capital has been provided in the past, and will be provided in the future, that the carrying capacity of the railroad will be

increased, that there is enormous abundance of coal that there is sufficient water, and that you can get it in the required time.

9,939. Is there not likely to be some difficulty with regard to water?—I do not think so.

9,940. Then your opinion and the opinion of your Committee, apparently, is that the only factor necessary for the development of this country to the extent you estimate is cheap unskilled labour?—Yes.

9,941. Mr. EVANS: Did you read Mr. Ingle's evidence before this Commission?—Yes.

9,942. He alleged in his statement that the mines are using native labour wastefully, and he instanced the Nourse Deep. He says, "As an exemplification of this wastefulness I quote the case of the Nourse Deep, which before the war required 1,600 natives, and would have offered to use 200 more, whereas under stress of necessity they are compelled to do with 900, and I am informed by one in authority they require no more." Can you give us any information on that?—No, I have no exact figures. I should say that his statement is incorrect, but I have not got the exact figures.

9,943. Would you say his statement is incorrect as regards the wasteful use of natives?—Yes.

9,944. Have you read Mr. Grant's statement?—I have.

9,945. Can you give us any information as to the results of Mr. Grant's efforts when he was Native Labour Commissioner for the Chamber of Mines?—The highest monthly increase for the year before the war, was about 1,800 net increase. Since the war this has gone up for about six months to nearly three thousand per month. Mr. Grant also stated that there was a surplus of natives, a greater supply than there was a demand on several occasions. On one occasion, in 1895, I believe there was, when the Robinson and the Crown Reef agreed to take more natives than they required in order to relieve the Labour Association of certain numbers of boys they had on hand. That surplus lasted but a very short time, less than three months. Early in 1897, Mr. Grant reported that there was a surplus of natives, the reason for which was that mine managers had got tired of requisitioning for natives, and had stopped doing so for a certain length of time. As soon as Mr. Grant stated he had a surplus, requisitions were made and his surplus practically disappeared at once.

9,946. Why had the mine managers got tired of requisitioning?—Because they never got sufficient natives.

9,947. That is, they had not any great confidence in Mr. Grant's organisation, is that what it means?—They had very small confidence, that is what it means.

9,948. Excepting at that period in 1895, do you remember any other period when there was ample or sufficient supply of native labour?—I have been in Johannesburg now since 1889, and that is the only occasion on which I know of a sufficient supply of natives. I have read the reports of the Chamber of Mines, from 1839 onwards, and you will find that from the start to the finish of them, the entire burden of the reports on the native labour question is the insufficiency. You have here an industry which is pushed by the most energetic class of people, and unbounded possibilities and naturally your demand for labour is immense.

9,949. Mr. Grant told us in his statement that the labour position on the Rand to-day was the result of either ignorance or design on the part of the controllers of the industry. Do you know any facts of any kind that would tend to justify a statement of that nature?—Well, of course, Mr. Grant has his opinion about the value of other persons running a department, and therefore as to ignorance, I cannot say. As to design, I know nothing. The whole interests of the leaders of this industry, the whole instructions to their employees are the exact reverse of that. The fact is that instead of working your mines normally you are working them abnormally in

order to increase your output and the number of natives you have got settles that point of design.

9,950. Have you any knowledge as to why the industry ceased to avail itself of the services of Mr. Grant?—I have no direct knowledge. I was not connected with the Native Labour Association, but I should say generally it was lack of success on his part.

9,951. I asked the previous witness, supposing there was a sufficient supply of unskilled labour for the mines, to what extent would that increase the white population of this place. Have you formed any estimates on these lines?—No, I have not formed any estimate on these lines as to how the labour supply on the mines would increase the population in the towns.

9,952. With reference to the formation of the Native Labour Association, have you any idea as to the circumstances under which it was formed?—I was in Johannesburg at the time, and have no knowledge of the action taken in Capetown, but I know that the principle underlying the root of the W.N.L.A. is merely the growth of the constitution of the Rand Native Labour Association, which was formed in 1896, in other words, to pool your demand for labour, if you could not pool your supply.

9,953. And as to the result, do you think it would have been possible for the industry to have done better if they had gone on with free recruiting?—You certainly could not. We had the results of many years before the war, which were less in bringing natives than the results of the W.N.L.A. If you compare the periods of the same type, that is to say in a certain year before the war there were, say, 38,000 natives, and a certain period after the war there were also 38,000 natives, you can, therefore, see you started alike, and if you compare the rest of the figures you can see that the W.N.L.A. had increased very much more rapidly, nearly double what the increase was before the war.

9,954. Mr. PHILLIP: You stated, Mr. Jennings, that you had rock drills which would displace 37,000 natives?—Yes.

9,955. And how many white men does it require to run these drills?—That is extremely difficult to say exactly. That figure is based on the number of rock drills, which is 1,850, as near as we can find out, and if you say that on an average a white man runs  $1\frac{1}{2}$  rock drills, that would mean about 1,200 white men employed on rock drills.

9,956. And if you employ 37,000 natives to do that work, how many white men would you require?—You generally try on a mine to get gangs of 30 natives, so practically you would have the same number of white men.

9,957. It would not, therefore, make any difference. You would not be employing less white men?—No, about the same.

9,958. At present you are using drills to a very great extent where you could do better with hand labour?—Yes, we are using drills in the way I stated. We select stopes in which to use drills. If we had sufficient hand labour we would work the mines more uniformly by putting hand labour in the narrow stopes, which would increase the grade of your rock.

9,959. Sir Percy Fitzpatrick told us that the Rand Mines Group are employing something like 10·8 natives per stamp?—Yes, something like that.

9,960. And his idea was that they required from 15 to 16 in that group?—I think it is a little higher. I have not gone directly into the figures of the Rand Mines Group, which would be taken by Mr. Webber, but I think it is nearer 19.

9,961. He also said that owing to that condition of things your profits were considerably less on that group than they ought to be?—Yes.

9,962. Can you give us any idea of what difference it makes?—No, I could not. I have not got the figures.

9,963. With reference to the stamping power in Australia, and the extract you gave us just now

from Mr. Charleton's book, have you any idea of what the reefs are that they work out there in Western Australia?—Mr. Charleton gave some very interesting descriptions of them. They vary enormously in width. They are broad masses, some are as wide as 100 feet. They are considerably softer than the reefs on the Rand. The fact that they are in lenticular masses makes development more necessary. You cannot reckon for a long period ahead, and they are nearly vertical, which aids you in getting the rock down your stopes.

9,964. Are they working at any considerable depth?—They are working as deep as 800 feet.

9,965. With reference to your mines that are working short of boys now, you have a mine, for instance, like the Rose Deep; could you give us any idea of what shortage there is on that mine?—Not on that particular mine, because I have not the figures before me.

9,966. Could you give us an instance of any one particular mine which is working with too few boys to-day and give us the results?—Well, I should say that they are all working with too few boys, and the results are those I have stated, that they select their stopes, they are not sorting sufficiently, they are not doing sufficient development.

9,967. There are numbers of mines that must be working at a loss to-day. Take the Simmer and Jack, do you know how many boys they are employing at the present time?—No, I have not the figures before me. We did not try to get any particular mine, but the Committee desired rather to present the picture of the whole industry.

9,968. Mr. PERROW: I think, Mr. Jennings, you mentioned just now that you are working stopes nearest to the shafts?—Yes.

9,969. I suppose that is to keep your mills running?—Yes.

9,970. The further you get away, of course, the further you will have to run your rock over broken ground by-and-bye?—Yes.

9,971. When you come to work, perhaps, eight or nine different levels to keep your mills going, every one hundred feet you get away you will of course have to leave portions in the level which you would not have to leave if you could get to the down grade and get working back along?—That is quite so.

9,972. When we come to work the other reefs by-and-bye, for instance, lots of our main reefs will have been standing over five or six years, and some places will not have been touched since the war?—Yes.

9,973. It will take a good number of extra boys to get these faces into working order so that the stopes can be worked in the future?—They will require attention, undoubtedly.

9,974. They want timbering?—Yes.

9,975. So that will make a good deal of difference to the number of natives required to work the same number of stamps as you run to-day?—It will make some difference. I have not gone into the figures as to how much, but it will undoubtedly make a difference.

9,976. What number of natives in a four to five feet stope would it take to do the same amount of work as two rock drills?—Working day and night, a rock drill on the average would break as much rock, that is, taking the average of the Witwatersrand, as 20 boys.

9,977. Do you say two machines?—No, one machine, working day and night would be equal to 20 boys. The machine working two shifts, it would take 20 boys working one shift to do as much.

9,978. That is, 10 boys to one machine?—Yes, to a machine per shift.

9,979. What number of boys do you work to a machine?—In stopes we generally try to work five boys to two machines, with one white man, i.e., we attempt to do that on the average.

9,980. And one white man with a gang of 20 natives would do as much in a four feet stope as two machines on one shift?—Yes.

9,981. Well, we are working away, and very soon you will get to the down grade, to your far end. Your ground is all taken out behind you, and I do not think it will be safe to run over places in the way we are working mines to-day?—Well, probably in many instances you will have to wait until the mine caves in, and becomes safe ground, so that you can get through it.

9,982. Do you think it would be better if you could get to the far end and work your ground back?—Undoubtedly it is better mining.

9,983. What percentage of ground would you leave in pillars working it the way you are working to-day?—Well, it is very difficult to say. One mine that I figured out before the war left in a certain area, 7 per cent. of the area as pillars. I could not say what the percentage would be we are leaving now, but it must be a certain amount more, I could not say what.

9,984. Could you tell us the percentage you would leave if you were going to the far end first and come back?—Practically nothing; you would allow the ground to cave in behind you.

9,985. So the way you are working to-day you would have to leave 7 per cent. of your rock in the mine?—Of course we hope to get some of that 7 per cent. out by careful mining afterwards, as we have done at the Crown Reef, where the upper levels were abandoned many years ago, and we are now attempting, by skilful mining, to get a certain proportion of these pillars out, and so far we have been successful, but it is expensive.

9,986. According to the increase of labour that you are expecting to get some time, would you increase the rock drills in proportion?—Personally, my idea is that the use of rock drills is only beneficial in development of drives. We have proved on the Rand conclusively, that you can sink a shaft by hand labour cheaper, quicker, safer, and leave a better shaft behind, than you could with rock drills.

9,987. That is by the use of native labour and skilled white labour?—That is it.

9,988. To-day are you sinking any shafts where you are running your mills?—Just at the present time I cannot call to mind any mine where we are sinking shafts and running a mill at the same time. A short time ago we were sinking some shafts which were absolutely essential on some of the mines that we were running a mill on, but at the present moment I cannot recall any mine on which that is being done to-day.

9,989. So, by-and-bye, you will have to get your rock further away, and you will have to sink your shafts to keep the thing going?—Undoubtedly, we will have to start sinking shafts and on milling mines very shortly.

9,990. That is why you have mentioned it will take about 20 natives per stamp?—That is not the only reason, that is one of the reasons.

9,991. Mr. WHITESIDE: I believe, Mr. Jennings, you have had a very lengthy experience as a mining engineer?—Yes.

9,992. Apart from this country?—Yes.

9,993. Could you quote off-hand any gold fields where you have had more experience, in addition to that on the Rand?—No other gold field.

9,994. In taking out the safety pillars of the Crown Reef, I think you said it was rather an expensive process?—Yes.

9,995. Was it not on this particular work that the white labour experiment was conducted on the Crown Reef?—Largely on that, as stated in the report I handed in on the employment of white labour.

9,996. Consequently, the employment of white labour at the taking out of the safety pillars would go to increase the cost of the experiment?—Not in the least, compared with the number of natives that would be employed to do the same work. If you

have read the report on the Crown Reef experiment you will find that I stated that, in the opinion of the Manager, the same work could have been done by the same number of natives, and the extra expense was figured on that. It had nothing to do with the cost per ton or anything like that.

9,997. Mr. QUINN: Would you please turn to that report of yours to the Chamber of Mines, marked "D," on page 5, paragraph 12, giving the estimates of the requirements of native labour for gold mining in five years from now, and stating that it has been based on the acceptance of the view that the gravity stamp will be retained for the purpose of crushing ore, and no allowance has been made for any crushing devices or change in metallurgical practice which may at any moment be brought forward. Is there any prospect of anything in view that led you to use those words?—I stated in answer to the Chairman that the engineers of the Rand are at the present moment busily engaged on what might be called stage crushing, and, as I stated, inventors are a hopeful race, and lead us to expect great things from them. We will try them shortly, and will then be able to know exactly what it does mean.

9,998. In the event of these being successful, would the saving of native labour be very much. Would it alter the whole economical condition of mining here?—It would be the other way about. The demand for native labour would be increased because you would crush more tons per stamp, and consequently want more natives. The number of natives used per stamp is a very bad average to take. It is convenient, but it is inaccurate from the fact that the stamp is not a uniform unit, as we show in one of our exhibits that a stamp which crushed something like 2 or 3 tons per stamp in 1890 is now crushing 4·9, and it takes just the same number of boys to break, tram, and shovel a ton of rock, irrespective of how many tons the stamp crushed.

9,999. With reference to this question of water, if you had all the natives which you could give employment to at the present moment, could you go on confidently assured that your present supply of water, or the supply which you could get at the earliest possible moment would carry you on without any stoppage?—Yes, with that which you can get in a sufficient time.

10,000. I said that?—No, you said at the earliest possible moment.

10,001. Supposing you had all these boys, have you sufficient water for stamp-dropping and development provided for in these figures?—There is sufficient water to drop all the stamps erected at the present time.

10,002. To carry on whatever development there may be?—Well, as for development, you do not require much water.

10,003. You require some?—Very little.

10,004. Was there a meeting on this very water question a little time ago amongst the Mine Managers?—There was a Water Commission.

10,005. I do not mean the Water Commission, I mean a meeting called recently of mining people?—In reply to a request from the Rand Water Board for information as to the amount of water that would be required in, say, three years from now, I, as Chairman of a Committee, got together a lot of figures which we submitted to the Water Board.

10,006. That was the meeting I meant. It was not a question of any immediate shortage?—No, none at all.

10,007. The CHAIRMAN: In comparing the tonnage per stamp in Western Australia, or other gold fields, and the tonnage per stamp here, Mr. Jennings, in the relation to the number of men employed, a fair comparison, I take it, would be the tonnage hauled from the mine in both places?—That is so. I attempted from the figures of the State Mining Department of Western Australia to find out what their crushing capacity per stamp was, but I was unable to do so from the fact that their returns included not only stamp mills but other crushing devices, and they do not give the tonnage crushed separately. From my knowledge of the wet

stamps—and I say they differ—it would be an unfair unit to take, and it is very much better to measure the efficiency of your entire labour force and plant together by finding out how many tons of rock you haul out of the mine. That eliminates the factor of sorting which we have here, and which they do not have in Western Australia, although there they rescue, which also affects the question. It is, however, the fairest comparison you can make, although I do not mean to say it is an absolutely fair one.

10,008. Do you know of any gold fields in the world apart from individual mines where they work 40s. rock as we do here?—Not over large areas. I would like to say in this connection that the circumstances alter cases enormously, that the cheapest mining I know of has been done in South Africa, where, for three years—I have a note of it here—97,418 tons were crushed, each yielding 3s. 5d. per ton, and the total cost in South Africa was 1s. 9d. per ton. That is an utterly fallacious comparison, unless you know the circumstances. No dynamite was necessary; it was all pick and shovel work. It was a quarry, and the bottom of the quarry was on a level with the top of the mill, which was run by water power. There were two white men besides the manager running the entire show. There were no expenses practically for stores, except mill stores, and naturally it is very cheap.

10,009. Where was that mine?—In Swaziland.

10,010. Has the question of the efficiency of native labour had more consideration now than before the war, has it increased?—Very largely; in that respect I would like to point out that at the present moment there are returns which look as if the native was working 90 per cent. of the time, and that only 10 per cent. of the natives are either ill or escaping the vigilance of the compound manager. That is an

extremely high percentage. I looked up the returns of white miners in America, and they worked 210 days on an average in a year. Now 90 per cent. of working days on a mine in South Africa is 280 days. I am a member of a Commission which has been taking evidence on the number of days which artisans in the building trades in Johannesburg work, and several artisans stated that they averaged 250 per year, so that your average of 90 per cent. for the Kaffir is a very high one, and one which I do not think can be kept up indefinitely. The Kaffir does not like to be forced to work. He is not naturally industrious, and at the present moment you are using all your persuasion to make it uncomfortable for the Kaffir if he does not work; and he has to go into hospital if he does not work, which he generally does not like unless he is ill; so it seems to me you have increased the number of days the Kaffirs are working on your mines very much, and you are not going to keep it up indefinitely.

10,011. I was talking more of the efficiency per head or, rather, the work you get out of the individual native apart from the number of days he works?—So many factors enter into that problem that it would be extremely difficult to say, but my personal opinion is that the Kaffir is not as efficient, although he works a greater number of hours.

10,012. You mean than previously?—Yes, than before the war.

10,013. Is there anything else you would like to say, Mr. Jennings, before you go?—No, I do not think so.

10,014. The CHAIRMAN: We are very much obliged to you, Mr. Jennings, for the evidence you have given.

The public sitting of the Commission will now adjourn till 10.30 to-morrow morning.

## TWENTY-FOURTH DAY.

Wednesday, 9th September, 1903.

THE COMMISSION SAT AT 10.30 A.M.

Mr. E. HOPPER called, sworn, and examined.

10,015. The CHAIRMAN: Have you before you, Mr. Hopper, a statement headed "Native Labour Requirements of the Coal Industry of the Transvaal" (v. Supra, pp. 619-20)?—Yes.

10,016. Do you hand that in as your evidence-in-chief?—Yes.

10,017. You are closely connected with the coal industry, I understand?—Yes.

10,018. Entirely or mainly Middelburg coal industry?—Mainly Middelburg.

10,019. You have a general acquaintance with the coal industry generally, I think?—Yes.

10,020. You have given us estimates here as to the natives required or natives engaged in that industry at present, I think, of 9,000?—Yes.

10,021. In the coal industry of the Transvaal alone?—Yes.

10,022. Have the coal mines a full supply of labour?—I think they have for their present requirements.

10,023. Can you explain to the Commission why it is they have a full supply of labour when the gold mines are short?—Well, it is necessary for the gold mines, railways, and other industries to have coal, and the W.N.L.A. must necessarily keep us supplied, so that they can get a sufficient supply of coal. That is the only reason, I take it.

10,024. Is it correct to say that the W.N.L.A. give coal mines a preference over gold mines?—Yes.

10,025. You know it has been publicly stated in England that there is another explanation as to why coal mines are supplied?—I don't think there is any other besides the explanation I have given that they get the preference from the W.N.L.A.

10,026. You know that to be the case?—Yes.

10,027. You give an estimate here of the amount of coal required per stamp per month on crushing mines, as 18 tons?—Yes.

10,028. Is that the present consumption per stamp?—As far as we can make it out. I have taken a good many groups, and worked it out very carefully, and that is the most approximate estimate I can give.

10,029. You have used that figure in estimating the future requirements?—Yes.

10,030. Do you not think that if we had a full supply of unskilled labour and fewer rock drills were at work that consumption would be reduced?—I do not think it would be materially reduced.

10,031. Using that as the basis, then, on page 2, you arrive at an estimate of the coal mining requirements when the pre-war output is reached. You give an estimate of 150,000 tons per month as the consumption of the mines alone?—Yes.

10,032. And by pre-war output I suppose you mean running the same number of stamps as we were running in August, 1899?—Yes.

10,033. How do you arrive at the figure of 60,000 tons per month as the railway requirements?—Well, present railway requirements are approximately 52,000 tons per month at the present moment for the C.G.R. and the C.S.A.R.

10,034. You say the C.G.R.?—Yes, it includes the coal that goes from Vereeniging and Viljoen's Drift to the C.G.R. I think by the time we get another 2,000 stamps running, there will be more traffic over the railway, which consequently will require more coal.

10,035. You allow for an 8,000 tons per month increase on the present railway consumption?—That is so.

10,036. Then you give a figure of 60,000 tons for other consumers. How do you get that?—I arrive at it by taking the present consumption; we were running about 4,000 stamps in July, which would probably take 72,000 tons. There is a further half of that quantity that will be required for developing mines, 36,000 tons; for the C.S.A.R., 36,000 tons; and for the C.G.R., 15,000 tons, making a total of 159,000 tons. Deduct that from the total coal output given by the State Mining Engineer, viz., 219,000, and it gives 60,000.

10,037. You deduct that from the total as given in your statement of the amount produced by the various coal mines during July, 1903?—Yes.

10,038. That is how you arrive at it?—Yes.

10,039. You deduct the consumption of railways and mines from the total consumption, and you find other consumers take 60,000 tons?—Yes.

10,040. Then three years hence you put the requirements of coal at 432,000 tons monthly?—Yes.

10,041. That is on the estimate that 10,000 stamps will be working at that time?—Yes.

10,042. Then, further on, you go into the question of export of coal from the Transvaal?—Yes.

10,043. That export is by sea as well as by land to the Cape Colony?—Yes.

10,044. Do you know what the export is to-day?—Oversea?

10,045. Yes?—Very small. I could not give you any figures, but between 2,000 and 3,000 tons per month. That is principally due to the fact that Delagoa Bay has absolutely no accommodation for ships and the cost of putting coal from the railway trucks into the ships' bunkers is 7s. 6d. per ton, and even then it cannot be done with any facility or expedition. I think when they have got wharves down there, they are going on fairly well at present, I certainly think there will be quite a big demand for coal in that part of the world.

10,046. Then the present export to the Cape Colony is what?—As far as I know, 15,000 tons per month.

10,047. So that the present export to Delagoa Bay and the Cape Colony does not exceed 20,000 tons?—No.

10,048. And you are figuring on an increase in three years of 40,000 tons?—Yes.

10,049. Then, assuming these factors, you estimate a total monthly tonnage in three years of 492,000 tons?—Yes.

10,050. And that requires 20,150 natives to produce?—Yes, that is so.

10,051. That is an increase on the present number employed of 11,150 boys?—Yes.

10,052. You said that it had been suggested that considerable saving in the number of boys employed could be effected by the introduction of labour-saving appliances?—Yes.

10,053. You do not think that that is likely?—Well, the cost of drilling and cutting coal by hand labour is extremely cheap. I think about 3½d. per ton, and I doubt very much if any mechanical appliance will improve on that.

10,054. Are not these appliances only profitable in narrow seams?—That is about the truth of it.

10,055. The seams that you are working in this country are almost all thick seams, are they not?—Most of them are about 12 feet seams.

10,056. You refer in the concluding paragraph to the large deposits of base metals in this Colony. Have you some knowledge of the working of these metals elsewhere?—Yes.

10,057. Do you confidently look forward to their being worked in this country?—Yes.

10,058. And, of course, with that, a further consumption of coal?—A very much greater consumption of coal.

10,059. You have not figured out the number of natives wanted for the coal industry on the development of the base metal industry?—That is impossible, but a very large number must be required.

10,060. From what parts are the natives you now employ in the Middelburg district chiefly drawn?—I think we have almost none that are not East Coast boys.

10,061. Is there not a fairly large native population in your own district?—That is so.

10,062. Where are they employed?—I do not think they are employed anywhere. I do not think they propose to work.

10,063. They are not working to any large extent?—No.

10,064. Not on the farms?—On the farms, perhaps.

The other Commissioners decline to cross-examine.

10,065. The CHAIRMAN: The Commission is much obliged to you for your evidence.

Mr. DAVID GILMOUR called, sworn, and examined.

10,066. The CHAIRMAN: I think you were Chairman of the Chamber of Mines Sub-Committee appointed to inquire into the labour requirements of the Public Works and other Departments of South Africa?—Yes.

10,067. Have you before you a Chamber of Mines document signed by you and the other members of the Commission marked Annexure "C"?—Yes.

10,068. Will you tell us briefly what action you took to ascertain the requirements of these bodies?—Well, we issued a number of forms asking specific questions, which we thought would be useful for purposes of this inquiry. A number of the questions which were asked were not able to be answered by many of the people. The questions asked were:—

1. Maximum number employed before the war
  - (a) Average wages paid per month (stating whether food and lodging were also provided).
2. Number employed at present time.
  - (a) Average wages now being paid per month (stating whether food and lodging are also provided).
3. Number estimated as necessary for current requirements.
4. Number estimated as required to complete, within a reasonable time, works already officially sanctioned, as follows:—
  - (a) Public Offices.
  - (b) Telegraph or telephone lines.
  - (c) Irrigation works.

(d) Roads and Highways.

(e) Asylums.

(f) Hospitals.

(g) Waterworks.

(h) Lighting and Power.

(i) Sanitation.

(j) Other works.

5. Estimated number required for administration:—

(a) At the end of three years.

(b) At the end of five years.

N.B.—It is particularly requested that an answer be given to Question 5 (b).

6. What proportion of unskilled white labourers is employed doing work usually assigned to natives when such are available?

7. Is any increased cost of white unskilled labourers compensated for by increased efficiency in any department?

8. Does the supply of native labour fluctuate periodically?

(a) If so, at what seasons?

(b) What are the reasons for such fluctuations?

9. Are recruiting agents employed or do natives seek work of their own accord?

10. What taxes do natives pay within the sphere of their employment?

11. How long, on an average, do the natives remain in service, taking from the date on which they are engaged to the date they leave for home?

12. What are the principal sources of supply of natives?

13. General remarks.

10,069. The CHAIRMAN: A very ambitious programme of inquiry?—Yes, unfortunately it has not been quite realised.

10,070. You sent out 172 forms?—Yes.

10,071. And how many came back?—There were 70 returned complete, and 9 sent back with no returns whatever. The remainder we have not got out, but one or two have come in since, but very few. We have received returns from Port Nolloth, Walfish Bay, Vryburg, Fouriesburg, and the Beira and Mashonaland Railway, and that is all.

10,072. Have you been able to alter your figures to include these later returns received?—No.

10,073. Do they make any material difference?—No, because they are all very small employers of labour, with the exception of the Beira and Mashonaland Railway, which employs 2,000.

10,074. Then of the 93 forms that you did not get back, these were not important?—Well, they were mostly municipalities and a few shipping companies. Only three are important, namely, the Rhodesian Railways, the Beira-Mashonaland Railway, and the P.W.D., Pretoria. The second we now have.

10,075. You submit an Annexure "A" to your report of the Sub-Committee which gives a list of 20 average-sized towns showing the amount of coloured labour used before the war and now, together with the estimated requirements three and five years hence?—Yes.

10,076. You give the average number of coloured labourers employed before the war, viz., 44, and also that they are now using on an average 85?—Yes.

10,077. An increase of 100 per cent. on requirements before the war?—Yes.

10,078. The average on that same list of 20 average-sized towns shows three years hence requirements of 140, and five years hence requirements of 180 per town?—Yes.

10,079. But, further on, you refer to the same thing, but on a larger scale, namely, the large increase of labour now as compared to before the war, and give certain figures in paragraph 5. Will you repeat those to the Commission?—We can only compare the unskilled white and coloured labour employed before and after the war from the returns actually sent in, which give these figures. A great many that came in could not give both, but 45 did,

and these 45 towns and municipalities and concerns show that they now employ 2,054 unskilled white and 79,755 coloured labourers, as against 434 unskilled whites and 45,122 coloured labourers before the war. The estimate of the Netherlands Railway pre-war figures have been taken at 6 natives per mile for their open miles of railway, and the C.T.K. pre-war figures have been based on the same average as they employ at present, namely, 1-3 per open mile. This increase of unskilled white labour seems very large for the reason that in Port Elizabeth are employed quite a large number of unskilled labourers at present and they can give us no return as to what they used before the war, because their records were destroyed by fire. The East London Harbour Works give us a large increase. The Port Elizabeth Harbour Board give us a return that they employ now 257 unskilled whites, but can give us no return of what they used before the war. There are a few like that which bring the number up very considerably; but these are the actual figures of unskilled whites and coloured labourers now employed.

10,030. Could you get any information from these municipalities, etc., using unskilled whites as to whether they are doing this from motives of economy, or whether these men are on what are called relief works?—No.

10,031. No figure at all given?—No. On the next page in paragraph 6, we say, "Despite this large increase in numbers working, there is still a shortage of 66,141 natives for actual present requirements." These figures are actually returned on the form in reply to specific questions.

10,032. Then you go on, and go into very large figures in the same paragraph referring to the works temporarily abandoned for want of labour, stating that if they were proceeded with, the present requirements would be 2,400 unskilled whites and 159,334 coloured workmen?—These are from absolute returns sent in. No estimate was made of the towns not sending in except these marked in Annexure "E," which gives the figures for the 90 other towns as 7,470 out of that 159,334. It has to be estimated that these 90 other towns employ about the same average at least.

10,033. You had difficulty, however, in getting any estimate of what was wanted three or five years hence?—They all gave us returns.

10,034. In paragraph 7, as regards the estimated number, you say this: that where the estimates are given they are not given specifically as regards the employment three and five years hence. They have given it as an estimate and said it could only be taken as a guess?—That is what it comes to really.

10,035. You have been able to arrive at a figure required three years hence?—For native labour, in Annexure "B," the figure is 175,830, and five years hence 177,316.

10,036. But you say that many of these figures have been given by the municipalities and public bodies concerned, with the remark that they are mere estimates?—Yes.

10,037. On the question of the pay the natives obtained previous to the war and now, what is the net result of your enquiry?—We got returns from 45 public bodies, railway companies and others, and out of these 45 returns 61 per cent. show an increase, and 30½ per cent. show no change whatever between now and the pre-war period.

10,038. Does this increase to-day amount to very much?—Well, it varies very considerably between wide limits, from 3s. to 32s. per month. The decrease varied over a smaller range than this from 11s. 2d. to 20s. There is a diagram here that shows the whole thing, marked "C1," showing the pay that prevailed before the war, with another line showing what they are paying now, and from that it will be seen exactly how much they pay and so on.

10,039. Would it be fair to say that the tendency with regard to the native pay would be always to a higher rate?—Undoubtedly.

10,040. Have you made a calculation as to what that would mean for the municipalities and corpora-

tions you have communicated with?—Well, from these 45 returns the average increase amounts to 1s. 8d. per month over 15,900 boys. Now, as this increase is an average for the whole 45 returns, and as of these 45 there were three large employers of labour, all of whom show a decrease; namely, the Cape Harbour Board, the Johannesburg Scavenging Department, the Johannesburg Town Engineer's Department; the result is that if you take out that great number of boys, it shows you exactly that these remaining 42 have to pay the increased wage over a smaller number of boys, and their suffering is greater than appears from that return. When these three items are taken out, the average increase comes to 9s. 8d. per boy per month, giving a total expenditure by the remaining 42 of £13,757, if they had all the labour they want; that is £165,000 a year. These corporations who are paying more money are really paying more than the averages shown here.

10,091. One section of your enquiry was in regard to unskilled white labour, and comparing the results from that with native labour?—Yes.

10,092. What was the tenor of the replies received?—Well, we only received a very few replies, but without exception they meant that the white labour would be done away with if they could get native labour on the score of economy and efficiency, saying that the extra cost of white labour was not compensated for by any increased amount of work, or efficiency, or in any other way at all. They are all very strong on that point.

10,093. One of the corporations that replied to you was the C.S.A.R.?—Yes, they stated that with their present unskilled whites an increase of £1,500 was made in the cost per mile, but that they could get other whites more efficient than those, but, even if they had them, the cost would still be increased by £1,100 per mile.

10,094. By Mr. EVANS: Have you in Annexure "B," that return numbered 34 for the C.S.A.R.?—Yes.

10,095. Who is it signed by?—Mr. B. Wall. The covering letter is from the Chief Engineer.

10,096. We have had evidence given here by the C.S.A.R. officers, who gave figures differing from those very considerably. The date of that is what?—The date of the covering letter is the 7th August.

10,097. What do they say exactly as regards their preference for whites?—The exact words are "The employment of white men is only experimental. If we could get the right kind of navvies, I should prefer to employ them rather than natives, provided, of course, that funds were increased in proportion. The test in the case of unskilled labour is cost. White unskilled labour of the best kind would cost £1,100 per mile more than native. It is too early to say what the present labour is costing, but the increase will not be less than £1,500 per mile."

10,098. That is signed by Mr. Wall?—Yes, B. J. Wall.

10,099. Have you any other return in which it is stated that they would prefer whites to blacks?—Oh, yes, a great many, 15.

10,100. Who would prefer whites to natives?—Yes. Oh, no, I mean who would not.

10,101. In this case he states definitely that he would prefer whites to natives?—Yes, provided the funds were increased in proportion. No one else makes that statement.

10,102. Do you know how long Mr. Wall has been in South Africa?—No. There is one return I may mention here from Woodstock. They say that works carried out by natives are very expensive as compared with works carried out by white labour in other parts of the world; they do not say in the Cape Colony. That is the only other return that touches on the point.

10,103. Mr. PHILIP: I see in "D," the C.S.A.R. give their rate of wages at the present time as 56s.?—At the present time, yes.

10,104. According to a statement made by one of the other witnesses and handed in, their pay sheet

for the month shows 62s. per native?—It would be necessary to explain that, in order to get at the figures or averages, as a great many of the returns did not state how much it cost to feed and lodge their natives—in order to get them all on one basis we considered that we should put an inside figure on this cost, and we adopted a figure of 6s. per month.

10,105. Do the railways not feed their labourers?—They provide them with food and lodging. We add 6s. to arrive at what they pay.

10,106. But they actually paid out in wages 62s. per native?—The return they give us states that they paid 50s.; that 6s. is added by us as the estimated cost to cover food and lodging. Their return now is 56s. per month with food and lodging.

Mr. F. HELLMANN called, sworn, and examined.

10,107. The CHAIRMAN: You have before you a letter addressed by you to the Sub-Committee of Consulting Engineers, and dated 22nd August, this year?—Yes.

10,108. And have you also two annexures referred to in the letter, viz.: Memorandum re Kaffir, Cheap White, and Chinese Labour, dated July, 1902?—Yes.

10,109. And have you a further communication, being a letter of your's dated 29th August, 1902?—Yes.

10,110. I understand you submit yourself for examination on these three documents?—With the exception of certain portions; the last paragraph of the letter of the 29th August, and the last paragraph of the memorandum, I wish to exclude.

10,111. Why?—I understand they are dealing with subjects that do not come within the reference of this Commission. I have just been told that that is so.

10,112. Chinese labour?—Yes.

10,113. Will you turn to your memorandum, page 6, the part, I take it, you want to exclude is the beginning: "The other alternative which has already been mentioned"?—Yes, that is so.

10,114. You want to exclude that to the end of the memorandum?—Yes.

10,115. Also you wish to exclude from your letter of the 29th August, 1902, on page 11, the paragraph headed "Coolie Labour"?—Yes, that is it.

10,116. You wish to exclude that as not being within our reference?—Yes.

10,117. There are certain exhibits which are attached to your letter, marked A, B, C, D, E, F, G. Have you these before you?—Yes.

10,118. This letter of yours of the 22nd August, arises out of a request, I understand, by the Sub-Committee of the Chamber of Mines, that you should supply them with information as to the excessive cost of white unskilled labour on your mines?—Yes.

10,119. You say that the experiments of obtaining white labour to use for unskilled work arose from the suggestion of the Commander-in-Chief at the close of the war?—Yes, that was so.

10,120. This experiment was carried on by you on a number of mines under your charge, I think?—Yes, it was done on behalf of the mines under my control at that time; but not on all the works, only on a certain portion of the plant.

10,121. What mines were specially under your control?—The East Rand Proprietary, Driefontein Consolidated, Angelo Gold Mine, New Blue Sky, New Comet, Cinderella, Cason.

10,122. And on how many of these mines did you try this white labour experiment?—On the Driefontein, Angelo, Comet, East Rand, and also on the Cason.

10,123. You seem to have anticipated failure from the beginning?—We were doubtful about it right from the start.

10,124. Why was that? I mean, why should unskilled work by white men have made you doubtful as to success as compared with countries where it is used extensively?—Well, of course, it was only an idea. We did not positively know at the time that it would be a success or not. If you put men who are absolutely unaccustomed to a certain class of work, to do that work at a very much increased cost, it must be naturally looked upon as a doubtful experiment until the result becomes known. That is the reason we did not feel sure it would be a success. What prompted us to do it was the absolute necessity at the time of finding work for a large body of men who otherwise would have had no means of subsistence in the country. We, of course, hoped to do better than without labour at all.

10,125. The men you employed, the first batch, were all of good physique and good character?—They were very good men.

10,126. Had they any experience of mining work or the work to which you put them?—No—practically none at all.

10,127. That first lot did their work fairly satisfactorily, I understand?—They did their very best, I believe, to learn the work and to do it thoroughly.

10,128. And did a reasonable percentage of men within a short time become efficient at the work?—Yes, that is proved by the fact that a great many of them left us after a while in order to take up billets elsewhere as efficient men in the class of work that they had been learning. Take, for instance, men were put into the mill as labourers to dress plates and do that kind of work. They soon became sufficiently competent to go elsewhere and get jobs as amalgamators. Although we did not employ many of them on rock drills, some of the men were put on as helpers, and they went away after periods varying from four to five months and got jobs as drill men in charge of machines.

10,129. As skilled workmen?—I think so. I did not know up their careers farther than our mines, so I really do not know. But I believe they got billets and went elsewhere. The result was we were obliged to replace them by labourers from elsewhere and to take anybody who offered. But the deterioration in the class of work and in the class of men was very marked indeed—I mean, as the places of these volunteers were taken by others who came and offered themselves. Anybody who came along we had to take on, but the class deteriorated distinctly.

10,130. And your experiment extended over a period of 13 months altogether?—Yes, thirteen months.

10,131. You have just referred to the deterioration of the quality of the labour as being very marked?—Particularly marked during the last six months.

10,132. What do you suppose is the reason for leaving on the part of the better class of men you employed first?—I fancy they got better jobs at higher wages, most of them.

10,133. You have divided your experiments into two periods, one covering the last seven months of 1902 and the other the first six months of this year?—Yes.

10,134. You employed 1,473 white men during that time?—Yes, I think that is the figure.

10,135. The figure you give here?—Yes.

10,136. The men, therefore, remained in your employ for an average of 1½ months each?—The way I got at that was this: We show an average of 150 men employed constantly. By dividing the number of men that passed through our books by 150, and the quotient into 13 months, you get the average time each man spent with us. It is not the actual time the men worked. It is got at in this way.

10,137. I understand. Will you express to the Commission in figures the efficiency as against Kaffir labour which you get from this?—Do you mean for the three periods, or for the whole period?

10,138. I am thinking of the total period?—Take the total period, it is 1'23. That is, one white man for the total time he worked was equal to 1'23 Kaffirs.

10,139. Are you including in that all the work the white men were employed upon?—Yes. The rate was higher in individual cases, as I think I pointed out in my letter, in the case of stopers and tramway men, men who had contracts. They did much better work, which shows that they were anxious to do it. They were given a contract on the surface to move all the trucks going into a mill from the crushing station. The only way by which they could benefit themselves in taking a contract was by reducing their numbers and increasing their efficiency. Assuming that nine men take a contract, and they are able to do the work with seven, the amount to be divided between them remains the same, so that the amount earned by each is naturally increased. Therefore their efforts were directed in the direction of reducing their own numbers, and consequently they were so much benefited by making every possible effort they could to reduce the number in that way. All these men we found worked much more efficiently. I think the efficiency in the case of stopers was high, and in the case of trammers it was high.

10,140. You give efficiency in the case of stopers at 2.1 and trammers at 3.2 as compared with Kaffirs. Will you give us these figures? They are taken from one of the blue prints. Were you comparing them with Kaffirs also on contract, or Kaffirs paid by the day?—No, they were compared with the Kaffirs that would be required to do equal work. The Kaffirs were not on contract.

10,141. The Kaffirs were on pay by the day?—Yes.

10,142. Would it be fair to assume that if the Kaffirs were also on contract this apparent greater efficiency would have shown less?—I think if you could get Kaffirs to work on contract it would be so, but I do not think you could get them to enter into the spirit of such a contract. It is quite evident that they would not understand taking a contract by which they would throw fellow workmen out of work in order to increase their own wages. They would not understand it. But if you could get them to enter into such a contract, it is quite likely their efficiency would be far greater.

10,143. Then on the question of costs. How do the costs compare?—The cost is shown in the last column, "ratio of cost of native and white labour, Exhibit G." For the first period, ending December 1902, the cost of white labour compared with native was 3'681. In the second period, for January to June, 1903, the ratio is 3'145, and for the total period, that is, the 13 months ending June, 1903, the ratio was 3'359.

10,144. Then, in your letter you go on to make some calculations arising out of these figures. You estimate before the war, when all the unskilled work was done by Kaffirs, the Kaffir labour amounted to 25 per cent. of the total cost. Were Kaffir labour to be entirely replaced by white labour, the increased cost for the first period would be about 67 per cent., and during the second period 54 per cent.?—Yes.

10,145. Then you give a figure here as the loss imposed on the company by reason of employment of white labour in place of Kaffirs. Will you tell us what that was, for a period of 13 months?—What page is that?

10,146. In the document before me, it is on the top of page 5. You state "the loss imposed on the company by reason of the employment of white labour in place of Kaffirs has amounted for the 13 months to £20,380 19s., the loss per ton milled has averaged 10.49d." Why do you think that white labour is less efficient here than it appears to be in other countries? You have stated that, I see in your report?—There are two or three reasons in my mind. In the first place the white man here is working alongside the native. As an unskilled worker he works in company with natives. At all events he is doing work that the natives have done. Our argument is this: These fields are

worked with the help of the native, and the tendency is to see the work done by the native and for the white man to do as little as possible himself. There is no question about that, and the result is, of course, that the native being unskilled generally in the work, takes considerable time to do it, and the white man watches while he does it. In other countries the white man does it himself, and as he is a trained labourer, in most cases he does the work much more rapidly.

10,147. Would you apply that principle of the inefficiency of white skilled labour all round with regard to skilled trades on the fields?—I think so, generally.

10,148. In the last page of your letter you speak of the substitution of white labour for Kaffir labour generally as meaning 50 per cent. increase in working costs?—Yes.

10,149. What would the effect of that be on working mines here to-day?—It would decrease the profits of working mines by about 12s. 6d.

10,150. Would not that mean the shutting down of a large number of them?—All the mines not making a profit exceeding 12s. 6d. would be shut down, and as the average profit on the Rand is 19s., it shows pretty well that all the mines would be seriously affected, and only the richest would continue to work.

10,151. Mr. DONALDSON: You think that if boys, Portuguese boys particularly, had the opportunity of getting liquor in reasonable quantities, they would stay here longer?—Yes.

10,152. Do you think it would make such difference in the period of their stay here?—I have never estimated what the difference would be, but I am quite certain that if they could get liquor in moderate quantities, it would be an inducement for them to stay longer and make them much more contented.

10,153. Well, if it had that effect, will you tell us whether it is your opinion that he is more efficient, or less efficient, if he stayed here longer, in the latter period of his stay?—Boys' efficiency increases in almost direct proportion to the length of their stay. It stands to reason that if a boy comes here to work at any given trade, in the mine, he has to be taught; and the longer he stays the more he learns, and therefore the more valuable he becomes. In my opinion, it is one of the great disadvantages under which the mines labour here, that they are constantly changing their boys, and constantly forced to train the new boys to do the work required of them.

10,154. Do you think if these boys stayed longer it would be a saving to the mines, also in the cost of recruiting?—A very material one.

10,155. In fact, a saving all round?—If you would like some figures on that I will give them.

10,156. Yes, please?—Well, we have been charging £1,000 a month for labour commission. Last month we were obliged to put it at £2,000. So that up to the end of August we have spent £9,000 on native labour commission.

10,157. To secure a supply of labour?—To get it. And in addition to that there is a bill for extra charges amounting to something like £700. So that our costs have been very nearly £10,000 paid for the eight months of this year.

10,158. That refers to a group of how many mines?—It refers to the whole group, and in that group there is one mine working 110 stamps, one working 60 stamps, and no other stamps are running at all. The other work is very much reduced, and consists entirely of development work, and that has been very much reduced on account of the shortage of labour.

10,159. At present you are running about 170 stamps, and the commission for boys costs roughly speaking £10,000?—There is an extra charge in addition to that in the way of labour for the developing mines. The number of boys we have is 3,600. At the present moment our complement would be, approximately, under existing conditions, 7,000.

10,160. If you supplied the natives with liquor in moderate quantities you would be enabled to obtain their services for a considerably longer period I understand you to say; you would also save considerably in the cost of recruiting these natives, and also you would save in their increased efficiency?—We should save enormously in the increased efficiency and we should save in the cost of getting them, provided the boys re-engaged and we were not charged for them again. Of course, the whole of the recruiting is done by the Witwatersrand Native Labour Association.

10,161. Mr. EVANS: It has been argued that the development of this industry should be regulated by the supply of labour in Africa. Have you any views upon that point?—Yes. I think it is a most pernicious one; a most injurious one.

10,162. It was submitted by one of a deputation that waited, I think, upon Lord Milner. Can you give us any views as to the value of time in extracting the gold?—I once prepared a little table for the purpose of calculating profits distributed over the life of a mine. I have not that table with me now, but if a mine is laid out so that its ore may be exhausted, say, in 20 years, and you double that time, you decrease the value of your claim and the shares of the company approximately 50 per cent. That is the result of the increased time taken in working the mine. Of course, it is all a matter of interest. It is the loss of interest that causes the depreciation in value. If you figure the total profits of a mine, say, with 200 claims, you figure out the total tonnage of that mine first and then work out what the yield will be, and what the cost will be, and you will find every ton mined will give you a certain profit. If you multiply that by the total number of tons you get the total profit for the life of the mine. By using an annuity table you can calculate the present value of the total profit. Each year's dividend being discounted by the time taken to receive it. And the others are discounted in the same way. So the result is you get a figure of the present value of the claim after deducting the cost of equipment. The total figure divided by the number of shares gives the value of the shares at the present moment. If you double the life of the mine, the value is, roughly speaking, halved. It means a depreciation of value in squares of approximately 50 per cent., so that the loss to the shareholders and the owners of mines would be enormous. And there is more. The loss to the Government would be very considerable indeed, because the money it gets from this mine in the way of taxes would be of very much less value than if it were got out of the mines quickly.

10,163. I take it the effect on the community in the number of the white population would be also very great?—I should think such a policy would absolutely destroy credit in this country throughout the world. Any policy of that kind adopted at the present moment would absolutely destroy the financial position of this country and its credit throughout the world. It would be a tremendous blow to the mining industry; there is no doubt about that.

10,164. Now, supposing a sufficient supply of unskilled labour was obtained, have you formed any idea as to the extent to which it would probably increase the white population of this country?—Yes, I have. I have given some figures in my memorandum. I estimated the total number of stamps that would be working.

10,165. On the first page of the memorandum of July, 1902?—Yes; I estimated that to keep 16,000 stamps going 320,000 boys would be required. I have put down the present number required to keep 6,100 stamps going at 120,000 boys, and that is with an eye to the necessary development and construction work. The 320,000 boys would be roughly 32,000, being one man to every 10 boys, about; so that the increase would be in the ratio of 32,000 to 12,000.

10,166. Have you formed any idea at all as to what white population the eventual number of 32,000 men employed on the mines would mean on the reef?—No, I have not gone into it.

10,167. Have you any figures as to the population of your district, say Boksburg and that neighbourhood; as to how many white people are dependent on the mines there?—The population, I cannot give you the figures accurately, I could only give them approximately. The voting population of Boksburg, for municipal purposes is about 2,000. The number of men on the East Rand Proprietary Mines at present is about 700.

10,168. With a voting population of 2,000, what would be the total population?—I could not say.

10,169. Mr. PHILIP: Can you tell us the loss the mines suffered prior to the war through drunkenness on the part of the boys: what is the percentage of loss?—Yes, approximately, but I will not guarantee that it is right. I think it was about 20 per cent.—as a matter of fact it was more like 16 or 17 per cent., that is on our mine.

10,170. If we allowed drink now, do you suppose it would increase their present efficiency by 17 per cent.?—I have never thought about that. I think it would increase their efficiency, but not to that amount.

10,171. You say if they are allowed to have drink it will induce them to stay longer: and the longer they stay the more efficient they become. Do you think that that efficiency will give you the 17 per cent. you lost prior to the war through drink?—No, because if you increase it by 17 per cent. you have 100 per cent. efficiency which is impossible. It would increase their efficiency very materially, I think.

10,172. I suppose it would be possible to obtain a white labour supply which would be far more economical than the white labour you have employed here?—In time, yes.

10,173. For instance, you might get Italians here to do the work at half the price that you paid before to the whites you were employing here?—I do not think that. I do not think that a man could live on it. It is a day seems to me about the minimum wage you can offer any man in this country.

10,174. But you can get a class of men who are used to that style of work?—Yes.

10,175. Do you think, should it be possible to get cheap white labour from some other country, that it would have any effect upon the present wages of the miners?—Most distinctly.

10,176. It will tend to reduce them very considerably, will it not?—I should, say so.

10,177. Mr. FORBES: You think the white unskilled labourers, working with Kaffirs, do not exert themselves as much as they might?—Yes; my statement is really that the efficiency of white labour in this country is lower than that of other countries where white men do all the work themselves.

10,178. Do you think it would be possible to get sufficient unskilled white labour to make the mines independent of Kaffirs at a rate of pay the mines could afford to give them?—Under the existing conditions, no.

10,179. Mr. WHITESIDE: Will you tell us what you meant by existing conditions in your last answer?—I meant the present cost of living.

10,180. Therefore, under more favourable circumstances the answer would have been different?—Yes.

10,181. On the first page of your statement, headed "B," dated 29th of August?—Do you mean in my letter?

10,182. Yes, your letter dated 29th of August, in dealing with the question of rates of pay for native labour, I take it, the logical assumption to be drawn from the first four lines is that the reduction of the rate of pay is to a very great extent responsible for the present condition of these fields?—Well, I do not think that is a fair deduction from what I say there. What I meant when I wrote that letter was that I felt the reduction in the rate of pay seriously affected the number of Kaffirs coming to the Rand

at that time, but I cannot apply that to the conditions existing to-day, because the rate of pay has been enormously increased since then.

10,183. Well, it must have a great effect on the supply, because in your judgment the rate of pay offered here at that time was too low. You refer, I suppose, to the 30s. rate of pay?—Yes.

10,184. In the next line you refer to the question of the reduction of the rate of pay to natives as having been discussed at Capetown. Were you present at that discussion?—I was present at some preliminary discussions. I was asked to take a part, but I went to Europe afterwards, and had to give it up.

10,185. Can you tell us whether any estimates were framed as to the amount that would be saved by the reduction in the rate in native wages?—No.

10,186. There were no estimates framed?—Not to my knowledge.

10,187. In the last two lines on the same page, or to take the whole paragraph: "The present demand for native labour has never been equalled, and probably never before in the history of the Rand have so many circumstances combined to reduce the supply as at the present time?" Would you amplify that, especially the last sentence, "So many circumstances combine to reduce the supply as at the present time"?—Do you wish to know what I meant by that?

10,188. Yes, please.—I mean, in the first place the crops were good, and, therefore, the Kaffirs were not coming out in the same numbers as they would have come out had the crops been bad. Then, too, the Kaffirs had considerable sums of money in hand owing to the military operations, and by coming in contact with the military. That was known to be a considerable sum, and it was generally thought at that time (I do not know whether they had any personal experience) that the Kaffir was so well off that he would not come to work probably for some time to come. The third reason was the resumption of work here, which, of course, at that time did not amount to the demand before the war, but everybody was crying out for labour then, as they are to-day; the railroads, the mines and other industries.

10,189. But these conditions, such as excellent crops, and the amount of money that passed into the possession of the natives, are what might be considered a temporary state of circumstances. For instance as to the last one, the quantity of money they have in hand, that will pass away?—Yes.

10,190. So it is not likely to have a permanent effect?—No.

10,191. Then, on the next page, there is another sentence: "It is a fact that of all competitors for native labour the mining industry, which, in importance ranks first, offers the smallest inducement to natives to enter its employ." That referred entirely to the low rate of wages at that time. That is a matter which has been remedied since.

10,192. What is the maximum rate of pay you could afford to pay natives on the East Rand?—I have never thought it out, but I can tell you what our output is, our yields, and what our costs are.

10,193. Well, what is the highest rate boys are getting at present on the Rand, 60s.?—I will not say that is altogether the highest, because we have some special boys who are getting special rates, but 60s. is the highest rates for mining boys.

10,194. You go on to say that the rates paid by the railway constituted a serious obstacle to the recruiting of natives for the mines, and that the railway was asked to reduce the rate to that paid by the mines?—Yes.

10,195. So far, according to the evidence we have had here, the rate of pay is approximately £3 per month on the railway, and, consequently, there cannot be serious competition except in natives liking railway work in preference to mining work?—You must remember that this letter was written

in 1902, and these were terms on which the recruiting was being done by the Native Labour Association at that time.

10,196. There is another sentence I would like to know a little more about. You say: "I am informed that the railway is about to introduce a sweeping reduction in the pay of its white employees"?—Yes.

10,197. Was that intended to be generally applied to the railway system?—No, that applies to the previous sentence, where I say: "I do not think that the railway will readily accede to this proposition, for that organization probably fully realises the necessity of keeping its work going whatever the necessary rate of pay may be whilst endeavouring to reduce its cost in every possible way." Then comes the next sentence, which is a proof as to endeavouring to reduce costs. "I am informed that the railway is about to introduce a sweeping reduction in the pay of its white employees." That I know was contemplated at that time, but I could not say whether it has ever been carried out or not.

10,198. The first part, I take it, was applying more to the native labour?—It meant the railway would pay what was necessary to the Kaffirs in order to keep their work going whilst making every attempt to reduce their costs, and the pay of their white employees must come under these attempts.

10,199. The average rate of pay, I understand, for natives now is £3 per month?—I do not think that is the average.

10,200. Is it not so on your property?—No; our pay figures out at about 1s. 8d. per day.

10,201. What was the average rate before the war?—I think about 1s. 7d. I do not remember it exactly, but it is in my evidence that has been handed in to the Commission.

10,202. On page 4 you deal with the question of reducing the hours of work for the natives. Do you think if you were to do that it would have a tendency to make the mines more popular with the boys, and consequently have a very beneficial effect on the supply?—I think in respect of the mills, where boys are obliged to work all Sunday, it would be an advantage to reduce the hours of working. The custom in mills is to work the boys 12 hours. I think that is a mistake and that it should be eight hours.

10,203. Is that practice not fairly general now as far as boys in mills are concerned, viz.: to work eight hours and to follow the same shifts generally as the amalgamators?—Not in my experience. As to whether it would help the mines, most of the boys are not working 12 hours. All the drill boys come up as soon as they put down their hole, and as they usually only do one hole, they are generally up by 12 o'clock on the day shift.

10,204. With regard to the question of the boys' tickets, which you have dealt with on the next page, have you any knowledge of the boys being dissatisfied with the method of calculating their time, with having to work 30 or 35 days before their ticket is filled up?—No, I do not know that I have ever heard any complaints on the subject.

10,205. I see you make some suggestions here?—I suggest that it would be much better to work the boys a stated number of days. When the boy has filled his ticket, he should be deemed to have worked one month, I adhere to that.

10,206. We have had evidence on that point by other witnesses that there was dissatisfaction amongst the boys because they had to work, irrespective of Sundays and holidays or anything else, and fill a ticket of 30 to 35 spaces?—I think the average number of days on a ticket is 28? Of course if they worked on Sundays it counted. They would not stay any longer on that account.

10,207. At the present time are you allowed by the Native Labour Association to fix your own rates of pay for the boys?—Within limits.

10,208. You advocate it here, I notice, on the next page that a certain amount of latitude should be

allowed?—I think so. The only restriction is imposed by the Chamber of Mines. The Labour Association have nothing to do with it at all.

10,209. Is that the suggestion that an average rate of pay should be maintained as far as possible?—Yes.

10,210. Are you not allowed this amount of latitude that you suggest here, so far as the boys being paid by the truck are concerned? Can you not adopt that system if you wished to do so?—I can now, yes. You will notice we have a number of boys on piece-work.

10,211. In your memorandum, dated July 1902, you tell us that the present scarcity of natives on the mines is in all probability due to a combination of circumstances, some of which may lie within the control of the industry, while others palpably do not. Can you tell us what the circumstances are that are within the control of the industry?—Will you remember that that was written in July 1902, and that I was referring at that time to the low rate of wages. As far as my memory serves me that is what I meant.

10,212. Are these particular circumstances now done away with that you were referring to as being within the control of the industry?—I do not think there is anything in the control of the industry at the present moment that would increase the number of boys. Everything has been done in my opinion that could be done to increase the number of boys coming in.

10,213. If boys, at the expiration of their contract re-engage with you, are you charged by the W.N.L.A. as though they were new boys recruited by that Association?—I am not quite sure, I do not know.

10,214. Is not the working of rock drills extremely expensive?—Well, the experience of the last few months has been a revelation in the matter of rock drills. It has always been understood on the Rand that rock drills are very much more expensive than hand labour. My returns for this period handed in to the Chamber of Mines shows that rock-drill work on our mines, considering the rate of wages, the cost of keeping the natives in compounds, and the extraordinary efforts which have been made to improve their conditions and food, and so on, we find that rock drill work comes out at a shilling per ton milled lower.

10,215. Therefore it is cheaper to use rock drills on your property than hand labour?—According to these results it seems so. I must, however, make an explanation here. The Driefontein Mine is working with 110 stamps, and the Angelo with 60, so the bulk of our rock comes from Driefontein. The Driefontein is a rock-drill mine, and the Angelo a hand mine, distinctly, as opposed to a machine mine. The mining costs on the Angelo Mine are very much higher, in the ratio of 14 to 12, including tramming, hoisting, and pumping. So that the deduction from that with regard to the Driefontein would be that it would be more economical to use drills. I would recommend rock drills for Driefontein, but not for the Angelo.

10,216. What is the proportion of white men employed by using drills as against hand labour, I mean as against boys stopping with hand labour?—Well, that would require some calculation. I cannot tell you.

10,217. Speaking generally, do you consider that it requires more white men to run the drills than it would if hand labour was being employed?—Certainly.

10,218. Mr. PERROW: Have you given white unskilled labour a fair test?—I think we have.

10,219. For something like how long?—13 months.

10,220. And you find that in employing white unskilled labour that your mines will not pay?—I did not say that, Mr. Perrow. I said it would increase our cost if we employed them exclusively.

10,221. Do you mean exclusively, or in conjunction with Kaffirs?—Yes, exclusively. It would increase our costs 50 per cent.

10,222. What have you been paying your white unskilled labour?—Well, it has come to £15 per month. I think it was 9s. 10d. a day it came out at really. In the first period it was 9s. 5.004d., or in round figures, 9s. 5d., and in the second period 10s. 2d. For the whole period of 13 months it was 9s. 10.474d.

10,223. That is very low pay for the white men to live on in this country?—I think it is hardly a living wage myself.

10,224. Do you employ on your property to-day 3,500 natives?—Yes.

10,225. What number of skilled white men do you employ?—We have got about 700 at the present moment, but of course we are doing a good deal of construction work. I think if we had 7,000 natives we should be employing to-day about 1,200 white men, from 1,000 to 1,200.

10,226. Nearly 500 more?—Yes.

10,227. You are fully convinced that native labour is cheaper than white unskilled labour?—Oh, yes.

10,228. Mr. DONALDSON: In answer to Mr. Philip you stated that before the war there was a considerable loss in efficiency through the natives being drunk?—Yes.

10,229. Do you think there is any insuperable difficulty in the way of carrying out legislation which would enable the Kaffir to get liquor without his losing time in consequence?—I think it could be done. I know it. I know that it could be done, that the Kaffirs can be given a moderate amount of liquor after their shift without the slightest detriment to themselves or the mine.

10,230. The CHAIRMAN: In that connection, Mr. Hellmann, you stated that previous to the war 17 per cent. of the natives on the East Rand were off duty through drink?—About that, yes.

10,231. How do you arrive at the percentage of those who were off duty through drink and those who were off duty owing to other causes?—Well, I have no records for that period before the war. I have only kept records of that particular period since the war—I mean, the percentages. I know the percentages that are sick to-day and the percentages not working, but before the war I have no record.

10,232. Then the 17 per cent. figure before the war is made up of natives who were off duty from all causes?—Yes. The figure in our mine has been considerable. We have had a greater number incapacitated since the war than before.

10,233. That is rather an unusual experience?—It is our experience, and it is due to the epidemic of pneumonia that we have had to deal with out there. The returns for the last 13 months show that we have had at least 20 per cent. of our boys off duty owing mostly to diseases.

10,234. All causes?—Yes.

10,235. You have had only 80 per cent. turning out to work on the average?—80 per cent.

10,236. Previous to the war you had 83 per cent.?—Yes.

10,237. Then to say that the 17 per cent. was due to the drink is hardly correct?—No, it was from all causes.

10,238. Mr. Jennings gave evidence yesterday to the effect that on the average 90 per cent. were now turning out?—I think that is quite likely. I have spoken to Mr. Jennings and others about it, and they stated that the boys were turning out well as compared with before the war. That is not our experience, but our experience is not due to the boys themselves, but to the epidemic of pneumonia we have had on the East Rand.

10,239. Your death-rate has been very high, mainly due to that cause?—Yes, first of all to scurvy, which was prevalent out there some months ago, and after that to pneumonia. I do not suppose there are any compounds on the Rand which do more for their boys, and try to do better for them than we do. We have increased our

accommodation and improved the conditions enormously, but an epidemic of that kind we cannot guard against.

10,240. You speak of the short hours which the drill boys work. What do you say would be the average number of hours they work?—I should say the average number is about five hours.

10,241. And the average for all boys underground, what would that be?—Including drill boys?

10,242. Yes, including them?—We keep our boys shovelling and trammers down the mine, they are supposed to work ten hours, but including the drill boys, I suppose it would reduce the average to something like eight hours.

Mr. J. H. JOENS called, sworn, and examined.

10,243. The CHAIRMAN: Have you before you, Mr. Johns, a document headed "A Report of Sub-Committee on Mining"?—Yes.

10,244. You were a member of the Sub-Committee of the Chamber of Mines which prepared that document, I think?—I was, yes.

10,245. You took pains to ascertain the present and future requirements of the mining industry of South Africa?—Yes, we went very carefully into that.

10,246. You circularised all the registered mining companies, I think, in the country?—Yes, especially on the Witwatersrand.

10,247. Then do you confirm generally the evidence given yesterday by Mr. Jennings on the question of the present requirements of the mines?—I have not read Mr. Jennings' evidence.

10,248. Then do you confirm the figures given in this document marked "D"?—Yes, certainly.

10,249. This shows, I think, a present requirement in the Witwatersrand of 129,588 natives?—Yes.

10,250. That we are informed is assuming work to be done as at present, with the same ratio between the white men working and the natives?—Yes, under present conditions.

10,251. And it appears from this statement that under ideal economic conditions, an additional number of 48,000 natives would be employed?—Yes.

10,252. Making a total of 172,000. I understand, Mr. Johns, that you are now connected with the Coronation Syndicate's mining operations?—Yes, I am acting as consulting engineer.

10,253. Are you employing many natives there?—At present we are not. We have run very short of labour.

10,254. You are very short of labour?—We are very short of natives.

10,255. You could employ a larger number if you had them?—Yes, a very much larger number.

10,256. Can you express to us in figures the number you are employing now, and what you could employ if they were available?—The last return I got from the management showed 193 natives at present employed. Before our labour ran short we were employing nearly 500.

10,257. And if labour was available now, how many could you employ, Mr. Johns?—Probably about 500 at the present time.

10,258. You look forward, I think, to considerable development in that neighbourhood?—We do, yes.

10,259. In the figures supplied in this statement as to the natives required five years hence, has any allowance been made for the probable number working in the Heidelberg district?—I think not, except the natives which will be required on the basis of a 300-stamp mill. The 300 stamps is, more or less, a guess. We cannot possibly say how many stamps we shall want to run in five years.

10,260. Do you know how many natives were allowed in that figure for "Other districts of the Transvaal," for the Coronation Syndicate's properties?—I do not know; I am not aware that any were allowed.

30718.

10,261. You have had a long experience, Mr. Johns, on the Witwatersrand?—Yes, I have been here 14½ years.

10,262. You were connected for most of that time with the Ferreira Mine?—Yes.

10,263. What has been your experience during that period with regard to the supply of native labour. Have you usually had sufficient, or have you been short?—We usually had sufficient, because we had a special arrangement which we entered into about 13 years ago with some people on the East Coast. I think the Ferreira Company was the first company on the field to import labour from the East Coast.

10,264. Previous to the war, the Ferreira usually had sufficient labour?—Yes, we had sufficient.

10,265. It has been stated to us in evidence that some companies took advantage of that arrangement of yours to get from you any surplus which you could get up?—Yes, that is so, but for a very short time only.

10,266. What has been the experience of the Ferreira Mine since the war?—The Ferreira Mine, up to the end of November last, when I left it, was very short of natives, because it was not allowed to import its own natives. All the native labour was supplied by the Witwatersrand Native Labour Association.

10,267. Then you suffered in conjunction with other mines?—We suffered in conjunction with other mines.

10,268. What has been your experience of the attitude of the mining industry generally towards labour-saving appliances?—I think in every case the mines have adopted any labour-saving appliances that they knew of and which were suitable.

10,269. Would it be right to say that you invariably welcome the introduction of any such appliances?—Yes.

10,270. Do you confirm mainly the conclusion on this document marked "D" as to the supply of capital, means of transport, coal and water, which we would want, assuming we should get a supply of labour we required?—Yes.

10,271. Do you know of any condition which is likely to retard the mining development of this country, other than that of labour?—No, I do not.

10,272. The words used in the report are: "The sole unfulfilled condition necessary to the extension of this industry and the increased prosperity of the country is the supply of labour." Do you confirm that?—Yes, certainly, that is my opinion.

10,273. Mr. WHITESIDE: Mr. Johns, will you please describe the special agreement which the Ferreira Mine had in connection with the importation of boys from the East Coast?—There was no special agreement other than that we entered into a verbal arrangement with individuals on the East Coast, and who were able to engage natives for us.

10,274. I thought you used the words "special agreement" yourself?—I think I used the words "special arrangement."

10,275. Yes, well, during the existence of the special arrangement did you have sufficient labour on the Ferreira?—Yes.

10,276. Consequently the Ferreira Mine has suffered through its membership with the Witwatersrand Native Labour Association?—Yes, probably more than any other company.

10,277. You have something to do with the Coronation Syndicate, down at Heidelberg?—I have something to do with it.

10,278. Are there many natives employed there?—I think about 190 at present.

10,279. Is that the number you want for your present requirements?—No, the number we require at present is about 500. How many more we should employ if we had ample labour I cannot quite tell you.

10,280. Have you any knowledge of the mines round about Heidelberg?—No.

G g

10,281. Mr. PHILLIP: You have had experience of mining in other parts of the world besides the Transvaal, Mr. Johns?—Yes, in England and India.

10,282. Can you give us the conditions of mining in India, what kind of reefs you had, what your labour cost, and so forth?—Yes, I think I have a few notes. I was employed as manager of one of the mines in the Kolar Goldfields, Mysore. There the reefs were quartz veins, fissure veins. The gold was found in shoots in the reefs, not regularly distributed in the reefs as we find it here on the mines. In some mines the reefs were very large, and in others rather narrow, but on the whole they would be about 5 to 6 feet in width. At least 5 to 6 feet would be stopped. Before I left India we employed white men under a three years' agreement, and natives from the district. The natives from that district only worked for us for two or three years. We paid most of them 4 annas a day, and a few special ones 6 or 7 annas.

10,283. What would that come to per month?—Six annas would be, roughly, sixpence, or sixpence half-penny, and they feed themselves. We had so much difficulty in getting the work done by the natives that in some of the mines Italian miners were brought out as unskilled labourers. But before I left in 1888 most of the Italians had been sent back again, because it did not pay to keep them there. We had then to employ labour from the West Coast of India. The natives from there are known as Moplahs, they were half-breeds, really. They were far better workers and far more robust than any of the pure bred natives we employed. The percentage of Europeans employed about three or four years ago in Indian mines was 2.2 per cent.; Eurasians, who are equivalent to Cape boys here, 7.6 per cent.; natives 96.2 per cent. The natives about four years ago—I believe the conditions have not altered—were paid from 4 annas to 10 annas for the drill men. The natives there run the rock-drills, instead of the white men. The whites were paid as follows: Rock-drill men (Italians), £6 to £10 per month; timbermen (English), £13 to £18 per month; smiths, £18 to £22 per month. The men are usually engaged under a three years' contract, they are supplied with housing, light, fire, and servants when necessary.

10,284. Have you had any experience with unskilled white labourers here?—Not with unskilled white labour.

10,285. Mr. EVANS: Can you tell us who were the gentlemen who represented the Ferreira Mine on the East Coast before the war?—Our compound manager. Recruiting was done through the compound manager, who was acquainted with the men on the East Coast.

10,286. Did Mr. Mello Breyner act for you at one time?—At one time, but for a short time only.

10,287. Mr. Mello Breyner, in his evidence told us he was acting for the Ferreira Mine for a considerable period?—I do not think he was acting directly for the Ferreira Mine. I think it was done through the compound manager. He acted in forwarding the natives for the mine. Some years ago most of the compound managers had the getting of natives for the mines they were connected with.

10,288. Do you know who were these recruiters he dealt with on the East Coast?—I forgot the names for the moment.

10,289. Was Mr. McGarry one of them?—No; not that I am aware of.

10,290. You do not know what these recruiters are doing now, whether they are employed by the Association or not?—I have not the faintest idea. I gave Mr. Goodwin a letter to one, who did most of the recruiting for the Ferreira, when he first went to the East Coast after the formation of the present Association. Whether he made any arrangements with this man to get natives I cannot tell you.

10,291. You do not remember the name of this man?—No. Torre do Valle, I rather think, was the one at Delagoa Bay.

10,292. You do not know what he is doing now?—No.

10,293. Mr. DONALDSON: Mr. Johns, before the war did you find Kafirs stayed here longer than they do now?—Well, I do not think my experience would be quite the average experience on the Rand, because we got all our boys from the East Coast, and they remain much longer than other boys, therefore my experience on that matter would not be what you would get from the average mine on these fields.

10,294. These East Coast boys are particularly fond of liquor, are they not?—Some of them are.

10,295. Do you think of the boys who come from there know that they could get a supply of liquor that that would tend to increase their stay here?—Well, I think if they had to pay for the liquor, if they were all allowed to purchase the liquor, it would tend to increase their stay.

10,296. There was a good deal of trouble before the war with natives losing time through drink, was there not?—Yes. I believe the State Mining Engineer, in his report for 1898, gave the number of boys off work as 15.1 per cent.

10,297. Do you think there is any insuperable difficulty in framing and carrying out regulations which would enable boys to get liquor and not lose time through drunkenness?—I do not think there would be any great difficulty.

10,298. Then it is your opinion, unless I misapprehend you, that the tendency would be, if they get liquor under proper regulations, to stay here?—I think they would.

10,299. Do you agree with Mr. Hellmann that the longer they stay here the more their working efficiency is increased?—Decidedly. The native when he comes here has to be taught the most elementary part of his work, and he often does not stay long enough to be able to perform his work well. We found on the Ferreira a year ago that by far the best boys we had were those who remain longest. Those who remained longest were those who drank most. They spent their money and could not go home.

10,300. Then, do you think it would tend to increase the supply of native labour if under proper precautions they were given facilities for getting liquor?—If they were given facilities for purchasing liquor and the other stores that they usually do purchase when they have the chance, I think they would remain much longer.

10,301. Mr. GOCH: If the natives were to get liquor, would you give it them out in rations or allow them to buy it?—I should allow them to buy rations. The reason I suggest their buying it is that the more money they spend here the longer they remain and the more efficiency they attain.

10,302. Do you think it would have a very material effect in increasing the number you now get there?—No, I do not think so.

10,303. You appear to be 196,000 short at present, if we compare this table on page 9 of the statement "D" with the one filed by the Executive of the Chamber of Mines on page 4. The first column on page 9 shows at present 244,001 that is the number that you require?—Yes.

10,304. But in that you have included 5,244 for coal in Natal, which is not in the statement of the Executive of the Chamber of Mines, and you have included 16,500 for Rhodesia, which is also not in the Executive's statement?—Yes.

10,305. If you take these out and add what you have left out on this page, that is, 113,104 for railways and public works, and 58,465 on other than public works, if you eliminate the two I have mentioned and add the other two, you practically come to the same figures which the Executive submit, except that you put your requirements at 172,000 instead of 129,000?—The 129,000 were required under present conditions.

10,306. Yes, to go on working the mines as you now do, which is very derogatory to their interests?—Yes.

10,307. But to do it properly would require 172,000?—Yes.

10,308. Exactly; well, then, you will see in that column submitted by the Executive 197,598 are employed at the present time for all these purposes?—Yes.

10,309. Therefore, if you deduct that from what you have arrived at on this basis it leaves 196,454 as short?—That would be taking in the whole of the other mining districts and the railways.

10,310. Yes, excluding only Rhodesia and Natal, that is what is wanted now; in five years' time you will want 650,000. Therefore you have before you a shortage to work up to the possibilities of your industry of 452,976?—Yes.

10,311. That is shortage?—That is shortage.

10,312. You must have that supply before you can work out this scheme you have there, to work out the 18,000 stamps?—To carry out what we have arranged for within five years.

10,313. Considering the different ideas and schemes submitted to you as likely to increase the supply, can the supply ever attain to this number or any portion of it do you think?—Well, I think a very small increase from the fields we have been recruiting from in the past is possible.

10,314. The suggestion of giving the natives a drink would not help very much. It is not worth considering in connection with the question you have before you?—No.

10,315. Mr. QUINN: Did I understand you, Mr. Johns, to say that you think if the natives were allowed to have liquor, allowed to buy it it would increase the length of time they stayed here?—Yes.

10,316. On the principle that they spend money and could not go home?—Yes, so long as they were not allowed to purchase too much liquor and kill themselves.

10,317. You know as well as any man, I suppose, the effects of the old policy of allowing natives to buy drink?—If they are allowed to buy too much?

10,318. Do you think it is possible from your knowledge of the liquor people in this place, that it would be possible to frame any set of restrictions or regulations once you allow the trade in liquor to effectually control that trade?—Well, I would never suggest that the liquor people should sell to the natives. I would not allow that. If liquor is to be sold it should be sold under restrictions, and sold on the mines by those who can be trusted to sell only so much as the natives are allowed.

10,319. Well, I may be misunderstanding you, perhaps; I want to make it clear. Your point is that they must be able to buy sufficient, such an amount as would interfere with their savings and leave them without money to return?—No, I do not suggest that as far as liquor is concerned. I speak also about the stores they are allowed to buy at. Natives spend a fair amount of money in clothing, blankets, beef, mutton, and so on, and in soup made at the canteens, which I believe is made more as a draw than anything else. They formerly spent a lot of their savings in that way.

10,320. Suppose, now, you agree that they should have some liquor, it would not affect the purpose you have in view of making them work longer, unless they spend so much that they would not be able to get back as soon as they otherwise would?—That is what we find.

10,321. Do you think the native is any better for liquor?—Well, under certain circumstances, yes.

10,322. What are the circumstances?—Well, the natives coming up from the mines in very wet clothing, in cold weather, often get a chill, when, if they could get into a shed close by the shaft and get something warm, I do not say liquor—

10,323. Oh, well, that is all right. Do you not think, that, as a matter of fact that cocoa or soup is infinitely better than liquor can possibly be. Do you not know that that is an established fact?—Yes, I do not say that is not so. But in speaking of

liquor I was simply speaking of the stay of the natives in the past who spent their money in liquor.

10,324. So that, if it is an advantage for the native to be able to buy liquor on coming out of the shaft on a cold day he would get a still greater advantage by being able to buy soup or cocoa?—Certainly.

10,325. And that would leave him with the bulk of his money, so that he could go home in time?—Yes.

10,326. Do you know anything of the working of the Diamond Mines at Kimberley, De Beers, and those big mines down there?—Very little.

10,327. You are not aware that for years now these boys never saw liquor?—I do not know.

10,328. I can tell you that from my actual knowledge. Do you know anything of the system of mining down there?—Yes.

10,329. Would you say it is less arduous and less trying to the health and strength of the boys than gold mining, or more?—I think they work quite as hard as the boys do on the gold mines.

10,330. Yes, very much harder. Are you aware that the conditions are more dangerous in every way, and infinitely worse than they are in these mines?—Yes.

10,331. And yet they bring them up on ginger-beer and sour milk. It has been proved there beyond a doubt that this argument about giving boys liquor is a fallacious one except as far as the liquor trade is concerned, where, of course, it is a very powerful one?—I do not think there is any advantage in giving them liquor except in the way I stated just now, that when very cold I believe kaffir beer is very good for the boys, and when they are very weak kaffir beer is also good for them; so I have been led to believe by medical men.

10,332. Are not soup and cocoa, which are known to be very nutritious, better than Kaffir beer; even beef tea is very good?—I am unable to say.

10,333. I hope you will never advocate giving boys liquor?—One of the reasons I spoke of liquor was that many boys refused to come here because they could not get it.

10,334. Suppose they could get it, and for a time it improved the supply, the result, in a few years' time would damage your supply again. You are aware that under the old Government we were constantly going to them with petitions against this very thing?—Yes.

10,335. Leaving the liquor question alone, do you know the cost of working in the mines in India to-day with cheap coloured labour; do you know the cost per ton?—Yes.

10,336. Would I be right in saying I have an extract here from a mining paper which gives the working costs of mines in India, and which may be roughly stated to range between 30s. and 40s. per ton of 2,240 lbs. It also states that white labour is not a particularly costly item, as many of the white miners are Italians, who come to India under an engagement at £6 to £8 per month, and that the black labour seems to be very cheap?—That £6 to £8 per month is not the maximum. The average would not be £6 to £8 per month, and I expect that would be the minimum.

10,337. Leaving white labour out for the moment, can you confirm or contradict the statement that the working cost per ton ranges from 30s. to 40s.?—Yes, including royalty and depreciation of plant 50s. 6½d. was the average working cost of these mines during 1899.

10,338. Is royalty a big item?—Five per cent.

10,339. It would not affect the working costs to any material extent?—It would.

10,340. Is it 5 per cent. per ton?—It is 5 per cent. of the gold output.

10,341. Mr. WHITESIDE: You told us just now that your experience of length of time a native stayed in pre-war days might be not the general experience along the reef?—Yes, that is so.

10,342. Would you tell us what your experience was, had the boys stayed longer?—Much longer, because they were all East Coast boys.

10,343. You were on the Ferreira for quite a number of years?—Yes, between 13 and 14 years.

10,344. Did your boys get the same rate of pay as what the other mines were paying?—Yes.

10,345. So that the condition of your compound was better than other mines?—I did not think so.

10,346. Did you have many changes of compound managers?—We only had one for the last 13 years.

10,347. Therefore the personality of your compound manager has a good deal to do with the matter. I suppose the boys all knew him, and he was popular with them?—Yes, he was known before he came to the mine through helping to build the railway from Delagoa Bay and all the boys knew him.

10,348. Did they get any better food than the other mines were giving to their boys?—I should not say that the food was any better than the average.

10,349. What do you ascribe as the reason why your boys stayed longer with you?—All East Coast boys stay longer than those from any other parts.

10,350. Well, if that was the reason, it would apply equally as well to the other mines?—Yes, if they had the same proportion of East Coast boys.

10,351. They would have the same experience?—Yes.

10,352. The CHAIRMAN: The Commission is very much obliged for the evidence you have given. The public sitting of the Commission is adjourned until 2.30.

Mr. H. A. ROGERS called, sworn, and examined.

10,353. The CHAIRMAN: I understand, Mr. Rogers, that you propose to give evidence on the statements submitted to us by the Chamber of Mines?—Yes, I have a copy here.

10,354. Were you on one of the sub-committees which prepared the report for the Committee of the Chamber of Mines who got up the evidence for us?—No.

10,355. I understand you are prepared to give some evidence on the labour requirements of the outside districts?—Yes.

10,356. Will you tell us which outside districts you are best acquainted with?—I have special acquaintance with Buffelsdoorn and Eastleigh, in the Klerksdorp district.

10,357. Are any of the Buffelsdoorn companies working to-day?—No.

10,358. How many mining companies are there in that district with which you are acquainted?—Three—Buffelsdoorn, Buffelsdoorn A. and the Eastleigh Companies.

10,359. The Buffelsdoorn, I think, worked before the war?—Yes.

10,360. Did you employ a large number of natives?—Yes.

10,361. Do you know how many?—Well, I think the statement here which I have prepared will elucidate the matter.

10,362. With regard to what?—The subject of these outside districts.

10,363. The SECRETARY read the following statement:—

Johannesburg,  
August 22nd, 1903.

Statement by H. A. Rogers, Chairman for the Buffelsdoorn Gold Mining Company and the Eastleigh Mines, Klerksdorp.

I would like to draw the attention of this Commission specially to some so-called outside mines, such as Eastleigh and Buffelsdoorn.

I have been connected with the Buffelsdoorn Mine since its inception. The dominant factors have been native labour and fuel. The building of

the Klerksdorp-Kroonstad Railway will dispose of the latter item in the future, as a plentiful supply of coal at reasonable rates is assured, but unless the unskilled labour supply is augmented very considerably, we shall not be in a position to restart our works. It is well known that a vast amount of capital has been expended on this property, and we think we are entitled to ask this Commission to put our case prominently forward. The past records of the company show that though every effort was made to secure an adequate supply of labour, it resulted in failure. The supply was always short of the demand, of inferior quality, very dear and difficult to keep. We were always spending large sums of money in trying to reach our full complement, and never once did we succeed. The cost in wages was 2s. per shift, plus food and cost of procuring the supply of labourers, some 20s. per head, or equal to a total of 72s. per month per boy. Considering we were handling a low grade mine, it was impossible to make it successful in the face of these adverse circumstances. In the pre-war period we ran 80 stamps, and we had 880 boys working, whereas we required 1,500 boys to keep everything going, thus showing a shortage of 620 boys.

We have 170 stamps erected, and to keep this proposition going, we require the following unskilled labour.

Underground	-	-	-	2,450
Surface sorting	-	-	-	100
Tramming	-	-	-	150
Battery	-	-	-	50
Cyanide	-	-	-	165
General	-	-	-	400
Total	-	-	-	3,315

Probably we would at first only run 80 stamps, for which we would require 1,500 boys.

In the past, our working costs have averaged 23s. per ton; it is, I think, reasonable to assume that with other items, such as coal and dynamite, tending to reductions in price, and with an ample supply of labour at a reasonable rate, we should be able to work 80 stamps at a cost of 20s. per ton, and our full installation of 170 stamps at 17s. 6d. per ton. These costs would leave a fair profit on our grade of ore.

It will probably take us six months to unwater our mines, and to get ready for running the battery, but it would be suicidal to start this work until there is a reasonable prospect of obtaining the necessary unskilled labour. It will be evident to this Commission how urgent is our need.

If we contrast, say, the Ferreira Mine with Buffelsdoorn from the unskilled labour aspect, it accentuates the deplorable state we have got into still more strongly. The Ferreira has everything in its favour—high grade, close proximity to the town, a favourite mine with natives seeking work, &c., and even there we are so short of the class of labour we require, that it reduces our grade of rock, thus seriously and considerably curtailing our dividend-paying power.

Turning to the Eastleigh, we have a similar state of things. The mine was closed down on the 1st May, 1898. The principal cause of failure was shortage of native labour. There were 60 stamps erected, requiring 1,300 unskilled labourers, which includes allowance for wastage. The highest point reached was 800 working boys. Of the principal factors, coal, dynamite and labour, the two former items are now practically assured at workable rates in this district, so we again face the dominant factor of unskilled labour. Given a full supply of this labour, work could be started with every assurance of success. With the above facilities, working costs would vary from 22s. 6d. to 25s. per ton, which would leave a fair return for shareholders.

Annexed are some extracts from the records of the company bearing on the subject.

With these companies outside the Rand work could, under present circumstances, only be begun by spending large sums of money in the procuring of labour and paying higher rates of wages than

those ruling on the Rand. This would only accentuate the present state of things, and probably end in disaster to those attempting it. Therefore, our only sensible course is to sit still and wait events.

I would like to make it clear to the Commission that in working these properties rock drills can only be used to a limited extent, and that hand stoping is essentially necessary, for the reason that rock-drills create an excessive quantity of fines which are unsortable, thus lowering the grade of millable rock.

It might be well to consider the white labour question in connection with this problem. I compute that if these two mines were started up on a milling basis of 80 and 60 stamps each, over 200 white wage earners would be employed, and this alone would increase the white population some 2,000 round these mines and in the neighbourhood.

I would respectfully submit that districts such as these should have the special attention of the Commission.

(Signed) H. A. ROGERS.

EASTLEIGH MINES, LIMITED.  
EXTRACTS OF LETTERS EXCHANGED  
BETWEEN SECRETARY AND  
GENERAL MANAGER.

Secretary to Manager, 17th January 1898.

The Directors would, of course, like very much to join the movement to reduce native wages to Johannesburg scale, but seeing that we had enormous losses month by month, principally on account of shortage of boys, and further that we have just been put to great expense and trouble in procuring boys, they do not think it advisable to endanger our native supply at a saving of wages per month, because, if we are short of boys we will lose much more in one month than if we can pay them the present rate of wages.

Secretary to Manager, 24th January 1898.

Kindly inform us whether the loss we are making month by month can be attributed now to the rate of wages which we pay to the boys, because we understand from you that, given sufficient quantity of boys, your return could be kept up.

Manager to Secretary, 7th February 1898.

I consider the causes of non-success of the company have been entirely beyond my control. They have been primarily caused by scarcity of native labour, and you will note that as soon as an adequate supply is obtained your value of ore mined increases.

Extract of Letter from Klerksdorp Chamber of Mines to Directors, re General Movement to reduce Native Wages, 24th February 1898.

Should you not deem it expedient to join the movement, which will be much to the regret of the members, you will be preventing a reduction on working costs not only on your own mine, but also on every mine in the district, a circumstance which, in view of the unsatisfactory state in which most of them are working, will mean the gradual closing down of the mines and collapse of the district as a gold mining centre until better working conditions prevail.

Secretary to General Manager, March 31st 1898.

We regret very much to hear that you are so short of natives, which will, of course, put the prospect of working for a profit during this month out of the question.

Note.—The Eastleigh Mine closed 1st May 1898.

10,364. Do you hand that in as your evidence-in-chief?—Yes.

10,365. The district in which the Buffelsdoorn is situated is essentially a low grade district, I understand?—You would not call the Eastleigh a specially low grade mine, but the Buffelsdoorn is a low grade property.

10,366. What do you reckon is the yield of the Buffelsdoorn, working under favourable conditions as to labour supply?—Six and a half to seven pennyweights, that is won.

10,367. You are speaking of the Buffelsdoorn?—Yes.

10,368. Then what do you mean by saying that is won?—That would be won, not the grade of the ore coming into the mill; the grade of ore from the mill, cyanide and slimes altogether.

10,369. That would be something like 28s. or 30s. per ton?—Yes.

10,370. And the Eastleigh Mine?—I reckon would come to 1 dwt. or 1½ dwts. more. I reckon about 32s. 6d. to 35s. Of course, with favourable conditions, that is, stoping by hand labour. It could not be done by machinery.

10,371. Machine labour would seriously reduce the grade of the rock?—Certainly.

10,372. When was the Buffelsdoorn Mine originally started?—Somewhere about 1890 or 1891, I should think.

10,373. You have not been able to mill continuously since then?—Oh no.

10,374. You had two difficulties, mainly that of coal and native labour?—Yes. The coal difficulty, of course, will be overcome by this Klerksdorp or Kroonstad railway, which passes over very good coal.

10,375. Is that under construction at the moment?—It is one of the contemplated lines, and it has been surveyed.

10,376. Can you say, speaking generally, that the Buffelsdoorn has never had a full complement of unskilled labour?—It certainly never has had.

10,377. Would I be right in saying that you have made all possible efforts previous to the war to get a sufficient supply?—Yes I think we made more efforts than we should have done, considering our financial position. It was a great expense sending labour agents all over. We sent them to Pietersburg and Delagoa Bay, to the Cape Colony and to Basutoland before the war.

10,378. Did you not at one time make an attempt to settle a tribe of natives, or part of a tribe, on your property?—Yes.

10,379. Will you tell the Commission something about that?—Well, it looked a very favourable scheme up to the time of the closing down of the mine. When the war started it was increasing gradually as to the amount of labour we could obtain from this location. Of course the reason of this was that these boys could work in the mines and go back to their families for the week end, and that enabled us to get a certain amount of labour, but still, with that thrown in, and all our efforts, we could never get enough. Had that gone on it would have increased our supply, but I do not think it would have accomplished what we wanted. Perhaps, after a number of years it might have done so. Of course we had the advantage of having the ground, a large estate, and they were squatted on our ground.

10,380. Were these natives to whom you gave squatting rights brought from any particular districts?—No, they were mostly Transvaal boys.

10,381. Were they not any particular tribe?—They were what we call the Transvaal Basutos.

10,382. Did you bring a large number there at one time?—No, they simply came in from different parts in small numbers.

10,383. Did you give them any special conditions? No, we allowed them to squat on the ground, and their women to plough and to sow on the condition that they worked in the mines.

10,384. You did not charge them any rent?—No, we were very anxious to see if we could accomplish our end in that way. Of course a great drawback then was the free sale of liquor amongst natives, which kept things back considerably, as those boys squandered their money on drink.

10,385. We have had evidence led here to show us that the free sale of liquor tempted boys to stay longer?—Yes, but that kept back the efficiency of the labour very often.

10,386. Then, in addition to the ordinary rate of wages you were paying to any other boys, these natives had squatting rights?—Yes.

10,387. They were allowed to run their cattle and plough as much land as they wanted?—Yes, as much ground as their families wished to plough or use.

10,388. Do you think anything could be done on these lines with regard to mining generally by giving squatting rights to natives?—I think so, to some extent, but not anything like to the extent of the amount of labour we require. It would help us greatly in many cases where ground could be had, and where the companies have sufficient ground to squat these boys.

10,389. Very few companies have ground?—In the outside districts they could arrange to get ground, but of course nearer town it would not answer.

10,390. Do you think we might expect the native to squat in large numbers here on the Witwatersrand?—In moderate numbers; I would not say large numbers.

10,391. Do you find that natives work in your districts more readily than on the Witwatersrand, or does the Witwatersrand offer more attractions?—The Witwatersrand always had the advantage. The natives prefer to work here to working on outside districts.

10,392. Then you conceive a considerable appreciation of the numbers working here without any appreciable numbers going to work with you?—Yes.

10,393. Do you pay wages equal to what is paid here?—More.

10,394. And that did not help you materially?—No.

10,395. Does the evidence you are giving with regard to Buffelsdoorn apply generally to the conditions of Eastleigh?—Yes.

10,396. Have they a large estate on which they can give Kaffirs squatting rights?—I think they would have a fair amount of ground.

10,397. Have you tried working your mines to any extent with rock drills?—Yes. We have been obliged to, but the results have not been satisfactory. We have a large installation of rock drills at Buffelsdoorn.

10,398. What is the average width of reef you work?—It would be difficult to give an average, as it varies greatly and narrows down very fine, very often, the gold-bearing part, to a few inches, and in places the gold seems to go into the sandstone. Usually it is a narrow vein and requires very careful stopping.

10,399. Mr. GOCH: Are you acquainted with other mines in the Klerksdorp district?—No, not sufficiently to give evidence.

10,400. Besides your Eastleigh Mine, there would be various others in the same position?—Well, we have Buffelsdoorn "A," an offshoot of Buffelsdoorn, where the conditions are the same. It is next-door.

10,401. If you had labour you would start working there?—Yes.

10,402. How many boys would you require?—We would start on the 60-stamp proposition.

10,403. That would mean 1,200 boys?—Yes.

10,404. You know nothing about the Niekerk Mine?—No.

10,405. Mr. PHILIP: Has the Buffelsdoorn Mine ever paid?—No.

10,406. Have you ever been able to work it on a profit?—Never.

10,407. That has been owing to the want of boys?—Of course, at one time we had no proper installation of machinery up to a certain period.

10,408. I mean since you had the machinery. You think that both mines, if you had a sufficient number of boys, could be worked at a profit?—Yes, I know they would be worked at a profit.

10,409. I see you refer here to the Ferreira Mine. You are connected with the Ferreira?—I am Chairman.

10,410. Can you tell us what their position is to-day with regard to boys?—They have been better off during the last few weeks.

10,411. But what has been their position up to last month? How many boys short?—I should say that last quarter we were about 400 hammer boys short.

10,412. Was that all you were short?—Yes, but we shall be working a bigger mill soon, and shall require more labour.

10,413. What is the full complement of the Ferreira?—The full complement is working on a basis of 80 stamps, which would mean about 2,000.

10,414. And 400 boys is all you are short?—Yes.

10,415.—There must be about 400 or 500 short now?—Yes.

10,416. What has been the result of that shortage?—The result lowers the grade of ore, through the working of rock drills.

10,417. Have you done away with sorting?—No, we are keeping up sorting.

10,418. What has been the result as to profits?—The results make a difference as to profits, but I would have to go into figures again before I could tell you.

10,419. How do your profits compare with what they were before the war?—We were paying £3 per share before the war.

10,420. What were your average monthly profits before the war?—Close on £30,000.

10,421. What are they to-day?—We range up to £20,000.

10,422. That cannot be all owing to the shortage of only 500 boys. You must be short of more boys?—We were short, but I am speaking of the present time.

10,423. You are connected with a good many other mines here?—Yes.

10,424. On several other mines the same conditions apply to-day?—Yes. There are several I know of.

10,425. Do you think the object of the directors in keeping these mines running at such a considerable loss of profit is in order to keep the white labour here?—Well, their idea is to do the best they can.

10,426. Do you think it is the best you can do for the shareholders to work under the present conditions?—Personally, I am against it.

10,427. Do not you think if you were to shut down the mines entirely until you were able to get your full complement of boys, it would be far better in the shareholders' interests?—It certainly would.

10,428. But you think that in order to keep the white employees here it would be much better to work the mines on a smaller profit, rather than close them down?—Quite so.

10,429. Mr. BRINK: Before the war, when you were getting boys to squat on your estate, you were drawing them from the neighbourhood and different parts of the Transvaal?—They were Transvaal boys, mostly living in the district of Krugersdorp, squatting on different farms, and it answered their purpose to squat on mining ground.

10,430. And you were paying them the same rate or even higher than they were earning here?—Yes.

10,431. Naturally that would be a very much higher wage than a farmer could afford to pay?—Oh, yes.

10,432. That would be drawing them away from the agricultural community?—Certainly, that is exactly what happened.

10,433. Mr. PERROW: I think you have been connected with mining for a great number of years?—Yes.

10,434. I think you stated you started in Buffelsdoorn about 10 or 12 years ago?—Yes.

10,435. You have spent a lot of money in the mine at Buffelsdoorn?—Yes.

10,436. You have not made much profit?—No. We have made a loss.

10,437. Through the scarcity of native labour?—Absolutely. The last time we started we had everything else in our favour. Of course there was the coal also, but that one difficulty we have got over now, and we are left with the other. We had everything in our favour except these two items when we started the last time, and I think we had 400 to 500 boys more, even then. The margin, I know, was very small against us.

10,438. I think you mentioned that the rock in two or three mines averaged from 28s. to 32s. per ton?—Yes.

10,439. That is milling and cyanide?—Yes, and the slimes.

10,440. And it cost about 22s. to 23s. per ton to get it?—In Buffelsdoorn it was 23s.

10,441. That was with hand labour?—No, we used drills.

10,442. Is that Buffelsdoorn?—All development is by drills.

10,443. You would much rather work your stopes by hand labour?—It cannot be done in any other way to make a success of it.

10,444. I think your reefs in some parts are very small?—It narrows very considerably in parts, but in others it widens out.

10,445. And, of course, when the reef is very small you want to go through the ground as narrow as you can?—Yes.

10,446. I think you mentioned that you had water in some of your shafts now?—We allowed the mine to run full. We have not done any pumping there, as there would have been no object in doing so.

10,447. You cannot see your way clear to pump the water until you have sufficient labour to run an 80-stamp mill?—That is so.

10,448. Mr. WHITESIDE: Mr. Rogers, what was the usual rate of native pay during the period of time covered by your statement?—I think I gave it there, and I computed it at about 72s. per month.

10,449. Is that amount to be taken as an average rate?—Yes, I think so. I think it would be a little more if it were carefully gone into.

10,450. What rate of native pay do you think these mines could afford to pay?—65s. including food.

10,451. Could you afford to pay that?—Yes, yes.

10,452. Why did the Eastleigh close down in May, 1898?—Well, I think the last extract from the manager's report tells you that, if you will turn to the last page.

10,453. Of course, this statement was only handed in a few minutes ago, and this copy is so badly typed I can hardly read it.

10,454. If you take almost the last paragraph on the last page, you will find it in the letter from the Secretary to the General Manager.

10,455. So it was entirely a question of the shortage of natives that compelled this mine to close down?—Yes. I have gone very carefully into the records of the Eastleigh, and I am perfectly certain it can be worked at a profit.

10,456. What is the reason that boys prefer the Witwatersrand?—I can hardly say. It is a well-known fact that they always crowd as near a town as they can get. We got a certain number on this location and that helped us.

10,457. Can you tell us what the rate of dividend has been for the Ferreira, say, during the last five years, leaving out the war?—During the last five years it has been £3 per share.

10,458. Has that rate of dividend been maintained since the resumption of operations?—No.

10,459. What was the last dividend?—The last dividend was 15s., equal to 30s.

10,460. What was the lowest rate of dividend ever paid by the mines?—I think we started with something like 7½ to 10 per cent. in the early days.

10,461. Consequently you are not at your lowest period now?—No, that was in the early days, when we had not proper machinery, and we did not know the value of the mine. Our period of prosperity was when Mr. Johns introduced sorting, then came big profits.

10,462. It is not a fair question that the Ferreira Mine is being run as a philanthropic institution to keep white men employed?—No, I do not think I should agree to that.

10,463. Notwithstanding that the shareholders are making a big return at the present time?—Of course the public make the value of the shares.

10,464. The CHAIRMAN: We are very much obliged to you Mr. Rogers for the evidence you have given us.

Statements of the following witnesses were handed to the members.

10,465. Mr. WHITESIDE: Mr. Chairman, are we supposed to cross-examine on this statement now?

The CHAIRMAN: That is as the Commission desires.

Mr. WHITESIDE: Then I object, for one.

10,466. The CHAIRMAN: Will you agree if it is read out?

Mr. WHITESIDE: We have already taken one statement put forward by Mr. Rogers, and it was put in front of me so badly typed that I could hardly read it, and now I am expected to take this statement and cross-examine on it. I object to do so, it is not a policy followed so far.

The CHAIRMAN: Of course, we have taken some witnesses without any statement at all.

The public sitting of the Commission will be adjourned until 10.30 to-morrow morning.

## TWENTY-FIFTH DAY.

Thursday, 10th September, 1903.

THE COMMISSION SAT AT 10.30 A.M.

Mr. J. A. HAMILTON called, sworn, and examined.

10,467. The CHAIRMAN: Mr. Hamilton, I think you were a member of the Sub-Committee of the Chamber of Mines Committee dealing with the financial aspects of the Labour question on the gold mining industry?—Yes.

10,468. Have you before you the general statement of the Chamber of Mines?—Yes, I have.

10,469. Have you also before you the report of that Sub-Committee of which you were a member, and which we know as Annexure "A"?—Yes.

10,470. In the general statement of the Chamber of Mines, paragraph 18, reference is made to the indirect loss owing to the hanging-up of a certain number of stamps, which are at present idle?—I see that.

10,471. If the stamps numbering 3,420 which are now idle could be set in motion, there would be a further increase in the gold output amounting to £11,000,000 sterling?—Yes, nearly double the present output per annum.

10,472. Then the statement gives, in paragraph 19, the typical case of a company which at present is only working a portion of its stamps?—Yes, 60 stamps out of 100.

10,473. And which could reasonably expect, within a few years, to increase its stamping power by another 100 stamps?—Yes.

10,474. A calculation has been made showing the annual loss which that company is now suffering through want of labour. What is that loss?—The present loss, after making all allowances, is £122,873 per annum.

10,475. That is for one company alone?—Yes.

10,476. Do you know if that would be typical of many companies on the fields, viz.: a company with at present 100 stamps erected, and only using 60, and having such life as to justify the erection of another 100 within a couple of years?—There is some element of the technical about that, but, speaking generally, I should say it is typical of all companies of the same grade, and having the same number of stamps.

10,477. And the same area of ground to work?—And the same life, yes.

10,478. Certain figures are given there showing what amount of money would be spent annually in salaries and wages to white men if the stamps now hung up could be got to work. What is that figure, Mr. Hamilton?—£1,985,463, or nearly £2,000,000 a year, would be spent in salaries and wages to white men if the stamps now in existence could be dropped.

10,479. And then you state a further sum here which could be spent amongst the mercantile community and coal companies?—Yes, over £2,000,000 would be spent in trade accounts.

10,480. These two figures together make a sum of £4,000,000 sterling?—Yes, a round sum of £4,000,000.

10,481. Per annum, which would be spent locally, exclusive of native wages?—Yes.

10,482. If these 3,420 stamps were now dropping?—That is so.

10,483. Will you now turn to Annexure "A," to that portion of it dealing with finance, and will you tell us, Mr. Hamilton, approximately, what you estimate the loss in dividends to investors now is through these stamps being hung up?—The present estimated loss in dividends is only £2,924,947.

10,484. The loss of profit would be £4,179,924?—But, reckoning that 70 per cent. of that only is divided, the shareholder is now receiving roughly £3,000,000 a year less than he would if these stamps were being dropped. There is a decrease in profits of over £4,000,000.

10,485. Then these shareholders, owing to the war, have been without dividends for quite a number of years?—Yes.

10,486. The effect of that suspension of the payment of dividends must also, I take it, hinder, to a considerable extent, the subscription of further capital for new companies?—It decreases the inducement for people to put money into the country.

10,487. The general statement of the Chamber of Mines goes on to show the number of stamps which would be erected within five years, given a sufficient supply of unskilled labour?—That is 11,000 odd.

10,488. Yes, 11,000 additional stamps would be erected in something like five years?—Yes.

10,489. Witnesses, competent to speak on the question, have indicated to us that there would be no difficulty in getting capital for these companies. Can you give us any idea what the total expenditure would be in connection with the erection of these 11,000 stamps, and the development of the mines to feed them?—Well, sir, the Chamberlain report, dealing with very much the same figures, estimated the capital expenditure upon new stamps and development at £50,000,000. I, myself, have had a typical case worked out for me by our engineer, at fifty millions, or, roughly, between four or five thousand a stamp. This particular case does not come to quite so much, but I do not think it matters in a case of this kind to five millions more or less. We will take it at £40,000,000.

10,490. To develop and equip?—Yes, up to the crushing stage.

10,491. For these 11,000 stamps you estimate an expenditure of something like £40,000,000?—Yes, between forty and fifty millions.

10,492. Can you tell us what proportion of that expenditure would be spent locally?—Yes, it divides itself into three heads: the sinking of the shafts, the development and equipment. The amount spent locally and over-sea for each period under each head of course varies, but the total spent over-sea, after deducting local profit, that is the actual net amount that would have to go abroad in payments is estimated at 30 per cent., and 70 per cent. would be spent locally.

10,493. You mean to say that you worked out the figures?—I have figures with regard to a case involving the expenditure of, in round figures, one million sterling. Of that £400,000 is put down for over-sea expenditure, less a local profit of 10 per cent. That leaves a net 30 per cent., or £300,000 to go home for machinery and plant, leaving £700,000 to be spent on the spot.

10,494. For that typical case?—Yes, which established the percentage which I have just given you of 30 per cent. over-sea, and 70 per cent. to be spent locally, out of the total estimated capital expenditure of £400,000 to £500,000.

10,495. Then, figuring on these percentages, the £40,000,000 figure you have given us would mean an expenditure over-sea of £12,000,000, and a local expenditure of £28,000,000, spread over five years, if the labour supply was adequate for the requirements of equipping and developing these 11,000 stamps?—Yes.

10,496. Have you made any sub-division of the figures as regards local supplies and wages?—This statement is merely the headings of over-sea materials and labour, but I gather that the whole of the material is treated as over-sea material, and that the 70 per cent. is practically all spent in labour. As a matter of fact the material supplied, whether it is bought locally or specially imported, is allowed for in the 10 per cent. I take it that the whole of the 70 per cent. appears here as labour.

10,497. Then the 12 million in the case of the total 40 millions would include, no doubt, a considerable percentage which would be actually spent in the town and locally to local merchants?—Undoubtedly, but the local profit is allowed for in the 10 per cent. The local people would only have the handling of the money as regards the other 30. They would have to send it away, still it would be trade to them.

10,498. Can you tell us, Mr. Hamilton, the value of the Transvaal imports at present?—I have a statement here from the Chamber of Trade of Johannesburg, which gives the figures, quantity, and value of the goods imported for the twelve months ending the 31st December, 1902. I will give you later on the 1903 figures. The year 1902 gave a total of thirteen millions. These are the imports.

10,499. Can you bring that more up to date?—Yes; for the half-year ending 30 June, 1903, the total was £11,400,000. That is at a rate of twenty-three millions a year, which we are importing now.

10,500. Have you any figures as to the export?—Yes, our exports for the year ending the 31st December, 1902, were £7,400,000, of which £7,232,000 were gold.

10,501. Practically all gold?—Yes, practically.

10,502. And since that period?—The exports for the half-year ending the 30th June, 1903, were £5,700,000, of which £5,579,000 were gold—again practically all gold. We are importing at present about twelve millions a year more than we are exporting, and in addition to having to pay for these imports, we have to pay interest on our debt, which is roughly one million a year, £900,000, to say nothing of the interest on the contemplated addition to our debt, and we have also to send home the dividends, which would work out at about three millions a year. These go home, most of them, so that in addition to paying for the imports we send home four millions a year in interest and dividends, making a total of 27 millions a year. We are exporting £11,400,000 on the basis of the last half-year. We are running into debt, therefore, at the rate of 15 or 16 millions a year.

10,503. There must be a limit to that, I should think?—I should say so.

10,504. You have not supplied us, Mr. Hamilton, with any statement, but you have come to be cross-examined generally on the statements of the Chamber of Mines, especially with regard to the financial aspect of the question. Is there anything else you would like to say before being cross-examined on what you have now stated?—I should just like to mention two points. One is that the whole of our arrangements and the structure of things commercial and otherwise at present is based upon a considerable increase in the population and trade of this place. If you take, for example, the land included in the municipal area, the six-mile radius, I think you will find that that is laid out to carry certainly half a million of population, and that the municipal valuation of that ground is based, not upon its value as ground on a producing basis, but on its assumed value as ground for residential purposes. The figures given show that it is quite impossible for Johannesburg to grow or for the country at large to develop in such a way as to justify these figures on our present production. I should like to have gone into the question of bank deposits and so on, to show how things are moving, but I have not had time to do that, but in the few minutes I had, I found that in one particular month there was a decrease of one million in the deposits of one bank and in another bank a decrease of £600,000 in another month, both in the last six

months or so. That does not prove anything, but it is suggestive, and it might be worth while to follow it up further.

10,505. Anything else?—In regard to the figures of imports and exports, I should like to call the attention of the Commission to a sentence from the speech of the Chairman of the Chamber of Trade the other day. He calls attention to the figures of the Customs, which practically mean the same thing: "It appears that the country is enormously overstocked, and in the near future we shall have great depression in commercial circles unless we get the mines started." That is quoted from a speech delivered two days ago.

10,506. Mr. QUINN: Who is the Chairman of the Chamber of Trade?—I do not know, sir.

10,507. Mr. Solomon, is it not?—It may be; I do not know.

10,508. Does it not give his name in the speech?—I am not reading from the speech. This is a newspaper cutting.

10,509. It is Mr. Solomon, who is engaged in mining. I understand you to say, Mr. Hamilton, that we were importing something like twelve millions now per annum more than we were exporting?—Yes, I have figures showing that.

10,510. Now in the exports, is gold included?—Yes.

10,511. What is the amount of gold given there?—Well, it is nearly the whole total of the exports which I gave you. The exact figures for the half-year ending the 30th June, 1903, totalled £5,700,000, of which gold was £5,530,000.

10,512. Mr. WHITESIDE: I believe in pre-war days the industry suffered a good many disabilities which are now removed. I mean, for instance, the dynamite monopoly. Is it not the case?—I would rather not speak on any technical point at all. There are other witnesses who have spoken or who can speak on these points. I am here merely to speak of the figures produced, assuming them to be correct.

10,513. But this is not a technical point. It is from a financial point of view that I am putting my questions. Can you tell us what would be the estimated saving from the new order of conditions with regard to the sale of dynamite?—No, sir, I cannot.

10,514. Mr. PHILIP: Have you got a detailed table of the imports there?—Yes, I have.

10,515. Can you tell us what amount of food-stuffs are imported?—For the half-year ending the 30th June, 1903, food-stuffs, corn and grain (would cover it I think), were £470,000.

10,516. For the whole year?—No, sir; for the half-year.

10,517. And flour, is that not included?—Yes, that is £245,000, making altogether £715,000 for the half-year.

10,518. Can you tell us what the imports of such things as butter and meat and so forth come to?—Butter is £183,000 for the half-year; there is £50,000 in biscuits.

10,519. And canned foods?—Candles are £80,000, and cheese £28,000.

10,520. There is roughly imported a million pounds' worth of food-stuffs that we could produce ourselves if we had the labour?—Yes, and the facilities of bringing it to the markets.

10,521. With reference to your statement as to the expenditure of £40,000,000 to work 11,000 stamps, could you furnish us with a detailed statement as to how that money would be expended as regards freight, home cost, etc.?—I could do it in time; I could split up the cost into as much detail as possible.

10,522. Mr. EVANS: It has been suggested, Mr. Hamilton, that there is not much depression on the Rand at present, and that if things go on improving at the present rate that there is not much danger ahead. Can you see any reason for such an optimistic view?—No, sir, I cannot.

H h

10,523. It has also been urged that the development of this industry should be regulated by the supply of labour available in Africa. That is, that if we have not enough native labour to work out a proposition in, say, 25 years, then we should wait and work it out in 50 years, when labour is forthcoming. What would be the effect of the adoption of such a policy as that?—Well, I should say in the first place that it is doubtful whether you would ever get it worked out at all, because it may pay to work out a thing in 25 years, and not pay in 50; but estimating that it is only the shareholders' loss, I still think that that is a policy the soundness of which to the country as a whole is open to very grave doubt. It seems to me that you have to generate here by means of the mining industry sufficient motive power to start into activity the industries of the country as a whole, including the agricultural industry. It may be quite possible to run this country in such a way that at the end of a certain number of years you would have nothing left but holes in the ground and a cemetery on the hill. In order to do that you would require a series of monumental blunders carried on through a long number of years, but the thing is merely possible, and whether you get that result or not, and whether you use the gold got out of the ground in creating other industries, in employing your men to get out gold in order to employ other men in growing wheat and various other things, depends altogether upon whether you create enough energy in the centre to, as I say, start into life the trade and industry of the country. To say that it is the same thing whether you work out the gold in 50 or 25 years seems to me very much the same as if you were to say: You take a boiler and you want to get steam up, and it requires so much coal burnt for a certain time to get up the steam. You say, no, we will burn half the coal for twice that period. You will not get your steam. Suppose you want to hatch chickens in an incubator. That requires a certain temperature maintained for a certain time. I think it would be a mistake to apply half the temperature to the incubator for twice the time. I do not think you would get your chickens.

10,524. So in your opinion the effect on the country of the adoption of that policy of regulating development according to the available supply of labour may be disastrous. It would leave holes in the ground and a cemetery on the hill, and nothing else?—Exactly.

10,525. Now, supposing a sufficient supply of unskilled labour was obtained, have you formed an idea as to the extent to which that would probably increase the white population on the Rand? Have you any estimates on these lines?—Well, I cannot answer that question now. I think, under favourable conditions it is not wildly optimistic to hope for a population of half a million, but I have not gone into the thing in detail. Take, for instance, the 3,700 stamps which are now hanging idle, and which would employ 6,000 more white men. I think these are figures given in the Chamberlain report, which shows 20 per cent. married men, that would give us 1,200 married men, which men would each represent five persons. That would give at once 6,000 people, which works out at a total of whites directly concerned of 12,000. Then, of course, there is the question of the indirect population that it would attract, which is very difficult to estimate. All these persons would attract other persons to supply their wants, and so on. I think the addition of so many thousand additional white workers would mean a remarkable increase in the general population.

10,526. Now, is this a correct statement of your estimate of the actual losses of the commercial community owing to the present insufficiency of labour? Yearly amount which would be spent locally on supplies, coal, and wages to white men if stamps now erected could be dropped, £4,000,000. Capital expenditure during five years on the erection of 11,000 stamps, etc., say £40,000,000 or £50,000,000, out of which you estimate about £30,000,000 would be spent locally, or per annum £6,000,000?—Yes.

10,527. That makes a total of at least ten millions, which would be spent yearly if only the

labour was forthcoming, which is not being spent now. Is that fair?—Roughly so, but that is either too much or too little, because the six millions a year to be spent on contemplated stamps includes native labour, and the four millions to be spent in regard to the 3,700 stamps now hung up does not include native labour. It is only white labour and trade costs. So it is ten millions, plus the cost of native labour attached to the 3,700 stamps, which is roughly about two millions more.

10,528. But I take it the loss is ten millions for the first of the five years only, because the amount that could be spent would go on increasing as the new stamps came into operation?—That is so.

10,529. So that the loss to the community is £10,000,000 for the first year and an increasing loss from there on?—Yes.

10,530. Mr. QUINN: Mr. Hamilton, in these elaborate calculations, showing the working cost now as compared to before the war, can you make clear what is the price of dynamite, or what is the saving on dynamite to the industry now as compared with before the war?—I came here to give you a certain class of evidence, and I decline to give you any other evidence.

10,531. But in this financial statement, in which elaborate figures are used to prove certain points, Mr. Chairman, we are entitled to press for these figures.—The CHAIRMAN: I think Mr. Hamilton is entitled to answer any questions, of course, if he has any information, but if he has not, of course he cannot answer you.

10,532. Mr. QUINN: You cannot tell us what the saving in coal or dynamite is?—No, I am absolutely ignorant of the details of practical mining work.

10,533. But I submit, Mr. Chairman, that this is not a statement on the details of practical mining work. We have a statement here prepared by all the financial geniuses on the Rand.—The CHAIRMAN: All of them, Mr. Quinn?—No, not all, there are one or two on the Commission that I forgot. Mr. QUINN: These calculations are made with a view to prove certain things. Now, when we ask this gentleman, who is as able as any man in the country, to tell us—to answer this question, what is the saving on coal, dynamite, etc.—he refuses to tell us.—The CHAIRMAN: There are many witnesses capable of giving that information.—The WITNESS: What report are you looking at?—Mr. QUINN: The one signed by you, and headed "A."—The WITNESS: That report is divided into two sections; what section are you referring to?—Mr. QUINN: It is the one over your name.—The CHAIRMAN: I think, Mr. Quinn, this is only a waste of time. Mr. QUINN: I should like to put the full value on Mr. Hamilton's evidence, but if he refuses to give us this information his evidence must lose all its value.—The WITNESS: I do not know the price of dynamite, nor the saving effected on the purchase of dynamite on the mines.

10,534. MR. QUINN: Nor coal?—Nor coal.

10,535. For native labour?—No, nor native labour.

10,536. Thank you. I understand you to say that you did not care to answer.

10,537. MR. PERROW: If you had sufficient native labour you could work eleven thousand stamps and spend forty millions of money in five years?—The report says, that given sufficient native labour you could work 11,000 stamps in five years, and I have given the Commission, to the best of my information, what it would cost to work them.

10,538. And twenty-eight millions would be spent here, more or less?—Yes.

MR. R. VON HARNACH, called, sworn, and examined.

10,539. The CHAIRMAN: I understand that you are compound manager on the Crown Reef?—Yes, sir.

10,540. Have you before you a memorandum sent by yourself?—Yes.

THIS VOLUME IS TIGHTLY BOUND

10,541. Do you hand it in as your evidence-in-chief?—Yes.

10,542. The statement was as follows:—

STATEMENT BY MR. R. VON HARNACH,  
OF THE CROWN REEF G.M. CO.

I am an Austrian by birth; arrived in South Africa 21 years ago; went in 1883 to Matabeleland, and after that to Lake N'gami; am fairly well acquainted with the ways and conditions of the South African natives; am Compound Manager on the Crown Reef G.M. Co. both before and since the war.

The pre-war conditions in Johannesburg required an ever so much firmer handling of the natives in the compound than at present, on account of their drink-soddened condition, want of discipline, and general moral decay.

It took me several months to bring the efficiency of the natives up to a certain point; at last the average percentage of working boys reached 95 per cent. for the months of April till August, 1899, inclusive.

After a few months the boys were quite contented without drinks, and I managed, by constant vigilance, to keep them in good order till the outbreak of the war. I had then about 1,800 boys.

The food consisted before the war of good mealie porridge ad lib, and once a week a pound of butcher meat (front quarters). In addition to that the natives made "macheo," a sort of gruel made of mealie meal and flour. The management ordered afterwards the killing of slaughter oxen, so the boys received about a pound and a half of fresh meat once a week.

I do believe the food was not varied enough, as we have had a considerable number of scurvy-sick boys in those days.

Since the conclusion of the war, the general treatment of the natives in the compounds is ever so much better; they are well looked after and well attended to.

The general way of bearing of the natives at present, the unmistakable, hilarious disposition, their playfulness and humour, shew a remarkable improvement in the degree of their contentedness in comparison to the pre-war days.

It is quite a pleasure to see them, after returning from work, and hard work at that, taking their bath in the two swimming reservoirs in the compound, yelling, shouting, laughing, like a lot of merry children; this is, to any man of average observing propensities, an unmistakable sign of their mental condition.

Likewise on Sundays, the day has hardly come when one hears out of the different rooms laughing and shouting, and an hour afterwards they appear arrayed in war attire starting to dance and career about the compound like young bucks, keeping it up the whole day.

There is only a very small proportion of natives of a morose disposition; they are not found amongst the East Coast boys, but are Cape Colonial natives, Amaxosos, Gaikas, Fingoes, and Pondos. Though of a higher intellect, they seem to be saturated with a great amount of hatred and animosity towards the white man; they are habitual grumblers, and always discontented, unfaithful and notorious deserters.

Out of a gang of 76 engaged for six months I only have 25 in the compound left, and there are still about two months unexpired.

Before the war I had a gang of 72 engaged for six months; they just lasted two months, the last one had deserted by that time. It is positively wrong and misleading when some of the witnesses before the Labour Commission make such sweeping statements and speak about a general discontent amongst the natives in the compounds; why should so many natives, after working in town, return to the compounds?

After working hours, they are at liberty to go where they like; special passes are always given to them, particularly on Saturday afternoons and Sundays; they may go on Saturday and return on Sunday evening.

No white man in the company is allowed to strike or ill-treat a native. The General Manager has discharged white men for doing so, and all complaints are brought to the notice of the manager.

It is also one of my duties to protect the natives, and see that their working tickets are properly marked. It occasionally happens with underground contracting men that they do not mark them properly. In a few of these cases, however, the reason is brought home to the native himself through not having done the work he had to do, but I must say that there are only a very few complaints in regard to this matter.

In our compound the natives are given overcoats to go to the shaft, and also when they return after work, and they are told to use them, particularly after coming up from the shaft. There are some who do not avail themselves of it, and get occasionally laid up with a severe cold, and even pneumonia.

In regard to food, since the conclusion of the war, I cannot but confirm the statements made before, by other responsible people, that it is much better and more varied than before the war.

To begin with, every native coming up from the shaft is given a large pannikin of hot, sweetened, really good coffee, with milk; while drinking it they cool down and go to the compound, where they can have as much porridge and macheo as they like; the same refers to the natives who are going to work in the morning. They eat warm porridge before they start work; coming back from work they again get coffee, eat warm porridge, and drink macheo.

Twice a week they are given per head a pound of good, wholesome meat, and about three-quarters of a pound each time of vegetables, consisting of potatoes, cabbages, onions, carrots, etc.; and twice a week they are given about a bottle and a half of Kaffir beer each, made in the compound. They enjoy it very much indeed, and I am certain that distribution of beer and vegetables accounts for the fact that we have not had a single case of scurvy during the last six months.

I made it a habit, for nine years, to test the food of the natives regularly, and put questions to them referring to it. I heard no complaints. Each tribe has its own cook; all that they desire is more meat.

But in regard to meat, as is well known, natives are insatiable, and I would like to bring to your knowledge the fact that the day before the British troops entered Johannesburg, the natives of the Robinson and Bonanza broke loose, looted the slaughter poles, and killed about 200 head of cattle, and, of course, polished them off in one day. So much in regard to their craving for meat.

It is worth the trouble to study the different gangs of East Coast and Northern Transvaal natives, when they arrive here, emaciated, lean, weak like convalescents, and compare them three or four months after, well rounded in their limbs, of glossy, sleek appearance, and all this in spite of hard work; but even hard work, when once accustomed to, is no hardship any more.

In regard to the housing question, it is not risky to state that 90 per cent. of all the natives working on mines and sleeping in the compounds have by a long way better accommodation than they had in their own homes.

In our compound there are 63 rooms, each 20 by 30 feet, which are occupied each by 10 to 20 natives; always brothers and friends occupy each room—one of the essential conditions for making them contented. They have their fires burning winter and summer, as a native is never happy without one.

Between 4 and 5 in the morning the night-shift boys return, eat their food, and go to sleep. In my compound they are never disturbed till about

11 o'clock a.m., when the inspector goes round to find the sick boys, and an occasional loafer.

When overtime boys are required, which does sometimes occur, they are only allowed to work three or four hours, so as to have sufficient rest again before going on night shift. Of course they are paid for overtime.

Any native who complains of feeling ill, or who is found in his room and pretends being ill, is without exception brought to the hospital for medical inspection. In the hospital they are cared for and attended to in a way which leaves nothing to be desired. A highly qualified medical doctor attends every day to their medical and surgical wants; they get meat, vegetables, bread and milk every day. Their baths, etc., are as the modern principles of humanity demand. In fact, I believe we overdo it, as only a few days ago an old consumptive Zulu told me he will never go out of hospital, though he is in it about seven months.

A good many natives attend a mission school, just behind the compound, and others attend church service on Sundays when the missionaries come; in the latter case I stop all dancing in one yard till the service is over.

I do not believe in treating the natives in general harshly, but firmly they must be treated; instead of always grumbling and snapping at them, which way makes them afraid to approach their only protector with possible real grievances, and eventually they get tired of such condition, and go.

A few kind words when they go to or return from work will do a great deal of good, because they see that there is some one who takes an interest in their welfare.

Yours faithfully,

(Signed) RICHARD VON HARNACH,  
Compound Manager.

10,543. The CHAIRMAN: You have been 21 years in South Africa?—Yes, a little over.

10,544. How long have you been on the Rand?—I have been in the Transvaal since 1885.

10,545. You are well acquainted with natives?—I am.

10,546. How long have you been compound manager of the Crown Reef?—From about a year before the war.

10,547. And you occupied a similar position on any other mine?—No, I stayed on the mine all through the war as caretaker.

10,548. How many natives did you employ on the mine before the war?—I had 1,800, and in addition we had about 300 Indians. Even then we had not enough.

10,549. You had not enough?—No, sir.

10,550. How many had you on the mine when you took up the position of compound manager?—About the same number, but I must tell you one thing. We had 1,800 officially, but as the Pass Law was so miserably handled, we had a good many boys who did work and had tickets, but were never on the book. I tried to get some passes, but it would have created a horrible row, because the Government were sitting on the Crown Reef to a certain extent. I tried my best, and negotiated with the pass inspectors to get passes for those boys who had none, but it was out of the question. As soon as I mentioned the point, they spoke of fining the company a thousand pounds or two thousand pounds. Then, when I discharged the boys, 250 were arrested for being without passes. In spite of that we had not enough boys.

10,551. Did the condition of the boys improve during your management?—Oh, greatly.

10,552. Do you know what percentage was usually off work?—When I started, about 17 to 20 per cent. were off work, 12 to 14 per cent. from liquor. As I mentioned in my statement, the number quite drink-sodden was very great, but I managed in three or four months of really uphill work to get as much as

95 per cent. to work. I kept a record for four months, and the rest of the time only a very small percentage was in hospital sick. I treated the boys very severely—firmly. They told me that they would kill me, but in spite of that I succeeded in stopping the liquor trade.

10,553. Do you regard the treatment of natives in compounds as better now?—Very much so.

10,554. Is the food better?—Oh, yes, more varied; the food they had before the war was right enough—mealie pap and meat once a week, and a gruel made of mealie pap and flour slightly sour. The boys liked it.

10,555. But, speaking generally, the feeding and conditions in the compounds are very much better than previously?—Ever so much, especially the treatment.

10,556. What do you mean?—Well, boys have no drink, and they are treated as they should be treated, and no one interferes with them as long as they do their work. Before I had to keep them back on Sundays, and could not allow them off the property, because by the time they got 200 yards away they were drunk. Now they are at perfect liberty to go where they like on Sundays, and every day they can go out when they have finished their shift.

10,557. Do you find any attempt made to supply them with liquor?—Oh, yes, you must always be on the *qui vive*, but it is not to any great extent.

10,558. You would not favour the introduction of a system by which liquor was sold to them in moderate quantities?—By the liquor dealers? I should rather think not. It would bring us back to the old state of things again.

10,559. You do not think it would induce natives to stop longer?—I have a number of boys in my compound, and they do not find it necessary to get it in the same shape as they did before the war. They get Kaffir beer, which they like very much, and the East Coast boys who are used to drink red wine mixed with brandy, they take to Kaffir beer, and it is quite harmless and does them a lot of good. Supposing we got more boys up to work, the influence of the boys who only came up because they could get liquor would be damaging to the other boys, and we should lose more than the 10 per cent. that the extra boys would represent.

10,560. You think, on the whole, the Kafirs are well satisfied?—The proof is that they get offers made by townspeople to get £1 or 30s. per month more than they get on the mines. When they have tried this they work two or three months, and then they come back to us and say, "It is not nice in town."

10,561. Then the mines are as popular as work in the town?—I cannot speak for the other compounds, but I can speak for my own compound, and the boys in my vicinity are treated all the same, on the Crown Deep, Langlaagte, Robinson and Bonanza.

10,562. You can speak for the other compounds as well as your own?—Yes, I can.

10,563. You do not seem to be favourable to Cape Colony boys as workers in the mines?—No, sir, because experience tells me they are the very worst for the work up here, particularly if they are under a six months' contract. Before the war I had a gang of 72 Cape Colony boys engaged for six months' contract. At the expiration of two months there was not a single boy left, they had all deserted. On the 4th April, I got another lot, engaged for six months, and though they have still two months to run, I have only about 25 left. More than 66 per cent. of them have deserted.

10,564. The Cape Colony boys do not stick to their contract?—And the Basutos the same. They do not like six months' contracts, because they are agricultural boys. They have got a piece of land to sow and reap, and if they do not go in time, then they lose their season for sowing.

10,565. Apart from the question of the length of contract, is the Cape Colony boy a suitable workman for the mines?—Yes, as a surface boy. He would

never go underground. If he is only engaged for month to month, then he earns as much as he can in a month or two and goes home again.

10,586. You say the native's desire for flesh food is insatiable?—It is a known fact in South Africa, that you can give a nigger as much meat as you like, and he always looks for more.

10,567. Do you think that increasing their supply of meat would make them more contented?—Oh, yes, rather. If you give meat to a nigger, he will do nothing else but eat it.

10,568. You say he would never go home?—Yes, he will go home eventually if he has saved money enough. But if he is well treated, if he gets better food, rich food, he stays longer.

10,569. Some witnesses told us they did not think there was sufficient hospital accommodation provided for the natives?—The witnesses who said that did not know, that is all.

10,570. I am speaking specially of Basutoland. They say the boys make complaints when they return, that when they were sick they did not have any special attention?—If a boy gets a scar on his hand, he wants to go home. Now, I am not willing to let him go, because I know the effect of it. No sick boy in my compound is allowed to go home so long as he is sick. We cure him first, and then we send him home if he is incapable of finishing his contract.

10,571. Are there any suggestions you can make to the Commission in the way of better or different treatment by which the natives could be made more satisfied than they are at present?—More meat. (Laughter.)

10,572. No other suggestion?—Very little else. They would be treated with fairness and justice, and given a sufficient variety of food. I do not think it would be advisable to pay them more money because they earn quite enough for what they do, if you compare it with white men's labour. I mean skilled labour. Then if they get more money, of course they would go sooner home.

10,573. That is a point on which we had a good deal of evidence. Is it your experience that the more money the native gets the shorter the period he works?—I am positive that is so.

10,574. You are quite certain?—Why the boys stayed so long here before the war was because they spent their money in drink. They were no good to the company, and no good to themselves, but when they found at the end of twelve months they had no money left, they were compelled to start another twelve months' contract or stay on from month to month as they liked. That is the reason why they stayed here longer.

10,575. Mr. EVANS: Do you know how the compounds here compare with those in Kimberley?—Yes, I know a little bit about it. Before the war the compounds at Kimberley were better kept than in Johannesburg, and the boys were better treated.

10,576. But not since the war?—I do not think there is any ground of complaint now in comparison with Kimberley. I know Kimberley from a long time ago, 1883 or 1884, but since then I have not been there.

10,577. But you have heard the condition of affairs?—It is only hearsay evidence, and I do not think you want that from me.

10,578. What are the boys you refer to who prefer work on the mines to work in the towns?—Those are East Coast boys mostly, and Transvaal Basutos or Transvaal Shangaans. They simply go to the town for a few months and then come back to the mines.

10,579. Would not that be to a great extent because their brothers and friends are on the mines?—At the present, I have only five or six Transvaal Basutos and Shangaans altogether. There are not many coming out at all. Where they work—I do not know if they work at all.

10,580. What are your boys?—East Coast boys.

10,581. All of them?—No, we get a sprinkling of Swazies, Matabele boys, Transvaal Basutos, Trans-

vaal Shangaans, Basutos from Basutoland—rather more from there, because I have a few small contracts—and then there are Cape Colonial boys, Amatongas, Pondos, and Fingoes. But the majority are East Coast boys.

10,582. Do you know what were the wages paid the natives working on the mines during the war?—Yes, I do. They were paid £1 per month. They got meat once a week. They broke away from two of the mines—the Bonanza and Robinson Deep—shortly before the British came up. The officials scouted. They forgot to pay the poor devils. (Laughter.)

10,583. That is the incident referred to in your statement?—Yes.

10,584. Mr. PHILIP: I see that you talk in the second paragraph about the drink-sodden condition of these natives before the war. Did it interfere very much with their efficiency?—Yes, when I came there were about 20 per cent. off work.

10,585. Could these boys who habitually drank—could they do anything like as much as the men who did not drink?—No, sir. It is a logical fact that if one gets drunk to-day he is to-morrow incapable of doing anything.

10,586. I do not mean when they were drunk, but when they were sober. Did these drinking boys do as much work as the ordinary natives?—No, sir, it is impossible. The boy who is incapable from drink to-day has a sick headache to-morrow. He tells you he has been drinking, and then he is off for a day or two lying sick. It is not the whisky that we occasionally drink, it is absolute poison.

10,587. You are strongly of opinion that it would not do to give them brandy again?—I do not say that. I say I would most decidedly object to the boys being supplied with liquor of a certain class, even by the authorised people, because it would take away the whole control of the boys again. If it is done, let it be done under strict control. I do not think it would benefit any of the mines unless it was given in the form of a stimulant twice per day. Some of the boys need something to stimulate them.

10,588. Mr. FORBES: Can you say how long the East Coast boys generally stay on the mines—I mean from first to last?—A boy before the war stopped very much longer than a boy since the war.

10,589. How long have they worked since the war?—We have been working since November, 1901. Some boys have gone home, and some are still here; some are re-engaged. Out of about 400 boys, East Coast boys, whose time was over, 141 re-engaged for six months, and some for twelve months. A good few in addition to that re-engaged from month to month.

10,590. Can you say how many years a boy puts in from his first visit to his last—how many years does he put in altogether?—I can only take an average. I could give you individual cases of boys who were here before the war, and are still here. But the majority go home when they have completed a twelve months' contract. As I say, I have had 141 re-engaged for six or twelve months, but about 70 or 80 of these have given notice now to leave. They stayed about three months after their contract time, making fifteen months. You can only make a fair average, and I put it at 15 to 18 months.

10,591. You cannot say how many years' work a boy does in his life?—In his life? Well, I really do not think a boy comes up a second time. They do, some, but in very few cases, because they try to accumulate as much money as they can, and then settle down at home. That is my experience in the compound.

10,592. You do not think they often come back a second time?—Not very many come back. Not because they are not satisfied with the work, but because it is characteristic of the native of South Africa to do as little work as possible. As soon as he has got sufficient riches to settle down at home, he has no need to work according to his opinion.

10,593. Mr. QUINN: What percentage of boys used to be sick or drunk in the compound previous

to the war?—Well, the percentage of boys sick was about 5 or 6. When I took the compound over there were about 14 or 15 per hundred sick owing to drink.

10,594. Would it be fair to say that when you took over the compound you found 20 per cent. off work?—Yes, approximately. Of course it got less and less as long as I stopped there.

10,595. Yes, I should judge that from your evidence. In April, I see, you managed to get 95 per cent. of your boys down to work?—I should be very sorry if I could not get down more than that. I have about 14 per cent. off from drink at present, and a few sick, about 20 or 30 boys altogether out of 330.

10,596. What is your percentage now?—Three per cent. off work approximately from sickness and other causes.

10,597. Do the company pay you by results?—They pay me fair enough.

10,598. Do they give you any bonus?—Yes.

10,599. On the efficiency you get out of your boys?—No, I do not get that, I get a bonus every year like other members of the staff. I consider myself quite well treated by the company.

10,600. I am not suggesting that they do not treat you well, for a minute. I was wondering whether, in the case of a compound manager who gets 97 per cent. to work, they would give him any recognition, because it is a good thing?—No, they do not.

10,601. They may think of it now after this?—As a matter of fact it is my duty to do it.

10,602. I understand you to say all the compounds are not alike?—No, not quite.

10,603. Therefore, that means that some compound managers are not so successful in handling their natives as you?—On the mines every man has to do his duty, and if he does not do it he is removed. We have no room for sentiment on the mines. Every man has to work.

10,604. I think you misunderstand me. There is nothing more remote from my mind than sentiment. I am talking now of business. I am trying to find out from you about other compound managers. If a man can get 97 per cent. of his natives to work, that is a very high percentage, and I am aware of a good many mines where they do not get nearly that. I want to know whether you know of them?—Yes, I do know of them.

10,605. Do you know why it is they do not succeed in getting so big a percentage as you get?—You had better get some more compound managers and examine them, they will give you the reasons. It is hardly fair on my part to run down other managers who may have to work under far greater difficulties than I do.

10,606. It may be because of difficulties?—It might be the disposition of the boys. Their boys might be more dissatisfied, or they might have got a lot of boys who came down in an emaciated, sickly condition. They may have sick boys to the extent of five per cent. There are many reasons why I do not want to speak about it. You must examine them themselves, and they will give you the reasons. It would be hardly fair on my part to attempt it.

10,607. Can you suggest any means—taking a commercial view still, not a sentimental one—can you suggest any means with a view to getting better results generally out of the natives than we do today?—Yes, there are a few items, but I do not know whether I should bring them forward. They are not directly in connection with the management of the mines; they concern the Government. One slight grievance we have, if you ask me the question, is that whenever a boy is off work without any legal reason, he is brought before the Inspector, and the Inspector fines him. To bring him before the Inspector the boy must be off another day. If the compound managers could be sworn in, as J.P.'s they could settle all such trivial cases, without bringing the boys specially before the Inspector, and the result of the cases would be laid before the Inspector

when he came round. When you take into consideration that you had a considerable aggregate number of cases per year, it can be seen that you might make your percentage by this means higher still.

10,608. Do I understand you to say that the compound managers should be made justices of the peace with the necessary powers to deal with boys and report afterwards?—Yes.

10,609. You think that would effect a big saving to the company?—It would improve things to a certain extent.

10,610. Have you made a suggestion to your employers?—Not to my employers, but to the Chamber of Mines. They asked my opinion, and I gave it to them.

10,611. How many natives have you in your compound now?—333.

10,612. Are you very much short?—Yes, in three weeks time there will only be 700 or 740.

10,613. If you get no more in the meantime?—There are none to be had in the meantime, because the railway has got all the boys this month.

10,614. How many boys do you want to get your full complement?—I think before the war we had 1,800 boys and over 300 Indians, and then we had not enough. I presume, we require about 2,500 boys, without wasting any of them.

10,615. How many stamps are you dropping?—120.

10,616. How many were you dropping before the war?—120.

10,617. You have got 800 boys now?—333.

10,618. So that you are managing to get your stamps dropped with about a third of the labour which you had before the war?—Yes; but it may be because of a wrong system. There is a great difference in running the pick of everything into the mill. That is the reason why we can still supply; but that not always. The mill has to stop if we have not sufficient stuff to get down.

10,619. You think you want twice as many labourers?—No, three times as many.

10,620. So that to make up the difference you work the mill as best you can in order to keep the stamps running?—Just so.

10,621. And to work the mine to the best advantage you would want another 1,600 boys?—Yes.

10,622. You are getting them dropped with 800, but you want 1,600 more?—Yes.

10,623. Do you think it would pay your company to give the natives still more meat?—I dare say, yes. If you take a horse and feed him better, then you get more work out of him. The same with a boy.

10,624. As a matter of business do you think it would pay, instead of giving them meat twice or three times a week, to give it them much oftener?—That would really be for the mining people to say. I do not think my humble opinion would be of much value to the Chamber of Mines. As a matter of fact it is evident that if you give a boy meat to eat every day, he would like it, and would be still stronger. We know that ourselves. But if my opinion is of any value I should say that for a boy to get meat every day would not be of any great importance.

10,625. I think your opinion on this particular question is as valuable as that of the Chamber of Mines.—Of course it would benefit the boys.

10,626. We have not got half such interesting evidence out of the Chamber of Mines as we have out of you. You are perfectly satisfied, then, that the whole system of allowing the boys to get liquor a bad one, and you would never suggest that again?—I would rather resign my position than act as manager under the former conditions.

10,627. You find now the boys are bright, cheerful, and happy?—They are like children. I mean the East Coast boys in particular.

10,628. I see that in your compound you facilitate their going to school if they wish, or having their little services?—I do not interfere with them. If

they wish to go to school, let them go by all means. They have their services in one of the yards, where absolute quiet is maintained.

10,629. Do you find there is a large number of boys who are rather fond of this kind of exercise; rather fond of their services?—I cannot say a large number—a considerable number. They go and sing songs, religious songs, and march about. You know what boys are.

10,630. This is an important point in my mind at any rate. Do you think that allowing them to do as they like in this matter without interfering with them, adds to their pleasure in life? Do they enjoy it?—A small portion of them do, yes. The others do not take the smallest notice of them. I may say some of the so-called "school Kaffirs" have a tendency to avoid Sunday work, even when it is absolutely necessary. I must tell you that it is a characteristic fact. They are told in the church by the teacher that Sunday work is against religion.

10,631. More power to them; I hope they will continue their opposition. Six days a week is enough for any man to work, black or white.—I mean work which has to be done.

10,632. Mr. EVANS: Can you give us the percentage of boys off on account of drink just before the war, that is after you had been in the compound some little time. What was the total in the middle of 1899?—About one or two per cent., because the sick boys got considerably fewer, so that the total of boys off work was about five per cent., of which about two per cent. was on account of drink. That was in my compound. I say nothing about any other compounds.

10,633. When would that be?—That was in the months of May, June, July, August, 1899.

10,634. Mr. WHITESIDE: Do you have many boys applying locally—volunteering—for work?—Yes.

10,635. Do you take them in?—Oh, rather. I engaged in March and April close on 300.

10,636. Volunteer boys?—Yes, I prefer such boys although they are most of them monthly contract boys. They just do the work, one ticket, and if they do not like it they give a month's notice. Then they go home. There are no desertions among these boys.

10,637. Does the Native Labour Association prevent you from having voluntary boys?—No, never.

10,638. It is not against their rules?—No.

10,639. But you are made to suffer for it. You have your allowance stopped on account of these boys?—If I get by private industry 300 boys it is a good thing for the company.

10,640. If you get 300 boys by your own private interest the company does not get the benefit of them?—Of course it does.

10,641. Your company may get that particular 300 boys, but it is in place of the boys allowed to you by the Native Labour Association?—No, it is not; these 300 boys are above my 700 which I am supposed to have. I am allowed to keep the boys.

10,642. Mr. PERROW: You mention 800 boys in the compound?—833.

10,643. And you are running 120 stamps?—Yes.

10,644. Before the war you had about 2,500 boys?—No, I do not think so. I said about 1,800 and 300 Indians.

10,645. That is about 2,100?—Yes.

10,646. I think before the war you employed the majority of your boys in hand drilling?—Yes, they were mostly engaged in hand drilling.

10,647. And to-day you use machine-drills?—Yes.

10,648. It has been stated to this Commission that one machine-drill is as good as ten natives?—Not quite so much.

10,649. So that the majority of your boys to-day are running drills, doing the work with machines instead of doing it with their own labour?—Yes,

machine-drills are ever so much more expensive than boys. Boys make labour cheap. We could make a better dividend by employing exclusively hand drills.

10,650. You could not keep going your 120 stamps with 830 boys if you did not increase your rock-drills?—No, of course not.

General OLIVIER, called, sworn, and examined.

10,651. The CHAIRMAN: I think, General Olivier, you live in the district of Winburg, Orange River Colony?—The Lindley District.

10,652. Did you hold any official position under the late Government?—Yes, Justice of the Peace.

10,653. Are you engaged in farming in that district?—Yes.

10,654. What size farm do you live on?—1,500 morgen.

10,655. Do you cultivate any large part of it?—Yes, a large portion.

10,656. How many morgen do you cultivate?—Between 40 and 50 morgen.

10,657. How many natives do you require for all purposes on your farm?—I am allowed five families. In the five families there are generally a number of young natives, so that I have from 10 up to 20 Kaffirs on the farm. From 7 to 10 is about the number continuously employed on the farm.

10,658. Have you that number now?—No, I have only three families now.

10,659. Is what we know in the Colony as the Plakkers' Wet, the Squatters' Law; does that same law apply in the Orange River Colony?—Yes.

10,660. Is it enforced by the Government?—I cannot say that it is in proper working now, because Kaffirs are not settled there the same as they were before the war, although at present a large number of Kaffirs are not allowed to stay on the farm without working.

10,661. Was the law well carried out previous to the war?—Yes.

10,662. It was well carried out?—Yes; I am speaking of my district.

10,663. Are there not seasons in the year that you require a larger number of Kaffirs to work on your farm than from 7 to 10?—Yes, sometimes I require a larger number, and that is why we have families on the farm. At certain seasons, for instance, when we are sowing and when we are reaping, we require a larger number. When we do not require them, about half the Kaffirs on the farm go and look for work elsewhere. When they come back the others go out and seek work. So that continually half of the Kaffirs on the farm are working out in other districts—in Johannesburg, or somewhere else—and the other half are at home.

10,664. What is the average size of a farm in your district?—Nearly all the farms are from 1,400 to 1,500 morgen, with the exception of a few of 2,000 or 3,000 morgen. There are also a few of about 500 morgen.

10,665. Does every farmer work as much ground as you do?—No.

10,666. Would they work as much ground if they had sufficient natives?—I cannot exactly say that, because some farmers are cattle farmers; stock farmers, and some like to work, and some do not like to work.

10,667. Can you give us any average number of natives which we might calculate on, referring to your district, that each farmer wants all the year round?—You mean both agricultural farms and stock farms?

10,668. Yes, give a figure for each, if you can?—The average number is from eight to ten, that is, taking the large farms with the small farms.

10,669. Yes, those were agricultural farms, and from eight to ten is the average number. What is the average number required on a stock farm?—The

average number required on a stock farm would be from 10 to 15. We put these Kaffirs at outposts on the farms, the Kaffir will never live by himself, and each outpost has to have a family, and this causes the number to be larger than the number required on the agricultural farms.

10,670. Are you speaking now of your own district, or do these figures apply generally to the whole Orange River Colony?—I am speaking only of the Lindley District.

10,671. From his knowledge of the Colony generally, would the Commission be safe in taking such figures and applying them to the whole of the Orange River Colony?—Yes, I think you might take that as being correct.

10,672. They are very much higher than any other witness has given us?—It may be.

10,673. Are you not including men, women and children in that figure?—I am including males from 12 years up to full-grown natives, because these little boys of 12 I use for looking after the calves, and that sort of thing.

10,674. Then, according to your statement, you require a larger number of male natives on a stock farm than you require on an agricultural farm?—Yes, and I will tell you why I am saying this. You very seldom find a farmer who only farms in stock, and who does not also do some sowing.

10,675. Is there a plentiful supply of Kaffirs on the farms in the Orange River Colony at present?—We can obtain sufficient Kaffirs there, although we cannot employ them all, because we have not sufficient food on the farms, and the Kaffirs have no food either.

10,676. When the country is thoroughly settled, and we get normal conditions, are you satisfied that in your district you will have sufficient Kaffirs for the work which the farmers want to do?—Yes, I decidedly think that.

10,677. Do you think any number of Kaffirs will leave your district to come and work on the Rand?—Yes.

10,678. Are there a number from this district working here now?—There are not many, and I will give the reason. In the first place the Kaffirs who were employed by the military obtained such good wages that they considered they had sufficient to keep going for a little while. Secondly, they had to stay there to draw up their claims for compensation, and, thirdly, they cannot leave now because they may be called up at any moment to appear on behalf of their claims. When this is over, when the compensation has been paid up, then a large proportion of Kaffirs will come to work here.

10,679. What wages do you pay the Kaffirs on your farm?—We do not pay our Kaffirs who live on the farms, for they have ground to till for nothing. In the good old times, when we sent our waggons away the day they returned to the farm, we used to give the leaders of the waggon 10s. and the drivers £1. Beyond that their only payment is the crops they produce and reap on the farms. They reap as much as from 200 to 300 bags.

10,680. Then, these natives who stop on your farm are not paid any money?—No.

10,681. Are they expected to work every day?—That is just the difficulty. The Kaffir never, or hardly ever, works every day with the exception of the reaping season. For one week then, or perhaps two or three, or as many as we require, he may stay at work the whole week through. Then on Sunday they leave, and two or three others come and take their places.

10,682. How many weeks in the whole year does the Kaffir work on the farm?—It is very difficult to estimate that. I do not think they work a full half-year.

10,683. In saying that you think there will be sufficient Kaffirs for the work in your district, can you give me any opinion with regard to the number of Kaffirs available for the whole of the Orange

River Colony. Do you think in the Colony generally they will have plenty of labour for the farmers?—It is difficult for me to state, but during the last six months I have been living in the town of Lindley, and I cannot tell how many families came to me to ask for permission to come and live with me, and I have refused.

10,684. Probably you have a very good name amongst them?—Well, I have never been without Kaffirs.

10,685. Mr. EVANS: Have you any idea how other farms are off for Kaffirs?—Yes, there are some farms on which there are none.

10,686. Generally in the Orange River Colony is the supply of Kaffirs equal to the demands of the farmers?—Before the war we always had sufficient. Now it is very difficult to say. There are some people who cannot take Kaffirs now.

10,687. That is, they cannot take them because they cannot feed them?—Yes.

10,688. Before the war, then, the supply was sufficient as far as the agricultural requirements were concerned?—Yes.

10,689. What is the average wage of a Kaffir on a farm?—The usual wage used to be from 10s. to 15s. a month. This was paid by some farmers who had no Kaffirs living on their farms, and used to hire them from their neighbours' farms.

10,690. Would high wages on the mines be likely to draw those Kaffirs away from the farmers and deprive the farmers of their labour?—I do not think that, because the Kaffir has to do his sowing, and also, he does not like to leave his family. Usually they have from six months, and when they come back another lot go.

10,691. Yes, well, have you any idea as to the number we would be likely to get with high wages on the mines?—No, that is difficult to say.

10,692. Do you consider that high wages on the mines are in the interests of the agricultural community?—Yes, I decidedly think so, because the money stays in the country and it circulates amongst us.

10,693. How would you treat Kaffirs squatting on Government land? Would you allow them to squat freely on Government land?—No, they should come under a master.

10,694. You would prohibit squatting on Government land?—Yes, very strongly.

10,695. Are there any locations in the O.R.C.?—Do you mean where there are large Kaffir kraals?

10,696. Yes, where there are large Kaffir kraals, and where they have lands of their own which they cultivate upon the tribal system?—The only two places are Witzi's Hoek and Thaba 'Nehu.

10,697. Do you think it wise to encourage that system, the system of locations; or would you be in favour of breaking up the tribal organization?—I am in favour of breaking down that system.

10,698. Then, as to squatting, are you opposed to any Kaffirs having any land as a tribe under a chief?—Yes, I am opposed to that. That is where all the trouble is brewed. All the evil breeds there. Kaffirs who have done any harm go there and you cannot discover them.

10,699. Then what do you advise as regards the Squatters' Law? Do you advise its rigid application, or amendment, or what do you advise?—I am in favour of the law that Kaffirs should live on farms and not be living about idle.

10,700. Is not the law in the O.R.C. the same as the law here. I understood you to say so?—Yes, it is the same, but powers are allowed under the Squatters' Law to get as many natives as they require on the farm, and the police see that they do not have more on the farm than they can use.

10,701. Does that law then allow an unlimited number as long as you can use them?—The number allowed was limited by the size of the farm. A small farm of 500 morgen would only have two or

three families upon it. A larger farm would have five families, but then, if a man could prove that he required more Kaffirs he would be allowed to have more.

10,702. Do I understand, then, that you are in favour of a policy of forcing the Kaffirs on to private farms, and forcing them out of locations, and out of squatting on Government land—is that correct?—Yes, I am in favour of that.

10,703. Do you advise any limitation as to the land they can cultivate on a private farm?—Yes, we did usually limit the amount of land, we tell them they could sow so much.

10,704. Would you be in favour of doing that by law in any way?—No, I am not in favour of having that limited by law. It should be a mutual arrangement between the Kaffir and his master, because, if the Kaffir obtains so small a bit of land to plough that he cannot make sufficient out of it, he will leave the farm.

10,705. Yes, but might not that lead to abuse? We had, I think, the Chairman of the Western Transvaal Agricultural Society, and he stated that that led to abuse on certain farms, that the farmer did not limit the acreage the Kaffir should cultivate, and did not limit the number of Kaffirs on the farms?—There should be some provision that the number of Kaffirs are not more than a certain number they require according to the law, but the amount of ground which they can cultivate should be, I think, a matter of mutual arrangement.

10,706. Has there been any modification in the system of taxing the Kaffirs in the O.R.C. since the war?—Before the war the male Kaffirs used to pay 10s. per head, but now it has been increased to £1. They have not paid the £1 yet for 1903, but it will have to be paid.

10,707. We have been informed by certain Transvaal witnesses, by farmers, that an increase of taxation on private farms has had a detrimental effect in the Transvaal; it has driven the Kaffirs off the private land on to Government land. Has this modification had any such effect in your district?—No, not yet. They have not paid it yet—they have not paid the increased taxation.

10,708. Do you approve of the increased taxation?—Yes, I do, I am perfectly at one with it.

10,709. Is it sufficiently high?—I am glad that you have asked me that question. For the first year, for 1903, it will be very difficult for them to pay the £1, because they have had no crops for this year or the last. If they will increase the tax afterwards, put it up to £1 10s. or £2, I think it will be better, because they reap as much as from 100 to 200 bags, and this tax is the only money got out of the Kaffirs.

10,710. Mr. PHILIP: Can you tell us what the Kaffir population is in your district?—It will be very difficult to answer that question. I have been on the Compensation Board for the past six months, and not been about the district.

10,711. What kind of Kaffirs are they in that district?—Basutos.

10,712. Are they Basutos who have emigrated from Basutoland, or do they only come for a time?—I have been living there for the past 15 years, and during that time a good number of Kaffirs migrated from Basutoland and came and lived in the district.

10,713. Mr. FORBES: Lindley is a very good agricultural district, is it not?—Yes.

10,714. Do you grow produce for sale?—Yes.

10,715. How far are you from the market?—The railway is at Heilbron; that is six hours on horseback from my farm.

10,716. Consequently, it will take you nearly as much work getting this produce to market as growing it?—Yes, that has always been the great difficulty. When you have loaded the stuff on the wagons and carried it as far as Heilbron, you hardly

think it worth your while to load it off there. You just bring it on the market by wagon.

10,717. Some farmers are more unfavourably situated than you are?—Yes, very much more.

10,718. It is proposed to make a railway from Lindley, is it not?—Not that I know of. The old line of survey was from Harrismith to Bethlehem; Bethlehem to Heilbron, passing close to Lindley; now they have surveyed another line. It goes along the Wilge River, with the junction at Vee-reeniging.

10,719. When they do have the railway there the farmers will be induced to grow a great deal more produce?—I speak for my district, past Bethlehem to Ladybrand. The great difficulty arising in these districts is that the people cannot get easily to the markets of Johannesburg.

10,720. Is it not a rich agricultural district along the Wilge River?—Along the Wilge River it is also good, but more this way it is better.

10,721. Then if they do get the railway there they will want a great many more natives, more work?—Yes, it will increase the sowing.

10,722. Mr. BRINK: How long has this Plakkers Wet been in force in the Free State?—Since I came into the Free State I have found that this system was enforced there, but a Boer was entitled to so many families, but after some time it was improved.

10,723. That was improved upon?—Yes.

10,724. That system answered very well in the Free State?—Yes.

10,725. And you have only two locations in the whole of the Orange River Colony?—As far as I know.

10,726. Will it surprise you to hear that in the district from which I come alone, the Rustenburg District, we have twelve locations where the Kaffir chiefs have tremendous tracts of ground. Do they allow Kaffirs in the Free State to squat on Government ground?—No.

10,727. Do you think it is a wrong principle in a practical farmer to allow natives to squat on Crown lands?—Decidedly, yes.

10,728. During the war the niggers were taken away from the different farms, were they not?—Yes.

10,729. That is why, as I understand from you that numbers of families had recently offered to go to your farm?—Yes, it may very likely be that.

10,730. It has become quite a habit and system of theirs to live amongst the farming community in the Orange River Colony?—Yes.

10,731. Do you consider we ought to have the same system enforced in this Colony?—I cannot think anything else.

10,732. You consider it evidently a wrong principle to let them squat on Crown lands?—Yes, especially where the Crown lands are lying between the farms.

10,733. I am speaking not of the tribal system, I am talking of the floating natives, the large quantity of floating natives not belonging to any particular chief. They will go and squat on Government ground?—Yes, it is a wrong principle. I am totally opposed to allowing Kaffirs to loaf about on Government Crown lands.

10,734. What I understand from you is that loafers, thieves, and bad characters, and so on, congregate there?—Yes.

10,735. You consider that the farming population in the Orange River Colony will have enough labourers for the whole Colony. They will all be as lucky as you are?—Yes, decidedly, I think so. If we have one prosperous year; if there is sufficient food there will be boys enough.

10,736. Do you think there will be a surplus population in the Orange River Colony above what are wanted in its own mines at Jagersfontein and in places like Bloemfontein?—We can estimate that

about half the boys work in the mines at Jagersfontein, Kimberley, and here at Johannesburg.

10,737. Do you think when they have had a good season a large number will be obtainable for these mines?—Yes, I decidedly think so. The Kaffir always wants money to spend, and when we have had prosperous years I have seen some boys go off to the mines before the others who had previously gone had come back.

10,738. Can you give us any approximate figure, whether there will be hundreds or thousands?—No, I could only guess, and that would not be good enough.

10,739. Your advice to this Colony would be to enforce the Squatters' Law?—Yes.

10,740. Mr. WHITESIDE: I understand you to say that high wages on the Rand would seriously inconvenience the farmers?—No, I did not say that.

10,741. Do you know what wages are paid on the Rand?—No.

The Commission then adjourned till 2.30 p.m.

Mr. C. J. PRICE, called, sworn, and examined.

10,742. The CHAIRMAN: You are General Manager, I think, of the Crown Deep Gold Mining Company?—Yes, I am.

10,743. Have you a statement before you addressed to the Labour Commission, dated the 5th of September of this year, and signed by yourself?—Yes.

10,744. Do you hand that in as your evidence-in-chief?—I do.

10,745. The statement was as follows:—

To the Chairman and Members of the Labour Commission.

During the past seventeen years I have been continuously in charge of extensive mining operations. In June, 1896, I came to these fields as manager of the Geldenhuis Deep, Limited. At that time only 50 of the 100 stamps erected by the Company were crushing, owing to the scarcity of native labour. At the end of 1896, 200 stamps had been erected, and of this number from 80 to 90 were kept running. I left the employ of the Geldenhuis Deep on the 1st April, 1899, and up to that time we never had one full month's run with the whole mill owing to the lack of natives. During this time, we paid £27,649 in premiums for natives.

Upon leaving the Geldenhuis Deep, Limited, I assumed the management of the Crown Deep, Limited, and at this mine, notwithstanding that we paid as high as £1,500 per month in premiums, the same shortage of natives prevailed.

During the six months just prior to the war we mined from five to ten thousand tons short of the monthly requirement of the Company's 200 stamp mill.

In December, 1901, this Company resumed milling operations with only 165 boys on the company's books. In January, 1902, this number was increased to 750. This number we were unable to increase until March of the present year.

Most of the companies with whom I am conversant, treat their natives with the utmost consideration. At the Crown Deep, whenever the ill-treatment of a native is brought to the notice of the management, the culprit is at once discharged. We have a large vegetable garden in connection with our compound, from which a plentiful supply of fresh vegetables is obtained during the summer months. During the winter months we supplement the vegetables from our garden by buying on the market. We have good, roomy shelter houses for natives, heated by steam, close to the collar of each shaft. In these houses strong coffee, well sweetened, is served to the boys each morning. Every afternoon, between the hours of 5 and 6.30, each boy is served with one pint of Kaffir beer, and at the evening meal each boy receives a dish of vegetable soup. They have their regular mealie pap, which is varied once or twice a week by the introduction of beans, or biscuit meal.

Between January 1st and June 30th of this year, out of a total of 394 time-expired boys, 101, equal to 25.63 per cent., elected to re-engage for periods varying from one to twelve months, owing, no doubt, to increase of pay and bonus paid them. Everything goes to prove, however, that the bonus is more of an inducement than the increase of pay, for in most cases it is the lower paid boys who elect to remain with us, whereas the higher paid ones, such as fire-boys, machine-boys, hammer-boys, etc., leave us at the expiration of their contract, and 95 per cent. of them return to their homes.

Appended is a tabulated form showing the condition of native labour under which we were working in June, and the results obtained. It also shows the number of natives required to run our full complement of 200 stamps under the same conditions. I also append a form showing the number required to run present erected stamps under what I consider the best economical conditions.

#### CROWN DEEP, LIMITED.

Estimate of total native labour force that would be required to run all erected stamps 348 days per annum under conditions prevailing June, 1903, viz.—Machines breaking 97.42 per cent. of total tons broken in stopes, and no rock discarded as waste.

	Tons.
Capacity of 200 stamps, 29 days, at 5,139 tons duty per stamp	29,806
Tons mined in June, 1903	19,965
Deficit from mine	9,841

	Tons.
In June, 1903, 16,903 tons of ore developed produced from faces	1,108
Therefore, 29,806 tons of ore developed would produce from faces	1,777

Which leaves a deficit of 669

Leaving to be mined from stopes a deficit of	9,172
97.42 per cent. of 9,172 tons equals 8,935 tons to be broken by machines.	
2.58 per cent. of 9,172 tons equals 237 tons to be broken by hammer boys.	

Machines—	Boys at Shifts.	25 shifts per month.
8,935 tons at 17.71 tons per machine day equals 505 × 5	2,525	100
Hammers—		
237 tons at .5 tons per shift	474	18
Shovelling—		
9,172 tons at 2.246 tons per shift	4,084	157
Tramming—		
9,841 tons at 7.367 tons per shift	1,336	51
Sundry underground—		
9,841 tons at 9.32 tons per shift	1,056	41
Surface (estimated)		40
Development (deficit on)		60
		467
Add 10 per cent. non-workers		52
Additional boys required		519
Native force, June 30th, 1903		1,136

Total required on basis of June, 1903, operations 1,655

	Stopping.	Developing.	TOTAL.
Average working in June, 1903	41.7	5.37	46.44
Additional required	21.00	4.49	25.49
Total	62.7	9.76	71.93

Native complement required to run present erected stamps under best economical conditions. viz., mining 60 per cent. of the required ore by machine drills, and 40 per cent. by hammer boys.

	Tons.
Total capacity of 200-stamp mill, 29 days, at 5·139 tons duty	29,806
Sorting 20 per cent.	7,452
Required from mine	37,258

In June, 1903, from 16,094 tons of ore developed, 1,008 tons were produced from development faces, therefore from 37,258 tons would be produced

This leaves to be produced from stopes	34,925
----------------------------------------	--------

60 per cent. of 34,925 equals 20,955 tons to be broken by machines.

40 per cent. of 34,925 equals 13,970 tons to be broken by hammer boys.

Machines—

	Boys at Shifts. 38 shifts per month.
20,955 tons at 16·8 tons per machine per day equals 1,247 × 5	6,235 240
Hammer boys—	
13,970 tons at 5 tons per shift	27,940 1,075
Shovelling—	
34,925 tons at 2·17 tons per shift ('99 av.)	16,094 619
Tramming—	
37,258 at 6 tons per shift	6,209 239
Sundry underground—	
37,258 tons at 9·32 tons per shift	3,998 154
Surface (estimated)	475
Development at 216 tons per boy	175
	2,977
Add 10 per cent. for non-workers	331
Total requirements	3,308

This is a complement of 16·54 boys per stamp.

The efficiency of unskilled whites on the Crown Deep as compared to natives is as 1·87 is to 1, which is arrived at in the following manner, viz. :—

For 13 months from June 1st, 1902, to June, 30th, 1903.

Average number of Machines working in stopes during period	27·10
Total tons broken by machines in stopes during period	166·875
Tons broken per day (26 days to working month)	493·7

One native will break 5 tons per day; therefore number of natives required to do the work of above 27·10 machines would be 493·7 × 2, equal to

Deduct number of natives working on machines (27·10 × 5)

Additional natives required to displace machines

Average number of coloured working during period

Making total coloured

1,684·4 coloured at 300 tons per day would produce

Total tons produced during period, 176,564, or, per day

Balance due to employment of unskilled whites (per day)

Average number of unskilled whites employed during period

Therefore one unskilled white would produce per day (ton)

Hence efficiency of unskilled whites as compared with coloured is as 1·87 is to 1.

Average number working

Average cost per man per day (including wages, food, etc.)

Average estimated number of tons produced per man per day

Average estimated cost per ton

The following deductions can be made from the foregoing statement:—

1. That the ratio of cost of unskilled whites to that of coloured is as 3·7 is to 1.

2. That the efficiency of unskilled whites as compared with coloured is as 1·87 is to 1.

3. That the estimated extra tonnage obtained by the employment of unskilled whites, allowing 338 working days for the period, amounted to 5,746 tons; or, in other words, sufficient ore was obtained from this class of labour, after allowing for sorting, to enable the company to run an additional 3·14 stamps throughout the period.

4. That the ratio of cost of labour per ton of ore produced by unskilled whites to coloured is as to 1·995 is to 1; or, in other words, that for every ton of ore obtained by the employment of these unskilled whites, the company had to pay 7/8·1 per ton over and above what they would have done if sufficient coloured labour had been available.

In analysing the costs of the period, which include the extra cost of unskilled whites and the extra tonnage produced by them, it is found that the average working costs are 2·7d. per ton higher, and the profits are consequently 2·7d. per ton lower than they would have been had the work been entirely done by coloured labour.

The following figures show the estimated working costs and profits realised in three stages of working:—

	Per ton milled. s. d.
(1) Estimated working costs for period if only coloured labourers had been employed	20 5·7
Leaving a profit of	11 8·6
(2) Actual working costs for period	20 8·4
Leaving a profit of	11 5·9
(3) Estimated working costs for period if all work were done by unskilled whites	28 1·8
Leaving a profit of	4 0·5

The approximate position can be summed up as follows:—

That by employing an average of 30·285 unskilled whites daily from 1st June, 1902, to 30th June, 1903, an additional 5,746 tons have been mined, or, say, an extra milling tonnage of 5,268 tons, from which a profit of £1,064 11s. 6d. has been derived. Had this tonnage been produced under normal conditions by coloured labour it is estimated that the profit resulting would have been £3,036 3s. 4d. It is, therefore, seen that in producing this tonnage by unskilled whites the profits are estimated to have been lessened by £2,021 11s. 11d., or at the rate of 7s. 8·1d. per ton on the extra tonnage milled.

In October of last year, I was one of a committee of three appointed to enquire into the advisability of employing unskilled white labour on the mines. As the experiment was being tried on a large scale at the Village Main Reef G.M. Co., this mine received our especial attention. The months of May, June, and July were months of transition when the experiment of working white labour was only beginning. The following figures, therefore, are a

comparison of the months of March and April with August and September:—

	March and April	August and September
Tons crushed - - -	18,980	22,630
Total value declared - - -	£38,214	£48,054
Value per ton - - -	40/3-07	42/5-16
Total costs - - -	£24,435	£35,633
White labour costs - - -	£3,234	£15,080
Native labour costs - - -	£3,516	£4,032

From this it is seen that during August and September 3,670 tons more were crushed than during March and April, at an extra cost of £11,198, or a cost for the extra tonnage of £3 1s. per ton, whereas the gold in the rock was only worth £2s. 5-16d. per ton. Or, in other words, by the use of white labourers the Village Main Reef was able to crush about 1,800 tons a month more, at a loss of 18s. 6d. per ton on the extra tonnage, instead of making a profit of 15s. a ton. Thus the experiment was costing the Village Main Reef in round figures, £3,000 a month.

At the Crown Reef, where unskilled white labour has been used on a large scale for the past fifteen months, figures prove that the efficiency is as 1 to 1, while the cost works out as 4 to 1.

Respectfully,  
(Signed) G. J. PRICE,  
Manager Crown Deep, Limited.

Johannesburg, 5th September, 1903.

10,746. When did you first come to the Rand, Mr. Price?—In June, 1896.

10,747. You were then Manager, I think, of the Goldenhuis Deep, Limited?—Yes.

10,748. You remained there as Manager until when?—The 1st of April, 1899.

10,749. Your mill was equipped in 1896 up to 200 stamps?—Yes, at the close of 1896.

10,750. You were never able, during all the time you were on the property, to keep your 200 stamps running?—Never for one month.

10,751. Was that entirely owing to the shortage of native labour?—It was entirely.

10,752. How was your labour recruited during that period?—We contributed to the Rand Native Labour Association (I believe it was then called at that time), and we also had private agents, and got boys in that way; but we were mostly dependent upon the Rand Native Labour Association for our supplies.

10,753. Did you augment that supply by the use of recruiters?—Yes.

10,754. Independent of this Association altogether?—Yes.

10,755. During the time when you were General Manager you spent a considerable amount in premiums?—Yes.

10,756. The amount stated here is £27,649?—That is correct.

10,757. You became General Manager of the Crown Deep, Limited, in 1899?—Yes, April 1st, 1899.

10,758. What was your experience there with regard to the supply of natives?—We were always short of natives.

10,759. What size of mill had you then?—200 stamps fully equipped.

10,760. Were you able to keep that always running?—Never, in fact; our shortage for the six months prior to the war was something over 8,000 tons per month.

10,761. On the average you crushed 8,000 tons less than you should have crushed had you had a full supply of labour?—No, allow me to rectify that. We should have mined rather more than 8,000 tons more than we did. A part of that would have been

discarded as waste, but we should have mined 8,300 tons per month more than we did to keep the mill supplied.

10,762. What is the complement of natives you require to keep the mill running full?—Under the most economical conditions something over 3,300.

10,763. How many had you before the war?—From 2,100 to 2,400.

10,764. How many have you now?—1,113.

10,765. Several witnesses have told us, Mr. Price, that natives returning from these fields to their homes complain about the treatment they receive here. What is your experience with regard to the treatment now meted out to the natives on the mines and in the compounds?—I consider it is very good. The treatment meted out to them now is really better than to some of the poorer class of white people.

10,766. Are they well fed?—Yes.

10,767. Do they get an unlimited supply of food?—Practically an unlimited supply.

10,768. Are they comfortable?—Yes, they have good houses, and also, in cases where necessary, clothing is provided them.

10,769. Are they better fed now than before the war?—Yes.

10,770. You state here that you have shelter houses for natives close to the shafts for the boys who come up from below?—Yes, and also for them when they congregate in the morning before going down. As they turn out of the compounds, they cannot all be sent down at once, and they congregate in the shelter houses, which are heated by steam; and they are supplied with coffee while waiting to go down, so that they are perfectly warm and comfortable when starting their work.

10,771. Since when have these shelter houses been instituted?—During the latter stages of the war, about the time peace was declared, something over a year ago.

10,772. Is the establishment of these shelter houses general along the Rand?—I could not really say that, but I know a great many companies have them.

10,773. Is a supply of coffee given also to the boys when they come out of the mine?—Do you mean in the morning?

10,774. When they come up after nightshift?—Yes.

10,775. You also supply them with Kaffir beer?—Yes, in the afternoon.

10,776. How long has that been done?—Some three or four months ago, ever since permission was given by the Government.

10,777. A system of bonuses to natives to re-engage after completing their term of service was introduced some time ago?—Yes.

10,778. How do you find that works?—That seems to have a good effect. A great many re-engage, quite a number. It is the lower-paid boys, however, that are more apt to sign on again than the higher-paid boys. Boys that are getting 2s. 6d. and upwards a day are more apt to leave than boys getting 1s. 8d. or 1s. 10d. a day.

10,779. What conclusion do you draw from that?—When they get a certain amount of money they are ready to return home. If they get up to a few pounds, £10, £15 or £20, they return home with it.

10,780. Do you mean to say that boys who have accumulated sums of money from £10 to £20, that the majority of them refuse to re-engage?—They do not leave us to go to other mines, but they go home. Ninety-five per cent. of the boys we have discharged in the last three or four months have returned to their homes, especially East Coast boys.

10,781. Have you any idea how long your boys remain on an average?—Not a great deal over a year at present. A few of them will sign on for longer, but the majority only engage for a year, and when their year is up they generally go home in a body.

10,782. How does that compare with the length of time they stayed before the war?—I really have not the figures previous to the war. My impression is, indeed I know, that they did stay longer. They seemed to have more opportunities for spending their money before the war, and they did not accumulate it quite so fast, and for that reason, I think, they stayed longer.

10,783. The only factor now influencing the saving of their money which did not obtain before the war is their inability to get liquor?—That is the main factor, and up to some months ago there were not so many Kaffir eating houses, not as many as there are now. You will know that they were not allowed to be put on mining areas for some time, but latterly they have been allowed to open.

10,784. Is that a further inducement to them to spend money?—Yes.

10,785. And, therefore, a further inducement to remain longer on the fields according to your theory?—Yes.

10,786. You have given an estimate here of the total native labour force required to run all the erected stamps, 345 days per annum, under conditions prevailing in June, 1903, namely: Machines breaking 97.42 per cent. of the total tons broken in stopes and no rock discarded as waste. Then you go into a very elaborate calculation here. Will you, in a word, explain to us what it means?—In what way, Mr. Chairman?

10,787. Will you look at the bottom of page 3?—Yes.

10,788. You will observe there that during the month of June, 19,965 tons were mined and put through the 200 stamp mill running 29 days on an average?—That will be a full month's running time, and our duty per stamp spread over a period of six months was 5,139 tons per day, which amounted to 29,806 tons to keep that plant fully for 29 days. We broke this rock with 1,136 boys, and to break the other additional 9,841 tons, working on the same ratio, and considering the boys to be of the same efficiency, it would have taken 519 additional boys or a total of 1,655 boys. It works out that machines working a double shift will break 17.71 tons. That is what we actually break now per machine day, and you have hammer boys breaking at the rate of 0.5 tons per boy per shift, shovelling boys average 2.246 tons per shift, tramming boys average 7.367 tons per shift, and then sundry underground boys work out at an efficiency of 9.32 tons per shift. Then the development deficit shows that we only develop 16,000 tons, where we should have developed 29,806. We should develop as much rock as we mine to keep pace with our mining, so that our development would have required an extra sixty boys, making a total, as I say, of 519 more boys than we had in our compound at that time, working exactly as we worked in June. No rock was discarded as waste, and everything brought from the mine was put through the stamps. We had idle stamps standing, so that in place of using boys for sorting we used them underground, and ran everything under the mill. It is not the most economical condition to work it, but as we had idle stamps we did it.

10,789. So you should have had working under present conditions 1,655 boys instead of 1,136 boys?—Yes.

10,790. Have you estimated the number of boys you would have wanted under the most economical conditions?—I think the next page will deal with that.

10,791. The most economical condition, then, for working your mine is that 60 per cent. of the required ore should be broken by machine-drills, and 40 per cent. by hammer boys?—Yes; we have a number of small leader stopes. The small leader is what carries the most of the money. We have above that a small pebble reef that only gives a few pennyweights, two or four pennyweights, but in breaking with machine that pebble reef also comes down. We cannot hold it up, and that has to be mined; whereas, if we could work with hammer

boys we could timber up fairly close to our face and hold this up, which we cannot do by working with machines. We could not put timber in thick enough here to hold it up. Breaking with machines brings it all down, and would break the timber down.

10,792. Practically, you are working 97 per cent. of your rock by machines now?—Nearly 98.

10,793. Yes; 97.4, and only 2.58 with hammer boys, whereas you state that the most economical way to work your mine is to break 60 per cent. by machine drills, and 40 per cent. by hammer boys?—Yes.

10,794. Under these conditions, how many boys would you require altogether?—3,303 boys.

10,795. So you are short of how many boys?—In round numbers we are short of 2,200 boys.

10,796. You need a complement of 16.54 boys per stamp?—Yes.

10,797. Whereas your complement is what?—5.5.

10,798. That is the complement you are working with now?—Yes.

10,799. I understand you have also had some experience with unskilled white labour?—Yes.

10,800. Extending for a period of 13 months?—Yes, from June 1st, 1902, to June 30th, 1903.

10,801. Will you summarise your results to the Commission?—If you will notice there I tried to keep up a single shift efficiency of whites as compared with blacks.

10,802. That is efficiency apart from cost?—Yes; work and also cost. It was very hard to get at the efficiency of the whites because we could not get their work separated entirely from the blacks. As a rule the whites were put in the best places for shovelling. I took the efficiency of the blacks during the nine months prior to the war, and took the total tons mined during that time, and the total shifts worked, which divided by the number of tons gives an efficiency of 0.3 per ton.

10,803. Per shift?—Yes, Kaffir shifts worked. Then I took the shifts worked during these 13 months and multiplied them by 0.3 per ton. The difference between that and the actual tonnage mined worked out at an efficiency of white as compared with black, is as 1.87 is to 1.

10,804. Do you wish to suggest that the result arrived at of the number of tons broken per shift was more favourable to the whites than would be the case in actual practice?—It is the nearest I could come to it. The reason I say it was most favourable was because they were working under the most favourable conditions, and since the war, with the limited number of blacks we had, we have worked them more efficiently than before the war. We had a small number of natives, and therefore we cut them down to the utmost limit; for instance, in some places where we employed two boys previously we work one now, but at the same time I am only giving the same efficiency for the Kaffir since the war that we had before the war, and in doing that I think the comparison is rather favourable to the whites.

10,805. Will you tell us briefly, apart from the question of tons broken as between white and black, what was the cost?—Yes, our cost per shift for that time for coloured labour works out at 2s. 3.8d.

10,806. Is that the cost per ton?—No, per shift of coloured labour. White labour is 8s. 7.622d., and then I go on the average estimated number of tons per man per day, and the white man produces 0.561 and the black 0.3, the average estimated cost per ton was 15s. 4.7d. for whites, and 7s. 8.6d. for coloured labour. The following deductions can be made from the foregoing statement (v. pp. 482-484):—

(1) That the ratio of cost of unskilled whites to that of coloured is as 3.7 is to 1.

(2) That the efficiency of unskilled whites as compared with coloured is as 1.87 is to 1.

(3) That the estimated extra tonnage obtained by the employment of unskilled whites, allowing 338 working days for the period, amounted to

5,746 tons; or, in other words, sufficient ore was obtained from this class of labour, after allowing for sorting to enable the company to run an additional 3'14 stamps throughout the period.

(4) That the ratio of cost of labour per ton of ore produced by unskilled whites to coloured is as 1'995 is to 1, or, in other words, that for every ton of ore obtained by the employment of these unskilled whites the company had to pay 7s. 8'1d. per ton over and above what they would have done if sufficient coloured labour had been available.

In analysing the costs of the period, which include the extra cost of unskilled whites, and the extra tonnage produced by them, it is found that the average working costs are 2'7d. per ton higher, and the profits are, consequently, 2'7d. per ton lower, than they would have been had the work been entirely done by coloured.

The following figures show the estimated working costs and profits realised in three stages of working:—

(1) Estimated working costs for period if only coloured labourers had been employed, 20/5'7 per ton milled.

Leaving a profit of 11/8'6 per ton milled.

(2) Actual working costs for period, 20/8'4 per ton milled.

Leaving a profit of 11/5'9 per ton milled.

(3) Estimated working costs for period if all work were done by unskilled whites, 28/1'8 per ton milled.

Leaving a profit of 4/0'5 per ton milled.

The approximate position can be summed up as follows:—

That by employing an average of 30'285 unskilled whites daily from 1st June, 1902, to 30th June, 1903, an additional 5,746 tons have been mined, or, say, an extra milling tonnage of 5,268 tons; from which a profit of £1,064 11s. 6d. has been derived. Had this tonnage been produced under normal conditions, by coloured labour, it is estimated that the profit resulting would have been £3,086 3s. 4d. It is, therefore, seen that in producing this tonnage by unskilled whites the profits are estimated to have been lessened by £2,021 11s. 11d., or at the rate of 7s. 8'1d. per ton on the extra tonnage milled."

10,807. I understand you had something to do with investigating a similar experiment carried on at the Village Main Reef?—Yes, I was one of a Committee of three appointed to inquire into the advisability of employing unskilled white labour on the fields here, and as it had been carried on on a large scale by the Village Main Reef, we selected that mine to give all our attention to.

10,808. Who were on the Committee with you?—Mr. H. B. Skinner, of the Durban Roodepoort, and Mr. Spencer, of the Consolidated Main Reef.

10,809. Did you go into the matter very fully?—Yes, we did go into it very fully, and devoted a considerable amount of time to it.

10,810. You gave some comparative figures as to the work done on that mine?—Yes, as the experiment was being tried on a large scale at the Village Main Reef, this mine received our especial attention.

10,811. The months of May, June and July were months of transition when the experiment of working white labour was only beginning. In March and April they employed no unskilled white labour, but in August and September they were employing a large number.

10,812. You exclude from your calculation the three months you mention?—Yes, before the experiment had got under full headway, they were taking on a few at a time, only the beginning of August when they had a large number of unskilled whites whom they worked during August and September. They commenced taking them on in May, and therefore we thought March and April would be fair months to compare with August and September (v. p. 434).

	March and April.	August and September.
" Tons crushed - - - -	18,980	22,630
Total value declared - - -	£38,214	£48,054
Value per ton - - - -	40/3'07	42/5'16
Total costs - - - -	£24,435	£35,633
White labour costs - - - -	£8,234	£15,080
Native labour costs - - - -	£3,516	£4,032

From this it is seen that during August and September 3,670 tons more were crushed than during March and April at an extra cost of £11,198, or a cost for the extra tonnage of £3 1s. per ton, whereas the gold in the rock was only worth 42/5'16 per ton. Or, in other words, by the use of white labourers the Village Main Reef was able to crush about 1,800 tons a month more, at a loss of 18s. 6d. per ton on the extra tonnage instead of making a profit of 15s. 9d. a ton. Thus the experiment was costing the Village Deep in round figures £3,000 a month."

10,813. From your knowledge of this white labour experiment on your own mine, and on the Village Main Reef, and other mines, may we take it generally that as the net result of it there was a very large increase of cost?—Yes, a very large increase of cost. I think were they worked out on a small scale, it might work out better in proportion than on a larger scale. They seem to deteriorate more where there are only a few. On the mine adjoining the Crown Deep, namely, the Crown Reef, they experimented there during the last 15 months, and I think their average has been 166 per shift, for that period, and their cost works out at 4 to 1, whereas the efficiency works out at 1 to 1.

10,814. Do you mean to say that at the Crown Reef the white unskilled labourer was able to do no more work than the black?—That is as it is figured out.

10,815. Your own experience was rather more favourable?—Yes, because we worked on a smaller scale. At the same time, as I explained, the figures I give you are too much in favour of the unskilled white, because I take the efficiency of the Kaffir to be the same as before the war, whereas I think they are working rather better now.

10,816. Do you think the Kaffir labourer to-day as an individual is more efficient than before the war?—I think we are working more efficiently in getting rather more work per boy than we did before the war. We have rather more economical appliances and are using the boys more economically.

10,817. Mr. WHITESIDE: Mr. Price, we have been told that there are something like 3,500 stamps at present working, and that the total number that are not working comes out at something like 3,600, making a total available for work, of 7,100. Do you agree with these figures?—In round numbers approximately.

10,818. In pre-war days, as far as we can ascertain, there were 91,000 natives employed on the gold mines. To-day we have approximately 66,000 natives. Do you think those figures are within the mark?—Fairly so.

10,819. Well, they work out as follows?—That we have 73 per cent. of the pre-war labour working at the present time, with only 50 per cent. of the stamps working. How do you explain that?—I dare say there are a great many more boys employed on construction.

10,820. But were they not also doing that before the war?—Not as much in proportion as they are now.

10,821. So you think the explanation is that there is a larger percentage of construction and develop-

ment worked now than there was before the war?—I should rather say so.

10,822. We have been told that something like 18,000 stamps could be at work in five years if we had sufficient labour. Do you think that is correct?—That is hardly a question I am prepared to answer. That is more of an engineering problem and not a mine manager's problem.

10,823. Mr. PERROW: I think you mentioned that you have a 200-stamp mill on your property?—Yes.

10,824. What amount of rock do you take to run your 200-stamp mill 29 days?—29,806 tons. The duty per stamp is 5·131 tons per day worked out for a period of six months.

10,825. You are not working all your stamps now?—We are not.

10,826. What number are you working?—We reported last month 150 stamps working 28 days.

10,827. Then you are really mining only about 21,000 tons per month?—21,357 tons we mined last month.

10,828. You are not sorting rock at all?—No.

10,829. But if you had sufficient native labour what could you sort?—About 20 per cent.

10,830. So you are really crushing 2,000 tons per month more than you ought to?—4,000.

10,831. Yes, 4,000 tons. You mention, I think, that you are breaking about 96 per cent. or 97 per cent. of your rock with rock drills?—Yes.

10,832. And you ought not to break more than 60 per cent.?—Quite right.

10,833. I think you mention a small section of reefs that carried the gold?—What we call the South Reef Leader. The Leader of the South Reef is always in the foot-wall.

10,834. You have got a foot-wall and a hanging-wall, so that your reef is really in two sections?—Yes.

10,835. And that with good hammer boys and skilled mining you could take that reef out without bringing down the waste rock between both sections?—Yes.

10,836. But to-day you are breaking waste rock and all goes into the mill?—Yes, we try to mine as close as we can, but this waste reef falls down. We leave numerous pillars, but still we cannot leave enough to keep it up.

10,837. If you had sufficient labour, you could timber them and go through the ground without bringing down waste rock?—I am sure about it.

10,838. Mr. PHILIP: You became the Manager of the Geldenhuis Deep in 1896?—Yes.

10,839. And at that time you were short of boys?—Yes.

10,840. During the whole of 1896 you were short of boys?—Yes.

10,841. And at that time, I believe, Mr. Grant was Commissioner for Natives here?—He was.

10,842. Mr. Grant has told us that, with the exception of a very short time during all the period he was connected with natives, there was a full supply?—He could not have thought of the Geldenhuis Deep when he said that.

10,843. Have you always been short?—Always.

10,844. And since the war?—Yes.

10,845. With reference to this white labour, I see you put down the cost of white labour at 8s. 7·622d. Is that not rather less than other companies were paying for white labour?—I rather think it is from the figures I have had submitted to me.

10,846. The figures we had submitted to us showed that it was at least 10s.?—Yes, but I had a great many ex-burgers who lived in Vrededorp at 7s. 6d. per day and they fed themselves. That is what brings the cost down.

10,847. So if you had to pay 10s. a day the cost would have been still further increased?—Certainly.

10,848. Mr. EVANS: Yesterday Mr. Johns told us that on the Ferreira Mine before the war he pretty well got all the labour he required. How would you account for the Ferreira having a sufficient supply of labour and the Geldenhuis Deep not having enough?—I would say, Mr. Evans, that the Ferreira Mine is more favourably situated, being close to the town, and also being an old established mine and an outcrop mine. The boys prefer working on an outcrop to a deep level mine, and I understand from conversations I have had with Mr. Johns that prior to the war he had agents on the East Coast who were getting up boys and were always sending them up to him outside of this Labour Association, and in fact he was able to help some of his sister companies with boys. Being an outcrop mine, it was, of course, more favoured. When the deep levels first started, the boys were very much prejudiced against them. They would come round the collar of the shaft and look at the wire cable, and say, "Boss, if that string breaks, where are we?" They prefer outcrop mines, because they can go up and down the ladder. I think myself that is probably the main reason why they always got labour.

10,849. Of course other mines were allowed to recruit on the East Coast if they liked?—Yes.

10,850. How would you account for the fact that the Ferreira succeeded in getting what they required at that time and you did not? Would that be due to recruiting arrangements having been made at an early date?—I should say so, before the time labour was so much in demand. It was one of the first mines, and was established before there was any great demand. They got boys, therefore, in the habit of coming there, and it was popular with them. It is the same way with boys now. If they have been treated well by a company, they look forward to coming back to that company, and the same applied before the war.

10,851. I see at the end of your report you state that the Crown Reef finds that the efficiency of unskilled white labour compared with black is 1 to 1?—Yes.

10,852. Do you know how the Crown figures were arrived at? Was that a different manner of calculation than the one you made for your mine?—I have a statement here made by the Manager and Secretary of the Crown Reef; it is as follows:—

#### NATIVE LABOUR.

Average number of boys for the period	
1/7/02 to 30/6/03 in compound . . . . .	821
Cost of supervision including passes, hospital attendance, medicines, and all compound expenses other than recruiting fees . . . . .	£2,429 18 0
Food . . . . .	7,455 6 7
Wages . . . . .	18,495 9 5
Recruiting expenses, including two calls of 5s. per share on 553 shares . . . . .	2,642 17 6
Total . . . . .	£31,024 11 6

This works out at a cost of 62s. 11·77d. per native per month, or 2s. 5·06d. per shift, taking an average of 26 days to the month.

#### DETAILS OF WHITE LABOUR.

Average employed during period 1/6/02 to 30/6/03 . . . . .	166
Wages . . . . .	£14,097 15 0
Food . . . . .	9,522 11 1
Total . . . . .	£23,619 6 1

This works out at a cost of £10 18s. 11·088d. per man per month, or 8s. 5·045d. per shift, taking an average of 26 days to the month.

The above does not include the cost of housing for helpers. For this purpose we have had to erect a long row of new rooms, which have cost us £2,085 11s. 3d., or £47 8s. 0d. per room, and, since

one room will only comfortably accommodate two men, the cost of housing these men can be taken to be £23 14s. 0d. per man.

10,853. Mr. DONALDSON: As to these experiments you speak of, your comparison of the two working periods on the Village Main, are there any circumstances you have not mentioned here which should be taken into account in order to account for this difference in the working cost?—Not that I am aware of.

10,854. I see you say in one part of your statement that a native will break half a ton of rock per day, and I see that during the two periods under review, for the purpose of this comparison, the native wages are, roughly speaking, £500 more in the latter period. The native pay at that time was in the neighbourhood of 30s. per month?—A little above that.

10,855. If it was 40s. per month, that would allow 250 more boys to be employed?—Something like that.

10,856. And according to the figures you submit, if a boy breaks half a ton of rock?—Allow me, please. Wages alone were nearly 40s., and then there is the cost of food and compound management and so on to be taken into consideration in addition to that.

10,857. Yes, in one case that would be the same as the other. The rate of pay in March and April was the same as in August and September?—Yes, but that would work out at nearer £3 per month than £2 per month. Taking into account the supervision of the native labour, the food, and so forth, that would bring it up to 160 or 170 boys. I think though that wages were increased a little in August and September compared to what they were in March and April, if I remember rightly.

10,858. Taking your figures that 160 boys extra might break over 2,000 tons of rock, and I see the difference notwithstanding the large increase of whites and a certain increase in blacks is about 3,000 or 4,000 tons?—Yes.

10,859. Does that not point to the fact that there must have been some other circumstances which have not been taken into account in this comparison? Do you think all these boys would have been available for breaking rock? There is a lot of other work in connection with the mine besides breaking rock?—I do not think so.

10,860. It seems to point that there may be some other circumstances which have not been taken into consideration in this comparison?—One of the circumstances was that we found in working unskilled white labour with Kaffir labour they both seem to deteriorate. They did not work so well side by side as they did separately.

10,861. But so far as you know there is nothing in the working of this rock that made it more easy in the one case than in the other?—I am not aware of that.

10,862. As far as you are aware, it was a fair comparison?—Yes. These are the figures from the books of the Village Main Reef Company for these two periods.

10,863. Mr. QUINN: Mr. Price, will you please tell the Commission what is the difference now in the price of dynamite and coal as compared with the latter part of the pre-war period?—I could not say exactly without having some figures before me to go into, and I am not prepared with anything of that kind.

10,864. Then, Mr. Chairman, who will we get this from?

The CHAIRMAN: I should suggest from Mr. Denny. There are one or two engineers coming on Tuesday.

10,865. Mr. QUINN: The engineers say this is a financial question, and the financial people say it is an engineering question?

Mr. EVANS: But if you ask them for it, they would prepare it for you.

10,866. The CHAIRMAN to the SECRETARY: Will you write to the Chamber of Mines, and say

that we would like to know the difference in the cost of dynamite and coal as between now and before the war?

The WITNESS: I could have procured the figures very easily had I known they were required.

10,867. Mr. EVANS: Probably Mr. Price can send it in if the members of the Commission would like to have it?

The CHAIRMAN: We had better get it from a witness on Tuesday.

10,868. Mr. QUINN: Have you had any experience, Mr. Price, in any other part of the world with cheap labour inferior to white labour?—No, not with labour inferior to white labour.

10,869. Where was your other mining experience, gained?—In the United States of America.

10,870. Was it with white labour?—Yes.

10,871. Do you know anything about conditions obtaining in Western Australia in regard to mining?—Nothing to speak of, only from hearsay.

10,872. As a mine manager, do you think the work of these fields is carried on as economically as possible?—Fairly so; we are getting on these lines very fast.

10,873. I ask you the question because one authority seems to ridicule the idea that the work is carried out economically; in your opinion it is?—Yes, sir, it is.

10,874. Mr. PERROW: I think you mentioned, Mr. Price, that you are getting behind in your development some 5,000 tons per month?—More than that.

10,875. How many months have you been going on like that?—Since we started operations in December; it is only during one month, the month of July, that we have developed as much rock as we have milled. I stated that we were mining from 5,000 to 10,000 tons per month less than we required for the mill previous to the war, and I think that is the statement you refer to.

10,876. Can you go on like that much longer?—Not economically.

10,877. Mr. PHILIP: Mr. Price, this Committee that was appointed to enquire into white labour at the Village Main Reef, did it make enquiries as to white labour at any of the other mines?—We got statistics from some other mines; a few figures.

10,878. Did you make enquiries as to the white labour in the case of the Wolluter?—We did not.

10,879. Mr. DONALDSON: I see in these two periods you had under review at the Village Main Reef allowing for native pay at £3 per month, there would be 170 more boys employed in the latter period, and at £15 per month, by the way, would that be a fair thing to allow unskilled whites?—Yes, about.

10,880. Then, at that rate of pay there would be 460 more whites employed in that period?—Yes.

10,881. Now, would you consider that the 3,670 tons that was milled during the later period was a fair proportion of work for that extra complement; 460 whites and 170 natives?—Do you mean if all the money was devoted to wages for boys.

10,882. You have white labour costing a difference of very nearly £7,000, and if you allow £15 per month for whites it gives you approximately 460 more whites at that later period than there were in the previous period?—Yes.

10,883. The extra tonnage milled was 3,670, and what I ask is would you consider that a fair increase for the extra labour?—I do not.

10,884. Would not that point to something that is not taken into consideration in this return?—As I explained before, Kaffirs and whites do not work well together, and they seem to deteriorate on both sides.

10,885. Is that what you put the bad result of these 170 boys and 460 whites down to?—That would account for some of it.

10,886. What in your opinion, in the ordinary course of mining, employed as they are all for the mine, the 170 mining boys and 460 whites, would be a fair return in the tonnage milled?—Worked to the best advantage it would be in the neighbourhood of 250 tons per day.

10,887. And you take 26 working days?—Yes.

10,888. That is 6,500 tons?—Yes.

10,889. And they only do 3,600 tons?—Yes, just about that. I might state that they were pushing this white unskilled labour at that time, and the thing was not organised as it should have been. The white men were going and coming, and they did not seem to be able to get them to stop. About the time a man should be getting efficient, he went off to something else, and they did not work long enough to work to the best advantage, in the same way as if you get a regular class of men that would stay on and work steadily.

10,890. Were these men employed in mining or in extra surface work?—No, that was one thing we very much condemned. They were employed on all classes of work, and the lowest unskilled work, discharging cyanide tanks, working in blacksmiths' shops and fitters' shops, etc., etc.

10,891. In this latter period might they have been doing back work that had been left previously through insufficiency of labour?—I hardly think so.

10,892. You are not sure?—I am not sure, but I do not say they were.

10,893. You would not say they were not?—No, but development was being left behind at that time.

10,894. I suppose if development gets behind in a mine it is possible for other things to get behind, too, that are essential?—Naturally.

10,895. And when extra labour came in, attention would be directed to getting off these arrears?—Yes; it would be essential. On a big property, a 200 stamp, they should have 700,000 or 800,000 tons developed to work the mine economically, and work a fair average of the whole mine, otherwise the richer and poorer spots of the mine will be liable to mislead you as to the value of the mine.

10,896. Might a proportion of these men have been employed on this work?—On development work? Not a great many more than usual.

10,897. Still you think it possible that a proportion of them might have been used in working up arrears?—It is possible, but I hardly think so.

10,898. Mr. EVANS: In the case of white men employed on your mine to do unskilled work, have any of them become skilled miners, and got blasting certificates, and so forth?—A few of them.

10,899. So they are getting now the same wage as the skilled miner?—Yes, in picking out from the unskilled men we had available to put men on rock-drills as helpers, we tried to get men that were miners, but were not rock-drillers, so that they should have some knowledge of breaking ground, and then they could in a few months time become acquainted with the drills, and so in time become efficient miners.

10,900. Then the experiment had the advantage of increasing the number of rock-drill men on the field?—Yes, that is one thing this Committee that examined into the work of the Village Main Reef advised in their report, viz., that a certain number should be used for machine helpers, as we considered good miners would always be scarce on these fields, at least for some time to come, and we advocated using them for that purpose.

10,901. The CHAIRMAN: Mr. Price, the Commission is very much obliged to you for your evidence.

Mr. H. B. WHITE, called, sworn, and examined.

10,902. The CHAIRMAN: Have you before you a statement bearing your signature, and dated the 22nd of August, addressed to the Chairman and Members of the Government Commission on Native Labour?—Yes.

10,903. Do you hand that in as your evidence-in-chief?—Yes.

10,904. The statement was as follows:—

The Geduld Proprietary Mines, Ltd.,  
P.O. Box 41, Springs,  
22nd August, 1903.

The Chairman and Members,

Government Commission, Native Labour.

Gentlemen,—I beg to place before you as evidence certain experiences which my Company has felt through the scarcity of native labour.

This Company—the Geduld Proprietary Mines, Ltd.—was registered in March, 1899, and on my being appointed to the management, the necessary preliminary work in such an undertaking as this was at once taken in hand, and after sub-dividing its mining area into six (6) blocks, to form finally six subsidiary companies, it was decided to commence work on the first two blocks, and three five-compartment shafts were located on them, to be sunk to the reef, a depth of approximately 2,000 feet each.

Between May and July, 1899, machinery and plant, including sinking engines, boilers, machine shop tools, timber, locomotive and rolling stock, to equip and work these shafts, was ordered to the value of close on thirty thousand pounds (£30,000), but, owing to the unsettled state of the country shortly afterwards, neither the sinking of these shafts nor any important works on the property were actually commenced, but all plans and arrangements were so matured that, as soon as work could safely be proceeded with, the opening up and developing of these properties of the Company could be undertaken on a large scale, combining speed with every efficiency and economy, and to this end further machinery and plant, to the value of over £56,000, was ordered, which, with the previous amount, totalled over £86,000. This machinery and plant was all ordered between May, 1899, and September, 1900.

With the exception of some timber, nothing pertaining to this amount was delivered to the property prior to 1900, but was either lying at the coast in large quantities for a lengthy period, or held back oversea awaiting instructions to ship.

From time to time after the British occupation, opportunities were given to get up from the coast that machinery lying there which would be earliest required on resuming work; thus, on peace being proclaimed in June, 1902, I was quite ready to commence developments vigorously, but, owing to the scarcity of native labour, this was impossible, and only such work could be attempted which the very limited native supply could reasonably be expected to cope with.

The native labour in the company's employ for the first ten months, i.e., from June, 1902, to March, 1903, averaged 29.5 natives, and consisted almost solely of squatters, who resided on this farm prior to 1900, and who were induced to leave the local Refugee Camps to come and work here by the offer to rebuild their huts for them, and, with the expectation of later being allowed to continue their squatting habits, i.e., farming and loafing; they were only available for surface work, and were at all times indisposed to the regular routine of daily labour.

Throughout this period, my Company, being an undeveloped concern, had naturally, with the great scarcity of native labour prevailing everywhere, to wait until the fully developed mines were better supplied, and in all probability, had I been unable to secure the before-mentioned squatters, it would have been impossible to commence any work until several months later.

In August and September, 1902, certain contractors whose contracts for brickmaking and quarrying were entered into prior to hostilities, and who were in consequence allowed to pay their natives any wage they felt inclined to, were induced to resume their contracts, yet even they had great difficulty in obtaining labour, and never experienced a full supply.

Until November, 1902, it was only possible to undertake surface works, such as excavations,

I i

foundations and buildings, as the squatter natives refused shaft sinking work.

In the middle of November, in order to commence sinking, unskilled white labour had to be employed, but, owing to the then proved expensive nature of this, it was only desirable to employ it where imperative in the best interests of the Company, and in consequence, instead of the three large shafts being commenced simultaneously, it was decided to sink only one at a time into the settled formation, so as to enable the shaft collars being secured, and thus render it possible to erect the permanent steel headgears, trusting that by the time this was accomplished the supply of natives available would have so improved that a sufficiency could then be obtained for further requirements.

The white unskilled labour employed, as above, between November 15th, 1902, and April 30th, 1903, averaged 45 men, the largest number employed being 61 in February. The wage paid them was 10s. per shift of 9½ hours daily (except Saturdays, which was 6½ hours), they found themselves, but were accommodated in tents provided by the Company; they were composed of various nationalities, but principally British and Dutch, and were almost entirely inexperienced in their work, and in consequence had to be trained to drilling, and in many cases to shovelling, which training would take them a week to a fortnight before they were hard and used to the work. Some would only work for a short period, especially when water was met with, and as a rule there was an average shortage of 20 per cent. to make up with new men each month. In the upper portions of the shafts, where the work was principally with pick and shovel, I consider their work was probably equal to that of two natives; but, as soon as ordinary sinking or mining conditions prevailed, they were certainly not more than equal to the usual underground native, whom, being more reliable and better under control, I would prefer from choice.

From the point of cost, 10s. a day for the white as against 3s. a day for the native labourer, it is evident that the work was not done to the best advantage, and only served to advance the position of the company as far as possible in the developing stage.

The amount of wages paid to white labourers, for this period was approximately £3,300, and I estimate that the same amount of work would have been done by native labour costing 3s. a day for £1,200, which would have been a saving of £2,100 to the company.

Only from the end of July last was I able to dispense with all white unskilled labour, replacing them with natives *especially recruited for the company on the East Coast.*

The position at date is that my company has in its compound:—

Surface natives	-	-	-	80
Suitable mine natives	-	-	-	49
Total	-	-	-	129

which is totally inadequate, as I could employ at the present time at least 250 in shaft-sinking alone.

The average depth of the three shafts is 116 ft., whereas, had sufficient labour been forthcoming, say, within three months after peace, there is every reason to assume that the average shaft depth would have been at least 700 feet, or, in other words, over 20 per cent. of the total underground development towards the producing stage would have been accomplished, instead of only 7 per cent. actually done. Further, all the machinery purchased could have been erected, which would have meant that instead of our two blocks employing, as now, 25 miners, mechanics and handy-men, there would be at least 75 of these men all drawing the usual rate of skilled wages.

Besides the six properties blocked out belonging to this company, there are on this Far East Rand, other companies and concerns with very considerable areas of mining ground of known value, as for instance, the Cloverfield Mines, Modderfontein Ex-

tension, Modderfontein Deep Levels, and Brakpan Mines, all of which are to-day lying quite dormant, being solely deterred from commencing actual development by their inability to obtain native labour, and these, if started, would require, besides, a large number of unskilled labourers, a corresponding number of miners, mechanics and others, at the usual high rate of wages, who would greatly benefit this country at large, contributing their quota in time to the general welfare and earning capacity of the country.—I am, gentlemen,

Your obedient servant,  
(Sgd.) H. B. WHITE,  
General Manager.

10,905. The CHAIRMAN: You are general manager of the Geduld Proprietary Mines, Limited?—Yes.

10,906. How long have you held that position?—I was appointed before the war, in June or July, 1899.

10,907. Had you some experience on the field before that?—Yes, in 1896 I was appointed manager of the Geldenhuis Estate, and since then I have been manager of the Roodepoort Central Deep and Princess.

10,908. You left the Princess to take up your present position?—I left the Princess and the Roodepoort Central Deep to take up the Geduld.

10,909. The Geduld Proprietary Mines cover, I understand, half a dozen subsidiary mines?—Yes.

10,910. These have been formed to work a mining area on the Geduld farm?—Yes.

10,911. Work was commenced on some of the ground before the war?—Very little was done before the war.

10,912. Did you sink any shafts before the war?—No.

10,913. When did you get to work?—We made a start as soon as peace was proclaimed.

10,914. During the war the company had ordered a considerable amount of machinery?—Yes.

10,915. For shaft-sinking and so forth?—Yes.

10,916. Soon after the British occupation you started work?—Yes.

10,917. Of course at that time labour was scarce?—Yes, labour was very scarce.

10,918. You were dependent for your labour entirely on some natives squatting on the farm?—Yes, and a few boys I took on locally.

10,919. You refer here to the scarcity of labour, and you add that only fully developed mines were supplied with labour before you had any number allocated to you by the Association?—Yes.

10,920. Do you know the principle the Association followed in allocating labour to the mines?—I think their principal object was to supply those companies first that were in a producing stage, rather than supplying undeveloped mines similar to mine.

10,921. That was the principle that guided them in the distribution of labour?—Yes, I did not expect boys for my mine until those other fully developed mines were better supplied.

10,922. When did your company, as a developing company, get its first supply of labour, do you remember?—I got my first supply about February last. I got a few surface boys, about 50, from the Cape Colony.

10,923. Previous to that, as far as you know, the distribution of labour was confined to milling companies?—Yes, to a large extent they were portioned out to the companies' groups, and the groups sent them along to those mines which they considered most urgently required them.

10,924. What group do you come under?—The Goerz group.

10,925. I suppose they had boys allocated to them some considerable time before February of this year?—Yes, but I did not get any supply from them up to that time beyond, perhaps, one or two.

10,926. You gave out some contracts towards the end of last year to contractors for necessary work?—Yes.

10,927. Were they able to get a supply of labour?—No, never.

10,928. About the same time, I understand, towards the end of last year, you made an experiment in using unskilled white labour?—Yes.

10,929. How long did you continue that experiment?—From November to April.

10,930. What wages did you pay?—10s. per day of 9½ hours.

10,931. You had British as well as Dutch?—Yes, a mixed community.

10,932. Were the British drawn largely from the irregular forces?—Yes, I think so.

10,933. They had no previous experience of the work?—As a rule, none whatever.

10,934. What was the result with Kaffir labour, in efficiency?—I think that with soft ground, in pick and shovel work, unskilled white labour is probably equal to two natives, but for ordinary mining purposes under ordinary conditions, especially in shaft sinking, I consider they are not more than equal to one, and I should prefer the native.

10,935. Then with regard to the cost, how does it compare?—The cost is the difference between 10s. and 3s.; 2s. per shift per native, plus food and expenses of management, which means about another 1s., making 3s.

10,936. Of course if he were equal in pick and shovel work to two natives, the difference would be as between 6s. and 10s.?—Yes.

10,937. You have not much pick and shovel work?—Very little. They were employed on shaft sinking, and they had very little pick and shovel work to do.

10,938. Under ordinary mining conditions there is, of course, a certain amount of general work to be done in the mine?—Yes.

10,939. I suppose you have not any experience of the comparison of white and coloured labour for that work?—No, white labour was used solely at that time, and I was unable to make any comparison as to the work.

10,940. Dealing with the total amount of money you expended in working where you employed unskilled whites, had you been able to get native labour you would have saved £2,100 to the Company?—Practically that. There should be a slight reduction made for the ground near the surface where the white labour showed better results.

10,941. How many shafts were you sinking?—Three shafts, but only one at a time.

10,942. What is the average depth of your three shafts now?—It is stated in this statement of mine as 116 feet, but it should be about 120 feet now.

10,943. Had you been able to get sufficient native labour these shafts would have been down 700 feet by now?—Yes.

10,944. What average per month do you make in the shafts?—I reckon the average would be about 110 to 120 feet per month.

10,945. So the shortage of labour has thrown you back six months at least?—Considerably more than that. I reckon the work there should have been done in from 9 to 10 months. In starting a new shaft you cannot reckon an average of 110 feet from the surface, as the first couple of hundred feet takes a longer time than the balance does.

10,946. You give a figure here as to the number of skilled artisans you could have employed if you had been able to get sufficient native labour?—Yes.

10,947. How many miners are you employing now?—About 25 miners and mechanics.

10,948. If you had sufficient labour, how many would you have employed?—About three times that number.

10,949. Are you acquainted with the ground adjoining your property and beyond you?—Yes.

10,950. You mention a number of mines in that neighbourhood?—Yes.

10,951. There is the Cloverfield Mines, Modderfontein Extension, Modderfontein Deep Levels, and Brakpan Mines; is any work being carried on there?—On the Brakpan Mines they are boring, and on the Modderfontein they are finished boring. They have been boring, but they are finished.

10,952. Has that boring been satisfactory?—Yes, I think so.

10,953. You say that these mines are lying quite dormant?—Yes.

10,954. Why is active work not going on?—I conclude solely on account of the shortness of labour.

10,955. Mr. EVANS: What was your experience as to labour before the war?—On the Geldenhuis we had a fairly good supply when I was there, but later on at the Roodepoort Central and the Princess we were almost always short.

10,956. Have you made any rough estimate at all as to what white labourers would be employed in the eastern end of the reef supposing there was a plentiful supply of unskilled labourers?—No, I have made no actual calculations.

10,957. Would it be a considerable number?—It would be a considerable number, I think. We have been employing 25 men; if we had a greater supply of natives we could employ 75, and I think the other mines could do just about the same as we could. Their requirements would be very similar to ours.

10,958. That would mean 500 or 600 men in the neighbourhood?—Not quite so many as that.

10,959. (Of course you do not mention the Modderfontein Mines, the Van Ryn, and other mines in that neighbourhood, that are also delayed for want of labour?—I have no data of that.

10,960. Mr. PHILIP: How many claims have you?—On the two blocks we are now working—403.

10,961. On the whole farm?—On the whole farm we have about 2,500.

10,962. How many stamps do you reckon you will eventually put up?—We are laying out everything now with an idea of working a minimum of 100 for each block.

10,963. How many claims, about, represent the block?—From 400 to 415.

10,964. Then you have about six companies?—Yes.

10,965. Each of 100 stamps?—Each at least 100 stamps.

10,966. And that would take at least 6,400 boys?—More than that; about 15 boys per stamp. They will take something like 9,000 boys.

10,967. And with a good labour supply, when do you reckon you would be able to get these stamps erected and at work?—I think it will take about four years on an average.

10,968. In four years' time you will be using nearly 10,000 boys in that one block of your own?—Not altogether. We have only started the two properties. If we were able to start all these companies right away simultaneously, in four years' time we could take that number.

10,969. Mr. PERROW: You mention that you had three shafts on your property?—Yes.

10,970. And only working one at a time. What size is your shaft?—29 feet 10 inches long, by 7 feet 6 inches in width.

10,971. How many boys can you employ at a time in each shaft?—From 100 to 125 boys in each shaft.

10,972. The CHAIRMAN: Is that per shift, or per day?—Per day.

10,973. Thirty-five on a shift?—Yes.

10,974. And that 35 boys per shift would sink about 110 feet a month?—110 feet a month.

10,975. How much have you been doing?—Anything from 20 to 55 feet.

10,976. And only working one shaft at a time?—Only working one shaft at a time.

The CHAIRMAN: The public sitting of the Commission will now be adjourned until Tuesday, 10.30 a.m.

## TWENTY-SIXTH DAY.

*Tuesday, 15th September, 1903.*

THE COMMISSION SAT AT 10.30 A.M.

Sir JAMES LIEGE HULETT, called, sworn, and examined.

10,977. The CHAIRMAN: Have you before you a memorandum headed "Statement and evidence of Sir James Hulett"?—Yes.

10,978. Do you put that in as your evidence-in-chief?—I beg your pardon.

10,979. Will you hand it in?—I have just read it; I suppose it is what I stated.

10,980. You dictated it?—Yes.

10,981. Statement of evidence of Sir James Hulett:—

I reside in Natal, and have been there for 46 years.

The native inhabitants of Natal are various, being composed of several tribes that either have fled for refuge from Zululand or are the remnants of tribes subjugated by Chaka in the past.

The natives of the southern part of the Colony are mixed up with the frontier natives of the Cape Colony, and are more allied to the Amatzoasa than to the Zulu. Those occupying the northern part of the Colony are more allied to the Zulu and kindred tribes.

The natives proper of Zululand have remained, up to lately, of a more unsophisticated character, and, consequently, are more backward as regards civilisation and regular habits of work.

The natives in Natal proper have undergone very considerable change in the last 40 years. At that time they were more like the Zulu in their habits of life.

The usual work of the Natal natives has been agriculture, general servants, store work, and labour in the Harbour Works, and latterly in the Gold mines. As far as farm work is concerned, to a considerable extent, the natives living on farms occupied by Europeans have usually to render service to their masters, according to agreement, for a longer or shorter period of the year. In some instances, they are allowed to go out to work when not required, in other instances they are required to give part of their services to the owner or occupier. In some cases, older men will render pretty general service, having no time or inclination, perhaps, to seek work elsewhere. Then the natives living in the locations are bound to dispose of their labour without, and have to offer their services to a limited extent to the farmers. In these cases, the natives prefer working as near their homes as possible. In other instances, the extent of labour provided, at the present time, to the various industries of the Colony by location natives may fairly be considered to be at least six months in the year, for all between the ages of 14 and 30. In many instances, they will go from ten to eighteen months without returning home; this would be particularly the case when they go out of the Colony.

There are several thousands of natives employed as ricksha pullers, either actually being employed at the work, or resting at their kraals, since the work is very heavy, and has a tendency to greatly deteriorate their physique.

The food of the natives is pretty well the same in one part of South Africa as another. The food supplied to Natal natives in the service of farmers would be maize meal only. In towns, or in household service, it would be maize meal, supplemented by other items according to the will of the employer. A great many natives that are employed in Durban

and Maritzburg, known as the Togat Kaffirs, provide their own food, since they are paid a daily wage.

Wages vary very considerably. On farms, where the natives are under a sort of contract with their masters, their pay may be service in lieu of rent. When engaged as drivers, leaders, etc., on farms, their pay may be from 20s. to 40s. per month. In towns the pay of monthly servants is according to the man. Where servants are boarded in household service in towns, they would get from 20s. to 30s. per month, sometimes the amfaans would get less. Togat labourers receive from 2s. upwards per day, according to demand. Regular storemen will, perhaps, get from £2 to £3 per month. Regarding the Zulus, it is only comparatively lately that they have been contributing any large supply to the labour market; still, the condition under which they are rendering their labour is now fast becoming more analogous to the general condition of Natal.

Regarding the amount of labour available in Natal, the deficiency for local requirements is very great; indeed, this deficiency has always existed. Natal, ever since it started agricultural development on any extensive scale, has always had to depend on outside labour.

As long ago as 40 years before the opening up of the Diamond Fields, we used to draw a considerable amount of labour from Basutoland, but when the opening up of the Diamond Fields took place, this labour was drafted away from us, and we then endeavoured to obtain labour from Amatongaland, from Swaziland, and from the far interior. In order to assist in their free ingress, there was an arrangement made in Cetewayo's time, by which several stations were instituted where natives could stop on the road and be introduced without fear of molestation by the Zulus. This was done in concurrence with Cetewayo and John Dunn.

The inadequate supply rendered it necessary for us to import Indian labour, in the first instance for the coast estates, but the increase in demand was not met by a continually increasing supply of native labour, and it became necessary to use native labour for ordinary farming purposes throughout the length and breadth of the Colony, as well as in the Coal Mines.

The Transvaal is taking, at the present time, a considerable number of our natives, but not to the extent, in my opinion, which existed before the war. Having broken up their connections with the Transvaal, and having found by experience that though the wages are nominally higher than those in Natal, and that they can net more at home, they will not return to the Transvaal. Besides, the heads of the kraals are exerting all their influence to keep their own men within the borders of the Colony rather than allowing them to go out; one reason being the deterioration that takes place in them physically from immoral practices, and considerable waste occurring from their remaining away altogether, or dying, thus throwing a large number of dependents upon the heads of the kraals.

Of course, taking all our requirements, we may say that Natal has no available labour, seeing that we import from Pondoland a considerable number of Kaffirs, besides East Coast boys, for work in Durban, in addition to the Indians.

Nevertheless, there will always be a certain amount of labour available for the Transvaal, induced by the higher rate of wages, and by desire on the part of youths to go abroad and see the world.

10,982. The CHAIRMAN: You have lived in Natal practically for a lifetime?—I have been there for 46 years.

10,983. You have been engaged for the greater part of that time in planting?—Yes, almost entirely; practically the whole of the time.

10,984. Are you employing many labourers now?—Yes.

10,985. How many?—About 1,200.

10,986. Have you ever employed a larger number?—No, never. We are employing an increasing number as opportunity offers. We want more.

10,987. More than you have now?—Yes.

10,988. You are now employing mainly, or nearly all, Indians?—Almost entirely.

10,989. In times gone by have you employed Kaffirs?—In the early days in Natal, when we could get them.

10,990. Yes. In all your experience have you ever known Kaffirs in Natal to be equal to the demand?—Never, except, of course, I have to look a long way back. There was one time in which Kaffirs could not find employment; that was just during the commercial crisis of 1862.

10,991. In all your experience, then, except at that period, there has been more work than Kaffirs can do?—Yes, always a greater demand than the supply. We have always gone abroad.

10,992. I think you state here that sometimes in your experience you have imported natives into Natal from Amatongaland?—We have always been open to take all the natives we could get. In the early days we used to get them from Basutoland, but then when the Diamond Fields were discovered, of course the Basutos left us, and we could not get any. We used to get some from Tongaland and Gazaland; they used to come right through Swaziland.

10,993. What was it that drove you to go abroad out of South Africa?—We could not get natives.

10,994. You speak here of going far into the interior at one time?—That was into Gazaland. We could get some; years ago there was an arrangement with the Government to give a safe conduct through Zululand; that was in Cetewayo's time.

10,995. Do you draw your supply for Natal from Zululand?—Oh, yes, of course, Zululand is Natal.

10,996. Yes, but I mean from that province?—Since the annexation we have had a larger amount of labour.

10,997. Do the Zulus from the province turn out as freely as the Natal Kaffirs?—I should think not as freely; they are not so accustomed to work.

10,998. Do you think we could look to Natal or Zululand for any considerable supply of natives for work here?—Well, you could—no, it is impossible to get any large number from Natal or Zululand, simply because we employ all we can get. Also there is a great disinclination on the part of chiefs and heads of kraals for their people to go so far away as the gold fields. They prefer their young men to work nearer home, and, practically, they get as good wages, if not better wages, in Natal, than they can up here.

10,999. Apart from the question of wages, why do the chiefs and heads of kraals object to their young men coming here?—Well, during the past few years the heads of kraals have said that their people have become so demoralised that many of them go, and leave their families and friends and people, and possibly never return, or get dissipated and do not care to return. In many cases men have been known to come up here and remain three or four years without going back, practically losing all touch with their people and friends, and the chiefs object to that. That was brought prominently to my notice a few years ago when I was Minister of Native Affairs. The chiefs complained to me regarding the number of people that were left in charge of the chiefs and headmen of kraals—the number of dependents, I mean, of men who have left and not

returned at all. Of course, a great many died and others would get demoralised, and if they did come back they neglected their people, and naturally there was a disinclination to allow these men to leave the country, if work could be found for them nearer home.

11,000. How long were you Secretary for Native Affairs?—Two years.

11,001. And in that official position this information was gathered by you?—Oh, yes.

11,002. To sum up the position, as far as Natal is concerned, is it not fair to say that any supply we might draw from you from these countries would make you still further short?—Of course, every native taken out of the country leaves us one short, and we want—we can employ to-morrow in the ordinary industries of the country, that is farming, not coast farming particularly, in the towns, and on the farms if we had them—60,000 to 70,000 men.

11,003. That is a very large figure?—Yes, but we could employ them. We are importing from the East Coast; Durban has a large number of East Coast Kaffirs. We are getting a considerable number for the farms in the southern portion of the Colony from Pondoland.

11,004. You employ a large number in the towns in the ricksha business?—Yes, a very large number; I should think some 3,000, about, are employed in Durban in ricksha-drawing, but not all at one time, because you can easily understand the natives do not go out year in and year out. There is a certain time they are employed and then go home to their kraals. This work is very trying, but it certainly is liked by the men, but at the same time it is tending to deteriorate them. They are so liable to pulmonary complaints through the tremendous strain put upon them. They like the work, but it does not like them, therefore they cannot continue the strain for any length of time, and I should say in Maritzburg there would be, perhaps, 1,500 more. We will say 4,000 to 5,000 men in the Colony are ricksha-pullers, either on furlough or at work.

11,005. What might be the average length of time a native works?—We generally consider six months. A great many from the locations and from distances from the towns work for six months. That is fair, but in many instances they work for nine months and even twelve, and then do not turn out again till they have spent their money and want some more.

11,006. You say that six months would be fair?—Yes, very few are working for less than six months. We reckon that you need double the number of men to supply the labour market to those actually employed at one time.

11,007. Do you think any large number of Natal or Zululand natives work regularly every year?—A considerable number of Natal natives work regularly, but of course there are many natives living on the farms, or near by, scattered over the Colony, who work year in and year out. Now, I have knowledge of natives on nearly every other farm who will work like that; men on my farm who will work for me with only holidays of perhaps a month at a time. They have been working like that for the last twenty or thirty years, and every farmer has a certain number of men of that class, but of course they live near by or on the farms. I am not speaking of those men who have to render so many months' service, as on the high veld farms, but of those employed at the ordinary rate of wages.

11,008. Can you suggest any means by which natives can be induced to work longer or regularly every year?—Well, that condition of things must change. You cannot expect natives living in locations, as ours do, to work year in and year out, without giving them families and friends. You see, if the natives lived in association with the Europeans as the labourers in other countries do, of course they could come in and go out, morning and night. If they could get to their homes like that it would not break up their family associations and connections, and consequently they would be able to work on as in the case of people at present who

live close to their work. Now in the locations, of course, young men ranging from 12 or 13 up to 30 or 35, and even in some instances 40 years of age are at work, but men that are married (and now natives in Natal marry sooner than they used in Zululand, and consequently get families earlier in life, and you cannot expect these men to leave their families entirely, and therefore they go out to work), come back again and perhaps remain away for shorter periods, and when they get to 30 or 35 years of age, they do not often want to work. They look after their herds and cattle, and their children have to go out to work and take their place. Of course, on the farms, men up to 50 years of age will work for those farmers where they give their services in lieu of rent.

11,009. Do not you think that if the ground rent were charged to natives living in the locations that it would be a powerful inducement for them to go out to work?—You see, they can earn so much money for short periods of time now, that it would make very little difference. The natives can go out and can earn about £3 per month. Well, they have now to pay in Natal 14s. a year hut-tax. The probability is that that will be increased before long, but supposing it is increased, it would not be increased to a very great amount. Supposing it is increased to £1 or £2, what would it be? It is earned in a fortnight or three weeks. Of course the greater their wants, the more you increase their wants, the longer they must work, or they must get a higher wage, but the rise in wages is greater than the increased wants. So you see men can get £3 a month in Durban.

11,010. Then you do not think any reasonable increase of tax is likely materially to increase the supply?—To a certain extent, of course, but not appreciably. The increased demand for Kaffir labour is far beyond anything that we can anticipate. We get the men out to work, and it is only if we can increase the average period of work from six months to, say, seven, that we can get more labour. But the demand is greater than we can possibly meet. We have now, practically, allowing six months as a fair average, the whole of the available native labour in Natal employed. Not all the available labour in Zululand, but the touts or labour agents have scoured the country so that directly anyone, any natives in the outlying districts of Zululand want to work, there are half a dozen hands held out to them to offer them work, and of course the number available in Zululand is increasing, but now that we are thinking of occupying Zululand with white settlers, that will at once make a local demand which will receive a larger amount of labour than is available now, because a great many of the men will find local work. Then the mining development likely to take place in Zululand will swallow up everything.

11,011. Mr. QUINN: What proportion of white men do you employ with your 1,200 coolies?—We only employ overseers and managers. All our rough labour is done by Indians. We employ, I suppose, on the estates 21 white families, directly supported on the estate.

11,012. How many white men would that mean?—I mean 20 white men. They are managers and family men.

11,013. Would that proportion of 20 white men to 1,200 coolies, would that compare as a fair average with other estates, similar to your own?—I suppose so; perhaps, I should think so. Of course, some employ Mauritians more than we do, but though they are coloured, they are supposed to be civilised people.

11,014. Can you tell us how many coolies are employed on these coast estates or farms?—I cannot tell you exactly. On the coast, you say?

11,015. Yes?—Of course, you understand that the coolies are not confined to the coast; they are all over the country.

11,016. Quite so. I want to get at another point?—I suppose about 15,000.

11,017. Can you tell us now, how many coolies you have in Natal altogether?—I suppose about 70,000.

11,018. What is the white population of Natal?—About 79,000 to 80,000.

11,019. And the native population?—In Natal proper, leaving Zululand out, about half a million.

11,020. That is excluding Zululand?—Yes.

11,021. And in Zululand?—From 200,000 to 250,000.

11,022. May we say that the population of them both is about three-quarters of a million?—That is about the estimate.

11,023. And 70,000 coolies?—Yes, I gave you the coolies employed roughly on the coast.

11,024. That was the first number of 15,000?—No, I think I said 70,000 on the coast; of course, there are a great many more employed in Natal.

11,025. I understood you to say that in the whole of Natal there would be 70,000 coolies?—No, not employed. That is the population, the Indian population of men, women and children, free and indentured.

11,026. How many of this number would be free?—The greater bulk of them; I should think 40,000.

11,027. What do they do for a living?—Everything. They are employed much in agriculture. I am not speaking of the Arabs, who come in of their own accord. They are employed chiefly in agriculture, they are small farmers on the coast, fruit farmers, maize growers, tobacco growers; in fact, they are the most industrious part of the population.

11,028. Is it possible for white men in a small way to compete with them on the land in the way you have been describing?—Well, yes, as fruit growers, not as maize growers. On the coast, of course. Up-country, as maize growers, the coolies are not in it. Not as market gardeners, because the white man would not be anything like as industrious as the coolie. Then, a white man's wants would be naturally larger. My contention is that the white man could employ himself to better advantage than by competing with the coolie.

11,029. What is the pay of the coolie on your estate, for instance, or on an average estate?—It is fixed by law, you see.

11,030. How is it fixed?—The free coolies are open to any contract. There are a certain number of coolies who make their own arrangements with their employers. They are not all farming on their own account. Sometimes they are employed on the estates. The indenture terms are: 5 years' indenture, and pay 10s. per month, rising a shilling per month per annum, plus rations and lodgings.

11,031. Can you tell us from your own very long experience, what your coolie labour costs per head, everything included?—My indentured coolies? We reckon from 28s. to 30s. a month.

11,032. All included?—Yes, I mean the men. The women get less if they are employed.

11,033. What do the women get? What do they cost?—My women get full rations, if they are in work, and half men's wages; children are paid proportionately.

11,034. Does this figure of 28s. include all charges?—Yes, all charges.

11,035. That is very much cheaper than the natives?—Oh, certainly; no agriculturist can bear the present rate of native wages. Of course, there are always natives that are working at a lower rate than the coolie. That is, people who live near by who do not want to go to the town for work, but yet who want to employ themselves. I suppose we have, perhaps, thirty or forty Kaffirs on the various estates, and their wages vary. My drivers I am giving £2 a month. But they could go out and get double the wages if they chose to go to a distance.

11,036. The position then is this. We may take it that the cost of the indentured coolie to the

farmer, such as yourself, would be 28s. per month?—How much?

11,037. 28s. per month?—Yes, 28s. to 30s.; of course to a small farmer it would cost more.

11,038. Well, we will say 30s., on the average?—Yes, 30s. would be the maximum for the indentured man, not for the free man.

11,039. I understand that the bulk, if not all, of the coolies employed on estates such as yours are indentured men?—Oh, no; for instance, under the new law, after their five years' term of service has expired, they have to remain re-indentured at a higher rate of wage, or they may claim a passage home, or they may pay a residential tax of £3, and, therefore, if they re-indenture they cost us more. And, again, if they are free, if they free themselves by paying the residential tax, many of them are now being employed on the estates at higher rates of wages because the demand for coolies is so great we cannot get them, so we have to give an increased wage; you may say the free men are costing the estate as high as £2.

11,040. So this proportion of coolie labour at 28s. to 30s. per month has a very important bearing on the labour question?—Yes.

11,041. I mean if it comes to a question of native labour or coolie labour at 28s. or 30s., you can only go one way, that is the way of the coolie. You can only make one choice. I mean it is a matter of pay largely?—Well, if we could not get for agricultural purposes cheap labour, we could not get on at all. No estate can afford to pay the large amount of labour necessary at anything like an average of £3 a head per month. It would not do; everything would be shut up at once.

11,042. Can you tell us what number of white men, in the aggregate, are employed in these various industries, that you state the coolies take so readily to, such as fruit-growing and other things of that nature?—Well, of course, fruit-growing is increasing very largely. Then, the white men that are employed in fruit-growing depend upon the blacks to do the work to a large extent. Take the neighbourhood of Durban, Bellair; large areas are brought under cultivation; banana cultivation, for export to this place and the Cape. Well, these small European farmers have to get coolie labour just in the same way as I have to do for my work, but of course the demand for their produce is so great that they can compete well with the Indian. The free Indian has an advantage, for of course his wife and children all do the same work. They work from morning till night. These Indians, of course, make a greater return than the white farmer who, of course, employs labour to do the work; but fruit cultivation is a paying enterprise for white men.

11,043. You cannot give us the figures, then, of the number of white men actually employed, whether as small farmers, assistants, managers, or anything else, on these farms in Natal?—Oh, I could not tell you exactly, perhaps 2,000 or 3,000.

11,044. 2,000 or 3,000?—Yes, probably that. That is, connected with the work. There are, of course, other branches of the enterprise, such as packing the fruit, box-making, which employ white labour to a certain extent, and superintendents, and that sort of thing.

11,045. But is not the box-making and marking all done by coolies under white supervision?—I do not know about the fruit-growers; all our work is done by supervised coolies, but it is only rough work, such as nailing together; white men have to superintend the sawing up of wood.

11,046. Yes, you have 25 white men supervising 1,200?—Yes, of course we have coolie overseers.

11,047. So that it comes to this, in practice, that the coolie is used for everything for which you can use him, even to making boxes for tea and fruit. As a matter of fact, to-day in Natal he does that kind of work?—Yes, to a great extent.

11,048. I mean absolutely, with rare exceptions, is it not a fact that wherever the coolie can be used,

he is used, naturally, because he is cheaper?—It is a fact that every one uses the cheapest labour he can get.

11,049. Whatever the colour is, down there?—Yes.

11,050. And quite independent of the ultimate results?—Well, it is simply an impossibility to use white labour. At the price white labour is we could not do it.

11,051. Even for making fruit and tea boxes?—Yes; a tradesman can get 15s. or 16s. a day, and in the first place a white man would not do as much as a coolie in a day.

11,052. Is that your experience, that a white man cannot make as many wooden boxes as a coolie in a day? No, he would not do much more than half as they work now. When a white man got 8s. and 10s. a day, he would do twice as much work as he does now. That is my experience; he did twice as much work 25 years ago, when he was getting 8s. or 10s. a day, as he would do now.

11,053. So the result of that is, as you say, that whenever you can use a man at 30s. a month you are not going to pay 10s. or £1 a day?—Well, we should not have a pound a day to spend on rough labour. We have to pay 18s. to a pound a day for artisan's work. I employ all the white artisans for my own work that I can. You put a question to me just now, how many white men are employed on the estate. Of course you mean permanent men, but for all our buildings we used white labour—I do.

11,054. You cannot get coloured labour to do it?—Oh, yes you can. I am in favour of using all the white labour I can. I have a certain amount of philanthropy, though perhaps not so much as some people would like. Some people used black labour—Mauritian people. I prefer the white if I can get it. I have been having an experience lately. I have been putting up a very large sugar factory with white labour, and it has cost me twice as much for that white labour as the same labour would have cost ten years ago. I do not object to that in itself, but the unfortunate part about it is that the higher wages you pay, the less work you get, and it is the same in the case of the coloured labour.

11,055. Is the reward all round greater than it was 10 years ago? To put it in another way, if the wages of the white man and the Kafir have increased, I suppose the profits have increased?—Not always. We cannot regulate market price, which depends on other causes.

11,056. In what condition is the tea industry in Natal? I mean, in this respect. Are all the latest labour-saving appliances in use?—We are now trying to get more labour-saving appliances in order to save labour as much as we can. We do all we can to save labour. Of course the prospect of Natal just now is rather dark, because we cannot get coolies. That is the worst part of it.

11,057. There is still China left. Now, what are the numbers of Arabs in Natal?—Arabs, I could not tell you. I might have brought the Blue-book. The Blue-books would give you a fair estimate of all the population of different classes. I do not know that they would differentiate between Arabs and Indians, but the Arabs are limited. They are traders almost entirely; they are not farmers. From the Parsee merchant to the Bunnia trader, they keep stores in Durban and all over the Colony. Wherever they can get a footing they get it. They do one thing, that is, they keep down the price of commodities to the lowest point, and as far as country stores are concerned, they have got a monopoly. They have taken that monopoly practically because white storekeepers in the country districts are unable to compete with them.

11,058. Quite so. So that it is a fact, and you will agree with the statement, that a small white trader cannot compete with the Arab?—No, he cannot. The natives prefer dealing with the Arabs to white men.

11,059. What is the result of this, which has been going on so many years in Natal? Is not it a fact that the trade that the Arabs engage in is gradually

passing into their hands altogether?—Yes. You might say the Kaffir trade of the Colony is practically in the hands of the Arabs. In the country districts, personally, I have no objection to that, because I think it is a poor look out for a young white man to devote his time to keeping Kaffir stores in the country districts. He might do something better for himself than that; and it is rather a demoralising life. The Arab wants are smaller than those of the white man, and to a great extent they deal more fairly with the natives than European traders. The European who trades in the country districts wants very large profits. Now, I can give you an instance of that in the case of Zululand. No Arabs or coolies are allowed to trade in Zululand. On the borders you find the Arab traders thick, and the natives will walk miles and miles across into Natal to get their goods cheaper, because the traders in Zululand will have enormous profits, and of course the Kaffirs prefer buying in the cheapest market like some other people.

11,060. But apart from the country districts, is not it a fact that these Arab traders are doing very big businesses, and ever increasing businesses in the towns?—I suppose so.

11,061. And is not the natural end of all this the elimination of the white man altogether from trade?—No.

11,062. Where will it stop?—It will eliminate a certain class, or character, of white man, but I think the white merchant and the white dealer, where they carry on business on fair lines, all hold their own. Of course it is a certain class of trade that these Indians have—a mixed trade.

11,063. But if the Arab, as we all know, can live where a white man would starve, and he is allowed to trade amongst white people the white people cannot bring their requirements down to the level of the Arab, and the natural result must be in competition that in time the white man must disappear?—I do not think so. Of course, I am not an advocate of the Arab trader. I would like to see him take his departure, but at the same time they meet a certain requirement, a certain demand, and that is all. The appearance of Durban does not show that the white trader is being ousted. In Durban, certainly, the white trade has increased in very much larger proportion than that of the Arab trader during the last few years.

11,064. Can you give us any figures to prove that?—I judge from going up and down the streets.

11,065. Oh, yes; but there are no statistics to support that. You cannot name any?—Well, of course, there is a difficulty on the part of Arabs to get licences. The licences are limited and their trade is to a certain extent limited, but the development of the trade of the town appears to me to be very much greater than it was, and that is almost exclusively on the side of the whites.

11,066. Has there not been agitation just recently against these very traders having licences, and being allowed to buy properties in West Street?—There always is that.

11,067. But it has taken a more active form recently?—Not so strong as it was a few years ago, because there are not so many licences given, and therefore the burden would not be so great. There is a strong feeling in Durban and the towns against Arab traders, there is a general feeling throughout the Colony against the Arab trader.

11,068. Coming back to this number of Arabs, have you any idea at all what the number is? Can you give us a rough number?—I cannot. It is so hard to tell. Perhaps 8,000 or 9,000. Of course it is only approximation.

11,069. Is there a very large amount of labour in Zululand that does not come out, do you think?—No. You see there is a population of 250,000, and and say you get one in five as available, that would give you 50,000. They would not all be out at one time. I think practically you would not be able to look forward to getting from Zululand any more, supposing they wanted to go out, than 3,000 more

people. And we want every one of these ourselves, and a good many more.

11,070. Suppose, now, in Natal, you are able to draw as many coloured labourers from India or any other place you wished, and that all employers of labour were put on the same level, and were allowed to look round the wide world for the cheapest labour market. If employers found such labour cheaper than native labour, they would get it would they not?—Yes.

11,071. What effect would that have on the native population of Natal. Do you think it would have the effect of making them willing to work for less, or drive them back into squatting on the land somewhere?—There will always be a demand for every single man to work that is willing to be employed, even if we can draw all we want from a foreign country, because we cannot draw without restrictions from the foreign country. The countries which send them, all impose restrictions, and there are difficulties in the way. The labour market of the world is rising in price, and this will help to equalise matters.

11,072. Suppose you can get labour from China, do you anticipate that the Chinese Government will lay down any restrictions?—I cannot tell you, because the Chinese Government is a Government of various Viceroys. It really does not come from the Central Government. I have no doubt that you can get Chinese labour.

11,073. I only mentioned it because you seem to think that the country concerned would put such restrictions on them as would prevent them spreading over the place?—I do not know; there might be restrictions put upon them. If the restrictions were too burdensome, you could not get them; but with the teeming population of China, I should think you could get them from certain districts without undue restrictions.

11,074. My point is this. I was trying to get your opinion. It is very valuable to this Commission on this Native Question. As to the possible result of this country, from one end to the other, not alone the Transvaal, being able to draw unlimited numbers of labourers—cheap labourers from some other country, what would be the general effect on the native populations of this country. Would this cheap labour force them, by competition, to give their services at lower rates, and so meet the new comer, or would it drive them back into the native quarters, to stop there and become a danger to the rest of the country? That is my point.—I do not think it would affect the native population. It would not drive them back. The natives, as they come out, become changed beings altogether from their original condition, and they will not go back again. I do not think competition from the world outside will affect them.

11,075. What would they do, supposing they could not get work?—They would render service. Their service would be as valuable then as now. I do not know what the effect would be, if we could get an unlimited supply of foreign labour at a cheap rate, but we cannot get an unlimited supply of cheap labour from outside.

11,076. You will be astonished at what we shall be able to do in that direction?—Well, we have been trying to get 18,000 coolies. We applied February, 12 months, and they were supposed to begin to come in July, 1902. They did not begin to come till October, and we have had 1,500 out of the 18,000. On account of the demand all our industries are at a standstill. Therefore, it is not likely if we find things in this way, and if we cannot get the number, that there will be such a tremendous importation of natives from different countries to meet the demand.

11,077. But are you not taking the view of importing from India when there are difficulties?—Well, I think you will find that there will be difficulties from any source.

11,078. Let us hope so, in case there is not. What has been the rate of increase in the native population of Natal during the last 30 years, as compared

with the increase of the imported coolie population?—The native coloured population is not increasing, but decreasing, in my opinion. The Indian population, of course, is increasing in very much larger proportion than the whites. This is because the whites import the labour and employ it. One man employs a great many coloured men, and, therefore, the Indian population is increasing. I do not think the white population has increased within the last 20 years more than 20 to 40 per cent. The total white population is about 70,000 men. I believe it was about 50,000 twelve years ago.

11,079. And there has been an increase in the coolie population?—That is always increasing. A certain proportion goes away. In the future we expect to return all of them. There is a natural increase by birth in addition to the importation. I suppose in the last 10 to 15 years the population has doubled.

11,080. Mr. BRINK: If we understand you correctly, you have said that the farming community require, that is to say, for agricultural purposes, the Colony of Natal requires 50,000 to 70,000 labourers?—Labourers, Indians, or anything?

11,081. Yes, native labourers—Indians or Zulus?—You mean the number of natives that the agricultural community requires?

11,081a. I understood you to say, in answer to the Chairman, that the requirements were about 60,000 or 70,000?—Oh, yes; but I did not quite understand the question put exactly.

11,082. I mean a general reply?—The agricultural population of Natal could employ more than 70,000. It is only bounded by the native labour supply.

11,083. Yes, but we want to strike some average?—Yes, not less than 70,000.

11,084. Do you say that farm labourers are very scarce and not to be obtained?—The farm labourers, ordinary farm labour, outside of what we call the coast plantation, stock farming, and all that sort of thing, yes. Native labour is so scarce that almost all the large farmers, and even the small farmers have to get coolies. The coolies are not confined to the coast districts by any means. A very large proportion of up-country farmers, stock farmers, and agricultural farmers have not enough.

11,085. But when they have coolies they are supplied?—But they cannot get them. They cannot get enough; that is the worst of it.

11,086. Do you think that one reason for the scarcity of farm labourers, pure and simple, is the high wages paid in the towns of Natal, harbour works, and so on?—If it was not for the high wages paid in towns, harbour works, ricksha-pulling, etc., naturally the wages would be lower on the farms. If the wages were lower, farmers would be able to employ more Kaffirs; but, as it is, the Kaffirs, of course, want high wages, and the agriculturists cannot pay. The stock farmer cannot pay anything like £2 to £4 a month to Kaffirs, consequently the Kaffirs go to the towns, or come up here, or go elsewhere. The farmer must either be content with those that may be resident on the farm, from whom he demands a certain portion of their labour in the year, or he must get fixed labour, imported labour.

11,087. Take the Colony of Natal, Sir James, what is your idea of what the farmer can pay to make farming pay?—Of course you mean ordinary farming?

11,088. Yes.—Well a high rate of wages would be 20s. per month, including everything.

11,089. Mr. FORBES: I think you have made the natives of Natal a study for some time?—Yes.

11,090. Do you consider him a reliable source of labour?—Oh, no; he never was reliable.

11,091. Then, would you consider it advisable for any one to enter upon any undertaking requiring cheap labour to depend upon it?—They could not do it.

11,092. Do you consider the system of having them under their own chiefs a success in Natal?—

Yes, on the whole. Of course there is a difference of opinion. The tribal system in Natal has been of advantage. The chiefs now complain that they are losing control over their people through their authority being undermined by outside influences, both on the part of the Government to a certain extent, and through their men leaving them and being independent. The chiefs complain that they lose touch with them; they have not the control over their young men that they used to have; but still the tribal system has been a benefit to us, because our population is composed of a quantity and variety of different tribes. These different tribes have all jealousies one against the other, and it has been a source of safety in Natal that this has been the case. Still, it is a fact that these natives are jealous of one another. Each is jealous of his fellow, and there are tribal disputes, so that in case of any tendency to disturbance in one part it would be the easiest thing in the world to take the opposite party to coerce the malcontents.

11,093. Does the location Kaffir turn out freely to work?—Yes, fairly well, but as I have said, they work on an average for six months in the year, and there is not a very large proportion that do not work sometimes during a portion of the year, beginning at 12 or 13 years of age.

11,094. Does the Natal Government insist upon the lobolo?—You cannot claim lobolo under the law, and therefore the thing now is made a matter of arrangement, since the rinderpest destroyed the Kaffir's cattle—the Kaffirs did not save 5 per cent. of all their cattle at the time of rinderpest, throughout the length and breadth of the Colony. Consequently they could not pay lobolo, and therefore practically lobolo is a matter of family arrangement between the friends as to the amount it should consist of. They cannot claim anything in a Court of Law for lobolo.

11,095. Consequently there is not the same inducement for the young men to turn out and work now?—But they require money.

11,096. They pay money?—Yes, to a great extent. But suppose he says, I will give the girl's father two or three head of cattle? He cannot get these cattle now under £15 or £20 apiece. They could previously be purchased for £8 or £9 apiece, and he had to give ten. Well, he cannot get them for £10, and therefore he gives money. They make their own arrangements as far as lobolo is concerned.

11,097. You mentioned just now the age at which the Natal natives marry. Does that apply to Zululand as well?—You know very well, with your vast experience, that in the olden time Zulus were not allowed to marry until they were told by their chief, and there were very few young men married under 27 years of age. Now, the young men marry about 22 or 23 years of age. And naturally in Zululand the thing is now getting more on the same lines as the Natal natives.

11,098. What is the average pay to Natal natives when you first employed them in Natal?—When I first employed Kaffirs, when you and I were neighbours, I paid 5s. a month, and mealies, their food, cost another 2s. 6d., then it went to 10s. and 15s.

11,099. What has been the probable cause of the rise in wages?—Well, the demand.

11,100. Mr. PHILIP: What measures do the Government take to secure natives for public works?—They have to go into the open market for the bulk of them.

11,101. Do you requisition them from the chiefs?—To a certain extent for public roads.

11,102. What pay do they give them?—They do not give them sufficient pay. Now they have to give them more, and I think a good policy would be to give them a modern rate of wage for similar work.

11,103. Can you tell us what pay they do give them?—I think it is a pound a month, including rations.

11,104. And have they any difficulty in getting them?—There is no difficulty; they requisition them.

I do not think it is a satisfactory way. I do not think the Government gain anything by it. I mean to say you cannot expect them to work well by forced labour, they do not get as much work out of them on the public roads as they would if they were not forced.

11,105. These Arab traders in Natal chiefly come from Africa, the East Coast, I believe?—Yes; well, they come from Bombay, Kutch, and the East Coast.

11,106. Are there not a great many natives of Africa?—I think very few. It is the same class of traders that are found over the whole of Central Africa; at least, a similar class. There is the Bunnia trader, there is the higher class of Indian merchants such as the Parsees, but there are very few of these. They are chiefly Banyan traders, they come to a very great extent from Persia.

11,107. Mr. EVANS: In your opinion has the importation of Indians been harmful to Natal? What is your opinion?—Well, I must not say it has, because I do not think it has; we cannot do without them.

11,108. Supposing if no Indians had been imported, if their importation had been totally prohibited from the outset, would you have such a large white population to-day as you have?—We should not have had a half.

11,109. That is your opinion?—We should have had nothing at all. There would have been no cultivation, we should have been small farmers in the up-country districts. On the coast there would have been no population at all; absolutely none. A regular supply of labour is absolutely necessary for coast industries. In the up-country districts where cattle farming is carried on, where of course you do not want so much labour, it might have existed, but not where you want a regular supply of labour month in and month out, and the natives would not give it to you. There was always this short supply of native labour from the outside when we used to work on estates at the beginning, with Kaffirs, we cultivated coffee, sugar, and other things. Certain Kaffirs would go out for four, five, or six months, and then suddenly went home to their kraals. They would throw away their tools and go, and you, perhaps, in the morning, would find that you had not any men to turn out. So early as 1866 or 1867 the Governor had to turn out, under his right, the natives of the Colony from the chiefs to reap our crops. That was just before the re-introduction of Coolie labour. All our cultivation depends entirely upon a reliable supply of labour.

11,110. Sir GEORGE FARRAR: You refer to 18,000 coolies you could not obtain. I understand that the policy of the Natal Government is not to increase the Indian population in Natal, but that they wish them to come in on indenture, and to be repatriated to India at the termination of their period of engagement?—That is our policy. Some years ago we passed a law after sending a Commission to the Indian Government to find out whether it was possible. An arrangement was made with the Indian Government by which they could be returned to India at the end of five years, but the Indian Government required that they should not absolutely be forced back, but that they might put a poll tax upon them if they remained. That law came into practical force about three years ago. Under this, all the Indians, as their terms expire, now and for the past three years, and all those in service now, as their time expires, will have to return to India at the end of five years, or pay a poll-tax of £3, or be re-indentured. We find by experience that they are paying the poll-tax. The white people are so anxious to get them that they are paying the poll-tax so as to engage them. Another Commission has been sent to India, and they have returned. They went with the object of getting the Indian Government to agree to the Indians going back, the indentures to terminate in India. The details of the arrangement have not yet been made public for reasons that are sufficient for the moment. We simply wish to know the general terms, and we believe they have agreed to the Indians finishing their

indenture in India. We are anxious that this Indian population, although of benefit to the country, shall not stay. We do not want them to remain to an unlimited extent, consequently we all hold that they will either be re-indentured, or return to India absolutely at the end of their indenture.

11,111. Mr. GOCH: In spite of the fact that the politicians of Cape Colony point to Natal as a dreadful example of the effect of Indian labour, the tenour of your answer to-day seems to point in quite a different direction, viz., that Indian labour is the salvation of Natal. That, I understand, is what you think?—That is my opinion.

11,112. Whether free or indentured?—I am not in favour of an extension of the free system, because I think we had enough of them. But if Cape Colony had imported 30,000 Indians on their West Land in the Albany princes, in the grain-growing districts of the west, they would have made the country. They would have absolutely made the country.

11,113. Do you remember, roughly, what the white population of Natal was about 25 years ago?—About 40,000 to 50,000. I suppose it would be 50,000.

11,114. I have a recollection of a controversy that occurred in connection with Natal at that time, and it was stated, roughly, to be about 20,000. You think that was wrong?—Yes, decidedly. The white population of Natal was fairly stationary from 1860 to 1880, and since then it has increased. As for our population, it was first taken off to the diamond fields; to a great extent a great part of that population came back again. Then the gold discoveries here followed. See what there is in the place of the white population in the Transvaal; see how much came from Natal. It was a large proportion, and, of course, that population first comes into Natal and settles down. A certain proportion of it always gravitates up this way, and, therefore, our population gets cut down.

11,115. If we put it at between 50,000 and 80,000 would that be about right?—I should think so.

11,116. That in the country there are 80,000?—I should think so; Durban has increased very largely.

11,117. When did you first begin to introduce coolie labour?—The first coolies were introduced in 1859; then only about 1,000 to 1,500 were brought in, and then it stopped. When their time was up—it was only a three years' indenture—they could then go away. When these estates started you could not get the natives to work in sufficient quantities, and a general collapse of our industries, that had just been started, was feared. In 1867, I think, we carried a regular system of emigration, and we have always wanted more than we have been able to get.

11,118. The increase in white population since 1880, that is in 20 years, has been 50 per cent.?—Yes, I should think so.

11,119. And this, of course, is a very much larger increase than a natural increase?—Yes.

11,120. The natural increase is about 2 per cent. per annum?—Yes.

11,121. And so far the employment of Indian labour has not kept back the white population, but has largely assisted to increase it?—Yes, but if you allow your Indian to remain, if they are allowed to come in and remain here permanently, of course the larger number we import, the larger will be the population. Very few of them would want to return to India if they were allowed to remain. The white population will, of course, increase proportionately with the numbers employed for development. In Natal, I consider the white man must be the predominant party, and they must exploit it for their purposes.

11,122. Mr. WHITESIDE: I understand that agricultural requirements are bound up with the supply of labour?—Yes.

11,123. The maximum wages that coolies are receiving is 30s.?—Yes.

11,124. That covers all expenses?—Yes.

11,125. Is it not a fact that the question of the scarcity of labour in Natal is more a matter of wages than anything else?—So long as coolies can be had the farmer will not employ the natives?—There are not enough natives. We would never have employed coolies if we had been able to get Kaffirs at the time. We used to take 15s. to £1 as the maximum, and we would never have paid that if we could have got coolies at the time. What ran away with our supply was the opening of the diamond fields. Supposing there were no coolies, and we wanted labour, and were doing the work that is laid out now, we could not get labour at £5. Of course labour goes to the highest market, and naturally prefers to go to the towns to remaining on the farms; for young people want to get into the towns where there is a larger amount of licence.

11,126. Do I understand that if the farmers could get natives they would pay the same rates?—No, because no agricultural enterprise will pay at £3 per month.

11,127. Therefore, it was, as I say, a question of wages?—If we do not get Indian labour, and could only get Kaffirs at £3, there would be no agricultural work.

11,128. Mr. QUINN: I understand that the coolie when he has finished his time, by paying a poll-tax, can remain?—Yes, at the present time.

11,129. Free?—Yes, free.

11,130. The new arrangement would not allow him to remain free, but would allow him to re-engage?—Yes.

11,131. Would it allow him to re-engage a second or a third time?—He can either re-engage, pay a poll-tax, or return to India. At first the demand for Indian labour was much greater, and we did not know how it would work. We anticipated a great number would return to India; but we find the people in the towns are offering free Indians pretty well anything they like, and are paying the full taxes for them, consequently it is adding to our Indian population. The demands are for stores, and a thousand and one things in town.

11,132. The new arrangement makes this difference: that they will not be allowed to remain except as indentured labour?—Yes, that is so. There is one point I would like to mention. You, Mr. Chairman, have put questions regarding the liquor traffic, as to whether it would increase the labour supply, if this was to be made free?

The CHAIRMAN: Yes.

WITNESS: I have a strong feeling as far as the liquor traffic is concerned. It is a serious mistake if you allow liquor in your mines, because it is understood in Natal that the natives are not to have liquor at all. It is a penal offence for a white man to give liquor to a Kaffir under any circumstances, and this may be a reason why our natives are under such complete control. That is also one of the reasons why the chiefs and the headmen have an objection to the young men coming here to work—the way in which they can get drink.

11,133. The CHAIRMAN: The Commission is much obliged for the evidence you have given.

Mr. J. KUSEL was then called, sworn, and examined.

He handed in the following statement:

11,134. It is my intention to give evidence regarding the Somalis, Abyssinians, and Arabs, and offer to do so more especially with a view to refuting certain statements made by Mr. Brentano when giving evidence before the Labour Commission.

In the first place, I would like to state that I resided in North-East Africa for twelve years, first entering the country in 1886. I was there in the capacity of Administrator of one of the districts of the German East African Company, and resided more particularly in Linde, Dars-es-Salam, and Tanga. I was frequently in Massowah, Djibuti, etc.

Mr. Brentano, you will remember, informed the Commission, in the first place, that the Somalis are excellent workmen, and that they would be in every

way suitable for the gold fields of the Rand. Moreover, he added, in reply to a question, that the reason for the experimental gang imported to Rhodesia not being satisfactory, was that they were enlisted under false pretences.

With regard to the first point, I am able to prove that they are not excellent workmen; indeed, they are much averse to work, are of a rebellious spirit, and are absolutely unfit for the work of mining.

With regard to the second point, it is of interest to know that it was I who recruited the Somalis for the Rhodesian labour, and I now give my assurance, which can be borne out by the authorities at Aden, that these people were enlisted under proper supervision of the Commissioner specially appointed by the Governor of Aden; that these people were, on enlistment, explained the exact conditions under which they were enlisted; that they were properly cared for both in food and in any matter of transport; and that the reason for the failure in Rhodesia was the very reason set forth in my reply to the first point.

It is possible to have the matter corroborated by any merchants of standing who reside in any of the districts mentioned.

Abyssinians.—With regard to Abyssinians, I would point out that in Abyssinia there are two classes of people, the one known as the Abyssinians, and the other constituted of the conquered races, chief of whom are the Gallas and Curazios.

The Abyssinians are used chiefly for military purposes, but it is necessary to point out that the army is worked on a system similar to conscription.

The total population of Abyssinia is between five and six millions, of whom 250,000 males are used for military purposes. The result of this is, that there is an abundance of labour available for emigration. The Abyssinians who were included in the experimental gang sent to Rhodesia proved themselves absolutely satisfactory, being both obedient and intelligent. But the best material obtainable in Abyssinia is obtained from the conquered races I have just mentioned, and by a proper system of recruiting, I calculate that from this source alone 30,000 to 50,000 could be obtained. Of course, a greater number of Abyssinians are available.

With regard to the system of recruiting, it is necessary that I should say a few words on the Constitution of Abyssinia, since it will assist the members of the Commission in understanding more clearly my idea. The Empire is under the immediate control of the Emperor Menelik, who styles himself the King of Kings. He sub-divides his country into so many provinces, ruled over by kings, who again sub-divide their provinces into districts, directed by Governors. The governors again apportion their districts under the control of headmen, all being military men. Each headman becomes responsible to his immediate superior for taxes obtained from the people, and their superiors are indirectly responsible to the king of the province, who again is responsible to the Emperor.

It will be seen that extensive emigration would affect the income of the various rulers, and they would naturally be averse to this unless some recompense, in the shape of a poll-tax, was made. I may here state that this actual point was discussed by Ras Makonnen (Viceroy of South Abyssinia) and myself, and he was agreeable to the suggestion, which, by the way, was raised by me.

It will be seen, therefore, that a person practically unknown in the country would experience the utmost difficulty in obtaining a few hundred men, and I submit that individual recruiting would be practically impossible.

Before recruiting could be feasible, it is essential that the recruiter should be a person already well known in the country, and one possessed of Government credentials.

Arab labour is plentiful, and is known as one of the best in the market. There are, however, several difficulties attached to exportation.

Firstly, there is only a small portion of Arabia under European control, viz. Aden, and since the demand for labour thereat is great, the people are, in consequence, averse to exportation. Secondly, the remainder of Arabia is under Turkish administration, and, although Turkish law prohibits emigration, yet recruiting is constantly carried on by a system of corrupt practices. These practices, therefore, render the matter of recruiting a difficult one, and, consequently, the amount of labour from Arabia could not be a regular one, but by working the two sources of Abyssinia and Arabia conjointly, excellent labour and a regular supply could be brought to South Africa.

11,135. The CHAIRMAN: Have you before you a statement headed "Statement of evidence of Mr. Kusel"?—I have.

11,136. You hand it in as evidence-in-chief?—I do.

11,137. You have lived for some time in North-west Africa?—I have.

11,138. You know we have had some evidence as to getting natives from Somaliland?—Yes.

11,139. You have read the evidence?—Yes.

11,140. And you disagree with it?—Yes, I have to correct certain statements in the evidence.

11,141. There is one special statement as to some Somalis being recruited for Rhodesia, and I understand that you were an agent in securing them?—Yes, for the Chartered Company.

11,142. You disagree with the statement as to the Somalis who were engaged?—Yes.

11,143. You say that they were made to clearly understand the conditions of their employment?—Yes, so far as I can understand evidence as given on the subject of the Somalis, which I do not agree with. When the native was cross-examined on several points, it was pointed out that he made statements which were not correct.

11,144. Without so much explanation, will you tell us about the Somalis recruited for the Chartered Company?—I went up with the intention of recruiting Somalis for the Company. I only wanted a small batch—say, 50 to 70 men. There was a special class for the district I went to, which could be useful for underground and service works, and which would be helpful in the engine-room, etc. Mr. Tullow was given to me as an assistant and as a confidential man of the Company. I made arrangements for the recruits in Aden. We had the power to recruit in French territory, and it was not necessary either. As he found that 50 to 70 were all right, Mr. Tullow saw no reason why the rest should not be useful. The steamer was simply crowded, as we had 700 on it, many of whom could not sit down.

11,145. How many did you recruit?—When I saw the men, I could not leave them alone. The Government at Aden does not allow them to be about without a certain employment.

11,146. Will you tell us, without all this explanation, how many you recruited?—I had to take between 300 and 400 out of the 700.

11,147. Did they clearly understand the conditions under which they were employed?—Yes, absolutely. I taught them with sketches the kind of work they would have to do underground in the mine. They knew something of what they would be doing from the experience in the fortifications.

11,148. They understood perfectly, then? Did they understand the wages?—Yes.

11,149. And also how long they were to be employed for?—Yes.

11,150. Will you tell us if you conveyed them to Rhodesia?—Yes, I did.

11,151. What was the cause of their failure?—They absolutely refused to work. The Somali would consent to work at anything, but when it comes to a day when he does not want to, he will not.

11,152. Then you do not think that we can look to Somaliland for a considerable supply of labour?—There are thousands of natives.

11,153. Then your experience is contradictory to what we have had in evidence?—Yes.

11,154. You are also acquainted with Abyssinians?—Yes, I think a supply of labour can be got from there.

11,155. Have you resided there?—I have been there many times, but have not been a resident.

11,156. Have you made enquiries with a view to ascertaining how much labour can be got from there?—I had a good look round.

11,157. And you think that a supply of labour may be had?—Yes.

11,158. At what are the inhabitants working now?—The real Arab comes under the obligatory military service. The others do anything. You would not get very many of the real Abyssinians. Many of them like to stay at home and get positions in the army. The opportunity has not been given to emigrate.

11,159. You speak of the Arabs?—Yes, I recruited some 500 of them for the Chartered Company.

11,160. How did they turn out?—Very well.

11,161. Are they still working?—Yes, they were when I left. In some cases the contract had expired.

11,162. How many did you recruit?—About 500 pure Arabs. A far greater number can be had from Turkish territory, but these things have to be worked in a certain way, and it depends on the Government to a great extent and how much money they make out of it. When the Dynamite Factory was intended, we wanted to get some Arabs, but we did not, because the Boer Government did not want to get Arabs. I have a statement here.

11,163. What is it—do you want it handed in?—No, it only shows that one can get Arabs from the Turks. They were to have come under a three months' contract.

11,164. Mr. EVANS: You state here that there is a possibility of getting Abyssinians in considerable numbers. Could they be got except by conscription?—They will go of their own free will.

11,165. Where did you recruit from?—In Harrar.

11,166. Did you recruit at Aden?—I had some men who recruited in Aden.

11,167. Do you know any other instances of Abyssinians going to work?—No.

11,168. You know what happened to the Abyssinians and Somalis you recruited?—The Abyssinians worked out well.

11,169. Are you sure of that, because the reports of the employers who employed them are very unfavourable?—Perhaps there is no distinction made between the Somalis and the Abyssinians.

11,170. Out of the total number two-thirds ran away?—Yes, nearly all of them were Somalis.

11,171. And a great many died?—Yes.

11,172. And the remainder were no good as mining men?—I did not inquire into that from the mines. I have seen many of the men working at the Rose Deep.

11,173. Were those the men that ran away?—No. These men had worked their contract and gone elsewhere. Some marched from Bulawayo to find work.

11,174. How many?—Twenty. Some found their way back and tried to work their passage home. Some found work in Bulawayo and Salisbury. My firm believed that the mines in Rhodesia did not want boys.

11,175. Then why did they go to the expense of sending you to recruit?—I cannot say; it is beyond my judgment.

11,176. The first boys sent down were useless?—They were sent to do overhead work, and some stone fell and hurt them. They wanted to be put on surface work.

11,177. I have a report here in regard to North-East Africans introduced by you into Southern Rhodesia for the mines during 1900 and 1901. It says: "Taken as a whole, they have proved poor labourers, and as workers they may be classed with others in the following order: Shangaans, Nham-baans, Zambesis, Mutabele, Mashanas, Abyssinians, Shamis, Arabs, Somalis, Swahilis, and Turks. Their general health has been most unsatisfactory, and is largely due to an absence of stamina, their filthy habits, and the great difference between the two climates. In spite of the good woollen blankets supplied to them on landing at Beira, and suitable accommodation, they appeared quite unable to stand any sudden change of cold. Forty-two have died of pneumonia, dysentery, phthisis, fever, and asthma, 214 deserted before reaching the scene of their labours, and 239 since, or a total desertion of 453 out of 603. The North-East Africans introduced have not been a success, and have proved most susceptible to cold, pneumonia, and fever (fully 25 per cent. being nearly always ill and absent from work); their physique is of a low standard; they are dirty, lazy, quarrelsome, never satisfied, improvident, dishonest, and require your constant attention and most careful handling."—I quite agree as to the Somalis, when the first batch of boys came down, there was no one to receive them; they had to be left out on the open veldt, and were lying there for six weeks; then they had to march 300 miles, and it wants a good constitution to stand that. The blankets were not given out until a number had died.

11,178. I have here a report from a company which says: "As labourers, they are unfitted for either surface or underground work; they have absolutely no energy, and little or no idea as to how to exert their strength." This refers to Arabs and the Abyssinians, but not to the Somalis. What have you to say on that report?—I do not want to recommend the Somalis, but I say the Arabs and Abyssinians are good labourers.

11,179. The reports I have read are extremely unsatisfactory. Have you any proof that there is a supply of labour available from Abyssinia, and have you any special information on the subject?—No, I have heard from the boys that the mine men are working well.

11,180. Are they Asiatics?—Yes, Asiatics.

General LOUIS BOTHA, called, sworn, and examined. (Evidence given through an interpreter.)

11,181. The CHAIRMAN: I think, General Botha, you are well acquainted with the native question of the Transvaal?—Yes.

11,182. Did you ever hold any official position under the late Government with regard to natives?—Yes.

11,183. What was it?—Field-cornet and Sub-Commissioner at Vryheid, and Native Commissioner in Swaziland.

11,184. How long were you Native Commissioner in Swaziland?—Not long.

11,185. A short time?—Yes.

11,186. But the other position you probably held for some time?—For about 13 years.

11,187. In the Vryheid district?—Yes.

11,188. You have been engaged in farming in the Vryheid district for some considerable time?—Yes.

11,189. Did you employ many natives yourself?—I usually employed about 30 to 35.

11,190. Can you tell us the average number of natives employed by each farmer?—It is difficult to say. The farmers who had Kaffirs living on their farms always had a good supply.

11,191. But you cannot give the figure, say, as to the average number an agricultural farmer would employ?—From five to six.

11,192. And how many would a stock farmer employ?—It depends on the quantity of his stock; but about the same number.

11,193. And it would be fair to take a figure of five or six for each farmer of the district?—Yes, if

you take the average, from five to six; that would be for a large farm.

11,194. But does a farmer who has a reasonable amount of ground to cultivate also employ about the same number?—No, for instance, a stock farmer does not go in for agriculture. Before the war, the majority of high veld farmers only farmed stock, and they planted and sowed sufficient only for their own personal use.

11,195. But how many natives would the high veld farmers who went in for stock as he describes, employ?—A great part of the time about six Kaffirs. During the lambing season and on special occasions they would require more, but that would only last for a month or so.

11,196. Was the Vryheid district well supplied with natives previous to the war?—Yes.

11,197. Have the farmers there as many natives as they require now?—I am not living at present in the district, so I cannot give particulars. I can only speak of one part of the Vryheid district, and there they commenced to work well, although just after the peace they refused to do so.

11,198. Do you know why they refused to work directly after peace?—Yes, Kaffirs looked down upon the Boers. They looked upon them as their equals, being under the heels of their conquerors, and statements were made by the natives that promises had been made by subordinates to the Kaffirs that if they assisted the British during the war the Boer farms would be given to them; and when we wanted the Kaffirs back my Kaffirs told me I had no business there, and I had better leave, and now the Kaffirs are beginning to see that the Boers and the British subjects are on the same footing. The Kaffirs are returning now that they see the farms are being given back to the Boers; they are returning, and whilst six months ago I could not obtain a single Kaffir, I have now from 30 to 35 who have come from the Vryheid district to Standerton to work.

11,199. Do you know that there is a scarcity of native labour on the farms in other portions of the country?—Yes, certainly.

11,200. Now, have you any suggestions to make to the Commission as to how this demand for natives for farmers is to be satisfied?—In the first place, the Squatters' Law (the Plakkers Wet) should be enforced more strictly; in the second place, I do not think the Government should have large centres where Kaffirs are allowed to congregate.

11,201. Locations?—Not only locations, but there are large portions of South Africa where the Kaffirs have the say, and to which our Kaffirs are continually trekking. I am of your opinion that these should be broken up, and the privileges the Kaffirs enjoy should be taken away, and that they should be placed on the same footing as the white men who would obtain the privilege, that is all.

11,202. Do you mean by that that you would charge Kaffirs rent for the land they occupy?—Yes, on the same footing as which a white person would obtain it.

11,203. You would not propose to the native the right to acquire land under freehold?—I am only speaking of rent. I do not mean to say that the Kaffir should become the owner of the property, and have the transfer in his name.

11,204. In referring to these other districts where natives are allowed to squat, are you referring to Swaziland and Basutoland?—Yes.

11,205. Do you know that there are many Kaffirs squatting on unoccupied farms in the Transvaal today?—Yes, in the low veld there are farms where hundreds of Kaffirs are.

11,206. You would propose, then, the Kaffirs should not be allowed to squat on unoccupied farms?—Not on a large scale.

11,207. When you favour the more strictly carrying into effect of the Plakkers' Wet, do you not think it is a hardship on a farmer who treats his Kaffirs well, and who can get a large number, that he should be confined or limited to five families?—

The Plakkers' Wet makes provision for that, and if a man requires more than five native families on his farm, he can make application to a Commissioner, and if upon enquiry the Commissioner finds he wants them, he is allowed them, and he is allowed more than five families.

11,208. You do not approve, then, of a farmer having more families on his farm than he can give employment to?—Not if he requires them for his own use; but what I am against is there are some farms on which Kaffirs are allowed to live, which is for the sole aim and object of making money out of them.

11,209. Charging them rent?—Yes. Kaffirs pay the farmer £1 10s. for the hut for one year. I think that the squatting not only tends to injure the surrounding farms, but also the native himself.

11,210. What do you mean by being injurious to the native himself?—It is a congregation of a large number of Kaffirs from which no good can come forth.

11,211. Do you know that before the war the hut-tax or poll-tax for £2 a head a Kaffir paid was reduced to 12s. 6d., if the Kaffir was living on a farm and not on a location?—I cannot exactly say whether it was lowered, but I know there was something in the law to the effect that if a Kaffir could not prove he was working he would have to pay an extra tax of £2 per annum.

11,212. Do you approve of the principle of making a Kaffir pay a higher tax if he cannot show he has been working for a portion of the year?—I am in favour of the Kaffirs being under one law for South Africa, under one law from Capetown to here. I think there should be some change in the manner of living of a Kaffir in so far that he should not live for nothing on Crown lands.

The public sitting of the Commission was then adjourned until 2.30 in the afternoon.

Upon resuming in the afternoon,

11,213. The CHAIRMAN said: This morning you (General Botha) stated, I think, that you favoured the more strict enforcement of the Squatters' Law?—Yes.

11,214. Would not the effect of that be to drive the natives in the South-Western portion of the country into Swaziland?—That is exactly the reason why I said there should be one law for the natives, one general law for the whole of South Africa.

11,215. Would the effect of the enforcement of the Squatters' Law until there is one law and one taxation—I suppose you mean for all South Africa—would that effect be to drive the natives into locations and native territories?—I will not say that. For instance, you could not easily get the Zulus or the Makatse to go and live in Swaziland.

11,216. But if there were native locations, would not the effect of the enforcement of the Squatters' Law be, where the natives were not satisfied to live on squatters' farms, to drive them to locations?—Yes.

11,217. It would have that effect?—That is also why I stated in my opinion locations should be broken up.

11,218. Mr. QUINN: I think, sir, that in public on several occasions you expressed your willingness to assist the people here who were in trouble over the labour question with your advice and help?—Yes.

11,219. And has it been your experience that the Boers with whom you have come in contact are of the same mind?—Yes.

11,220. Do you think that the present scarcity of labour is an exceptional thing that will disappear in time?—Yes.

11,221. Do you think that it has been brought about—that is, the scarcity—by an abnormal condition of things all over the country?—Yes.

11,222. And as these abnormal conditions, or some of them, cease to exist, is it your opinion that the demand for labour will be met with a much greater degree than at present by our country labour?—I

can only judge from my Kaffirs and my neighbours' Kaffirs, who six or eight months ago refused to work and are now coming forward to work for us.

11,223. Have you noticed the evidence given before this Commission by Sir Godfrey Lagden?—Yes.

11,224. Did you notice the figures he used with regard to the estimated native population of the Transvaal?—Yes.

11,225. Do you agree with those figures?—No.

11,226. Do you know how those figures are arrived at?—As far as I can understand they seem to have been got more or less from the Kaffirs who pay hut-taxes.

11,227. And in your opinion that is not a safe way of estimating the total native population?—No.

11,228. Would you be in favour of supplementing the present cheap native supply of this country by importing other labour from elsewhere?—It depends upon the labour you intend to import, and from where.

11,229. Quite so; you know the conditions that obtain in Natal in regard to natives and native labour?—Yes, a little.

11,230. You are aware of the fact that in Natal they have imported something like 70,000 coolies?—I am aware they imported coolies into Natal, but I cannot say how many.

11,231. We have it in evidence this morning—when you were present—by Sir James Hulett, that the present coolie population in Natal was 70,000?—Yes.

11,232. And the same authority also stated that the Arab population of Natal was about 10,000?—Yes.

11,233. And that the African native population of Natal was about half a million, including Zululand?—Yes.

11,234. And that the native population of Zululand was probably a quarter of a million?—Yes.

11,235. Making in all a clear total in Natal of about 840,000?—Yes.

11,236. And the white population was 70,000?—Yes.

11,237. Will you please tell the Commission what, in your opinion, the effect of all that imported labour into Natal would have on the natives of Natal?—The best thing would be just to take a paragraph in my statement in answer to that.

11,238. What statement? Have you answered it in a statement?—Yes, I made a statement which was not accepted.

11,239. Will you please be good enough, for the benefit of those who appreciate that statement, to try and get on without it; and, therefore, if you will be kind enough to do that, will you please repeat what you put in that statement, if it is your opinion, in answer to my question?—Yes, in my opinion Kaffir and coolie are increasing more rapidly than the white population.

11,240. It is your opinion that the constantly increasing use of imported labour down there would be detrimental to what should be the natural progress of the natives?—Yes, decidedly.

11,241. And what is your opinion of the effect of this class of labour on the white man's prospects in Natal?—In my opinion, if the coolies are allowed to carry on business in Natal, as they are, in about 25 years they will drive all the white men out in the business line.

11,242. So that your opinion is that the policy in Natal of leaving the natives pretty much to themselves, and importing cheap labour, coloured labour, from elsewhere, would be detrimental to the country's best interests?—Yes.

11,243. Can you tell us whether that is the general opinion amongst the Boer people?—Yes, more or less, that is the general opinion the country over.

11,244. Leaving Natal for a moment, and coming back to our own shortage, will you tell the Commission what are the normal conditions which are re-

sponsible for the shortage to-day?—In the first place I would state that the military during the war spoiled the Kaffirs. They paid the Kaffir too much money. The Kaffir is a barbarian, but after being mixed up in the war, he now considers himself a sort of master in the country. It will take a considerable period before the Kaffir will have a true insight into the real state of affairs.

11,245. How have they got the idea that they are the equals of the white people?—In the first place the Kaffirs were employed as scouts, and also in the block-houses, and to fire upon whites, and in one way they consider themselves better than a certain class of whites.

11,246. What class of whites?—The Boers.

11,247. Was it found by the Boers when they returned to their farms, that many of their farms and holdings were in the occupation of natives?—No. A Kaffir hardly ever lives in a white man's house. The natives were in possession of the Boers' cattle.

11,248. I understood the General to say this morning that some of the natives were promised by subordinates all sorts of things if they supported the British?—Yes.

11,249. And those promises have not been kept?—No, I think not. The Kaffirs did not get the land.

11,250. What is the effect on the Kaffir mind now?—Well, the Kaffirs are gradually beginning to see that the Boers are just as much masters as the other white men, and that the two white races are standing together.

11,251. What effect is that having on the Kaffir? Is it driving him to work?—No; that is one of the reasons why the Kaffir is sulking a little, and which has kept him back. For instance, there are Kaffirs now who before the war possessed nothing, and at present are in possession of hundreds of cattle of ours. If they are lucky enough to retain possession all their life, they will not need to work.

11,252. What is your opinion with regard to the locations where natives are now squatting in large numbers?—I think it is a very wrong policy to keep up these locations. In the first place the Kaffirs come together there, and it leaves an opening for all the rascals to congregate. In the second place it does not benefit the Kaffir himself, because there they do not progress on civilised lines, but live more in a lazy, barbarian fashion. In the first place it gives him two great privileges, privileges which white men do not possess. So long as they pay their £2 hut-tax, they are absolutely free, and not indebted for anything further. The farming population who reside in the vicinity of these locations have any amount of difficulty on account of thefts, and so on.

11,253. These locations, then, in your opinion, are very undesirable institutions?—Yes.

11,254. What do you think is the best thing we can do to get over this labour shortage? We are told by the mining people to-day that they are short of 50,000 or 60,000 boys at present, and they say that natives cannot be obtained. If we take it for granted that there is a very big shortage of labour, and I think everybody admits it, what does the General suggest for getting over the difficulty?—I must say, in my opinion, there are many more natives to be obtained for work than are working at present in South Africa. As I say, great confusion has been caused on account of this war, and we must have a little patience to solve this native problem.

11,255. And if it is eventually found that there is not sufficient native labour available, how do you propose we should supplement that labour?—I am in favour of keeping this a white man's country. I am in favour, if we are forced to import, of importing whites.

11,256. What do you think would happen if to increase the supply of cheap labour it was decided to import, not whites, but some other class of cheap labour? What would the effect be upon the natives and white people of South Africa?—I think it would be a mistake.

11,257. It would have a bad effect?—Yes, if I am to judge from other countries, I should say it would be wrong.

11,258. Supposing it is decided there is not enough labour, and it is decided to import a very large number of labourers from some other country, what effect do you think it would have upon the farmers and merchants of the country?

The CHAIRMAN: Is not that going a little outside the scope of our reference? I have allowed you a good deal of latitude, Mr. Quinn.

Mr. QUINN: You are Chairman; you can stop it if you will.

The CHAIRMAN: I think I have given you all the latitude I can. Our reference is to define the requirements and then see if we can satisfy them from Central or Southern Africa.

Mr. QUINN: May I point out to you that you have already accepted papers before this Commission dealing with Chinese labour?

The CHAIRMAN: There was Mr. Hellmann's evidence, and at my request he withdrew his papers. It was done here in open Commission. The first thing Mr. Hellmann did when he came into the box was to say that he did not quite understand the scope of the Commission, and to ask leave to withdraw certain portions of his evidence.

Mr. QUINN: After they had been distributed to the Commission.

The CHAIRMAN: Yes; but they do not appear on our records.

Mr. QUINN: May I ask why the statement offered by General Botha has not been accepted?

The CHAIRMAN: It was handed to me this morning, and I had representations made to him. It was impossible to ask him to delete certain portions of it, as it mainly dealt with the question of Chinese labour, which is not before us at all.

Mr. QUINN: I only want to show what the effect would be upon our present native labour supply of importing another coloured supply.

The CHAIRMAN: I think the last question you have put to him is outside the reference.

Mr. QUINN: I will try and find a way of putting it which will be inside.

The CHAIRMAN: I shall be very pleased if you succeed, I am sure.

11,259. Mr. QUINN (to witness): Did you hear much talk about a shortage of labour before the war?—Not so much as I hear now.

11,260. Were there ever any representations made to the old Boer Government calling attention to the great requirements of the mining industry in the future, and asking assistance to meet them?—I know the Government issued instructions to us who were working with the Kaffirs to use our influence as much as possible to induce Kaffirs to go and work on the mines.

11,261. Can you tell us whether any representations were ever made to the Boer Government that the labour supply was extremely short, hundreds of thousands short of what would be required in the course of a few years?—No, I know nothing of it.

11,262. This new demand may be regarded as one of the blessings of conquest and peace?—There were a good many complaints formerly about many of the Kaffirs being drunk and incapable, and on that account there were so many short.

11,263. And they are more short now when the Kaffirs are sober? What, in your opinion, would be the effect of cutting down native wages immediately after the war, or before the war was over, by nearly one-half? What would be the effect on the Kaffir supply?—It would be an injurious effect.

11,264. Do you think it is surprising, remembering that fact that wages were cut down, and remembering other things which I do not wish to go over—do you think it is surprising that we have been met with a difficulty in filling up the labour requirements since the war?—No, I am convinced that the

resolution then taken is one of the causes why there are not sufficient Kaffirs at present at work.

11,265. Do you think that with a proper use of Kaffir labour and increased use of white labour, we shall manage to carry on all we want to do in this country?—I am of opinion that with a little patience we can get many more Kaffirs back to work, because the money which they received during the war and the compensation they have just lately received cannot last for ever. The Kaffirs will also gain more confidence when they see that they are being paid the same as formerly.

11,266. Mr. BRINK: You said this morning that under the old Government, natives who worked a certain period of the year had only to pay 12s. 6d., and if they could not produce a certificate of this kind they had to pay £2?—Yes.

11,267. You consider that was a good principle?—Yes.

11,268. Do you know that that principle has been done away with?—No.

11,269. Supposing the Government did away with it, that would be wrong to your ideas?—I do not say it would be wrong, but in my opinion it used to be a good law.

11,270. Then, according to your opinion it is wrong?—In my opinion, if the Kaffirs who live in locations were made to pay a certain sum of money, not as taxation, but as rental for the ground occupied, just as a white man would have to pay for it, that would have a better effect upon them.

11,271. But surely the ground should be limited to a certain area to each family, according to the number of them?—Yes.

11,272.—Something similar to the Glen Grey Act in Cape Colony?—Yes.

11,273. And, according to your opinion, it is a great mistake to allow Kaffirs of any description to squat on Crown lands?—Yes, decidedly.

11,274. And also on unoccupied land?—Yes. The difference is this: the Plakkers' Wet makes an allowance for Kaffirs living on unoccupied farms, while, on the other hand, Kaffirs living on our farms may be split up and forced to live in locations.

11,275. If these locations were emptied, of course with the increase of native population they would have to find ground somewhere else. That would take time, would it not?—Yes, certainly.

11,276. I should like to have the General's opinion as to the number of natives required on farms in the Transvaal. General de la Rey has given us a figure, and I should like to see if he agrees with it. We have 11,650 farms in the Colony, but we know a number of these farms are not occupied, whilst a number are subdivided into smaller farms. Supposing we take 5,500 farms as occupied, do you think it would be too much to say ten natives are required for each farm. Is that over or under estimated in your opinion?—Over estimated. In the first place, so far as I am acquainted with the country, half the farms are not occupied.

11,277. What proportion would you give?—In my opinion there are only one-third of the farms occupied.

11,278. Giving us, more or less, 4,000 farms?—Yes.

11,279. What would be the general estimate for each farm, taking the great number of these farms as sub-divided into many portions?—Unless you go into particulars, it is almost impossible for me to answer this question. I do not think any answer I could give would be of much value to the Commission.

11,280. We have had other witnesses giving us 40,000 or 50,000 labourers for the requirements of the farming community of the Transvaal?—That is very likely. What I wanted to say is that the great majority of farmers have Kaffirs living on their property, and these people are satisfied with their supply of labour.

11,281. I quite see the drift of the General. I do not put these questions to catch him, but it is part

of our duty to get at the demand and supply. I want to get the demand of the agricultural community, and then we will try and get at the population and see the supply. A rough estimate is what I want?—I said this morning that the Boers could very well do with from four to six Kaffirs.

11,282. Then we will take it at 25,000 Kaffirs?—Yes, you would require more than that.

11,283. Sir Godfrey Lagden gave us figures of the population of the Transvaal as 620,000. In the General's opinion that is an under estimate?—Yes.

11,284. His idea is that we have a million, roughly speaking?—Yes.

11,285. What percentage does the General think of the million of natives would be able-bodied men, who would seek employment?—It would be more than one in ten, at least one in six, to judge from the ward in which I was Sub-Commissioner. There was a large quantity of Kaffirs there, everybody had sufficient labour, and we used to send a number to the mines to work.

11,286. According to the General's opinion, we are paying the Kaffirs quite enough, in fact, too much?—Yes, I think that from the start the mines spoiled the Kaffirs, and made a mistake by paying them too much.

11,287. As a practical farmer, is the General of opinion that the farmer can pay £3 a month for a Kaffir, feed him, and make farming pay with all the drawbacks we have to contend with?—For certain months in the year, for instance, sowing and reaping seasons, the farmer can afford to pay the natives more than at other times, but he cannot pay that for the whole year. It is really only in these few months that a farmer requires more labour.

11,288. Can the General suggest any improvement in the Squatters' Law. Perhaps he has not read it carefully lately?—No, not unless I read it over again; but, for one thing, the existence of locations should be stopped.

11,289. The tribal system must be done away with?—I should not say altogether, but it should not be encouraged.

11,290. The General can now see the difficulty of the Commission. One witness tells us the tribal system must be encouraged, and the next will express the same opinion as the General.—I will stand by my opinion. I want to say that in my opinion if certain tracts of country occupied by Kaffirs are under chiefs, you would obtain less labour from those tracts than if it had been cut up and divided. In Zululand we could never engage a Kaffir formerly. In 1884, when we took the country, it was sub-divided and surveyed, and every farmer could obtain a sufficient supply, and also there were sufficient to go to the mines continuously. The idea of a white man shewing a Kaffir that he must work to progress is an inducement to him to put his own hand to the plough and start working, but where the chiefs are it leads to kingdoms. Take Swaziland, for instance, you find that round the young king or queen there were thousands upon thousands of Kaffirs doing nothing. They also make laws amongst themselves that every petty chief should send so many Kaffirs to live with them. They formed Kaffir regiments, in which all had to take their places.

11,291. Of course the General is well aware that at the present moment native labour as far as the farming community is concerned is not to be had?—Oh, yes, there are places that I know where labour is very scarce. There are some places right in the midst of where the Kaffirs are living where labour is scarce.

11,292. Mr. FORBES: Ask Mr. Botha if there is much stock in the part of the country with which he is acquainted?—Unfortunately, no.

11,293. Only in the hands of Kaffirs he speaks of?—Yes, to some degree. I wish to explain. For instance, on farms in Swaziland, Vryheid, and Zululand there are Kaffirs with great numbers of cattle, even in Sekekuni's country, and in those

portions of the country held by Boers there are very few cattle.

11,294. The farmers have practically no stock to get an increase from?—No.

11,295. Does he not think that with railway facilities and a market within reach that the farmers will want to increase their agriculture?—I think they will increase it if they can, whether the railway comes there or not. The new lines will give possibly many facilities for getting to the market.

11,296. And they, therefore, will require more labour?—Yes.

11,297. Under these circumstances, how many natives does the General think a farmer will require?—I say from four to six.

11,298. Mr. PHILLIP: Did not the Boer Government, just after the outbreak of war, reduce the wages to 20s. a month?—After which war?

11,299. Just after the outbreak of the last war?—I think we paid them nothing. I cannot say for certain, but I do not know of any resolution to that effect. I know the Kaffirs working for the Boers, more or less, fell under the commandeering system.

11,300. Under the Boer Government Indians were allowed to have stores in the towns, were they not?—I think it was only in some places, in a few cases.

11,301. Such places as Potchefstroom?—I mean that it was occasioned by the interregnum from 1877 to 1880.

11,302. Sir GEORGE FARRAR: You said that you would recommend the breaking up of locations like Swaziland, Zululand, and Basutoland, and the putting white settlers there?—I would suggest that these countries be given up to the white people to live in.

11,303. Your people want the extension of railways, irrigation works, and no doubt on account of the shortage of cattle they will have to go in very largely for agriculture?—Yes, they will.

11,304. And, therefore, you will want much more labour now than before the war?—No, it is not exactly necessary, for where one man before the war had 5,000 or 6,000 sheep, he also required a good number of Kaffirs to attend to them, and these he could now use for agriculture.

11,305. But you want these extensions of lines for agriculture more than for stock, do you not?—Yes.

11,306. So that if there is to be an increase of agriculture, therefore, you will want much more labour?—Certainly.

11,307. Do you think the importation of free Indians into Natal has been detrimental?—Yes.

11,308. The reason is that it has caused the white population to be more or less stationary?—Yes.

11,309. The white population during the last 25 years have increased 150 per cent.?—Mostly in Maritzburg and Durban. They have decreased in all the small towns, there the coolies have—

11,310. Now, you heard Sir James Hulett talk about the sugar and tea industry on the coast. He said that the industry could only be worked through coolie labour, as the continuity of labour cannot be depended upon?—I do not know much about it. I know that coolies are paying up to £10 per month for ground there.

11,311. Sir James Hulett said that the Natal Government are not importing any more free coolies, but they want them indentured. That is, they come from India under indentures, and that at the end of the indentures they return to India, and are paid off so that none of them remain in the country?—Yes.

11,312. Does the General think that an improvement, or does he object to that?—I consider that, for the white population of Natal, it is better if they did not allow them to go on to the farms at all.

11,313. And then, rather than run the sugar and tea industries by coolie labour, he would rather that

the country was not cultivated?—No, decidedly not. I do not know where the white man can go and live next to the coolie and work profitably. He cannot live as the coolie lives and pay £10 to another man for a small bit of garden, and still make it pay.

11,314. Therefore, rather than have the coolie he would prefer not working the land?—If the coolie were not there the white man would be able to work it well.

11,315. With tea and sugar?—Anything.

11,316. Coming to the mining industry, Mr. Botha thinks we could increase our supply of labour in the country?—Yes.

11,317. And if we cannot get sufficient natives in the country, therefore, we must import white men to make up the deficiency?—Yes.

11,318. What kind of white men?—Any kind of whites.

11,319. Italians or Finns, or anyone like that, we, the mining companies, should bring them in?—In any case I think it is worth the while to make some inquiry and find out from where they could import these men.

11,320. But his recommendation is that we should import these people if we cannot get sufficient native labour in the country?—Yes.

11,321. Well, it would actually bring down all the wages of white men in the country?—I do not exactly know what the white men are getting now.

11,322. But I do not suppose that these white men would work as cheaply as natives?—No, I do not think it would be as cheap, although some of our people are working for 5s. a day.

11,323. But it is only temporary; he hopes it will not continue?—Yes.

11,324. Therefore, it would raise working costs, this employment of white men?—Yes.

11,325. And, naturally, low-grade mines could not work?—Yes.

11,326. Therefore, it would restrict the industry?—I should still have my opinions even if you imported yellow labour. I do not know if you can import them so cheaply. My opinion, that there is sufficient labour in this country is supported by the resolution of the Chamber of Mines to reduce wages by £1 10s. Of course, I cannot believe that that body would, knowing at the time that there was not sufficient labour, take a resolution to that effect.

11,327. But that is some time ago. Now we are paying 50s. and £3?—Yes, but we have had labour strikes all over the world. In my opinion this was the beginning of a Kaffir strike, and it will take some time before the Kaffirs can see that things are right again.

11,328. Practically, then, it is better to regulate the progress of the industry by the labour we have in the country rather than import from elsewhere?—Yes, you want to save yourselves from one evil by doing a greater to the country.

11,329. You would regulate the industry by the amount of labour available?—No, there is other labour to be obtained, as I have already stated. There are white men who can be imported.

11,330. Can you work a farm with white labour?—Yes, certainly, if they would only work.

11,331. And if you have to pay them £20 a month?—It is not necessary to pay them £20 a month.

11,332. What do you pay, then?—We farmers pay a white man who takes our sheep under his charge from 20 to 25 sheep a year.

11,333. And you can get all the men you want on that wages?—I can obtain more than I want.

11,334. Then the farmers do not want any Kaffirs?—All the farmers who have no Kaffirs on their farms are in difficulties.

11,335. Oh, they are? I thought they were so happy and they did not want any more?—No, they are lucky, but not as lucky as all that.

K k

11,336. I mean all this shouting in the western side of the Transvaal about want of Kaffir labour on farms, you do not think it is quite well founded?—No; I do not think you quite understood me.

11,337. That the general tenor of your remarks is that there is sufficient labour, and it only wants a little patience to wait for it, that is all?—I have distinctly stated that there is a greater amount of labour to be obtained amongst the Kaffirs than has at present been obtained. But there are farmers who have farms, and have no natives living on these farms. For these people it is difficult to obtain natives, because the natives who are not living on the farms are in locations. If the locations were broken up the natives would be made to live on farms.

11,338. You suggest that we should break up such lands as Basutoland, Swaziland and Zululand?—Yes, I say that such places are a source of evil. It is building up a Kaffir kingdom in the midst of us which is not only bad for the Kaffirs themselves, but is a danger in the future.

11,339. But take Zululand for instance; there is a quarter of a million people there. What would you do with them if you break up their territory?—They would all live on the farms as the white people are doing now.

11,340. Oh, you want to cut up the land into farms and give it to the white people, and retain the Kaffirs on the farms?—Yes.

11,341. On what basis do you want to keep the Kaffirs on the land?—On the same basis on which they are living on the farms here.

11,342. You mean something under the provisions of the Squatters' Law?—Yes.

11,343. But what will the white people do with the Kaffirs, pay them wages, or charge them rent for the ground, or what?—My opinion is that the Kaffirs, who now live in locations, should work for the white people, and the land should be exploited. The white people would pay them for the work that they did, and this would gradually civilise them.

11,344. A nation like the Basutos, you would deal with in the same way?—Yes.

11,345. They at present occupy the land; we have had evidence before us to the effect that every inch of land in Basutoland is occupied and worked by the Kaffirs themselves as their own property?—That is just my argument. So it will afterwards be in Swaziland and Zululand. The Plakkers' Wet was enforced in the Free State. I was an inhabitant there, and thousands of Kaffirs living in the Free State trekked into Basutoland.

11,346. That is on account of the Plakkers' Wet being enforced?—That was because there was an opening for the Kaffirs there. They could go and live there without doing anything.

11,347. But they do something. They work the whole country; they have a lot of grain?—Yes, for themselves.

11,348. Exactly; they have the right to do that?—Yes.

11,349. But you do not want to let the Kaffir do as he likes. You want to cut this land up into farms and give it to the white men, and retain the Kaffirs as their labourers?—Oh, no; I distinctly stated that I refer only to Crown lands, Government property they are living on. The Kaffir must not only pay his hut-tax, but he must also pay the same as I would have to pay if I hired a farm from the Government.

11,350. Well, then, if the Kaffirs pay the same as you pay, that is a quit-rent of 30s. per year, that would remedy the evil. It is not necessary to drive them away?—No. I am on a Government farm to-day, and I have to pay from £10 to £40 according to the value of the farm.

11,351. That is probably a leasehold farm. That has only lately been established?—No; before the war we used to hire the Government ground.

11,352. I want to get at this: You said that Basutoland and Zululand and others should be broken up, and you said that the land should be given to the white farmers and the Kaffirs should be retained under a Squatters' Law. I have shown you that Basutoland is fully occupied by Kaffirs, and they work it. Do you want to apply your scheme to Basutoland?—I do not know very much about Basutoland. I have never been there personally; but I am well acquainted with Zululand and also Swaziland, and I want to state this, that in my opinion it is not only a wrong policy, but also a dangerous policy to have large tracts of country inhabited by uncivilised races, and to keep them there on the present terms.

11,353. But these natives lived there from time immemorial. It was theirs before we came here. How can we drive them off the land now, and take it for ourselves?—I think we are feeling very happy that we drove them from Johannesburg in the olden days. They lived in this country, too, just the same. And the Kaffirs who became civilised under us have improved.

11,354. Supposing the Kaffirs do not allow themselves to be driven off, and will fight for it. What will you do then?—I do not think there is much danger in that.

11,355. Well, we know that Kaffirs did stand up and fight for their rights before now?—Yes.

11,356. Are you prepared to face another Kaffir war for the sake of carrying out such a policy?—It is quite unnecessary to face another war, and it is unnecessary to have such a thought to speak about it.

11,357. In answer to a previous question put by one of the Commissioners, you replied that coolie importation was bad for the natural progress of the natives?—Yes.

11,358. You instanced Natal, and your answer was that by leaving the natives to themselves as in Natal on account of the coolies coming in to take the labour from them?—Yes.

11,359. Yet we have evidence from all sides that there is no Kaffir labour to be got; they are all fully employed?—There are half a million Kaffirs in Natal, and only 70,000 whites, and if the latter have not sufficient labour then it shows that they do not want to solve the problem.

11,360. It is a fact that the Kaffir there gets better wages than the coolies do to-day?—Very probably. If you go into the streets you will see them running about with 'rickshas, hundreds of them.

11,361. They are earning money, and getting better wages than the coolies, so that the coolies could not have displaced them?—It is very possible, but the majority of the coolies do not work in Natal. They are living on the farmers' and farms. Some pay £5 per head to live there. Some obtain and buy property, and live on their own property. How can you expect a Kaffir, who has his own farm, to work for another person, white or black?

11,362. Well, to earn money, they must have been working?—Therefore, it is unnecessary for them to earn more money, because they sell their produce, and they also engage in transport-riding.

11,363. If they are doing good work and earning good money for their work, the coolies are not displacing them?—The coolies do not take their place. They are extending themselves all over Natal, from place to place.

11,364. Sir James Hulett said this morning that the coolie labourer was the salvation of Natal. That you do not believe in?—No, decidedly not.

11,365. But, then, Sir James is a man who has been living all his life in Natal; working there, and has, I suppose, a better knowledge than you can claim to have?—Very possibly.

11,366. Mr. EVANS: On what do you base your estimate of 1,000,000 as the Kaffir population of the Transvaal?—On the official figures of the Government of the Transvaal prior to the war.

11,367. What were those, roughly; were they as much as 1,000,000?—No, between 800,000 and 900,000.

11,368. In your estimate of 1,000,000 do you include Swaziland?—No.

11,369. Roughly, how would the Kaffir population be distributed?—I have not those figures before me. The late Government had a law that the Native Commissioners, when they paid in their taxes, should take a census of the native population in their wards, and this was systematically done before the war. Those figures ought to be obtainable at Pretoria.

11,370. Do you consider the native statistics given in the "Staats Almanack" for 1899 as approximately correct?—I could not say for certain.

11,371. Those would be the official figures?—Yes, but then you must also consider whether everything was included in that.

11,372. Have you any reason to doubt the correctness of those figures, of the official figures published in the 1899 almanack?—No, I have no reason to say that the figures are wrong.

11,373. Take the last estimate that was submitted by the Superintendent of Natives to the Volksraad, do you consider that a fair basis, a correct basis to go by?—Yes, but then you would have to take the whole report with it; to consider the whole report.

11,374. I take it, you are basing your estimate on the Superintendent of Natives' reports?—I cannot say exactly whether it was on his report, or on the information which he gave to the Volksraad.

11,375. But you are basing it on information supplied by the Superintendent, and not on information you possess yourself in any way?—Yes, on the figures which we received from the Government.

11,376. How do you account for the shortage in the Cape Colony?—I know nothing at all about it.

11,377. Mr. PERRON: I think the General is a farmer?—Yes.

11,378. What is the size of his farm?—At Stander-ton he has 3,000 morgen.

11,379. What number of natives does he employ to-day?—I think I am employing from 10 to 12.

11,380. How many does he require?—For my sheep, which are not at present on my farm, I think I require some more Kaffirs. For the cattle and the agricultural work I employ from 20 to 25 Kaffirs.

11,381. How long had the General been waiting for the 25 Kaffirs that he has on his farm to-day?—I waited a few months. Last season I had only three small Kaffirs.

11,382. Why did he not employ white labour when he could get it?—That is just what I do. I have four whites working.

11,383. He wants 25 natives on his farm?—Yes, but one white man is worth a good deal more than a Kaffir.

11,384. I thought he would do nothing much?—No, decidedly not, I did not say that.

11,385. Is the General aware that we are very short of labour on the Rand to-day?—Yes, I have heard so, and have read the speech of Sir George Farrar.

11,386. We are short of something like 80,000 to-day. If we cannot get any more labour, would you suggest the importation of 80,000 or 50,000 or 60,000 unskilled white labour?—Yes, always, in preference to Asiatics.

11,387. Do you think we could get unskilled white labour to work on the mines from England or Italy, or from all those places?—It is not for me to say. That is why I said the white question should be thoroughly gone into to see how many, and for what, you could obtain white people for labour.

11,388. Would you like to see white men getting three good meals a day?—Yes, the labourer is worthy of his food.

11,389. Do you think 25 sheep would pay white men?—I do not understand you.

11,390. I think the General mentioned just now that he could get white men for 25 sheep a year?—I do not think you quite caught what I said. I stated that to white men who came to us we used to give 20 to 25 ewes a year.

11,391. You got sufficient white labour at that figure?—In addition I gave them their food.

11,392. I think you mentioned we should wait with patience?—My meaning was, if you will allow me to explain, that we should use patience, rather than rush into a greater evil than we have at present.

11,393. How long do you think we will have to wait for 80,000 natives?—It is impossible for me to say.

11,394. Do you think you will get them in three or four years?—I think if the mining people would work properly they ought to obtain a greater supply than at present, judging from the present output and the output before the war.

11,395. You cannot say how long we will have to wait?—No. In any case I hope you will not let us wait very long.

11,396. The CHAIRMAN: The Commission is much obliged for the evidence Mr. Botha has given.

Mr. BOTHA: I want to know if the Chairman, who cannot accept my statement, will hand it back.

The CHAIRMAN: Yes, certainly.

Mr. ALFRED G. ROBERTSON was then called.

11,397. He handed in the following statement:—

#### STATEMENT OF MR. ALFRED G. ROBERTSON.

Yours of the 14th instant duly to hand. I am willing to go to Johannesburg to give evidence, should you deem my knowledge of any use to the Commission. I have lived in the Wakkerstroom district all my life (36 years) and have employed and had to do with natives all the time. The object of the Commission, I believe, is to find out how to increase the native labour supply and how to make the natives work. My method may, perhaps, not commend itself to the Aborigines Protection Society, but we here know the lazy and peculiar way in which natives live and have lived for generations; also that they do not know the dignity of labour. Every white man in this country must do a day's work to live, and I do not see why a native should not work. He has no ambition beyond obtaining numerous wives, and it is the duty of South Africans to make these men work for the good of the country and themselves. To do this, without resorting to slavery, it is essential to have uniform laws for all the British Colonies in South Africa. We must legislate on, say, the following lines:—No Government locations; no unoccupied farms to be occupied by natives; all natives between the ages of 18 and 40, on proving that they have worked six months out of the year for a white man, to be exempt from direct taxation, failing which, from £10 to £12 a head to be paid; the usual tax of £2 a head for natives over 40 years of age; only the number of natives the owner of the land requires to be allowed to squat on his land, but no regulation number to be fixed as by the present law; if, after the above has been enforced for one or two years, a surplus is found, then a Government location can be made near the places in each Colony where the greatest number of natives is required, and where they can easily find employment.

Laws framed more or less on the above lines will, perhaps, in time place all natives in the labour market for at least six months in the year, but at present from these districts there is not much hope of augmenting the supply.

In Piet Retief and Wakkerstroom districts, I estimate the number of inhabitants at about 28,000, of which 10,000 are men, 9,000 working boys. Of these probably 3,000 are working on the farms on which they are squatting, one thousand more are probably working in towns in their immediate vicinity, 1,000 more are working on the mines or towns further

away; the rest are squatting at home. Of the last 4,000, I think 2,000 should not be reckoned, as they must stay at home and look after the families, leaving 2,000 in the two districts available for work. Nothing but exceptional scarcity of food or tempting inducements will prevail upon them to walk a long distance to find work.

I am a farmer, and have personally always plenty of working boys. They are living on my property, and, while working, I pay them 10s. a month, but also help them with ploughing, etc., which is worth a good deal to them.

11,398. The CHAIRMAN: Have you in front of you a statement headed "Evidence of Mr. A. G. Robertson"?—Yes. It is just a short letter to the Secretary.

11,399. You hand it in now?—Yes.

11,400. Are you a farmer?—Yes.

11,401. And live in the Wakkorstroom district?—Yes.

11,402. You have been a farmer for many years?—Yes.

11,403. How much ground do you cultivate?—Between 400 and 500 acres.

11,404. How many natives are employed on your land?—We have working for us altogether 40 natives every day of the year, sometimes a few more, sometimes a few less.

11,405. Where do you get them from?—They are living on our own farms.

11,406. And on what terms?—They have to work when we require them, for which we pay 10s. a month. We give them grazing for their stock.

11,407. How many are working on the land altogether?—We have three farms and altogether 100 working boys living there.

11,408. How many does that represent altogether—men, women and children?—Between 500 and 600.

11,409. And how many families?—About 80 or 100.

11,410. How much ground do they cultivate?—As much as they can. Just now the amount is a little less than it was before the war. They have cattle.

11,411. How much land were they cultivating before the war?—I should think from 300 to 400 acres. Just now they have not got a large number of stock, before they had altogether 600 head of cattle.

11,412. They occupy a good deal of the farm?—Yes.

11,413. Do you charge them rent?—No.

11,414. How long do the Kaffirs work?—The married men six months, the unmarried 12 months.

11,415. When they are not working for you they can go away to obtain work elsewhere?—Yes.

11,416. Have you the labour you want?—Yes, at present.

11,417. In the district, have they enough?—Yes. Speaking generally, I would say labour was scarce.

11,418. Have you any remedy to suggest to increase the supply for the farmers?—No Government locations, and allow no unoccupied land to be occupied by niggers. Then, I do not think the taxation makes them turn out to work. You should tax them very highly, and if he works, a certain part of the taxation should be remitted. The Kaffir is an economist and always tries to save. If he can work six months out of the year and save the direct taxation, he will work and save the money.

11,419. Then you think that the taxation should be remitted under certain conditions?—Yes, except when the natives are too old. If the Kaffir is too old he should only have to pay the usual £2.

11,420. Can we look to your districts for a supply of native labour?—Not at present.

11,421. You want it all for yourselves?—Yes.

11,422. Do you know Swaziland?—Yes.

11,423. Do you know it well?—Fairly well.

11,424. Did you get a certain amount of labour from Swaziland for your districts?—Yes.

11,425. Do you think that there is a considerable likelihood of considerable numbers coming from there?—No, I do not think so.

11,426. We have been told that we could get from 4,000 to 5,000 workers for the mines?—If you could induce them to come, or force them to come, yes. Otherwise I do not think that they would come willingly.

11,427. Would the exercise of force be feasible?—It would not be feasible, unless you brought all the natives under one law.

11,428. Mr. DONALDSON: The farmers in your neighbourhood are short of labour?—Yes.

11,429. Is it your opinion that to provide labour for the farmer it is essential that the labourers should live on the farms?—Yes.

11,430.—The only way for them is to have them on the farm?—Yes, that is the best way, especially when you want the natives to a day.

11,431. Mr. PHILLIP: You employ a number of boys?—Yes.

11,432. They work for six months of the year?—Yes; we want 20 extra boys.

11,433. What do you reckon is the average number for each farm in the Transvaal?—It is difficult to say. Farms are of such different sizes. For the cultivation of one acre you want about three men; for the next five you want six, and so on as you go along.

11,434. Do you think this would be a low average per farm for boys required in this country?—It all depends. For one farm it would be a low average, for another a high.

11,435. Can you give us some average throughout the whole country?—I can only speak of my own district. I should think you would want an average of eight or ten in our district, particularly now, because people are cultivating more than before.

11,436. What do you think of the locations, would you do away with them?—Yes.

11,437. Do you think if the Squatters' Law were enforced, and the natives dispersed amongst farmers, that labour would be more plentiful?—I do not approve of the present Squatters' Law, but I do not object to the principles of it.

11,438. What objections have you to the present law?—I do not see that there should be any limit, such as five huts on a farm. I think each man should have as many natives as he requires, and no more.

11,439. Is that not allowed by law?—Before the war, I went to the late General Joubert, who was then Commissioner of Native Affairs, and pointed out our difficulties, and said that we wanted more natives. I asked him for a ruling on this law, whether it meant a kraal of 40 or 50, or an individual married man. He said that in his opinion it meant a chief above a kraal which might contain 50 natives. I said: "In that case, I do not want more; I have enough." I went to another Commissioner of Native Affairs, and he said each native man constituted a family. Then I did want a great many more. One does not know exactly how a Commissioner of Native Affairs will interpret the law; so it is rather unsatisfactory to us—we do not know exactly where we are.

11,440. Do you believe in breaking up the powers of the chief or headman?—Yes, as much as possible.

11,441. Do you think the boys would come to work if they had ground for themselves?—To give them freehold ground.

11,442. Not freehold, but pay rent?—If he lives on Government ground he must pay rent.

11,443. Do you favour that breaking up of tribal power?—Yes.

11,444. Mr. BRINK: Mr. Robertson, are your farms in Wakkerstroom sub-divided or full farms?—Full farms.

11,445. Have you any idea how many farms are there. You have 285 farms in the Wakkerstroom district. Do you mean to say you have only 285 farmers?—Oh, no; I know we were a community of 800 or 1,000 when commandeered.

11,446. How many farmers have you there?—Probably 800.

11,447. And each of these 800 farmers requires some labour?—Yes.

11,448. What would be your average?—Well, at the least, four or five natives.

11,449. I am asking these questions because we have had witnesses from Piet Retief stating there are 225 farms there and about 800 farmers, and one witness said that at the least 5,000 natives were required. We have about 11,650 farms in the Transvaal, a large number unoccupied. We will take the occupied farms at less than half, say 5,000. Do you think ten natives to a farm would be too much?—No.

11,450. Do you think it under-estimated?—No, each farm can have ten natives at least.

11,451. I am taking 5,000 farms, not 5,000 farmers. That is why I am putting the question. You have 225 farms in that district; Piet Retief has 225, and yet they have about 800 farmers, at a rough estimate. So if we have 5,000 farms occupied, some of these farms, we have had in evidence, and we know it, are sub-divided into 40 or 50 portions, do you think ten to a farm would be under or over-estimated?—It is over-estimated, supposing you had a lot of farmers on a farm. Each farmer requires ten.

11,452. I am trying to get to know the number required for purely agricultural purposes?—Each farmer requires an average of ten.

11,453. And if I say that 60,000 or 70,000 natives, able-bodied men, are wanted in this Colony for agricultural purposes, do you think I am saying too many?—No, I do not think you are saying too many.

11,454. What would you put it down; 50,000 or 60,000, or 70,000 or 100,000?—I would say 50,000 or 60,000.

11,455. Mr. PERROW: What do you pay?—10s. a month while he is working and his food. I give him some consideration worth something to him and me.

11,456. What is the privilege you give to the native besides 10s. a month; what is it worth?—It might be worth 10s. a month more or less. It depends how much I give him, or how much I plough for him or help him. One man helps a little more, another a little less.

11,457. Is £1 a month all you can afford to pay the native?—Yes, I should not give him more, unless I could do it with a great deal of machinery, and save a lot of natives.

11,458. Mr. FORBES: Do you believe a native would prefer to work a longer time rather than pay an increased tax?—He would prefer to grow and work for a certain time rather than pay an extra 10s. a month or an extra 20s.—the nigger is a great economist.

Mr. JOHN QUAYLE DICKSON, called, sworn, and examined.

11,459. The CHAIRMAN: Mr. Dickson, have you before you "A Statement of Evidence by Mr. John Quayle Dickson"?—Yes.

11,460. Do you hand that in as your evidence-in-chief?—Yes.

11,461. The statement was as follows:—

STATEMENT OF EVIDENCE BY MR. JOHN QUAYLE DICKSON.

I, the undersigned, John Quayle Dickson, am Principal Native Commissioner for the Orange River

Colony, and am well acquainted with the native inhabitants of the said Colony.

I have also travelled through nearly every district; before the war I was a resident in the Cape Colony for upwards of twenty years.

I estimate the native population of this Colony to be as follows, viz.:—

Total native population	- - - -	146,358
Estimated number of males between the ages of 18 and 35 years	- - - -	35,038
Percentage of increase of population during the last five years	- - - -	No increase.
Estimated percentage of increase during the next five years	- - - -	25 per cent.

In the Orange River Colony at the present time there are 11,294 farms, and I do not think that on an average there are more than two heads of families employed on each farm, whereas about five could be used to advantage.

The majority of natives are employed in agricultural pursuits.

The usual diet is mealies and Kaffir corn.

The average wage on farms ranges from 10s. to 20s., and in town from 20s. to 60s. per month.

The native residents in the Colony are for the greater part only suitable for agricultural labour and are not suitable for mine work.

The native population is not sufficient to contribute to the requirements of the Transvaal.

APPROXIMATE NUMBER OF NATIVES IN EACH DISTRICT.

District.		
Bloemfontein	- - -	17,700
Edenburg	- - -	3,126
Harrismith	- - -	22,500
Heilbron	- - -	4,000
Ladybrand	- - -	10,500
Thaba 'Nchu	- - -	21,000
Senekal	- - -	3,000
Smithfield	- - -	1,200
Springfontein	- - -	1,500
Vrede	- - -	4,800
Rouxville	- - -	4,000
Bethlehem	- - -	8,000
Winburg	- - -	5,300
Vredefort	- - -	2,600
Hoopstad	- - -	1,140
Boshof	- - -	2,421
Ficksburg	- - -	3,800
Fauresmith	- - -	6,571
Frankfort	- - -	2,200
Jacobsdal	- - -	1,000
Lindley	- - -	4,000
Wepener	- - -	1,000
Kroonstad	- - -	15,000
		<u>146,358</u>

11,462. You are a Principal Native Commissioner for the Orange River Colony?—Yes.

11,463. Have you occupied that position long?—Only about eight months.

11,464. Were you formerly living in the Cape Colony?—Yes.

11,465. Are you well acquainted with the natives of Cape Colony?—Yes, fairly well.

11,466. You give the estimate of the native population of the O.R.C. as 146,358?—I think it is fairly correct.

11,467. How is it arrived at?—We took a rough census of all communities.

11,468. Recently?—Yes, since you asked us.

11,469. It is 120 odd thousand in the last census of the old Government; when was that?—It was 129,787 in 1890.

11,470. You also made an estimate of the males between 18 and 35?—Yes, 35,038.

11,471. You say there has been no increase of population during the last five years?—No; a great many of our boys have gone to the Cape and elsewhere. There has been an increase since the last census, but a great many of our boys left, and have only just come back.

11,472. You give an estimate of the increase during the next five years?—Yes, 25 per cent. I expect many of our boys back. They are gradually coming back now.

11,473. You have 11,294 farms in the Orange River Colony?—Yes.

11,474. You have about two heads of families employed on each farm?—Yes.

11,475. And you estimate in normal times you could easily use five families per farm?—Yes, on some farms we would not use so many, but on some farms, more. It is a fair average.

11,476. Are these 11,294 farms occupied now?—Yes, nearly all the farms in the Orange River Colony are occupied. There are a few not occupied, such as at Boshof.

11,477. Are you short of labour now?—Yes, we are; on some farms there is none at all.

11,478. You anticipate a considerable increase of mining operations in the Orange River Colony?—Some mines next year will require more than double what they have now.

11,479. The practical question as far as we are concerned, is whether you think that the Transvaal, especially the Witwatersrand, might look to the Orange River Colony for any share of its native labour?—You see we have none to give away. We have only two locations in the Orange River Colony—Thaba 'Nchu and Harrismith, and at present moment 75 per cent. of these boys are adult males, are working or are not. The reason why they are so working—so well—is that the railways are close to their homes. I have taken great trouble to get at the figures. The Baralongs are not fit for work. Within the last two months only three boys applied at Thaba 'Nchu to come to the Rand for work.

11,480. Mr. BRINK: You say you have 11,294 farms in the Orange River Colony and you say that nearly all those farms are occupied?—Yes, a great many of these farms have been cut up lately in the agricultural districts for settlers.

11,481. Can you give us some idea of the farming population—farmers pure and simple. I am sure there are more farmers in the Orange River Colony than 11,294?—Yes, a great many more. I could not tell you exactly. I should think you could say about two to each farm.

11,482. About 22,000 altogether?—I cannot tell you the population.

11,483. But you have about 22,000 farmers, and about 25,000 natives?—Yes.

11,484. That would be about 1½?—Yes, that is about it.

11,485. What in your idea, with farming at the present moment, are the requirements of the Orange River Colony?—I think it would be about five or six natives to a farm. At present there are only four. If we had a good season we should want five. A good deal depends upon the season.

11,486. Make it three. Then you would require about 60,000 able-bodied natives?—Yes, or more.

11,487. For the farmers alone?—Yes. You see they are getting a number for the agricultural portion of the Colony from Smaldeal, Thaba 'Nchu and districts. Each of the new farms wants as many boys as one farm did before the war.

11,488. We will take a low estimate. You say there are 22,000 farmers?—Yes, I take it there would be about that.

11,489. I take it you would get a supply from Basutoland?—Yes, if you were not taking them from Basutoland we could get more.

11,490. Unfortunately, I am a farmer, too?—I did not know; on the border districts of the Colony we

draw a good many from Basutoland, Ficksburg, Thaba 'Nchu, and that district.

11,491. And absolutely you have not enough labour in the Orange River Colony for the farming community?—No, many of the farmers are continually worrying me to try and get them natives.

11,492. Mr. PHILIP: This number of natives which you give; does this include the natives imported from elsewhere?—It includes the total number of natives in the Orange River Colony at the present time.

11,493. A large number of men came from Basutoland?—Yes, on the border districts.

11,494. So you have not absolutely enough for the farmers?—No, we have not.

11,495. Can you tell us how many are employed by the military and the railway in the O.R.C.?—No, I cannot tell you.

11,496. In the Thaba 'Nchu district I think there is about 3,000, can you give us the number at Jagersfontein and Koffyfontein?—Yes, I think I can. The total number in the mines is 3,825.

11,497. What are they chiefly?—They are chiefly down-country Kaffirs or Basutos. A few of them are Baralongs from Bechuanaland.

Mr. H. HUGHES, called, sworn, and examined.

11,498. The CHAIRMAN: Have you before you a document headed "Statement made by H. Hughes, Esq."?—Yes.

11,499. Do you put that in as your evidence-in-chief?—Yes.

11,500. The statement was then put in as follows:—

STATEMENT MADE BY H. HUGHES, ESQ.,  
GENERAL MANAGER TRANSVAAL GOLD  
MINING ESTATES, LTD., PILGRIM'S REST,  
LYDENBURG DISTRICT.

For the information of the Native Labour Commission, my knowledge of the Pilgrim's Rest Gold Fields dates from December, 1893, in the first instance, as a mining engineer to the late Transvaal Gold Exploration and Lands Company, Ltd., by whom I was then engaged. On that Company amalgamating with the Lydenburg Mining Estates, Ltd., and afterwards with my present company, the Transvaal Gold Mining Estates, Ltd., I still retained the same position until I was appointed manager in October, 1898. Recently I have been appointed to the position of general manager to the company.

I have much pleasure in submitting the following information in connection with my company:—

Prior to the war we did not experience any great difficulty in obtaining a sufficient supply of native labour in order to carry on mining operations, and to supply the full complement of the 30 stamps we have erected. The total number of natives required to carry on productive and development operations with our 80-stamp proposition is approximately 1,600. The actual number in the company's employ at present is 700, which is equal approximately to 43 per cent. of our total.

This company is not a member of the W.N.L.A. A labour agent obtains natives for the company. He has only been able to obtain about one-seventh of the total number of natives in the company's service. The remaining natives offered themselves voluntarily for work. Mining operations as well as development and prospecting work are constantly hampered for the want of sufficient native labour.

The total cost of wages and food per boy per month in May, 1899, was 63s. 7-78d., whilst in June this year it works out at 67s. 10-58d. The food supplied to natives, before and after the war, consists of good sound mealie meal and fresh meat once a week.

Hospital accommodation is provided on the mines, where natives are attended to by a qualified medical practitioner.

A large compound, to contain about 1,000 natives, similar to those erected on the Rand, was erected on the property, at considerable expense. The natives in the company's service prefer, however, to live in Kaffir kraals adjoining the mines. A certain number of them visit their homes in the immediate neighbourhood of the mines on Sundays, our mines doing only absolutely necessary work on that day.

I attribute the cause of our not having sufficient labour at present to the following reasons:—

a. Natives were very well paid by various agents during the war and are in possession of funds, and consequently prefer to remain in idleness at their kraals.

b. The Lydenburg district is now being largely drawn upon by the Public Works Department.

c. Recruiting agents belonging to the W.N.L.A., Middelburg Coal Fields, as well as the military, have also largely drawn upon our district labour supply, who did not recruit before the war.

d. Natives used to cross, before the war, the border from the Portuguese Territory, whereas now they are not permitted to do so.

H. HUGHES,

General Manager,  
Transvaal Gold Mining Est., Ltd.

11,501. You are the General Manager of the Transvaal Gold Mining Estates, Lydenburg district?—Yes.

11,502. You have occupied that position for some time?—Yes, I have occupied that position for the last two months. Previous to that I was manager.

11,503. Previous to the war, did you find you had sufficient labour in that district?—Yes, we had.

11,504. Are you short of labour now?—Very much.

11,505. How many natives are you employing now?—About 700.

11,506. How many can you employ?—About 1,600.

11,507. Is your company a member of the Witwatersrand Native Labour Association?—No, it is not.

11,508. How then do you get your natives?—Partly voluntarily, and partly through an agent.

11,509. You employ an agent?—Yes.

11,510. Where does he recruit for you?—Down below the berg.

11,511. Do you take any natives offered by free recruiters?—I do not. They come there and voluntarily offer themselves for work.

11,512. Have you no natives offered by persons other than your own agents?—No, I have not.

11,513. It is generally known that you are short of labour?—Yes, it is only since the war. For about six months I had plenty of Kaffirs. Since then I have been very short of Kaffirs.

11,514. How do you account for the shortage?—There are several reasons. As I state here we are short of Kaffirs because "the natives were very well paid by various agents during the war, and are in possession of funds." I may explain that some agents went into the Kaffir grounds from Lydenburg and other places, and bought cattle from the natives. The consequence of this is that these natives have got sufficient funds to enable them to remain in idleness in their own kraals.

11,515. It is your experience, then, that the native only goes to work when he wants anything?—I think so.

11,516. There are other reasons, are there, apart from having plenty of money?—Yes, the district has been largely drawn upon by the Public Works Department for repairing roads, railways, etc., also by the agents of the Witwatersrand Native Labour Association.

11,517. They are recruiting there also?—Yes.

11,518. Does the Public Works Department pay higher wages than you?—I could not say what they pay; it is stated that they pay them £2 a month. At the start, I know they paid 30s., and now I believe it is £2 and food.

11,519. What do you pay?—We pay just about the same as we did in 1899, about 43s.; now it is the same.

11,520. The wages are the same as in 1899?—Yes.

11,521. Did you reduce your wages when you got to work?—Before I started crushing I did, but when I started crushing and wanted more boys I rose the figures to the same figures as they were in 1899.

11,522. Prior to crushing what did you pay?—Something like 35s. per month.

11,523. Since you started your mill you raised wages to the pre-war figure?—Yes.

11,524. And you remain at that?—I am remaining at that.

11,525. You got a certain supply previous to the war from Portuguese territory?—We always got some from there. They would cross the border into the Lydenburg district; now they are prevented from doing so, and they must go via Komati Poort where they are recruited by the W.N.L.A.

11,526. Why do you not join the W.N.L.A.?—We have that in contemplation.

11,527. Mr. EVANS: Have independent recruiters any difficulty in getting permission to recruit?—I could not reply to that.

11,528. Are there any independent recruiters in the district?—There are one or two.

11,529. Independent of W.N.L.A.?—Yes.

11,530. Have you heard of these people having any difficulty in getting authority to recruit?—I do not think so, but I could not say.

11,531. Are natives free to come to your mine from Portuguese territory, via Komati Poort?—I suppose so, if we joined the W.N.L.A.

11,532. Are they free to come through on their own account?—I really could not say.

11,533. Mr. PHILIP: Are there not a large number of unoccupied farms in the Lydenburg district?—There are some.

11,534. Are there many natives squatting on them?—Yes, a considerable number.

11,535. Are there any locations up there?—Yes, several.

11,536. Do the natives go out to work from these locations?—There are too many recruiters drawing upon them for other purposes.

11,537. The natives are too well off then?—I think so.

11,538. Is there any repatriation depôt in your neighbourhood?—At Lydenburg there is one.

11,539. Have they not finished work yet?—That I could not say.

11,540. Do they employ a large number of natives?—They used to.

11,541. Mr. WHITESIDE: How long have you been contemplating the desirability of joining the W.N.L.A.?—Only within the last few months.

11,542. What are the reasons that have induced you to consider the necessity of joining?—The shortage of labour.

11,543. Do the boys that come voluntarily to your mine get the same facilities now for coming? That is to say, more particularly the boys that come from Portuguese territory?—No.

11,544. They have not the same facility?—No, I do not think so. Before the war they used to cross the border, nobody checking them; now they have to go through Komati Poort, the recognised channel.

11,545. That is the reason why you contemplate joining the W.N.L.A.?—I think so.

11,546. The CHAIRMAN: Who puts these restrictions upon the native?—I do not know, but the fact remains that before the war they were free to

come through from Portuguese territory to our place; now we do not get the Shangaans our way at all.

11,547. Is it not a Portuguese regulation to insure their getting a poll-tax?—It must be.

11,548. Mr. PHILIP: Do you not get a large number of natives from Swaziland?—No, never.

11,549. Sir GEORGE FARRAR: There are restrictions by the Portuguese Government against the Shangaans coming in that way. There are the same restrictions against Portuguese coming into Chartered territory in the same way, I believe?—I think so.

11,550. Mr. A. L. NEALE, called, sworn, and examined.

11,551. The CHAIRMAN: Have you a statement before you headed: "Statement made by Mr. A. L. Neale, Manager of Glynn's Lydenburg, Limited"?—Yes.

11,552. Do you put that in as your evidence-in-chief?—Yes.

11,553. The following statement was then put in:—

STATEMENT MADE BY A. L. NEALE,  
MANAGER OF GLYNN'S LYDENBURG,  
LIMITED, BEFORE THE LABOUR COM-  
MISSION.

1. I am the Manager of the Glynn's Lydenburg Gold Mining Company, Limited.

2. The property of the Company is situated in the Lydenburg District Gold Fields.

3. I have been connected with this company as Manager from its inception in 1895.

3A. This Company is not a member of the Witwatersrand Native Labour Association.

4. From the inception of the Company, in 1895, to the closing down in 1899, I experienced no difficulty in obtaining sufficient native labour for the full requirements of the Company, practically obtaining all labour by voluntary applications of the natives.

5. From the date of my return in July, 1902, and up to the month of May, 1903, I experienced no difficulty in obtaining sufficient labour for our requirements by voluntary enlistment.

6. Since May there has been a rapid falling off in native labour, the boys already on our register giving notice as their time expires, and practically very few coming forward to fill up deficiencies.

7. Previous to the war, our underground boys were mostly Shangaans, who voluntarily came to our mine from the Portuguese territory. (A distance, approximately, of a week on foot.)

8. The boys employed on the surface work, generally, including those employed on the mill and cyanide works, and prospecting operations, were principally local natives.

9. On my return, in July, 1902, the local natives voluntarily came forward for both underground and surface work, engaging themselves, however, but for short periods, averaging, at the most, four months per boy; and as soon as sufficient money was earned to pay their taxes they returned to their kraals.

10. The shortage in the supply of Shangaans I attribute to the arrangements entered into between the W.N.L.A. and the Portuguese Government, which, I am informed, practically preclude the native seeking work other than through recognised channels, and the keen and complete arrangements made for recruiting all available boys from the Portuguese territory by the above Association.

11. Prior to the war, and up to the last few months, no recruiting agents were, so far as I am aware, operating in our immediate district.

12. The country is now overrun by recruiting agents for the Public Works Department, the Military, and the Middelburg Coal Fields, and the

W.N.L.A., all of which recruiting is at the expense of labour requirements of our district.

13. The food supplied by this Company consists of full rations of mealie meal from sound, locally-grown grain, and meat once a week.

14. The boys on our mines are not compounded, but live practically under the same conditions as at their kraals.

15. The number of stamps installed is 20. At the present 15 are being run with the assistance of ore on dump. This is practically now exhausted, and from the present shortage of labour, I may, in the very near future, be reduced to 10 stamps.

16. The total number of boys required to run the 20 stamps, and keep development up to normal is approximately 285 boys. I at present have approximately 170 boys. At the time of my leaving the mine 30 of these were under notice as time expired, and comparatively none coming forward to replace them. The above number of 285 boys do not provide for the extensive development of our large property, which is contemplated when labour, etc., becomes available. Our then requirements will be, at the least, double the above estimates, or, approximately, 600 boys.

(Signed) A. LEGGETT NEALE,  
Manager,  
Glynn's Lydenburg, Limited.

11,554. The CHAIRMAN: You are Manager of that Company?—Yes, I am Manager of the Company.

11,555. How many natives do you require to run your mill?—To keep the mill up to its normal state I require about 285 boys at present.

11,556. How many stamps is that for?—Twenty.

11,557. Have you a larger stamping power in contemplation?—Yes.

11,558. How many natives would you require for the increasing stamping power?—Fully double the number required at present.

11,559. Approximately 600?—Yes.

11,560. How many have you working at present?—I think when I came down there were about 160 or 170. I think 170, but that is reduced occasionally by those sick.

11,561. You are now employing 170, but you want 285?—Yes, I require them for my work.

11,562. Did you employ a similar number before the war?—Yes.

11,563. Had you a full complement of natives before the war?—Always.

11,564. How do you account for not having a full complement now?—Well, as I said in my statement, the country is overrun by recruiting agents for the Public Works Department, the Military, the Middelburg Coal Fields, and the Witwatersrand Native Labour Association. In the pre-war days, the Shangaans worked underground, and they crossed freely from over the border to the mines. There were no restrictions against them. Since we re-started we have not got the Shangaans.

11,565. What wages are you paying?—We pay about an average of £2, which is exactly the same as the pre-war wage. I have not reduced the wage.

11,566. You state in your statement that your company is not a member of the W.N.L.A.?—No.

11,567. May it not be that the fact that you are paying lower wages than they are paying on the Rand prevents you from getting Portuguese natives?—I do not think so, because before the war the Rand was paying the present rate of wages and our mine also, and then we had a full supply. I do not see why it should apply now in contradistinction to pre-war times.

11,568. Had you then a large number of recruiters in your district recruiting there before the war?—Before the war we had not any.

11,569. How do you account for their going there now?—The great stress of labour requirements here. They are diving into every outside little place they possibly can.

11,570. You resent that so far as your district is concerned?—Naturally.

11,571. You think you have first claim?—Yes, on our local labour. Another thing I should like to state—that is, my opinion with regard to recruiting for, say, the Public Works Department. We have only two or three actual mining districts in the country at present where real work is going on, and I think you should leave these little outside districts where actual work is going on to have the native labour, and it should not be taken for public works and that sort of thing.

11,572. Have you made any representations in another quarter in favour of that?—No, I have not. I thought that it would be rather more public here instead of sending it to one particular department.

11,573. You think that the Public Works Department, the military, the W.N.L.A. and free recruiters generally should not be permitted to recruit natives in the northern mining districts where mining operations are carried on, and where the natives are scarce?—I think not, in justice to ourselves. That is purely my private opinion.

11,574. Mr. WHITESIDE: Does it not argue from so many recruiters being up in your district that there might be a certain quantity of natives available for work?—Not necessarily. I do not say that there are not a certain quantity of natives that should be available, but that is a very different point.

11,575. Have you given any estimates as to the quantity that might be obtained for outside work?—I do not think they have really recruited any great quantity. They are intercepting many that used to come from the Shangaan country.

11,576. Still the mere fact that the different people are sending recruiters there seems to show that they expect to get some definite result?—It is in desperation, I think.

11,577. And yet you only want something like 100 or 150 to complete your complement. Is that correct?—No. That is to carry on operations as we stand to-day. That is not what we require.

11,578. How many do you require?—I estimate practically about 600 boys.

11,579. When do you want them—immediately, or in the future?—We propose doing developments on certain portions of our holdings which we cannot touch at present.

11,580. What is the reason why you cannot get the Shanguans at present?—I have said here in my statement, at least I think so, it is owing to the Portuguese regulations with regard to natives leaving the country for employment on the mines. The natives have, I believe, to pay a certain tax; I am not acquainted with the amount—but they make them go by a certain route, one being through Ressano Garcia, so that they can keep track of the boys and collect this tax.

11,581. Do you know how long this regulation has been in force?—I believe since the inception of the W.N.L.A.

11,582. Are you contemplating the desirability of joining the W.N.L.A.?—Not at present.

11,583. Sir GEORGE FARRAR: Previously these boys came from Portuguese territory across the border, and so were practically smuggled into the Transvaal, and did not pay the labour tax to the Portuguese Government. That is a fact?—Yes.

11,584. And therefore the Portuguese Government, in order to collect this labour tax, sent all their boys through Komatipoort?—Probably.

11,585. Do you think this a good policy on the part of the Portuguese Government in order to collect their tax?—That is purely a matter of internal administration of their own.

11,586. I mean you would defend your own districts in the same way?—If I wanted to obtain a certain revenue.

11,587. You think your labour ought to be retained in your district?—Not necessarily; I do not say that.

11,588. Well, you want us to divide with the Public Works Department?—But as you are well aware there are boys and boys, and my experience is that for underground work the Shangaan is the best.

11,589. Is there a large native population in your district?—Not very large.

11,590. If there were they would sooner go to work where they can have company at hand than go a long way from home?—If they can go on surface work.

11,591. They do not like underground?—No, they do not like it.

11,592. Plenty of surface boys?—Yes.

11,593. They will not go underground?—No.

11,594. Not even at a high rate of wages?—No.

11,595. Mr. EVANS: Are you losing any boys just now?—Within the last three months we have been losing them very largely and very few are replaced.

11,596. How many natives have you got?—I think about 170, and at this time I have 30 under notice.

11,597. Why are these 30 giving notice?—They give no reason. I tried to find out. Absolutely they did not give me a reason. In my opinion it is the attractions held out by others for surface work, by the military, and that sort of thing.

11,598. Did you have any particular instances of the attractions held out?—This particular thing I could not state upon oath, but I hear—I heard from my boys—that the military were offering them £2 a month and soldiers' rations. This is what I have heard. I cannot give it as evidence. I have heard that stated by the boys.

11,599. Where has that been done?—Presumably at Middelburg.

11,600. Is that a reason given by your boys for leaving?—Some of them.

11,601. Sir GEORGE FARRAR: I wish to ask you, if a boy comes to you for six months, whether you have any means for enforcing your contract?—No.

11,602. Because there is practically no Pass Law?—No, practically none.

11,603. A boy can go away to-morrow and you lose sight of him altogether?—Yes.

11,604. Mr. PERROW: What number of boys do you require per stamp on the mine where you are general manager?—Roughly it would work out at about 11 boys.

11,605. What size is the reef on the average?—About nine inches to one foot. But we have no blasting, it is all pick work.

The Commission then adjourned until Thursday morning at 10.30 a.m.

**TWENTY-SEVENTH DAY.**

*Thursday, 17th September, 1903.*

THE COMMISSION SAT AT 10.30 A.M.

Mr. J. W. WATTS, M.I.M.E., Barberton, called and sworn.

11,606. The CHAIRMAN: Mr. Watts, you have before you a statement headed, "Evidence of J. W. Watts, Esq., M.I.M.E., Barberton"—I have it before me.

11,607. Do you hand it in as your evidence-in-chief?—Well, scarcely that. I was not aware that I was going to be called before the Commission with regard to the statement, but I was quite willing. Had I known I would have got further evidence. The statement is more a matter of opinion.

11,608. But you do not take any exception to the statement?—No.

11,609. Witness handed in the following statement:—

**EVIDENCE OF J. W. WATTS, ESQ.,  
M.I.M.E., BARBERTON.**

I have been 29 years in South Africa, and have been an employer of native labour the whole time. My experience has been with the Zulu, Swazi, Amatonga, Shangaan, Inhambane native and tribes to the immediate east and north of Lydenburg district.

1. It is attempted to solve the labour problem by the employment of African labour.

2. It is attempting the impossible. We have the wrong material, and not even enough of that.

3. The natives at our disposal are either agricultural or pastoral. We are trying to make them industrial. In other countries this is not attempted.

4. Much importance is attached to statistics relating to population. They are not a true indication of the numbers to be got to work. They simply go to prove that given a population you have not the labourers. Natal has a big population (800,000) she has not the labourers. She imports them.

5. No such tyranny in the labour market has ever existed as that of native labour in South Africa.

6. The native when in your service naturally does as little work as possible. If he wishes a day, a week, a month off, he takes it. We not only take him back again, but are glad to get him back. We go to him, and beg him to come and take our money, and we feed him well, and house him. The white man has to come to us and beg for a job. We beg the native to take one. Such conditions are fast becoming impossible.

7. The native is by nature indolent, and works only with reluctance.

8. He has comparatively few wants, and takes no thought of the morrow.

9. Good qualities he certainly has, but not such as make for settled labour.

10. The Government grants him privileges that it denies to the white man. For instance, it permits him to cultivate land free of rent—permits his wives, rather, for he does not work himself.

11. It follows that native labour is of the most desultory character; steady industrial enterprise cannot be carried out with it.

12. No higher tribute can be paid to the mining men of this country than the fact of their having built up the industry to its present proportions with such non-promising and uncertain material to work with, as the African native.

13. There are many well-meaning people, who not only have excuses in plenty, but who actually encourage the native in his idle habits.

14. These people will usually be found under the three following headings:—

(a) The armchair philanthropist at home.

(b) The new chum here.

(c) The "white Kaffir."

The first has pretty well had his day. Exeter Hall is fast becoming discredited. The second, a few years' actual contact with natives usually cures. But for the third, and worst, there is no cure. He is a deadly evil in the country, often an educated man, he thinks and speaks in Kaffir. No native is ever wrong; no white man is ever right. He supports the natives against the white man and against the Government. He will readily pay the fines justly imposed by the Court on a native; prefers to drink and to snuff with a Kaffir by the company of a white man. Will "yammer" by the hour with a Kaffir at the camp fire, and loves the scent (due to Tambotie root) of the Kaffir women and girls.

15. The origin of the white Kaffir's attitude is vanity, pure and simple. He loves to pose to the natives as a big white man, will take up a native servant's case against his master, merely to show the native his importance, and to bulk big in the native's estimation; no one knows better how to work him to advantage than the native himself. Needless to say, that this kind of man is a consistent enemy of the recruiting of native labour.

16. All South African Governments have been and still are disinclined to tackle the so-called native question, and no help can be looked for in this direction to increase the supply of native labour. Yet the native of South Africa is particularly easy to rule. Fear and justice are all that are needed. Do not forget either.

17. I am not an advocate of heavier taxation as an inducement to the native to labour.

18. Cutting down the wage unquestionably retarded the flow of labour to the mines, but paying a higher wage just as unquestionably sends the native home again quickly.

19. I am not a believer in total abstinence for the native, particularly for the Portuguese East Coast boy.

It is commonly asserted that owing to the absence of drunkenness a much larger percentage of boys turn out to work now than formerly. I am of opinion that the "sick and absent" at present are not far short of pre-war days' "drunks." A small amount of drink properly regulated would do no harm.

20. I do not compound my natives at my own mine, and I allow as many women as choose to live with them to do so. The huts of the different tribes are kept apart. Many of my natives have been 10 to 12 years with me. I prefer the men who have women.

As a whole, the natives in the Rand Mines' compounds are well and justly treated, and it would not pay to treat them otherwise.

21. I do not look with disfavour on any attempt to educate or civilise the natives. It will amount to nothing in the long run. They will always lapse to savagery. The black has had the opportunities of becoming educated and civilised equally with the white man for several thousand years, and the result

is before us. A few cases of apparent civilisation do not affect the real position.

22. The missionaries have, I know received complaints from certain native chiefs that their boys in some cases return home maimed or otherwise injured. Whilst there may be no desire on the part of compound managers to keep and feed maimed boys for an indefinite period, it is certain that in the majority of cases of this description, the natives themselves insist on returning to their kraals, hoping for relief from their native doctors.

Those who have had most experience with sick natives will corroborate this statement. I do not think special treatment or hospitals would do much to remedy this trouble. The idea is excellent for whites, for blacks it would not answer.

23. The native utterly abhors a time contract, and the enforcement of it militates against success of recruiting.

24. Whatever amelioration might be effected in the general treatment of the native, and whatever you pay him, or whatever facilities you give him for coming to, or returning from, work, the result would be the same. The labour to satisfy the requirements of the mining industry would not be found in the African native.

11,610. The CHAIRMAN: I understand you are working a mine on your own account?—That is so; I am leaseholder and option-holder of the Ivy Mine.

11,611. Have you worked there in some other capacity?—Yes, as General Manager for 11 years.

11,612. Do you occupy any public position in the Barberton district?—Yes, I am Chairman of the Mine Managers' Association and Vice-president of the Claimholders' Association.

11,613. You are, therefore, here in some representative capacity?—Quite so.

11,614. You have been 30 years in South Africa?—Yes.

11,615. Have you been connected with natives all that time?—Yes.

11,616. Have you been employing them in various capacities?—Yes.

11,617. Therefore, you are competent to speak on the subject of native labour?—I hope so, as far as anyone can.

11,618. How many natives do you employ?—At the present time altogether 300, but before the war I employed 450 to 500. I am in need of half as many again.

11,619. You are short of natives then?—Yes.

11,620. Have you been so since the war?—Yes.

11,621. And previous to the war?—I never had a sufficiency. I have had a bare sufficiency, but not a full sufficiency, if I may use the term.

11,622. Can you speak of the position in the Barberton district generally?—All short.

11,623. Are you speaking of the mines?—The mines and the farms also; labour is short on the mines in particular.

11,624. Can you suggest any particular cause for the present shortage? I am not speaking of the general cause, but the special cause.—The absence of desire and of necessity on the part of the natives first of all, and then the operations of the W.N.L.A., so far as Barberton is concerned.

11,625. In what way does the W.N.L.A. affect the supply?—We now get no East Coast boys. Previous to the war, in 1889, I was employing 13 East Coast boys for every Swaziland boy or Zulu; in 1897 it had gone down to 3 to 1, and in 1899, just before the war, I would employ 2 East Coast boys for every Swazie. At the present time the whole position is reversed, and I am employing 3·8 Swazies for every East Coast boy. It is due to the W.N.L.A., the work of which is wholly excellent, and which has guarded the border so closely that no East Coast boys can come in.

11,626. What has it to do with the border; it is not looked to by the Portuguese authorities?—The W.N.L.A. agents are on the border.

11,627. I do not quite understand. I thought the East Coast natives coming across the border was a matter regulated by the Portuguese authorities in their own interests, and in order to secure the poll-tax?—That is so.

11,628. Then, would it not be more correct to say it is due to the more stringent carrying out of the law?—I am quite content to take that view.

11,629. You go on in your statement to refer to the somewhat debated point, I think, as to whether the population of native districts is any indication of the number of natives who may be expected to be obtained to work elsewhere? What is your opinion on that?—I think that the figures are fallacious with regard to the labour that may be got from a certain population. I think the population does not infer labour in South Africa as a general rule. You might have a population, and might expect a certain number of natives, but you might not be able to get any.

11,630. You think, then, that to base any figures on the population, and the natives that would go a long distance to work is a false ground to work upon. Have you any suggestions to make as to how the numbers could be increased; has having free ground any influence?—That is one of the points I make for. It is an important point. They have privileges we have not.

11,631. Would you then advocate charging a ground rent in locations, or wherever they squat?—Yes, on every acre they occupy.

11,632. Would the effect be to send them out in larger numbers?—I do not think so.

11,633. Then, what is your object? Do you wish to increase the revenue?—I think it would be an excellent thing for the natives, but I do not think it would increase the supply of labour to any great extent.

11,634. It would have some influence?—Yes.

11,635. You state that a certain class of people encourage the natives in certain habits of thought?—Yes.

11,636. The arm-chair philanthropists, the new chum, and the white Kaffir?—Yes.

11,637. You evidently think the "arm-chair philanthropist" has an influence on the natives?—I think so.

11,638. Has that influence been an hindrance?—Yes, it has in the past all through South Africa.

11,639. Then you deal with the "new chum" and the "white Kaffir." Do you think there are many of them?—Yes, there are in every district of South Africa, and are absolutely antagonistic to the recruiting operations. They think that natives should be left in complete idleness, and that no effort should be made to induce them to labour.

11,640. Are you acquainted with the general principles of the Squatters' Law?—Yes, I am.

11,641. Have you any suggestion to make as to the carrying of the law into effect?—I think it should be put into effect.

11,642. You would then limit the number of families on any particular farm?—Yes, I think the number should be strictly limited so that the evils might be touched both here and in Natal. In Natal not only Indian but Kaffir farming is going on.

11,643. Some witnesses have advocated allowing farmers practically as many natives as they can usefully employ. You object to squatting on the farms being encouraged simply from the rents they pay?—Quite so.

11,644. Would you go so far as to prevent it?—I would scarcely go as far as that. I do not think it would affect the labour to any appreciable extent. I would allow a certain number of natives to look to the farm, see that the boundaries were being conserved, and so on, for an absent owner. I would limit the number of families to five.

11,645. Would you allow it to natives not put on one by the owner?—I think it would be fair to allow a certain few to be on the farm, even if unoccupied.

11,646. You think that the payment of wages by the mines lower than the rate current before the war retarded the flow of labour?—I hold that opinion. It was perfectly justifiable for the Chamber of Mines from the standpoint of that body. It was done under some misapprehension. They thought that granted population, it meant labour, so that if they thought that labour existed, they were quite justified; at the same time I disagree with the cutting of the wages, and in 1902 I was here as a representative from Barberton to meet the Chamber of Mines and to make arrangements for labour for the mines. I pointed out at that time that I was against cutting down the wages. That was in April, 1902. At that time I thought the labour did not exist, and the Chamber was justified from its point of view. It has retarded the flow of labour because the labour did not exist.

11,647. And presumably because a higher rate of wages was paid in other employments in other parts of the country?—Yes.

11,648. We have had a good deal of evidence by persons who know the natives well, like yourself, as to the effect of high wages on the periods the native puts in at work?—It drives him home all the quicker.

11,649. The higher wages do?—Yes, particularly if he is living anywhere near where his home is. My own place is close to the Swaziland border, and as a general average the native is four months at the outside in regular employment. If I paid a low wage he would not come, and if I pay a high wage I drive him away as soon as he has the money he requires.

11,650. You hold the view that the natives come to work to get a certain amount of money?—In some cases only, particularly when you are near the ground on which the native lives. Then he will only work a short time. Proportionate to the distance is the length of time he will work.

11,651. Then if your district was twice as far your natives would work eight months instead of four?—Yes.

11,652. You have an experience differing from that of the Rand?—Yes, I keep them in different villages. I keep the Swazis separate from the Shangaans, and I have separate cooks, and not only keep them separately in the villages, but I keep separate labour sheets. That was how I was able to inform the Commission of the populations. I find in looking through the sheets that some of the boys remained with me since 1889. I also find that the wages in 1899 averaged 28s. per month. In 1893 it had got up to 39s. 6d., in 1899 to 48s. 6d., and now it is 54s. 6d. The old wage-earners will get 60s., and are doing the same work as the others.

11,653. The natives that have been so long with you are living with their families?—Yes.

11,654. That explains their working for so long?—Yes.

11,655. You think the long contracts with the natives are a mistake?—Yes. They dislike it intensely. My neighbours, the Sheba Mine, for instance, had over 100 deserters, and the deserters' only excuse when taken was that they were bound to work a certain time. I have never employed for a stated period or at a stated wage.

11,656. If you had labour brought a long way costing £4 per head in premiums, etc., would you in that case be content to take a monthly engagement?—No. I would make them have a time contract, it would keep such natives.

11,657. Have you seen a statement of the Chamber of Mines as to the labour requirements?—Yes, I was a member of one of the sub-committees.

11,658. You know that they say the large shortage affects even the starups running to-day?—Yes.

11,659. You know something of the working of the W.N.L.A.?—Yes. I am Chairman of the Association in the Barberton district.

11,660. Do you think, speaking generally, that the Association has done as much as any other method of recruiting these last two years?—I say, "Yes," unhesitatingly. Their influence has been wholly for good. They have done far more than free touting would have done. The touts could not have done half of the good work the W.N.L.A. have been doing.

11,661. You are speaking from knowledge of their work?—Yes, I speak as one who has suffered more than anyone over it. It is the greatest possible tribute to the work of the W.N.L.A. that the East Coast boys are not able to come in. They are taken in Portuguese territory and sent here.

11,662. Speaking from your 29 years' experience, do you think that there is an available supply of labour for the present requirements?—I was of opinion 18 months ago that the labour could not be got.

11,663. Sir GEORGE FARRAR: Now you have got no boys from Portuguese territory. It is the same in Rhodesia. The Portuguese authorities guard their borders so that no boys go to Rhodesia, and so that all have to come in through Witwatersrand. You are no worse situated than the people of Rhodesia?—Quite so.

11,664. There is only one other point. I see in your statement that some of the natives go home maimed. Naturally so, is it not?—We contemplate having an insurance on natives as is the case with the whites, so that in case of fatal accidents the native's relations get a year's wages, and in case of losing a limb he gets compensation.

11,665. Do you think this will give satisfaction or give us more labour?—I do not think it will give us any more labour, but it may give more satisfaction.

11,666. Mr. FORBES: Do you find the Swazis willing to work and to go down as they are learning and are taking an interest in mining work, are they willing to go down the mines?—It is quite true they got down head first at the beginning. I mean they went head first down the ladders; they get over that by and by.

11,667. You find they object to long engagements?—I never make a long engagement, nor do I allow them to ask the rate of wages.

11,668. Do you engage many of the local Kaffirs, those not on your own mines—do you get many in the neighbourhood?—Yes, we get a few, but not many. I might explain, I am close on the Swaziland border, as you are aware, and any boys that are local will be from Swaziland proper. The few boys that are about, local boys, prefer to work in the stores in the towns. We do not get them on the mines, for they can get work in the town.

11,669. But you are emphatic as to the shortage of labour in South Africa (Kaffir labour)?—I may say that the population of Barberton district is 14,620, the judicial area. Of these, 3,745 are males.

11,670. Mr. WHITESIDE: You are a Mine Manager, Mr. Watts?—Yes, I am a Mine Manager. I work my own mine. I have a mine manager also to assist me.

11,671. I notice you have been 29 years in South Africa, and have been an employer of native labour the whole time. Have you employed these natives as a mine manager?—No, not the whole time.

11,672. In what capacity, then?—Agriculture and stock as well.

11,673. Are you acquainted with any other districts besides these mentioned in your statement? In the second of your opening paragraphs, in the last portion, you say: "My experience has been with the Zulus," and so on?—I am acquainted with De Kopp, Natal, and Lydenburg.

11,674. Have you any experience in Central Africa?—No, none whatever.

11,675. Then, on what do you base your opinion that there is not sufficient labour in South Africa?—I had an opportunity of examining the documents of the Consulting Engineer.

11,676. Consequently that expression of opinion is based merely on documentary evidence?—So far as Central Africa is concerned.

11,677. In Clause 1, you say: "It is attempted to solve the labour problem by the employment of African labour," and in Clause 2 you say: "It is attempting the impossible. We have the wrong material, and not even enough of that." Do you not think "the wrong material" have done excellent work since the discovery of the Witwatersrand?—Yes, but they have had excellent heads to make them do it.

11,678. Nevertheless they had the material?—Yes, but I cannot call it excellent.

11,679. But the results show that the material could not have been so very bad; we have the same direction in the future as in the past?—Quite so.

11,680. You go on to tell us "much importance is attached to the statistics relating to population." What statistics do you refer to?—To Sir Godfrey Lagden's.

11,681. Are not these statistics based on the revenue derived from natives?—I imagine so; to a certain extent they would be.

11,682. Do you consider it a reliable method of obtaining estimates?—I should say it would be as reliable as any you can get from any other source.

11,683. But do you think it is a good indication of the total population of natives?—Yes, I should say the average is very little out.

11,684. You say: "Natal has a big population (800,000)." Where do you get the figures from?—It is a trifle in excess of Sir James Hulett's figures the other day. He gave 750,000.

11,685. So you are basing your opinion on Sir James Hulett's figures?—No, I am not. I got these from the Secretary of Native Affairs in Natal.

11,686. Is that where you got the figures from?—Yes, Mr. Moor; that includes Zululand, I may say.

11,687. At the bottom of your first page, in dealing with the natives, you say: "We go to him, and beg him to come and take our money, and we feed him well and house him." Has the native always been fed well on the Rand to your knowledge?—Always well, I say always; I have heard complaints he has not been well fed, but I would not take an isolated case to say it were not so.

11,688. In Clause 7, you tell us: "The native is by nature indolent and works only with reluctance." How do you reconcile that with the vast numbers that are at work all over South Africa generally, seeing practically the whole of the industry, public works and so on, is carried on by native labour; railways, harbours, mines, and so on?—I understood, from evidence I heard the other day, they were using Indians in Natal.

11,689. In Natal, exactly so; but they are not altogether dependent on them. The Zulu is employed principally in Durban, in public works and so on, and yet you tell us "the native is indolent and works only with reluctance"?—If anybody has any other opinion I am very glad.

11,690. The native has very few wants, you say, are not these wants increasing very rapidly?—They are increasing because they are able to indulge on account of their high wage.

11,691. Is it not a feasible proposition that if these wants increase so rapidly it will cause them to go out to work to get money to supply these wants?—If the natives existed.

11,692. That is your opinion?—That is my opinion.

11,693. You say the native has some good qualities; what are they?—He is hospitable, truthful and honest. These I consider are excellent qualities.

11,694. So they are—very good qualities?—I do not say he will keep them very long when he comes to town.

11,695. I am afraid not. What do you mean by the "white Kaffir"? I see you give the explanation further on. Are there many of this class about?—Yes, sir, quite a number.

11,696. Hundreds?—Yes, you will find them in every community.

11,697. Would you say there are more than hundreds, as a general impression?—No, I should not say that; but a considerable number in the community endeavour to influence the natives in each district in which they live.

11,698. That is something new?—I am glad it is new.

11,699. Could you suggest any means by which we can counteract the influence?—Drastic, I am afraid.

11,700. Never mind how drastic. We shall have to consider such if they are good suggestions.—I think I said it is impossible to eradicate them.

11,701. You tell us: "All South African Governments have been and still are disinclined to tackle the so-called native question." Do you know of the Commission that the Cape Government are appointing for this purpose?—I have heard of it.

11,702. That does not bear out your statement. There is one very important Government able to tackle the question?—About to.

11,703. Yes?—It has not been tackled yet.

11,704. But still they have taken the matter in hand and they are appointing a Commission?—I have no doubt that it will be tackled. I am speaking up to the present moment.

11,705. You are speaking in the past tense?—Yes.

11,706. What do you mean by "fear" when you say that fear and justice are all that are needed? Do you mean we should make him fearful of the white man?—No, keep him in his proper place; not treat him like a baby, not play with him as so many people are inclined to do. They should keep him in his proper place—make him fear the white man.

11,707. That is the literal meaning?—Yes.

11,708. I see you are not an advocate of heavier taxation? I think I remember you answering a member of the Commission that you would tax the native for every acre he ploughs?—I think so.

11,709. Would that not be heavier taxation?—Not direct taxation. I was speaking there in regard to the hut-tax. I would simply give him the privileges that you or I or the Governor have in paying taxes. I am not myself able to go and squat on any ground and plough any piece of ground I please, which the native can.

11,710. That means you are in favour of the Plakkers' Wet?—Certainly.

11,711. You tell us "cutting down the wages unquestionably retarded the flow of native labour to the mines, but paying a higher wage just as unquestionably sends the native home again quickly." That sounds rather paradoxical. What should be done?—When you pay a high wage you send him home quicker than by paying a low wage.

11,712. But you say the wages should not have been cut down?—I disagreed in the cutting down of the wages. My reasons were, as I explained to the Chairman, that I was aware in 1902 that the labour did not then exist, and that to cut the wage down was simply to emphasise the situation. It was perfectly just, both to the natives and to the employer, to cut the wage down; it was, and it is, too high, but the labour not existing, it simply emphasised the situation.

11,713. Well, I am afraid it is not quite clear to me, because you are against the cutting down the

wages and against a high wage. I suppose you would like a happy medium to be struck?—Quite so, if the medium allowed the mine a payable margin.

11,714. That also is very vague. Some mines paid £5?—Only a very few mines.

11,715. Do you think we have had sufficient time to recover from the reduction to the 30s. rate?—Quite. I do not see you have any more labour by raising the wage than then, in proportion.

11,716. We have had it in evidence that the native is very sceptical. He will not credit that the wages have been raised to the previous figures until he has evidence of his own tribe coming back to kraal with the result in his hands. Do you believe that?—In reply to that, I may tell you my agreement with the W.N.L.A. had nothing to do with the wage. We stuck to our old wage in the Barberton district, and we never reduced it.

11,717. I am not dealing with the question of reducing the wage. I am speaking about the natives being sceptical about wages being put to the former figure and not believing it until their people come back and tell them. Do you believe that is a correct representation of the native mind?—They have already had plenty of time to understand the wage has been raised.

11,718. Yes. When was the wage put back? Was it not February of this year?—I do not think it was quite so early; as far as our district was concerned, we did not have an intimation that the wage could be raised until about March or April.

11,719. Do you employ boys on six months' contract?—No, I do not.

11,720. But that is the average on the mines. The boys that we got at the increased rate in February or March are only just completing their contracts, and no comparative number have returned to their kraals. In the face of that do you think the natives are convinced the wages are back?—I think those on the six months' contract, previous to the time of going home, have had lots of time to say the wages are increased and what their brothers are getting.

11,721. You tell us that in your opinion "the sick and absent at present are not far short of pre-war days' drunks." Have you anything to back up that opinion?—I have my own statement of figures. I have been working a mine since the war—since peace was declared—and I find that my "sick and absent" are just as short as previously. That is the Ivy and Sheba Mine; the two principal mines in the district working. They are rather in excess of what they were before the war.

11,722. You put it down to liquor?—No, I do not. I may explain to you, sir, that I never had any trouble in liquor. Being on Moody's Concession, we were able to control it. During pre-war days, for the past 12 years, I have had no trouble in connection with liquor.

11,723. Do you think this high proportion is due to the fact they cannot have liquor?—No, not altogether, but to a certain extent. Many of these East Coast boys are accustomed to getting liquor, and my boys sometimes go to Delagoa Bay for a little relaxation, and then they are not able to return here. They are recruited by the W.N.L.A., and I lose some boys through that system.

11,724. That is one of the benefits of the W.N.L.A.?—Yes.

11,725. I see you do not believe in any attempt to educate or civilise the natives. You tell us "They will always lapse to savagery"?—I do not think it matters either one way or the other.

11,726. Are you gifted with the prophetic instinct?—None whatever; only the experience of the past thirty years.

11,727. You do not approve of native hospitals; you say: "I do not think special treatment in hospitals would do much to remedy this trouble"?—This is another department; there are complaints from the missionaries that the natives are sent home

when maimed or sick, and the chiefs complain to the missionaries that these boys should have been treated here before going home. In certain cases they might have been so treated, and the boys might have been allowed to go home sooner than they should have gone; but anybody who has experience of sick natives will know, however sick they may be, if they think they will not recover at the compound, they want to go and be treated by the native doctor. They have more faith in the native doctor than in the white.

11,728. You would make a concession to the native opinion? If he wants to go home, you would let him go?—Yes, certainly; I never keep a native if he gets sick in the middle of the week and wants to go home. I pay him off and let him go. The only occasion I have ever had to recruit was in the past month; all my labour has been voluntary.

11,729. Have you had sufficient?—No, I am very short.

11,730. But when you had voluntary boys?—No.

11,731. Were you inconvenienced seriously?—I have been inconvenienced seriously; but when I was short my neighbour had a sufficiency, and when I had a sufficiency he was short. I put it this way; if A had a sufficiency, B was short; if B had a sufficiency, A was short.

11,732. I see you are less emphatic against the contract system? Do you think if the Witwatersrand Native Labour Association from the commencement of its organising work had had anything to do with the contracting system, that they would have been more successful in their recruiting. Supposing from the outset they had recruited boys without fixing any period of time they would work, do you think they would have got a larger number?—I think they might have got a bigger number, but it would not have been policy.

11,733. Would not have been policy?—No, a business man would not run the risk of boys coming up here and paying a heavy cost per head, and then giving the boys the chance of going back at the end of the month.

11,734. Do not you think it a better policy to take that business risk? Would you get it more reliable?—By the time he is broken in and getting valuable he is gone again.

11,735. But you say you have had boys all these years?—I have had them 15 years. I still have them.

11,736. Then there is not a very serious business about it, if the Witwatersrand Native Labour Association adopt this policy?—Your conditions are different to ours. I have any amount of ground. I could let them have their women and let them have their families. I do not know whether you could adopt this system also.

11,737. Would you advocate it here supposing it was possible?—I think you would get a longer service.

11,738. Consequently a more efficient service?—I would not say that always. He gets to a certain state of efficiency, but when he has got to that state he gets no further. I am speaking generally, and of boys doing that same work.

11,739. But the boys are accustomed to the work, and it is trouble to work with new boys?—I grant that point.

11,740. The last paragraph in your statement is extraordinary to my way of thinking?—It follows upon the rest.

11,741. You say: "Whatever amelioration might be effected in the general treatment of the native, and whatever you pay him, or whatever facilities you give him for coming to or returning from work, the result would be the same. The labour to satisfy the requirements of the mining industry would not be found in the African native." You do not limit yourself to South Africa. You go all over the Continent—you are not going to get sufficient in Africa to meet the requirements?—Yes, that is so.

11,742. Do you appreciate the full significance of your words?—Oh, yes, I do quite.

11,743. Seeing that you have only documentary evidence of the other part of the Continent, with the exception of Natal and the Transvaal?—Documentary evidence is bound to have weight when you get it from proper sources.

11,744. Proper sources; what are proper sources?—From every Administrator, every Governor, who has had to do with these natives. The evidence seems quite sufficient to my mind.

11,745. It is not on all fours with the evidence before this Commission. You have got good results with the boys you have employed. You can see the percentage of the boys that have remained on your mine for periods, say, longer than one or two years?—I have given all the evidence to the Chamber of Mines Sub-Committee Consulting Engineers. I cannot remember the figures at the present moment, but they are on record.

11,746. You get your East Coast boys through the Witwatersrand Native Labour Association, I understand? Are you in a worse position for labour to-day than before joining the Witwatersrand Native Labour Association?—I am.

11,747. Do you consider that you have derived benefit from joining the organisation?—I have derived benefit, because I foresaw, whether I joined or not, we could not get the native.

11,748. Another instance of your prophetic instinct?—Possibly.

11,749. Mr. QUINN: What is the meaning, Mr. Watts, of your statement in paragraph 5: "No such tyranny in the labour market has ever existed as that of native labour in South Africa"?—Oh, I think the next paragraph well explains it.

11,750. Are you not subject to the same tyranny, the same as every white man, coloured man, and every class of man?—I do not know, sir; but I am fully persuaded very few white men would put up in white employes what they put up with from the native.

11,751. But is there nothing to stop a white man from being subject to this so-called tyranny?—His own good sense.

11,752. But supposing his own good sense told him he ought to go—and you call that tyranny?—No.

11,753. Is it tyranny because he goes when he wants?—We put up with it because we cannot do anything else.

11,754. What do you mean by "put up with it"?—A native labourer goes away, we are glad to get him back—we are so short.

11,755. I do not see where the native tyranny comes in. Every native is allowed the same privilege as any other man. They work when pleased to work, or decline to work. I do not see where the tyranny comes in?—If you have to arrange your labour every morning, as I have to. I call the roll every morning, "sick and absent." When I call the labour roll, boys call out the sick and absent. I have then to arrange the labour again, and I have much inconvenience and trouble. I put it this way. If you lost your house boy, or your stable boy was sick and absent in the morning, the inconvenience he caused you would no doubt be great, but the inconvenience the absentees cause the mine manager is a hundred-fold more.

11,756. Quite so. But I do not see where the tyranny comes in. How would you propose to get over this tyranny?—Supply and demand. That is what I wanted you to say at first. It is purely a question of supply and demand.

11,757. You would not advocate a system by which every African native or the native of any other country or a white man would be compelled to work for you?—Not for one moment.

11,758. In paragraphs 13 and 14 of your statement, you say, "there are many well-meaning people, who not only have excuses in plenty, but who actually encourage the native in his idle habits. These people will usually be found under the three following headings;—(a) The armchair philanthropist at

home; (b) the new chum here; (c) the 'white Kaffir.'" What do you mean by "encouraging these natives in their idleness"?—That is the "white Kaffir."

11,759. No, you say there are many well-meaning people who encourage the native in his idleness?—Quite so. Many of them supply the natives with native newspapers, and they inform the native that they are absolutely necessary to us, and if only they stand out they will get what wages they please—that they are masters of the situation. These are the people who principally encourage the native not to work.

11,760. Who are these people, Mr. Watts?—There are plenty of them in every community. I have already been examined on the point.

11,761. But you are subject to cross-examination. It is an interesting point. Who are the people referred to?—I refer to certain people who live in all communities, in all districts of South Africa. We have them in our own districts and probably you have some of them in this district here. And I say their opinion is that no white man can do any right and no native can do any harm. I have myself known these men pay the fines in the Court and take the boys back to their own place, when they have been justly fined. I am speaking from my own experience. I have seen that done. That man is the man who discourages recruiting, and he would prefer that the native should be allowed to live in idleness.

11,762. What is that class of men you refer to—a particular class?—No, sir, no particular class. He is probably an educated man.

11,763. You call him here the armchair philanthropist at home. You are not referring to him?—No, I am referring to the white Kaffir.

11,764. Who is the "white Kaffir"?—The men I have just been referring to.

11,765. What is his profession?—He may have no profession.

11,766. So you do not know what you mean by this?—I do, perfectly well.

11,767. Can you tell me?—He is the man who, as I have said here, believes that the natives can never do wrong, and the white man never does right; all the arguments in the world will not convince him that the white man is right and the black man wrong.

11,768. Is not the man you describe as the "white Kaffir" the man who insists, against what appears to be your sentiment, that the native ought to have the same right of free contract as you have?—I beg your pardon; you do not gather that to be my sentiment here.

11,769. I want to find out what you mean by "white Kaffir," because he has evidently a serious effect, according to you, on the labour market. The philanthropist at home at Exeter Hall does not bother us for the moment. Who is the individual you describe as the "white Kaffir"?—I say, he may be an educated man; he may be of any class—put him in any particular class, I say you find him in every community; I know them personally, plenty of them.

11,770. I do not wish to push the subject unnecessarily far, but I really was curious to know what class of men you meant—if he really affects the labour supply. I am sorry to say you have not told us. It is a very vague statement to say they are in every community, and that there are lots of them. There is no description of them here, except that you speak of them as "white Kaffirs." If I knew what you meant I should be probably able to give them a name by which others would know them as well as myself.—Most people who have had large experience of natives admit it.

11,771. I have had a large experience of natives, and I do not know what you mean?—You have been exceptionally fortunate.

11,772. Do you refer to missionaries?—Not exactly. They sometimes take up that attitude.

11,773. They may sometimes be "white Kaffirs"?  
—Yes, certainly.

11,774. Is there any other class which contains amongst its members "white Kaffirs"?—He does not belong to any particular class.

11,775. I see. But, seriously, has this anything to do with the supply and demand to any extent?—It has to do with the recruiting.

11,776. You see it is a very important point. Mr. Watts?—Quite so, Mr. Quinn. I have every wish to assist you. I think nearly every member of this Commission would probably have come across the individual I speak of.

11,777. Probably we have, but it is the way you designate him that is peculiar?—It is the common expression amongst people who have been amongst natives for a number of years.

11,778. I have been amongst them for nearly 20 years, and I have never heard these people described in this fashion?—It is a common term for a man when he takes up that particular attitude of mind, to be called a "white Kaffir." It is most common throughout South Africa.

11,779. And do you think that this class of individual seriously affects the supply?—I say he affects the recruiting. I do not say he affects it seriously, but he does affect it. He is one of the factors preventing recruiting, but I do not say even if you eliminate the white Kaffir that you would get the natives sufficient for your requirements.

11,780. If he prevents recruiting, and if he can be eliminated recruiting would be better?—Recruiting would be better; you would get a few more.

11,781. Have you any method to propose by which this gentleman whom you describe as a "white Kaffir" could be done away with or stopped in his nefarious designs on the labour supply?—I should say the best way would be to agree with everything he said, and not disagree with him. Once that attitude of mind is taken up it is impossible to move him. He is hopeless.

11,782. Yes, hopeless as the advocate of the Chinaman.

11,783. Mr. BRINK: Mr. Watts, in answer to a question by one of the Commissioners, you said you also employed boys, or did employ native labour in the agricultural industry?—Yes; I did.

11,784. Have you any idea what the farmer can give his labourers, and still make farming pay?—No, in those days we always paid natives from 10s. to 15s. per month. That was the highest that was paid to them.

11,785. How many years ago?—Twenty years.

11,786. You have no idea what the average pay should be now to make farming pay?—I only know that in our district the farmer cannot compete with the mines.

11,787. And with the towns?—That goes without saying.

11,788. You know that farmers, speaking generally, have lost all their stock?—They have in our district.

11,789. And that the farmer now is entirely dependent upon agriculture to make a living, and for that he wants labour, is that not so?—Yes.

11,790. Now the farmer has got to support his family principally out of agriculture, and he cannot compete for labour with the towns, and with the mines. Have you any idea of what is going to become of the farmer?—He cannot possibly carry out operations to pay at present prices of native labour.

11,791. Have you any suggestions as to what is going to become of him? Do you think it would be advisable for the farmer to go and earn a wage at some of these large towns?—There again you are trying to bring in a rustic population into an industrial occupation, the same thing as we are trying to do with the native; you cannot do it.

11,792. You know something about the De Kaap Valley, near Barberton?—Yes.

11,793. It is very fertile, is it not?—Very fertile.

11,794. Do you think it is producing to-day as much as it could?—Not by 50 per cent.

11,795. And that is through the laziness of the farmer?—I would not put it down to the farmer's laziness; the farmer has no labour to work for him.

11,796. Mr. EVANS: In reference to population statistics, do you mean that the estimates themselves are unreliable, or that population figures generally in the case of native populations, are not a test of the quantity of labour obtainable?—I could not put it better; that is exactly what I mean. I think the figures are reliable, as far as figures can be with regard to native population, but they are no test of the available labour you can get out of a given number of natives.

11,797. It has been suggested that as a sound business principle it would be better to recruit boys and bring them in without any engagement. Now, you are aware that the East Coast boys, when they arrive in Johannesburg, cost something like £3 a head. Would you consider it good business to bring in these East Coast boys without any contract?—No, I distinctly stated before that I would contract them.

11,798. The CHAIRMAN: Are you aware, Mr. Watts, that Sir Godfrey Lagden told us in his evidence that the figures of population which he gave for the Transvaal were based not on the numbers who paid hut-tax, but as a result of a series of queries, which his agents, who were collecting the hut-tax, put to the various natives?—I do not remember that now, sir.

11,799. The suggestion to which I understood you to assent, that the population of the Transvaal was based on the number who paid hut-tax is wrong?—Well, I imagine that the native Commissioners based their estimates on them to a certain extent.

11,800. What Sir Godfrey Lagden told us in evidence was that a schedule was prepared before him, and sent to all the Commissioners, and was used by them when the hut-tax was collected, queries being put as to sex, numbers, and so forth, and that his statement of population was based on the replies to these queries. Are you aware that that is what he told us in his evidence?—No, I was not.

11,801. I understood you to say, in reply to a question of mine, I think, that you had only been convinced of the scarcity of labour in the Transvaal during the past eighteen months, or eighteen months ago; and, in reply to another, you said you were convinced of this in 1899?—I have been convinced of the insufficiency of labour ever since I have been in the country, but that statement I made referred simply to the contract at the time I was making it with the Witwatersrand Native Labour Association. I was aware of it then. Personally I have been aware of it ever since I have been in the country.

11,802. Have you anything else you would like to say to the Commission?—I think not, sir.

11,803. Mr. H. H. WEBB, called, sworn, and examined.

11,804. The CHAIRMAN: Mr. Webb, have you before you a statement headed: "Extract from Valedictory Address"?—Yes.

11,805. Do you hand that in as your evidence-in-chief?—Yes; I give that in as an extract from my address showing the information I obtained as to the number of natives employed on the Witwatersrand in July, 1899.

11,806. The question I am putting to you is a formal one. We wish to get this placed on our records, and I am obliged to ask you if you hand this in as your evidence-in-chief?—Yes.

11,807. You do?—Yes.

11,808. The statement was as follows:—

Extract from Valedictory Address, "Discovery and History of the Witwatersrand Gold Fields." By Mr. H. H. Webb, retiring President, South African Association of Engineers, 24th June, 1903:—

The number of natives generally quoted as being employed by the Mining Industry on the Wit-

witwatersrand in 1899 is between 90,000 and 100,000. Take for instance, the month of July of that year, which is given as one of the best months, the Chamber of Mines report 96,704 as the total number employed. The late Government returns show 95,326 for the same month.

The monthly returns to the late Government were made out on forms which called for the average number of natives working per day of 24 hours, not the number in the compound.

The returns to the Chamber of Mines were made on a form calling for "the number of natives actually employed." On enquiring into the matter of how the returns were made by the various companies to the Chamber of Mines, I find that those for July, 1899, were from 91 companies, that 19 companies, the returns from which I have since been able to get, made no returns then, and that four Witwatersrand coal companies were included in these returns out of the number then working. I find that some of the companies made returns on actual workers, that is, shifts, and others on the number of boys in the compound. For these reasons the figures given in the Chamber of Mines returns, not being compiled on a uniform basis, are not reliable.

At my request, Sir George Farrar, the President of the Chamber of Mines, instructed the Secretary to circularise the various mines, asking:—

1. How the labour returns to the Chamber were made before the war.
2. Whether on shifts worked or on natives in the compounds.
3. The number of natives in the compounds on July 31st, 1899.

Eighty companies have replied. Of this number 54 state that their returns were made up on the total number of boys in the compound, and 26 replied that the returns were made on the average shifts worked.

Taking the returns as now received of the boys in compounds at the 31st July, 1899, there is an excess of 9,327 over the figures given to the Chamber of Mines at that time. Where no returns have been received, the figure returned to the Chamber for that month has been accepted.

The total number of natives, therefore, may be put at 106,031 for the ninety-one companies. The nineteen companies referred to above, which sent in no returns in 1899, on investigation, show that they had in their employ the total of 5,666 boys.

This would prove that, at the date mentioned, there were no less than 111,697 natives in the employ of the companies above referred to. It is probable there were other natives in the employ of other companies which have not been included in the above. In the 1899 returns to the Chamber of Mines of the 91 above-mentioned companies, it is stated that they considered that their requirements were 17,000 boys short. The Witwatersrand N.L.A., in December, 1902, from statistics acquired at that time, estimated that on September 30th, 1899, there were in the employ of the gold mines of the Rand alone, and not including any outside districts or collieries, 104,500 natives. There are no Chamber of Mines or Government returns for this month, but the shortage in labour became marked on account of approaching hostilities.

Turn now to the late Government returns for the same month, which are based on actual shifts worked, and if we add the much-talked-of 25 or 30 per cent. for drunkenness, idleness, etc., we have totals of 127,000 and 136,000 natives on the mines for that month before the war.

The statistics of the Government Mining Engineer show that, for the months of this year, 1903, about 8 per cent. of the natives are non-workers through illness, idleness, and other causes. In the opinion of many men who, from experience, are competent to judge, if this number were doubled, and 16 per cent. taken, it would more accurately represent the average number of natives throughout the month unavailable through drunkenness, idleness, illness,

and other causes in the compounds of the different mines previous to the war. If this figure, 16 per cent. for inefficiency, is applied to the late Government figures of actual workers, it would show the number of workers at 113,483, as against 111,697 shown by the returns which have just been sent in, and which probably do not include all the mines.

11,809. The CHAIRMAN: You have evidently given some attention to this somewhat vexed question as to the number of natives at work on the Witwatersrand previous to the war?—Yes.

11,810. There was some difference in the returns sent in respectively to the Government and the Chamber of Mines as to the number of natives employed?—Yes.

11,811. You have evidently endeavoured to arrive at the facts with regard to the number of natives actually employed previous to the war?—Yes.

11,812. Will you just tell the Commission briefly, it is no use going all over your evidence, because it is mainly concerned with this question; will you tell us briefly what the result, in figures, of your investigation has been?—Well, I rather thought that there was something wrong about the returns that have been published, not only from conversation with others, but, because at the Simmer and Jack, prior to the war in 1899, they had an average of about 4,500 boys in their compound, whereas the returns as handed in to the Chamber of Mines showed, I think, an average for five or six months of 1899 of about 3,590 practically 3,600. On enquiry, I found out that these returns were sent in as the actual number of boys at work, and not the boys in the compound, and so I asked Sir George Farrar if he would have the Secretary of the Chamber of Mines look into the matter and find out exactly how they did it. We took July, 1899, because it was one of the best months, and one not affected by the war scare.

11,813. You are speaking now of July, 1899?—Yes, we found that, according to the records, 91 companies had sent in returns for that month.

11,814. To the Chamber of Mines?—Yes, to the Chamber of Mines.

11,815. You are still speaking of July, 1899?—Yes; they showed the number of boys on the 31st of July, 1899, to be 96,704. Circulars were sent to each of these companies asking them again for the total complement that they had in their compounds on the 31st July, 1899. I think there were 80 companies who sent in returns.

11,816. You mean 80 companies replied to your circular?—Yes; 80 of the 91 companies had sent in circulars, and of that number there were 51, who replied that they had sent in their list according to the number in the compound, and 26 had sent in according to the number of average shifts worked. Then the other companies who did not reply, those from which we got no returns, we took the return which they had given to the Chamber of Mines in 1899. Some had lost their documents during the war. These returns gave a total of—

11,817. 106,031 you have out here?—Yes, 106,031. Then there were 19 other companies that I got hold of, who had not given any returns in July, 1899, and from which I got the information that they had in the month of July, 1899, 5,666 boys, which made a total for all these companies of 111,697.

11,818. Then, do you wish the Commission to understand that the 111,697 natives that you know for certain were in the employ of companies in July, 1899, is the figure that should be compared with the number of natives at work to-day?—Well, I daresay there are probably companies which I did not get at, which might have added somewhat to that figure, but that is the figure I should take in comparing.

11,819. Because that figure makes 14,993 more natives at work on the Rand in July, 1899, than this first figure of 96,704?—Yes, I take it, about that.

11,820. Do I understand you, to wish us to understand that there may have been other companies

that you have not been able to get on to?—There may have been.

11,821. I suppose you did all that was humanly possible to reach them all?—I tried to. I had only a few days before the evening that the address came off.

11,822. Yes; that would mean that this figure you now give us of 111,697 may be understated, but it is not overstated?—No, I should say it is not overstated.

11,823. Then, can you tell us now what is the number of natives for last month, or any previous month you have a record of, at work on the Rand, on mines. Have you that figure?—It gives here that the number of natives employed on the 31st of July was 61,632.

11,824. You are speaking now of July of this year?—Yes; I must say in regard to this statement, I tried to confine it strictly to the Witwatersrand, and not to the Transvaal.

11,825. Did you confine it to the Witwatersrand?—Yes, to the mines of the Witwatersrand in which are included the Nigels. But I did not go beyond this district.

11,826. And the figure you are now reading?—The figure of 61,632 is the number of natives employed by members on the 31st July.

11,827. That is the figure we want, I take it?—The number of natives employed by members on the 31st August was 63,051.

11,828. You are speaking of members of the Chamber of Mines?—Members of the Witwatersrand Native Labour Association; subscription members.

11,829. Then do you suggest the number of 63,051 may include some companies which are not included in the figures you have just given us, the 111,697?—It may; if it does they are probably outside companies.

11,830. And does the 63,051 mean boys in the employment of the companies, or boys actually at work?—It says the number of natives employed, and, I take it, that would be the number in the compound.

11,831. That makes a difference, then, between the two figures, or a shortage of 48,646, taking the one figure from the other?—Yes.

11,832. You also say in your statement that previous to the war, dealing with July, 1899, these same companies stated that they were then 17,000 boys short?—Yes, in the forms that they sent in to the Chamber of Mines.

11,833. Have you given any attention, Mr. Webb, to the experiment recently carried on here with regard to the employment of unskilled white labour?—Well, the Consolidated Gold Fields have not gone into that very much. At the Robinson Deep we let out a contract one month to 25 discharged irregulars to load trucks from a development dump, which was on the surface, and deliver them to be taken on to the mill, and they were given a shilling a truck carrying three-quarters of a ton, and their board, and they could not make any money out of it. The manager let the same contract to some Cape boys, at 9d. a truck, without board, and they did make money out of it.

11,834. Is it the only experiment of unskilled labour in your group?—On the Simmer and Jack they have been employed on certain work, but the manager is not in favour of it. They are much more expensive than Kaffirs, and not so easily handled. The general opinion of our managers who have employed a few at times is that they prefer not to have them if they can get the natives.

11,835. Mr. QUINN: I want to try and understand these figures, Mr. Webb, if you will help me. Suppose we accept these returns which have been sent in to the Chamber of Mines that were asked for by you through Sir G. Farrar. For the sake of argument, we will take them as correct, but before doing that I should like to ask if these returns were sent in quite recently?—They were sent in in June last.

11,836. I mean since this big discussion about labour?—In June last, about the middle of June.

11,837. They were not returns sent in before this labour question had taken on the colour that it has to-day. They were not returns before the war. They were supplied to you in June of this year?—They were supplied to me a few days before the 24th of June; the last one came in about the 25th of June.

11,838. For the sake of argument, we may take them as correct, although it would have been much better if we could have had returns made up before the war.—Well, they have the records before the war at the Chamber of Mines. They have those forms and records there.

11,839. It is rather an important point, Mr. Webb. The forms were sent out this year about June?—The returns which I gave you were made up towards the end of June.

11,840. For the sake of argument, we will take them as correct but not otherwise. The 111,697, in round figures 112,000, represents roughly the number of natives in these various compounds before the war?—In the compounds, yes.

11,841. Now the point I want to make is this. These were not boys on shift; they were boys in the compound, so that whether they were on shift, or not, they were counted here for this purpose?—Yes, they were counted.

11,842. Turn over to the next page of your statement. In the second paragraph you speak of from 25 to 30 per cent., and you say, "if we add the much-talked-of 25 or 30 per cent. for drunkenness or idleness we have a total of so many." You add on here in these figures 25 to 30 per cent. which is talked of as being idle or drunk before the war to the figures on the previous page as being in the compound?—No, I beg your pardon, I said "To turn now to the late Government returns." We have been talking of the Chamber of Mines' returns.

11,843. What are the Government returns?—Well, I give them here.

11,844. What are the numbers of the late Government returns?—"The late Government returns show 95,326 for the same month." That is the end of the first paragraph.

11,845. And then you add your 25 or 30 per cent. to that?—I do not believe the wastage was that much; I do not think it was more than 16 or 18, but that figure was talked of a great deal.

11,846. I do not wish to tie you to that, you have merely used that figure as an illustration?—Yes.

11,847. Let me take the 112,000 that the Chamber of Mines gave as being in the compounds?—Yes.

11,848. That would include these drunks and wasters?—I suppose so; it follows that it would.

11,849. I do not bind you to that 25 per cent., but because you have used it, I wish to use it in what I think you will agree, will be a perfectly fair way. Take this number, and take, not the highest figure mentioned, but the 25 per cent. That gives you a number somewhere in the vicinity of 84,000?—Yes.

11,850. And in this figure of 84,000, in those days, you were running 6,000 stamps?—No, no. I have not taken it that way. I have taken that 25 or 30 per cent. as being much talked of, but if you wish to pin me down, what you must take are my own figures.

11,851. But you used 25 or 30 per cent. to work up a case in support of your argument?—No, the last paragraph supports my argument. I have simply quoted that case because it was the figure talked of around the town.

11,852. But you see that you have added that figure to the shortage?—To the Government returns, but not with regard to mine at all.

11,853. But at first you say how many natives were employed, and then you add that you do not believe it, but you believe it all the same. Take 112,000 again, and take your own figure and 16 per cent., what is 85 per cent. of 112,000?

Sir GEORGE FARRAR: 97,000.

Mr. QUINN: Oh, no, it is not.

WITNESS: About 95,000.

11,854. Mr. WHITESIDE: We have had an estimate that in five years' time 18,000 stamps could be got to work on these fields. Do you agree with that estimate?—Well, I agree with it as far as it affects my companies.

11,855. I take it that includes Nigel also?—I cannot say what other groups are going to do. That figure is compiled by the returns handed in by the engineers of the different groups.

11,856. We will take it for the whole of the Transvaal. Do you think it is a reliable estimate?—I should say it is handed in by reliable men, and is reliable.

11,857. And you would agree with it?—I say that I believe it is reliable; I vouch for my own estimate only.

11,858. If you were asked for an estimate, what figures would you give?—From my own information I should give about what they give here.

11,859. Consequently this statement might so far as your evidence is concerned, be taken as your opinion?—Yes, I should think so.

11,860. Is it right to base the estimate on the intention that all known mineral wealth in the Transvaal must immediately be developed?—Well, I do not know that it is based on that.

11,861. That is what I am asking you?—I do not think you did ask me that.

11,862. I asked you if that estimate is fairly reliable?—Yes. I do not think it takes in the whole of the Transvaal. It is meant for the Rand almost entirely, and perhaps the Nigel.

11,863. Well, then, we will take it as described by yourself. It is based on the intention that all the known mineral wealth must be immediately developed?—Not by any means.

11,864. Is it based on the universal principle that natural wealth must be developed as circumstances permit?—No, it represents the laid-out intentions of the different groups who are represented by that estimate. As I said before, you must ask me, if you want to pin me down, as to my own information and to my own group. I can tell you how many we have estimated.

11,865. I am not asking you as connected with any of the groups?—That is all right, but my estimate, and that of other engineers, is made up—for instance, as in my case—on mines on which money has probably been spent, running up into heavy sums. I think on all of these there has been some money spent, and in the majority a large amount. Now, if we do not carry out the ideas on which we estimated when this money was advanced, we will simply not be acting in good faith and will be ruining our own financial standing.

11,866. Then do not you think it is a right principle that these properties can only be developed as circumstances permit?—No, I think on certain properties, the one which I have included here, companies have been formed, we have asked for money and spent it up to a quarter or half a million on companies which are non-producing, and I think it is a matter of necessity to get them going, and if we are to sit down and fold our hands, and allow interest to roll up against these sums—if we can turn anywhere in the world for help we shall do so.

11,867. Were you basing your calculations on native labour?—I suppose so. At that time I do not think we had anything else to go on.

11,868. Mr. PHILIP: I think you are getting a little mixed about these figures. You based your figures in the first place on the number that the Chamber of Mines reported in 1899, that was 96,704?—Yes.

11,869. Then you add to that the 19 companies who had not sent in returns, but whose returns you have since got, 5,666?—Yes.

11,870. To that you add from the returns which you have since got in, 9,327 over the figures given to the Chamber in 1899?—Yes.

11,871. Adding these together, you get your total of 111,637?—The returns we got from these 91 companies, plus 5,666 from the companies who did not return, give that figure.

11,872. Mr. EVANS: Is the number of natives on non-producing mines greater now than it was before the war?—Yes, I think it is.

11,873. How do you account for that, have you any explanation?—I think before the war it was about 8½ per cent., now it is probably 15, as near as I can make out. I cannot apply the fact to our companies, as all of our companies but two are non-producing, and we have large sums of money invested in them, and we have a right—the shareholders have a right—to ask to hurry these on, and get them to the producing stage as soon as possible, because the necessity is real and the longer they wait the greater the loss, and the shareholders have a right to expect some return.

11,874. If you were not given your proportion of boys, what would the position be? I mean, what would happen, for instance, supposing the Association announced that they would give all the labour to the producing mines?—There would be a big row, and in all probability the Goldfields, or some of the big groups would draw out or try to.

11,875. Combination would be impossible?—Yes, we would try to get labour independently.

11,876. It has been suggested that the mines were using natives wastefully before the war?—I do not think they were. I think that probably the managers are using them to better advantage and watching them more closely, but to make a broad statement that they were used wastefully then, I do not think is quite true. I think that at the present time, in almost every mine, the portions which lend themselves more to working with a fewer number of boys have been worked; every effort is made to work with a fewer number of boys, stopes which are nearest the shaft, and do not require long tramping, and stopes with steeper angles of dip are worked where rock can be got down with fewer boys, and I think wide reefs are being worked now more than they were then. Every effort is being made to place the natives where the best results can be got, but we have to come back to the balance afterwards, and the portions that are being neglected now on account of the scarcity of labour will have to be taken in hand some day, and then the returns will not be as good.

11,877. Is the system sound economically?—No, I do not think so. It is an arrangement that cannot be continued for an indefinite period, that is, if you have the value of the mine in view.

11,878. It has been asserted that the mines are not using labour-saving appliances to the extent that they might be used. Is there any foundation for that?—I think they are using them. I think that any gentleman who doubts that, if he is of a mechanical turn of mind, could soon be shown proof. Every effort is being made in that direction. You cannot buy them off the shelf as you would a suit of clothes. They have to be worked up, and that is being done as far as possible. The greatest saving in appliances will be underground rather than on top, because over 50 per cent. of the cost goes underground in mining. I know that every effort is being made in that direction, not only to get the rock out of the stopes, but in mechanical haulage and every other way.

11,879. Can you tell us anything of experiments with small stoping drills?—We have tried them on different mines, but they have not proved economically successful with us.

11,880. How does the price of dynamite and coal compare now with the prices paid before the war?—I do not think there is any reduction in coal to speak of. It may be very slight per ton milled, but, if there is any reduction, the collieries are probably getting the benefit of it. At the Simmer and Jack

they had a siding before the war and were using flat-bottomed trucks. The difference they get now is simply represented by the discharge from hopper-bottomed trucks, about 4d. per ton. The statement, I think, from the Rand Mines shows that it is a very slight gain.

11,881. It has been asked for by members of the Commission from other witnesses?—As I say, the Rand Mines have had a better opportunity than we have of testing this, because we have only two producing mines. For nine companies of the Rand Mines in 1899 the cost per ton milled was 1s. 10d. For seven months in 1903, for the same mines, it cost 1s. 9<sup>7</sup>/<sub>16</sub>d., practically the same thing.

11,882. There is a difference of a farthing?—Yes, 25 per cent. of a penny per ton milled.

11,883. Now, as to dynamite, how does the price compare?—The same statement shows that the reduction in cost per ton mined in the seven months of 1903 as against 1899 was about 9<sup>1</sup>/<sub>2</sub>d. or so, perhaps 10d. per ton mined. I have 9<sup>1</sup>/<sub>2</sub>d. here. At the Simmer and Jack it is about 11d., and, taking the statement of the Engineers to Mr. Chamberlain, there was a reduction of 30 per cent.; if you figure it out on the sheet, it works out at about 9<sup>9</sup>/<sub>16</sub>d. per ton for the 23 companies mentioned.

11,884. Can you give us any idea as to the relation between the number of white men employed on the mines and the total white population here on the Rand?—I think that it is about one in twelve. I have got some figures, where I think it is about that proportion of the total population. I think it was estimated in the "Standard and Diggers' News" on October 16th, 1899, from the exodus which had taken place there were about 120,000 inhabitants between the Langlaagte Estate and George Goch, and the estimate of the "Star" from the figures of the Claims Lottery was that between the Simmer and Jack and Springs there were 39,000 white inhabitants. I think Mr. Kruger, at the Conference at Bloemfontein, estimated and stated to Lord Milner that the probable voters under a five years' franchise would be about 60,000, and I think he also made that statement in Europe as the probable number to get a vote.

11,885. The CHAIRMAN: He is speaking of the whole country.—Well, the nominal white population inside the three-mile radius before the war was about 100,000, so I think that if we take in all that, in 1899 from Randfontein to Springs, there were 150,000 on the Rand within these limits, and there were anyway about 12,000 to 13,000 white workers on the mines which would give about the ratio of one in twelve.

11,886. Mr. EVANS: That is for every white man employed on the mines there would be twelve white inhabitants?—I should say so.

11,887. With the 17,000 stamps working the estimate, I think, is something like 34,000?—About two per stamp, that would mean a white population of 400,000 on that basis.

11,888. In your extensive experience, has there been any time in which there was a sufficient supply of natives?—I do not remember it, but I believe it has been so stated. I suppose that anyone finding it out would immediately requisition the authorities and reduce it. I do not remember it.

11,889. It has been suggested that there was at the time of the Industrial Commission's sittings?—I think I saw that.

11,890. What was your experience at that time?—I am afraid I cannot give you any reliable data, except that I cannot remember that we ever had enough.

11,891. Sir GEORGE FARRAR: I see, Mr. Webb, that you stated that, at your request, I, as President of the Chamber of Mines, instructed the Secretary to circularise the various secretaries of mining companies for certain information? Did you require that information for the address you were making on the history and discovery of the gold fields, or for a controversial purpose?—Well, I had gone through a good deal of trouble to get

information as to the history and development of the fields, and labour was such an important factor, and this point had cropped up as to the number that were employed here, that I thought it would be an important and necessary addition to bring into the paper.

11,892. You think 16 per cent. is now about the percentage of inefficient?—I think so.

11,893. Mr. QUINN: Suppose you were able to get an abundance of cheap coloured labour, do you think you would maintain on the mines the same proportion of white men under such conditions, say two per stamp? I understand the white men have been used to the fullest possible extent consistent with a working profit?—Yes, I think so. They have been used to the best advantage.

11,894. That has been the position taken up here, and in fact Sir Percy Fitzpatrick, in one of his speeches at the Chamber of Mines, stated that you had got to your limit in that direction, at two per stamp?—Yes, at two per stamp; I do not know how many mines that are being equipped would effect that.

11,895. Taking it in broad lines, what in your opinion would be the effect, if instead of coloured labour being almost unobtainable and unsatisfactory, you could get it in abundance whenever you wanted it?—Cheap coloured labour?

11,896. Yes, there is one word to describe it which is banned and forbidden at this conference. What would the tendency be, would you maintain the extreme limit for the use of white men on your mines?—You mean, would we supplant white men by coloured?

11,897. I will put it in my own way, please. You are now using as many whites as possible, and more than you would ordinarily, because other labour is scarce. Is that fair?—Yes.

11,898. If, instead of native labour being scarce, it was abundant, would the tendency be to still use as much white labour as possible, or the same proportion?—I do not think the tendency would be to decrease the white labour. It would be, on the contrary, to increase it, and the strides would be made in the development of the industry, in opening up new holdings and working low-grade rock, so that the number of whites would be increased a great deal.

11,899. But for low-grade rock, I understand you would require cheaper labour than the other?—Yes, but it has to be bossed up by white men.

11,900. Do you think it would increase the number of white men per stamp?—Well, it would increase the number of the stamps, but I do not know that it would increase the number per stamp. It would certainly increase the number of white men.

11,901. But I am trying to get at the proportion. It is admitted that if we are going to get 17,000 stamps we would get more white men?—I do not think it would be reduced per stamp.

11,902. But if to-day you are making up by an increased use of white labour for a deficiency in coloured, and if coloured labour were no longer deficient, the natural inference would be that white labour would be used less?—I think you increase your white labour as you increase your coloured labour.

11,903. But let us first get my question answered. I understand that owing to the scarcity of coloured labour, white labour is being used to as great extent as possible. You admit that?—Yes.

11,904. If you had more coloured labour you would use it?—Yes.

11,905. Therefore you would use less whites?—No, I do not think so.

11,906. Then you would add to your working expenses?—No. I will give you an illustration. The Simmer and Jack are running to-day with 17 boys per stamp. If we had started up the Nigel Deep we should want 50 boys per stamp at least, and our surplus would go there, and it would go to working underground, narrow reefs especially, and

you would get these worked to the best advantage, getting the most we could out of them. That is where our surplus native labour would go. It would not go in supplanting white men.

11,907. But you cannot go on for ever opening up new Simmer and Jacks and Nigels?—We can, so long as we have mineral wealth that will pay in the production.

11,908. But you will have to come to an end some day?—Yes; it may be a long time or may be a short time.

11,909. My point is this: If you employ more coloured labour than you are now employing, and you are using white labour to the fullest extent, it must have the effect of reducing the number of whites employed?—I do not think so.

11,910. It is logical?—It is not, because you increase the number of stamps just as long as you can. When you come to the point that you cannot do any more, you can turn them out on to your farms to let them do something for the farmers.

11,911. Mr. EVANS: In the case of coloured labour, they, the coloured labourers, would not be allowed a blasting certificate?—I think not.

11,912. And not allowed to handle machinery?—I think not.

11,913. Do you not think, having regard to the possibility of a more extended use of mechanical appliances, that the proportion of white men to coloured men might really increase and not diminish; that a larger proportion of white men would be employed in the future owing to the discovery of comparatively new mechanical appliances?—I should think so, yes.

11,914. Mr. PHILIP: In the case of your getting a large number of natives, would it not have the effect of diminishing the number of white men?—I do not think it would; that is, except where the white men are doing work that they ought not to do.

11,915. That is in cases when you are employing at present unskilled white labour?—Yes.

11,916. Mr. WHITESIDE: Can you give us the name of any particular mine which is now crushing under conditions you are intimately acquainted with, so far as labour is concerned?—I can give you the Robinson Deep.

11,917. Right. How many white men are there employed?—Something like 220. I should say, in round figures.

11,918. How many natives have they got in round numbers?—I think at the last report they had about 1,450.

11,919. How many are they short?—Do you mean to run to the very best advantage?

11,920. Yes?—Well, with the 200 stamps, I should think they ought to have about 4,000.

11,921. How many stamps are they running now?—130 to 150.

11,922. That is less than 10 boys per stamp?—Yes.

11,923. Now, then, assuming that you get these 4,000 boys, and you have 220 white men at present employed, how many extra white men would you require. Would the 220 be sufficient?—I do not think they would be sufficient, because you see the South Reef of the Robinson Deep is rather narrow, and to work it to the best advantage it should be stoped by hand, because its values are diluted so much that large portions of it hardly pay to get out. We would turn boys into more stopes, especially on the South Reef, 20 or 30 boys in charge of white men, and so I am quite sure we should increase the number of white men.

11,924. Is the South Reef at present being worked?—Yes, with drills.

11,925. Rock-drills?—Yes. Some boys are stoping on it, too.

11,926. So you have white men working on the reef at present?—We have some, yes. But the majority of the rock coming to the mill is coming from the Main Reef. That is where we are using machine drills altogether. About 60 per cent.

11,927. So if you get these extra natives the majority will go to increase the numbers already at work under the white staff that you have on the mine at present?—Well, as I say, the majority would go on to the South Reef, and we should do away with the drills and put 20 or 30 of the boys under each white man.

11,928. You would simply replace the rock-drill men by stopers?—Yes.

11,929. Consequently there is no increase in the number of white men?—I do not know about that, because we should work more South Reef than we do to-day. I do not suppose these rock-drills in the stopes bring down more than 10 tons in the 24 hours.

11,930. How many boys are there to each drill?—About five boys in the two shifts.

11,931. How many natives to each stoper?—About 30, I should say—25 or 30.

11,932. Mr. PERROW: Is the South Reef of one size, or are some portions of it wider than others?—Some portions are wider than others. The average, I think, is about 12 or 14 inches, that is the average throughout the mine, but in some places it is quite narrow, and in other places it is wider, two feet or something of that kind.

11,933. You want to work the narrower places with hand labour?—We should get the values out to better advantage.

11,934. Working the same number of machines, rock-drills, that you are to-day, you would employ more white labour for working in these small stopes?—I think we should. I think that would probably be the result. We would get better results. Certain portions now do not pay at all; we cannot make them.

11,935. I think you mentioned two white men per stamp?—Yes, about that.

11,936. If you had sufficient native labour to work the 17,000 or 18,000 stamps you are talking about, you would want something like 30,000 skilled whites?—Yes, 36,000 I should say.

11,937. Instead of about 12,000 to-day?—Yes.

Mr. C. H. SPENCER, called, sworn, and examined.

11,938. The CHAIRMAN: Mr. Spencer, have you before you a statement headed: "Statement of Evidence for Labour Commission"?—Yes.

11,939. Do you put that in as your evidence-in-chief?—Yes.

11,940. Statement put in as follows:—

#### STATEMENT OF EVIDENCE FOR LABOUR COMMISSION.

In conjunction with Messrs. Skinner and Price, I was appointed to go thoroughly into the experiment being carried on at the Village Main Reef of substituting cheap white labour for native labour.

The conclusions unanimously arrived at during this enquiry were generally unfavourable.

During the latter part of 1902, as also the present year, native labour has been just as difficult to obtain as it was when this report was written, and to enable certain necessary work on the Consolidated Main Reef Mines to proceed, it has been necessary to employ a certain number of unskilled labourers, comprising ex-regulars, ex-irregulars, and Dutchmen. My experience of unskilled white labour has been restricted principally to surface and construction work, and on this class of labour the unskilled white at 10s. per day does no more than the good native at 1s. 3d. per day, plus food, say 2s. 6d. per day inclusive. Further, this class of labour is most irregular. The men do not remain any length of time, and during their short term of service they cannot be depended on to turn out regularly; this uncertainty applies more especially to the week following payday. During the last twelve months I have employed 147 whites, an average of 36 men working per month, and the results from this experiment have been so poor that I consider it waste of time

L 1 3

and money to attempt to solve the problem by this method, and work at a profit.

Referring to the Western District, I consider that the lowest average number of natives allowable per stamp 25, owing to the unsuitability of rock drills for the very narrow stopes in this district, and the large percentage of sorting that has to be done to secure a profitable product.

The following statement, kindly furnished by the Mines Department of Krugersdorp, shows at a glance the state of affairs existing on the West Rand amongst the companies that were producing prior to the war:—

#### STAMPS ON WEST RAND.

Stamps erected in district at December, 1902, 1,475.  
Stamps idle at June 30th, 1903, 1,020.

Percentage of stamps idle, 62·15 per cent.

Percentage of stamps working, 30·85 per cent.

On estimated basis of 25 boys per stamp, 1,020 stamps idle.

This represents (approximately) 25,000 boys still required on the West alone.

Since December, 1902, 160 stamps have been erected, which are not included in the above figure (1,475):—

80 stamps at Randfontein.

80 stamps at Consolidated Main Reef Mines and Estate.

Stamps erected in district at June 30th, 1903, 1,635.

Stamps idle at June 30th, 1903, 1,180.

Percentage of stamps idle, 72·17 per cent.

Percentage of stamps working, 27·83 per cent.

On estimated basis of 25 boys per stamp, 1,020 stamps idle.

This represents 29,500 boys still required on West Rand alone.

This resume does not include any of the numerous new projected developments, many of which had already commenced operations before the war. Under this heading I may instance the three deep levels under my charge which were all started in June 1899. These properties will require (approximately) 3,000 labourers each, or a grand total of 9,000 labourers, within four years of sinking operations being re-started, to enable them to become producers. This is only one of the many instances that might be mentioned. (Vide Chamber of Mines Summary.)

With regard to the parent Company, the Consolidated Main Reef was one of the first to commence any active construction and development work during the war, and started with 240 boys in January, 1901. Now, after struggling along with construction and development work for 2½ years, we find ourselves with a new reduction plant of 120 stamps practically completed, and a mine capable of supplying this plant with rock, but to do so we require 3,000 labourers, whilst we have to-day only 410, or a net increase of 170 natives over a period of 2½ years.

#### NATIVE RATIONS.

In addition to the ordinary mealie meal and meat rations which the native received before the war, he now receives a more liberal allowance of meat, kaffir beer twice weekly, hot coffee daily, fresh vegetables two or three times a week and army biscuits. The average cost per month per native on this property before the war for food was 8s., whilst it now works out at 14s., an increase of 75 per cent. The wages show an increase of 6s. 3d. per boy per month, whilst the native pass money is not now deducted. Further, no deductions whatsoever are now made for recruiting expenses. The native is no better worker now than before he was supplied with these luxuries, but is certainly much more independent, and often inclined to be insolent.

With regard to physique, the East Coast native, on whom we principally depended for underground operations, has fallen off considerably from the pre-war standard, the percentage of youths and piccaninies being abnormal. I note that it has been stated by several witnesses that the 30-day month or ticket payment causes discontent amongst the natives. My

experience has been exactly the opposite. When we re-commenced work I started paying every boy on the property at the end of each month according to the number of shifts worked, to avoid the native labour suspense account. This worked well for a time, but after about 12 months a deputation of natives waited on me and complained strongly about receiving money in small sums, and informed me that unless I returned to the old system of paying when the ticket was full that every boy would leave.

I naturally agreed to this, as it was a small matter, but it certainly shows that the system of not paying until the ticket was full in no way militates against the recruiting of natives.

11,941. The CHAIRMAN: I think you are Manager of the Consolidated Main Reef?—Yes.

11,942. Does that cover the control of any other mines?—Yes, three subsidiaries—Main Reef East, Main Reef West, and Main Reef Deep.

11,943. In addition to the Consolidated Main Reef itself?—Yes.

11,944. You state here that in conjunction with Messrs. Skinner and Price you have gone thoroughly into the experiment being carried on at the Village Main Reef of substituting cheap white labour for native labour?—Yes.

11,945. Have you had any experience yourself, apart from the experiment on the Village Main Reef, of using unskilled white labour here?—I have had experience myself for the last 12 months, about; but I have used them very little for underground, mostly on construction.

11,946. And what, briefly, has been the result upon construction; can you tell the Commission?—Yes, very unsatisfactory indeed; most unsatisfactory.

11,947. Are you speaking now when you say that as to cost?—Yes.

11,948. How does it compare as to cost with native labour?—Well, taking the average, a white man who receives 1s. a day does no more than an ordinary Kaffir on that class of work.

11,949. What are the Kaffirs' wages; how much?—2s. 6d. a day.

11,950. Including his food?—Yes, 2s. 6d. a day including his food.

11,951. Does this expense on the Village Main Reef refer to underground work?—Underground and surface work.

11,952. Can you tell the Commission briefly the result of the Village Main Reef experiment underground?—Well, roughly, it was the same as Mr. Price told you the other day, that he added greatly to the cost; in fact, that he added far more to the cost than the gold in the rock was worth.

11,953. Mr. Price was also a member of this Committee of Inquiry?—Yes.

11,954. Do you think the Village Main Reef experiment was more favourable to the use of white labour or less favourable than similar experiments in other parts of the Rand?—Well, I do not know,

11,955. Do you not know as to other places?—No.

11,956. Do you think that the fact that most of the white unskilled labour which has been tried on unskilled work here was drawn from the irregular corps on their disbanding has given the question of white unskilled labour a fair trial? Or, to put the question another way, do you think that a better class of unskilled white labour might be got?—I think it might, most decidedly, because the class of labour we have had has been very, very bad.

11,957. Have you any experience in other gold fields, or other work, of using unskilled white labour in other countries?—None at all.

11,958. Your experience is only confined to this one?—Yes.

11,959. A good deal of your statement refers to work in the western end of the Rand?—Yes.

11,960. You state here that the lowest average number of natives employed per stamp with you is 25?—Yes.

11,961. And you are referring, in stating that I take it, to the Western Rand generally?—Yes, to the Western Rand as a district, taking one mine with another.

11,962. Why do you require to employ such a large number of natives per stamp compared with some other parts of the Rand?—Because our reefs, taking an average, are not suitable for rock-drills. That is to say, our reefs are not even leaders; they are stringers, and not altogether very rich. We want to get the rock out as clean as we can. With stopes 32 to 36 inches in width, machines cannot do it well; they cannot make a good job of it.

11,963. Does that mean that by working the machines in these stopes you break a much larger quantity of rock?—Yes, and you break it up into such a condition that you get such a large percentage of fines that you cannot sort it profitably.

11,964. And is the result to bring down the yield?—Yes, to bring it down considerably.

11,965. You have a statement here as to the number of stamps erected on the West Rand in December, 1902, 1,475?—Yes.

11,966. I think you later on say that 160 stamps have since been erected?—Yes.

11,967. Making 1,635?—Yes.

11,968. On the 30th June last the number of stamps idle was?—1,180.

11,969. Expressed in percentage, what is that?—27 per cent. working, and 72 per cent. idle.

11,970. Is that number standing idle entirely caused by the shortage of natives?—Well, I cannot answer that question very well, Mr. Chairman. I should think certainly the majority. I do not say all of them.

11,971. Are you running any stamps on the mines that you are controlling?—None at all.

11,972. Are you ready to run any?—We are ready to run 120; we shall be ready in a fortnight's time.

11,973. On which mine is that?—The Consolidated Main Reef.

11,974. How many boys have you on the Consolidated Main Reef now?—On that statement I rendered, I think, 410. Since then I have lost 63 yesterday, 5 to-day, and I have got 48 leaving to-morrow.

11,975. Are they time-expired boys?—Yes.

11,976. How many would you require to run your 120 stamps?—Somewhere over 3,000.

11,977. Are you figuring on a basis of 25 per stamp?—Yes, that is to start the stamps that are lying idle without allowing for new construction work or work started before the war.

11,978. Have you included in that number of 29,500 additional natives required, those required for your deep level mines?—No, not at all, without regard to other deep level mines on the West Rand.

11,979. Has any allowance been made in that figure for this?—No, none at all; only stamps idle to-day that ought to be running.

11,980. You draw attention here to the increased cost of feeding the natives now, as compared to pre-war days?—Yes.

11,981. What did it cost to feed the natives before the war?—Eight shillings.

11,982. And what does it cost now?—Fourteen shillings.

11,983. What are you paying the natives now?—We are paying the natives now, I think, an average of 6s. 3d. per shift, and the amount before the war was about 5s. per month of 30 days.

11,984. That works out at an average of 5s. 2d. per shift?—Yes.

11,985. Do you make any deductions from their pay?—No deductions at all.

11,986. Were there deductions before the war?—Yes, deductions for pass money. I was not on the West Rand before the war; I was then on the other side of the Rand, and I used to deduct half the recruiting expenses, and usually got it, though not in every case.

11,987. That deduction is not made now?—No.

11,988. That is really an addition to the amount of the natives' pay as compared with before the war?—Yes.

11,989. Some evidence has been led here with regard to natives from Basutoland, and possibly natives from elsewhere, objecting to the method of paying them by the shifts worked per month. You refer to that in your statement here. Do you find natives object to that form of payment?—I give you what happened with my own men. I state what actually happened with these boys. They came to me stating that they refused to go on with their work if they were paid by the number of shifts worked per month. They stood out for being paid when their ticket was full. For instance, suppose a boy worked 16 shifts a month, I pay him for the 16 shifts worked instead of allowing them to go over until next month until he gets a full ticket. They object to that. In fact, they all struck and refused to come to the mine unless I went back to the old system and paid them when their ticket was full.

11,990. What mine was that?—The Consolidated Main Reef.

11,991. Mr. PHILIP: Did you go into the question of white labour on any other mine besides the Village Main Reef?—No.

11,992. And on that you made out the white man costs 7s. 6d. more than the native?—No. That is my own experience on my own mine.

11,993. It is about the same on the Village Main Reef. We had Mr. Hellman, who told us that they cost three times as much; Mr. White, 7s. per day; Mr. S. Jennings, on the Crown Reef, white labour cost four times as much, so at any rate three times as much would be a very low figure to take?—Very low.

11,994. Mr. QUINN: I see you are one of the Committee who went thoroughly into the experiment of the employment of white labour on the Village Main Reef?—Yes.

11,995. All you tell us about it is that the conclusion unanimously arrived at during this enquiry was generally unfavourable. Did you draw up a report of this?—Yes.

11,996. Have you got the report with you?—No.

11,997. Could you send a copy of it in to the Commission?—I do not know whether I can get a copy of it now.

11,998. Did you keep a copy yourself?—Yes, I think I have a copy at the mine.

11,999. Can you supply a copy of that report to the Commission?—Well, it is a private report. I do not think I can. I certainly could not do so without submitting it to the gentlemen I made the report to.

12,000. There are no private reports so far as this Commission is concerned. Both you and Mr. Price have given us parts of that report, which I believe are decidedly misleading, and I think the Commission—it is a very important matter—ought to have a copy of the report put in?—If so, you want all the figures.

12,001. We want the report exactly giving the result of the enquiry into the Village Main Reef experiment of employing white men. We want the whole of that report handed in as giving the results of your enquiry. I submit, Mr. Chairman, that this report certainly ought to be handed in. It is of vital importance. It has been referred to twice, by two witnesses. Statements have been taken out of it, but the bulk of the report we have not seen. It is the only instance of a report of a Committee of mine managers on this question.

12,002. The CHAIRMAN: Is it your property, Mr. Spencer?—It is a private report to Sir George Farrar and to Mr. Hennen Jennings.

12,003. It is not your property?—No.

I do not think, Mr. Quinn, you can ask him to put in a report to private persons if he does not desire to do so.

Mr. EVANS: That report, I believe, was really made for the Chamber of Mines, and if we apply to the Chamber of Mines they will give it. I do not think there is any objection to a copy of that report being put in. There have been several witnesses from the Chamber of Mines before us, and I am sure Mr. S. Jennings and Mr. de Jongh, or any other member of the Chamber would have given it if asked.

Mr. QUINN: Seeing, I take it, that Mr. Evans is speaking with authority that there is no objection to our having that report, will you, Mr. Chairman, please ask the Secretary to apply for it?

The CHAIRMAN: You must ask the proper authority for it.

Mr. QUINN: Am I to understand that you rule that we are not entitled to insist upon the report being put in?

The CHAIRMAN: Not at all. You must have misunderstood me. I simply said you must apply to the proper authorities. Mr. Spencer cannot be asked to supply what he does not possess. I presume if Mr. Spencer applies to the Chamber of Mines they are the proper parties to supply it.

Mr. QUINN: Two or three references have been made to it. How can I examine on this statement if we have not the report before us?

The CHAIRMAN: It is our business to apply to the proper authorities. That is all you want. The Chamber of Mines can supply it if we ask them to put in that report.

Mr. QUINN: I think that report has been twice referred to here. Pieces have been taken out and, I say, unfairly used. It ought to be put in as a whole.

The CHAIRMAN: The Secretary will apply to the Chamber of Mines for a copy of it.

Mr. EVANS: If the first witness referring to it had been asked, I think you would have got it. You should have asked him, and in my opinion I think you would have had it. I cannot see any possible objection to its being put in.

12,004. Mr. QUINN: There is one other question. On page 4 of your statement, at the top, you say that the average cost per month per native before the war on that property was 8s.—Yes.

12,005. You considered you were able to feed them properly at 8s.—Well, I think the natives were perfectly satisfied with the food we gave them at 8s. You must remember that before the war the Kaffir used to spend all the money he got.

12,006. My point is this: You were paying 3d. a day as food?—Yes.

12,007. It is no wonder they spent the other part. So it works out at an average of 75 per cent. Is the native any better as a worker than before he was supplied with food at 14s.—They got luxuries compared with what they had before the war.

12,008. Yes, I can understand they would consider what they get now as luxuries compared with what they got before the war. You think the native is being well-paid?—I do not think he gets enough chance to spend his money.

12,009. My point is: Do you think the mines give him too much food?—I think they are spending enough to feed him as well as he is accustomed to be fed.

12,010. Is it possible to feed the native at 6d. and feed him successfully?—I think so.

12,011. Mr. EVANS: Were you manager of the Treasury?—Yes.

12,012. Was the Treasury compound one of the most popular compounds on the Rand?—Yes; it was nearly always full.

11,013. What did the boys get in food before the war?—I cannot tell you the exact figures, but they were something like 8s.

12,014. And they were perfectly satisfied?—Yes.

12,015. Had you any difficulty?—No difficulty at all.

12,016. Mr. WHITESIDE: What was the reason of the popularity of the compound, seeing that it was always full? I suppose there is some special reason?—Well, I really cannot tell you, Mr. Whiteside.

12,017. The CHAIRMAN: The Commission is much obliged for the evidence you have given.

Mr. J. B. PITCHFORD called, sworn, and examined.

12,018. The CHAIRMAN: Have you before you a document headed "Statement of J. B. Pitchford, Esq.?"—I have.

12,019. Will you turn to page 7, the paragraph at the bottom of the page? You are dealing there with a matter which is outside the scope of the Commission. I would be obliged if you would withdraw that paragraph at the bottom of page 7, the whole of page 8, and the last four words at the top of page 9. Will you amend the statement accordingly?—I am perfectly willing to do so. What is there is simply an illustration of what has been done by cheap labour in other countries.

12,020. The scope of the inquiry is restricted.

Mr. QUINN: Very.

The CHAIRMAN: If we admitted discussion on such subjects we would be sitting a long time.

Mr. QUINN: We have all read it, so it has served its purpose.

WITNESS: I think there is a little inaccuracy in my statement as to the number of stamps.

12,021. The CHAIRMAN: You want to make a correction?—Yes. I do not know exactly what it is—I know there were 3,725 stamps running at the end of July and 2,600 idle on the whole of the Rand. I said there remained over 2,600, but I think it is 3,000.

12,022. You wish to correct that and make it 3,000?—Yes, there were some stamps erected since the data I based that on.

12,023. Are there any other corrections you wish to make?—I do not care to make any others, for the simple reason that most of my figures are given as a matter of illustration and not as actual statistics. Some of the figures are compiled from the statements given by different engineers before Mr. Chamberlain.

12,024. The witness handed in the following statement:—

STATEMENT OF J. B. PITCHFORD, ESQ.

The Witwatersrand is the largest and most uniformly continuous gold mining area known to the world at the present time. The approximate selling value of the organised properties is about £175,000,000.

It is probable that no industry in the world of as great a magnitude is being retarded to the same extent unnecessarily. There are a number of enterprising people here, but in consequence of the peculiar conditions existing at this time, they have only, with vigorous business management, been able to get the gold output up to less than one-third of what it ought to be.

The principal impediment appears to be lack of cheap labour, and it has taken two years to find out that there is only an insufficient supply obtainable in this part of Africa. The Witwatersrand Native Labour Association has been strenuously endeavouring for the past two years to obtain labour, and at the present time there are less than 76,000 natives obtained, and at the end of July there were only 3,725 stamps running, so that there remained over

3,000 erected stamps still idle for want of cheap labour. These figures show that, for the developing and crushing mines, at the present time the average number of boys per stamp is over 20, and we know the mines are all running short-handed, and this has increased the working costs by 5s. per ton on many mines, which, in some cases, will be sufficient to prevent them from being worked at a profit.

It has been pointed out by several leading mining engineers in various tabular forms that have been compiled for the Chamber of Mines, that the larger portion of the mineral zone of the Witwatersrand is below a value of £2 to the ton, and that it requires the employment of five people for every ton of ore crushed; if 90 per cent. of the gold were extracted from this ore, there would be 36s. recovered. It must be evident from this that the 36s. produced will never pay sufficient wages for five Europeans and for all the supplies.

The following is a list of some of the supplies that are required for running a mine: Air-hoses, belting, boiler tubes, bolts, nuts, washers, nails, rabbit metal, cyanide, candles, coke, crusher jaws and spares, coal, cement, drill steel, dynamite, fused borax, feeder and mill spares, fuse and detonators, greases, general machinery spares, hemp ropes, leather, lime, native food, oil, paraffin, pipes and fittings, quicksilver, rock-drill spares, sundry chemicals, sheet steel and bar iron, screening, sulphuric acid, shoes and dies, steel ropes, steel rails, timber, trucks, waste, and zinc discs.

Three items in the above list, viz., explosives, coal and native food, amount to £150 per day based on an equipment of 100 stamps, crushing 500 tons of ore per day.

There would also be required pay for 2,000 to 2,500 natives, at least 200 skilled white employees, office expenses, depreciation of plant to be written off, and, lastly, the poor shareholders will expect to receive interest on their money. They have invested from one to two million pounds in a mining property equipped on 100 stamp basis, that will produce £1,000 per day, if properly and continuously worked. The interest they will obtain on their investment is what is left after 2,500 people have been paid their wages and the above long list of supplies have been paid for, together with office expenses and management.

Everything should be done so that this vast body of low-grade ore can be worked quickly and cheaply. A large number of mines adjoining each other, using similar materials in large quantities, should have the effect of reducing rates.

Every effort has been made by the managements to reduce costs, so that more of the low-grade mines can be worked. There is no lack of business ability, and the mechanical and metallurgical talent has endeavoured to reduce working costs as far as lay in their power, by the introduction of up-to-date appliances and methods. All improvements that are developed are made known through the excellent Technical Societies which have been organised on the Rand for the purpose of disseminating knowledge that will benefit the mining industry. It would appear that nearly everything that can be done is being done for the advancement of these mines, except the rapid introduction of some kind of cheap labour, which would be a benefit to the country at large.

According to statistics, it appears that at some of the mines, the proportion of money paid for skilled and unskilled labour is as £34 is to £20. So that for every £2 paid for unskilled labour, there is over £3 paid for skilled labour, and it is evident that, if we cannot obtain the unskilled labour, it will be impossible to pay for all white labour.

It is assumed that a going mine in a good section of the Rand, on a 100-stamp basis, can crush 500 tons of ore per day, and produce £1,000 in money. This property is worth from one to two million pounds.

Suppose we allow the shareholders to make at the rate of 10 per cent. on a little over one million valuation, this would amount to £275 per day. Suppose this mine had large reefs, and could be

worked with 20 Kaffirs to the stamp, it would require 2,000 Kaffirs. The results would be as follows:—

Interest - - - - -	£275 per day.
2,000 Kaffirs at 3s. - - - - -	300 per day.
Assume for white skilled labour - - - - -	250 per day.
This would leave less than half enough for stores for one day - - - - -	175 per day.
	£1,000 per day.

The above rough approximate figures should be sufficient to show how impossible it is to work reef that pays less than £2 per ton with white labour, because £2 will not pay five white people, together with the necessary supplies, and allow anything for interest on the capital invested.

The position of the mining industry is simply this: Cheap labour must be obtained or less mines will be worked than were before the war, and the money invested by shopkeepers and others, in anticipation of more vigorous work being done, will be lost.

There are 32,000 claims on the main portion of the reef, not including a large amount of deep level area, and a second, third and fourth row of deep levels.

About 1,100 of these claims have been worked out, which means that since the mines were first started they have worked out less than one-thirtieth of the claims and produced £80,000,000. From the above figures, there are thirty times £80,000,000 left to be worked, without counting some of the deeper levels. It is for this community to decide whether this shall remain in the ground where it will do no one any good, or whether the mining companies can take it out and pay 16 unskilled Kaffirs or other labourers £2 a day and pay three white skilled employees over £3 at the same time. If the unskilled labour cannot be obtained, there will be no use for skilled labour,

The following is a list of the different trades and occupations of white employees on the principal mines on the Rand in December, 1898:—

Managers - - - - -	54
Battery Managers - - - - -	48
Mechanical Engineers - - - - -	59·75
Draughtsmen - - - - -	23
Secretaries - - - - -	58
Shift Bosses - - - - -	117
Machine Drillmen - - - - -	1,547·2
Engine drivers - - - - -	701·15
Pumpmen - - - - -	86·75
Carpenters - - - - -	712·95
Fitters, etc. - - - - -	883·25
Masons - - - - -	153·2
Assayers - - - - -	84·5
Cyaniders - - - - -	
Concentrators - - - - -	} 289
Vannerman - - - - -	
Mine Overseers - - - - -	57
Other Overseers - - - - -	163
Surveyors - - - - -	63
Electricians - - - - -	115
Mine and Office Clerks - - - - -	325
Miners and Trammers - - - - -	1,499·4
Pitmen - - - - -	203
Greasers - - - - -	29
Stokers - - - - -	120·5
Blacksmiths - - - - -	629·1
Painters - - - - -	41·3
Labourers - - - - -	110
Amalgamators - - - - -	339
Miscellaneous - - - - -	811·3
Totals - - - - -	9,326

These men were paid about £250,000 per month, but they could not have been employed at all unless there had been Kaffirs or some other cheap labour employed as well.

The amount of money paid as wages to these white men was in the following order:—

Rock-drill men	-	-	-	-	1
Miners and trammers	-	-	-	-	2
Fitters	-	-	-	-	3
Engine-drivers	-	-	-	-	4
Carpenters	-	-	-	-	5
Blacksmiths	-	-	-	-	6

After going through the above list of the various trades and callings that are requisite for operating these mines, it will show the absurdity of some people who imagine that it is possible to substitute unskilled labour in those places, and it appears to be very evident that there is no use for the skilled labour set forth in the above list unless an adequate amount of unskilled labour can be obtained to do their portion of the work.

There are millions of unskilled labourers in the world, who work for an existence; it always has been so, and it will continue to be so unless the more intelligent portion of the community can show how this labour can be employed in such a manner as will be beneficial to both parties. Millions of people are content if they can get enough rice or mealies to eat. These mines can not only give them this, but a little more, and if a Kaffir or any other unskilled labourer is able to save enough out of one year's work to rest for two months, it is to his benefit, and no skilled white man should begrudge him this as long as he knows that only by the work of the unskilled labourer is it possible for there to be work for the skilled labourer.

It would be impossible for the people of Johannesburg to be here to-day if there were no Kaffirs, and very few people stop to think of this.

It has been worked out that the cost per month of maintaining a white family in Johannesburg, consisting of a man, his wife, and three children, will exceed £24 per month, and the greater portion of this money goes to the shopkeepers. For every one of the skilled men able to spend this amount per month there must be employed eight or ten unskilled labourers, or there will be no need of his services.

How much would a rock-drill machine man make if he used white labour entirely on his contracts? There are no mines in the world where the white miner has such easy times and good pay as he has here. The reason of all this is because of the assistance that is derived from unskilled labour.

According to the Engineers' Report for the Witwatersrand Native Labour Association, in June, 1902, it was estimated that 141,250 boys would be required for the gold mining groups of the Rand, based on the then erected 6,325 stamping equipment, and this should be doubled if the payable mines known to exist were worked at the rate they should be. This indicates that there should be in these fields 22 boys for each stamp erected, to keep the mills running, and do the necessary amount of development, construction, transport, and contractors' work, and place other properties on a milling basis. It must be borne in mind that over 20 per cent. of the boys' time is wasted through sickness, drunkenness, or laziness and neglect of duty.

The following gives the average number of boys allowed per stamp for eleven mines on the Witwatersrand that are equipped on 100-stamp basis:—

Angelo	-	-	-	-	18.59
Glen Deep	-	-	-	-	21.76
Jumpers	-	-	-	-	20.89
Jumpers Deep	-	-	-	-	20.89
Lancaster	-	-	-	-	18.89
Langlaagte Deep	-	-	-	-	20.26
May Consolidated	-	-	-	-	22.49
Nourse Deep	-	-	-	-	18.62
Robinson Deep	-	-	-	-	24.18
Village Main Reef	-	-	-	-	21.39
Woluter Gold Mines	-	-	-	-	20.95

Average number of boys per stamp for the above: 20.81.

The following was the allotment made to the

different mining groups that were in the Witwatersrand Native Labour Association in May, 1902:—

Group.	Complement of all Mines.
Consolidated Gold Fields	16,497
H. Eckstein and Co.	21,033
Farrar—Anglo-French	12,282
General Mining and Finance	11,591
Goerz and Co.	9,564
Neumann and Co.	7,401
Consolidated Investment Co.	16,424
Rand Mines, Limited	25,199
J. B. Robinson	16,732
Sundry Companies	14,317
Total	151,041

This was based on the present stamping capacity of the Witwatersrand. If double the number of stamps are erected, the number of boys required will be in the same proportion.

A large amount of time and money has been spent in procuring statistics in regard to obtaining natives and a number of the best authorities in Africa have been consulted. The Witwatersrand Native Labour Association has been working hard for two years, and the Mining Companies have been adding to the food and comforts for them, as well as increasing the pay.

With all these efforts it is plainly evident that there will not be a sufficient number of natives obtained to work these mines, so it is evident that cheap labour must be obtained from some other country than South Africa, and the quicker it is decided to do so the better it will be for the progress of the whole of South Africa and the general advancement of the interests of the British Empire.

12,025. The CHAIRMAN: What position do you occupy?—Consulting Mechanical Engineer to the Randfontein Group.

12,026. Have you held that position for a long time?—For over three years.

12,027. Were you on the Rand before?—Yes, as Consulting Mechanical Engineer to the Consolidated Gold Fields Company.

12,028. How long have you been in South Africa?—I came here in 1896.

12,029. Then you have been here, except for the war period, ever since?—I was away just one year.

12,030. As to the Randfontein Group, can you tell us how many stamps are erected there to-day?—We have 500 stamps on the Randfontein Group, 100 of which are running. There remain to be erected 100 stamps which are lying on the ground ready for erection, and another 300 are in the course of erection. Four 60-stamp mills were erected before the war. Since that time these 60-stamp mills augmented to 100, and a new lot of 100 stamp-crushers in addition. Of these we are only able to man 100 stamps by taking the labour for the surface and construction work of all the other mines. The South Randfontein is running with 1,800 boys and 300 to 320 white men at the present time. We should have over 2,000 boys, and the white labour should be about 220.

12,031. How many natives do you employ altogether on the Randfontein?—I am not quite prepared to answer the question accurately. I would judge that we have between 3,000 and 3,500.

12,032. And how many white men?—Over 1,000. I cannot give you the correct figures; that is approximate.

12,033. What is your estimate of the number of natives required?—I estimate that for every mine fully equipped, with all surface completed, we need between 2,000 and 2,500 to work the mines economically. On that basis the mines should pay £2 for Kaffir labour and £3 for white labour. It means that if we take out £1,000 on the 100-stamp basis, £250 could go for interest to the shareholders, and £450 could be paid for labour in the proportion of 2 to 3, and the remaining amount would go to merchants for supplies and machinery. It is well

understood that of the amount paid out for labour three-quarters goes back to the shopkeepers. Without the black labour it would be an absolute impossibility to run the mines, because the rock is of too low grade. We might as well send white men to raise rice. To undertake to work ore of that grade with white labour would be a degradation. I have worked for over 40 years continuously with a very few weeks' intermission, at different kinds of work. I started in the mining business in 1871, and before that had been on steamboats and on railways. I do not want to degrade the white man, and I do not do so in my suggestions. In the article I wrote in a leading journal here, I thought of the good of the community in general, and for white labour in particular.

12,034. Have you any experience of mining in other countries?—Yes.

12,035. Have you had experience of coloured labour in mines?—I have seen it in gravel mines.

12,036. Have you tried any experiment for utilising white labour on the Rand?—We have tried it at Randfontein—Dutchmen.

12,037. Dutchmen only?—Principally Dutchmen.

12,038. Was it underground?—Yes, underground tramming.

12,039. Tell the Commission what your experience was as to the efficiency and the cost as compared with native labour.—I am not prepared to go into these details, because it is not my part of the business. I know it was unsatisfactory as to the cost, and also unsatisfactory as to reliability of labour. They will work till they have a few shillings, and then you have to get a fresh batch.

12,040. You refer in your statement to the impossibility of working rock of the value of 40s. with white unskilled labour?—Yes, I did. If you get to rock which pays 40s. per ton, and get 90 per cent. extraction, which is considered good, you will get 36s. for 100-stamps, while you may crush as much as 500 tons a day. Then you want to keep the mill running constantly—Sundays as well as week-days. Then, if you have 36s. a day divided between the necessary labour, the wages would be absolutely insufficient for any kind of white men, on account of the extra cost of living here. This is only degrading the men, and putting them on an equality with the blacks. There is a proper place—a proper proportion for the coloured labour to the white, and I think that the proportion as far as the mines are concerned is £2 to £3. Unless there is some proportion the mines with 40s. rock cannot be worked at a profit. I will venture to say that 90 per cent. of the mines will have to shut down if you undertake to run them with white labour entirely.

12,041. Mr. QUINN: Can you tell us what the average yield per ton is for the whole Rand?—It is a question more for a mine engineer than for me.

12,042. You have made the statement that it is below £2 per ton?—I have taken that from statistics which you could have seen as well as I, furnished by the engineers and mining men who have gone to considerable trouble in comparing all the values that made up the average. I think it was Mr. Webb who made up the average for the whole of the Rand at £2 per ton.

12,043. Do you accept the statement made by all the engineers, including Mr. Webb and Mr. Sidney Jennings, where it gives the figures per ton?—I think so.

12,044. It gives us less than 40s.?—It may be more for the best portions of the Rand. I am speaking of the Rand as a whole.

12,045. But I see here that the yield is 41.9 shillings per ton, and the average profits 10/7.4d.?—You have 1s. 9d. against me, but it is a very small amount. In a discussion of this kind it is a small amount, where percentage does not cut much figure.

12,046. But 5 per cent. cuts a figure?—You must bear in mind that only the best portions of the reef have been worked, and there is a much larger

amount of ore than comes to the stopes, and is not stoped because it is not payable—the labour is too high.

12,047. But the average is given as 41s. 9d.?—I am speaking of what remains in the reefs themselves. There is much that cannot be taken out on account of the extra cost.

12,048. I understood you to apply to the present when you said the average yield was less than £2 per ton?—I firmly believe that if the reef was worked from Randfontein to Holfontein it would not yield 40s.

12,049. WITNESS: I should like to remark that being so, the average yield has been 41s. 9d.

12,050. From what?—From the results from which these statistics are tabulated.

12,051. That is something that we can stand on. That is why I prefer it.—That is what it has been.

12,052. Do you know that it is at the present moment?—Well, I am not prepared to say. It would take too close figuring and too many qualifications to explain it even if I knew it.

12,053. It says here the average profits derived are 10s. 7.4d. per ton. Now, on the first page of your statement I want to ask you one or two short questions. Turn to the last paragraph on the first page. It must be evident from this that 36s. produced would never pay sufficient wages for five white men and all the supplies, supposing your proposition of working the mines by white labour only?—Yes.

12,054. Would five white men, if profits were large enough to allow of it, be enough per stamp?—Not per stamp; that is per ton of ore crushed. You see there are 500 tons of ore crushed in a 100-stamp mill, and that takes 2,500 people, that is, five to each ton, to pulverise the ore and get the gold out. That includes Kaffirs, white labourers, and the staff in the office.

12,055. I am afraid I do not quite understand yet. I think you are taking a case and working it out on a basis of five white men per stamp running a 100-stamp mill?—I was desirous of showing how impossible it was to divide 36s. between five white people, and let them make a living out of it. They would only have a common existence.

12,056. Are you working on a basis of five white men per stamp?—No, for every ton of ore crushed, five of all kinds—black and white, but if you make these people all white there would be five white people to pay with 36s. for every ton.

12,057. Will a 100-stamp battery crush 500 tons per day?—The latest equipped will crush about five tons per day per stamp if under proper working conditions.

12,058. And then that means that supposing these are white people, you are using 25 white men per stamp?—Yes, altogether 25 white men per stamp, employed directly and indirectly round that mine.

12,059. I understand now, all in?—Yes, all in.

12,060. Do you know what they are crushing per stamp in Western Australia, for instance, according to Government returns?—Well, I do not think that anything you can cite about Western Australia or the United States or any other country has anything to do with conditions existing here. We have conditions that exist here that demonstrate that we must have from 2,000 to 2,500 labourers for every hundred stamps. If you have a place like in Alaska, a quarry, and can put in a blast in a lot of pay reef and put the whole lot in a mill, you can run with one-sixth of the labour, also in Western Australia you can do the same thing. These Australians cannot come here and do any better with this reef.

12,061. That is interesting, but not an answer. I asked if you knew anything of mining conditions in Western Australia?—No, I do not.

12,062. Do you know that with a practically similar reef they are mining with five white men per stamp?—Well, that cannot be done here, it is impossible.

12,063. What is the proportion of white men employed per stamp here now?—You mean just at the present moment?

12,064. Say before the war?—I should judge that per stamp for all mines, including milling mines and developing mines, there were close on 25 boys per stamp.

12,065. No; I mean white men?—Oh, the proportion of white men would be about somewhere between 1 in 8 and 1 in 10.

12,066. That would be between two and three white men per stamp?—Every eight to ten coloured labourers you employed you would also employ one white labourer.

12,067. So, then, on that basis, you would have three white men, before the war, or, say, two white men and 20 Kaffirs?—Yes.

12,068. So that these 22, of whom 20 are Kaffirs, are able to deal with five tons per stamp per day?—Yes, I believe so.

12,069. Do you consider that a Kaffir is equal to a white man, or what is their proportionate value?—In drilling, stopping, and shovelling he is equal to a white man.

12,070. Mr. PHILIP: With reference to a question just asked regarding your figures of the value of the ore extracted per ton, I have before me the Chamber of Mines monthly analysis for July, 1903, and the average for the whole of the Rand is 39·25s. per ton, that is, for the whole country?—Yes, and they are taking out some of the best rock they can find.

Mr. G. A. DENNY, called, sworn, and examined.

12,071. The CHAIRMAN: I think you are a member of one of the sub-committees or the sub-committee on mining appointed by the Chamber of Mines to prepare evidence for this Commission?—Yes, sir.

12,072. You are a mining engineer?—That is my profession.

12,073. What position do you occupy at present?—I am consulting engineer to the General Mining and Finance Corporation.

12,074. How long have you been on the Rand?—Seven years.

12,075. Have you any mining experience in any other part of South Africa?—In Zululand, and the South-eastern part of the Transvaal.

12,076. And in other countries?—Yes, Australia, America, Central America, and some parts of Europe, Hungary, especially Transylvania.

12,077. Is the General Mining and Finance Corporation controlling many mines on the Rand?—We are controlling at the moment 12 mines. Some are producing, others are not producing, and there is one on which work has not yet been started.

12,078. Do these mines employ a very large number of natives?—They would employ a very large number if they were available.

12,079. Do you know how many approximately they are employing now?—In August, we were employing 4,245.

12,080. And how many could you employ if they were available?—An additional 6,500.

12,081. Are there many of your mines crushing now?—Van Ryn, the New Goch, Charlton, and the Roodepoort United.

12,082. Are all your stamps dropping?—No.

12,083. How many stamps are dropping, and how many are erected?—On the Van Ryn 60 out of 160; on the Goch, the full 60; on the Charlton, 65 out of 80; and on the Roodepoort United, 65 out of 110. Possibly, this month we may have 70, but that has been the average.

12,084. If you refer to the statement headed "Report of the Sub-Committee on Mining, submitted by the Chamber of Mines" (v. pp. 605-7) that enquiry, I understand, embraced the labour requirements of mining in South Africa at present and in five years' time?—Yes.

12,085. To get that information, you circularised all the mining companies in South Africa?—Yes.

12,086. And from the replies received you made up the figures which are embodied in this document?—These figures are based as far as possible on actual data received by the mining companies.

12,087. You estimated at present the mining companies in South Africa require 244,001 natives?—Yes.

12,088. Looking now at page 607?—I have not got figures in my copy. I cannot quote from memory.

12,089. The figure given here is 244,001, and five years hence the same companies will require 486,541 natives?—Yes.

12,090. I see that your statement (v. p. 605, pr. 5) shows that working the mines under present conditions, you require 129,588?—Yes.

12,091. Do you know the number employed at present?—Last month on the non-producing mines it was 8,833, and on the producing mines, 46,674, i.e., 55,507.

12,092. That figure was given this morning as something like 63,000?—Yes.

12,093. I understand that estimate of the requirements was based on work under present conditions?—Quite so. There are two columns given—one headed under present conditions, and the other headed under best economical conditions.

12,094. Can you remember the figures of the best economical conditions as stated there?—142,473.

12,095. What do you mean by best economical conditions?—Conditions under which we can run our stopes and mine to the best advantage, do the maximum amount of sorting, and reduce as far as possible the number of rock-drills employed on various portions of the mine, in fact, as far as possible, the percentage of white to coloured labour.

12,096. Are the mines that you are connected with situated on different parts of the reef or are they in one district?—They extend from one end to the other.

12,097. Have you any in the West?—We have some on the West, the United Roodepoort, the West Rand Mines, Violet and other unfloatated property.

12,098. Do you agree that on the West Rand you require an unusually large number of natives per stamp?—Certainly on the West Rand, more particularly in the Roodepoort district. It may not be so true if applied exclusively to the Krugersdorp district.

12,099. What is the reason for the extra number of natives required per stamp on the West Rand?—Purely the thinness of the reef and the stratified rocks being of such a nature that it is impossible to use rock-drills there in the stopes.

12,100. Why impossible?—For the reason that it is stratigraphically impossible. The quartzite there are so stratified that any undue blasting would, despite the very greatest care, bring all the hanging wall down and render the stopes unworkable. It increases the width of your stopes and pretty soon you would not be able to get your stopes worked at all. The whole country would come down about your ears.

12,101. It is not altogether, then, a question of economy?—No; there is a mining difficulty which necessitates the employment of hand labour.

12,102. But taking extremes upon the Van Ryn, how many natives per stamp do you require under the best economical conditions?—Not less than 25 boys.

12,103. Do the same conditions obtain there?—Just the same. We are working the stopes down to 20 inches by hand labour.

12,104. That is surely a record for the Rand?—No, not quite. There are other mines on the West Rand with 20-inch stopes. It is impossible to work them otherwise than by hand labour.

12,105. Then, in the Central Rand you have control of one or two mines?—Yes.

12,106. What number of natives could you profitably employ there?—From 17 to 18 boys per stamp, probably, under the best conditions, perhaps 20. These conditions are that we use rock-drills in the stopes at a given figure, and that figure should compare with the *prima facie* cost of hand labour. Machinery shows a higher cost when you take into account the surface gear and depreciation. Then you find that the rock-drill is considerably more expensive. Therefore if we replace the rock-drills it will pay us still better.

12,107. That figure of 18 or 20 boys per stamp would be fairly applied to the Central Rand generally?—I should say so.

12,108. In connection with this labour difficulty there has been some public discussion on the subject of labour-saving appliances?—Yes.

12,109. You have told us of mining in other countries, do you think the fullest advantage, or as full advantage is taken of labour-saving appliances on the Rand as in other mining countries of your acquaintance?—To a considerable extent, greater advantage is taken in this country, and greater use is made of labour-saving appliances in this than in any other country.

12,110. In making this estimate of labour required five years hence, I take it that in this figure, I think, 18,000 stamps that might be run, there are other requirements besides that of labour, such as capital, water, fuel, etc.?—Naturally.

12,111. I have no doubt you have gone into all these questions in connection with your enquiry?—Yes.

12,112. Do you think that assuming labour was supplied, there would be any difficulty under any of these heads?—Not the slightest with respect to fuel, and there is capital in abundance for legitimate undertakings, and water in abundance, if properly conserved.

12,113. In connection with this statement of the Sub-Committee on Mining, you supplied a map of the Rand which is variously coloured as shewing the mines which could be crushing within five years. I understand that in making that estimate of 18,000 stamps, you excluded what may be called low-grade rock?—Quite so.

12,114. Would it be correct to say that if it proved economical to work low-grade rock in many of these mines now left untouched that that number of stamps might be exceeded?—Yes, it certainly might, but I regard that figure of 18,000 as quite optimistic, and therefore I have not made any other proposition of further advancing; that is, it is only probably, based on the understanding that low-grade ores, of certain sorts, will be taken into consideration. On our mines the proposition is this, we have a certain number of stamps and a certain expenditure: if it were possible to secure labour, it will be competent for these mines to increase their stamps enormously and bring within the reach of payability ore which under present conditions we cannot profitably work out.

12,115. Then you do leave standing in your mines blocks of ore too low to work?—Yes, that is the case in every mine.

12,116. Mr. EVANS: In your experience of South Africa do you remember a time when there was a scarcity of labour for mining purposes?—Never, in my experience.

12,117. It has been suggested that the development of this industry should be regulated by the labour obtainable in South Africa. What is your view of such a proposition?—Well, such a proposition seems to me—might I use the term?—ridiculous, from a business standpoint. If mining companies go on as they are doing, it will involve them in ruin. If the present situation goes on, I think that these companies will find themselves hopelessly involved in debt. Moreover, the time question is such an important factor. If the capitalists were to try to run the mines on the mere possibility of getting

labour, it seems to me that that is the very worst possible aspect of the whole case. One cannot take a worse or a more gloomy aspect of it than for the mines to wait until conditions prevail gradually and naturally, in order to work out the enormous-capital sunk in these undertakings.

12,118. So in your opinion the effect of the adoption of such a policy would be disastrous from a financial point of view?—Absolutely disastrous.

12,119. That is, taking a mine which should in the natural course of things be worked out in 15 years to extend its life to 30 or 40 years?—Makes it doubly ruinous from the shareholders' point of view.

12,120. You refer to the estimate of 17,000 or 18,000 stamps as optimistic? Is it in your opinion, as far as the group with which you are concerned, a practical possibility if an ample supply of labour were forthcoming?—Certainly.

12,121. Mr. PHILIP: Have you had experience of other countries? Australia, for instance?—Yes.

12,122. Are the reefs similar there?—No.

12,123. We have heard it stated that five is the average number of men per stamp in Australia?—It was not so in my days.

12,124. What weight are the stamps in Australia?—Anything from 600-lb. stamps to 1,100 to 1,200-lb. stamps in Western Australia.

12,125. On the fields in Australia are there larger reefs?—It depends entirely with what section you are dealing. In Ballarat they are generally not large; in Western Australia they generally are large. In Western Australia it is segregated vein which may give you 20 feet of stone; in Ballarat you may get perhaps 3 feet.

12,126. Mr. QUINN: I am unfortunately without some notes I have made, so am at a disadvantage. With regard to Western Australia, do you know what the duty per stamp for the mills is there?—The duty runs from about 4 to 5 tons.

12,127. If we are then able to reduce this within a measurable distance in our own case, do we by comparison so far as stamping power goes?—Oh, yes.

12,128. I could have given you the authority, but unfortunately the papers are not here.

12,129. If Government returns for these parts of Australia show that they run these stamps at 5 men per stamp, would you be disposed to doubt it as being correct?—No, I should not doubt it at all, Mr. Quinn. I may say here that the question of the white man is one of which I have had some general experience. When I came to this country, I thought, as perhaps a great many others did, that white labour might be exclusively employed, and I brought over from Australia a certain number of white men, first-class labourers, whom I had employed there, but I found after the first month I could not get the work out of them. I may mention, as a point of interest to the Commission, when comparing the white man of Australia and a white man here, you are dealing with two enormously different factors, for the reason that the white man here finds himself in contact with a servile race, and will not do work here as before he did. In the case of railroad construction, duplicating the line from here to Krugersdorp, the Railway Commissioner said it would cost from £13,000 to £14,000 per mile. That duplication means no original surveys, and practically no bridges—simply earthwork. A report has been prepared for the Federal Parliament by five engineers specially appointed to deal with the construction of the line of Port Augusta, in West Australia, to Kanowna, near Kalgoorlie, and the estimated rate to build this line, including the original surveys, including the carrying of water to a desert country, is about £4,800 per mile. I undertake to say that if you brought these same men here the cost of the same work on the railroad here would increase to about the figure your Railway Commissioner has found here.

12,130. It has been handed in by the railway people on this very subject, that in regard to the white labour, such as they have had, the increased cost per mile over all black labour—of actual labour—was £1,500, but if they could pick their white

labour it would cost them about £1,100. That is really a fairer comparison for us, knowing our own conditions, that is, the cost of the white over the black—not the cost of the railway in another country and under different conditions?—That is only after all a contemplated figured amount. They are advocating the efficiency of the white man in another country where there is stress of competition.

12,131. Not on actual results?—But they are actual results as £13,000 or £14,000 per mile.

12,132. But they have given it here?—Yes, I know.

12,133. Your evidence is very interesting, Mr. Denny. Do you believe, if you could get a good amount of unskilled labour—because there are varieties of it as there are of skilled labour—to work, either on sections of a mine or entirely on a mine, do you think that experiment would produce anything interesting to us?—I do not think it would prove anything but a hopeless failure. The only opinion I have about it is this; if you populated this country to a considerable extent—to some extent proportionate to its area—then only could you work white labour to any advantage. You have to get the reservoirs of labour upon which to draw. Then when you have that, you could work the mines with white labour.

12,134. Do you know any mines to-day where there are unskilled labourers and where they are earning £1 a day?—Certainly, I know a lot to-day. I know we are employing a lot of men whom we are forced to pay £1 a day, but a great number of them are not worth 5s. per day.

12,135. But I mean cases of men who have gone as unskilled men at 8s. per day, and by piecework—when there can be no question of the work done—are earning about an average of £1 a day?—I should say there are such cases, but collectively I do not think you can do it as long as you have the native to come in contact with.

12,136. The CHAIRMAN: One of the witnesses of the Chamber of Mines was asked a question bearing on the point as to the comparative value of a ton of rock in a mine on which a sufficient number of stamps had been erected, to work the mines out in say 15 years, and that was compared with the value of a ton of rock if, for any reason, it would not be worked out on that mine for 30 years. He promised to send us his table he had figured out on that in making these comparisons. Can you tell us in any more exact way the value of a ton of 40s. rock, assuming you are going to work it for 15 or 30 years?—I think I could give you an instance here. Here is a book I published in which I spoke about that very thing.

12,137. What is the name of the book?—"The Deep Level Mines of the Rand." I have a case here of an assumed property of 200 stamps, with a life of 20 years. I assume on that the total profits to be earned by that company in 20 years would be £6,720,000. That is on a basis of crushing 28,000 tons per month. The present value of the total amount of £6,720,000 discounted 20 years hence, and paid out as stated, would be 336,000 tons for 20 years, calculating your dividend at 6 per cent. and allowing 3 per cent. for amortisation, but if the total amount of £6,720,000 were discounted as a yearly dividend at £672,000 for 10 years, reducing the life of your mine by a half, and doubling the stamps, if necessary, at the same rate instead, the present value of the mine would be £4,564,224, or £1,107,456 greater than the same amount earned in 20 years period. The full capital expenditure necessary to do this would amount to about £400,000, so that the net gain to your company by reducing its life, by having abundance of labour, and by increasing stamps—the additional dividend to your company would be £700,000, after deducting for the £400,000 required for extra capital outlay.

12,138. Is there anything else you would like to say to the Commission bearing on the general evidence given by the Sub-Committee on Mining? There may be some points not raised in cross-examination?—There is one point that has been missed, that is, as we are paying less for dynamite

and less for coal, we should be able to afford higher wages on the mines. I had a statement prepared shewing that despite the fact we had made certain reductions in dynamite, we were still paying our men such a wage that the profit they made was greater than the figure they had before the war.

12,139. Mr. WHITESIDE: Mr. Denny, I believe you are well acquainted with the district of Ballarat?—Yes.

12,140. The reefs of that district approximate very much, so far as size is concerned, with the reefs on the Rand?—Yes, more or less.

12,141. The average on the Rand is about three feet?—Yes, approximately, that would be the milling width.

12,142. Would that apply just the same to Ballarat?—Yes.

12,143. Can you tell us how many white men per stamp they use in Ballarat?—No, I cannot tell you that, because in Ballarat the conditions have enormously changed since I was there, and it is very largely run on tribute to-day.

12,144. The comparison ends so far as the nature of the reef is concerned, I take it, because the reef here is altogether different from the class of reef in Ballarat?—Oh, entirely.

12,145. For instance, it is a different formation altogether?—Quite.

12,146. More broken up, and they have to do much exploring before they can develop it?—Quite so, but it is all pick work in Ballarat; there is practically none of the hard country we have to deal with here. They are comparatively soft silurian slates on which they work. The great point of this is: You cannot get a man who would work in Ballarat to work here for seven shillings per day. You cannot get that man to work even indifferently well at £1 a day. That is the whole gist of the difficulty in employing white labour.

12,147. Simply through contact with the natives?—Simply through contact with the natives.

12,148. Mr. PERROW: I think you mentioned just now about the Roodepoort United?—Yes.

12,149. And you mentioned that the rock was very soft?—The rock is not so soft as it is fissile. It is in thin stratified layers—comparatively thin.

12,150. And the reef is very small?—Very small and very broken, though not so much broken as changing position.

12,151. So it will require good boys and skilled miners to work that reef?—Yes.

12,152. I think some time ago you gave a bonus to the best miner for working the smallest reef in the best shape?—Yes.

12,153. How many boys did you work per man?—It averages about 15 boys per man.

12,154. Is that the smallest number?—No, we work in some cases up to 30 on certain stopes, where there is not the same amount of supervision.

12,155. So you work on your mines about 20 boys per man?—Yes, underground, that is.

12,156. The CHAIRMAN: The Commission is very much obliged to you, Mr. Denny, for your evidence.

Mr. A. P. CABRAL called, sworn, and examined.

12,157. The CHAIRMAN: Have you before you a document headed "Statement of Mr. A. P. CABRAL"?—Yes.

12,158. Do you hand that in as your evidence-in-chief?—Yes.

12,159. Statement of Mr. A. P. Cabral.

My name is A. P. Cabral. I am the oldest recruiter in the districts of Inhambane, Gazaland, and Lourenço Marques. Until about the middle of August last I was in the employment of the Witwatersrand Native Labour Association.

Just before the war I was recruiting for the Ferreira Mine. Since 1894 I have been appointed several times to several Special Commissions by the

Portuguese Government in connection with native affairs in the interior, as I have a thorough knowledge of the subject.

I have been very successful in my recruiting for the W.N.L.A.

Lately the W.N.L.A. have centralised their recruiting work under the auspices of four persons, who have formed themselves into the East Coast Recruiting Syndicate, and who now monopolise the recruiting. For me to have remained, I should have had to subordinate myself to them. They wished to exercise power over me to make me do things which I had no authority to do, and which would be in conflict with the existing regulations and the desires of the Portuguese Government. I refused to do this, and, in consequence, gave up my position. The result of this syndicate's doings has been that a few days after I left permission was refused them to recruit in three recruiting grounds from which I had obtained many boys; at some times as many as one thousand per month.

I am prepared to say that there are many sources of supply which are still untapped, and from which many additional boys might be obtained, were free recruiting allowed. Under present circumstances, viz., the formation of the syndicate mentioned, there are reasons why it is improbable that the syndicate will exploit these other sources of supply. The policy of reducing expenses will be a factor in reducing the supply.

I can give very interesting evidence, and I should like to be examined by the Commission.

I can throw much light upon the Native Labour Question, and can point out some of the drawbacks of the present system.

12,160. The CHAIRMAN: How long have you been recruiting in Portuguese East Africa?—Ten years; I have been in Portuguese East Africa ten years, but I have not been constantly recruiting.

12,161. You state here that you are the oldest recruiter there?—Before the war I was a recruiter, but I had no permit in my own name. When blacks were recruited I gave my boys to another recruiter who had a permit. I was with the Ferreira Mine before the war, but when the war broke out I gave it up.

12,162. You were a recruiter for the Ferreira before the war?—Yes.

12,163. You have done recruiting until recently for the Native Labour Association?—Yes.

12,164. For how long?—For one year.

12,165. You were very successful in getting labour for the Association?—Yes, I have several letters from them saying I was doing all right. I have very complimentary letters from managers of compounds.

12,166. You state that since you left the Association permission has been refused by the Association to recruit in certain recruiting grounds where we used to get labour?—The Association has the monopoly of recruiting, and as I had no permission from the Association, I could not recruit any more. I propose to get another group or syndicate.

12,167. By whom was permission refused to recruit after you left their service?—It was refused by the Association to me. The Witwatersrand Native Labour Association refused to grant me authorisation to recruit.

12,168. You mean to say that when you left their service you asked permission to recruit on your own account from the Association?—It seems to me that there is a syndicate over us that must be gone to; people recruiting for the Association.

12,169. Do you mean to say that there is a syndicate working between the Association and the natives?—Yes, a syndicate of four men.

12,170. And this group of four men has refused to employ you after you left the Association?—Yes, that syndicate has proposed to the Association to dismiss me.

12,171. You say in your statement that there are many sources of supply still untapped?—Yes.

12,172. Are you referring to the southern provinces of Portuguese East Africa, or to the northern provinces?—I speak of the district where the Association is at work now, in the south.

12,173. But is it not to the interest of the recruiters of the Association to get labour wherever they can. Does it not pay them to do so?—First of all the head of the recruiting department over there tried to make economies in reducing their staff; secondly, the men recruiting are not quite competent, and have not got the confidence necessary. They do not understand the country, nearly every one of them has only one source of supply.

12,174. Have the Association not taken into their employment most of the men who were engaged in recruiting previous to the war?—No, some of them, but not wholesale.

12,175. Mr. QUINN: Is everything being done in your opinion that ought to be done to get plenty of natives; are the recruiters down there doing everything they could do to get a supply of natives?—No; they are certainly doing something, but they might do much more.

12,176. What more could they do?—They could bring here at least 130,000.

12,177. Did the compound managers go down to these parts some time ago to try and induce boys to come up?—Yes, they have been in my districts.

12,178. Did you give them every help; did you help them?—I received a circular asking me, encouraging me to put all facilities in the way for the agents of the company, and on the other hand I also received a letter from the Association, I do not say from whom, by which I was told to lay every obstacle; not to give them any facilities.

12,179. You received a circular saying that the compound managers were coming down to try to persuade the natives to come out first, and then you received a private letter from the Witwatersrand Native Labour Association, from the manager, is that it, telling you to put every obstacle in their way?—Yes.

12,180. Have you got that letter here? Have you got copies of the circular and the letter?—I have; but I am in a foreign land, and I do not want to be responsible for anything that may happen to me. But I have the circular.

12,181. Have you the letter?—I must be covered.

12,182. You have the circular with you. Have you got the letter as well that you received after the circular; and have you a copy of both?—Yes.

12,183. Now you are safer here than in Portuguese East Africa, that is a certainty. You have no need to be afraid of anything that may happen here. You are safer here than in your own district. What you say is very important, and we must have some proof of it. You must produce the letters?—I have got them.

12,184. Hand them to the interpreter, and he will read them?—You take the responsibility. I am not in my country. In my country I know the law, but not here.

12,185. I will take all the responsibility. If you have any more papers like that I should like them. You will read the letters.

The following letter was then handed in and read by Mr. Quinn:—

Witwatersrand Native Labour Association,  
Limited,  
Lourenço Marques Agency,  
31st March, 1903.

(Private and confidential.)

Dear sir,—With reference to the compound managers who proceed to the country to-day, you will understand that it is important that these managers should get only those natives recruited by native

collectors, and must not get natives recruited by your own runners. It is to your interest that I point this out, because if these men go back to Johannesburg with a large haul of natives, they will make the most of the fact and create an impression that the recruiters have not done their best in the past, and that these compound managers make more successful recruiters than the present staff. These men have the idea that they have only to present themselves in the country when the natives will immediately flock round them, and so, I think, it rests with you to see that they leave your camp with a different opinion. I do not wish you to put obstacles in their way, but it is not to your interest to make them presents of natives recruited by yourself. I have instructed these managers to take provisions with them, but if you are put to any expense in food for them, please send me your account, and I will see you are reimbursed.—I am, dear sir, yours faithfully,

J. M. MURRAY,  
District Manager.

P.S.—Please note that your assistants cannot give safe conducts; therefore, the boys will have to wait until your arrival.

12,186. Now when you got that letter, I suppose you took good care that these compound managers did not get any natives if you could help it?—After I received that letter I went to Cogano, which is the compound at the recruiting centre of the Association. The manager at Cogano told me to put difficulties in the way, not only of the compound managers, but also of the native collectors; from both sources.

12,187. Put everything in their way, both of compound managers and native collectors?—Yes. The native collectors were three from each mine sent there with the compound managers to recruit. The native collectors received instructions from here that all the blacks recruited from the Association were to be treated in the same way.

After discussion as to the difficulties of interpretation, witness continued.

WITNESS: The native runners had received instructions to act in the same way at the request of the Association.

12,188. That was to put every hindrance in the way of the compound managers?—Yes.

12,189. And therefore your recruiters and other recruiters like yourself had instructions to put every obstacle in the way of their getting boys?—The request of the company was to put difficulties in the way of native collectors.

12,190. Was that circular that was sent to you, that letter, was it sent to the other men down there?—All over the country.

12,191. Did the compound managers return to Johannesburg with a good haul of boys?—No.

12,192. So you did your work all right?—Yes, according to instructions. The compound managers went away bad-tempered, annoyed.

12,193. In addition to that letter did you get any verbal instructions of the same nature as the letter?—Yes.

12,194. You got verbal instructions to the same effect?—Yes.

12,195. And why did they not put it all in the letter?—I did not understand it at first, their instructions, one telling me to encourage the compound managers and the other to discourage them, so I asked them verbally and I received additional instructions, verbal instructions, to hinder them in every way I could.

12,196. You say that having got two sets of instructions, one to help and the other to hinder them, you did not know what to do, so you asked?—Yes.

12,197. And then you were told to hinder them all you could?—Yes.

12,198. You say at the bottom of your statement: "I am prepared to say that there are many sources of supply still untapped." What sources do you

refer to?—There is Gazaland district. It is too big and there are only two recruiters there.

12,199. You say there is one district in Gazaland, where there is a big district, where there are only two recruiters?—Yes.

12,200. You think there should be more recruiters?—Certainly, because there are plenty of boys.

12,201. And you think there are large numbers in Gazaland that are not being obtained because there are not enough recruiters?—Yes, and also in parts of Lourenço Marques, as well as the district of Inhambane.

12,202. Mr. EVANS: In your statement you say that you are the oldest recruiter in the districts of Inhambane, Gazaland and Lourenço Marques. Is that correct?—For several years I had no direct permission to recruit from the authorities, but I handed over the Kaffirs to other men who had.

12,203. Are you an older recruiter than Mr. M'Garry, for instance?—I had already permission from the Chamber of Mines, but I was actually recruiting before that. I was handing over these Kaffirs to the other recruiters with permits.

12,204. To what other recruiters?—To Struben and Mancini.

12,205. To Santos?—No.

12,206. To George Grey?—I do not remember now the names. There was one man with a strange name; he is now in England.

12,207. You were in a subordinate position, recruiting for these other recruiters?—No.

12,208. What were you doing?—I handed them the Kaffirs I had, and they gave me the money.

12,209. Who gave you money?—The different people who took the Kaffirs.

12,210. What different people?—These men, Struben and Mancini.

12,211. Recruiters?—Yes, recruiters with permits.

12,212. Then you were in a subordinate position to these recruiters?—No, I was independent. I was a merchant. I had them in my compounds, say 50 Kaffirs, and then men with permits came and I sold them the Kaffirs.

12,213. Then you were not recruiting at all?—Officially, no.

12,214. When did you start recruiting? When did you get a permit?—A few months before the war.

12,215. Then you are not the oldest recruiter? That is not a correct statement?—It is a condition of words; it depends how you word it.

12,216. You say that just before the war you were recruiting for the Ferreira Mine?—Yes.

12,217. Did you receive instructions from them?—Yes, from the compound manager, Cochrane.

12,218. Did you recruit any boys for them at all?—Yes, I did recruit them, but I do not know if they were received.

12,219. But surely you know whether you got paid for them or not?—No, I did not get paid.

12,220. Do you know Mr. Teixeira?—Yes.

12,221. Had he anything to do with employing you to recruit for the Ferreira?—No, I was in Gazaland at the time.

12,222. Were you employed by Teixeira?—No; I was not a regular employee, but I handed over the Kaffirs to Teixeira.

12,223. And you were not paid for them?—Yes, Teixeira paid me.

12,224. But you have told us that you were not paid by the Ferreira Mine direct?—There are names that I remember now to whom I sold Kaffirs. Just before the war I worked for the Ferreira. I did not know anybody here, and therefore I was not appointed a recruiter.

The Commission then adjourned until the following day at 10.30 a.m.

TWENTY-EIGHTH DAY.

*Friday, 18th September 1903.*

THE COMMISSION SAT AT 10.30 A.M.

Examination of Mr. Cabral continued through an interpreter.

12,225. Mr. EVANS: In his statement, Mr. Cabral says that a few days after he left, permission was refused to the Association to recruit in three recruiting grounds. Has that refusal anything to do with his departure?—He wants to put this statement in.

12,226. That, I think, rests with the Chairman?—He wishes to do so before he answers further questions. (Reading.) Before commencing to reply to the questions which are about to be put to me, I want to say one thing, that I have not come here expressly for the sake of saying evil about the W.N.L.A., but only to demonstrate that the actual system is bad and that free recruiting would give better results, and that the number of recruits or emigrants would increase considerably. To point out the defects of the actual system, I must necessarily say things that are displeasing to the Association, but that is a necessary consequence of facts, and I must say again that my opinion is that of everybody on the East Coast, as can be seen by the Press at Delagoa Bay, and, following out the same train of thought, I can give all the necessary facts in regard to the natives on the East Coast.

12,227. I was asking a question on that last paragraph but one. He states that a few days after he left permission was refused to the Association to recruit in three districts. Had that refusal anything to do with his departure?—It was not on the occasion of his leaving that this happened, but after he left other agents came there and made a great deal of difficulty. It was owing to the action of these subsequent recruiters that the Government acted as it did.

12,228. What proof has he of that; how does he know?—The papers gave a report of it.

12,229. Is that refusal still in existence?—He thinks so. He knows for certain, as far as the town of Inhambane is concerned, it is still in existence. He has received letters to that effect.

12,230. Does he know Mr. Pinto Coelho?—Yes.

12,231. Who is he?—He is a native agent or fiscal at Lourenco Marques.

12,232. Is he the Minister, as it were, in charge of native affairs in the whole of Portuguese East Africa?—He is not head of the departments; he calls him the fiscal.

12,233. Indendant for native affairs, is that correct?—Yes.

12,234. He is responsible for native affairs in Portuguese East Africa?—He said just now that he is not.

12,235. But I am asking that question now. Is he now responsible?—He says he is not at the head of the department, but he does not know, of course, what is his relation to the Government.

12,236. Now I have a wire here from Delagoa Bay from the agent of the W.N.L.A. there.

12,237. Mr. QUINN: What is the name of the sender?

Mr. EVANS: It is a telegraphic name, "Recruiter." I believe the name of the sender is actually Lloyd. (Reading.) "Within the last month complaints have been made regarding re-

cruiting of private servants in Inhambane Township, Maxixe, Quilala, and Mozambique. These complaints have in all cases received attention. The Government asked us to cease recruiting in Inhambane Township and suburbs, but, after correspondence, the matter has been settled satisfactorily to all parties, and recruiting continues. Intendant approves foregoing. These complaints had no connection with Cabral's dismissal." Then I have another wire here from Mr. Pinto Coelho himself, in which he states (reading), "Have seen your wire, No. 341, to Lloyd and his reply, which I confirm. Such difficulties as arose at Inhambane were met by the Association to the entire satisfaction of both parties."

12,238. Mr. QUINN: What is the date of that?—It is dated the 16th from Delagoa Bay.

(The telegrams were translated to the witness.)

INTERPRETER: The witness says that bears out his statement that after his departure there had been difficulties.

12,239. Mr. EVANS: But had it anything to do with him or his departure?—He said that before if you recollect.

12,240. Does he accept that as a correct statement?—He merely says this, that he reiterates his former statement. He did not say that his leaving caused difficulties, but the conduct of those who succeeded him.

12,241. But he accepts that as a correct statement?—Oh, yes.

12,242. Why was he afraid of producing this document yesterday?—Which document?

12,243. This letter marked "private and confidential"?—He says that he did not know the law of the country, and was afraid that there might be some reason why the letter should not be published.

12,244. In the letter it is stated that "the compound managers should get only those natives recruited by the native collectors, and they must not get the natives recruited by your own runners." Now, were not the natives recruited by his own runners already available for the Association?—The compound managers stated that these native collectors had the same rights and guarantees as the native runners.

12,245. The question I am asking is whether the natives recruited by his runners were not already available for the Association? I am asking a simple question. He is referring to natives already recruited by the runners. Were these ready to be sent on to the Association in the Transvaal?—He stated just now that the same natives were available to the collectors.

12,246. I am not asking that question. I am referring to the natives after the recruiting had been accomplished, the natives recruited by the runners and who were ready to be sent on to the Transvaal; those that he had recruited by his own runners he would forward on to the Association. He would not hand them over to the collectors or to the compound managers. What I want to know is were these natives available to be sent on to the mines?—They were ready.

12,247. Would not handing them over to the compound managers instead of sending them on

M m

30718.

through the Association—would not that have given a false impression of the numbers recruited by the compound managers or of the work that was done by the compound managers?—He says he could not give the natives to them.

12,248. Then the instruction he received in the letter is in accordance with what he would have done in any case?—I do not quite understand, but he says that his instructions were that he was not to allow the native collectors to engage or have anything to do with these people.

12,249. That is not in the letter, that statement of his?—He could not understand this letter when he received it, and went to this place and was told to put all these difficulties in the way of the compound managers. That is not in the letter.

12,250. Mr. QUINN: Might we not have it read out to refresh our memories; it is very nice. I do not think I should mind hearing it again.

The letter was read again.

12,251. Mr. EVANS: Let us finish with this letter first. Would he, supposing he had not received that letter, would he have made a present to the compound managers of natives recruited by his own runners?—He says that if he had not received this letter he would have facilitated matters as best he could, and would not have put difficulties in the way as he did afterwards.

12,252. The question I am asking is whether he would have made a present to the compound managers of all the natives his runners had recruited?—That depends.

12,253. On what?—Supposing a compound manager was in his camp, and some natives came in with this particular manager and expressed a wish to go to that particular compound or mine, he would let them go, but after understanding that he was to put difficulties in the way of the compound managers, he did not facilitate their objects.

12,254. But where does it state in that letter that he has to put these difficulties, or what is there to prevent him letting the natives go with the compound managers?—He says that as he did not quite understand the terms of this letter he went to Coguno.

12,255. But can he point out anything in that letter which justifies the statement he has just made?—He says he did not understand it, and, therefore, he went and got his instructions.

12,256. Are these instructions in writing?—He has got letters and telegrams in Portuguese. He says you ask him where are the instructions in this letter pointing to show that he was to embarrass the compound managers. The witness says that he did not understand the terms of this letter, and, therefore, went to Coguno, and there got his instructions. He is then asked if he has anything in writing, and he says that he has letters in Portuguese.

12,257. Why did he not bring the letters? Has he nothing beyond his own word to prove his statement that he was instructed to place obstructions in the way of the Association?—He says the proofs are in the Portuguese letters.

12,258. Mr. EVANS: What does he produce, then, in proof of the allegations?—He says when do you want them?

12,259. How is it that he did not produce them?—He says he thought there would be no doubt about them.

12,260. That we would take his word?—Yes. He says that he received verbal orders that he was to obstruct the work of the compound managers.

12,261. Coming back to the letter, I see it is signed by "John Murray, for the District Manager at Lourenco Marques." What was the manager's name at that time?—Pickard.

12,262. Is he aware that Pickard is no longer in the service of the Association?—He says he is.

12,263. What was his position?—He says he was a recruiting officer.

12,264. In a subordinate position?—He says the salaries vary, but the positions are the same.

12,265. Was he getting a large salary?—The salaries varied, but the responsibility to the Government and to the licences is the same, he says.

12,266. Did he leave the service of the Association of his own accord?—It appears that he had some conflict with the representative. He went to Lourenco Marques and complained about the representative. He said: "Since you cannot get on at Inhambane, you cannot stay."

12,267. My question was whether he was dismissed, or did he leave of his own accord?—He says that is another affair. He could continue in the service of the W.N.L.A. but he refused to work for the East Coast Syndicate.

12,268. Did he resign or was he dismissed?—He says: "I was told I could serve elsewhere."

12,269. Why was it that they dispensed with his services?—Because he could not get on with the representative.

12,270. Was that the only reason for his dismissal?—There was an order that the advance of £1 per head was to be made before the military commandant. The natives objected for some reason to do so, because they were afraid. But he got leave to make advances without the officer being present, because both the natives and the military trusted him. The other men who sent up afterwards could not manage because the natives did not trust them. The practice was stopped, and there was then a difficulty in getting advances fixed up satisfactorily. The natives would not come in.

12,271. Those are his excuses. Ask him if he is surprised to hear that since he left the recruiting results of the Association have considerably improved?—He says it is not true. There were no recruiters when he went there, and he recruited satisfactorily.

12,272. Sir GEORGE FARRAR: As he has recruited so many of the 900 boys, he must be the most capable recruiter. As he was a very able recruiter, even if he had not put difficulties in the way of the compound managers who went there, they would not have been able to recruit as he would have been able to do?—Not more than he did. If he had not put difficulties in the way they would have done as well. The compound managers could not have recruited to the same extent as he could. They would have done better if he had not put a spoke in their wheel.

12,273. Then the boys would have come to him after the compound managers had gone away?—Yes.

12,274. What are the names of the three districts which were closed for recruiting?—Quilala, Maxixe, and all round Inhambane.

12,275. Are the districts now closed?—When he left they were not open. According to a telegram he received they are open now.

12,276. What was the nature of the difficulties he put in the way of the compound managers?—He says as an example he would tell them to go to Inhambane and then send no horses for them. He would keep them there for a time.

12,277. What is the East Coast Syndicate he refers to?—He says it was a thing founded in April by the W.N.L.A.

12,278. Their syndicate is sheltered by the W.N.L.A.?—Yes, he says it was protected by the Association.

12,279. Who composed the syndicate?—He says there are four men in it and several employees. The four are gaining a great deal of money and the others are on fixed salaries.

12,280. Does he think the syndicate employs enough men to get the best results?—No, he said so yesterday. It does not suit the Association to employ more men.

12,281. It is too expensive?—He says it is, and consequently their profits are curtailed. The employees do not work willingly or carefully, because they are getting fixed salaries or are getting less than the others.

12,282. The syndicate is really a monopoly?—He says that is his opinion and that of others.

12,283. It is not to the interest of the syndicate that other recruiters should be permitted to recruit there?—He knows that there are others.

12,284. There have been some questions as to certain telegrams in his possession. Will he hand in any letters in corroboration of what he was charged?—He says he is perfectly willing to hand in the letters. They do not all treat of the subject, but extracts can be put in. Portions of the letters are private.

12,285. What was the name of the manager at Inhambane to whom he went?—Hall Neergaard.

12,286. What nationality?—He says he was a Dane.

12,287. Has he been long in the position of recruiter?—Since April, 1902, when the company was formed.

12,288. Is not Inhambane the principal source of the supply of Portuguese East Coast natives, that is to say south of latitude 22?—Yes.

12,289. I have not his statement before me. How many years have you, Mr. Cabral, been in this particular district?—In Inhambane and Lourenco Marques, in the interior 10 years.

12,290. Then your opinion ought to be of some value. What do you think is the maximum output of natives which might be obtained south of latitude 22?—You mean monthly?

12,291. Yes?—Well, the maximum that could have been recruited in the three districts during the last 18 months might be from 150,000 to 160,000 boys. There ought to be 130,000 turned out.

12,292. There could be 130,000 here; but what I want to get at is, suppose we have the two recruiting methods, what do you think might be the maximum monthly output from those districts?—It depends upon whether the native stays here one, two or three years, as the case may be. It depends entirely upon the length of service. I simply divide the 130,000 by 18.

12,293. That is about 12,000 per month?—Not so much as that, about 7,000 a month.

12,294. That is what you consider?—Yes.

12,295. In the three districts south of latitude 22?—Yes.

12,296. What do you think of recruiting boys for six or 12 months, as the case may be, or do you recommend that they should be monthly contracts—three months, six months? What is your opinion?—They want to be recruited for not more than one year, because they want to have money to buy women with.

12,297. How long do you think this output of 7,000 per month could be maintained?—I think I could get 7,000 per month within the next six months.

12,298. And after that?—I should have to wait until the others came back.

12,299. We may take it that we ought to maintain 7,000 per month?—For six months.

12,300. Do you know anything about the northern parts of Portuguese East Africa?—I have met people from there who have told me, but I have not been there myself.

12,301. Do you know Mr. Pickard?—Yes.

12,302. Do you know the reason why he left the service of the W.N.L.A.?—No.

12,303. Mr. BRINK: Are the local demands of Lourenco Marques and Inhambane on the increase? What are the local demands to-day; are they larger than they were before the war?—About the same.

12,304. Have they started any new industries down there. That is, are there any kind of new industries at Lourenco Marques and Inhambane?—I believe they are talking about going in for some mineral oil and paraffin works, but I do not know anything about it.

12,305. I am asking if any have already been started?—No.

12,306. Have they started any sugar industry anywhere about there?—There is some sugar industry at Inhambane which employs between 300 and 400 natives.

12,307. Were they employed there before the war?—No.

12,308. And what is your idea; will the demand increase?—For the sugar industry?

12,309. Anything. You were talking of oil just now?—No, not immediately.

12,310. Not immediately may mean not tomorrow. Will you tell us whether that means next year or 20 years?—I mean not the immediate years.

12,311. It may be years?—Yes.

12,312. We have heard such a lot about you having been ordered to place obstacles in the way of these compound managers bringing out boys. I want you to give us the approximate number, supposing you had done everything to assist them, that these compound managers would have brought back with them?—I said just now that 130,000 natives could be brought out.

12,313. Yes; but I want to know the number of natives that these compound managers would have got if you had not put obstacles in their way, but had facilitated them?—I cannot say.

12,314. You have been recruiting 10 years, and must have some idea of the number?—I gave some approximate figures just now.

12,315. You think they would have brought 7,000 with them?—No, I said I could get 7,000 a month.

12,316. I want to ask you a question about that letter. You say the compound managers went away disgusted and in a temper, and I presume it was partly because you and others placed these obstacles in their way. I want to know, suppose you had not placed the obstacles in their way, but had assisted them, how many they would have obtained. You must have some approximate idea?—There were two compound managers there. If I had helped them and one had stayed a month, which they did not, they might have got 3,000 boys each perhaps.

12,317. That is 6,000, and according to your opinion these boys are still to be recruited?—Yes, there are natives that can be recruited.

Mr. F. PERRY, the Chairman of the Witwatersrand Native Labour Association was then re-called, sworn, and examined.

12,318. Mr. WHITESIDE: Mr. Chairman, I ask the reason why Mr. Perry is re-called.

The CHAIRMAN: He has asked to be re-called in connection with the evidence of this witness.

Mr. WHITESIDE: Are we to accept the principle, then, that any evidence that is, if I may use the word, unpalatable to a previous witness may be rebutted.

The CHAIRMAN: That is a question we will discuss afterwards.

Mr. WHITESIDE: We shall be establishing a precedent.

The CHAIRMAN: You all agreed to it.

Mr. WHITESIDE: No, sir.

The CHAIRMAN: Excuse me; I mentioned it this morning, and it was agreeable.

Mr. WHITESIDE: Pardon me; I myself put the question to you, and you said that Mr. Samuelson could not be called now. I thought it was adjourned at the time.

The CHAIRMAN: I understood that you agreed to it.

Mr. QUINN: I did not agree. It seems to me a bad principle if the evidence one witness gives is not acceptable that you are immediately going to call another witness who has already been here and try and rebut what has gone before. It seems to me a novel way of running a Commission.

The CHAIRMAN: I consulted all the members of the Commission this morning, and I understood from them that the request of the W.N.L.A. to be represented by Mr. Perry was agreed to.

Mr. QUINN: You did not consult me.

The CHAIRMAN: I spoke to you.

Mr. QUINN: You did not; and I certainly object to it. I think it is a wrong precedent to set, to bring in a witness here to rebut the evidence given by another man.

The CHAIRMAN: It is for the Commission to decide. I have a distinct recollection of consulting every member of the Commission on the point. The only point I thought was whether Mr. Samuelson, who had come from Natal, should be called before Mr. Perry.

Mr. QUINN: I was not asked about it.

The CHAIRMAN: I spoke to you myself.

Mr. QUINN: No, sir, you are mistaken. This is the first I have heard of it, a few minutes ago.

The CHAIRMAN: It is entirely a question for the Commission to say. The W.N.L.A. put in a request that Mr. Perry should be heard on the question raised by this letter.

Mr. QUINN: I have no objection to hear Mr. Perry, but the principle is bad. The Commission can decide what value can be placed on the last witness's evidence, and how far it can be relied upon.

The CHAIRMAN: It is a question for the Commission to decide whether or not we should hear Mr. Perry. I was very certainly under the impression that I had consulted every member about it this morning.

Mr. QUINN: You did not speak to me.

The CHAIRMAN: My impression is that I did.

Mr. QUINN: You told me that he was coming, but you did not ask me to agree to it.

The CHAIRMAN: Will the Commission please decide?

Mr. QUINN: I wish to say the Commission will do as it likes. I am strongly opposed to it, as being wrong in principle. We can make up our minds what value to put upon the evidence. I think we all know its value pretty well. It has never been done before.

Sir GEORGE FARRAR: I think the last witness made serious allegations against the Witwatersrand Native Labour Association, and, as I think the Commission certainly wishes to get at the truth in all these matters, I can hardly agree with Mr. Quinn that there can be an objection to Mr. Perry being heard. We are all here to endeavour to get at the truth, and if Mr. Perry can give us any more information on the evidence the last witness has touched upon, I do not think we ought to object.

The CHAIRMAN: Will someone make a definite proposal; it is the only way to settle the matter?

Mr. PHILIP: I propose that Mr. Perry be heard.

Mr. BRINK: I second it.

The matter was then put by the Chairman, when there voted:—For: Messrs. Perrow, Brink, Forbes, Philip, Evans, and Sir George Farrar. Against: Messrs. Quinn and Whiteside.

The examination of the witness was then proceeded with.

12,319. The CHAIRMAN: Mr. Perry, have you the letter before you, handed in by the last witness?—This letter marked "Private and Confidential"?—Yes, I have.

13,320. Do you wish to make a statement with regard to it?—It may be convenient if I explain

what the position was with regard to the native collectors, and compound managers. As regards this letter, I may say this first, that neither I nor anyone connected with the Association here saw it till to-day, and I may say at once that I do not approve of it. It is not that there is anything in the letter itself to object to, when the circumstances are understood, but I think that the tone of it is wrong. When these compound managers and native collectors were sent down, with a view of bringing back boys who had been employed on the mines before, to bring them back to their old mines, there was naturally a certain amount of jealousy expressed by recruiters living in the country. We did everything in our power to remove that feeling. We agreed that we would guard them from suffering pecuniarily by it in any way, and we assured them they would not suffer in reputation. We asked them to make a success of collecting for special mines, and we urged upon them strongly from here, both on them and on the Head Office in Lourenco Marques to give every assistance in their power to this experiment. We had reason, I think, to complain of the management at Lourenco Marques in the matter, for instead of trying to remove the jealousies of recruiters, they rather inflamed them. They took no pains to explain the situation to them, and the tone of this letter, which emanated from the Head Office at Lourenco Marques, does not go very far in that direction. It was written by Mr. Pickard, presumably. He was instructed, over and over again, that every assistance was to be given to these compound managers. We knew that most of the recruiters of the country would be jealous. We explained to them that they need not suffer by the experiment in any way. He did not do that; there is no doubt about it. We had information from various sources, and, after the experiment had been going on for about a month, I had to send for Mr. McGarry, who is one of the oldest recruiters, and is in their confidence. I explained things to him, after which I believe things were put on a more satisfactory basis. They may serve to explain Mr. Cabral's statements that he was told to put obstacles in the way of the compound managers. That he was actually told to do so I should be disinclined to believe, because this man's superior, Mr. Neergaard, made complaints against Cabral's own attitude towards the compound managers. He was at the time of his dismissal Cabral's superior. He is the man referred to at Inhambane. As regards the sending down of native collectors, and compound managers, I should like to put in two documents before the Commission—the first is a circular, which was issued by the Native Labour Association, dated the 3rd of March:—

Witwatersrand Native Labour Association, Ltd.,  
Chamber of Mines' Buildings,  
P.O. Box 1199. Johannesburg,  
3rd March, 1903.

The Manager,  
..... Co., Ltd.,  
.....

Sir,—It is supposed that there may still remain on the East Coast a number of natives who formerly worked on the mines and who may return to work more readily if they are asked to engage on some particular mine on which they have worked before or where their friends are working, instead of engaging themselves for work on the mines in general.

In order to try this, the Association proposes to ask every mine which employed any number of East Coast boys before the war, to detail two or three trustworthy East Coast boys at present in its employment to go down to the East Coast and assist in recruiting for that particular mine alone.

It is proposed to send these boys down at the end of March. Each of them will be sent to the recruiter in charge of the district to which he belongs with a notification of the mine for which he is to collect boys, and the number of boys which he is to collect. After three weeks or a month he will be sent back with the boys whom he has collected to his own mine.

Will you be good enough to say whether you wish to take part in this on behalf of your mine, and, if so—(1) How many boys you wish to send down (not to exceed three) and do what districts they belong; (2) how many boys to you wish to collect for your mine (not to exceed 300). It is understood that you will accept and employ on your own mine all the boys they succeed in collecting for you up to that number. If boys are recruited specifically for one mine they cannot be drafted to another.

An answer to these questions is requested not later than 15th March. The boys should be ready to start by the end of March. Their expenses will be paid by the Association. The Association will also give them a bonus of 5s. per head on each native collected by them for their particular mine.

In case you would prefer to send boys to assist in recruiting for your mine to some other district and not to the East Coast, e.g., the Northern Transvaal or the Bechuanaland Protectorate, the Association will be prepared to arrange this at the same date as the recruiting for individual mines takes place on the East Coast.

Yours faithfully,  
H. W. P. STEEDS,  
Secretary.

The second is another circular dated the 17th March; this was not sent to the mines, but to a group interested in mining:—

Witwatersrand Native Labour Association, Ltd.,  
Chamber of Mines' Buildings,  
Johannesburg,  
March 17th, 1903.

Messrs. ....  
Johannesburg.

Dear Sirs,—With reference to my circular letter of the 3rd inst. to the mines, it has been suggested that compound managers might go down from each group with the natives who are being sent down at the end of this month from individual mines, to assist the recruiting for their own mines.

There is no objection to this, but it is desirable that the numbers of the white men going down should be limited, and it is hoped that the mines of each group will arrange to be represented by the same individual, if they desire to send anyone at all.

The names of the men selected to go down on behalf of each group should be notified at once to the Association. They will presumably accompany the natives from the mines of their group. They should call here before going down, and will receive letters to the head office of the Association at Lourenco Marques.

They should be most carefully instructed to conform in every particular to the directions of the Association's office at Lourenco Marques; otherwise trouble is likely to arise with the Portuguese authorities, who are extremely jealous of unlicensed recruiting.

A copy of this circular has been sent to all the mines in your group, which have notified their intention of sending down natives to the East Coast.

I am, dear sirs,  
Yours faithfully,  
F. PERRY,  
Chairman.

Then there is a letter covering that, to Mr. Pickard, dated the 19th March:—

No. 29. 19th March, 1903.  
G. V. Pickard, Esq.,  
District Manager,  
Lourenco Marques.

Sir,—With reference to my letter, No. 22, of the 11th March, I have the honour to forward you a copy of a circular which has been addressed to the groups, relating to the sending down of compound managers from the various groups, in charge of the native collectors. You will see that any white men who will be sent down are placed under your direction and at your disposal. It is not, of course, intended that they should act as recruiters, or con-

ductors, and this should be clearly explained to the Portuguese authorities, who might otherwise object to their presence in the country.

The sole object in sending them down is to give confidence to the native collectors and the boys collected by them, that they will, in fact, be allowed to go to a particular mine to which they belong, and will not be thrown into the general pool of natives recruited by the Association.

It has been suggested that in order to further this end, it would be a good thing for the compound managers to take charge of, and assist in looking after the natives collected for their groups as they come in. It is for you to say whether this is desirable, and how it can best be done.

Presumably the gangs will come in to Ressano Garcia, and, if compound managers do not go into the country, there will be no need to keep them at Lourenco Marques after the distribution of their natives has been effected, as they can return to Ressano Garcia, if required, when the gangs are coming in.

I have the honour to be,  
Sir,  
Your obedient servant.

Secretary.

P.S.—I also enclose a copy of a circular issued to mine managers who are sending down boys to the East Coast, from which you will see that your views as regards the payment of bonuses to native collectors have been acted on.

Then there is the letter of introduction given to each compound manager:—

Witwatersrand Native Labour Association, Ltd.,  
Head Office, Chamber of Mines' Buildings,  
Johannesburg, 25th March, 1903.  
The District Manager,  
W.N.L.A., Ltd.,  
Lourenco Marques.

Sir,—This letter is to introduce to you the bearer, Mr. —.

Mr. — . . . and has come down to the East Coast in charge of the native collectors lent to the Association by —,

You are already acquainted from my letter No. 22, of the 11th March, with the objects which have dictated the sending down of a responsible person known to the natives in charge of the native collectors from each group of mines.

Mr. — has been instructed to put himself at your disposal, and to act during his stay in Portuguese Territory entirely according to your wishes.

Should you desire him to proceed into the interior, you are authorised to arrange the necessary transport at the expense of the Association.

Mr. —'s railway fare, and a subsistence allowance will also be paid by the Association, but the payments in this respect will be arranged at this end.

We trust that you will find Mr. — of assistance, and that you will show him every courtesy in your power. You will give him the necessary introduction to any recruiters whom you may think it advisable for him to visit.

Yours faithfully,

Secretary.

And as a result of that, about 150 native collectors, that is, police boys from each mine, and I think seven or eight compound managers went down to the Portuguese East Coast and stayed there for various periods varying from one to three months. In this letter, the "native collectors" refer to special boys sent down from each mine; "your own runners" refer to permanent runners, engaged in recruiting boys in the country. The direction was that the compound managers should get only those natives recruited by native collectors, and not "by your own runners." There is nothing to object to that in itself, of course. These native collectors

M m 2

and compound managers were sent down entirely with the idea of getting old mine boys. This was to avoid confusion. We said from the beginning that while these boys were in the country that all the boys who wanted to go to a special mine must go through them, but then they must not take any except the old mine boys, because it was obviously desirable we should not have compound managers—I do not say they would have done it—but there should not be the possibility of compound managers louting for their particular mines or groups of mines among natives who would come down in the ordinary way. So far as the compound managers went, they were sent down mainly to advertise the true conditions of the Rand. We thought that by going through the country and holding native dances, beer-drinkings, &c., they would advertise the improved food and conditions, and also the rests on the road, and the wages thoroughly. As I say to get back the old boys, which to a certain extent they did.

12,321. Mr. EVANS: What position did Mr. Cabral occupy?—He was assistant recruiter to Mr. Neergaard at Inhambane. I believe he had two things in his charge. He had a country district to recruit. He was also forwarding agent at Inhambane. It is to that he refers when he talks of the large numbers he recruited. These were boys he sent on as forwarding agent, not the boys he recruited himself.

12,322. Did he leave of his own accord or was he dismissed?—No; he was dismissed. There had been several complaints against him for unsatisfactory work, insubordination and inefficiency, and, particularly, instead of working his country district, where he ought to have spent most of his time, he spent nearly all his time amusing himself in the town of Inhambane. As a result the recruiting was not properly done, and he did not get the boys he ought to have got.

12,323. Were the Portuguese authorities informed of the charges made against him?—Yes, when he was finally dismissed. What happened was this: Mr. Neergaard, who had made several complaints against him, at last, owing to a particular row he had with him—which arose out of his having gone away for ten days without leave, and refusing to come back to his work when told. Mr. Neergaard suspended him, and sent him to Lourenco Marques with a recommendation that he should be dismissed, and with a general statement of the charges against him, which had been accumulating for some time. We are always reluctant to dismiss a Portuguese recruiter, because the Portuguese authorities lay stress on their subjects being employed. But it was decided it was impossible to keep him. He was dismissed with the assent of the Portuguese Government, which was consulted.

12,324. In his statement he refers to a refusal to recruit in three districts?—Well, as far as I know there is no truth in that. I may say at the time that Mr. Cabral was dismissed he came up here, and there was a newspaper report, which I understand emanated from himself that three districts had been closed to us. I telegraphed at once to know if there was any truth in it, and they had no such information whatever, and then I took no more notice of the matter until this came up, and I telegraphed to Mr. Pinto Coelho, who is the Minister for Native Affairs, and to Mr. Lloyd; and it seems to me that their answers dispose of the matter. The truth seems to be that there were complaints of the recruiting in the town of Inhambane itself, and that people's servants were taken away from them, and the Government asked that recruiting might be stopped in the town itself. That of course is not very much.

12,325. In your opinion has the Association suffered much owing to the dismissal of Mr. Cabral?—Oh, temporarily, because he has done all the harm he can. For instance, he told his police boys that there was no more work at Johannesburg, and to turn back any boys coming to the camps. When a man has had charge of a district for two years, he

has much influence and power to do a certain amount of mischief.

12,326. What have been the results in the Inhambane district?—The output for the whole of the Inhambane district has improved. It is better than the average. That is true of the whole East Coast. It has advanced in about the same proportion as the whole of the East Coast.

12,327. You heard his evidence about a recruiting syndicate? Can you tell us about that?—What he calls a recruiting syndicate is an arrangement of recruiters on the East Coast, for pooling their commission. We pay the commission to recruiters in certain districts, and to avoid jealousy in the distribution of districts—because one man could say it was not fair for him to work a poor district while another man had a highly populated one—we tell them to meet among themselves and come to some arrangement, and they do. I do not know the details of the arrangement, but I believe it comes to a pooling of the commission and a dividing of it in fixed proportion, and some people said they would take a salary. But the recruiters' syndicate has no power beyond that. It does not, for instance, control the number of licences. We do that without any reference to this syndicate.

12,328. Mr. QUINN: Why did Mr. Pickard leave the service of the Witwatersrand Native Labour Association?—Well, we were not satisfied with his management of our affairs.

12,329. In what respect?—There were several matters. The treatment of the compound managers was one of them.

12,330. Did he leave, or did you tell him to leave?—Well, I think it was suggested to him it would be as well.

12,331. And if he had not acted on your suggestion?—He did act on our suggestion.

12,332. Then you know something about this matter, this foreshadowed matter?—I know that the head office at Lourenco Marques had not taken the pains they ought to have done.

12,333. That is putting it mildly. "Not taking the pains they ought to have done"?—No, the recruiters would feel jealous at people coming into the country, and pains ought to have been taken to disabuse them of the idea there was any intention of harming them or cutting their throats, and the office at Lourenco Marques was told very distinctly to do that, and they did not do it. They took the same view as the recruiters and exaggerated the difficulties.

12,334. Is Mr. Murray in the service of your Association?—Well, he is a secretary, not a responsible officer.

12,335. Do you doubt the authenticity of that letter?—No, I should think it is quite likely.

12,336. If Mr. Murray was merely a secretary, who do you think was responsible?—Mr. Pickard. It is signed for the district manager, Mr. Pickard, he being presumably out of the office.

12,337. You did not seem to believe the statement of the last witness that in addition to this letter which was sent to him he had verbal instructions to hinder the compound managers as much as he could?—He did not say from whom. If it was from Mr. Neergaard I should be inclined to doubt it.

12,338. Do not you think such instructions would agree with the subject matter of this letter?—If this letter had not been in existence I should have been inclined to believe that the last witness was a disappointed man, not telling the truth.

12,339. Do not you think, with this letter before you, about which there appears to be no doubt, that his statement that he had verbal instructions is correct?—I did not have that letter. I should think it likely he may have had suggestions from some of the other recruiters. But from my own knowledge Neergaard was less jealous than anybody else of these compound managers. When he says that Neergaard gave him instructions to put obstacles in their way, I should think it unlikely, because

Neergaard complained at the time of Cabral's attitude. Pickard was at Louronco Marques, and could not have given verbal instructions to Cabral. It is more than likely Cabral saw some of the other recruiters, that is, at the end of March, and that they said, "we are not going to let these people do anything." We had trouble about it for a month, and we were writing and telegraphing about it.

12,340. But the idea seems to have been that they had only to present themselves in the country when the natives would immediately flock around them, "and I think it rests with you to see that they leave your camp with a different opinion." Does not that support the evidence that the witness gave that he had verbal instructions as well to oppose these people and put obstacles in their way? That letter is cautiously written. Anyone reading it must come to the conclusion that this man was instructed by his chief clearly to oppose the objects the compound managers had in view by going down there?—That is what I say. I think the tone of that letter is very objectionable.

12,341. But is it not reasonable to judge the evidence apart from the witness, whose character has been attacked? Apart from his own unsupported opinion, is it not reasonable to assume that it amounts to nothing more than these—the verbal instructions—only in another form?—Yes, I say I knew that myself, that some of the recruiters were inclined from the first to put obstacles in their way, and did so at first.

12,342. This is the first time you have seen this letter?—Yes. Of course my knowledge of their attitude was based partly on Mr. Pickard's attitude, and partly from what I heard from compound managers, and other sources in the country.

12,343. What report did the compound managers bring back?—I saw most of them when they came back. They said that they thought their visit had done good, particularly in the way of advertising. They said they thought more boys would have come to them if in the first month of their stay they had been helped more by the recruiters.

12,344. But they themselves knew they were not receiving the help from the recruiters they were led to expect?—Yes.

12,345. So that supports this man's statement?—Oh, yes; no doubt the thing is true. The only thing I really doubt is, that Neergaard gave him instructions.

12,346. If that letter is fully supported by the report brought back to you by the compound managers that they had been hindered, surely it is not an unreasonable thing?—Yes, but you do not see my point. My point is this; Cabral was one of the people who put most of the obstacles in the way of the compound managers, and I should think he is more likely to have done it on his own than from instructions from Mr. Neergaard.

12,347. What evidence have we that he did put the obstacles in the way of these people on his own account?—Well, he was specifically complained of by some of the compound managers.

12,348. For carrying out the instructions he had received from his chief?—Mr. Neergaard said he did not give them. This is a matter which came up independently, a long time ago.

12,349. Mr. EVANS: Have you read Mr. Brentano's evidence?—Yes.

12,350. Have you any observations to make on it?—There was a point in cross-examination; Mr. Brentano stated, as far as I remember that in the first interview which I had with him I asked for a guarantee. He understood there would be a sufficient guarantee if the payment for these natives he offered to supply were made on a sliding scale, that is, that instead of paying £5 down here, to pay £3, and the remainder on the completion of the contract. He made that offer, and then in reply we asked for a guarantee of £5,000. Well, I should like to contradict absolutely the statement that in the interview I had with him, which preceded the

letters, I said that the guarantee of the sliding scale would be sufficient. I can state absolutely that I said we should require a guarantee of a sum of money. I would not swear I said £5,000, but I said we should require a guarantee of a sum of money, or a guarantee of a responsible firm, that he would be able to carry out his contract; a sliding scale I did suggest, but in addition, because the price was too high, unless we were going to get a considerable number. I must say it is quite possible Mr. Brentano did not quite understand me, because when he first came to me he spoke in English, and I spoke to him in English. I discovered afterwards that he said he did not understand English well, but that he preferred to speak in French; but our first interview was spoken in English. However, I made it quite clear to him, I repeated it over and over again, we should need a guarantee, and of course I never considered myself a sliding scale as a guarantee.

12,351. Did you offer to take boys from Delagoa Bay without a guarantee?—It is possible I did that, because in the first place I asked him if he would not quote terms for delivery in Delagoa Bay, as I thought it would make it more probable by doing business, I said, if he told us what his terms would be for delivery there. However, he refused to entertain that at all; he said he would not do it.

12,352. Mr. WHITESIDE: Before I proceed, I should like to know whether the Commission will re-call Mr. Cabral, seeing that certain statements have been made against him?

The CHAIRMAN: That is for the Commission to decide.

Mr. WHITESIDE: I should think he should have the right to rebut these statements.

12,353. The CHAIRMAN: That is quite reasonable. Do you wish him recalled?

Mr. WHITESIDE: Yes.

The CHAIRMAN (to the Secretary): Will you re-call Mr. Cabral; I suggest half-past two.

Mr. S. O. SAMUELSON, called, sworn, and examined.

12,354. The CHAIRMAN: There is no statement with this witness. You are the Under-Secretary for Native Affairs in Natal?—Yes.

12,355. How long have you held that position?—From 1st of November, 1893.

12,356. That covers Zululand as well?—Yes, and the northern districts recently annexed.

12,357. Have you been in the service of the Natal Government previous to that?—Yes, from the commencement of 1881.

12,358. Always connected with the Native Affairs Department?—Chiefly; I was for a long time interpreter to the Supreme Court of the Colony. I was a little out of touch with Administration matters as interpreter.

12,359. But you interpreted for natives in the Supreme Court?—Yes.

12,360. So you have practically spent a life-time in connection with Native Affairs, one way and another?—Yes, I have.

12,361. You are a native of Natal?—Yes, I was born there.

12,362. You have before you, I suppose, the Blue Book dealing with Native Affairs in Natal?—Yes.

12,363. Can you tell the Commission, first of all, what the present population of Natal and Zululand is?—We have never had a census of the native population. The population is estimated rather roughly on so much per hut, on the basis of the hut-tax paid; if you refer to the Blue Book for 1901 you will see there how the population is estimated.

12,364. 1901 or 1902?—1901.

12,365. I find in the Blue Book for 1902 some statements showing how it is arrived at?—Possibly I may be mistaken.

12,366. Blue Book, 1902, Page B, 54, the latter section of the book. Will you give the figures, and explain how they are arrived at.

12,367. You will find in that statement appearing on Page B, 54, shewing the approximate number of native males between the age of 15 and 50 years in Natal, and the estimated number of such males available for service.

12,368. Can you not deal with the total population of the Colony first?—The total population is estimated in the Natal Province at 4,136,47 per hut. In the Zululand Province at 3,330,55 per hut. For the northern districts, I suppose, our estimate will be based on the same figure as for the Zululand Province, but we have not had all our hut-tax returns in yet.

12,369. Leaving the new territory, what is the estimated native population of Natal, that is, the estimated population of natives between certain ages?—It gives a very large figure, 571,697.

12,370. Does that include the whole lot?—I think it does. The total huts and dwellings in the Natal Province are 138,209, the estimated population 571,697.

12,371. And the figures for Zululand?—For Zululand, the total huts in Zululand are 66,347, the population reckoned at 3,330,55 per hut works out to 219,313, that makes a total population of 791,010.

12,372. Confining ourselves strictly to population, now that basis of estimating the total population of so much per hut. How was that arrived at?—It was arrived at by taking an average from, say, seven or eight kraals in any magisterial division, and the result of that partial census was that you arrived at these figures as being fair to enable you to arrive at the total population?—Yes.

12,373. Then the table goes on further to deal with the total male population, also estimated at certain figures per hut? That gives a total figure of how many?—Of 364,928.

12,374. Then you have a further column there?—The number of males between 15 and 50, reckoned at 50 per cent. of the total males, 182,464; the estimated number of males between 15 and 50 available for service 164,000.

12,375. These are your most recent figures?—Yes, they are.

12,376. Taken from your Blue Books on Native Affairs for 1902?—1902.

12,377. I have here a statement dealing with the number of passes issued to the natives of Natal to proceed to the Transvaal for labour purposes. I think you sent it up?—Yes, that is for last year.

12,378. It gives the total number of passes issued for 1896 to 1902. It gives for 1896, 26,487; for

1897, 20,092; for 1898, 16,886; for 1899, 7,582; for 1900, 13; for 1901, 16; and for 1902, 2,628?—Yes.

12,379. Do you happen to have figures for the last six months of this current year?—I have, sir.

12,380. The number of passes issued to natives to go to the Transvaal?—Yes. That is to the end of August, the statement shewing the number of inward and outward passes issued in Natal for labour purposes from January 1 to August 31, 1903.

12,381. Dealing with the outward passes first, the grand total for eight months?—12,782.

12,382. Would 50 per cent. of that give you approximately the figure for the year?—You cannot very well calculate it that way. It depends very much on the season of the year and the occasion that brings the native up. I do not think you can make a figure on which you can depend for the whole year out of these facts.

12,383. Would you read the monthly figures?—I have not got them.

12,384. Only the grand total?—Yes, but during the same period 246 went away to the Cape Colony for labour, and to the O.R.C. and Basutoland 657, and to other places, 115.

12,385. Well, you have handed in another statement showing the number of passes issued to natives entering the Colony of Natal from other States for labour purposes. For 1896 it is 15,692; for 1897, 11,433; for 1898, 5,808; for 1899, 7,714; for 1900, 8,950; for 1901, 3,726; and for 1902, 16,680, all entering Natal from neighbouring States?—Yes, chiefly from the Cape Colony.

12,386. Can you give us the same figures for 1903, or the first eight months of this year?—From the Cape Colony, for labour purposes, 10,021; from the O.R.C. and Basutoland, 2,648; from the Transvaal, 2,040; and from other States, 922. Then, simply passing through the Colony with indefinite objects or unstated objects—I think that the natives were really going to employment, but they did not state that object particularly—were from Cape Colony 2,649, from O.R.C. and Basutoland 463, from the Transvaal 1,350, and from other States 53.

12,387. Can you leave these figures now for the moment. We will come to them presently. Give us the grand total of natives, going into Natal, up to the end of August to work there?—15,631.

12,388. Against a figure of 16,680, for the whole of last year?—Yes.

12,389. Well, now you put in another statement showing the number of passes issued to natives passing through, what is the total of that figure?—4,515.

12,390. The four statements were as follows:—

STATEMENT SHOWING NUMBER OF INWARD AND OUTWARD PASSES ISSUED IN NATAL FOR LABOUR PURPOSES.

FROM JANUARY 1st TO AUGUST 31st, 1903.

Where from.	Inward Passes. Schedule B.		Where to.	Outward Passes. Schedule A.
	Natives of Neighbouring States entering the Colony.			Natives of Natal leaving the Colony.
	For Labour.	Passing through.		For Labour.

\* Not recorded.

The Commission adjourned for lunch.

12,391. The CHAIRMAN: In giving your figures of the native population of Natal this morning, you excluded the population in the Northern territory?—Yes.

12,392. Have you any figures to show what the population is?—The general idea is that it is about 50,000.

12,393. Men, women and children?—Yes.

12,394. There is a statement here which appears to have been sent in, in which the figures appear to have been given for that territory. Will you read them?—The number of huts in the Northern territory paid for up to the end of August was 21,388, and, reckoned on the same figure as the Zululand population, that is at 3.30555 per hut, the population would come to about 70,699.

12,395. And the grand total of the Northern territories, Natal and the Zululand Province?—861,709.

12,396. In your Blue Book for 1902, page B 54, have you got that before you?—Yes.

12,397. First of all will you tell us over what Provinces the partial census of 1891 extended, and the number on which you based these figures of so many per hut?—These figures were obtained from the results of a partial census of the native population taken in 1891, when 10,002 souls, the occupants of 2,418 huts, were counted in Natal.

12,398. I understand you to say, that these persons were not counted in any one district, but a number in every Magistracy?—Yes.

12,399. And on the figures so obtained you based your numbers per hut?—Yes.

12,400. Now you give a total male population of Natal and Zululand of 364,926?—Yes.

12,401. Then you give us in the next column the number of males between the ages of 15 and 50 reckoned at 50 per cent. of the total males, or 182,464?—Yes.

12,402. In the next column is an estimated number of males between the age of 15 and 50, available for work, that is 164,000?—Yes.

12,403. Do you wish the Commission to understand that in arriving at these two last figures, they are based on the same partial census of 1901?—The statement shows how it was done.

12,404. Now in the same Blue Book, page B 55, you give a statement of the approximate number of natives who entered service in Natal during 1902?—Yes.

12,405. Details are given as to the various occupations they were engaged upon and of the various towns in which they worked?—Yes.

12,406. You give a grand total of 201,640?—Yes, that is so.

12,407. For 1902?—Yes.

12,408. These figures, I understand, include 17,000 males entering the Colony from the adjoining States?—Yes.

12,409. Natives of all ages, male and female?—Yes.

12,410. Are there many female natives working in Natal?—No, there are not.

12,411. It would not affect the total figure materially?—Not much.

12,412. Then you show a total number of natives, even after deducting 17,000, entering service greater than that estimated as the number of males available for service?—Yes.

12,413. What is the explanation of that?—It is one almost impossible to make, because both statements are based on estimates chiefly. There is nothing definite on which these statements are based, and the statement of 201,640 has been worked out in one way by a clerk in the office, and the other statement on page B, 54, is one on which I place most reliance as being more in accordance with the facts.

12,414. But is this statement of the total number entering service a fairly correct record?—Well, for instance, to get, or day labour, that is a very uncertain item to deal with. It is impossible to say how many at any time may be out at service at that time, and how long they are occupied on that kind of work in any one year, and you will see that the figures there are stated to be an approximation.

12,415. But these figures would indicate that something like 25 per cent. of the total population go out for service for a certain period of each year?—Yes.

12,416. That is a very large proportion, is it not?—Well, I should not like to say so, in the absence of any reliable census of the native population on which we could base a statement of that sort. We do not know actually how many natives we have in our Colony. I rather think, from travelling about in the large locations in Natal that we have more natives than we have estimated for here.

12,417. Tell me if you have any figures on the probable increase of the natives in Natal. Have you any idea what that is?—No, I think that this statement here or one of the statements I put in shows that it is practically an approximate. The increase during the next five years is estimated at 7.7 per cent. That percentage is for the next four years.

12,418. About one and a half per cent. per annum?—That is about it.

12,419. You have a table, B 53, dealing with the summary of the identification passes issued. Are the figures of that of use to us or is it more a local

matter?—I do not think it will be much use to the Commission, except in this respect, that every native who leaves the Colony or wishes to leave for work outside has to be possessed of an identification pass before he can get his outward pass.

12,420. But is that not covered by the outward pass?—Yes.

12,421. Will you turn to the Blue Book for 1898, Page A 49?—Yes.

12,422. The estimated value of goods imported into Natal from Kaffirs from 1894 to 1898?—Yes.

12,423. The total figures of 1894 are £140,082?—Yes.

12,424. For 1895, £135,500?—Yes.

12,425. For 1896, £155,070, and for 1897, £132,850, and for 1898, £164,300?—Yes.

12,426. For 1902 (I cannot find any figures for the intervening years), the figures are given as £271,450?—Yes.

12,427. I cannot trace in your books any figures for the intervening years, but I want to get at the approximate amount per head of population spent on imported goods by natives. On that figure, and taking your total population as 800,000 it works out at between 6s. and 7s. per head?—That is a subject I have never studied or worked out.

12,428. Now, I want you to turn to the total figures?—Yes, our department had had hardly anything to do with labour matters, and we have not had occasion to inquire into these points or to get any information about them.

12,429. But we have had several Natal witnesses who, on general principles and matters of opinion, gave us very valuable evidence, but we want to get on record from you these figures of population, &c., as given in your Blue Book. We do not wish to incorporate bulky documents of this sort in our record?—No, I suppose not.

12,430. Can you tell us what period of service a Natal kaffir usually fills, would it be three months or six months?—It is very difficult to answer.

12,431. Is there no average figure?—No, I have had servants working for me for eighteen months straight off, and others who only worked for three.

12,432. You can give no figure?—No, nothing definite; but usually I should say it is about six months.

12,433. What is the influence which sends these Kaffirs away from their kraals to work?—Well, on private lands, of course, they have to pay rent, and on locations they have to pay hut-tax and dog-tax. The hut-tax is only 14s. per hut per annum, and the dog-tax 2s. That is about the total expense they are liable for in locations to the Government. They have naturally needs for the upkeep of their families, but the great object, I think, with natives is to get money with which to buy cattle, in order to give lobola consideration for their wives. That is to say, there is that system of passing cattle in order to obtain wives. This is in force under the native law of Natal.

12,434. Do you find that the influence of a bad harvest brings any appreciably larger number out of work?—It has done so this year.

12,435. Has it usually that effect?—Well, we have never had such a bad season. They have generally been able to tide over the scarcity in some way, and during the war the natives got on very well indeed. The wages paid by the military were quite unprecedented, and they are only just now beginning to run out of the money earned during that time, and find that they are required to work again. They have been resting on their oars for some time.

12,436. Do natives on private land pay hut-tax as well as their rent?—Yes, in many cases.

12,437. Can you give any average figure as a rent per hut charged by private owners in Natal?—It runs up in some cases, I have heard, to £10 per hut.

12,438. But an average price?—I should put it at about £4 right through.

12,439. And what does the native get for that in addition to space to build his hut?—He gets grazing rights and cultivation rights.

12,440. Would that price of £4 be charged on poor ground or good ground?—Well, I think that is an average throughout for bad and good.

12,441. And when this larger price is paid, is that because of extra good ground?—Yes, and I rather fancy it is due sometimes to the farmer not being so anxious to keep his tenants, and is intended as a measure to remove them from his land.

12,442. Do these natives paying these high rents earn the money by cultivating the soil, or by going out to service?—I think it is more by going out to work.

12,443. And this charge for rent has the effect of sending them out to service?—O, yes, I feel sure it has, but a large number of farmers require labour in lieu of rent. I should have mentioned that. They require the natives, so I have heard, to be always present or somewhere near by, so that they can be called out for weeding, harvesting and planting.

12,444. And they allow squatting rights in return for this labour? Do not they charge them rent in addition?—In some cases. It varies. It is a matter of agreement between landlord and tenant.

12,445. Has it come within your notice that natives returned from these gold fields and spread reports as to their treatment on the mines?—Yes, I have heard a great deal casually. We do not invite any criticism or report, but many of them call at my office on their way home just to report their return, especially leading men who have come up here to work. They have had various complaints to make.

12,446. Is that lately or before the war?—No, lately; since the war.

12,447. What is the nature of these complaints?—I think one of the most prevalent complaints is the reduction of wages some time since. I forget the year. I saw some reference to it in the papers. There was a combination here for a reduction of wages. A number of natives were here at work at the time, and found themselves put down to lower wages, and when they got home to Natal, they spread this report, with the result that a large number of our natives who would have come up here elected to get work locally. Another complaint they had is their treatment on the railway lines.

12,448. What complaint is that?—They are not given sufficient accommodation. They are crowded into the carriages and not notified of stoppages at certain places where the train stops for 20 minutes in order that they might attend to their requirements. There are also difficulties in regard to getting their tickets at the ticket offices. They find that they are kept for very nearly time for the train to start, and are hurried up to the office and tickets given to them in a great hurry. They hand in their money and often do not get change, and they do not know the amounts due for the places to which they are travelling.

12,449. Do these complaints refer to the Natal or Transvaal Railways?—A good deal to the Transvaal Railways. The Transvaal Railways carry them in open trucks; they complain of that a good deal. They are exposed to the sun and weather, and natives are very often sent away from here by their employers along the railway lines to Natal who have been very ill. They succumb on the road. No care has been taken that these natives get home safely. Also natives who have been maimed in service, who have lost an arm or leg or been injured in some way, are sent away to look after themselves, and are not helped to their homes. These are matters I have heard of accidentally. The natives carry them home and make the place unpopular.

12,450. These complaints you have heard since the war?—Oh, yes. I should not call them complaints; they are conversations that natives indulge in when they go to their homes. I ask them how they have been getting on, but they do not come to

make complaints. I should not have used the word complaint, perhaps, it is simply conversation.

12,451. Do you know that the Transvaal is not allowed to recruit natives in Natal at present?—It is not only the Transvaal, the law prohibits touting by anybody for service outside the Colony.

12,452. Do you think if the Natal Government could be induced to amend that law in favour of the Transvaal, we would get any appreciably larger number of natives for service here?—It depends very much how the touting is carried on. This Act was not made as a protective matter to restrict the outflow of labour to the Transvaal, it was made more in consequence of the reports that were rife amongst the natives as to those who went amongst them collecting them.

12,453. The recruiters, you mean?—Yes, that is a thing I felt a good deal about. In fact, I felt that if the flow of native labour could be directed to Johannesburg or towards any part of South Africa without the use of recruiting agents, it would be a good thing for the natives.

12,454. What is your objection to the agent?—Well, I cannot say that I have any personal objection to him. I am speaking from the point of view of the natives themselves. There are recruiters who will go to the kraals and tell the natives that they will give them employment for a certain wage, and will give them certain facilities and privileges, pay their railway fares and bring them back again and things of that sort. These promises have in many cases not been fulfilled, and they have got to be very suspicious. I think that if recruiting is to be authorised, it should be in the hands of responsible agents of, say, a Government. It should be really a Government department.

12,455. Then the principal objection to recruiting natives in your mind is the fact that irresponsible recruiters make promises that were not fulfilled?—Yes, then there is a good deal of competition between the recruiters of labour. One may be interested on behalf of one company and another on behalf of the Association. I do not know, of course, how these things are regulated in Johannesburg, but speaking for Natal, touting is allowed there for service in the Colony, and we have a number of labour agents collecting labour. Of course they try to beat each other down amongst the natives. One offers a higher price and another offers greater privileges and advantages.

12,456. For the internal requirements of the Colony, is labour scarce at present?—No; I should not say so. I know that Durban, at any rate, is well supplied with labour.

12,457. Has it been well supplied for any length of time?—No, only recently there was a plague scare in December, January, and February, and a large number of natives went away from Durban, and for a time the town was very badly off, but at present I think they have more labour in Durban than they require.

12,458. How do you account for that surplus at present?—I think it is the scarcity of food in their gardens. They had no return from their crops and men who usually sit at home, as a previous witness described, have been compelled to go out to keep their families.

12,459. Then in time of plentiful harvest a smaller number will come out?—Yes.

12,460. Have you considered in Natal the possibility of charging natives a ground rent in locations like that charged in the case of the private owner?—No, it has not been considered as far as I know.

12,461. Do you think if it were done it would induce a large number to come out?—Well, it might make some difference. When wages are so high it is easy to earn wages, and then the natives can idle about half their time; you would have to put on a heavy rate to make it any use in sending them out to work.

12,462. Do you know that the Natal Native Trust is at present engaged in one or more irrigation

schemes on the Mooi River and elsewhere for the benefit of the natives?—Yes, there is one at the Tugela called the Tugela irrigation, and another one on the Mooi River which has just now been commenced.

12,463. Do you know if it is correct, as it has been reported, that the Government Department has difficulty in getting natives from the locations to carry on the work?—Up to the time I left I had not heard so; the works were going on all right.

12,464. Have they sufficient labour?—Yes, they have more than enough. During the last season the natives learned the use of irrigation and are going in for it heartily. I went there myself and saw the chief of the district who had called for natives to assist him. He turned out 230 men locally without any difficulty.

12,465. Has your Department been asked to assist in turning out natives for public and other purposes?—Yes, we have; for railway and harbour purposes and in the Public Works Department.

12,466. I understand that you levy on the chiefs to turn out the men?—Yes, they are paid £1 per month and rations.

12,467. By railway purposes do you mean construction or maintenance?—Construction. We have also turned them out for such special work as guards in connection with Rhodesian redwater and for other public needs.

12,468. Natives are turned out and are paid £1?—Yes, for the public works; for the railway £2; and as guards at their special work they are paid from 30s. to £2.

12,469. Mr. WHITESIDE: I think you told us, Mr. Samuelson, that the reduction of native pay had the tendency to stop a number of boys coming to the Transvaal?—Yes.

12,470. You are not sure of the date?—No, I have no official information, but I saw some mention of it in the papers.

12,471. The rate of pay has been raised since February of this year. Do you consider that if the natives were informed of the fact, it would have the tendency to bring them out?—Well, I think so. I think if they knew that they could get higher wages they would come; I do not think Johannesburg is paying higher wages than elsewhere.

12,472. Is the state of affairs, so far as wages are concerned, abnormally high?—I am not aware of the ruling rates.

12,473. I think you said, in answer to the Chairman, that if there was any recruiting allowed the effect would depend on the recruiters sent from Natal. Assuming we had a thoroughly satisfactory condition of things you would consider that there is an appreciable number of boys available for service in the Transvaal?—Taking it from the labour standpoint that everything was satisfactory, and if higher wages were obtainable, and if the difficulties in coming here and going back were removed, they would go of course to seek for employment in the best places. There is nothing to prevent them coming up.

12,474. You have had lengthy experience and your opinion is of value to the Commission. Do you think a considerable number would emigrate?—I do not see why as many natives should not come now to the Transvaal as before the war.

12,475. Mr. BRINK: Mr. Samuelson, in your Blue Book for 1902 on page A 2, the different magistrates report on the labour supply. In one of the divisions there is a great scarcity of labour, as the natives prefer to go to the mines, as the pay on the mines seems to be £3 10s., and many receive twice this amount. In the next magistrate's statement, he gives the number of natives on page 4a, and says the number of natives leaving this division is 532. That is Mr. T. Maxwell. We find on page 7 that in the Colony the number of identification passes taken out was 2,537. It only represents those that have gone out to service since June, 1902. Prior to that there was no record of the number,

but it was estimated at 2,500, the total for the year being about 5,000. The number that left the Colony has been steadily increasing owing to the removal of certain restrictions. Mr. Savage, of Klip River, on page 11, says he cannot give the number of natives employed in the division. The general labour is scarce in the division, and farmers are not well supplied. I am sorry to see they are going in for the importation of Indian labour. Since the war wages have been high. The majority of farmers in the division have to adopt this course in order to obtain labour. Mr. Leonard goes on with the scarcity, and right through the Blue Book, as far as farmers are concerned, labour appears to be very scarce and wages very high. Do you agree with the remarks of the different magistrates?—I cannot see on what facts they base their reports. I suppose they have information on which they can rely. But they are not in a bit better position than I am. They have no actual statistics.

12,476. But this is about the scarcity of labour?—There is a difference between scarcity of labour, that is to say unwillingness or neglect, and labour being actually unobtainable or unavailable.

12,477. It does not alter the fact that the magistrates say that only farmers who can give advances to natives can obtain labour?—I am not prepared to dispute what the magistrates have said. I have been about the Colony, and I find whether I go to towns or to the villages or to the farms that the work is done by natives. Practically we have had no difficulty in getting labour. There are certain departments of work which have languished, but they are unpopular. The natives favour certain employments rather than others.

12,478. They naturally favour high wages?—Yes, and also certain classes of employment.

12,479. A native would not work for 1*l.* on a farm even if he liked it, if he could obtain 3*l.* elsewhere?—I do not know about that; we have a number of men engaged as messengers and as policemen, and only paid 30*s.* They like the employment.

12,480. It is a very easy employment—that of a Government official—I have been one for 20 years?—We have men who have worked in the Native Departments as messengers right away back to 1878—two men.

12,481. In your Blue Book, under heading "Labour," and taking that as a basis, I cannot come to the conclusion that the labour is very scarce?—We will be in a position to tell you next April, because then we will have had a census taken.

12,482. Then you will make them turn out to work?—I suppose when a man does not require to work he usually does not turn out.

12,483. Supposing you find the population is larger than the estimate to-day?—If you can turn them out it will not have any great effect. The higher the wages the more able they are to meet the expenses they are put to.

12,484. Mr. PHILIP: On page 55 you give the total population as 571,697?—That is the Natal provinces.

12,485. Including Zululand?—No.

12,486. Then your figures of the total numbers of male natives available for labour include Zululand?—I do not know what you refer to.

12,487. In B 55 of the Blue Book, 1902, the total available men is given as 182,454, and the total going out for work 164,000. Is that only for Natal?—No, it is inclusive of Zululand.

12,488. And the total population is only for Natal?—I have already stated the figures.

12,489. Do you think the population of men available for work is rather large for the size of the population. It works out at 1 in 4?—I have only been interested in one aspect of able-bodied native labour in connection with defence.

12,490. One-half will be females?—More than one-half. I feel I cannot put down the fighting

strength of the Colony at more than one man per hut.

12,491. How many huts, about 204,000?—About that: you have had the figures before you.

12,492. What is the white population?—At the present time?

12,493. Yes, at the present time?—I would say about 70,000.

12,494. Has it increased very much during the last 20 or 25 years?—Yes, it has.

12,495. Do you know what it was 25 years ago?—I do not know; I have not consulted the Statistical Books, but they will give you all information.

12,496. We have had it from witnesses that it has increased very much or even doubled. Do you think it is as much as that?—Yes, I think so.

12,497. Has it increased in the same ratio as the native population?—We have not had native births registered till this year.

12,498. Mr. EVANS: Did I understand you to say, in answer to Mr. Brink, that the number of natives able to come to work is sufficient for the needs of Natal?—I certainly think so.

12,499. Then all these statements here from the different magistrates are exaggerations?—I do not like to say that; I do not like to characterise their statements as exaggerations, but I do not think they have any better means of getting at reliable statistics than our department.

12,500. You know what they are paying the natives?—Yes. Unfortunately there are instances where they are paying quite too much. What affects the labour supply is the day labour system; it is doing a lot of mischief.

12,501. Can you tell me the amount?—I have been told that natives are receiving 4*s.* 6*d.* a day for day work in some parts of Durban.

12,502. Do you think it is too much?—Yes, for the amount he does in a day, and the manner in which he does it.

12,503. Is it reasonable to suppose that employers would give such high wages if there was a sufficient supply of labour?—No, I do not think so.

12,504. If there is not a scarcity, why do employers pay such a high wage?—In using the word scarcity, I do not like to be understood to mean that there are insufficient natives for work. I said before that I thought the number of natives able to go to work in Natal were sufficient for its needs, but I did not state the number at present available in the population.

12,505. Is it still your opinion that the number able to go to work is sufficient for the needs of Natal?—I do not like to say so, because we have to import labour from Cape Colony. I think, if I may, I will take you through the statements of our Blue Books as to the natives leaving the Colony for the Transvaal, for instance, in 1901. On page 43, referring to inward and outward passes, you will see that there were issued by the magistrates and pass officers during 1899 outward passes (for labour purposes from the Cape Colony) 7,462. Look further down, you will see that the outward passes, that is of natives coming to work in the Transvaal, the number was 7,582. We had to supplement our labour, or rather the losses which were occasioned by departures for the Transvaal, had to be supplemented with imported labour from Cape Colony.

12,506. Does it not strike you that the two facts which you have mentioned, the high wages and the importation of labour from the Cape Colony, confirm the statement made by magistrates in this book that there is a scarcity?—I do not think so. The late war has spoilt natives as far as wages are concerned. They were paid such high wages that they will think they are worth the same amount for all time. Up to the present they have been living on the money earned during the war. They are too well off. Another thing that has been felt is their doubt about the political situation. They have all felt nervous about going from their homes, as they did

not know the position of things, and many have been kept by hesitation due to that cause.

12,507. If the labour is sufficient, why are the people of Natal importing Indians in such large numbers?—That is really a question relating to the economics of Natal, and I have some difficulty in answering it, because I have had nothing to do with Indian labour. So far as I can see, the importation of coolie labour is to meet a demand in a kind of work which the coolie is better able to do than the natives.

12,508. Was not it owing to the scarcity and unreliability of the Natal natives?—I do not think it was due to the unreliability of the supply so much as to the duration of the engagement. Coolies you can import and have them for a period of five years and be sure of them. The native comes when he pleases and goes when he pleases. He is not bound to a certain time.

12,509. Would you not call that sort of labour which comes when it pleases and goes when it pleases, unreliable?—As an employer of labour in my own home, I would certainly prefer labour I could keep hold of.

12,510. Mr. Courtney Acutt said he would never think of sowing anything if he had to depend on Kaffir labour to reap it. Was not Indian labour imported because it was more reliable?—I am afraid it was at that time—it was the harvest season.

12,511. Does it not mean that the labour was unavailable from other sources?—No, I do not think so.

12,512. Sir GEORGE FARRAR: The coal mines are short of labour in Natal?—Will you excuse me if I put in a telegram from the Protector of Indian Immigrants, as I thought I might be asked about Indian labour, and I asked for the total number imported; his reply was 100,312. I asked him also for the present working number, and he said 26,223; then I asked for the requisitions which are out for the introduction of labour, and his reply was 15,750. If the Commission wishes to have the telegram, I will hand it in. As to the coal mines, Sir George Farrar has asked me a question. Would he mind repeating it?

12,513. Are the coal mines short of labour?—At present I think they have sufficient for their requirements.

12,514. Taking it year in and year out, have they enough labour, or have they had to send in requisitions for Indians?—They have Indians I have heard. As to the mining industry of Natal for the year 1902, I will hand a document over to the Commission. On page 43 we have a table showing the increase of the output of coal to the present time. In 1889 you will see the output was 25,609 tons; and at the present time, that is in 1902, we had an output of 592,821. We have a table showing the labour employed in the mines.

12,515. Anyway they have used coolie labour as well as native labour?—Yes, they have.

12,516.—I do not know whether I was correct when I thought you replied to Mr. Evans, that if labour went out from Natal you would have to supplement yours by recruiting in other colonies?—Yes.

12,517. Why do not the same number of natives come up here as before the war? Is the local demand increasing since the war, or is it about the same?—I think it is rather on the increase.

12,518. What is the effect of the Government turning out labour for public works, &c.?—To bring them out for service.

12,519. Is the effect of the Government turning them out for public works that they seek work, in order to evade compulsory service?—Naturally he will get more money—I think that is so.

12,520. Mr. Moor stated that the effect of calling out natives on Government work was that the natives worked more freely on private work?—I think it is a useful means of getting them to work.

12,521. I notice that approximately 200,000 natives go out to work in Natal. I believe it is the general

practice that they work about four months. Do you think that is correct?—I am very sorry I am unable to place the Commission in possession of what I can rely on as facts, but I think so.

12,522. There is one other question, which is this closing of Natal to the touts. Of course, there are good and bad touts. It practically closes the colony to labour for the Transvaal market. If you had a good agency they would naturally promise the boys to pay their fares, and there would be some inducements to come here. It seems a thorough restriction and the only way to get boys is for the agents to give them money for their fares, and take them to the railway station?—Possibly it is so.

12,523. Of course that would be illegal?—Yes.

12,524. Then practically Natal is closed to the Transvaal as a recruiting centre?—I do not quite think so.

12,525. Well, Mr. Moor thinks so?—A good many natives may get out.

12,526. Mr. GOCH: The natives pay rent to farmers; do they also labour for the owner of the farm?—There are three kinds of conditions on farms, so far I have been able to ascertain. One is where they pay rent for the tenancy; another is where they give their rent partly in labour and partly in money; and the third is where they have to work altogether to pay their rent.

12,527. They give labour for the occupation?—Yes.

12,528. Are these things regulated by law?—Yes, they are regulated by Law 15 of 1871.

12,529. Is it similar to our Squatters' Law?—Well, it is called the "Law to Facilitate the Obtaining of Labour." I will hand you a copy of it.

12,530. Thank you.—If you look at the end of that you will find a reference to contract between landlords and tenants on the farms. For instance, natives may be engaged as servants, and the conditions are to pay them wages of so much a month, and give them sufficient rations. It is rather a lengthy thing.

12,531. It is not under this law that the Kaffir squatter pays rent?—No; it is a matter of free contracting. To be a legal contract it has to be made under the provisions of the law.

12,532. Is there in it any restriction as to the number of hut families?—That was under Law 2 of 1855. It has never been carried into force.

12,533. Then, practically, he can have as many as he likes?—Yes. I think it is the same thing here in the Transvaal. There is a law, but it has never been carried out.

12,534. And what about turning out natives on public works?—That is under Law 19 of 1891, section 36: "The supreme chief has power to call upon all natives to supply labour for public works or for the general needs of the community. . . . The natives are bound to obey such a call."

12,535. The native chief is a Government official?—Yes.

12,536. This Act is for compulsory labour?—Yes.

12,537. There was no outcry in your Colony about it?—On whose part?

12,538. We hear a lot of objections about compulsory labour?—I think all labour is, to a certain extent, compulsory with the native. I do not think he would work unless compelled to do so. He does not pay rent for occupation of location lands, and his being turned out is a means of making him pay for occupation of land; that is the practice we go on—he has to give labour for his occupation.

12,539. Is it law or custom?—We turn them out at one man per eleven huts per annum.

12,540. Ten per cent. are, therefore, subject to service in this way?—Yes, you will find the number turned out every year.

12,541. Is the rate fixed by law?—By an order of the Supremo Chief.

12,542. And for how long do they serve?—Six months. You will find the number for 1902 on page B 19; 4,227 were turned out for work.

12,543. Employed on Government work?—Yes.

12,544. Are they employed in other ways elsewhere?—We have them turned out as guards and in the postal service for carrying the post.

12,545. This 10 per cent. is fixed under the law?—Yes. Six months system. The chief is authorised under this power to turn them out, one man per eleven huts per annum from locations and mission reserves only.

12,546. That practically means one in ten of the men?—No, one man for eleven huts, as already stated.

12,547. The general effect of your evidence is, I may say, that you hold the opinion that there is plenty of native labour in Natal. Am I correct in taking that view?—So far as my information goes. I must qualify it that way because we have no positive information about our labour supply.

12,548. And the Blue Book statement that you are actually employing 201,640 against your total 164,000 must be wrong?—I do not quite understand.

12,549. Your Blue Book states that there are 201,640 natives employed, and it also states that you have only 164,000 able-bodied men available, so that every available man seems to be employed in Natal, and more than that?—I disapproved at the time that statement was prepared. I did not agree with it personally.

12,550. You dispute the figures in your Blue Book?—I say they are not based upon definite and incontrovertible data.

12,551. The CHAIRMAN: I would like you to give us the white population of Natal for various years. I think you have a statement before you that gives it? Will you give us the figures for 1870; we have had several guesses?—It was 17,737.

12,552. And for 1880?—25,271.

12,553. And for 1891?—41,783.

12,554. And for 1900?—64,951.

12,555. Now, I think that the 1900 figure is exclusive of aliens from the Transvaal and the military?—Yes, they were 12,435.

12,556. So that 64,951 excludes aliens, refugees, and military?—Yes, that is so.

12,557. So that if we ask you what has been the increase in the Natal European population in 20 years, from 1880 to 1900 it works out at over 150 per cent.?—Yes.

12,558. Mr. QUINN: Do you think that population to-day, compared with the nearly 900,000 coloured men of various kinds you have got there to-day is a comfortable white population for Natal? Is it satisfactory?—The white population?

12,559. Yes, when you compare it with the vast numbers of all shades you have got there would you say it was a satisfactory condition of things? You have got 64,000 whites in the whole of Natal, and from figures we have in our possession, which are not questioned, something like 900,000 coloured people of various sorts?—Yes, that is with natives.

12,560. Do you think that is a satisfactory thing for the future of the country?—Do you mean for defensive purposes?

12,561. No, I do not mean for defensive purposes. Do you think it a satisfactory condition of things from a white man's point of view that out of a total population of nearly one million, less than 70,000 are whites?—I suppose we must make the best of the position, and we must be reconciled to circumstances.

12,562. Yes, get deeper into it?—I do not know that it will be very much deeper, because you see the white race is increasing, and the time will come probably when odds will be more even when the numbers will be even.

12,563. You think so?—I do think so.

12,564. Have you formed any calculations when that is likely to be?—No, I have not, it has not been in my line to do it.

12,565. I notice in the interesting picture book you have brought us that in 1889 the labour employed on producing collieries was a grand total of 50 white men and 42 Indians and 359 natives. We will skip the intervening years and come to 1902, fourteen years afterwards. You will find the whites have increased from 50 to 89, the increase in coolies was from 42 to 1,065, and the increase of natives from 359 to 1,465. The result of that is for fourteen years, and the whole collieries of Natal got the magnificent total of 89 white men employed?—Yes.

12,566. It has been stated here, over and over again, in fact it is one of the pet arguments that if you get plenty of cheap labour you will employ an almost corresponding rate of white labour. In Natal in fourteen years the increase of white labour is from 50 to 89, and you have 25 times as many Indians. That is so according to this statement. So much for that argument?—I suppose the labour of Indians and natives is cheaper.

12,567. Yes, quite so. Now, Mr. Samuelson, what is the effect on the natives of this continually increasing number of coolies coming in? Just a moment before you answer that question. Do I understand you to mean when you said there were 100,312 coolies that that was the total brought in or the particular number there now?—That is the total number of coolies brought in since the commencement.

12,568. That makes no allowance for those who have returned?—No, it does not, nor does it make allowance for an increase by births and so on.

12,569. Do you know what the actual population in the whole of Natal is to-day, free and indentured?—No, I do not know.

12,570. Would you regard Sir James Hulett as a gentleman likely to know?—Certainly he should know, if anybody does.

12,571. He is a bit partial to them, is he not?—I do not know what his feelings are about it. I know he employs them very largely.

12,572. Do you think he would be a fairly good authority on this question?—I certainly think so, as he is a large employer of Indian labour himself.

12,573. Yes, we have got his figures. What is your opinion of the possible effect of this continual importation of coolies coming into Natal and stopping there. I mean the effect on the Kaffir labour supply. Is it drawing it out or what is it doing with it?—I should have to be very guarded in replying to a question like that, because I have not studied the question at all. But I certainly do not think that the influence of the coolies has been anything for good. I certainly do not think so.

12,574. And the influence on the white man?—I do not suppose they have much influence on him.

12,575. Are the coolies gradually getting hold of a certain class of trade in your towns which once was in the hands of the white man?—You will find that traders are in every part of the country, and I see you are getting them in here.

12,576. But we want them; we are welcoming them. But is it not a fact beyond question that the Arabs and the coolies between them, the Indians as merchants and the Arabs as storekeepers are gradually turning out, forcing out by sheer competition, numbers of white men who might be engaged in these pursuits?—I think the tendency must be in that direction.

12,577. Has not there been some trouble in Durban recently owing to their appearance in West Street?—I see the Indians as carpenters and I see them at other trades. They work cheaper than the European. The European must either go out of the country or starve. That is to say, those who prefer to employ labour because it is cheap would naturally prefer to employ them. Native builders and native carpenters are getting a good deal of work now.

12,578. In addition to the number you have now, which Sir James Hulett told us was about 70,000, 26,000 of which only are indentured, there are 15,750 applied for?—Yes.

12,579. The CHAIRMAN: You are not quite correct, Mr. Quinn. I think you made a slight mistake. You speak of the number of white men in the employ of the Natal Collieries now as 83. That is underground. The total shows two columns are given; the second indicates the number of persons employed underground.

Mr. QUINN: The result is the same.

12,580. The CHAIRMAN: Oh, no. (To witness): Certain deductions are drawn that I should like to put a question to you about. Take 1898, the first year that the Natal coal output approached any reasonable dimensions. I find the figures of white men employed in that year to be 118?—Yes.

12,581. The figures of the numbers employed in 1902 are 208, or very nearly double?—I think that is the average.

12,582. I presume that is the average for 1902. I do not know how the figures are made out. Indian labour in 1898 is 854, Indian labour in 1902 is 1,710, or just again about double. Kaffir labour in 1898

was 1,703, and Kaffir labour employed in 1902 was 1,932, shewing a small increase.

12,583. Sir GEORGE FARRAR: In spite of this large coloured population in Natal, the white population has increased by 150 per cent. during the last few years from 25,271 to 61,320?—Yes, that is so.

12,584. Sir James Hulett and Mr. Moor are authorities on native affairs, are they not?—Well, I would prefer not to answer that question. I am not a judge of political ability.

12,585. They held positions as Secretaries of Native Affairs?—Yes, they did.

12,586. These gentlemen said that in their opinion the aboriginal population is not increasing. Would you say that their opinion was the correct one?—Do you mean that the natives have not increased?

12,587. Yes, the aboriginals?—I think they have considerably increased.

12,588. You think they have largely increased?—Yes, they are increasing. I will not say largely, but they are increasing; but, as I have said all along, we have no statistical data to go upon.

12,589. But in your opinion they are increasing?—Yes, it is my opinion. There is a statement here I should like to have handed in before I close.

#### COAL RETURN FOR THE MONTH OF AUGUST, 1903.

(Sufficient at the present price of coal.)

Estimated that in 5 years' time more than double the present labour will be required at the same rate of development and production.

12,590. The CHAIRMAN: What is that?—The coal return for the month of August. That is the last return we have of these mines. It shows the output of coal and natives working above ground and natives working below ground, the labour employed on unproductive work, the returns of coal output. It shows that during the month of August there were 187 Europeans employed, 2,631 natives, and 1,647 Indians, making a total of 4,465 of all kinds. And on unproductive work 38 Europeans, 248 natives, 37 Indians, making a total of 323. The output was 67,053 tons, and from what the Commissioner of Mines told me if the rate of development and production goes on as it is now, as it has been doing, in five years' time they will require over 9,576 labourers for this work.

12,591. Local work?—Yes, that is more than double the number that is employed now.

12,592. Is there anything else you would like to say to the Commission?—Yes, there are some points I have made a note of. I should like to bring forward specially the system of day labour or togt work, if I may read from a report I made on togt work: "Togt, or job work, is another form of demand on the resources of the Colony which is operating very injuriously. This system discourages orderly and regular monthly service, because it exhibits to natives so employed large monthly gains when compared with the wages obtained in the usual way, coupled with an attractive but seriously unwholesome liberty. It destroys or fails to create any feeling of mutual interest between master and servant. The system, if not checked in some way, will reach to the full development to which it has a natural tendency, a large fluctuating native labouring population subject to very little restraint except to that of their own convenience combining to enrich themselves at the expense of the colonist by excessive demands. The consequence of togt or job work is that the natives who engage in it refuse to accept any employment that will bind them longer than a day. As a rule they demand, and employers are compelled by their necessities, to give wages far in excess of the higher rate paid to monthly servants, while, as a few exceptions, the skill and value of the labour so highly paid for are less. The system creates uncertainty in the supply of labour except at exorbitant wage."

12,593. That is a thing I should like to bring before the Commission, because this togt or day work is upsetting the labour market, particularly in Natal. I do not know what its effects are here. You also have a system that we have, the hauling of ricksbas in Johannesburg. We have it in Maritzburg and Durban. It is a system of day work, and it is taking the natives out of the ordinary monthly

labour market, and putting them to job work, which they prefer. They make more money at it, and it never makes reliable or useful servants of those natives. They are not responsible to anybody; they are not in anybody's service; they can go about at all times of the night and day: they are practically free, free to enter into all kinds of irregular things, and I think it is a system that should be watched with great jealousy. I am more in favour of monthly service than this day service. You should also increase the facilities for coming and going, and arrange for passes to be recognised right through. Now you have your Transvaal pass. This pass is issued for a native going home. He gets to the border of the Transvaal, and he has to give up the pass for another, and when he gets away to the further border he has still to take out another pass.

12,594. A very good suggestion. Have you anything more?—If you can get the pass to be a passport right through to their homes and also a passport taken in Cape Colony to be a passport right through to Johannesburg, it would greatly facilitate their coming and going. Try to relieve them of what may in any way be regarded as a tax upon wages. They are made to pay 2s. in one labour area, and they go into the next area and have to pay another 2s. That is also upon their wages.

12,595. Natives on the mines do not; natives in private employment do.

12,596. WITNESS (continuing): This tax upon wages they do not like. Insist upon fulfilment of contracts and undertakings made by labour collectors and others. If you can see the promises made to natives by collectors of labour are carried out, that would go a long way to popularising the Transvaal and the mines. I think that, say, at Volksrust, you might have an office in charge of some competent European, with a staff to interview all natives coming in, in order that they might make a contract at that point stating what they have agreed to come in to work for and that should be done in writing, and should be carried out. Protect the natives, if possible, from loss of wages by insolvencies and theft. It is very hard for a large number of natives who may be employed by somebody to lose all their wages for two or three months by the insolvency of the employer. There are cases where the employees who receive wages have gone off with the wages and the natives have had to lose their money. Encourage some of the native chiefs, and chiefs to come up to have a look for themselves, and to see the work that is going on, and how their natives are treated and fed; what kind of work they have to do, and what accommodation they have. Let the work at the fields be better known amongst the natives. Provide

shelter for the use of natives going home if you can. A large number of natives going from Johannesburg to their homes in Pondoland and Cape Colony have often very large distances to go where there is no railway; between the terminus of the railway at Richmond, Port Shepstone and Pondoland there is a great distance. After leaving the railway, natives have to protect themselves; there is no assistance in getting to their homes. Avoid, if possible, combination for the reduction of wages. That makes the Johannesburg or the Transvaal labour market very unsatisfactory to the natives. They never know where they are. Allow the natives to be certain of the wages to be paid when they come up here. At railway stations help them to obtain their tickets if you can; very often they are hustled about, and attention should be paid to see that they get their change correctly. I think these things should be done and before it is decided—I do not know, of course, what will be the result of this Commission—but I think before you decide to introduce foreign labour, that the natives at any rate might be told what the result would be of the introduction of such labour to themselves in the future so as to give the natives opportunity of coming forward or leaving it alone and allowing men to see what the possibilities are of their being thrown out of work.

Mr. F. B. SMITH, Director of Agriculture, called, sworn and examined.

12,597. The CHAIRMAN: You are a Director of Agriculture in the Transvaal?—Yes.

12,598. You have not been able to supply the Commission with any statement as evidence?—Unfortunately, no. I sent an abstract, but the secretary tells me that it was enclosed in the wrong envelope, as he received a communication of a widely different nature.

12,599. Under what heads do you propose to give us evidence?—Well, the following three heads:—1. At the present time labour for agricultural purposes is difficult to obtain. 2. That it is anduly expensive. 3. The future demand.

12,600. You say it is difficult to obtain at present?—Speaking generally it is.

12,601. On what do you base that statement?—Not on direct census returns, but on the monthly reports which I receive from Resident Magistrates and the leading farmers in the various districts, and from my own experience in continually being about the country and communicating with the farmers generally.

12,602. Then do you get monthly reports from all the magisterial divisions?—No, I get a general agricultural report in which the supply of labour, native and white, is always mentioned.

12,603. Do you have regular reports from leading farmers as well as the Magistrate's report?—That depends largely upon the Magistrate. Some Magistrates include the report from five or six farmers in the district to me. I not only receive the Magistrates' reports, but I have many voluntary reports from the farmers.

12,604. Do you conclude, then, that from that information you are able to form a sound conclusion as to the present supply of native labour for agricultural purposes?—I think probably the soundest conclusion to be formed at present.

12,605. And that is?—Undoubtedly that labour is difficult to obtain.

12,606. How many farms are there in the Transvaal?—I understand about 11,000.

12,607. Can you give it exactly from the Registrar of Deeds Office?—Yes, this return gives it, 11,655.

12,608. Is there any information you can give us as to the number of these farms that are occupied?—We have no data, but I am informed that the general impression is that about a half or nearly a half are occupied in one way or another by Europeans.

12,609. You are aware also that many of these farms are sub-divided?—Quite so.

E 30718.

12,610. From your knowledge of the country, can you give the Commission any approximate idea of the number of native labourers on each farm?—Unfortunately I have no data, but from my own observation I know it is very, very few.

12,611. Can you put a figure to it at all?—Well I should say they keep within the bounds of the Squatter's Law, and average about five or six natives.

12,612. But under normal conditions, with a further increase of their oxen for ploughing and so forth, can you give us any figure as to the average number of workers required per farm?—Perhaps I might do that by comparison of the number of acres a man can work, say in England, America, or other agricultural countries. In England a man can work by the aid of machinery from 20 to 25 acres of arable land. In America he works rather more, but on the other hand he makes a greater use of machinery—in fact, the agricultural labourers there might almost be called skilled mechanics, and if we are going to work our agricultural land we must have quite as much labour as in England. We shall want quite that amount and more if it is to be done well.

12,613. You remember that the use of machinery is limited?—Of course that will increase the demand for labour or reduce the number of acres cultivated.

12,614. One witness put the number of acres that one native could cultivate at three?—That may be so in the primitive fashion of the present time. I think it is probably true.

12,615. Various witnesses have put the numbers which the ordinary farmer requires at from six to ten natives?—He cannot pretend to work the farm on that. He can only keep a few cattle.

12,616. We are assuming the average cultivation of a Dutch farmer?—He has no surplus produce, except perhaps a little tobacco.

12,617. Under the second head, you say that native wages at present are unduly expensive?—I take it, that the wage paid here, taking into account the quality of the labour, the hours worked, and the quality of the work done, is the most expensive in the world at the present time for agricultural purposes.

12,618. What would you put the wages at?—Well, I think, from what I can gather, on the farms, taking into consideration the fact of their having the use of the farms, and also allowances, they will cost the farmer in the end £3 per month.

12,619. And in your experience that figure is very expensive?—Well, the English labourer, who is a good worker, according to the recent Commission, with allowances and everything included, averages just under 18s. a week, and that works out at about the same amount, £3 a month, as the Kaffir receives, and the English labourer works much longer hours than the Kaffir.

12,620. And does more efficient work?—Undoubtedly.

12,621. Then, with regard to the future demands. Do you anticipate an increasing demand for agricultural labour in this country?—Well, if we are ever going to supply enough produce to keep ourselves, of course we must break up more land and employ more labour. If more labour is not employed than at present, matters will be nearly at a standstill. We shall just sit and watch a few animals grazing.

12,622. You have not been able to put in a figure or estimate of native labourers now employed?—Unfortunately, I have no data at all. I cannot obtain it.

12,623. Looking forward to an increased cultivation of land in this country, can you give any approximate idea as to within 5 years what increase on the present supply we should require; should it be doubled?—I think you might quadruple it very well, if the land is cultivated as it should be, can be, and ought to be. On each farm there are six labourers now; in five years we could very well do with 24.

N n

12,624. Then, for every 24 natives now working, we might look forward to require, in five years' time, 100?—That is my belief.

12,625. Mr. BRINK: To make farming pay at all you want labour, but it must be continual?—Quite so, it must be continuous, so that you can train it and depend upon it.

12,626. It will not be wise for a farmer to plough 300 or 400 acres and trust that at harvest time he would find sufficient labour?—That would be ruinous.

12,627. We have a very rough estimate of the Transvaal requirements of farm labourers, about 60,000, and other witnesses at the present moment make the same estimate for this country?—I think that is a very low estimate.

12,628. Most of these occupied farms are very much sub-divided?—Yes.

12,629. In my own district there are 7 or 8, in some cases even as many as 15 or 16 portions, the average being about 4 or 5. Each farmer is allowed 5 families with the consent of the owner of the farm?—So I understand.

12,630. Would you say that 60,000 farm labourers would be a fair estimate of the requirements at the present moment of the Transvaal?—I should say that at the present moment it would be quite a fair estimate.

12,631. I would go even further and say we shall have to get 1,000 per cent. more in time to come?—Yes.

12,632. Mr. FORBES: With sufficient labour, do you see any chance of the Transvaal becoming a considerable agricultural country?—I hope so with irrigation and the storage of water, and so on, that it will become, or many parts of it will become, an agricultural country.

12,633. You have travelled about the country?—Yes, a great deal. I have not been into every corner of it, but I have a general idea.

12,634. Is not a lot of the land suitable for agricultural purposes?—Undoubtedly.

12,635. Without irrigation works?—Yes, undoubtedly.

12,636. Mr. PHILIP: What is the general opinion you have heard from the farmers during your travels with regard to the locations?—Well, I must say that I have not devoted much attention to that. I have been thinking more of agriculture and the farmers themselves. I have heard from the farmers a good deal of feeling expressed that the natives were harking about the locations, and would be better occupied on the land.

12,637. Breaking them up would affect the labour supply?—I think so.

12,638. Mr. EVANS: Now, do I understand that in your opinion there is very little hope for agriculture in this country under existing conditions, talking now of the quality of labour and wages paid?—I see a very grave reason for very great difficulty with labour at its present rate and quality. It seems to me to be most unfavourable.

12,639. A very poor chance for agriculture?—I think so, unless we get cheaper labour.

12,640. Have you gone into the Squatters' Law at all?—Well, I know the Squatters' Law.

12,641. What is your opinion of it?—I think it would require extending. It will be a great pity to limit the number of natives on any cultivated farm to 5, because it will be a great advantage if we can get the natives to live on the farms, work for one master, learn his ways and work continuously for him.

12,642. Would you limit the quantity of land which the native should be allowed to cultivate?—If the farm is actually occupied by the farmer, I should say not. I should leave the farmer to make his own arrangement.

12,643. But is there not some risk that he would simply live on the natives. Farm his farm out as it

were?—In that case he obtains produce which he would put on the market, and the result to the country would be practically the same. It would not make much difference what he did with his land or wages.

12,644. The CHAIRMAN: Is there anything else you would like to say?—No, I think not, sir. I have just expressed the ideas I have formed in travelling about the country.

12,645. The Commission is very much obliged for your evidence.

Mr. W. BLELOCH, called, sworn, and examined.

12,646. The CHAIRMAN: Have you a document before you headed "Statement of evidence of Mr. Bleloch"?—Yes.

12,647. Do you hand that in as your evidence-in-chief?—Yes.

12,648. Statement of evidence by Mr. Bleloch.

I desire to state that I am at one with many previous witnesses in the knowledge of the present general paralysing shortage of unskilled labour in all departments of industry, and like them I dread its consequences.

I submit that the mere fact that a deputation of citizens interviewed His Excellency the Lieutenant-Governor and begged him to restrict the employment of natives on new railway works urgently required by the country, is evidence itself of the dearth of unskilled labour. His Excellency was particularly asked to give some 4,000 natives. The desperate nature of the industrial crisis is even made clearer by the comment on this interview by a responsible daily journal, that this extra 4,000 natives may be standing between this community and ruin.

#### SUGGESTIONS ON NATIVE LABOUR.

I would further submit that, although there are large numbers of natives in South Africa, many are in such a position that "they have nothing to lose by idleness and nothing to gain by work." I am of opinion that a moderate increase in the taxation, payable by these people, is desirable in order to make them bear their due share of the burdens of civilisation. But it should not be carried to the extent of forcing them specially to work on the mines. There are other fields of labour required for the up-building of the Colony, which increased taxation would probably cause them to engage in. Chief among these is agriculture.

At present there is a form of labour freely offered to natives (males) which I think is wholly undesirable that they should be engaged in—that of housework—of a class usually performed by women among civilised white people. It is a common sight to see lusty muscular Kaffirs engaged in kitchen work, feeding on the fat of the land, and drawing £4 per month in wages. These men should be made to find a different place in the industrial army, and it is for the white people themselves to effect the change.

#### UNSKILLED WHITE LABOUR.

A remedy for the shortage of unskilled native labour has been suggested in the substitution of unskilled white labour. I am of opinion that under present economic conditions with high costs of living this will be found to be no remedy. A period of transition must elapse before the country can produce food cheap enough to make the plan practicable. Even if it were possible, it is doubtful whether it is desirable. Hitherto labour, except that of agriculture, has been roughly divided in South Africa into two classes—skilled labour for the whites, unskilled labour for the blacks.

Under present conditions it appears that this dichotomy of labour is not only an economic, but also a social necessity. To discontinue it would tend to level down the white man to the status of the black. He would suffer both in his wages and in his standard of civilisation.

SCOPE FOR EXPANSION OF THE  
MINING INDUSTRY.

In addition to being in full agreement with previous witnesses as to the shortage of unskilled labour for working the mineral resources of the country already opened and partly developed, I submit the following evidence of probable extensions of the principal gold-bearing strata of the country.

Annexures A, B, C, D, E, F, are geological maps compiled by well-known geologists. Attached to each map is a short explanatory note:—

Annexure "A," Geological Map of Western Witwatersrand, by J. T. Carrick, Ph.D.

Annexure "B," Geological Map of Farther Western Witwatersrand, by David Draper, F.G.S.

Annexure "C," Geological Map of Klerksdorp District, by David Draper, F.G.S. and Dr. Molengraaff.

Annexure "D," Geological Map of Venterskroon-Orangia area, by Dr. Molengraaff and M. E. Frames, F.G.S.

Annexure "E," Geological Map of Heidelberg District, by M. E. Frames, F.G.S.

Annexure "F," Geological Map of Springs—Bethal—Ermelo, by J. I. Hoffmann, M.I.M.M.

Reference to the maps will show that the gold-bearing blanket formation of the Witwatersrand is present throughout the greater part of the areas represented, but that it is covered up to a great extent by more recent formations. During the past 12 months the greatest progress has been made in testing and proving the value of the blanket of these areas and with the most encouraging results. New facts about the geology of these districts are being continually discovered. As an example, the area between Randfontein and Klerksdorp is striking. Reference to Annexure "B" will show that for a distance of over 70 miles from Randfontein to Buffelsdoorn only the lower beds of the Witwatersrand are here and there visible at the surface of the ground—the higher beds, which are those containing the payable gold, being covered by dolomite and other more recent rocks. Owing to this fact, previous prospecting work done on the visible outcrops resulted in disappointment, but recent boring through the dolomite has revealed the existence of highly payable blankets. For instance, the 7 oz. reef found in borehole No. 4, Western Rand Estates. (See Annexure "A.") Recent prospecting in the Klerksdorp district has proved reefs highly payable, values 17½ dwts. to 3 ozs. (See Annexure "C.")

On the Venterskroon-Orangia area a number of gold-bearing blanket reefs have been located; one gives an average of 16 dwts. over 3 feet of reef. In the Heidelberg district, the Coronation reef has been located and developed during the year, giving values as shown on map "E." Reference to this plan will show high values recently proved in widely separated properties in the district. On the Springs-Ermelo area vigorous prospecting has been begun, and has so far resulted in proving the continuity of the Witwatersrand formation as far as Eelspruit. The total length along the strike of the Witwatersrand beds existing in the districts, shown in the maps, is approximately 400 miles, and there is no reason to conclude that the beds are either richer or poorer than those developed along the Rand.

Along the Rand area the length of reef along the strike is about 62 miles, and of this about 30 miles may be said to be rich enough to provide active working mines, under pre-war economic conditions. That is about 50 per cent. of the whole area. It has been stated that the mines of the Rand, that is the mines carried on along the 30 payable miles referred to, employ at present over 60,000 natives, and for ideal economic working they require a present total of 179,000, and in five years they will require nearly 368,000. To these must be added natives required

for service of the accompanying population and industries, and for coal mining, and a total for present requirements of the Rand mining industry and community inclusive may be put at 250,000, and in five years at 450,000. Working these numbers out per mile of reef payable under present economic conditions it gives:—

	Unskilled Natives Required.	Mileage of Payable Reef.
Now	250,000	30
In five years (period) of 3rd deep levels.	450,000	30

	Natives per Mile of Payable Reef.
Now	8,333
In five years (period) of 3rd deep levels -	15,000

These figures may be accepted as a guide for considering the requirements of the new areas described. Assuming that, instead of 50 per cent. of these areas being payable, as in the Rand, that only 10 per cent. may prove payable, we have one-tenth of 400 miles, or 40 miles of probable length of payable blanket reef. Further, assuming that for the first five years the new areas will develop slowly up to the basis of crushing on only outcrop properties, and taking only 100 unskilled labourers per mile, during the prospecting stage, say two years, 1,000 per mile in five years, and 10,000 in fifteen years, we have a requirement of these new areas of 4,000 immediately, 40,000 in five years, and 200,000 in ten years, 400,000 in fifteen years. These figures may well be noted in considering future requirements.

In addition to these areas of Witwatersrand blanket there are other areas being actively prospected at present. Some of these are giving results which promise the establishment of new payable mines. Among these are the Barberton and Lydenburg fields, and the blanket areas of Kaapseho Hoop and Haenertsburg.

Base Metals.—Active work is being done in proving the deposits of minerals containing base metals. Tin on the borders of Swaziland, zinc at Malmani, lead and silver at Malmani and Pretoria district, and, in addition, research is being made as to the exploitation of the enormous deposits of rich iron ore. It is a growing belief among mining men that a great iron industry can be established if labour is obtainable.

It is impossible to compute the labour requirements of these industries, but they are certainly industries *in posse*, and they should be taken into consideration.

Diamond Mining.—A great mining industry has developed enormously during the past 12 months in the Pretoria Diamond Fields. At present over 1,000 natives are employed, and the requirements of this industry alone during next year cannot be put at less than 5,000 unskilled labourers.

Railways.—The requirements of the extended railway system rendered necessary by the urgently-required growth of mining and agricultural industry, must also be considered.

Dangers in Present Economic Position Through Shortage of Unskilled Labour.—During the first half of this year goods of a value of £11,415,044 were imported into the Transvaal, and for the same period goods were exported of a value of £5,708,515, of which £5,579,730 was gold.

To an old-established money-possessing country like the United Kingdom an annual excess of imports over exports probably means an annual increase of

wealth coming in the shape of interest on money invested in other countries, but to a Colony like the Transvaal, working almost wholly on outside capital, and with a huge Colonial debt to serve and pay, a large excess of imports over exports can only mean impending disaster.

Such a deficit as £5,500,000 in the balance of exports with imports in the present case of the Transvaal must mean, not only a failure to produce sufficient to pay interest on the large sums invested, but also a disastrous and compulsory eating up of capital.

It is no wonder that, seeing the hesitancy on the part of a section of this community to seize the means of increasing production, capital is taking alarm, and the banks are forced to pay unheard of premiums for gold, in order to be able to send it to London and comply with the urgent calls of disappointed investors. Investors, who put this money in the country knowing its available wealth, are now withdrawing it because of the failure in production. Our production, the base of our economic structure, is too narrow and will not carry the present load of capital and debt for long; it is top heavy, and a little thing may topple it over.

If the present conditions continue, I venture the opinion that, instead of £33,000,000 being a fair valuation of the town of Johannesburg and its suburbs, one-half will be an over-valuation in a year or two from now, and the same standard of reduction may be applied to other towns.

**Agriculture.**—The attempt to secure a great increase of South African native labour for the mines is, in my opinion, to be deprecated.

While it is an economic necessity for this Colony in its present case that the mines should be worked to their fullest capacity, it does not follow that this can be best done by taking for the mines an unduly large percentage of South Africa's available workers.

Mines have invariably proved great factors in building up prosperous and vigorous communities—witness Australia and California—but they are chiefly useful as a means to an end; the end being the successful growth of a permanent population. If too large a proportion of the inhabitants are drawn off the land, this end will be in danger. Experience in the case of both ancient and modern peoples has shown that it is an evil thing for the agrarian population to be taken from the country and congregated in the towns.

The consequences have always been degeneracy and decay. There is no likelihood of a different result in South Africa if either white or black are forced from their natural work. The true policy seems to me to be the careful direction of the available workers to work likely to be most beneficial to the State. A large proportion of the available labour should, in my opinion, be directed to agriculture, an industry at present only second in economic importance to mining, and eventually likely to be of even greater importance. Its present condition involves an appalling neglect and waste of resource and extravagance of expenditure. During the first six months of this year there were imported into the Transvaal:—

	£
Cattle to the value of	118,762
Meat (preserved)	327,986
Meat (fresh and game)	424,809
Mealies	197,068

Vegetables (fresh)	39,000
	<hr/>
	£2,305,419

Or equal to an annual expenditure of £4,610,898 on goods which should be produced in the country itself. It is as necessary to increase the agricultural production of the Colony as it is to increase the productiveness of the mines; indeed, until food is produced cheaply in the country itself, the ideal economic working of the mines is impossible.

**Urgent Requirements.**—For agriculture it appears to me that it is desirable to keep the present country population both white and black, as much as possible on the land, and supplement the force with additional agricultural labourers. These are required to work at rates of wages of from 16s. to 20s. per month, and they should be of a race not requiring a status of equality with whites. Further, they should be British subjects, as it is not desirable to have aliens spread over the land. I submit that an adequate supply of trained agricultural labour at cheap rates would prove an enormous boon to the Boers, and would enable them quickly to raise Transvaal agriculture to a pitch of prosperity never before known. For the cities and the mines it is desirable, in my opinion, that the white industrial population should, as far as possible, be built up with skilled men from without. These would in time naturally overflow into the country and augment the present country stock, and thereby help the growth of a permanent white population. But, in order to enable the country to enter on the prosperity, which alone can make these ends possible, it must be made capable of producing enough to pay its debts and create a large market for its future agriculturalists. To this end, it is a prime and imperative necessity that the shortage in unskilled mining labour should be made good without loss of time. The immediate and future prosperity of the Colony depends almost wholly on the successful supply of this most urgent requirement. The ideal labour of the class wanted would be that of a race or races inured to mining work—contented with a status lower than that of the white men.

12,649. The CHAIRMAN: You refer in this statement to what you call a general paralysing shortage of unskilled labour in all departments of industry?—Yes.

12,650 I presume, therefore, that you would wish to give evidence mainly about the mining industry?—Yes, and agriculture.

12,651. From your own knowledge, you are aware that there is a very considerable shortage in the mining industry. Have you much experience as to the shortage in agriculture?—Yes, and also on the mines. I will treat the mines first.

12,652. Regarding the mines we have had a very full statement from the Chamber of Mines, dealing mainly with the Witwatersrand and other centres where mines have been carried on for some time. Can you tell us anything about new districts?—I have a statement here upon the probable developments of an extension of the Rand formation, regarding which I have submitted maps, which I might now explain.

(Witness here explained maps submitted of new districts where the Rand series of beds has been proved.)

Along the Witwatersrand as at present worked we have 60 miles approximately of gold-bearing reefs. Of that 60 miles about 30 contain reefs which are being actually worked. The balance contain reefs too poor to be worked under present economical conditions. Those maps illustrate areas covering over 400 miles. Assuming that they are found to be much poorer than the strip of country along the Rand, for which assumption I may say there is no reason, and estimating that only 10 per cent. of these new areas will be found to contain payable reefs, although 50 per cent. is the actual fact on the Rand, we then have a basis on which to compute the probable labour required for these new areas. I find that at present, taking the full present requirements of the mines, the actual needs of the town and the industrial population of Johannesburg, that these 30 miles of reef actually being exploited require approximately 250,000 unskilled labourers, which works out at about 8,000 Kaffirs or other unskilled labourers per mile of working reef, and on that basis we can get an idea of what would be required if this 40 miles is proved, i.e., 10 per cent. on 400.

12,653. You would multiply that 40 by 8,000?—Not at present. They require now about 100 Kaffirs per mile of reef, in two years the total estimate is 40,000, and in 10 years the number required on the Rand will be about 8,000 per mile. In 15 years we can expect to require at least 100,000 for these new areas, and I should say that this estimate is extremely moderate.

12,654. It is only moderate, of course, because you have used the figure of 10 per cent. of the total mileage?—Yes.

12,655. On the Rand it is 50 per cent.?—Yes.

12,656. But allowing only 10 per cent. of this 400 miles, it is moderate in that respect?—Yes.

12,657. 8,000 per mile is the number required on the Rand?—Yes.

12,658. You make a suggestion here which is new to the Commission. That is that native women should be employed in domestic service instead of native men?—Yes.

12,659. If that were done it would release a large number of able-bodied natives?—Yes.

12,660. How is that to be brought about?—Well, that is for the Commission to decide. I should say by persuasion, and, if necessary, by legislation.

12,661. You just throw that forward as a suggestion to release a large number of natives?—I think it is a pity to see able-bodied men working in the kitchens when they are required on the farms and mines. One question of principle I should like to emphasise. There is an idea that the last Kaffir should be drained off the land and put on the mines. That is a mistake. We should endeavour to keep as many workers on the land, both white and black, as possible, and endeavour to get the labour for our mines from outside sources. If we drain the labour from the land the cost of living will always be high in this country.

12,662. You do not appear to favour at present the unskilled white worker?—I think it would be impracticable on account of the high cost of living and also on account of the quality of labour that has existed in the past. We have had unskilled labour always performed by a race of lower status. I think it would be a mistake to alter that.

12,663. You make a reference to the possibility of base metals being worked to a large extent?—Yes.

12,664. I understand you have a very direct knowledge of the Transvaal generally?—I have made a considerable study of it.

12,665. Do you think from your knowledge of its mineral deposits that we may look in the near future to iron ore being worked?—Certainly.

12,666. Do you think there is a market in this country sufficiently large to justify the enormous

expenditure necessary to establish blast furnaces and iron works generally?—Every industry has a beginning. In Scotland it started in a very small way, and I do not see why we should not start here.

12,667. Yes, but Scotland has the world for a market, this country has a limited market, being so far from the sea coast?—It is not so very far, about 250 miles.

12,668. You look forward with confidence to seeing the iron industry established here before long?—Certainly.

12,669. That would largely increase the demand for unskilled native labour?—Yes, if we had cheap labour, the iron industry would already be in existence here. The labour is the one difficulty.

12,670. You refer to the financial aspect of the question, and you compare our imports with our exports?—Yes.

12,671. You say here that in the first part of this year, I suppose from January to June, we imported £11,415,044 worth of goods?—Yes.

12,672. And our exports were only £5,708,575, the bulk of which was gold?—Yes.

12,673. You infer that this vast difference in a borrowing country like the Transvaal must end in disaster?—Yes.

12,674. Of course, there are exports which our fiscal returns do not show. That is to say, if scrip is exported from this country to a large extent, as does happen, although there is not much going out now, that must go towards equalising that difference?—I am afraid I cannot agree with you there. I think we must produce something more material than scrip to satisfy our creditors.

12,675. But it represents some value?—Yes, but it must be taken out of the ground first.

12,676. But if cash is brought into the country in return for this scrip?—They may give us cash for a time for scrip, but the time will come when they will ask for something more substantial.

12,677. You sum up that position on page 8. Our production, the basis of our economic structure, is too narrow, etc. Then you deal with the valuation of Johannesburg. Do you know that the recent valuation of the town and suburbs runs into something over £30,000,000?—Yes.

12,678. You think that if the industry does not get into full swing before long that valuation—?—Will have to be reduced.

12,679. You give a summary here of imports of foodstuffs which might be produced in the country itself?—Yes, that is for the half-year.

12,680. For the whole year they run into £4,610,898?—Yes.

12,681. If we had sufficient labour for agriculture, you reckon that all that might be produced here?—I should say the greater part of it.

12,682. And the imports under these heads would naturally shrink?—Yes.

12,683. We would be nearer a balance as between imports and exports?—Yes.

12,684. Is there anything else you would like to say, before the members of the Commission examine you further on this statement?—I do not think there is anything else. The main object is the principle that we should endeavour to maintain as many labourers as possible on the land, although we require labour very badly for the mines. I think it will be still more ruinous if we take the last labourer from the land.

12,685. Mr. EVANS: Referring to the question of the Chairman about the possibilities of an iron industry. In your opinion is there as good a chance for the industry here as in Pittsburg, U.S.A., which is very far from the sea?—Otherwise, I should say we have as good a chance.

12,686. I mean, are not our chances rather better than those of Pittsburg?—I could not exactly answer that. My opinion is to this effect, that

we have iron ores equal to any in the world; in fact, some are better than have been found anywhere else. We have also unlimited coal. There is no reason to doubt that the coal could be made into suitable coke with proper machinery. We have an abundant supply of lime with which to flux the ores, so that we have all the necessary material for the starting of our iron industry, with the exception of labour to manipulate it.

12,687. In the case of Pittsburg, they bring their ore from a considerable distance?—Yes.

12,688. On page 7 you show that during the first half of this year goods to the value of £11,415,044 were imported, and for the same period we exported £5,708,515, of which £5,579,730 was gold. Now of that last figure a portion will, I take it, be distributed to shareholders in Europe as dividend on their shares, and will not return to this country in the way of imported goods?—I should say so.

12,689. So that that tends to balance any difference there may be on account of the scrip to which the Chairman referred?—Yes, I should say it would over-balance it, if anything. I think we must produce the actual gold or the actual material or value to pay for all the money invested in this country. I do not think we can pay it in scrip.

12,690. Mr. FORBES: I gather that you do not consider it is absolutely necessary in order to work iron profitably to have coal and iron quite close together?—Of course it is an advantage. We have both together in this country.

12,691. In many cases but not all?—No, not all.

12,692. How far East can these reefs be traced from here?—Well, the furthest point of our actual Rand formations has been struck at Holspruit, 30 miles east of Springs. I am speaking just from a guess, it is about that.

12,693. Mr. BRINK: I see in your statement on page 9, "a large portion of the available labour, etc." I suppose that is the view that every sensible man takes on the question?—I should think so.

12,694. You go on: "Its present condition involves, etc." I want to get at the three first items that were imported on your list—cattle and meat (frozen and fresh). You make a total of £2,300,000. That would be absolutely a million and a half of other things that we, in this climate, with this soil and with large rivers running waste into the sea should be able to produce here?—Yes, certainly. Of course, owing to the war, there are present causes which swell the imports, but every effort, I

should think, should be directed to reducing that as quickly as possible.

12,695. But we all look forward to a great increase of population, and these imports will go on increasing. What I am really coming to is this: Leaving out these first three items, we start with mealies, flour, oathay, &c. In your opinion, would it pay the Government to spend two or four millions on large irrigation schemes?—I think so, in suitable places.

12,696. Without that I do not think we shall ever be able to produce the large quantity we shall require in the near future, but we have the climate, the soil, and the water running waste?—Well, we know for a fact from these two large schemes at present working that they do not appear to have lowered the rivers used an inch. The water is apparently inexhaustible.

12,697. In your opinion, you think it would be productive, it will pay interest and pay itself if the Government should go and spend, say, five or six millions on large irrigation schemes?—I think so, if properly spent.

12,698. But then, we want a second thing, and that is labour. It would not be good to spend millions in trying to dam all these rivers without having labour to work with?—Quite so.

12,699. Well, we shall very likely be able to get the money. How can we solve the labour problem?—I have put forward a suggestion. My idea is that we should import Indians for the farmers, and a different class of people for the mines.

12,700. The CHAIRMAN: That is beyond the scope of our inquiry.

Mr. BRINK: No, we have not the supply nor the quality of labour. I am very certain that we have not the supply. I have been round the Western Transvaal recently and the farmers cannot get labour.

12,701. Mr. PERROW: We have iron ore and coal very near each other?—Oh, yes.

12,702. A good quality of ore?—Yes.

12,703. Is the coal good enough to make coke of?—They make coke out of worse coal in the North of England.

12,704. We have coal and iron coming out of one shaft in England?—Yes, but the iron is usually inferior in such a mine, but we could work future smelting works with the coal and iron at hand here.

The Commission then adjourned until Tuesday morning at 10.30 a.m.

TWENTY-NINTH DAY.

Tuesday, 22nd September, 1903.

THE COMMISSION SAT AT 10.30 A.M.

General BEN VILJOEN, called, sworn, and examined, handed in the following statement:—

12,705. I am at present residing at Johannesburg. I was acting during the late war in the capacity of Assistant-Commandant-General of the Burgher Forces.

Before the war I was for two years Field-Cornet of Krugersdorp and Under Native Commissioner, and led an expedition through Swaziland in 1897, and another during 1898 against the Magato tribe.

I am at present interested in farming in Zoutpansberg; we employ about six boys. They are paid from 10s. to 15s. per month. They are mostly Low Country or Spelonken boys, and there is no trouble to get labourers for farm work.

These same boys are afraid, they say, to go to the mines, because of the heavy mortality. A petty chief told me recently that if he sends 100 boys to the Rand, only about 66 return, and some of these have even scurvy. Bad ventilation of mines and unsuitable (or unstaple) food is thought to be the cause of the heavy death rate. Boys also complain of their treatment by some compound managers.

I think the Labour Association, in having a monopoly to recruit boys, great harm is done, as no opposition or free recruiting is possible, and often agents not belonging to the ring are stuck with boys they may get to dispose of.

There are very large tribes of natives, for instance, Schoekaenics, Swaas, the Swazi, Basuto, Zulu, etc., who do not give up a fraction of their able-bodied men for labourers and who are living on the finest lands in South Africa, paying practically nothing for it. I think these should be broken up and ground given to white people to cultivate, and the natives forced to work for the white man.

The enforcement of the Squatters' Law would be very desirable. A great deal of harm was done during the war by troops employing Kaffirs against us and promising them our farms; also permitting them to loot and keep the loot.

A Kaffir should be treated justly but firmly and always kept in his place.

It is possible that the extensive public works and new mining ventures, especially deep levels, require a larger number of boys than the country could conveniently supply.

A great number of Boers see and feel the condition of things prevailing through the state of the labour market, and would therefore agree to supplement the labour supply by imported labour, if done under strict rules and proper legislation. There is a general apathy, as people have no confidence in the Legislature.

Coolies are not favoured, and we fear a rush of poor whites as labourers, as we have already such a war-stricken and poor population.

12,706. The CHAIRMAN: Have you before you a statement headed "Evidence of General Ben Viljoen"?—Yes.

12,707. Do you hand that in as your evidence-in-chief?—Yes.

12,708. Did you hold any position under the old Government, in connection with native affairs?—Only as Field Cornet, and Under Native Commissioner.

12,709. For any lengthy period?—About two years.

12,710. You had something to do with an expedition to Swaziland in 1897?—Yes.

12,711. And to Magato's country in 1898?—Yes.

12,712. How long have you been in the Transvaal?—I have been in the Transvaal since 1896.

12,713. And in South Africa?—I was born in South Africa.

12,714. Then you have a fair acquaintance with natives, I take it?—A fair acquaintance.

12,715. Do you speak the language?—Yes.

12,716. You are interested, I understand, at present in farming in Zoutpansberg?—Pietersburg.

12,717. Do you employ many natives there?—We employ about five or six boys.

12,718. Are you engaged in agriculture or stock-farming?—Both.

12,719. Have you all the natives you want at present in that district?—Well, all we want under the circumstances. The drought and scarcity of cattle does not enable us to use as many as we might if things were different.

12,720. Are the farms in that district generally occupied?—Yes.

12,721. And you know the conditions of the farmers generally in the district as to the native supply?—They have a fair supply of boys, being near the Spelonken and Low Country. There is not much difficulty in obtaining farm labour; in fact, the boys prefer to work at the farms there, to coming back to the Rand. I may mention, sir, it is an exception probably, with that district, being so near the Low Country, and so near Spelonken, and so near their farms.

12,722. It is an exception for the farmers in other districts to have a good supply?—Yes.

12,723. And is the average you pay your Kaffirs 10s. to 15s. a month; is that the universal wage in the district?—More or less. That includes, of course, the food, and they expect old clothing and so forth, but that is more or less the wages paid to them.

12,724. Do any large numbers of natives come from the district to the Rand?—From Spelonken and the Low Country, a good many.

12,725. You had some experience, I suppose, in talking to natives there?—Yes.

12,726. And you find some of them have an object in coming here?—Yes. I spoke to boys that are working on the farm. I also spoke to several petty chiefs, and they tell me they had objections to come to the mines; at least they were afraid of the mines, because of the heavy mortality from time to time that they experience, and the boys are frightened. They tell me that they are working in the mine all night or day, and that it is a pretty close atmosphere, and when they come out of the mine in the morning or evening, they are tired and fatigued, and go into the compounds to sleep, which, in many instances, are close and badly built, and they ascribe a good deal of sickness to that, also to the food. They say they do not get much; in fact, in some cases, they complain of not eating anything but

mealie meal, and that meal not very good. I am only speaking what they told me. I have not investigated the matter myself.

12,727. Now, were these statements made to you previous to the war or since?—Since the war.

12,728. Were these boys speaking of their experience since the war or before the war?—They were speaking generally, since the war, and probably before the war. I, myself, because of the labour question being such a burning question of the day, made most of the enquiries since the war.

12,729. Do you think these natives are speaking of their experience since the war?—I thought so.

12,730. But you are not sure?—I really think they meant since the war.

12,731. You refer to the work of the Labour Association here, and of their having a monopoly. What do you mean by that?—I understood a man had to be licensed by the Labour Association to be able, or to be allowed, to recruit.

12,732. In the Transvaal?—Yes.

12,733. Where did you get that impression from?—I heard it in Pietersburg, and I had the impression because I had been told by several people who used to be recruiting natives, and who told me they could not do it now under the same conditions as before the war, because a monopoly was given to this Association.

12,734. You know that is quite a mistake?—Well, I do not know very much about it. I do not know the constitution of the Association. I merely mentioned it because if it was so it would not be to the advantage of things in general.

12,735. Sir Godfrey Lagden, who gave his evidence here, gives the number of persons who had recruiting licences in the Transvaal during the last 12 or 16 months or two years. It ran into 200 or 300; so that recruiting is not confined to the Association?—I may mention I saw a recruiting licence, or a licence was issued, to an agent, as it was called, by a man in Pietersburg, who represents the Labour Association. I cannot think of his name—I think it is Sileckmann. He issued a licence to a man to recruit, who certainly proved he had the right. It seemed a sort of semi-official document. It was certainly like a concession.

12,736. Well, of course, that was not a Government licence, I take it?—Well, it looked a semi-official document.

12,737. Well, licences are given in the Transvaal to recruit under certain conditions of the law. Certain securities have to be given to ensure respectability and so on?—I merely mention this, if it was true, because I am in principle against concessions or monopolies in any sense of the word. It may be I am rather—

12,738. Peculiar in that?—Well, I may be thought narrow-minded; but it is my feeling.

12,739. I do not think you are very peculiar in that respect. Now you go on to speak of many tribes in South Africa who only give a small proportion of their able-bodied men for labourers?—Yes. My experience was, speaking of the time before the war, that Swaziland, for instance, gave a very little labour—very few. I do not think Basutoland gives very many in comparison with the number of the tribe; neither do you get very many labourers from Zululand; but I am referring specially to Swaziland, and the Swazi tribe in the north.

12,740. Well, now, have you any idea of the population in Swaziland?—I have not any figures before me. I know it is a pretty large tribe and a very fertile country, and that they live very well without wanting much work, and I mention it because I do not see where the advantage comes in generally for the country to have these tribes living there on part of the best lands in South Africa, while we are here struggling with the question of what somebody called one of life and death almost, namely, the labour question, where you are short of labour, and where you are having a fight between the population in the endeavour to solve that question.

We believe in civilisation, and I cannot possibly see where we are civilising the natives by keeping them there on the best land in South Africa, leaving them to live in their own custom. The only civilisation being brought about is by a few missionaries amongst them, who are doing more harm than good, as the history of South Africa in the past will prove; while we, the thousands of people, of poor people, might be doing very well if we had a farm to farm on.

12,741. And how would you tackle a country like Swaziland, then, as far as the labourers are concerned? You believe more in forcing them to work? How would you proceed to do that?—I do not think I said force them to work.

12,742. I think on the top of page 2, you say “and natives forced to work for the white man.” Will you explain to the Commission how you carry that out?—By cutting land up and granting the cultivatable land to white people, to farmers, and thereby forcing the natives to go out to work. I do not mean to force them by driving them with the sjambok, but by altering the circumstances under which they live to-day, when the advantages in many cases are better than that of the white man.

12,743. Other witnesses have suggested to arrive at the same object the charging of natives with ground rent for all the ground they occupy?—I do not think that would be a bad idea, if the charge was of any importance, if the charge could be made of any importance.

12,744. Others have said that they would very shortly, owing to the high rate of wage, earn any reasonable rent put on them, by a few months' labour, or by cultivation of a few extra acres of ground. Have you given any consideration to this question of charging ground rent?—I have thought the best possible, and the most practical way would be for something like the old law by which the native should pay a certain tax per annum, which would be reduced in proportion if he could prove that he worked a certain number of months within the year. I think that would probably meet the case.

12,745. Increase the supply if that were done? But witnesses have told us the hut tax previous to the war was £2 per head in the locations, but 12s. 6d. per head where the natives lived on a farm?—I am not positive about the figure.

12,746. Well, several witnesses have told us that plan was in operation before the war?—Yes, there was such a law in operation, I believe. I believe the enforcement of the Squatters' Law would probably go a great way to alter things.

12,747. The enforcement of the Squatters' Law?—Yes.

12,748. The main provision of that is to confine the number of families on a farm to five unless in special cases?—Yes.

12,749. Do you think that is a good law?—Yes, I think so.

12,750. Is it not rather unfair on the industrious farmer who can use 10 or 12 that he should be deprived of them?—Well, I should say for the proportion it should be regulated according to the land a man gets or cultivates. But 5 or 10 families generally give quite a number of labourers—quite a large crowd.

12,751. Mr. WHITESIDE: Will you look at the first page of your statement, “and often agents not belonging to the ring are stuck with boys they may get to dispose of.” Would you explain that, please?—Well, I met a man named Walker. He said he was a recruiting agent and running about from one place to another, trying to dispose of the number of boys he had obtained, but that he could not do so because he had not gone through the proper channels. I met another in Pietersburg, who said he brought from the Low Country about 150 boys, and because he had no licence he got into difficulties, and could not dispose of the boys.

12,752. Was Mr. Walker a licensed recruiter?—I could not say; I do not know.

12,753. Did he have any comparative number of boys?—I think he said he had 200 boys.

12,754. You state here, "A great deal of harm was done during the war by troops employing Kaffirs against us and promising them our farms." That is a very serious statement, is it not?—It is quite true.

12,755. That Kaffirs were employed against you, and your farms promised to them?—Yes. I do not say it was promised by Lord Kitchener or anybody responsible, but it was certainly done by commanders of columns in many cases, and commanders of detachments up country. I may mention, I made the statement because I had most of my experience in the northern districts, where there was a deal of trouble with natives, and I came in contact with a good deal of this sort of thing.

12,756. What do you mean by saying, "The people have no confidence in the Legislature"?—The present Legislature, because it is not a representative Parliament. They are not selected by the people. We do not know anything about them excepting they were sent there by the Government, and they do not represent the people, and therefore do not expound the views and feelings of the people. They are making laws or going into laws which are of a fundamental nature, and which in many cases are serious, and I do not think it is a healthy proceeding for any country.

12,757. Then I take it you do not consider the Dutch representatives as being representatives of your people?—Not at all, by any means.

12,758. Mr. FORBES: You are farming near Pietersburg?—I am interested in farming near Pietersburg.

12,759. Are you far from a market there?—Not very far; about 10 miles.

12,760. Is there much stock in the country at present?—No, there is very little stock, sir.

12,761. How many natives do you think the farmers there would require, those that are doing cultivation?—Well, it is very difficult to state the particular number, sir. It all depends upon the circumstances.

12,762. Say on an average what would they require?—If the country had the stock it required, and if we had the rain required, or if we had the water required, the farmer would want, I believe, a very considerable number; he may want double or treble the number of boys he is employing at the present time, but I should say a farmer could not do very well with less than 6 to 10 boys per farm.

12,763. Then, not having a large stock, the farmer would naturally wish to go in more for agriculture?—Yes.

12,764. And in that case how many natives do you think they require per farm, or rather per farmer?—We are hardly in a position to judge, sir, since the war, as in every case we have had such unfortunate seasons. There has not been a chance yet of doing anything.

12,765. You spoke of Swaziland, and the Swazis, as being a very numerous tribe?—Yes.

12,766. Do you know that the Swazis are only about one sixth of the natives in the Transvaal?—Yes.

12,767. And the whole of the natives available in the Transvaal are only sufficient for the needs of Johannesburg and Pretoria, about 57,000, that is the available labour out of the whole 600,000 odd in the Transvaal. The Swazis are supposed to be under 100,000. They certainly do not come out much to work, and you recommend that the Swazis country should be divided amongst white people. Do you know that at the present time every acre of Swaziland is given out under concessions to white people? Every farmer in the eastern part of the Transvaal has got winter grazing in Swaziland and a great many of them have agricultural rights also. You were not aware of that?—I am not aware of the fact that the country was given out in concessions. I know concessions were given out for every sort of

thing you can possibly mention, about 50,000, but I do not think the country itself is given out under concessions.

12,768. Yes, every corner of the country I know Swaziland very well; I do not know the area of one farm that is not given out?—With regard to the available labouring boys in the Transvaal, I think there is a difference of opinion about the numbers I have in the statistics before me; therefore I do not feel justified in speaking about it.

12,769. The Commissioner of Native Affairs gives the whole of the natives in the Transvaal at 620,000?—Yes.

12,770. And one in ten he reckons to be available for labour?—I believe the statistics by the Native Commissioner of the late Boer Government were much higher. I do not think the tribes have decreased by any means during the war or since the war?—I do not wish to dispute your number, sir. I have not any statistics before me. I do not know. I mentioned Swaziland in particular because there have been such a number of natives living in Swaziland in that corner of the country. I had been there once. I had been garrisoned there for nine months, and I had plenty of opportunities of seeing the country, and seeing where the tribes lived; and, judging the numbers, and the only condition the old Government and the present has had of Swaziland is trouble so far as I know.

12,771. No, I do not think it is trouble, as a matter of fact. I think the Swazis are the only tribe in South Africa that has not been at war with white people?—But it certainly caused the old Government to send expeditions once or twice. It was certainly very drastic.

12,772. That suited their purpose?—It is a question of opinion.

12,773. Mr. EVANS: You mentioned: "a great many Boers see and feel the condition of things at the present through the state of the labour market." Have you any idea how the Boer farmers are off for labour?—I believe I am justified in saying that away from the native tribes, for instance, in any district but Lydenburg, Carolina, or Pietersburg, or, say, Wakkerstroom, they are particularly badly off for native labour.

12,754. What do you consider a fair wage for a Kaffir on a farm; what do you consider a farmer can afford to pay?—Well, the farmer generally pays a Kaffir a very low wage. He either gives a cow and a calf every year, or he gives a portion of the land which is cultivated for him, and in very many instances the young boys are paid from 10s. to a pound per month. I should say a pound on a farm is a very good wage for a Kaffir.

12,775. This amount you think a farmer could afford to pay and make a success of farming?—I should think so, yes.

12,776. Have you formed any idea as to the effect of high wages on the Kaffir?—Do you mean on the Rand, on the mines?

12,777. Well, the high wage paid here and in other parts of South Africa. Does it not tend to diminish the supply?—I do not see how it should, though the effect of your reducing the wages a year after the war by 50 per cent, certainly did not increase the number of labourers.

12,778. But we have been told by several South African witnesses that the Kaffir goes out because he wants a sum, say £10. If certain he can earn that £10 in six months, he goes away in six months. If it takes 12 months to earn that £10, he stays 12 months. We have had a good number of witnesses acquainted with the Kaffir, and they have told us that the effect of high wages is to diminish the labour supply. What is your view?—I must respectfully differ from that. I was born and bred amongst the natives in British Kaffraria, and that is not my experience there.

12,779. Then what do you consider, as far as the mines are concerned, would be a fair wage, such as would not deprive the farms of the labour to which

they are entitled?—Well, I should say £2 to £2 5s. would not affect the farmer in the least. I think it would be a fair wage for the Kaffir.

12,780. Forty to forty-five shillings?—Yes, about that.

12,781. Then in your opinion the wage at present is too high?—£3?

12,782. Yes, 50s. for surface work, and £3 for underground?—Yes, I think it is a very high wage for unskilled Kaffir labour.

12,783. Now, do I understand you to say that you are in favour of breaking up the tribal system?—Yes.

12,784. Abolishing the chiefs?—Yes.

12,785. And by that means distributing the natives over the farms, and sending them to labour centres to work?—I think it would cause them to distribute and would lead them to abandon to a large extent the way in which they live at present, and it would distribute them to the advantage of the country in general, whereas they are no advantage to any part of the country at present.

12,786. Yes, the difficulty is to do that without some injustice to the native?—I would not attempt to suggest any injustice to them. I think they would be treated fairly, but I think you would be doing them a service to themselves. I do not see what good you are doing with them at present by leaving them to live as they do.

12,787. You say that the supply for the needs of the farmers is insufficient. What policy do you suggest in order to meet these requirements of the farming community?—Well, I thought, to speak in a general sense, when I said that I felt that the supply was insufficient. I think the enforcing of the Squatters' Law would have a good effect, and I think that every possible effort should be made to obtain labour in South Africa, but if there was not sufficient labour to be obtained in South Africa, that other means might be adopted.

12,788. Sir GEORGE FARRAR: Do you think there is enough native labour in South Africa for the future requirements of the country?—That is a very difficult question to answer, sir. I have not been convinced actually that there is not sufficient labour in South Africa. I am inclined to think that with the developments of numbers of new mines, especially the deep levels, and the tremendous lot of work required for public works, the labour market or the labour supply is very much strained at the present moment, and that it is just possible that there may not be sufficient labour in South Africa. I am speaking with some reserve, because, on principle, we are very much afraid of imported labour, and it is only as an alternative when it comes to the very existence that we feel inclined to agree with you—or, at least, to coincide with the importation of labour from other parts of the world.

12,789. I suppose that the farmers will grow much more now than before the war?—Well, there is not very much prospect of that at present, because of the want of means to do so.

12,790. Yes, but suppose the Government found the means for irrigation works, etc.?—Oh, that would certainly improve things. I think that irrigation has been terribly neglected by the late Government, and so far by the present Government, but it has hardly had a chance to do much yet.

12,791. Of course everything depends on labour. If you get irrigation works you will want much more labour?—Certainly.

12,792. You would, therefore, have to supplement the labour supply by imported labour, if done under strict rules. What legislation would you suggest?

The CHAIRMAN: I think we are not considering imported labour here. That question must be ruled out of order.

Sir GEORGE FARRAR: I only asked a question that has been asked of other witnesses.

The CHAIRMAN: I stopped that.

Mr. QUINN: You did not wrap it up sufficiently.

The CHAIRMAN: You may be referring to imported labour from Natal, of course; I do not know.

WITNESS: I should very much like to answer that question.

The CHAIRMAN: It is out of order, General Viljoen.

12,793. Mr. DONALDSON: By breaking up the tracts you have mentioned in your statement, it would tend to increase the labour supply?—I think so.

12,794. And I gather from your remarks here, that to effect this they should be broken up, and the ground given to white people?—Yes.

12,795. That practically is a proposal to dispossess the native of land which he looks on as his own?—I do not mean to dispossess him exactly. There are great stretches of land in Basutoland, Zululand, and Swaziland which are very fertile and fine country, and which I consider would be utilised for white people without drawing the natives off the country. But by cutting up the blocks, I cannot express it very well, by breaking it up, it would alter the way they live now in bunches and thousands in one little spot, where they are able to obtain a livelihood, or sufficient food to exist on comfortably. If they were forced to be satisfied with less land, or to pay taxes, or hire the land as a white man has to do, or to pay rent and taxes for it, it would cause them to go and work.

12,796. You think, then, that there is an alternative to this suggestion of breaking up these tracts. As an alternative you suggest that possibly another way might be to tax them?—Yes.

12,797. What do you think would be the better way?—Well, I think possibly we would obtain the same end by taxing them, but I am afraid that the present Government, or any English Government, would be disinclined to put on taxation to force them to leave the country and go to work.

12,798. Do you not think it would lead to trouble with these tribes to give their ground to white people, or to tax them to a degree which they might, in comparison to present conditions, consider excessive?—I do not think there is any possibility of trouble in Swaziland, or with the Scholkalis; there might be trouble with the Basutos, but as they have never been subdued, it will not make much difference if they are subdued now.

12,799. Do you think that, morally, the Government of South Africa have any right to take those countries?—I was thinking of the Basutos.

12,800. Would you except Basutoland?—No, I am speaking specially of Basutoland.

12,801. You said the country had never been conquered?—No, not in the right sense of the word.

12,802. Then, morally, has the British Government any right to go in there and say to these people, "We are going to put white people in here, and break up your kraals." Or to say, "We wish to impose taxes on you for your good." Have they any right to do so?—I think so.

12,803. Mr. GOCH: Have you a rough idea as to the number of farms in the Transvaal? We are told that there are 11,000. Have you any reason to dispute that?—No.

12,804. Then, of course, the great proportion of these are not occupied for cultivation?—The proportion is about half.

12,805. Amongst the half that are occupied there are a great many that are sub-divided amongst a number of holders?—Yes.

12,806. It would be about fair to say that there are 12,000 farmers occupied in cultivation?—That might be right.

12,807. But supposing that to get a figure, you say that every farmer, at any rate to work well, should have from six to ten natives?—Yes.

12,808. You would prefer to have ten, to being shortened up to six?—It depends on circumstances. You cannot do much farming with less than ten, that is if you want to farm properly.

12,809. Then you want 100,000 to 120,000 labourers?—Something like that.

12,810. Do you think it is about a correct estimate if you go to a kraal where natives live on a location and taking the whole population, that every tenth person is an able-bodied man capable of work, or would there be more?—I think that is a very fair proportion.

12,811. If that is so the estimate of a tenth of the whole population being available as working men, would give us, in the whole of the Transvaal, according to Sir Godfrey Lagden's estimate, 62,000, or according to the estimate of the late Superintendent of Natives, 80,000?—Yes, more or less.

12,812. Then in the Transvaal, supposing we take the greater number of 80,000, the farmers require 120,000, and there is a shortage of 40,000?—If these figures are correct, that would be so.

12,813. Of course evidence has been given to that effect, and it is your own opinion that one tenth is a fair basis, is it not?—Yes.

12,814. But breaking up all this native country and dividing it amongst white people to farm would not increase the number of labourers?—I think it would.

12,815. Increase the numbers?—Well, I mean not numerically, but practically.

12,816. You think it would make them more available?—Yes.

12,817. You do not seem to consider that there would be any danger of provoking a native war by taking them out of their locations and planting them around?—I do not think so, if it was done in a diplomatic and sensible way.

12,818. Of course these natives would feel that they were being harshly dealt with?—I daresay they would be told so by the Aborigines' Society and the missionaries.

12,819. Well, but they would naturally think so?—If they had never paid any taxes to speak of and never had any responsibility.

12,820. You are dealing, of course, with small natives and want to move them. Will they all have that feeling that they are being badly dealt with? What sort of diplomacy would you employ to make them take that pill nicely?—I am afraid there would be too much politics in that question.

12,821. We should like to have your opinion on the matter?—Well, I would not take the course you took when you took this country.

12,822. You would not take it by force?—No.

12,823. Well, how would you proceed?—I should say by a tax on all able-bodied men, or men with families, a tax that would be of sufficient importance to cause them to go out to work and earn money, or to have to cultivate a farm sufficiently to make the necessary funds out of the land, so that as much of the cultivated land as possible is divided up and given out to white people. That would leave the natives in the country and let them live on the land with the white people, and hire it on the same footing as a white man to whom you are giving the country. That would not necessitate war.

12,824. You would proceed by taxation?—Yes.

12,825. Your policy would also involve this, that they would get a certain amount of land to work and pay so much a year? I understand that they are very good farmers, and would earn that money very readily?—I do not agree. I do not think they are very good farmers. They farm on the most primitive way. Your policy would be to levy a rent on the land so that the Kaffirs would have to pay to the Government for all locations and countries on which they live?—Yes.

12,826. That would have a civilising influence?—It would civilise them more rapidly than we are doing at present.

12,827. It would help farmers and bring out those who could not pay to work as labourers?—It would help the minds as well.

12,828. Of course in the evidence given we already know that almost every available man in the Transvaal is already at work or that we cannot hope to get more?—I am afraid you are confusing the Transvaal with Basutoland and Swaziland. Basutoland is quite outside the Transvaal. I do not see how we could calculate the able-bodied men in the Transvaal and Zululand from that.

12,829. Quite so; I am excluding that. In Sir Godfrey Lagden's statistics you will find that the natives of the Transvaal are practically all at work?—I do not know.

12,830. Mr. QUINN: Certain figures have been suggested to you as being the likely requirements of an ordinary farm, and that the figures have been multiplied by a number of farms, and it has been suggested to you that the total realised from that multiplication should be the number required for the farms in the Transvaal. Now, supposing—what are the farmers growing principally on the farms which are being cultivated?—Well, the usual crops; but, since the war, or since peace was declared, there has been nothing done, owing to the unfortunate seasons. There has been terrible drought all over the country.

12,831. But the farmers' requirements would be influenced by the markets they had for their produce. For instance, suppose Johannesburg, Pretoria, and Krugersdorp, the requirements of these places for produce, and supposing that on the mines they fed the natives on rice instead of mealies, then the farmers would be very seriously affected. They would have no market, as they cannot export?—Oh, I think it would affect them if the Kaffirs were fed on rice. I do not think the Kaffirs would have that.

12,832. Suppose the market for mealies were to go down almost entirely, and the requirements of the populous towns of the Transvaal were to diminish seriously, that would naturally affect the farmers?—It would affect them.

12,833. The farmers are not in a position to export produce? Europe is out of the question?—Oh, the production is so much lower than the consumption that you can hardly make a comparison.

12,834. But under present economic conditions the Transvaal farmers are not in a position to export their produce, like those of Canada or Australia?—Well, we have none to export.

12,835. But on economic grounds, you could not export if you had it?—No, you could not.

12,836. Therefore, if your market is shut up, if your requirements for mealies diminish and the requirements for the white population get less and less, then the farmers would have no market, and their requirements for the natives would be small?—In that case it would affect the farmers.

12,837. There has been a great deal made of the agricultural interests, in this Commission. It is a very good thing, and I want to push it a little further. It is most excellent ground, and has been worked well. In the true interests of the agriculturists of this country, what they want would be bigger markets, for their produce, a bigger white population?—They also want privileges, or possibilities of producing stuff for the market. At the present time you can hardly expect them to do much.

12,838. On account of their poverty?—That is one reason.

12,839. Oh, but they are not going to remain in that position for long. They have too much backbone for that?—Oh, we do not intend to remain in poverty, but at present it is impossible to prophesy.

12,840. But plenty of them beside farmers are suffering all over the country as a consequence of the war, but they will not sit down under it?—Oh, the Boers will not do that.

12,841. We know too much of the race for that. They will work out their own salvation, and

become producers again, and will want markets for their produce, and therefore any policy settled on and carried out which would tend to increase enormously or to a very great extent the white population would naturally be to the benefit of the farmers, and any policy calculated to do the opposite would be to their detriment?—It certainly would.

12,842. Sir GEORGE FARRAR: It is suggested that the white population in this country will decrease. Do you think it will?—I do not think it will decrease.

12,843. You know Natal well?—Not very well; fairly well.

12,844. You know there are coolies there? As a result these coolies do not decrease the white population?—I have not gone into the figures of that.

12,845. Well the white population has increased 150 per cent. in Natal in the last 25 years.

12,846. Mr. FORBES: You speak of an alternative to make the Swazie turn out to work to tax them. Are you aware that at the present time they are taxed exactly the same as the native of the Transvaal, 2*l.* per head. Would you propose to tax them more than the Transvaal natives?—Oh, no, I would tax them evenly.

12,847. Well, at the present time they are taxed exactly alike?—The tax is too low.

12,848. Mr. WHITESIDE: You have just been asked about the population of Natal, and you have been told that the white population has increased 150 per cent. Do you know in what ratio the coolie population has increased?—Not exactly, but I have read in the papers that they increase very rapidly.

12,849. Yes, far more than the white?—They generally do.

12,850. Mr. EVANS: You were asked just now whether the economic conditions of the Transvaal allowed the export of produce. Is not the shortage of labour the only economic condition that limits production by the farmers?—Well, the shortage of labour is one.

12,851. Is it the main economic consideration?—Well, it is so far reaching, because if you have not sufficient labour for the mines, there is no market, and then, again, we have not sufficient labour.

12,852. But it is the insufficiency of labour in all its ramifications that is the main consideration?—I think that is the case anywhere in the world, and it must be the case here naturally.

12,853. The CHAIRMAN: The Commission is very much obliged to you for your evidence.

Mr. HENRY NOURSE called, sworn, and examined.

12,854. The CHAIRMAN: Have you before you a document headed "Statement of Mr. Henry Nourse"?—Yes.

12,855. Have you also letter dated 21st May addressed by you to the Chamber of Mines?—Yes, extracts from the letter; not the whole.

12,856. Do you hand these in as your evidence-in-chief?—Yes.

12,857. I do not propose to make any lengthy statement or to go into statistics, but will give plain facts, the result of experience gained as a colonial-born, having resided in the Transvaal since, and as an employer of labour on a fairly large scale; my various duties and occupations having brought me continually in contact with the native, his habits, and all phases of his life.

Decrease of Native Population of South Africa and its Causes.—Twenty-five years ago, having taken part in various native wars, and as Commandant of the Transvaal Mounted Police during 1877—1881, British occupation of the Transvaal, my various duties caused me to travel through nearly every Colony in South Africa, viz., Cape Colony, Natal, Zululand, Swaziland, Orange River Colony, Transvaal, Griqualand West, Bechuanaland, Portuguese territory and the north-eastern territories south of the Limpopo. Throughout these

Colonies, more particularly the Transvaal, evidence in the way of innumerable deserted habitations (kraals), is to be found in support of the fact, that at an earlier period natives were much more numerous than at the present day, but, owing to tribal wars, there is no question that their numbers have been greatly reduced. As is well known, in these tribal fights the weaker was practically annihilated, including old women and children, with the result that the weaker tribes were compelled to establish themselves in such places as were found to be amply protected by Nature in the way of mountain fastnesses and caves.

Native laws also played a part in keeping down their numbers, for whenever a chief found his subordinate thriving to such an extent that he became a factor to deal with (on account of numbers and riches) a witch-doctor was summoned, with the result of wiping out such petty chief with all his belongings.

Subsequent wars which have taken place in my time, such as the Transkeian wars, two Zulu wars, two Langberg, Basuto wars, war in Griqualand East, in Swaziland, in Portuguese territory, two Secocuni (one Dutch, one English), Mapoch, Malaboeh, Bechuanaland, and Rhodesia, besides numerous faction fights which have taken place unknown to the authorities, have all had their effect in reducing their native population in South Africa.

Native population again increases.—Of recent years, through the progress of civilisation, and since the native has learnt that the white man is his master, and more or less put himself under the white man's protection, their numbers are no doubt gradually on the increase; this applies more to the Zulus in Natal, the Basutos, the natives of the Transkeian territory, and the Swazis. No doubt in course of time the natives of other parts of South Africa will also increase for the same reason, viz., protection under civilised Governments.

Shortage for Present Requirements.—The shortage of native labour is not a matter of to-day. For the past 25 years, to my knowledge, it has gradually been becoming scarcer owing to the development of the country and the requirements of labour for mining and other purposes. I have been a director of several companies from the very start of these fields, including gold, coal and diamond. At the present time only one of these companies has an adequate supply of labour, viz., the Olydesdale Collieries, and this only through a special arrangement with the Chamber of Mines, in order to insure a sufficient fuel supply. One company, the Witwatersrand, has had to shut down, and all the other mines are working at from 5*s.* to 12*s.* 6*d.* per ton loss; in other words, had they their full complement of labour, the cost of production would be so much less. When I first came to the Transvaal in 1877 the general rate of wage was from 5*s.* to 10*s.* per month; when working for farmers it was a young heifer per annum, at that time worth 20*s.* to 30*s.* It consequently took a native years to earn sufficient money to pay for his requirements, such as hut tax, and cattle wherewith to purchase wives; at that time the possession of a gun was also one of his chief aims.

As wages increased the supply of labour decreased. Where a man formerly took years to acquire a certain sum he now takes months, owing to the present high rate of wages, and as the majority of natives only seek work with some special object, when that object is attained he, generally speaking, returns to his kraal and lives in complete idleness, depending on his women and stock for food supply.

Pre-war Shortage.—It is well known to all connected with the mining industry and farming, previous to the war, that labour was very scarce, and, although the then Government sanctioned touting, and all Native Commissioners were employed in this way, the mines had to pay at the rate of £4 and even as high as £5 in order to obtain boys. Subsequent to the war, owing to the enormous advance in the development of the country and the mining industry in every direction, the great demand for labour (such as Public Works Department,

domestic servants, and the increase of contracts for building, not only in Johannesburg, Pretoria and other large towns in the Transvaal, but throughout the whole country, the requirements for repatriation and military transport service) have all increased the demand for labour to such an extent that the present rate of wage has increased fully 50 per cent., including food, without, however, any appreciable increase in the supply, as it is not available. It must, therefore, be palpable to all that the increased wages has a very detrimental effect on the public revenue and the general development of the country, as only the richest propositions can earn profits. From an intimate knowledge of the country, I am certain that it is impossible to obtain sufficient unskilled labour in South Africa to in any way meet the present and future demands of the country.

Owing to climatic and other conditions, I do not think much can be expected from Central Africa, and, moreover, I do not think it would be fair to expect assistance from other Colonies in Africa where the white man has taken up his abode, as in most cases the only market for his produce is a foreign one, and the only way of competing with other markets is through cheapness of labour. If one places oneself in the position of an inhabitant of such Colonies, the heads or Government cannot be expected to sanction the recruiting of labour in their territories to their own detriment, viz., an increase of wage which would deprive them of their source of existence.

Demand for Labour.—This is not only local, but is a serious question affecting the whole of South Africa, the farmer as well as the miner. The wine-growers in the Cape Peninsula, were it not for convict labour, could not exist.

Locally unless some foreign labour can be procured, the present stagnation will continue, and it will go from bad to worse. The white population is on the increase through immigration, and the small capital brought in by them is gradually being expended owing to scarcity of employment offering through insufficient unskilled labour being available to develop the enormous resources of the country.

From my experience, gained through an extensive knowledge of the native, he is in no way progressive or inclined to work more than is actually necessary to supply his immediate wants. It may also be mentioned that he does not as a rule hoard money, but only seeks employment when driven to it through need. I am farming extensively in the Orange River Colony and Cape Colony, and the farmer, with few exceptions, throughout South Africa, is suffering through want of labour just as much as the mining industry. Not only in many cases is it impossible to get labour, but, where it is procurable, the high rate of wage renders it impossible for the South African farmer to compete against foreign markets, and, as I have already stated, by receiving such high wages the native soon acquires his few wants and refuses further employment.

In conclusion my confident opinion is:—

1. That it is impossible to obtain sufficient unskilled labour in the country for its requirements.
2. That unless the same can be obtained from other sources than South Africa, the present stagnation is bound to continue.
3. That the native, as well as the white population of South Africa, is on the increase, and in years to come the local labour supply will gradually improve for reasons already stated.
4. That it is essential to import unskilled labour to tide over the next, say, ten years at least.

I would also refer to my letter to the Chamber of Mines on the 22nd May, 1903, copy attached.

(Sgd.) H. NOURSE.

P.O. Box 126, Johannesburg  
21st May, 1903.

The President and Executive Members  
of the Transvaal Chamber of Mines,  
Johannesburg.

Gentlemen.—I should like to have said a few words at next Friday's meeting with reference to the labour question, but regret being compelled to leave Johannesburg before that date.

As there seems to be a great diversity of opinion with regard to labour supply for the Transvaal mining industry, I thought it would not be amiss, at this stage, to put my ideas in writing, and, if you consider them of sufficient interest, kindly have them read at your meeting.

I may mention that I am one of the pioneers of the Transvaal Gold Fields, and have been largely interested in the industry ever since, and am still a director of several companies.

1. White Labour.—After a fair trial, in my opinion, it has been proved quite impracticable to employ white as a substitute for native labour—

- (a) On the score of expense.
- (b) The class of white labour offering.

2. Native Labour.—It is quite evident that this is unobtainable in South Africa in sufficient numbers for the enormous increased demand from all quarters since the cessation of hostilities.

3. The result is stagnation. A number of mines are unable to work, and others that are working cannot do so at their full capacity; consequently work at a great disadvantage. Practically every ton of ore milled to-day is at an approximate loss of from 5s. to 10s. per ton owing to increased cost of production through scarcity of labour.

4. \* \* \* \* \*

5. The importation of cheap white labour from Italy and Finland has been mooted, but, from the skilled British workman's point of view, I should say that this would be the worst remedy, as a large influx of these men would no doubt lower the price of skilled labour and in this respect British subjects are entitled to consideration.

6. \* \* \* \* \*

7. \* \* \* \* \*

Native Wages.—I would draw the Chamber's attention to the fact that at the present day native wages are considerably higher than they were before the war. On going into statistics, I find that a fair estimate for the average cost for native labour, including food, before the war, was about 60s. per head per mensem; whereas under the new rates of pay it will shortly rise to approximately 90s., which, on the face of it, denotes a very serious aspect. This will mean a general rise in native wages throughout the country, which only first-class propositions can survive; increased cost of living in every respect, and the farmers of the country practically going to the wall, as it will be impossible under the circumstances for them to compete against other countries.

I have heard it mooted "Legislate to make the native work." This would appear wrong on the face of it, but, even if this is done, I do not think it is possible to obtain a sufficient supply. Competition is the only solution.

I am, Gentlemen,  
Yours faithfully,  
(Sgd.) H. NOURSE.

12,858. You are colonial born. I think?—Yes, in the Cape Colony.

12,859. When did you first come to the Transvaal?—In 1877.

12,860. Have you been an employer of labour for the greater part of that time?—Yes, to some considerable extent.

12,861. Have you also been brought much in contact with natives during that time?—Yes.

12,862. Do you think that there has been a decrease in the native population, going back, say, for 50 years?—It is difficult to say. I am of opinion

that the native population at the earlier periods of this country has decreased.

12,863. And what are the main causes?—Principally tribal wars and faction fights on native land, and also European wars; for instance, the taking of Natal, Orange River Colony, etc., and the Transvaal, and so on from time to time, and it has had the effect of decreasing the population for a certain time.

12,864. You think that in recent years there has been an increase?—Yes, in certain parts, but not in the whole of South Africa. I do not think that the effect of better Government is being felt on the whole country as yet. But it certainly is in Natal, Basutoland and the Transkeian Territories.

12,865. Do you think that the increase has been general?—Yes, of late it has, owing, I take it, to better Government, viz.: Protection, the result of civilised Government. I am also of the opinion that, as civilised Government penetrates further into the interior, the native population there will also increase.

12,866. Then it has been due to the cessation of tribal wars, this increase?—Yes, but there are also other causes. The effort of civilised Government in the way of putting a stop to epidemics and all sorts of diseases, and the native laws working in themselves. I have travelled all over the country, and I found evidence of settlements, tremendous settlements, which are now deserted. The whole of the country appears to have been heavily populated, so much so, that certain portions have been terraced to obtain land for cultivation. But now you find the country deserted. Wherever there is a native settlement you find it stuck away in some mountain fastness where they could retire to the caves in case of an attack from their neighbours. Take nearly any part of the country and you find that the natives' headquarters are in these fastnesses. Take the Matebele, Mashonas, Secocoent, Mapoch, Magato, Malabock and the Basuto, and so it is with nearly every tribe. Under more civilised Government it would not be necessary, he would spread out on to the farms and increase in numbers as he is doing now in certain parts.

12,867. The first point the Commission has to consider is the requirements of the agricultural part of the population. I understand that you are engaged in agricultural pursuits as well as in mining?—I am largely engaged in agriculture in the Orange River Colony, Cape Colony and also in the Transvaal, but not on a large scale. I have a large number of relations, farmers, both in Natal and the Cape.

12,868. You are able, then, to give us some idea of the agricultural requirements. Is the agricultural demand well supplied?—No, and if the agricultural industry went ahead in the Transvaal as it ought to, the native supply would hardly meet the ordinary requirements of the country, leaving the mining industry out of the question.

12,869. You think that there is not more in the Transvaal than will supply the agricultural needs?—Yes, and the supply would have to be increased as the agricultural prospects increase.

12,870. You mean at the present moment there is not more than a supply for agriculture?—At the present moment, as Mr. Ben Viljoen has said, the farming industry has no very great demands on it, but in a year or two, I take it, when the effect of the war has died out, the demand for labour will be much greater than it is to-day.

12,871. The supply or the demand?—The demand.

12,872. And what has your experience been in the Orange River Colony?—Very short indeed. I may tell you, however, that there are tribes of Basutos who go out to work. I think the Orange River Colony is better off for labour than most of the Colonies, but still in certain parts it is very, very short. Just round Basutoland the natives prefer farming, they are a pastoral and agricultural people, and prefer working on farms at a small wage than coming to the mines.

12,873. And what has been your experience in the Cape Colony?—It is very short indeed, shorter than any other Colony.

12,874. Are you speaking still of agricultural requirements?—Yes. I am farming in the Middelburg district and it is almost impossible to get labour. In Murraysburg, where I am interested in horse-breeding, we have practically not got a boy. If I want a horse I must send for it, and it is the same with cattle. A stipulation is made that people who buy have to send for them.

12,875. Any native territories near to that district?—No. I may mention that I was in the Cape Peninsula, and I visited several wine farms where convict labour is used. I asked about it and was told that if convict labour ceased, wine farmers could not carry on; I refer to the Lategans of Constantia.

12,876. You are connected with a number of mining companies. We have had the evidence of the mines as to the shortage on the mines. Is there anything you would like to add?—I may say that I have been connected with mining since before the Main Reef series were discovered. In the early times we could get a certain amount of labour and get it cheap. We used to pay from 10s. to £1 per month. As soon as the Main Reef series was discovered, the demand became greater, and we found it an immediate tax on the mines. The labour would not come voluntarily, and we recruited throughout the whole country. We found the country itself could not supply natives as the demand grew greater. The fact of a high wage had no effect, as the natives were practically not in the country, and you will not find a sufficiency of labour to meet the present demand of the mining and other industries—which are bound to increase as the country goes ahead. Previous to the war it was just as difficult under the old Government. That Government sanctioned touting, and even the Native Commissioners were asked to assist. We never could get sufficient labour. Since the war we have tried recruiting, as you know, in every part of South Africa, but it is quite impossible to get an adequate supply. It does not matter how high the wage, you cannot increase the supply to any great extent. My opinion is, that the native is not in the country to in any way meet the demands of the mining industry. The way I look at it is this. The number of natives you have in the country to-day, in these different Colonies, is only sufficient—and barely sufficient—to meet the demands of the agriculturists and other ordinary demands, such as contracts, house-building, etc., etc. There is no actual native labour in the British Colonies of this country at the present moment available for the mining industry, and the demand of the mining industry, which is abnormal, must be met from outside.

12,877. You make a statement as to the wages increasing, and the supply decreasing?—I mean by that, from my knowledge of South African natives, that practically he is an idler. He has never been a worker. Up to recent years the women did all the work and the men lived comparatively a life of idleness. The higher the rate of wage the sooner the man is able to obtain his requirements, and formerly, where it took him years to earn sufficient money for his wants, it now only takes months. In that way I maintain that the higher rate of pay the native gets, it decreases the supply of labour, as it takes him less time to obtain his wants, when he retires to his kraal and refuses further employment until he wants something further.

12,878. Do you think that applies to the South African native generally?—Yes, generally. The South African native is not a hard worker.

12,879. What effect has the present rate of wage on the agricultural interest?—Well, the difficulty of the farmers is this. Having to pay a higher rate of wage for his farm employees, he cannot compete with other countries having better facilities. He cannot compete against foreign markets in the way of cheapness of production.

12,880. Is it a fact that the 60s. wages paid on the Rand means a rise of wages for the agriculturist?—Yes, the demand being so great means a rise of wages on farms.

12,881. In that way the farmer is naturally at a disadvantage. Every native that leaves to go on the mines is lost to the farmers' employment, and this is detrimental.

12,882. Do you think the high rate of wages materially increases the supply, or does it attract natives from one district to another?—Of course the higher wage makes a certain number of natives come to Johannesburg. As a rule they are not hard workers and prefer farm work at a lower rate. Mostly young men come to the mines, because the higher wage enables them to buy cattle or wives quicker than by working on farms.

12,883. Mr. PHILIP: You heard Mr. Ben Viljoen give his evidence?—Yes.

12,884. What do you think of the results of a policy of splitting up Swaziland and Basutoland and giving them to white men?—I do not think any Government could possibly countenance such a policy. I think it would have a detrimental effect. If all these tribes, who are practically owners of the land, have their land taken away, I think it would have the effect of decreasing their numbers rather than increasing them. Their countries or locations are now not over-populated, but eventually they will become so, and they would be bound to go to work, and in that way would prove a great benefit to the South African labour difficulty.

12,885. The result of such a policy would be that we would have these native wars on our heads?—Yes, which would destroy the labour we are seeking; besides there would be the cost.

12,886. Mr. WHITESIDE: Have you before you a paper dated May 21st, 1903?—Yes.

12,887. Will you tell us the reason why the remarks on 4, 6 and 7 have been left out?—These referred to the importation of foreign labour.

12,888. Mr. QUINN: Will you please tell the Commission how many natives in your opinion were working on public works, mines and similar works 30 years ago?—I am afraid I cannot do that.

12,889. Were there 20,000 working? Would you be inclined to doubt that at least a quarter of a million are working now, whereas there were not 20,000 thirty years ago?—I would not doubt it.

12,890. Does it not seem to point to the fact that the native is very rapidly becoming a worker?—I may tell you that in the earlier years, when I first came here, the native did no work because there was no work to do. He was not taxed and required very little; now he is being taxed and his wants are gradually increasing, which forces him out to work.

12,891. Do you know the East Coast?—I know a lot about the boys, and I have been in Portuguese Territory, but I do not know anything except from my experiences on the mines.

12,892. The CHAIRMAN: The Commission is very much obliged for your evidence.

Mr. W. T. BROWNLEE called, sworn and examined.

12,893. The CHAIRMAN: Have you before you a document headed "Statement of Mr. W. T. Brownlee, Resident Magistrate, Butterworth, Cape Colony"?—I have.

12,894. Do you put that in as your evidence-in-chief?—I do not know that I can put that in as my evidence-in-chief, as I do not know the extent and scope of the examination to which you wish to put me.

12,895. But you had in that document?—Yes.

12,896. The statement was as follows:—

1. Districts with which Acquainted.—The several districts of the Transkei and the district of Qumbu in East Griqualand.

2. Length of Time during Which Knowns.—Many years.

3. Character of Natives of such districts.—

(a) Usual Work: When at home, agriculture and

stock-raising; when away from home, mining, railway work, dock labour, water works; in fact, manual work in all its branches. (b) Usual Food: Mealies, Kaffir corn, flesh, pumpkins, milk, Kaffir beer. Mealies are prepared in a great variety of forms: when green, roasted on the cob, or pounded and made into a sort of pudding; when boiled, they are eaten whole or ground and made into a sort of porridge. The native diet scale in good seasons is plentiful, palatable, wholesome, and nutritious. (c) Usual Pay.—Local, from 10s. per month for servant boys to £2 or £3 per month for experienced servant men, and, of course, food. When at work natives expect to earn at least 3s. per diem, and at the various ports they can, by working overtime, earn as much as 30s. to 35s. per week. (d) Physique: Usually excellent.

Aptitudes.—Skill with pick, shovel and crowbar soon acquired; management of cattle comes naturally. Ailments.—Chest complaints, rheumatism, and heart complaints consequent upon the latter. All these ailments might be avoided by the use of proper precautions. (e) Special Conditions which would (a) induce and (b) deter labourers going to Johannesburg. (a) A fair wage and good treatment, (b) low pay and ill-treatment. There are other conditions, such as good or bad seasons, etc., but these, in my opinion, are of not nearly so much consequence as the two former.

I can give no special instances, but it is the subject of common discussion among the natives in this part of the world that the treatment of native labourers at Johannesburg has in no way improved since the late war, and, if anything, is even worse than it was before, and the pertinent remark that one sometimes hears made use of by natives is this: "It was what might be expected that we should be ill-treated under a Boer Government, and so we put up with it; but that we should be ill-treated under the Government of the King is what we cannot understand and cannot endure." (f) Approximate numbers: Roughly, 25,000 for the district above referred to, and about 100,000 for the whole of the native territories. (g) Enterprises managed by Europeans in such districts as require native labour: None. I should like to add that the Cape Colony provides employment for a large number of native labourers, Capetown, Port Elizabeth, and East London each requiring several thousands for harbour and shipping works. The various railway works absorb a large number of workmen, and there are various other minor works which each attract fewer or more native labourers.

The three great attractions are the three great ports; there, by working overtime, an industrious man may earn 5s. per diem. If Government work, he is well looked after, and his pay is handed to him promptly in full, and no ill-treatment is allowed. Contrast this with a nominal 3s. per diem and an actual payment of £2 or £3 per mensem, which is the wage currently reported to be that paid at Johannesburg, and draw your own conclusions. It is scarcely necessary for me to say that the added item of alleged ill treatment at Johannesburg above referred to will, with low wage, account for the reluctance of the Transkei native to go there.

Further, it seems to me that the whole question is one of "consideration" or value. One often hears a remark such as this: "A native can live on, say, 1s. a day, therefore he can afford to work for 1s. 6d. a day." I wonder how many mine-owners would like to work for a trifle over what it cost them for their food, or how many Europeans who could earn more would be content to work for £10 a month because it cost them only £7 10s. per mensem for their board.

The situation strikes me thus:—Here is the mine-owner, who wishes to extract as much gold from his mine as he may and to reap as large a profit as he can, and here is the native labourer who wishes to earn as much as he thinks his work is worth. His labour has a certain market value in Capetown, Port Elizabeth, and East London from 2s. 6d. to 5s. per diem, paid in cash every Saturday. Why should not the mine-owner pay full value for the labourer's work? The latter certainly thinks it worth more than a nominal 3s. per diem producing £2 or £3 a month.

12,897. The CHAIRMAN: You are acquainted with the Transkei?—Yes.

12,898. How long have you had your present office there?—Seven years.

12,899. Were you connected with native administration previous to that?—I was.

12,900. For what period have you been connected with natives in the country?—Something like 26 years.

12,901. Then does your acquaintance with the native in Cape Colony extend to the Transkei territories generally?—I am not personally acquainted with natives within the Colony proper, but with the natives in the Transkei, in the Transkeian territory.

12,902. Are you in a position to give us the population of the natives in that territory?—I should say there are between 800,000 and 1,000,000.

12,903. The Cape Blue Book for 1902 gives the total for 1901 as 822,494. That excludes the European population of these territories and excludes the mixed population—the population of the mixed coloured races, I take it—8,561?—Yes. Do I understand you to say that is for 1901?

12,904. Yes, it is taken from the Blue Book for 1902, and gives the figures for 1901. Is your Blue Book, giving the figures for 1902, published yet?—It has just been issued. It has only very recently been issued.

12,905. You do not know what increase of the population is estimated?—I could not say accurately. The statement is based upon an estimate. These increases are not census figures; they are based upon an estimate.

12,906. When did you take a census of the natives in Cape Colony?—In 1901, I think it was; no, I mean 1891.

12,907. Then is this figure arrived at by adding to that census?—Yes, by adding to it.

12,908. Have you ever prepared figures showing the number of males available between certain ages, for work outside those districts?—Not beyond the census figures.

12,909. The census of?—Of 1891, which did give accurate figures.

12,910. Between what ages did you reckon?—It gave accurate figures of male adults, and of all classes between various ages from 1 to 15, and from 15 and over.

12,911. Can you tell us approximately the number of natives—males—between, say, 15 and 45, or 15 and 50, whatever your census figure was, in these territories?—Do you mean now or at the time of the census? I should not like to give the number of males between specific ages, but I can say that approximately we have something like 100,000 able-bodied males in the territories.

12,912. You are speaking of the present time?—Yes.

12,913. Can you give us any idea of how many of these would be available for labour outside those territories?—From the 1st January to the 30th June last we dispatched 40,000 from the native territories.

12,914. Is that a normal number?—It is not an abnormal number.

12,915. Can you give the figures for the year previous, 1898?—No, sir.

12,916. Would you think it was a larger or a smaller number?—Probably larger than in 1898, because the figures have been steadily increasing.

12,917. What do you imagine, then, from your experience, would be the total number which would leave the territories for labour outside during the current year; that is to say, would you consider them equal to those or less?—It would probably be somewhat less.

12,918. Then, taking one year with another, what would you say would be the average number which would leave your territories for work elsewhere for

any 12 months?—I should say from 60,000 to 70,000.

12,919. Can you tell the Commission how long they remain out at work on the average?—About five months.

12,920. What is the shortest period for which they remain away?—If they go a long distance from home, three months. It is not worth while for them to go out for less.

12,921. And the longest period?—Many of them remain out for the whole year, but there are a few instances in which they remain two or three years.

12,922. Speaking generally, and taking the average, you say the average period would be about five months?—Yes, from five to six months.

12,923. Where do they labour chiefly?—Cape-town, I suppose, absorbs the largest number; then Port Elizabeth, East London, and the Cape Colony railway works, and also the various Cape colonial towns. A few of them come up here. Of the 40,000 who left during the first six months of the year, 8,000 left for this part of the country, for the Transvaal.

12,924. In the six months?—Yes.

12,925. Can you remember the numbers who used to leave the territory previous to the war in any six months, or in any 12 months for work on the Rand?—I have no statistics made out, but the statistics are published year by year in the Cape Blue Books. That is, the Blue Book on Native Affairs.

12,926. Do you come in contact with the natives who have returned from work on the Rand?—Not as a rule.

12,927. But from other magistrates, do you learn something of the reports they bring back with them?—I would not say I hear them from other magistrates, but I hear them generally from the native headmen, and so on.

12,928. What reports since the war do they bring back as to treatment when working on the mines here?—Unfavourable reports.

12,929. Would you elaborate that a little. Will you tell us what these reports are?—Of course I can give them to you merely as reports. I do not vouch for their truth or otherwise. I merely give them to you as reports. The reports are that wages are not paid in full. That is a great complaint, and they also complain of rough treatment.

12,930. Any other?—I do not think there are any others. At least I have not heard of any others. Of course there is the item of unsatisfactory treatment on the railways; that is during their passage to and from their work. But that is a matter quite apart from this centre, and is a matter which I believe is being taken in hand by the various Governments, with a view of ameliorating their treatment.

12,931. Have you examined any natives yourself who have brought back these statements, that they were not paid the wages promised?—I have myself seen one, but unfortunately I have not brought his statement. At my hotel I have statements made by two from the adjoining district to my own.

12,932. Can you remember what the nature of the reports were?—The one whom I saw personally said they were engaged at 3s. day, which ought to produce about 18s. a week; the salary being paid weekly, but they very seldom received more than 10s. to 12s. a week.

12,933. And the other two?—I have their written statements and I shall produce those. I shall refer to these, and see what they really say. In one of them, two men complained of having been assaulted by one of the European overseers, and the other complained of having been fined 6s. for the accidental breaking of a pick shaft, value, I suppose, at 9d. to 1s.

12,934. I presume these boys were working on the mines here?—The one whom I personally saw was working at the railway goods shed. The other two

I think, were working on the mines. In fact one of them mentioned the name of the person who assaulted him. I should like to say, before going any further, that these are two mines which are excepted from the usual stigma. I can only give you the native names. One is called the "Mavumbuka," and the other is the "Umhlamane." I rather think that is the Langlaagte, but I am not sure of the other.

12,935. The East Rand?—I could not tell you.

12,936. Mr. QUINN: The Ferreira, perhaps?—I do not think it is either of those two, but the natives are very easily enabled to locate those two names.

12,937. The CHAIRMAN: You will bring those statements with you this afternoon, perhaps?—Yes, I will.

12,938. Do you know whether this native who complains of not receiving 3s. per day, whether he was engaged by the Native Labour Association recruiters, or was he engaged by some independent recruiter?—The one man was not engaged by any recruiter. He came up on his own account.

12,939. He was then made the promise of 3s. per day?—Yes.

12,940. Then his statement is not that he was promised 3s. a day by a recruiter down there?—No. He was promised it by the man who employed him.

12,941. Was it on one of the mines?—No, the railway goods shed. First of all he was at the cycling track. His engagement there was terminated rather suddenly, and then he was later on employed at the railway goods shed, but at neither of these places was he paid in full.

12,942. There is no great demand for labour, I understand, in the Transkeian Territory itself?—Comparatively speaking very little at present.

12,943. Why do you say at present?—I say at present because the construction of the railway has been begun through the Colony proper into the native territories. It has not yet reached the limits of the native territories, when it does there will be a demand for native labour there.

12,944. Will that be a considerable demand?—Not a very large demand, because it is not a very long railway. At present the railway runs only 24 to 25 miles into the territories, and if they do not carry it any further it will not be a very large demand. But the idea of the Government was to carry it some 70 miles further still, and if they do that they will open up a considerable demand for labourers.

12,945. Apart from this railway, is there any other demand in the Transkei itself?—Comparatively speaking, very little.

12,946. You cannot indicate to the Commission what the effect would be on the men now at work when the construction of the railway is in full swing. Will it be an appreciable effect upon the number going out to work elsewhere?—I hardly think so.

12,947. Surely, if the railway construction will employ some thousands of boys?—They would not employ very many thousands. It is only a short railway.

12,948. Can you tell the Commission whether Johannesburg is an attractive place for your natives, or is Capetown or the coast ports more attractive?—Judging by results, I should say the coast ports were more attractive than Johannesburg.

12,949. Is that owing to their being paid higher wages there?—It is owing to the fact that they can earn higher wages there. I think it is greatly owing to that fact.

12,950. Apart from the question of wages, are there any other considerations, do you think, by which they favour these coast ports more than Johannesburg?—Well, one does not hear remarks of ill-treatment down there.

12,951. Are there any other considerations?—I do not know that there are any other considerations that I could mention. No other considerations occur to me except this, that East London and Port

Elizabeth are comparatively near to their homes, much nearer than this place, for instance.

12,952. That is what I want to get at?—Of course, Capetown is further than this.

12,953. But Port Elizabeth and East London are nearer?—Yes, they are nearer.

12,954. I think in your statement you indicate that at these coast ports they have the advantage of working overtime?—They have.

12,955. And are enabled to earn as much as 5s. per day?—Yes.

12,956. I take it, however, that these wages do not include food? The native has to feed himself?—They feed themselves, yes.

12,957. Do you know that in Johannesburg food is supplied on the mines?—I believe that is so.

12,958. Do many of your natives go to work with farmers in your territories?—Not many.

12,959. Where do the farms in your territories draw their labour from?—I fancy they draw the greater number of their labourers from among the native territories within the Colony.

12,960. Do you know what wages are paid by the farmers?—Very often they pay in kind, that is to say, they pay in cattle, but if they do not pay in kind, they pay something like 10s. or 15s. or a pound per month, and then they feed the boys.

12,961. Are you in a position to give us the total native population of the Cape Colony apart from the Transkeian Territories?—No, I am not.

12,962. A number of witnesses have told us that the higher the wage paid to the native the shorter period he works, or the longer the period of rest he takes when he returns to his home. What is your experience?—That is to say, the larger amount of money he earns, the longer he stays at home. I suppose you may accept that as a correct statement.

12,963. Underlying that statement, of course, is the theory that the native only goes out to work to earn a certain amount of money which he wants for some specific purpose?—I do not think that is correct.

12,964. You think not?—Very often that is an inducement for him to go out, but I do not think it is always the case that he goes out with the intention of earning just a specific sum.

12,965. Then what are the influences at work which induce your natives to go out to work in the numbers you have given us?—To feed themselves, to clothe themselves, and to support their families, and also for the purpose of acquiring stock. Every native has, more or less, the aim to become a cultivator, or what you would call a crofter, to settle down in life comfortably, and many of them are induced by the aim of acquiring property and stock.

12,966. Can you give us any idea how many years a native will usually work? Natives go out to work now, do they go out for a certain number of years and then retire, or do they go out for a period and then remain at home before going out again?—I do not think you can apply a fixed rule, large numbers go out regularly year by year.

12,967. Speaking generally, then, do you look forward to any large increase of natives going out to work from your territories?—I believe there is every prospect of their going out in increasing numbers.

12,968. Do you think the mining industry here can look to your territories for any appreciably larger number of natives than they are getting now?—I think so.

12,969. You say that 8,000 came out to work here during the first period of this year?—Yes.

12,970. Can you give us any estimate of the number that will go out in the second portion of the year from these territories?—It would be impossible to give any estimate beyond the estimate based upon the number who have already gone out. I suppose you might add a couple of thousand for the second half of the year.

12,971. And do you think that during the next year we may look for an increased number?—I should not think you could look for any appreciable increase for a year or two, but I think as the improvements go on the numbers will grow with them. I will give you my reasons for saying so. I suppose railways cannot be carried on indefinitely within our own Colony, there must come a limit, and as each railway ceases to become a source of employment that will throw a large number of men into the labour market. In addition to that we have the policy initiated in the Cape Colony of individual tenure, which means the giving out of arable land up to a certain point—they make land allotments—and thereafter there can be no more land grants of agricultural land, within any given district as soon as the principle of individual tenure is applied to that district. It means this, that a large number of young men who are coming on will have to look elsewhere than the land for the means of a livelihood. They will have to go out to labour centres or mining districts such as this. At present the tribal system of tenure of land means this, that as soon as a young man marries he is ready to apply for a plot of land which he may cultivate and from which generally he provides himself with food. As soon as you introduce the principle of individual tenure the land is surveyed and only the surveyed allotments are given out for agriculture. As soon as these surveyed allotments are exhausted, there is no more land to be given out, and the young man then who marries and wants to support a family and has not the land to fall back upon must work for it. Well, that policy having been initiated in the Cape Colony, and presumably having been initiated with the intention of applying it through the Colony and right through the native territories, in the course of time it seems to me the effect will be that these natives will go out in larger numbers year by year.

12,972. Are you speaking of the provisions of the Glen Grey Act now?—I am.

12,973. Are you acquainted with the working of that Act?—I am acquainted with a modified form of it, which we have in our district. You see that Act applies to the Glen Grey district, which is within the limits of the Colony proper. Outside those limits, that is to say, in the native territories, we have not the Glen Grey Act, but we have a modified form of it, simply provided by proclamation, and I am acquainted with the working of that.

12,974. Will you explain the working of it more fully to the Commission?—The working is this. It applies taxing powers, which it places in the hands of the Native Council, corresponding with the Divisional Councils in the European districts, who, within these limits, have the administration of the revenue so collected.

12,975. Are these taxes levied in the form of a poll-tax or levied by a hut-tax?—At present they partake very much of a poll-tax, but where the survey has been applied, they partake of the nature of a tax on landed property.

12,976. You mean land-tax?—It is not given that name, but is simply called a general rate. At present it is applied to every landowner in general, and to every male adult, even though he be not a land owner.

12,977. What area per head of the family is given in land?—Four morgen is the usual amount. We have not the survey throughout the Native Territories. The survey in the Glen Grey district is applied by the Glen Grey Act at once, but in the Transkei the survey is not applied by the Council proclamation. It is brought in as a separate measure entirely.

12,978. You mean to say the land is not surveyed there?—The survey does not follow upon the application of the Councils, but it is brought in district by district under a proclamation.

12,979. And four morgen of land is allotted to each family?—Yes, to each head of a family.

12,980. What will the ground rent levied per man be per annum on the four morgen of land?—There is a quit rent, which goes into the Government coffers,

of 15s. per allotment; then there is a district rate, the general rate of 10s. per head of the family or adult male.

12,981. Is there any other charge?—No, that is all.

12,982. And on the average, then, per allotment, it is 35s. the annual amount per annum paid by each head of a family?—About that.

12,983. And 10s. for each additional adult male?—That is about how it works out.

12,984. Then, in addition to that, is a poll-tax levied by the Government?—No, we have no other poll-tax.

12,985. Is there a hut-tax?—10s. is collected per hut, but that is practically for every wife.

12,986. Now, then, these natives who are paying this annual contribution to the Government and to the local authority, do they earn it for the most part out of cultivating the land they have, or do they work outside?—I think the great bulk of the money is earned outside.

12,987. Then do these heads of families cultivate these four morgen to any great extent?—They cultivate them almost entirely.

12,988. And the produce is sold to the storekeepers?—Whatever surplus produce they have is sold to the local storekeepers, and then, besides that, as a means of revenue, he will produce sheep and rely upon those to a great extent also to produce revenue.

12,989. You promised us this morning to bring some memoranda re certain complaints natives have made as to their treatment on the Witwatersrand?—I find they do not complain of the treatment on the mines, but of the treatment on the railway works; shall I read the statement?

12,990. Yes, are they affidavits?—Yes, both of them. The first is this:—Maloga, sworn, states: I reside in Sofika's ward. In December last I went to work at Johannesburg, being contracted for six months, and began working on the 10th December, 1902, at the Maintenance Stores, Johannesburg, under D. van Niekerk and G. Thomas until the 10th June, 1903. I was being paid monthly at the rate of £2 10s. per month. While in my third month, G. Thomas told me to work on a Sunday, which I reported. He then arrested me, together with others, and lodged us in gaol. We were fined and sentenced each to one month's imprisonment with hard labour, or in default £2. I paid the fine, and was sent back to my work. During my work there I was several times beaten by Rees and Hill, overseers of Thomas. Thomas also beat me at other times. They beat us because eight of could not carry the bars of iron. They beat us by striking us with their fists and kicking us. We complained to Thomas and to Gevins, the labour agent, who engaged us at Johannesburg, but we got no satisfaction. The names of the men who were fined and sentenced with me for refusing to work are Witbooi, our foreman John, Langwan, Willie Matchmi, Huly, Suadozis, Welamoti, and Josiah. These are from Comfurraba district. Pom-pom was the only one from this district, besides myself, who were fined. Amperdood, from Engebo, and others were also fined. Mr. Leary fined and sentenced me. The next is from Madoda alias Daniel. He states on oath: "I reside in Bangiso, Sanggu's location, and am the son of the late headman Sanggu. In December last I went to work at Johannesburg, having contracted for four months from Idutywa by Enoch Mamba, who told us that we were going to work on the railway road there. When we got to Johannesburg, one Ted Wilson received us from E. Mamba's foreman, whose name is Gleni Lobi, of Lota, Idutywa district. When E. Mamba contracted with us 93 men, he told us that we were to receive £3 per month and food, and he told us that we were to pay for our railway fares from our first month's wages that was due, 10s. from each man; at this time we were working at the railway line loading up trucks instead of digging, what we were told; we were several times beaten. I was beaten three times by Overseer McPhail, and once by Wilson. They beat

us—Wilson because we wrote to E. Mamba complaining of the ill-treatment. McPhail beat us without any cause, and remarked, that we are "Enoch Mamba's goats." On my third month I was paid 6s. short because a pick-axe broke while I was using it at work time and during the month of May, 1903, they deducted 4s. when they said it was for stamps on my pass." I have now before me the Cape of Good Hope Blue Book for 1903. The total Bantu population of the Transkei territories for 1902 was 832,371; for the same year the mixed races totalled 8,600. There is a report here showing the number of natives who had obtained passes to proceed to various centres in 1901-3, and I would like to get the exact figures on record. The total for 1900 was 56,813, the total for 1901 was 53,354, and the total for 1902 was 56,714. Proceeding to the Transvaal, in 1901 there were 47, in 1902 there were 3,799.

12,991. You gave us 8,000 in the first six months of this year?—Yes.

12,992. It is interesting to notice the number that left the districts to work in Natal. In 1900 it was 8,054, in 1901 it was 10,439, and in 1902 it was 12,289. You were speaking when we adjourned of the working of the Glen Grey Act, as it applied to your territories. Is there anything else you would like to say as to the operation of that Act?—I do not know whether there is.

12,993. We have heard a great many witnesses who advocate charging a ground rent on all natives in native locations as a means of inducing them to work more. I take it that one of the objects of the Glen Grey Act was to induce the natives to go out to work in larger numbers, and we would like to know whether in your experience it is having that influence on any natives? Is it working well now?—The Glen Grey Act, was, I think, intended in the first place to put as many natives on the land as possible, and they then brought in a sort of side-wind clause, called the "labour tax," which is intended to drive them out. It had, therefore, a two-fold intention, the illogical part of the whole thing is this. The Act is applied in the part of the territory which sent out the largest proportion of labour, and the portion that produced few labourers it does not touch at all. I will give you some figures and statistics from my own district, which is under the operation of the Act. The total population is something like 20,000, and at the highest you would have 5,000 able-bodied men. If you divide the total by five, you would only get 4,000. About 200 are owners of land and stock, and are thus beneficial occupiers. About 3,000 have this year gone out to work. You have thus every able-bodied male accounted for as having done work during the year. It is one of the districts where the Glen Grey Act is put into operation, and it was naturally unnecessary to introduce any legislation to act as a mild stimulant to the people. They should instead have stimulated the districts where the people are backward in coming forward, as one may say. It seems to me that the solution of the whole question of native labour is the question of the division of the land. You apply the principle of the Glen Grey Act and you put a limit to the giving out of the agricultural land. As I have said, when the supply of agricultural or arable land fails, the young men must go out to work. They must do so to procure a living.

12,994. Would you advocate the application of the policy to our own Colony here—the principles of the Glen Grey Act—despite the fact that the native locations are not overcrowded?—Of course I do not propose to go into the question of overcrowding. I would, however, advocate the extension of the policy everywhere as far as possible.

12,995. Would it mean breaking up the tribal system?—Yes.

12,996. If that were done, would not many evils result?—If you are to divide the country it would mean the appointment of a large staff of surveyors, and the work is very slow. In my own district there were some 4,000 allotments and we were surveying for over two years. Carrying out such a policy would involve a very long period of survey.

12,997. You have said that in your own district, where the Act is applied, practically all available able-bodied men go out to work?—Yes. They are occupied for a large portion of the year or go out to work.

12,998. Can you speak as to other magistrates and tell us what percentage of their able-bodied men can be or are employed?—No, in some of my districts they go out to work even better; in others, and in Pondoland, the labour returns are not so favourable.

12,999. Mr. QUINN: The sum and substance of your remarks is this. Given the natives and better wages, and better treatment, we will get more than enough?—Yes, that is practically what it amounts to.

13,000. Before the Industrial Commission in 1897, Mr. H. Jennings gave evidence on this very subject, and said, "Anyone wanting to encourage them to come to the mines, would have to give facilities for coming here, and make their lives as pleasant as possible, and pay them as much as possible." Would not these things be the best inducement to get the natives?—I think certainly that that is what you should do.

13,001. Mr. FORBES: You have mentioned that the natives get 2s. 6d. and 5s. 6d. per diem. Could they all find employment at these rates?—They have not at East London a sufficiency.

13,002. Hitherto, all that have turned out have found employment?—Well, hardly at a less rate of pay than that.

13,003. You mention the operations of the Glen Grey Act. It gives four morgen per family?—Yes, that is the limit. They have also the right of pasturing on land which is suitable for agriculture, and a right to the surrounding commonage, which is vested in Location Boards.

13,004. Mr. PHILIP: You give the estimate of males able to work at 100,000. According to the Blue Book, 66,000 were at work last year; I think that you mentioned five months as the average term of service?—Yes, five to six months.

13,005. That will give you 80,000 always going out?—I do not quite say that. I say that 40,000 have come out in six months of this year.

13,006. Going out for six months?—Yes.

13,007. Do you expect that the same number will go out?—I should estimate between 60,000 and 70,000 may be expected to come out.

13,008. That will only give you 34,000 able-bodied men to do all the work of the farms. Is it not a large number out of the population of 10,000?—The 100,000 is the able-bodied males. I did not include old men or young boys.

13,009. In Port Elizabeth and Capetown the pay is much higher?—I do not think so. At Port Elizabeth, I think, that it is 3s. 6d.

13,010. Of course the natives prefer to live where they like to being compounded. Have they, are they, in perfect freedom?—They are not compounded, but a location is provided for them.

13,011. They live in their own huts, and can do practically what they like?—Yes.

13,012. They are much nearer to their families?—Yes.

13,013. Do you not think that the weather would be an inducement in preference to the colder weather?—I suppose, as a matter of fact, that they never do get cold weather.

13,014. Would you not consider the Cape climate an inducement?—No, I have never heard that the weather was an obstacle to coming up here.

13,015. Is it possible to get a number of boys from your part if 66,000 leave it?—I think it is possible.

13,016. What number is possible in the near future?—Well, you see, it strikes me you are all asking for the immediate future. I think the thing must be allowed a little time to grow.

13,017. What would you say it would be in a couple of years?—I would say from 15,000 to 20,000.

13,018. Mr. EVANS: Do you not consider that the information contained in this Blue Book as to natives trustworthy?—To what do you refer?

13,019. Generally to the reports and statistics contained therein?—I think they are reliable.

13,020. I would like an expression of opinion from you of the statement made in the report of the Chief Inspector of Native Locations for 1902. It says, on pages 37 and 38: "The demand for native labour is greatly in excess of the supply, or rather the demand is greater than is obtainable. We have the natives in their thousands, but the difficulty is to get them to work at all, and, when working, to work continuously. This scarcity of farm servants is deplorable, as it is seriously handicapping the farmers, more especially the agriculturists, who in hundreds of instances are unable to produce even a third of what they would otherwise produce if labour were procurable. The queuseion of a labour supply for this Colony (I am not now referring to a supply for the Rand) is a most serious one, and is of very much more importance than many of the questions exercising the minds of our legislators, for unless the farms of our Colony can obtain sufficient native labour to carry out the necessary work on the land, a very large number of farms will be thrown out of cultivation altogether, whilst many others will only be partially cultivated, thus reducing the food supply. The cultivation of the land is of paramount importance to the public, especially in view of the large influx of population which is going on, and the high cost of the necessaries of life." So far as your information goes, do you think we can accept that view as correct?—That officer has nothing to do with the Transkei.

13,021. I am referring to the report of the Chief Inspector of Native Locations for the whole of the Cape Colony?—Yes, for the part where you have the bulk of the natives. If you will allow me to express an opinion on the remarks, they are, I think, intended to apply to farm servants, and he excludes the Rand.

13,022. If you will look a little later on, on page 39 you will see, "The same scarcity of native servants obtains in the towns; they are almost unobtainable." He is speaking of the Cape Colony apart from the Transkei. Can we accept that as correct so far as your knowledge goes?—Do you mean as to the scarcity of labour and the condition of farmers? I think it is so, and the reason is not far to seek. You have the mining companies paying £2 per month and food, and the farmer in the Colony can pay 10s. to £1 and give food. Well, the native is sufficiently astute to go to the place where he can get the larger sum of money.

13,023. Is that not serious for the farming industry?—Certainly.

13,024. I should like to direct your attention to another statement which appeared in a paper at the beginning of last month: "At a meeting yesterday of the Western Province Horticultural Board—Mr. Merriman presiding—the failure of the scheme for the importation of agricultural Italian labour was referred to, and discussion followed regarding the feasibility of importing Kabyles from northern Africa, Swiss or Frisians. It was finally resolved to call the attention of Parliament to the fact that the effort to import Italian labour had not been successful up to the present, and to express the hope that the same vote or an increased one would be passed by the House for the purpose of importing suitable agricultural labour from any part of the world that the Secretary for Agriculture might deem advisable." Now, I suppose, it is owing to the insufficiency of native labour that these efforts have been taken to import agricultural labourers from abroad?—The cause is the insufficiency of labourers coming forward; it is not necessarily because there are not labourers enough in the country.

13,025. It is the insufficiency of labour obtainable?—Yes.

13,026. Have you formed any idea as to the requirements of the Colony at all?—For labour, no. I have not compiled any statistics or formed any estimate.

13,027. You have suggested the possibility of the Rand obtaining in two or three years 15,000 or 20,000 labourers from the Transkei, but you have not taken into consideration the position in the Cape Colony?—With regard to these farmers, no, I have not.

13,028. But do you think it likely that the Colony will go on indefinitely allowing labourers to go out when their own people are suffering from the want of labour?—It is simply a question of payment. If these men can afford to pay the same as you are paying here, or the ports are paying, the labourers will go there, but a farmer or fruit grower wants a man to work all the year round, which the natives are not disposed to do.

13,029. You know what the position in Natal is, I suppose?—No.

13,030. That they have prohibited recruiting in Natal altogether. Do you not think it is possible that in time the farmers in the Cape Colony might also force the Government to adopt some such policy?—I do not think so. It is not likely, for this reason, that these labourers who go out bring enormous sums of money into the Cape Colony year by year.

13,031. That is into native territories, I take it?—Yes.

13,032. Does that compensate for the failure of carrying on agricultural pursuits, for the failure of these farmers to find sufficient labour to till the ground?—That is a question I can scarcely be prepared to answer off-hand; I suppose it might not.

13,033. There is a report in this book, I think on page 47, by Mr. Stanford. He states there on the top of the page, the approximate native population of the territories as 800,000, and taking one in eight as a fair average, 100,000 is arrived at as being the approximate number of adult males capable of manual labour. From this must be deducted the men engaged in work in their own homes, the care of their families, the care of cultivated lands, carriers on their own account, those engaged as drivers or leaders by European carriers, workmen and servants in towns and farms, and labourers. On the Transkeian territories perhaps six months will be a fair estimate of the average period of service? Do you agree with that?—Yes, practically.

13,034. Can you give any rough estimate of the men that must be deducted as being engaged in work in their own homes, etc.?—I could not give you anything like an approximate idea even of that number. I myself should not be disposed to deduct any, because I consider that this 100,000 is a low estimate. It is arrived at by taking 1 in 8, which is a low figure. When I put down an estimate of 100,000 I estimated that these would be actually available for work.

13,035. Do you think that the percentage of able-bodied men would be greater, for instance, amongst Kaffirs than among the French or Germans? We have exact figures as to these percentages. How do you think the Kaffir population compares with them?—I think very much the same.

13,036. Well, in their case it was something like 1 in 10 or 13?—That is when they call out the whole population.

13,037. Yes?—I do not think there is any material difference in the proportions of the sexes between natives and Europeans.

13,038. Then that would seem to indicate that Mr. Stanford's estimate is a pretty generous one?—Certainly, I think that is so.

13,039. You gave an instance, I think, in your own district of a rough estimate of how many able-bodied men there were there, how many were occupied locally, and how many were able to go out?—The number able to go out, it was. The number who actually did go out was something like 3,000.

13,040. In a population of 20,000?—Yes, so that according to your figures there were more than 1 in 13.

13,041. Yes, but of course they might go out twice?—That is very unlikely. From the district of Butterworth, there were 2,700 in 1900, and 2,100 in 1901, about 1 in 10 of the population. I see the return for labour in 1902 does not seem to be published yet.

13,042. Well, take the figures you gave to the Chairman just now; that is quite near enough, I expect. Now, out of the 25,000 able-bodied men, how many do you consider would probably remain at home?—This 2,000, I think, were quite entitled to remain at home.

13,043. That would be 40 per cent. of the able-bodied men. Do you think that is too much? How much per cent. do you think we should deduct from these figures of Mr. Stanford's as the number that should remain at home?—I think very little.

13,044. 20 per cent.?—I should certainly not deduct more than that, if so much.

13,045. He seems to give the impression here that it does not amount to a considerable percentage, to judge by the way he enumerates the work they do?—Well, you see, he is speaking for the whole of the native territory. I am speaking of figures which I have compiled from my own district.

13,046. Yes, but your figures are, at any rate, 40 per cent.?—Yes, that is upon my estimate of 5,000 able-bodied men out of a population of 20,000. If you apply your own principle of 1 in 13, of the men recruited, how many is it?

13,047. 2,000, roughly?—Less than that considerably. I said out of 20,000, not out of 25,000.

13,048. Say 1,400?—Well, then, the number you estimate, instead of that 2,700, would be 2,100. There are already close on 3,000 that have left the district, which gives you more than your 1 in 13.

13,049. Are you certain of your population figures?—Practically certain, yes.

13,050. Do any native workmen go out twice?—Very seldom in one year.

13,051. That seems to indicate, then, that there is a much larger proportion of able-bodied men among the native population than among a European population?—It would have that appearance if you give the proportion of Europeans at 1 in 13.

13,052. I said 1 to 10 in one case, and 1 in 13 in another?—Yes.

13,053. Now you are of opinion that the extension of the operations of the Glen Grey Act or a modification of it will in the near future send out a considerable number of natives to work?—Yes.

13,054. Have you formed any estimate as to how many will go out, say, in four years' time?—No, it is impossible to form an estimate of that kind.

13,055. But is that not likely to be a very slow process?—It is likely to be slow, yes.

13,056. How many labourers would it add to the labour market per annum?—It is impossible for me or anybody to say.

13,057. You have formed no estimate?—None.

13,058. Do you think it will be a considerable number?—Yes, a considerable number, and as the years go on it will be a growing number.

13,059. Sir GEORGE FARRAR: In reading your statement one would gather that you are of opinion that the natives in Johannesburg on the mines are treated very badly; in fact, worse now than before the war?—I do not give that as my opinion; I give it as current rumour.

13,060. Amongst natives?—Yes.

13,061. In your official capacity, how many cases of ill-treatment have you had to represent to the Government here or to the Commissioner of Native Affairs?—I have not had to represent any.

13,062. You have now represented two cases against the Railway Department?—I have not represented them; they have been put in here as evidence.

13,063. And they are the two direct cases you had before your notice?—It was brought forward by a man who has come up here to make enquiries into the treatment of native labourers.

13,064. Any grave cases you would represent yourself?—I do not know that I would.

13,065. Now, you know, there is a recruiting agency called the Witwatersrand Native Labour Association?—I have heard of such.

13,066. They recruit in your territory, I believe?—I do not know that they are recruiting there just now.

13,067. They have got in the Cape Colony a District Manager?—I do not know that.

13,068. Do you know that the instructions to the District Manager are that in every case of alleged complaint of ill-treatment he is to make the fullest enquiry and report to the Association here?—No, I do not know that.

13,069. Now, I believe in 1898, 18,000 boys came from your district to work here?—Well, the figures for back years are given in these Blue Books.

13,070. A considerable number has come up this year, and you know that the mines pay the railway fares of the boys they recruit there, and do not deduct them from their wages?—I know that in many cases the boys have been told that.

13,071. Do you think, then, that they recruit them down there, and tell them that the money for their fares will not be deducted, and that in many cases it is deducted afterwards?—So far as I am aware, what has been done is this. They have been told that their fares will be paid if they work for five or six months, but if they do not work for that time it has been deducted.

13,072. But the contract is signed before your officials?—It is not the custom. I have not signed a single contract nor seen one signed.

13,073. Then there is no form of contract signed in the Transkei?—I have signed none. The natives object to signing contracts. They prefer to come up here on their own hook and obtain employment for themselves.

13,074. Do you know that between 8,000 and 9,000 boys from your territory are now working on the mines on a six months' contract?—I know that that number has come up.

13,075. Now, if there is such a demand for these boys in East London and Capetown, where they can get as much as 5s. a day, is it not rather strange that they should come here to work?—A man will always go where he has been before to work, and has become acquainted with certain employers.

13,076. Do you know that the Cape Colony natives will not work underground?—I have heard that statement made, and I have heard it contradicted.

13,077. Do you know that there is a differential payment for a surface boy and an underground boy?—I am quite aware of that.

13,078. Mr. Stanford states that if the average for January and February he maintained throughout the year the number employed will exceed 100,000, etc. I suppose that is a fairly correct estimate?—Well, if there are only 100,000, how can you exceed that number.

13,079. But you told us that this number left your district every five months of the year? That would mean that 50,000 are continually in service?—Yes.

13,080. Mr. DONALDSON: From the numbers that left the Transkei, and you have the returns of those going beyond its borders for work, is there any proportion of women among that total?—These figures refer entirely to men. The women are not included here at all. They do not get passes to go.

13,081. The CHAIRMAN: Is there anything else you would like to say?—Nothing else, thanks.

13,082. The Commission is very much obliged to you.

Mr. F. H. P. CRESWELL, called, sworn, and examined.

13,083. The CHAIRMAN: Sir George Farrar hands in a report signed by Messrs. Price, Skinner and Spencer.

To Messrs. Sir George Farrar and Hennen Jennings.

Gentlemen,—After careful consideration of the reports and figures submitted by Messrs. S. J. Jennings and F. H. P. Creswell relative to the labour employed by the Village Main Reef Company, and its effect on the general working of that mine, and after a thorough personal examination of the surface and underground workings, we are of opinion:

1. That to introduce unskilled white labour on the mines in place of natives, in its entirety is impracticable, and would mean the cessation of profitable work in most of the mines in the Witwatersrand.

2. Whilst deprecating the universal employment of unskilled white labour, we are of opinion that it can be beneficially used in the following departments, and for the undernoted classes of work. Care should, however, be taken that an incentive should be held out to the unskilled man to better his position in proportion to his efficiency. In the departments mentioned underneath, this in the ordinary course of things would follow, for we believe that good workmen in these departments will always be in demand.

(a) Underground.—Rock-drilling: As many unskilled men as possible should be trained to run rock-drills (all due precaution as to health being taken). These men eventually to be numbered as efficient rock-drill operators in the fields.

A limited number of unskilled men might also with advantage be employed in charge of mechanical underground haulages, platelayers' and pipemen's helpers, and as onloaders at stations.

(b) Surface.—We think it would be advantageous for the industry to employ white labourers in main engine installations as engineers' assistants and cleaners, in mills for the feeder and cam floors and in oiling. White men might also be employed at a low initial wage around crusher stations, and at sorting tables young white boys could be advantageously employed especially in the neighbourhood of towns. In the carpenters', fitters', and blacksmiths' shops, we urge that the principle of properly indentured apprentices be adopted, which, whilst releasing to a certain extent the native attendants, would largely assist the training up of youths to useful trades.

In the above noted departments of work, there could, in our opinion, be little difficulty in keeping the white and native element separate while at work, and in each of these classes of employment, the incentive to work, with the prospect of bettering the men's position, would not be wanting.

We consider that by the adoption of such labour in the foregoing departments, and with the mechanical labour saving appliances, the present high estimate of the needs of the industry as regards native labour would be considerably reduced; for instance, in a mine where rock-drills can be used in the majority of stopes, we say that to run 100 stamps and to do the necessary development 1,000 to 1,200 natives, together with 125 to 150 skilled whites and 75 unskilled whites, should suffice. (These unskilled whites do not include lads on sorting table.)

These opinions are advanced on the assumption that the native labour available, or rather procurable, falls far short of the present, and for some time to come, estimated requirements; but should the contrary be the case, the position would be entirely altered, as we consider that notwithstanding inefficiency, and other disabilities in its employment,

native labour, at anything near the present rate of wages, is much the cheapest and most profitable tool for the working of these mines.

If unskilled white labour is adopted to the extent outlined in the foregoing, mines should be in as good a position as regards profits, as in 1899.

We think the present shortage in the native labour supply has been beneficial at this time, inasmuch as it brings home to the management, and those concerned in the economical working of the mines, that other conditions being the same, a like amount of work can be done by fewer natives than was formerly deemed necessary. The strict enforcement of the liquor law has been of great assistance to the mines in this respect.

In conclusion, while not agreeing with Mr. Creswell, we highly appreciate the thorough manner in which he has endeavoured to augment the limited supply of natives at his command by the intelligent use of unskilled white labour, and we consider that his present ideas for the distribution of this labour underground, cannot be improved on; although his efforts in this direction during the past few months have certainly been disappointing, mainly through attempting too much in introducing this labour in departments to which it is impracticable.—Respectfully,

(Signed) C. J. PRICE,  
H. R. SKINNER, } Committee.  
C. H. SPENCER, }

Johannesburg,  
4th November, 1902.

13,084. The CHAIRMAN. Mr. Creswell, you are manager, I think, of the Village Main Reef Company?—I am.

13,085. Previous to occupying that position, you were manager of the Durban Roodeport Deep?—Yes.

13,086. How long have you been manager of the Village Main Reef?—Since December, 1900.

13,087. How long were you manager of the Durban Roodeport Deep?—From March, 1895, until the war broke out.

13,088. You remember the number of natives you had in your employment when you went to the Durban Roodeport?—We had none at all. We were starting sinking shafts and had to accumulate for ourselves.

13,089. Were you short of labour?—Yes, more or less. In the very early part I do not remember any serious shortage. In fact my recollection is that the importation fee of 1*l.* was rather excessive, and the few boys that I required did not necessitate my buying any.

13,090. But the last year or two?—We were certainly short.

13,091. Short of many?—We had 1,100 in 1899; we wanted, I think, 1,500.

13,092. You have before you this statement headed "Evidence of Mr. Creswell." Do you hand that in as your evidence-in-chief?—I do.

13,093. With it you hand in four tables?—Yes, I have them here.

13,094. Evidence of Mr. H. P. Creswell.

I used white labour in 1896 and 1897 in sinking two shafts at the Durban Roodeport Deep. The results were there satisfactory. Some time before the war, in response, I believe, to an appeal from the authorities, many mines endeavoured to give work to indigent burghers. Some of these were sent to me at the Durban Roodeport Deep, but were not a success, chiefly, I think, because they considered that they were sent to the mines as a convenient way of providing for them.

From June 1902, to March 1903, I used a considerable amount of white unskilled labour on the Village Main Reef. Its use was discontinued so far as general labourers were concerned in the latter month, my directors being of opinion that its use was not profitable.

Since that the only departments of the work in which white labour has continued to be employed where formerly native labour was used are the following:—

1. On development driving with rock-drills.
2. On stoping with rock-drills.
3. In the mill.
4. In the cyanide works, excluding the lowering and discharging of tailings.

These are consequently the only departments in which I can testify to the results obtained after a sufficiently long use to enable conclusions as to permanent results to be drawn.

1. Development Driving.—I am now employing only white men on this work, and it is all done on contract. White helpers are employed, and their wages, 10s. per day, are charged against the contractor. For purposes of comparison I have extracted from the company's records the contract cost of driving on the reef in May, June, July, and August 1899, in the same drives as we have been driving in May, June, July, and August, 1903.

A comparison between the contract cost in these periods is given in Table No. 1.

2. Stopping by Machines.—With the exception of one stop, the whole of our machine stoping is done by white men. Helpers on this work commence at 8s. 6d. a day.

Contract work was started in this work in the middle of June. In that month 15 per cent. of the machine stoping was done by whites on contract; in July, 64 per cent.; and in August, 76 per cent.; while in September I anticipate that the contracts will account for about 85 per cent. of my fathomage. I have, therefore, in Table No. 2 compared the machine stoping in July and August, 1903, with that in May to August, 1899, so far as the records of that period permit.

In a few cases some of the men who tried contract have failed to make fair wages, and in certain of these cases a certain amount was paid by way of bonus to carry them on. Such cases, both in the 1899 period and the 1903 period, are classed apart under the head of "Contracts made up," and such added money is included in the total cost.

There is no record in the 1899 period from which the cost of stoping by day's pay can be got.

This work, if any was done, would have been more costly than by contract. Neither is there any trace of any stoping having been done by machines on the Main Reef Leader.

In comparisons as to costs, therefore, the contract machine stoping on the South Reef has been taken as the basis.

The average rates of net wages per shaft earned by contractors on development during the last six months stands at 22s. 9d. per shift, and on contract stoping during the last three months 18s. 1d. We have been continuously increasing the number of machines at work both on development and stoping, and new hands have had to be taken on and trained.

The great majority of the men working on contract to-day are men who have learned their work during the last year, although now occupying the position and drawing the pay of skilled men.

I anticipate, therefore, an improvement on present results as time goes on, both in respect to the cost of the work and to the men's earnings.

Except in a few cases, each contractor works one machine.

3 and 4. Mill and Cyanide Works.—In the mill we are at present using no natives at all.

In the cyanide works, excluding the lowering and discharging of tailings, only one native is permanently employed.

Learners at a low rate of pay, viz., £12 10s. per month in the mill, and 50s. per week in the cyanide works, are employed instead.

Table No. 4 gives a comparison between the labour costs in these departments in this mine in July, 1899, and July, 1903.

From Tables Nos. 3 and 4, which give the results in the only portion of the work in which the records supplied the necessary data for the calculations to be made it is seen:—

That the cost of driving, so far, has been greater, and the cost in stoping less, than for similar work in 1899.

That, taking the contract work, driving and stoping on the South Reef together, the actual contract cost was 7s. 0·6d. per ton mined in 1899.

That on the basis of theoretical calculations as to the cost of the white labour made by the Consulting Engineers in statement prepared for Mr. Chamberlain (Exhibit 20 of that statement) and stated to be based on assumptions unduly favourable to white labour, the cost with white labour in 1903 should be 1s. 4·7d. more per ton mined than in 1899.

That in actual practice it is found to 3·2d. per ton less than in 1899.

That in the mill the labour costs were in 1899 4·83d. per ton. That on the same theoretical reasoning it should with white labour be costing 0·77d. per ton more than in 1899.

That in actual practice it costs with white labour 0·53d. less per ton than in 1899.

That in the cyanide works it should with white labour, by the same theory, be costing 2·2d. per ton milled more than in 1899.

That in practice it is found to cost 0·38d. per ton less than in 1899.

These figures show that the conclusions arrived at theoretically by the consulting Engineers are not borne out in practice, and the Commission may judge for themselves as to the value to be attached to such theoretical statements.

A comparison of the gross results of work in this mine in two periods of 1902 has been laid before you and deductions wholly misleading were drawn therefrom as to the cost of white labour in the latter period.

As a contra picture bearing on the question of the economy of white labour, I beg to set before you the following:—

	March and April 1902.	July and August 1903.
Tons crushed - - -	18,980	35,600
Value per ton - - -	£10/3·07	35/2·5
Total cost - - -	£24,435	£41,821
White labour costs - - -	£8,234	£13,134
Native labour costs - - -	£3,516	£7,422
Total cost per ton - - -	25/9	23/6

If I wished to imitate a previous witness, I might say, "Or in other words by the use of white labour on the milling of 35,600 tons, the Village Main Reef Company has effected a saving of £4,000." These figures, however, are merely set before you to expose the fallacy of comparing the results in two periods unless all the differences in working conditions in these periods are taken into account and their effect on results numerically expressed and calculated on.

To do this is excessively difficult, and I beg to state that in the calculations which follow it is not pretended that all such different circumstances are exhaustively allowed for.

All I wish to do is to demonstrate the alterations in deductions which follow from the elimination of a few only of the varying factors.

Some of the differences affecting the above deductions which have to be accounted for are:—

1. The fact that in 1902 we were sorting, and in 1903 we were not sorting.
2. That in 1903 the cost per shift of native labour was nearly 66 per cent. higher than in 1902.
3. That during the 1902 period we were availing ourselves of rock lying broken in the stopes, in the

mining of which we incurred no cost, while in 1903 we had no such reserve rock to draw on.

A rough and ready method of arriving at the eliminations to be made for non-sorting and no reserve rock is facilitated by the fact that the tonnage of the reserve rock used in the former period can be taken as about the same as the tonnage of waste rock then sorted out.

If, therefore, we deduct from the total cost for March and April, 1902, the cost of shovelling, tramming, hoisting, and sorting out 5,405 tons (the amount of waste rock sorted—taken also as the amount of reserve rock) we shall get a figure from which the differences due to non-sorting and to reserve rock are more or less eliminated.

If further, we add to the total cost the percentage of native wages required to bring these up to an equality with the rates now prevailing we shall have eliminated that difference also.

In March and April, 1902, the cost of shovelling, tramming, and hoisting 24,385 tons was £3,809 16s. 6d.

The proportional cost on 5,405 tons was  
therefore... .. £844  
The cost of sorting out 5,405 tons was ... 275

Total deduction to be made from total cost  
therefore ... .. £1,119

The total native wages in the above period  
were... .. 3,516

Deduct native wages on 5,405 tons in above  
accounts... .. 337

Difference ... .. £3,179

65 per cent. of £3,179, equal to £2,066, must therefore be added to the total cost of March and April, 1902.

The figures now stand as follows:—

	March and April 1902.	July and August 1903.
Tons crushed - - -	18,930	35,600
Total costs as corrected -	£25,382	£41,821 (actual)
Total cost per ton - -	26/9	23/6
Total cost of crushing 35,600 tons at same rate as corrected cost in March and April, 1902 - - - -	- - - -	£47,608

The saving due to the use of white labour would now appear to be £5,785 on the crushing in July and August.

I wish, however, explicitly to state that this is not given as being the true figure representing the actual saving effected during the two months by the use of white labour.

To arrive at the exact figure from a comparison of the two periods would require a most exhaustive analysis of all the differences in working conditions which I could not afford the time to undertake.

Attached to this statement are:—

Table No. 1.—“Comparison of contract costs of driving on reef, 1899, with natives, and, 1903, with whites.”

Table No. 2.—“Comparison of Machine Stopping, 1899, with natives, and, 1903, with whites.”

Table No. 3.—“Comparison of total cost per ton mined of machine drills contract work of South Reef, 1899 and 1903.”

Table No. 4.—“Labour costs mill and cyanide works, July, 1899, and July, 1903.”

13,095. You state that you sunk two shafts on the Durban Roodepoort with white labour?—I sunk part of them with white labour.

13,096. The results were satisfactory?—Yes.

13,097. Can you give the Commission any information as to what you mean by that? Will you deal first with efficiency and then with cost?—I do not know that I have all the papers here, but I have some of them. I have the figures for 1896. To the best of my recollection we began using white labour in April. In one shaft we had all plain sailing and no water, but in the other we were continually stopped by the water being in excess of our pumping capacity. In the straightforward one we sank in six months 726 feet, or at the rate of 121 feet per month, the maximum month being 135 feet, the greatest rate of sinking then accomplished on these fields. Labour gave some trouble, but the advantage I found from it was in regulating my work so that no time was lost. Our shifts were working on the bonus system, and each shift did its own work and succeeded in the ordinary rotation.

13,098. Had you any means of comparing this work with native labour?—Only with what we previously had.

13,099. I see that these are merely gross figures?—Yes, I do not know that you should attach too much weight to them. In January, the month of the Raid, we sunk 23½ feet at a cost of £53 12s. 3d. per foot; in February 73½ feet at £20 12s. 7d.; in March, 99½ feet at £20 5s. 2d.; in April, 37 feet at £39 13s. 1d.; in May, 110 feet at £16 5s. 7d.; in June, 106 feet at £17 18s. 10d.; in July, 131 feet at £18 1s. 2d.; in August, 121 feet at £17 4s. 6d.; in September, 135 feet at £18 9s. 11d.; in October, 123 feet at £17 15s. 6d.; and in November, 34 feet at £28 13s. 3d. The white labour, as far as I can judge from these figures, fell as follows:—In March, native wages were £200, and the white £650; in April, native wages were £109 and white wages £489; in June, native wages were £49 and white £840, from which I take it that the transition was complete in June.

13,100. Have you the average cost of sinking with natives?—I have not.

13,101. What did sinking with white labour cost?—I have not got the average cost here, but I can easily let you have it. I would point out that in such a matter as shaft sinking the whole cost per foot is divided over the number of feet sunk, so that the chief cheapness arises from the rapidity of sinking.

13,102. And you wish the Commission to understand that by using white labour you overtook a greater footage than by using native labour?—Certainly.

13,103. At the Village Main Reef, from June, 1902, to March, 1903, the period covered by your statement, you used a considerable amount of white unskilled labour?—That is not the period covered by my statement; that is the period omitted.

13,104. Previous to March, 1903, you were using white unskilled labour on the property?—That is correct.

13,105. Was that profitable as compared with native labour?—There was a great deal of difference of opinion on the subject. In my opinion it was the most profitable way to dispose of the labour supply available. The directors were otherwise advised, and I carried out orders. I wish to point out that in that matter I do not wish to imply that it is cheaper to run your surface with white than native labour, but that with a given amount of native labour it is more profitably employed underground than scattered about the surface.

13,106. Is it better under control?—No, but you are producing more gold that way, which is the object of your mines.

13,107. Since then did you have to confine your work to unskilled labour to development, driving, etc.?—Yes.

13,108. Now, in the development driving, can you state to the Commission the comparative results obtained while using unskilled white labour as

compared with native?—I have done so in these tables, which show those figures.

13,109. No. 1 shows comparison of contract costs of driving on reef, 1899, with natives, and 1903 with whites? That table is divided, I think, into work with native labour supervised by whites and into all white labour?—It is. It would not be a fair estimate except when taking like with like, which I have endeavoured to do.

13,110. Referring to "A" at the top of the page, this 40/2 was the average rate of driving on the south reef by native labourers supervised by whites on the ordinary rock-drill with one white man to two or three natives?—Yes.

13,111. There is, then, a saving in expenses and the natives are costing you more?—They would be if we had them.

13,112. Then what is the comparative figure to-day using white labour?—It costs more, 42s. 11d. as compared with 39s. 11d. per foot driven, as 9'55d. as compared with 7'99d. per ton developed, or a matter of 1½d. per ton, or a matter of 6s. or 7s. per foot.

13,113. What does "C" mean?—"C" refers to the evidence upon the theory propounded by the consulting engineers that the cost of white labour for running the mines as compared with natives, making no allowance for the difference in cost between now and before the war, is to be arrived at by taking every native shift and substituting for every two native shifts one white shift at 12s. a day, and it is stated there what would be the loss to the mines if using all white labour. I have been at some pains to show it that way, and I have been able to compare like with like, without which it would not hold water.

13,114. Where is that theory propounded?—In the statement to Mr. Chamberlain put in in your evidence; it is called "Exhibit 20," and is on page 21 of that statement. On page 21 it is stated thus: "Suppose white labour were insisted upon by owners of rich mines and only whites were employed at a minimum wage of 12s. per day Exhibit 20 shows the detailed calculation on the basis of the wages paid in 1899 when whites received about the same as at present, but the natives 2s. 4d. per day with food. Granted that the 12s. white man may do twice as much work as the average Kaffir. Even with these favourable assumptions with white men, it is seen that the average cost per ton would be increased 10s. 1d., that 50 per cent. of the mines would be worked without profit, and the remainder would reduce their dividends 4½ per cent."—Now I turn to this table here, this Exhibit 20, and you will find it is compared with this calculation as follows: The cost of native labour employed is given, the cost of European white labour to replace native labour. The total cost of native labour in 1899 is given. The total working costs in 1889, less the cost of labour. Then the theoretical cost of labour is added to that total cost, bringing out a new theoretical total, which averages 10s. 1d. higher.

13,115. Per ton?—Yes, per ton. That is on the whole working of the mines. I pointed out here in such cases where comparison is able to be made, so far from 10s. 1d. being borne out in practice, it actually cost less per ton.

13,116. What are the supposititious figures in this theoretical evidence?—The supposititious figures are made on the men employed, white men at 12s., and that the fact of employing a white man has to be calculated, is calculable on this value, that you can arrive with all the changes of your organisation and all the reactionary effect it may have upon your skilled labour by simply making an arithmetical calculation of substituting one white man at 12s. per day for two native shifts, and establishing a current cost upon this; that is a basis which I consider wholly fallacious.

13,117. And in support of that view that it is wholly fallacious, you give your own experience?—I point to my own experience.

13,118. In which table do you show your experience?—On page 3.

13,119. Table 3 or page 3?—Page 3 of my statement, I summarised those statements. Table 4 is a comparison on that basis on the mill and cyanide works.

13,120. And the net result of that is expressed on the prices per ton?—It is expressed in the cost per ton. If calculations be made it is found that the cost of driving so far has been greater and the cost of stopping less than in 1899 actually, but, taking the contracts for driving and stopping the south reef, it shows that the actual contract cost was 7s. 0' 6d. per ton mined in 1899. That, on the basis of theoretical calculations as to the cost of white labour made by consulting engineers in statement prepared for Mr. Chamberlain (Exhibit 20 of that statement), and stated to be based on assumptions unduly favourable to white labour, the cost with white labour in 1903 should be 4' 7d. more per ton mined than in 1899. In actual practice it is found to be 3' 2d. per ton less than in 1899.

13,121. And you argue, then, that these figures show that the conclusions arrived at theoretically by the consulting engineers are not borne out by facts?—I argue that when they can be put to the test of practice, they entirely fail.

13,122. Then the practice you are referring to is your experience on the Village Main Reef?—Yes.

13,123. For how many months are you basing that experience?—I am basing my results on June and July, which are the best months I have arrived at so far. I have done that because I am comparing a system which is in its infancy with one which is, one may say, a system which has been evolved in the whole history of the fields from 12 to 14 years; therefore I wish to avoid, as much as possible, judgment being passed upon another system which is in course of construction, so to speak. I point out the results actually obtained here, as I have already pointed out. I look upon it as by no means final. Certainly I anticipate a very considerable improvement upon that.

13,124. You do not think it would be fairer to take the average results over a longer period than to take the two best months?—I do not. They are the two most recent months. I am quite willing to take any two future months. Improvements are going on, and I wish to give the Commission the last figures.

13,125. As bearing upon the contra picture upon the economy of white labour, you give a statement at the top of page 5. What do you want us to draw from that?—This was put in, because in previous evidence I saw figures quoted as regards the Village Main Reef, which I consider of a most misleading character, leaving an impression as to the cost of white labour, which was absolutely erroneous. I put this in in order to show partly that very different deductions may be drawn if the periods were taken; partly to show the figures in a lump, if there is any desire to arrive at a fair conclusion, it is impossible simply to take your lump figures and by the application of the rule of three to arrive at a result. They must be analysed, and when you eliminate elements of difference very different figures may be arrived at.

13,126. You say these two statements you give here at the top of page 5 indicate that "by the use of white labour on the milling of from 35,600 tons the Village Main Reef Company has effected a saving of £4,000?—That is taking it in the same crude rough way as the figures previously laid before you were taken.

13,127. You do not claim that for the use of white labour?—I expressly state that I worked it out to a figure of £5,785 and I state on the last page that this "is not given as being the true figure representing the actual saving effected during the two months by the use of white labour. To arrive at the exact figure from a comparison of the two periods would require a most exhaustive analysis of all the differences in working conditions, which I could not afford the time to undertake." It is not a thing to be done at all to draw a deduction by taking the lump figures and just applying the ordinary rule of three arithmetic.

13,128. What are some of the differences you refer to which must be considered?—For these two periods there would be such differences as the time our boys had been with us, and then the position I was in. One of the chief difficulties, for instance, was to get steam enough to run my plant, whether I was on a steam limit or was in easy circumstances and working economically in other departments, and so on.

13,129. The question of sorting you refer to?—I did refer to that. I endeavoured to eliminate these two things, but there are many other factors.

13,130. The Commission has had considerable evidence placed before it with regard to this white labour experiment on other mines on the Rand. How do you account for your experience being very different from that of all the other evidence given us on this question?—You ask me for my opinion?

13,131. Yes. It strikes the Commission as somewhat peculiar that your experience should differ so greatly from that of, I may say, practically all the engineers who have given evidence before us?—Well, I must give you my opinion as it is. I anticipated some such question. The first is that the conditions under which this white labour experiment has been carried on have been most unfavourable to its success. The reasons which are wholly, I beg to state, a matter of my own opinion, and which I believe to be formed in the same way as most opinions, are as follows:—I am of opinion that the consensus of expert opinion laid before you against white labour is largely due to the following causes: (1) That the financial authorities at home viewed it at the outset with disfavour, being afraid that the employment of a large number of white men as labourers would make the labour element too strong a factor in economic questions, and when representative Government was given in political questions. (2) That the leading experts, besides being naturally influenced by these ideas on the part of their employers, had made the success of their careers here on the old cheap, inferior labour system and would be reluctant to admit that a new departure must be made if any way of perpetuating it were possible. (3) That in these circumstances all arrangements and results adverse to white labour would be welcomed, while those on the other side would be combated and sifted with a view of proving them fallacious. It does not, therefore, seem to me surprising that, approached in this way, an experiment requiring careful handling and resolution to overcome difficulties as they arise should in many cases have been pronounced a failure. I would add that there are other causes. I have heard of another mine in which the use of white labour is being, with comparative success, carried on.

13,132. Is the evidence laid before you?—I must be excused if my memory be incorrect, but I remember noticing that the reference to the Mining Committee was to ascertain information as to the excessive cost of white labour on a number of the mines. There appears to be an absence of any desire to get any place where economy had resulted from the use of white labour, and that is the reason why I submit to you why my experience may have been different from others laid before you.

13,133. Do you suggest, then, that other engineers and managers have approached the subject with a preconceived idea that it could not be successful?—I think a great many of them did. I think many approached it with a preconceived notion that it might succeed, but found it hardly worth while making it succeed. They have simply to say, "It is no good," and there is no one to say, "You must make them do because there is nothing else." It is a very different matter indeed to the attitude with which you would approach it if you saw you had to make it do and it has to be done.

13,134. Have you read the evidence given before us last week by Mr. Price?—I have.

13,135. Mr. Price, I understand, was a member of the Committee, which Committee of three mining managers was appointed to inquire into your experiment at the Village Main Reef?—They were.

13,136. Mr. Price told us, I think—we had not then the report before us which those mine managers submitted to Sir George Farrar and Mr. Jennings—he told us that the experiment was unfavourable?—Yes, I believe he did.

13,137. I cannot give you the question and answer in which he expressed that to the Commission, but I think he was asked if there were any circumstances which had not been taken into account in order to explain the difference in the working costs at your mine between white and black labour?—I do not quite understand.

13,138. Here is the question. It is No. 10,853. Mr. Donaldson asked, "As to these experiments you speak of your comparison of the two working periods on the Village Main Reef, are there any circumstances you have not mentioned here which should be taken into account in order to account for the difference in the working cost?"—The reply was, "Not that I am aware of." I wish to state that there were the following circumstances not mentioned by the witness, which should be taken into account in order to account for the difference in the working cost:—(1) That in the former period a large amount of reserve rock was being used, and in the latter a very small amount. This reserve rock was free of cost as far as actual mining was concerned. (2) That out of 750 boys, 320, 42·6 per cent. left between July 20th and August 4th, and were made up in batches, 287 to August 7th and the remaining 43 later. (3) That the great increase in our white men took place in July and August, as the following figures show:—

March	-	-	167	white men employed.
April	-	-	162	do.
May	-	-	208	do.
June	-	-	241	do.
July	-	-	389	do.
August	-	-	481	do.
September	-	-	266	do.

That all these and other points of difference were detailed in my letter to Messrs. Price, Skinner, and Spencer, dated October 28th, 1902, and that therefore witness was perfectly well aware of them. I may mention further as affecting this matter, that on the 25th of September all my machine men were out on strike, which made it rather a disastrous month.

13,139. On the 25th of September of last year?—Yes, it was one of these months taken into account.

13,140. Have you before you the report which these mine managers submitted?—I have, I believe.

13,141. Is there anything you would like to say to the Commission with regard to it in addition to what you have said?—I do not think so. I cannot say I agree with it. I do not think they went far enough. They went a fair way towards the position I was endeavouring to establish, but they did not go as far, I think, as should be done at all events.

13,142. Mr. GOCH: On your table No. 1 you give two periods. Can you tell me whether this is in connection with driving on the reef in 1899 with natives and 1902 with whites—the drives were of the same width?—Yes.

13,143. Practically the same?—Yes.

13,144. Reducing the actual cost to that condition of things which you found it would be to fit the comparison in 1903, you arrive at 35s. 11d. That is the cost per foot?—Yes.

13,145. As against 42s. 11d. done by white men?—Yes.

13,146. The difference, therefore, is 7s. on the main reef leader. Take the same comparison, that is under the main reef leader, the difference is 7s. 8d. per foot?—Yes.

13,147. Thus in drifting the cost of employing white labour in that work is a good deal more than employing natives supervised by whites?—I would point out this, that in the former period they were natives supervised by skilled whites. In the majority of these cases the work is done by white partially skilled men trained within the last comparatively few months. White labour, I quite

admit. I have given you here this case showing the increase in cost, but what I wish to point out is that I do not by any means despair of getting the cost down. As my men become more skilled, I anticipate getting the cost down to the modified rate. Actually it is so, but I have not got the benefit of the same skilled work as in 1899.

13,148. You attack the theoretical table given to Mr. Chamberlain?—I do.

13,149. I presume that table is based upon a fair comparison on all conditions both for the white and native labour?—I am afraid I cannot agree with you, Mr. Goch.

13,150. The comparison in the same period, taking the wages at the relative difference as they would exist at the time?—I do not quite follow you.

13,151. Well, at any rate you attack the theoretical evidence given, and you shew in your table that if the driving with white unskilled as per theoretical evidence under "C" of your table No. 1. That is 10s. 8d. more than was the cost on the south reef under "B"?—Exactly.

13,152. On your own shewing, the actual differences has been 7s. The theoretical evidence is therefore not so very far out, the difference is only about 3s. 8d.?—3s. 8d. is a great big lump, out of 10s.

13,153. Well, at any rate in endeavouring to upset the theoretical evidence on your own shewing they are not very far wrong for this particular class of work?—Not that particular class of work.

13,154. And do you not think they come pretty nearly right. They are at present within 40 per cent. On the main reef leader you give the cost of driving with white unskilled labour, as per theoretical evidence as 42s. 8d.?—Yes.

13,155. Why should it be so much less when the reefs are the same width?—It is easier ground.

13,156. There the cost is 9s. 1.3d. more than shown in "B," on the main reef leader?—Yes.

13,157. Whereas the cost on the main reef leader compared with the actual cost for white labour is 7s. 8.1d. The difference, therefore, is 1s. 4d.?—Yes, in the driving; we are not doing as good work relatively as we are in other parts. That, as I say, is incidental to the licking into shape of a system where I have comparatively little help from the old skilled hands.

13,158. At any rate the theoretical costs which you attack in this case, they come out within 11 per cent. of your actual cost?—In one case, certainly, but I would point out to you it means that the theoretical cost per ton developed come out at 7.8d., and the actual cost comes out at 7.5d. or 7d., or say 1.3d. less 1.4d. within the possible. Possible, not the actual.

13,159. Is yours a theoretical case, too; I thought you were basing it all on the actual cost here?—Quite so, I have given you these actual costs which I am satisfied are accurate. You are now dealing with one in which I say the cost of driving in 1899, which you may call a theoretical cost. I am taking the matter actually which I have dealt with. I have given this for your information.

13,160. I understand your table is actual cost?—33s. 6d. is not the actual cost.

13,161. No. You brought it down, that is what you ought to do. That is to have the same conditions prevailing for your white men as for the natives. That, of course, is the correct way to compare the actual cost in 1899, to your actual cost in 1903. Of course the conditions were totally different?—I do not quite know. You speak of the theoretical cost, the consulting engineer's theoretical cost. You arrive at that in a precisely identical way that it is arrived at in Exhibit 20 of the statement. I quite agree with you that it is entirely unfair.

13,162. No, no. You have shown here what the theoretical evidence amounts to, and you show that this 9s. 1d. in the main reef leader is more than the actual cost should be to-day?—Yes.

13,163. Compared to your white labour. And I point out to you that whereas you say that it is totally wrong, it comes to 11 per cent. of what is correct?—Well, if you regard 11 per cent., in the only one in which it approaches, is sufficient to substantiate a theory.

13,164. We may differ upon that point, but when we deal with a question of that sort, the theoretical side of a case on the one hand as against the actual on the other, that the theory is proved to be within 11 per cent. it is very good for the theory?—I cannot admit you have proved 11 per cent. It is only in one particular question.

13,165. That only shows that the south reef differs more than the main reef leader. Several things have to come in before you can come to a conclusion and condemn that theory?—I quite agree with you.

13,166.—Turn to your table No. 2. You give here a comparison of machine stoping in 1899 with natives, and in 1903 with whites, and the comparison here is confined to the South Reef. There appears to be no records for the Main Reef Leader. You claim that from July to August, 1903, the cost per ton for machine stoping was 5s. 11.9d., as against 6s. 3.7d.; roughly 4d. cheaper in favour of white labour?—In favour of white labour based upon post-war conditions.

13,167. You have taken the conditions for 1899 as the actual cost, without allowing for the difference. Do you think the post-war conditions are less favourable to that comparison?—I think you will find them referred to in table 3. In that I give you the cost in 1899 with the correction for the present cost of explosives and natives.

13,168. You bring it back, I know that?—I think I show you that for correcting the cost for explosives and natives that the balance is in favour of the post war period.

13,169. In spite of the high cost of explosives?—Explosives are cheaper now than they were before the war.

13,170. Exactly, that is in your favour?—It is in favour of cheaper working to-day.

13,171. That is why you show 4d. cheaper. Turn to table 3. Here you give a comparison of the total cost per ton mined by machine drill contract work on the South Reef. In mining a very great deal depends on the width of the stope, does it not?—A good deal, yes.

13,172. Have you brought the two conditions exactly similar in this table?—You mean, was our contract stoping by machines wider or narrower in 1899 than to-day. I have no reason to suppose that it is any narrower.

13,173. You think they were the same?—I should be inclined to say the same.

13,174. I suppose you took some pains to inform yourself on that point, because it is a very important point?—Yes, a good deal of pains.

13,175. Well then, taking the actual cost of 1903 white labour you arrive at 6s. 9.459d.?—Yes.

13,176. You compare this with the results as worked out on a corrected basis, that is, with regard to explosives and natives. I mean, the cost of 1899 corrected in that way, and it comes to 6s. 4.393d. The difference roughly, therefore, may be taken as 5.66d. dearer per ton; that is against your white labour to that extent?—It would be against my white labour if you regarded the results already obtained as the best possible that could be done with white labour.

13,177. Now you are theorising again. I thought you were going to bring us down to actual facts?—I am, sir.

13,178. Very well, then, stick to your facts. You admit you are 5d. dearer than native labour would be?—I will not commit myself to any further statement than that it is 5d. dearer at the price you can get it by correcting the cost of explosives and natives in 1899.

13,179. Have you taken great care to correct the returns of 1899 in all particulars as regards the cost

of living, cost of wages, cost of explosives, and these other conditions? Did you take care to go into that?—I took care throughout every contract that concerns these figures. They were taken out by an independent man and were corrected for explosives and natives. I think the correction for natives is an under-estimate. I charge them 2s. 10½d. per shift, while the former cost was 2s. 5d.; the present natives average 2s. Machine boys would cost more. My cost for natives, exclusive of the actual wages is somewhere about 1s. 1d. to 1s. 2d. per shift.

13,180. At any rate, you are satisfied that you are quite fair and it comes out dearer by white labour. Now we will go to table 4, where you show the results in July, 1899, of 15,000 tons through the mill, as against 17,000 tons in July, 1903. The latter is the actual cost of white labour only, I understand?—There are a few natives in the latter period.

13,181. With regard to the cyanide you make the same comparison. I would like just to ask, with regard to the cyanide, do you move the stuff to the vats, and after it is finished with, remove it from the vats with white men?—I expressly said in my statement that they are excluded.

13,182. I wanted to be quite clear, that is the most costly part of cyaniding work, is it not?—Well, that cost in labour at the present time, it is costing me 5d. in labour, wagon grease, and some stores they use. As you see—excluding this—it is costing me 4.920d. I think I am correct in saying 5d. for shifting tailings.

13,183. The comparison here is not quite fair?—Perfectly fair.

13,184. Because you retain a large number of natives. It is not altogether a white man's shift?—It is perfectly fair, because these natives are exclusively employed by contractors on specific work; the ordinary staff is on the cyanide work.

13,185. I suppose a large number of natives are required to move this stuff?—Yes.

13,186. The result appears to be this, that with regard to milling, you show about 0.59d., that is to say ½d. in round figures, you have done the milling cheaper and the cyaniding you have done in the same round figures about one-third of a penny cheaper?—Yes.

13,187. So, even taking account of the number of natives which you do employ there, you show you have done?—I do not enter into this at all in this milling and cyanide.

13,188. You show you have cheapened the cost per ton in milling and cyaniding combined by less than one penny per ton?—Quite so, except that it is not 3d. more as it should be.

13,189. Where is that?—It should have been increased by nearly 3d. according to the theoretical estimate.

13,190. I do not think the comparison is perfectly fair under the circumstances, because you are employing a large number of natives?—Excuse me, not in that work. They have nothing to do with that work.

13,191. Milling, cyaniding, is less than one penny cheaper?—Exactly.

13,192. I suppose you expected it to be a great deal?—No.

13,193. At any rate examining your tables, it would appear that whereas you are 5d. and some odd dearer in the stoping, I can see that your tables appear to be less than one penny on cyaniding and milling cheaper?—That involves other questions which I have avoided in this statement. My directors, for instance.

13,194. I thought the whole cost was before us?—Quite so, but actual machining costs so much more.

13,195. Now I would like to turn to page 5 of your statement you give two tables for two periods, March and April, 1902, and July and August, 1903. Now these, I understand, are actual results in both cases?—Yes.

13,196. If you were to correct March and April, 1902, with the costs as they previously existed, for

1903 you claim a few pages further on that you would have saved a further 1s. per ton, or rather the cost of the March and April total would have been 1s. dearer on a similar amount of tonnage?—I think I said there that it is not pretended that such different circumstances are exhaustively allowed for.

13,197. No, I want to make myself clear, but at any rate if we allow it as far as we can possibly do so, you claim it would be 1s. per ton cheaper?—As far as applies to two elements.

13,198. Now you say, taking this table on page 5, may I ask again whether you have made full allowance, or rather to be clear you did not make an allowance for putting in material or any other costs?—I have stated in the statement those variations for which I have attempted to make some allowance.

13,199. Yes, but in the figures given that is the actual cost. You further claim you have saved 2s. 3d. as compared with March and April return per ton?—(Answer inaudible.)

13,200. I see you say that "By the use of white labour on the milling of 35,600 tons, the Village Main Reef Company has effected a saving of £4,000." The object of your comparison, I presume, is to show that you do work cheaper by white men?—The object of my comparison is stated there to show the fallacy of arriving at conclusions from lump figures. Please understand me, I do not wish to say we do not get a considerable amount of advantage by using white labour, we do.

13,201. Yes, 1d. per ton?—No, we get much more advantage, excuse me.

13,202. But, Mr. Creswell, your experience here at any rate, as you say, goes to show that on the total cost there is a saving of 2s. 3d.?—No, but a considerable saving.

13,203. Well, whatever it may be, what do you make it out to be?—I said that to arrive at it you must be content to take this merely as an estimate.

13,204. I thought you were dead against theoretical evidence?—Quite so, that is the reason I have not given it.

13,205. Let us examine it exactly. It is not theoretical. You claim a saving of 2s. 3d.?—I think I said what I put it forth for very clearly.

13,206. Unless you bring up one period with another period under exactly the same conditions your comparison will not hold water?—That is precisely the point I wish to establish.

13,207. Very well, you appear to establish it here in this way. That the cost of labour, white and native, in March and April, 1902, taken together, would come to 12s. 4½d. per ton. The cost for the same labour in 1903 would be 11s. 6½d. per ton?—You have worked that out from these figures.

13,208. Yes, that is a difference of 10d. in your favour now. You are obviously therefore quite wrong in trying or wishing to suggest a comparison between the total cost of the two periods?—Why?

13,209. Because all you have to concern yourself with as far as I can see is the actual cost of labour and not other conditions in this table?—You have taken the whole of the labour and the whole of the tonnage and one of the points I make is that the tonnage being increased reduces our cost in practice. You must give that figure.

13,210. Yes, that brings me to another point. Why did you not sort during this period?—Because on the whole we decided that it was more profitable not to sort than to sort.

13,211. And also, I suppose, because labour was difficult to get?—Not so much so, because in point of fact, I am, during this next month, going to make a practical test in the matter and sort, and take the sorted rock into the mill and mill that. We shall find labour to do that.

13,212. The result of not sorting seems to have lowered your return to 35s. 2d.?—If you are mining exactly the same value of stuff in both periods you

might say that, but I should be very sorry to answer that question without comparison with my assay plans.

13,213. But as a matter of fact, the Village Main is a pretty uniform mine, and I think it runs for very long period at 64s.?—It has gone down, because most of the 64s. rock is milled, and we are milling two reefs instead of one, and in the period you are speaking of we were milling almost entirely south reef rock.

13,214. The two periods shown are from the same reef?—Yes, but that is not 64s. rock.

13,215. At the first period you sorted and new you do not?—Yes.

13,216. Well, it is a fair deduction to say that through your not sorting you have lowered the quality of your rock?—Certainly, if all my waste rock sorted were going to give me 40s. 3d. I should not be throwing it away.

13,217. But you were in trouble about your labour and are not sorting, that was one of your reasons?—Yes, I do not know that it is altogether the cause at present. My decision not to sort until the whole mill is running is founded upon quite other considerations.

13,218. But where this table strikes me is this, that on the only item on which you are entitled to make a comparison of the cost of labour there is a difference of 10d., which would show a saving of 35,600 tons, or £1,483, in your favour?—I think that is your own deduction.

13,219. Well, can you suggest any other way of arriving at it?—No; I only wish to point out that you have gone on the method of taking out only a few in order to arrive at a correct figure from the comparison of two periods. You must take them all.

13,220. You have not done so?—I have not pretended to do so.

13,221. But you take credit for the tonnage cost?—I have given you the tonnage cost in connection with another comparison.

13,222. Yes, but you have brought forward a comparison that rests on a fallacy?—Excuse me, I have brought forward a comparison and eliminated certain differences, and stated that it is not to be taken as a true figure because I cannot afford the time to take a complete analysis.

13,223. At any rate all you can prove here is 10d. in your favour?—That is your opinion, Mr. Goch; it is not so.

13,224. On the other hand, you have lost £8,980 through not sorting?—I beg your pardon. Are you prepared to say that there is no gold in the rock we put through the mill which we should otherwise sort out?

13,225. Instead of making a gain for your company, you have made a tremendous loss?—Well, I am perfectly willing to take a contract on the same lines of your mines and take your losses.

13,226. Sir GEORGE FARRAR: I am sure you must sympathise with us when you see the difficult position you have placed us in in approaching any figures in regard to the comparative cost of white and native labour, because you infer that these consulting engineers and these mine managers who were all supposed to be men of the highest integrity, have from political, financial or other reasons, practically on instructions, all combined together to burk this issue, and that their figures and evidence are practically incorrect?—Would you repeat that?

13,227. It is rather long; I might not be able to repeat it in the same way?—Well, I have read my statement here and the view that I have taken is stated therein.

13,228. And you think that these engineers, if they could only have got these mines working by the employment of unskilled white labour, would have burked the question?—I think if Ohina and Asia have been sunk into the sea—

13,229. The mention of these countries is always ruled out of order?—Well, if the supplementary supply alluded to in this statement, if they could have foreseen that that was impossible, these mines would have been running to-day by white unskilled labour.

13,230. We will take some figures, the Wolhuter Gold Mine, I do not know whether they are in the ring. There is a statement with regard to shaft sinking, of which the figures may or may not be correct. To take actual figures, on the Kleinfontein they sunk 858 feet, the shaft being 21 feet by 6 at a cost of £13 15s. 11d. per foot by native labour. Should you say that these figure are not correct?—Not in the least.

13,231. Now, Mr. Creswell, why did your directors come to the conclusion that the employment of white labour was unprofitable?—Because during the months of June to February our costs had been, per ton, 27s. 10d., 34s. 5d., 30s. 11d., 31s. 11d., 34s. 11d., 29s. 11d., 27s., 26s. 4d., and 29s. 4d. During the latter portion of each period sorting had been to a large extent abandoned. I presume they had a reason for stopping it, and also that it was in response to advice they received.

13,232. They were also got at?—No, not at all. I never suggested anyone being got at.

13,233. Then your costs were 27s. 6d., and now they are 23s. 6d.?—Yes.

13,234. How is that saving effected?—By increased tonnage chiefly, I think.

13,235. Did your directors then not eliminate white labour in all classes?—They instructed me to drop white labour with due regard to avoiding dislocating of mining work. I began with the general labourers on the surface.

13,236. You dropped it and went practically on the lines of the report of these three mine managers?—I can only interpret that by what they are doing. They certainly recommended as many men as possible to be used on machines, but I do not think they are doing it themselves.

13,237. What was your decrease in white unskilled labour in January?—I am afraid that I cannot give you that. I can give you the total.

13,238. It was for January, 221; February, 129; March, 84; April, 53; May, 28; and June, 28, for unskilled whites in the mine?—I am afraid that there is some mistake there.

13,239. You will put in the numbers, I daresay?—Certainly. The unskilled white is a very difficult thing to arrive at. I have taken it at anything earning 13s. 6d. or less per day.

13,240. Then what is your number to-day?—I will put that in.

13,241. You used white labour from June, 1902, to March, 1903, when your directors thought it expedient, on the advice of these prejudiced engineers, to decrease the numbers?—If you like to put it that way.

13,242. You do not put in your comparative statements for that period, but for the period you had been using less white labour?—I think that there is an old proverb, that fools and children show half-finished work. I do not propose to judge of white labour by its unfinished work.

13,243. But practically you have based things on the working costs in June and July. That is 23s. 6d. on which your experiment is based. Is that not so?—July and August, I gave you the latest results.

13,244. Quite so. In fact you have put in your figures on the reduction, since your directors came to the conclusion that less white labour would be profitable?—That is the best value for the Commission.

13,245. But no comparative statement from June, 1902, to March, 1903?—No.

13,246. And there has been a considerable alteration in your policy since then?—Yes.

13,247. You are paying helpers 8s. 6d. to 10s. 6d. per day?—Yes.

13,248. Do you think that a living wage for a married man?—I do not think that it is a living wage for a married man, but it is a great deal better than nothing. Excuse me a moment. As far as a living wage goes, there were married men working there for 9s. 6d.

13,249. Do you think that under present conditions you can draw considerable numbers of white men that way?—I think so, if it was fairly put before them.

13,250. You would have to subsidise them, pay their passages and so on?—I do not think so. I think that a number of men began with me and are now earning 20s. per day, who were not earning anything before. They began and got a foothold.

13,251. How many unskilled white men have you had through your hands during the last six months?—I can put it in. Possibly 1,000. It is due to this continual changing that our costs are not lower.

13,252. Do you think that you could get any considerable number of men at 8s. to 10s. per day?—I think that if they were told that they could get 8s. 6d. per day to start with, which would enable them to live, and then that within a few months they would get skill enough to earn 13s. to 14s., you would get a large number.

13,253. The inevitable consequence would be the white or the white skilled labour would be brought down to the price of the unskilled?—I do not look upon that as a consequence.

13,254. Then as your figures are based on 8s. 6d., how are you going to give them 13s. 6d.?—Because they could make it on contract on purely rough work. There is a case where I am informed the men are earning 13s. per day, at pure Kafir work.

13,255. Are these men in your employ permanent men?—Yes, very steady.

13,256. They are practically learners?—Yes.

13,257. So that what you are doing is educating these unskilled men into skilled men?—I am employing them in capacities where they have an opportunity of acquiring skill.

13,258. But when it comes to a practical question, yours is rather an experiment in educating unskilled people to become skilled?—No, I think not.

13,259. You have referred to the costs before the war. Were they high before the war compared with other mines?—They were below the general average.

13,260. Can you give us figures?—Yes, the total costs for the months of 1898, averaged 31s. 6d.; which was above the average. In 1899, the following year, they were 27s. 2d.

13,261. That includes the 5s. charge for development?—That is always included. We only charge 3s. 3d.

The Commission adjourned.

## THIRTIETH DAY.

Wednesday, 23rd September, 1903.

THE COMMISSION SAT AT 10.30 A.M.

Examination of Mr. CRESWELL continued.

13,262. The CHAIRMAN: Mr. Creswell, you were asked by Sir George Farrar yesterday to supply a list of unskilled white labourers employed at your mine for a certain period. Can you supply that?—I had that in now.

13,263. Will you read it out?—Yes.

THE VILLAGE MAIN REEF GOLD MINING COMPANY, LTD.

*Unskilled White Labourers with daily wage of 13s. 6d. per day and less.*

January to August, 1903, excludes contractors and development men paid by contractors.

January, February and March include boys (white) about 25.

	Average No.		
January,	280	} Average	270
February,	293		
March,	242		
April 10th,	163		
April 24th,	162		
May 8th,	163		
May 22nd,	158		
June 5th,	166		
June 19th,	143

July 17th,	130		
August 1st,	150	} Average	140
August 15th,	144		
August 29th,	154		

13,264. Then, I think, you were also asked if you could supply information as to the total number of unskilled whites that had passed through your hands for a given period?—I am afraid that would take a very long time to get out; it involves going through the time-books for a number of months, and comparing each name and seeing how long a man has worked. I may mention in regard to these figures that they have only just been handed to me. The unskilled men going on contract work under contractors will not be included in this. I presume they are correct. I hand them in as correct.

13,265. What do you mean by contractors?—The unskilled men going on contract would not be included in this.

13,266. Going on contract at the higher skilled wages?—At the rate at which he would make a higher rate of wage.

13,267. Can you give the Commission any approximate idea of the number who have passed through your hands, unskilled men, in any given time?—I could not give it, but I think you could take from 100 to 120 per month; it is very difficult to give. A very large number of changes are made each month. How many of these men whose places are filled come back another month, I could not tell you, without, as I said, going through the books very carefully, which would take two men three to four days. If the Commission wishes it, I can have that done, but it was quite impossible to do it between last night and this morning.

13,268. Mr. EVANS: Mr. Creswell, have you read Mr. J. I. Ferraz's evidence, given before this Commission?—I have not.

13,269. In his evidence he said that previous to the war a gang of 69 boys recruited in the Mozambique district were sent to the Durban-Roodepoort

Deep, and then he goes on to say that the mine was to blame for keeping these 69 boys in one single room in their compound, leaving them to suffer the consequence of their dirty habits. Can you tell us anything about that gang of 69 boys?—It is quite impossible for me, after this lapse of time, to remember the identical inhabitants of each room, but I am perfectly prepared to state that it is untrue that 69 boys were in one single room.

13,270. Then, that the room was filthy and dirty and a danger to health?—I should think that is exceedingly likely, because the boys were of the most filthy habits, and I do recollect, without doubt, that they are a source of excessive trouble in that direction.

13,271. He states here: "When I entered this room it must have been a miracle that I escaped alive from the stench. No wonder the Mozambique boys died so much on the Rand." Was every step taken on the mine to safeguard the health of those boys?—So far as I know. I would suggest that the compound manager at the time, who would have much more close knowledge than I would, should be called to contradict that. I can only speak generally. I naturally exercised supervision, and went to see the boys when in the compound, and it is a fact that these Mozambique boys were of exceedingly filthy habits, although every measure was taken for their proper sanitation.

13,272. Do you think the evidence given by the compound manager would show that everything, as far as possible, was done in that case?—Certainly.

13,273. Coming to this question of white labour, will you tell the Commission the circumstances under which Messrs. Skinner, Spencer and Price were appointed a committee to examine into the working of white unskilled labour?—The idea originated, I think, with yourself, Mr. Evans, in the course of a conversation. As far as I remember, you stated that not being a technical man, you would like, with regard to these arguments I was using, some independent mine managers to give an opinion upon them.

13,274. Yes?—You arranged, I think, with Sir George Farrar and Mr. Hennen Jennings that such a committee should be appointed. In its inception my cordial agreement to that committee was based upon the understanding of the conversation, that they would be a fair committee to inquire into the white labour and into these arguments I was using. When that committee was appointed, I wrote to Mr. Hennen Jennings as follows: "I wish to lay before the committee of mine managers who have been appointed to investigate the question of white labour, as full and complete evidence in support of the views I hold as possible. In order to do this I am to leave out no facts or figures which I believe to have a bearing on the matter. I want to have access to facts and figures on a number of mines besides my own. I should be much obliged, therefore, if you will give me a circular letter to the mines of the R.M. Companies and other mines under the control of H. E. & Co., requesting them to give me any information and figures I may require for my purposes. I will endeavour to ask as little as is needful, and all information will be used only for the purposes of this investigation, and will, therefore, be confidential." To that I received a reply as follows: "Yours of to-day's date to hand. Regarding your request for full and complete evidence

from other mines, to white labour, I would point out to you that this is a pretty big order, and that time is a point to be considered, as our report must go to the Chamber at an early date. The main idea that we had in appointing this Committee of Mine Managers, was to obtain detailed information regarding your own particular case and not of the fields generally. I have obtained, in connection with the Rand Mines, figures similar to those requested from you, and I take pleasure in sending you herewith a rough copy of same, which may supply you with some of the information you desire. Please return this to me, and regard the figures subject to correction." Upon receipt of that letter I was rather inclined to abandon the committee. I did not look upon it as a matter to investigate the Village Main Reef during the previous two or three months, and I drafted a reply somewhat to that effect. However, on a reconsideration, and I think I showed it to you, I left it alone, and I agreed that that should go on. That committee then investigated matters on the Village Main Reef. I put before them my views, and such evidence as I could collect from the Village Main Reef only.

13,275. Before we come to that, I should like to know whether you were consulted as to the composition of the Committee?—Oh, yes, certainly. I was quite agreeable to that committee.

13,276. Were these three gentlemen chosen mainly because you considered them very competent mine managers, and men who would be likely to treat the question in a sympathetic manner?—In a fair manner.

13,277. In a fair manner?—Yes.

13,278. I mean they were men who were quite friendly with you, men of whom you hold a very high opinion?—Oh, yes.

13,279. Now what did that Committee recommend?—The Committee's report, I think, is before you.

13,280. Yes. Well, now, briefly, would it be right to say that what you are doing now is practically carrying out the recommendations of that Committee? They started by saying that "To introduce unskilled white labour on the mines in place of natives in its entirety is impracticable and would mean the cessation of profitable work in most of the mines in the Witwatersrand." That has been carried out to a certain extent?—That is a proposition, to place white unskilled labour in the role of natives in its entirety that I cannot recollect at any time recommending.

13,281. Since this report was written you have ceased employing a considerable number of unskilled white men that you were employing before?—I have.

13,282. Then they go on to recommend. They say, "Whilst deprecating the universal employment of unskilled white labour, we are of opinion that it can be beneficially used in the following departments and for the undernoted classes of work. Care should, however, be taken that an incentive should be held out to the unskilled man to better his position in proportion to his efficiency. In the departments mentioned underneath this in the ordinary course of things would follow, for we believe that good workmen in these departments will always be in demand." Then they enumerate the departments: first, "Underground rock-drills. As many unskilled men as possible should be trained to run rock-drills (all due precaution as to health being taken). These men eventually to be numbered as efficient rock-drill operators in the fields"?—I think that is being done.

13,283. "A limited number of unskilled men might also with advantage be employed in charge of mechanical underground haulages, platelayers, and pipemen's helpers, and as unloaders at stations"?—That has not been done except the ordinary unloader.

13,284. "A limited number of unskilled men it would be advantageous for the industry to employ white labourers in main engine installations as engineers' assistants and cleaners"?—That is not being done.

13,285. "In mills for the feeder and cam floors and in oiling"?—That is being done.

13,286. "White men might also be employed at a low initial wage around crusher stations and at sorting tables; young white boys could be advantageously employed, especially in the neighbourhood of towns"?—That is not being done.

13,287. What you are doing is a part of what was recommended by this Committee of mine managers?—I can only interpret that as far as I know. There is only one of the signatories to this who may be expected to be carrying it out, and his view of what he recommends, as interpreted by what he is doing, appears to be very different from mine, because I am using unskilled white labour on the machines. That is to say, I am using unskilled labour as helpers on the machines and as many as get a chance—as many as choose to take the chance—of improving their efficiency are able to do so. Those who do not take the chance remain as labourers. I am applying it as a system rather than as a—

13,288. What are you doing over and above what is recommended here?—Unfortunately nothing. I think I told the Commission that the use of general labour is interdicted.

13,289. Then the figures and arguments you have given us, they simply prove the soundness of the recommendations of this Committee?—So far as they go.

13,290. Yes. Do they prove anything more than that?—Nothing. I have no opportunity of proving it.

13,291. Do you consider your figures prove anything in favour of the employment of white men for purely unskilled Kaffir work?—Do you mean with a white man first as a muscular machine? Do I claim that a white man as a muscular machine, say shifting sand from one end of this room to the other, is more economical than the Kaffir if he is available and paid a very much lower wage? Because I do not, and never have done.

13,292. Then you are not trying to prove that a white man doing work when there is not much prospect is more efficient or cheaper than Kaffir?—When there is no prospect I agree with you. I would point out, however, that it entirely turns upon the question of prospect.

13,293. I will come to that again in a moment. You say here that the results of shaft sinking on the Durban Deep were satisfactory?—They were.

13,294. Would you have done cheaper work or quicker with natives and hand drills?—I must reply to that that I could not. It was the best I could do at the time.

13,295. Then was it the best you could do at the time owing to the fact that there was an insufficiency of Kaffir labour?—No, my reason for doing it was that the customary method at that time of sinking with machines was with three shifts of machine men and helpers. These machine men and helpers drilled out. If at the end of their eight hours' shift the drilling was not complete, the next gang finished the drilling out and blasted, upon which these same men returned and began shovelling out the stuff. They were succeeded by the next shift, who finished up whatever the second gang left and commenced drilling. My reason for stopping this was that I was employing there for a large portion of the time skilled rock-drill machine men in the rough work of shovelling, and I therefore conceived the idea of sub-dividing my work and providing the very best rock-drill men I could get, so as to get the drilling done in the very shortest time, having another class of labour to follow to do the rough work and also in the quickest possible time, so as to reduce the time occupied by the men on drilling and cleaning up as low as it could be got. My footage was done quickly and by that means we did arrive at a very rapid footage during the time; I believe more rapid than up to that date had been achieved.

13,296. Had Kaffir labour been plentiful at that time would you have used it?—I do not know that. I had no reason to suppose that I could not get Kaffirs.

13,297. I understood you to say, in answer to a question, that the supply of Kaffirs was very short at that time? I said at a later period.

13,298. It did not apply to this period?—It did not. The question of Kaffirs, to the best of my recollection, did not enter into this. My reason was I could not get better control and a quicker succession with my white men working on that system.

13,299. Could you give the Commission the costs of this shaft sinking?—I wrote them out yesterday, and I have got them, but I have not got them complete. I think it would be much more simple to get them from the mine.

13,300. Yes, I expect the mine will offer no objection in giving them, but I should like you to hand them in?—I will certainly.

13,301. The information I should like to get would be the size of the shaft?—That I can give you now. It was 16 × 6 inside timber.

13,302. In both shafts?—Yes.

13,303. The rate of sinking; that you are in a position to give. I see that during the six months it averaged 121 feet per month, with a maximum of 135.

13,304. Then the total cost, and how much of the total cost was wages, and also the number of white men employed and natives, if any?—From my recollection of our account at the time, I do not think there would be very much difficulty.

13,305. Then I should like to have the rate of pay of the white men and the length of their stay?—The latter I am afraid would be almost impossible—very difficult, at all events. I do not know, but it might be got from the time books. You are dealing, of course, with a period which is rather remote now.

13,306. But these facts are unnecessary in order to judge of the work done?—It has never been hinted or inferred to me that the work was not satisfactory.

13,307. I am not suggesting that. I am only suggesting that these facts may be got so that we can judge of it. You go on to say in your statement that "from June, 1902, to March, 1903, I used a considerable amount of white unskilled labour on the Village Main Reef." I think you have some figures as to the total number employed at that period?—The total number employed; that is a figure that if the Commission attach an importance to it I will endeavour to get, but it will take probably a week or more.

13,308. I may state that the information that I should like to get in connection with that figure would be the total number of individuals, how long on the average each individual stayed, what was the average pay. That is practically the information I should like to get if you can possibly manage it?—It is always possible with time, but it is work that involves a great deal of clerical labour, but if the Commission wants it I shall be only too pleased to give it.

13,309. Up to that time, that is to say, from June to September, 1902, was there any objection to your entirely replacing your Kaffir labour by whites?—It was never proposed. Such a thing I should never dream of proposing myself.

13,310. You had no idea of doing it?—No, certainly not. I certainly did not propose to dismiss all my Kaffirs.

13,311. Now, in your table, No. 1, you compare May, June, July and August, 1899, with May, June, July and August, 1903?—I have.

13,312. Can you tell us how many white men you had doing unskilled labour during the latter periods?—In the driving, you mean?

13,313. I will take them in each department?—I cannot possibly give them off-hand.

13,314. Would it be possible to get them?—Yes, quite so.

13,315. Then I should like to know how many white men receiving a wage, say, of 12s. and under,

per shift were employed during the period?—13s. 6d. was the sum I have taken in this return.

13,316. I accept 13s. 6d. Can you give that?—I can give you 12s. if you prefer it.

13,317. I will take 13s. 6d. I took 12s. because it happened to be the figure in these tables. Then I should like to get the average pay per day of these white helpers and white unskilled workers during that period. I should like to have them in departments, if possible?—Yes.

13,318. Then I would like to get at the average number of men of this class in your employ during that time?—The average number of this class of men on each table?

13,319. Yes, and also the average stay of these men?—That is to say, the average stay of men working at 10s. a day; if he goes to a higher rate you would count it as staying.

13,320. No, the average stay at 13s. 6d. and under?—That is to say that if he remains and replaces someone of more efficiency, he goes out of that class.

13,321. Yes. Can you give us some idea of the efficiency of these labourers, the unskilled white men as compared with the Kaffirs?—I am afraid not.

13,322. Would it be possible to get the figures giving, say, the number of shifts of Kaffirs compared with one shift of white men?—That is a question I cannot answer, for this reason: We will take it, for instance, that on two machines in the stopes under Kaffir circumstances you use one highly skilled man to five Kaffirs, and on the system I have now in vogue, I am now using one half skilled man on each machine. You cannot distinguish how much of the half-skilled man is displacing the Kaffir, or to how much of the unskilled man is displacing the Kaffir. I cannot get at it, and so I cannot answer the question.

13,323. You can compare the total results?—Yes, I can compare the results in cost.

13,324. But you cannot separate the Kaffir from the white?—I do not think so. It is a matter for an anthropologist.

13,325. I would have thought that the mine manager would have had some idea of the value of the two classes of labour?—That is a method I consider very fallacious and dangerous.

13,326. You consider the method of measuring the value of each individual's labour is fallacious?—I did not say that.

13,327. Well, now, can you get at these results?—I cannot do so—incompetence, perhaps.

13,328. Roughly, what do you consider the average wage paid for these unskilled men?—I would put it down in development work at 10s., but I pay a higher rate than that. I take on men at stoping at 8s. 6d.

13,329. Do you consider that the wages of 10s. is all the men are getting?—That is all, with the exception of lodging, which amounts to about 2d. a shift.

13,330. Are not they all being taught an occupation which will enable them to earn a big wage?—Well, I hope it is a good living wage.

13,331. Is not that an important consideration?—Yes.

13,332. Is it possible to separate these unskilled labourers, these 10s. men, and say how many are simply apprentices and how many are unskilled labourers pure and simple? In your opinion is a large percentage unskilled, pure and simple?—I hope not.

13,333. Now, is not the inducement there because it is a school where they are being taught something?—The reason why I hope a large number of men are still working is because they had a prospect of making more money, and it is because of the prices we are paying, the unskilled man can make a fair living, where, as soon as they acquire a greater amount of skill, they can get on.

13,334. Do you think that any appreciable number are unskilled pure and simple, in the same way as in the coal mines in England?—I am afraid that many have only come to get a few eight and sixpences and then clear out.

13,335. It is only in that class?—Well, I hope that many are remaining with further ambitions than earning 8s. 6d. a day.

13,336. Has the system you have established any element of permanency?—I would say it has the element of absolute permanency.

13,337. Supposing your system was established by every mine on the Rand, would it not mean that in a comparatively short time probably all the male population would be skilled white workmen?—I hope so.

13,338. Then where would you get the men to do the unskilled work?—I hope they will come in from outside.

13,339. Do you think they will come in from outside to earn a wage of 10s., with no prospects of getting on?—I understand that the demand for labour is considerable, and will be expanded. I do not think we will be able to get it for many years.

13,340. When you have educated enough skilled miners on the Rand, they will have little chance of getting up from the bottom?—I think the demand will be continually expanding. The increase in skill will enable them to make a good living.

13,341. You are really of opinion that the system is capable of general application?—Certainly.

13,342. If all the other mines did as you are doing they would still be able to get men at 10s.?—On the same system, certainly. Put them on the contract system and let them make as much money as they can at it.

13,343. Can you give us any idea as to how many more Kaffirs you would require to enable you to dispense with unskilled white labour—taking the later period you are dealing with in your statement?—I have given it to you there. I have given the native shafts in former periods. In driving 394 feet in 1899, I took 2,249 shifts, so presumably it would take the same number of shifts now. It is in table 1, and the same thing is in tables 3 and 4.

13,344. Is that per foot?—Yes.

13,345. But I was asking how many natives would have been required to drive 520 feet and enable you to dispense with the unskilled whites. Have you worked it out?—No. It follows, I think, that you can produce it from that. I have given the data.

13,346. Is it possible to estimate how many Kaffirs are being economised by the use of cheap white labour?—I think I have given you enough data there.

13,347. How many would you think then?—I have made no estimate.

13,348. Could you make up such an estimate—just roughly?—Well, I do not think so.

13,349. Well, we can leave that till later. Now do you know any other mines where the use is made of white labour to the same extent?—I do not know of any being used to the same extent in these departments. I think, however, that probably there is another mine which used the labour for tramming and shovelling. It was tried successfully, I think.

13,350. Supposing you had an abundant supply of Kaffir labour, would you use them in preference to white labour?—If I had an abundant supply of Kaffir labour which reasonably promised to be continuous, I would do without every machine in my stopes. I do not mean it to be understood by that that I do not anticipate being able eventually to get it as cheaply by machines, but under the present circumstances, if you guarantee me a supply, I would certainly do so.

13,351. Then do I understand that you do not exactly claim that white labour is as cheap as black labour for purely unskilled work?—At the present time I think it is indisputable you can give as good labour at a lower rate of pay.

13,352. You mean that, as far as the Kaffir labour is concerned, supposing that the supply was available?—Supposing that the supply is there, it would not be worth while to shape the white labour to do my work. Whether he can eventually do it as cheap is another matter.

13,353. Do you know of any instances in South Africa where a considerable number of white men have been doing unskilled work for any long period?—I do not.

13,354. Now do you not think that your experiment is rendered practically wholly inconclusive by the fact that all your white men have a prospect in front of them? They are working not only for their wages but to better themselves almost immediately?—I consider that this is one of the inducements of a new country. I do not think it is inconclusive in the least.

13,355. In your table, on page 4, how many natives were employed in 1899 in the mill?—I think it was 12 or 14—I can also obtain that for you.

13,356. Do you know what white men you replaced them by?—We are running anything from 60 to 160 stamps at a time and then we were running 100. We have now in our mill the ordinary mill staff, a battery manager, foreman and amalgamator—14 men altogether. There is an amalgamator, assistant amalgamator and two hands on each shift. That is 12, and the foreman and the other hands makes it 14.

13,357. As compared with what?—I think I can give you the numbers now. There are in table 4, 15,000 tons treated in July, 1899, and 17,600 in July, 1903.

13,358. Supposing in July, 1903, you had only treated 15,000 tons, how many fewer men would you have employed?—The men are accounted for in the wages given in the table. I do not think the same staff is running more than 100 stamps.

13,359. There would have been no reduction?—No, nor any increase.

13,360. Do you not think that consideration renders the table valueless?—No, not in the least.

13,361. If you distributed this expenditure over 15,000 tons instead of over 17,600 the cost per ton would be higher now?—It does not alter that fact the least little bit that the cost of the staff was £302 and it is now £312. I do not say that under the old Kaffir conditions £302 would have enabled them to run in July.

13,362. If you had treated 15,000 tons instead of 17,600 tons, your cost per ton would have been higher than the cost in 1899?—That is a matter of working out per contra, if we had had the same number of stamps running in July our staff would have been higher.

13,363. You have just told me you could have managed with the same number of staff?—I am now speaking of July, 1899.

13,364. Your argument is that the difference would have necessitated the employment of more Kaffirs?—Yes. If I had been running with 100 stamps with no prospects of increasing, I might have cut down.

13,365. I take it that what you have stated here is correct?—Yes, it is perfectly correct.

13,366. You might have required a certain number more to deal with 2,600 tons?—I might have required more men in 1899.

13,367. Is there any change in your method of estimating the tonnage as compared with 1899?—I really was not there in 1899.

13,368. Then you are not certain that the comparison as to working is on all fours?—I would say it was.

13,369. How do you arrive at your opinion?—I arrive at my opinion from the number going to the mill, of which a large number of determinations of weights of cubic feet in the slime stands, and I arrive at that as being the best way of getting the actual number of tons I have milled.

13,370. How were the tons measured before the war?—I cannot tell you. You can get at a strict comparison if you like.

13,371. Was there a weighing machine before the war?—No.

13,372. How does your actual extraction compare with the theoretical?—Poorly. In the mill it compares poorly and with the cyanide less poorly. You can get exact figures.

13,373. Can you give me your working costs since the beginning of the year?—I gave them, I think, yesterday.

13,374. Would you mind repeating them? I should like to get them for publication since March last?—March, 26s. 1d.; then, monthly, 28s. 1.8d.; 26s. 8.8d.; 23s. 4d.—(this is speaking from memory)—23s. 5.9d.; and 22s. 5.9d. in August.

13,375. Can you also give me the number of whites and natives employed for these periods, say since February?—I have not got them here. Would you like that also sent in?

13,376. Yes. I have a statement here which shows that you were employing in April 336 whites altogether, and 779 natives?—Well, I may have these papers in here somewhere, but I do not know where.

13,377. Then in May, you were using 327 whites and 735 natives. Is that approximately correct?—These figures I have no doubt come from the mine, and are therefore correct.

13,378. Then you come down in June to 322 whites and 772 natives?—Yes, that would be about the time when the whole of my surface labourers were swept off.

13,379. But is it not rather striking that the drop in working costs from 26s. 8d. to 23s. 4d. is coincident with the reduction in the number of whites employed?—It is a striking face comparison. Whether there is much real value in it or not, requires analysis to discover.

13,380. But that is the fact?—Yes. I would also point out that in March, with 380 whites, and in April with 336, you may notice that there is a drop of 44 whites, and in that month there is an increase in working costs. It would be absurd to attribute the increase in the working to the drop in whites; it is not sound analysis.

13,381. How many natives do you say that you employ altogether?—I think that 1,008 was my last whole number, of whom a certain number are on construction work.

13,382. And you are employing 140 unskilled whites?—Yes, that is they are not contracting.

13,383. Can you give any idea as to how many more natives you would require in order to enable you to dispense with that 140?—I will let you have that if the Secretary will give me these points.

13,384. I think that you were asked to supply a statement to the Chamber of Mines, who applied to you in connection with this enquiry?—No; they sent round a catechism of about 70 questions to be answered. I answered a good many of them, and left a good many unanswered.

13,385. You gave as much information as you could?—As much as I felt justified in giving—I do not recollect ever being asked for a statement.

13,386. Mr. PHILLIP: When the Sub-Committee, appointed to examine into the Village Main Reef experiment, handed in their report, you saw it?—I did.

13,387. Did you take exception to it at the time?—What do you mean by taking exception to it?

13,388. Did you try to, controvert the figures at which these gentlemen arrived?—I do not think that they arrived at any figures in their report.

13,389. Well, I am referring to Mr. Price's evidence. The part where he finishes up?—That was not the finding of the Committee as per the report. It does not mention that in the report. These figures and sentences are taken direct from a letter by Mr. S. J. Jennings which are controverted by myself in the

letter to which they refer here. I took distinct exception to them at the time.

13,390. We have reports here from various mines in evidence handed in by the Chamber of Mines. Mr. Price gives as the case of white labour at the Crown Deep as being 3.7 as compared to native or 7s. 8d. per ton. On the Crown Deep the whites cost four times as much as natives, and it was taking native labour at 2s. 5d. and white labour at 8s. 7d. The whites cost 7s. more than the natives, considering the work they did. The Manager of the Lancaster gives it as exactly three times as much, and Mr. Hellmann, of the East Rand, as three to four times as costly. Mr. Denny, of the George Goch, gives us details of shaft sinking. Do you think that these managers are competent men?—I do not think that it is for one in my position to be their critic.

13,391. They are men competent to work a mine properly?—I am not their employer.

13,392. Is it not rather strange that yours is the only instance we have had of white labour being cheaper than black?—I have already given my reason for being of that opinion, and in this matter one piece of positive evidence as to its success is of more value than 20 statements as to its non-success.

13,393. I understand you to say that for two drills you require two white men?—Yes, one skilled and one unskilled for each drill.

13,394. And one skilled man and five natives work two drills?—Yes.

13,395. There would not be much saving there?—Apparently there is. You see the combination.

13,396. Do you put that down to the contract system?—Yes.

13,397. Do you not think that if the contract system were applied to natives, you would get more work out of them?—If they are resident here long it would have the effect, but the great defect of the native labour is that when you get them up to a moderate degree of skill, is just about the time when they are leaving, or shortly after. You are in a continual process of training new men who do not stop.

13,398. When the white labour you had was unskilled when you first got it, it did not take you long to train it up to the skilled point?—To a moderately skilled point—yes.

13,399. I have known an instance of natives on contract working very much better. On the United Diamond Mine, Bultfontein, it was tried five or six years ago. When working with natives at monthly wages the cost was 1s. 6d. per ton; but natives on contract earned much better wages, and the cost per ton was 10d.?—Yes, that very largely arises from the system instituted, from keeping wages on a more or less uniform level. It is almost impossible to a manager to let out piecework as he likes, and yet maintain the uniform level.

13,400. A native, drilling, can do his ordinary shift in about four hours? Could they not do two shifts if you paid them a little more?—I have tried it and there you have uniformity. You say there is so much for a three-foot hole.

13,401. The largest number of unskilled whites employed was in August and September?—Yes.

13,402. Can you give us the cost during these months?—They are before you.

13,403. You had a very large number in those months, 480 or something of the sort?—Yes, they are in Mr. Price's evidence.

13,404. In August you had 481 whites working and 736 natives, and your costs were 30s. 11.4d. When you reduced the number in September, you had 309 whites, and the cost was 29s. 11d.?—If you attribute it to that, and take these figures without analysis, you can adduce that the whites are responsible for the whole of the costs. You must remember that in that period a large number of the whites were new hands dumped down from the irregular corps, and in some cases were very irregular, and in the month of September a large number of my

205

machine hands, practically all of them, struck work, and the whole time was one of reorganisation.

13,405. Mr. PERROW: I think you are employing 150 unskilled white labourers to-day?—Yes.

13,406. How many are underground?—That I cannot give you straight off. I should say over 100.

13,407. What are they doing? Mostly machine helpers, chuck men?—Yes, two to both machines.

13,408. How many men does a skilled man superintend?—One.

13,409. I will take every different place in your mine—I will take driving, sinking, raising, stoping, etc. You shall place the white unskilled men, and the skilled miners, and the natives and skilled miners. Which would be the cheapest according to your rate of pay to-day?—You have that in the tables given, precisely.

13,410. You have just mentioned that this white unskilled labour is working machines?—Yes.

13,411. Do you use them in cleaning down stopes and tramming?—No, I can only speak from experience.

13,412. I have to get a correct figure?—I have not got the figures or data to do so with. That must come from another mine.

13,413. When you are doing only part of the mine with white labour, you cannot say that the white is cheaper than native labour?—I should deprecate turning every nigger out of the country and only using whites, because I look upon them as an asset.

13,414. Why do not you place the white unskilled labour to clean stopes down, and tramwork, as you use it for machines?—My directors' instructions to me was not to use general labour. I had to discontinue it. I might be doing it possibly now, but one thing at a time is sufficient.

13,415. How long does it take for an unskilled miner to get his blasting certificate? Have they got any since you have been on the Village Main?—Oh, yes; the time varies. A particularly intelligent man would get it in a month, another might take 12 months. He has to satisfy certain qualifications laid down in the mining regulations. I take the responsibility of granting a provisional certificate, as those laid down in those regulations.

13,416. Suppose all the mine managers were to adopt this plan of working with unskilled white labour, do you think the skilled miner is going on training these men to take his place?—No, because they never could before many years are out. For many years there is room for any quantity of skilled miners.

13,417. You mentioned that a man could get a blasting certificate in a month?—Yes, if he is a particularly intelligent man.

13,418. It would not take long for the country to be filled with white skilled labouring men with blasting certificates. Are these men going to work at 10s. per day?—I hope not.

13,419. You would employ these men at 5s. a day cheaper?—Excuse me, the granting of a blasting certificate does not make a skilled man with a higher wage, nor does it guarantee him an employer. All it does is to enable you to employ a man in a certain class of work. If a man works for 12s. or 13s. a day, it is because he has not acquired enough skill.

13,420. Do you issue certificates if a man is skilled?—If I am satisfied that he is qualified under the regulations. I do not say he is skilled enough to earn high wages. That is his look out.

13,421. Have you any places in your mine where you will require hammer boys?—I use hammer boys in order to get well in under the hanging, so as to employ machines without smashing up.

13,422. Have you employed unskilled white men for hammers?—I would not do it at present.

13,423. Then the native is cheaper?—Certainly he is cheaper on the hammer. I think you misunderstand my position. I do not advocate dispensing with all our native labour. It is a most valuable

asset to tide us over till conditions very materially alter, but what I do maintain is that with the present native supply eked out with unskilled whites, we can work as cheaply as in 1899, and eventually very much cheaper.

13,424. But I understand it is as cheap to work with white skilled and unskilled labour, as with skilled white and native labour?—I adduce these figures to shew that these arguments as to the excessive cost of white labour do not hold water.

13,425. But I am not talking about one position of a mine and leaving the rest of it, we should go through the whole of it?—Well, I should think you could get someone, perhaps, to try and work like that, using white men in the stopes. I would not do it myself, because I could employ them very much more profitably elsewhere.

13,426. Mr. QUINN: Do you call your mine a representative mine?—Yes, I think so, fairly. There are mines which are more suitable for machine work, and others which are less suitable. It is fairly representative.

13,427. Was this interesting experiment of yours with white labour carried out under the most favourable conditions?—No, I should say not. Taking it all round, no.

13,428. Do you consider that it has been carried out under unfavourable conditions?—Yes, in that I met with what I might almost call virulent opposition from my technical superiors, which of course made it more difficult.

13,429. Are you keeping up development?—Yes, pretty fairly.

13,430. In your opinion, would it be economical possibly to work mines like yours with from say 8 to 10 natives per stamp, supplemented by this labour we have been talking about this morning?—Certainly, as cheaply as it was done before the war. Most undoubtedly.

13,431. You can do it with your mine, and do it as cheaply as before the war?—Certainly.

13,432. Would it be possible to work low grade mines by this method?—Well, I anticipate that once we get over this bugbear of dependence on a mass of cheap labour for working the mines, it will be done on a very much larger scale with a reduction of working expenses very materially.

13,433. How many natives would you say would be necessarily supplemented by this white labour to run the number of stamps that were running before the war at no higher price than was the case then?—I should say 50,000 or 60,000.

13,434. A little while ago, in answer to Mr. Evans, you stated that if you had an abundance of native labour and were reasonable sure of being assured a continuance of it, you would do away with every machine in the stopes. Does that mean that you would do away with the white men in the stopes working these machines?—Of course, I should not require them any longer. I should simply employ gangers over 20 to 30 natives.

13,435. Under the same conditions with an unlimited supply of unskilled labour, and grounds for believing in its continuance, would the same principle go on to any extent besides in the stopes? Would it have a tendency to make you independent of these white men and naturally make you do without them?—If you had a great many long-service natives, who were, so to speak, a class of servile labour. Of course it would make you more independent.

13,436. But in the stopes at least, with a full supply of labour guaranteed you, would you do away with the white men?—The only white men I should use would be in driving.

13,437. Have you studied the Report of the Industrial Commission?—Yes.

13,438. Mr. Hennen Jennings stated before that Commission, "I am satisfied that the Kaffir is susceptible to learning, and becomes far more useful to us if he has been with us for any length of time. American experience shows, etc." Do you agree

with those views?—Well, he alludes there, I think, to South America, where they use West Indian negroes. They live in the country and are used on machines without any white men.

13,439. But that supports the view that the tendency would be to eliminate a large number of white men?—Oh, yes.

13,440. We have something later than that in the same direction I want to read. In a report of the Sub-Committee on mining handed in to this Commission, signed by Mr. Sydney J. Jennings, Mr. Denny, Mr. Webber, Mr. Webb, and a number of the principal mining men, on page 3, column 5, paragraph 7, they state: "Column 5, in Exhibit No. 2, shows that 142,743 natives would be required to drop all the erected stamps under the most economic conditions, *i.e.*, sorting up to the maximum profit obtainable by this means, developing as much as is mined, stopping all over the mine, only stopping with rock-drills where the conditions are favourable, and replacing the unskilled whites, Cape boys, and Coolie by the native." So the idea seems to be admitted that a big supply and a reliable supply of cheap native labour would have a tendency to eliminate to a large extent the white man now employed on the mines. Is that your opinion too?—Certainly. I do not see there is any question of it.

13,441. Now in your statement handed in you draw attention to the fact that in development and stopping, with your rock-drills at present, the cost is a little higher?—Yes, certainly.

13,442. Now, suppose you were allowed a free hand to continue your experiments, have you hopes of getting the work in these two details still further reduced?—Certainly.

13,443. You have reasonable hopes for that?—Oh, yes, certainly; in course of time, of course.

13,444. The unskilled men you have been using, many of them, I take it, when they come to you, know practically nothing of their work?—Most of them, yes.

13,445. And as money earners were very much inferior? Their value was much less than it became afterwards, when they had had some experience?—Yes.

13,446. That is proved by actual figures?—Certainly, in individual cases.

13,447. Would it be fair to put it this way, that you have taken men who have had no training, no expert knowledge, whose money value as labourers is very small, in the course of a few months they have become fairly competent and able to earn a considerable amount of money?—Yes.

13,448. Do you consider that a good thing for the country?—Most emphatically a good thing for the country, I think.

13,449. With regard to natives, is it fair to say that the tendency is to increase the cost for them, with the cost increased, I should say, that is, they are getting better food than they used to get, and better compounds put up, that the tendency among the native labour is that way?—With a restricted native supply and apparently an ever-increasing demand for labour, so long as you make your native your staff on which you lean—the thing you cannot do without—then the natural tendency must be to rise. It cannot be otherwise. If everyone is wanting a native very badly, any sort of ring you make to keep their prices down does not seem to me to hold for ever.

13,450. Suppose we could draw upon an unlimited supply of coloured labour with greater skill than we use now, would that further still have a tendency to reduce the number of white men employed on a mine?—On a given mine, yes; working on the same scale, certainly.

13,451. Suppose you had a large number of coloured labourers at your command to-day, more intelligent than those you are employing to-day, would not that tendency go further—for mine managers would be compelled by competing and demands among employers to reduce the cost

further, and, if the more intelligent labourers could do the work done by the white man, they would put him to it?—If I could, certainly.

13,452. Are you acquainted, Mr. Creswell, with this small document given to Mr. Chamberlain?—I am acquainted with it. I cannot say I have gone through every exhibit there. I am acquainted with the document.

13,453. I do not think anybody else has gone through them all. Have you compared some of the arguments used in this book with the statements put before the Industrial Commission?—Yes, I have.

13,454. I have been busy in that myself. I would like to know, Mr. Creswell, what has been the noticeable difference between the two papers?—Well, I have given some time to it myself, and I confine myself chiefly to the question which interests me most, that of white labour and the arguments brought to bear thereon, and some time ago—a couple of months ago or more—three months ago—I went into them. The chief difference I noticed is that it says on page 17 of that statement, "The high and important position which these fields have won in the gold mining industry is referable to other factors than the value of yield per ton of ore—if the average value of the ore worked here is compared with that of other countries as set forth below." Further down they say, "Some higher yields are the following." It goes on to say, "The prime factors in the gradual advancement of these fields to a position of pre-eminence—apart from human endeavour—are the great extent of the blanket deposit and the large tonnage which they include containing moderate amounts of gold." I contrast that with the evidence given in the 1897 Commission in reference to American mines. Mr. Heanen Jennings, with scrupulous fairness, points out you have to compare every circumstance by the circumstances in different countries, and then goes on to detail the value per ton of mines in various countries. He mentions the case of the Alaska Treadwell Mine, as being exceptionally favoured by nature, so that can be left out; and the American mines he cites there are a number of mines appearing on page 216 of the Industrial Commission of Enquiry Report, 1897. These mines on page 216 are of some considerable period anterior to his evidence, and he refers that Commission—I think I am correct—to Mr. Leggett's evidence for more recent results. I may mention, Mr. Leggett, in his evidence, devotes a considerable length of it to showing that the mines he states are strictly comparable with those of the Witwatersrand, and Mr. W. Hail devotes many pages to show how very much more favourably we are situated, and leaving out the Alaska Treadwell as exceptionally favourable by nature, and confining ourselves to the other North American mines, which we are told are comparable with the Witwatersrand mines, out of five gold mines and two copper mines, of which the yield is given, the richest is one with the yield of 54s. 2d. per ton; the next richest has a yield of 30s. 3d.; three have a yield of under 30s. and over 20s. 2d.; and two have a yield of less than 10s. per ton. In this document presented to Mr. Chamberlain, the only American mines cited were the Cripple Creek with a yield of 200s. 6d. per ton, and the Nevada with a yield of 205s. 4d. per ton, and the Colorado with a yield of 127s. 9d. per ton; and no mention is made of these others, except, I believe, Mr. Chamberlain was presented with a copy of this voluminous report, from which—

13,455. He could find it out for himself?—Find it out for himself. That is one point. Other matters concern the cost of living, and I would point out to the Commission there, as it is a question of rough labour, I hardly think it is a fair comparison; a fair basis to take the living wage, the living cost of a skilled artizan and family, who should be, and I believe, are in most countries living in a greater state of comfort than the rough labourer. I do not see why, if these be taken as the basis of living, why they stop there—I mean it would be equally fair in my opinion to take the professional classes. It would be a very great hardship for men in the professional class to live in a cottage on a mine at

£26 a month, and I see no endeavour to get what the actual amount they were living on was—what the actual labourers were living on. I did try myself in one case, but I found it difficult and unsatisfactory. I asked the question, "What is your butcher's bill; what is your baker's bill?" I was met with, "I do not understand the question." That man said the vrouw bought a bag of Boer meal and they baked their own bread. It seems that to find out what the labouring classes could live on, by taking as a basis the unskilled artizan class, who should be living in a state—compared with that of the labourer—of considerable prosperity, should not be taken as a basis.

13,456. I do not know whether you read the evidence put in by the mines to this Commission a few days ago?—I am afraid that I did not.

13,457. Well, in a statement I have already quoted from, marked "D," signed by the engineers on page 5, they have given certain estimates on the number of natives required now, and five years from now. It works out at about 20 boys per stamp, and on page 5, paragraph 12, they state, "The estimate of the requirements of native labour for gold mining in five years from now has been based on the acceptance of the view that the gravity stamp will be maintained for the purpose of crushing ore, and no allowance has been made for crushing devices or change in metallurgical practice, which may at any moment be brought forward." On the next page, page 6, they also tell us (paragraph 14), "No allowance has likewise been made for any mechanical device or improved method of working that may be introduced, and designed to save labour." They go on to say, "Nor has any allowance been made for replacing natives by unskilled white labourers." Do you think that it is a reasonable thing to suppose that five years from now on these gold fields, with all these brains, there will be no change, no improvement either in metallurgical treatment of the ore, or in your mechanical devices? Do you think it a fair thing to base calculations five years hence, and leave out of consideration these two factors, the first of which we are told by the engineers themselves "may at any moment be brought forward"? Do you think that a reasonable way of calculating requirements?—I think that it is perfectly fair. They do not take them into consideration, and, as an engineering estimate, you estimate on what you have. No doubt you will improve upon that; I hope so.

13,458. Well, leaving your estimate for a moment, is it probable, or at all likely, is it reasonable to expect that any improvements which cannot be mentioned in these two paragraphs might be reasonably expected in the next five years?—I certainly hope so.

13,459. Has much progress been made in the last five years, leaving out the war period?—Yes, I think so, certainly. I do not know what you mean in figures, but it is engaging the attention of engineers.

13,460. I want you to take to this report made to Sir George Farrar and to Mr. Hennen Jennings by the Committee of mine managers. On page 2, second paragraph, they say, "We consider, that by the adoption of such labour in the foregoing depths" (cheap white labour) "and with the mechanical labour-saving appliances, the present high estimate of the needs of the industry as regards native labour would be considerably reduced; for instance, in a mine where rock-drills can be used in the majority of stopes, we say that to run 100 stamps, and to do the necessary development, 1,000 to 1,200 natives, together with 125 to 150 skilled whites, and 76 unskilled whites, would suffice." So that in this particular this committee of experts agree with you, or at any rate are near you, when you say that from eight to ten Kaffirs per stamp, supplemented by cheap white labour, would be sufficient to run the mines?—Do I understand as cheap as in 1899? Because, if you give me an unlimited number of labourers at 1*l.* a day, I would naturally run it cheaper.

13,461. Yes, always bearing that qualification in mind. So they agree with you?—Yes, apparently. They do not go all the way with me.

13,462. Is it within your knowledge, Mr. Creswell, that in 1896, for instance, a very large number of stamps were hung up?—Not in my knowledge.

13,463. Well, Mr. Hennen Jennings stated on page 195 of the report of the Industrial Commission: "On the Witwatersrand fields they have from about 5,500 stamps erected. The annual report of the Chamber of Mines shows that on an average 3,470 stamps were running during 1896, consequently, it would appear as if 2,030 stamps had been stopped, but this is not really so, as many have been dismantled, and new ones have replaced them. But it is a fact that there are on the fields many companies with a large number of stamps, and have suspended operations, and there are several others which during this year will probably follow suit. Now, take Mr. Hennen Jennings' statement, which I think we all accept as being most carefully correct. Can you tell me why these stamps were hung up in that period?—I cannot.

13,464. Then, to sum up your evidence, Mr. Creswell—and I think the Commission will put the greatest possible value on it—it amounts to this, if I have understood your evidence right—that with the native labour supply we have got, used to the best advantage, to supplement it by white labour, in the way you have been endeavouring to supplement it on your mine, there is no reason why at the present moment we should not be dropping the same number of stamps at roughly the same cost that obtained before the war?—With one exception, I will agree to that. You said, "Using it as I am using it." I do not lay claim to using it in the way that would commend itself to other managers. Other managers might get results in other directions; but in the main I agree with your summing up.

13,465. Mr. WHITESIDE: Mr. Creswell, is not the supply of unskilled labour for the mines derived in the main from outside of South Africa?—It is.

13,466. Is it not the case that practically there are no facilities for training the skilled labour required on these fields?—Practically.

13,467. Do you consider that it is a good thing for the country, to be wholly dependent on immigration?—No, certainly not.

13,468. Mr. DONALDSON: You said yesterday, Mr. Creswell, in reply to Sir George Farrar, that you supposed at the outset the white unskilled labourer would be regarded with disfavour by the financial houses. Would you tell us why you supposed that?—I gave an answer which I had carefully written. I knew a question of that sort would be asked me. It was that "I am of opinion that the consensus of expert opinion laid before you against white labour is largely due to the following causes: That the financial authorities at home viewed it at the outset with disfavour, being afraid that the employment of a large number of white men as labourers would make the labour element too strong a factor in economic questions, and when representative Government was given in political questions." I do not know why, because people have money, they should not have political views; but my justification for holding that opinion is in this letter addressed to me by my Chairman, which I will hand in as evidence.

Sir GEORGE FARRAR: We would like it read.

Mr. CRESWELL: Shall I read it out?

The CHAIRMAN: Yes.

Mr. CRESWELL then read the following letter:—

23, St. Swithin's Lane, London, E.C.,  
3rd July, 1902.

My dear Mr. Creswell,—With reference to your trial of white labour for surface works on the mines. I was not present at the Board meeting when a letter was written stating that the Board did not approve of the suggestion, and on receipt of the last mail, I called another board to reconsider the matter in view of the fact that the local board had

already commenced to adopt my suggestion. I have consulted the Consolidated Goldfields people, and one of the members of the board of the Village Main had consulted Messrs. Wernher, Beit and Co., and the feeling seems to be one of fear that if a large number of white men are employed on the Rand in the position of labourers the same troubles will arise as are now prevalent in the Australian Colonies, *i.e.*, that the combination of the labouring classes will become so strong as to be able to more or less dictate, not only the question of wages, but also political questions by the power of the votes when a representative Government is established. I cannot, of course, set up my own personal view against that of the authorities I have mentioned above, but at the same time I think that if the European population of the Transvaal is going to increase to anything like the extent to which Lord Milner and the other best authorities anticipate, that the extra number of working men which your scheme would provide would be merely a drop in the ocean."

The Board finally agreed to the trial being made, and a cable was sent to that effect. I hope that you will meet with success.—Yours sincerely,

PERCY TARBUTT.

H. P. Creswell, Esq.,  
The Village Main Reef Gold Mining Co.,  
Ltd.,

P.O. Box 1891, Johannesburg, S.A.

13,469. Sir GEORGE FARRAR: Whom was that from?—Mr. Percy Tarbutt, the Chairman of my company.

13,470. What date is it?—July 3rd, 1902. That opinion was supported by the fact that Mr. Fricker at a public company meeting declared himself emphatically in favour of Chinese labour; that, further, Mr. Chaplin, in an article in "The National Review," spoke of the "trail of the serpent of trades unionism," and took a very hostile attitude to white labour generally on political and semi-political grounds. That in the course of these experiments which I was engaged on up to a certain point, it was sympathetically received. I may mention, in passing, from the heads of the house which I have come in contact with, Sir Percy Fitzpatrick and Mr. Schumacher, I had every sympathy and support, and from the consulting engineer up to a certain date. Shortly after the arrival of Mr. Hennen Jennings from London, the opinion changed, veered round to the diametrically opposite quarter, and it was followed at intervals by the very strongest attacks and endeavours to "make out" everything I was doing, in course of doing, judging an experiment in the course of work, instead of letting it go on and anticipating every circumstance. I considered that it was not being carried under favourable conditions in that respect. I would put it in another way. If in trying an engine (I was using the first Whiting hoist, or almost the first), when that started, there were a great many difficulties. If I had gone to the consulting engineer, who was very much interested in the thing, and believed in it, and I said, "The thing is no good; give me another hoist," he would have said, "It is not being used well. Look into it, and if you are not using it successfully it is your fault." The same thing applies to this matter. I simply say that the conditions were such that results adverse to white labour would be welcomed naturally, and I spoke of the financial authorities viewing it with disfavour. It is perfectly within their right to do so, but it shows they were willing for the experiment to be tried, that it has been tried.

13,471. Mr. DONALDSON: Is that not the point of the whole thing?—They have allowed me to try it certainly.

13,472. And they have given you a full opportunity of testing it, and they have put their leading experts to report on it?—Yes.

13,473. You state that they felt disposed to give it a fair trial?—My directors, I consider, have acted most loyally by me throughout. At a certain stage it was represented to them very strongly it was un-  
economical, and in the exercise of their discretion in

certain directions they stopped me. Other matters were also represented, and they stood very loyally by me.

13,474. Would it be correct to put it this way. You thought the employment would be economically satisfactory, and your directors gave you permission to try it?—Yes.

13,475. And backed you up loyally against the advice of their experts?—Up to a certain point, yes.

13,476. Then these experts reported unfavourably on the matter?—Their experts did very unfavourably, continually on grounds which I combated at the time, and which combating at the time was sufficient to allow it to be continued. The last "attack," so to speak, took place, if I remember rightly, at the end of November. The result of that, after my letter combating points, was that no change was made.

13,477. Consequently again your directors stood by you?—Most loyally.

13,478. Well, then, is it a correct statement of facts, as they have occurred, that the sole difference is that you hold one opinion and that many experts here hold another?—It appears so. All I gave that opinion for was to show that the circumstances were such that one example of the successful use of white labour weighs against 30 negative results that the chances of the successful use was considerably against.

13,479. But do you believe that these experts who have condemned your white labour experiments have reported their honest convictions and belief?—I have no reason to think otherwise, but your honest convictions and belief may be influenced by certain causes, and I brought this influence before the Commission to enable them to give weight or otherwise which might attach to them. I carefully, in framing this answer, avoided anything which could be thought to impugn on the honour of the leading experts. I say "The leading experts, besides being naturally influenced by these ideas on the part of their employees, had made the success of their careers here on the old cheap, inferior race labour system, and would be reluctant to admit that a new departure must be made if any way perpetuating it were possible." I consider that a natural inherent influence in the mind of any successful man, which would naturally tend to make him very conservative, and very, very strongly inclined to an adverse opinion to white labour; but it does not really affect the point whether white labour can or cannot be successfully used.

The Commission adjourned until 2.30 p.m.

13,480. Mr. EVANS: This letter is dated July 3rd, 1902. Did you believe, when you received it, that it was the opinion of Messrs. Wernher, Beit and Co., that the employment of white labourers would give rise to the same troubles prevalent in the Australian Colonies?—Yes, it is quite possible.

13,481. Are there circumstances within your knowledge which would tend to show that Mr. Percy Tarbutt was misrepresenting the views of Messrs. Wernher, Beit and Co.?—I do not think so. Messrs. Wernher, Beit and Co. might quite possibly have those views, and yet be sufficiently large-minded to try it.

13,482. Did the attitude of Sir Percy Fitzpatrick and Mr. Schumacher not tend to show for months after the 3rd July that Mr. Tarbutt was wrong in his statement?—I do not think so. I have already stated to the Commission that from both Sir Percy Fitzpatrick and Mr. Schumacher I received the ready and sympathetic support. What transpired between them and Messrs. Wernher, Beit and Co. was no business of mine.

13,483. But do you think they would have supported you in the way they have if these had been the views of Messrs. Wernher, Beit and Co.?—I certainly think that Messrs. Wernher, Beit & Co. might hold those views, and at the same time consider that their mere personal interests did not justify them in burking a thing which the country might be justified in attempting.

13,484. But do you know any circumstances

besides the statements in this letter which would lead you to believe that Messrs. Wernher, Beit & Co. held these views?—I know Mr. Jennings' attitude confirmed me very much in that opinion.

13,485. When was that?—When he came out, about the end of August or the beginning of September.

13,486. But this letter was on the 3rd July. During the whole of July, August and September, the representatives of Messrs. Wernher, Beit & Co. here were doing all they could to let you have a free hand to make a fair and impartial trial of white labour?—Yes.

13,487. Now do you think it quite right that you should publish this letter without some accompanying explanation as to whether the attitude of Messrs. Wernher, Beit and Co. really confirmed or otherwise Mr. Tarbutt's assertion?—I stated explicitly that from Sir Percy Fitzpatrick and Mr. Schumacher I received ready and sympathetic support.

13,488. You did not state that in connection with this letter?—I think I did, or within a few minutes afterwards.

13,489. Now, have Messrs. Wernher, Beit and Co. or their representatives here ever dealt unfairly or unjustly by you?—Never.

13,490. You know the publication of this letter is an appeal to popular prejudice. Do you not think you ought to have accompanied it with some sort of statement?—That is what I have endeavoured to do. I stated, and they allowed, this white labour experiment to be carried on and rose superior to mere political views. I have endeavoured to be most careful in dealing with the matter. I produce that letter to substantiate what was my opinion, and what continues to be my opinion.

13,491. Still the facts so far as Messrs. Wernher, Beit and Co. are concerned, do not confirm it?—The facts, so far as the members of the house here, do not. The facts, so far as the consulting engineers, do.

13,492. Was not the conclusion of the consulting engineers based upon an examination of your mine?—The examination was made into a period of great difficulties, and with only a grudging allowance of those difficulties, leaving an impression in my mind, that these consulting engineers had already made up their minds, and that their brief—their determination—was to prove it unsuccessful. I do not mean "brief" in the sense that they were paid for it.

13,493. Then do you consider that Messrs. Skinner, Spencer and Price were also holding a brief for these people with certain political views in London?—I have never suggested anything of the sort.

13,494. Do you suggest it now?—No. I am suggesting that the consulting engineers, in examining into the matter, did not show by any means the fairness with which they would examine into the question of a new machine. They judged things by results, in course of being arrived at.

13,495. But did not these three mine managers come to practically the same conclusions as the consulting engineers?—No, I do not think so.

13,496. Was it not in consequence of their report that your Board instructed you to suspend this experiment?—If you will have it, Mr. Evans, that report was sent in by my consulting engineer, in November, I think. No action was taken at all until after the deputation, which I was unfortunate enough to join, waited upon Mr. Chamberlain, and I had the temerity to give utterance to views which were regarded as heretical.

13,497. This action took place after the report of the three mine managers?—Yes, some time after.

13,498. And you are carrying out practically the recommendations contained in the report? You admitted that this morning?—I admitted it, with qualifications.

13,499. Sir GEORGE FARRAR: I think you stated this morning that if the industry had followed your example, the 3,000 stamps which are now idle

might have been at work?—With the present number of natives, yes.

13,500. Your position to-day is that you have got 375 whites and 1,000 natives, that is practically one unskilled white per stamp?—About that.

13,501. How long do these unskilled whites remain? According to figures sent by your mine, which I will put in, they stay an average of about three months?—Probably about that.

13,502. So that for 3,000 additional stamps you will want 3,000 additional unskilled men?—Yes.

13,503. And as they only stay three months in order to keep the volume going, we shall want to bring into the country 12,000 white men per year?—That does not follow. Some of the men I am employing are not men who come out to do labouring work. I am taking what I can get under the most unfavourable circumstances, because it has been given out that unskilled white men are not wanted.

13,504. If they are only with you three months they must become something else?—Quite so.

13,505. As they join the ranks of the skilled workmen, you have to replace them?—Yes, that is so.

13,506. If you have got 1,000 natives for 120 stamps we should require 30,000 natives for these additional stamps? I am taking your own figures?—But I do not want any more natives for 160 stamps.

13,507. You would put in more white men?—Yes. It comes to this, and you want a certain number of natives to see you over the "dead centre," and after that the number of natives ceases to be a limiting factor.

13,508. If we are going to start 3,000 additional stamps, we shall require an additional number of natives. That stands for reason. Taking your own basis, you have 1,000 natives for 120 stamps, so that for 6,000 stamps, we should need 50,000 natives?—Unless you redistribute the natives.

13,509. That was not what you stated to Mr. Quinn. What you said was that if we had all followed your example, 3,000 stamps more might have been at work, and prosperity restored to the Rand?—As near as I can recollect, what I contended was that with the number of natives at present here, eked out by unskilled whites, the same number of stamps might be employed as before the war. Whether that involved a redistribution of natives or not, I do not touch upon.

13,510. What do you mean by redistribution?—Take a mine which has got 1,500 or 2,000 natives, and limit it to 750 or 1,000.

13,511. You want 1,000 natives to work 120 stamps?—No.

13,512. But you have got them?—Yes.

13,513. And you are working with rock-drills?—Yes.

13,514. And what about the mines, where reefs are too narrow to work with machine drills?—(Witness did not answer.)

13,515. What you suggest is that the natives should be taken from the developing mines, and put on producing mines. Is it not?—I will not go further than the statement I have made.

13,516. Let us be perfectly fair. There is an impression gone abroad that there is a conspiracy with regard to white labour and native labour. Now, taking your own figures, there must be an increase in the native supply to get these additional 3,000 stamps going?—It would certainly be easier.

13,517. You do not advocate with the doing away with natives entirely? You would employ natives in conjunction with unskilled whites?—Yes.

13,518. And your system is based upon the expansion of the industry by employing white men as they become skilled in skilled work. It follows that the supply of natives must also be increased in a proportionate degree?—That is not my contention. What I have endeavoured to make clear is that the

number of natives need not be a limiting factor to our expansion. After a certain point you can get on without increasing your number of natives.

13,519. Your figures are based on unskilled white labour at 10s. a day. Do you consider that a living wage?—I consider it a living wage for a single man. I am not anticipating that some hundred thousand men will come out with their wives and families complete. I do not think that that has occurred in the history of any new country. I say that 10s. per day is a sufficient wage to attract men with the chance of getting on.

13,520. Do you think that if the native labour supply did not increase you could work the lower grade mines, say west of Langlaagte?—I say that your working costs should decrease sufficiently for you to be able to work the lower grade mines west of Langlaagte.

13,521. Do you know how many white men you employed during the period from April to June, 1899? I will give you the figures if you like—226 in 1899, to 318 in 1903. We will take off an average of 140 unskilled men, so practically you are employing about 178, against 226 before the war. Is that so?—That may be so.

13,522. Practically you are employing fewer skilled men now than before the war?—That is what appears from these figures. There may be circumstances which would account for it.

13,523. There is a letter put in, which begins, "Dear Mr. Creswell," signed by Mr. Tarbutt. I take this to be a private letter? It is not written on Village Main Reef paper?—No.

13,524. It is a private letter to you?—It is not marked "private and confidential."

13,525. It is a private letter which you put in—not official—letter from the Board?—So far as I can remember, the first official letter from the Board was suspending the thing altogether.

13,526. You have not thought fit to put that in?—No.

13,527. Were there any political reasons given in that letter?—Not to my recollection.

13,528. So practically you use a private letter in order to get in political reasons?—I did it in order to substantiate the opinions which I hold.

13,529. You know I control a few mines. do you not?—Yes.

13,530. This letter does not do me the honour of mentioning my name?—It does not.

13,531. You heard the evidence of Mr. Hellman?—I did not.

13,532. Well, he is not at one with you in regard to the working of white labour. He practically says he has given it 13 months' trial, and he agrees with the remainder of the engineers?—I may remark also that at a very early date, within a month after we began using white labour, he wrote a statement in which was expressed a well-matured conviction that Chinese were the only solution.

13,533. We are not dealing with Chinese labour. Do you say that a man like Mr. Hellman, whom I always took to be an honest man who has been with me some years, and I have never been able to influence his opinion when he thought it was the correct one—do you say that for political reasons he has not given honest evidence before this Commission?—Have I said so?

13,534. I will quote your own words, "That the financial authorities at home view it with decided disfavour, being afraid that the employment of a large number of white men as labourers would make the labour element too strong a factor in economic questions, and when representative Government was given, in political questions." That practically implies they are politically prejudiced?—You can make any deduction you like; I am only responsible for what I have said.

13,535. You say these men who are well known to this country, who come here with reputations, have been politically influenced to give incorrect evidence before this Commission?—I have not said so.

13,536. That is what I read anyway?—I am sorry, I cannot help it.

13,537. One thing more. Have I ever expressed political opinions to you on this question of white labour?—You have not.

13,538. There was a report put in in which my name was mentioned, and I came down to your office with Mr. Jennings, did I not?—Yes.

13,539. I think I said the Chamber of Mines wanted a report, subject to your approval, on the working of the Village?—I cannot remember.

13,540. We said that we proposed to appoint three mine managers, whose names would be submitted to you?—Yes.

13,541. We did not thrust any particular men down your throat?—No.

13,542. Mr. PHILIP: What wages do you pay to the two white men working a drill?—One is in most cases a contractor, who earns as much as he can. The other is paid on development 10s. a day, and when he stopes he begins at 8s. 6d.

13,543. What would the contractor get?—One man who has done drill work for little more than a year has earned £45 a month for the last two months. That is the maximum; the average is 18s. 1d. per day.

13,544. And what wages would you pay the boys, 2½ boys per drill?—I am not using any native boys now.

13,545. But when you did use them?—It was 2s. a day, I think. I rather fancy it is more at present.

13,546. Therefore, with natives, you are running two drills for 45s., and with two white men you are running one drill for 40s. Do you mean one drill does as much work as two drills?—To put it in a nutshell, I should say, and with natives on the whole system I should get my work done for 5s. a fathom cheaper.

13,547. What would that mean on the day's wages?—That is where I cannot follow out the argument. It depends upon the white men and the nigger.

13,548. Do you do as much work with one drill as with two drills worked by natives?—No.

13,549. You make a very considerable saving by working with natives?—About 5s. a fathom. I am working one stope with natives, and the difference is about 5s. a fathom.

13,550. What I want to get is this. You have two drills worked by five natives and a white man, and you have one drill worked by two white men. What is the saving—working with natives?—One white man would get on the average 13s. 1d. and his helper we will put at 9s. 2d. That is 27s. per day. In the other case, the white man would certainly be an old-time, skilled man, and we will put him at 20s., and 2½ natives at 3s. 1d., you can call it. I think it comes out to about the same thing.

13,551. But in one case you are only working one drill?—I beg your pardon. I should have said 10s., not 20s. I am afraid the calculations will only lead you to results which do not work out in practice.

13,552. I want to know in what department of the work you make this saving, because if a white man costs four times as much, and if, as you say, a native can do as much ordinary work, like shovelling, as a white man. I do not see where it comes in?—I do not say that. What I said was, that such work was done by white men at approximately Kaffir rates.

13,553. If you were to take a mine with nothing but white men, would you work it as cheaply as you do a mine with 75 per cent. natives and only 25 per cent. whites?—If you gave me time. It might take a very long time. It is merely a theoretical idea.

13,554. Mr. QUINN: Have you any reason to doubt the genuineness of the letter?—No.

13,555. There is no shadow of doubt in your mind that it is a genuine letter?—There never was.

13,556. A doubt seems to have been thrown upon it?—I cannot help that.

13,557. Did you answer this letter?—I really forget.

13,558. Is not the policy as laid down by several circumstances to which you have called attention this morning?—I have given the facts as they are. I must ask to be excused for drawing deductions of that sort; I simply give facts. I met with most virulent opposition from the consulting engineer at that time.

13,559. This letter only refers to white labour for surface work?—That is all.

13,560. That is made clear in the first line of the letter?—Yes, it is what was proposed at the time. That is all that was intended at that time.

13,561. Mr. EVANS: Did any of the Commissioners throw doubt on the genuineness of the letter?—I think not.

13,562. Mr. PERROW: Do you think, Mr. Creswell, that an unskilled labourer can go down in your mine and in six months learn to earn 35s. a day?—I can only tell you that it has been done in one case after 12 or 14 months.

13,563. I suppose you know that after a man has got his certificate, and is supposed to be well up in mining, he has to go at things and ask a practical miner for advice on his work?—That is a matter between himself and the practical miner.

Mr. A. P. CABRAL, recalled.

13,564. The CHAIRMAN: When you were last called you promised to put in certain letters which you said you had at your hotel. Have you them with you?—Before the Commission proceeds to examine me, I wish to read and lay on the table a certain statement which I have prepared. This statement is supported by documents which will be of interest to the Commission. It refers to these letters you have just referred to.

13,565. It refers to the letters which he is now handing in?—Yes.

13,566. Statement read as follows:—

In view of Mr. Perry's evidence, which appears to destroy some of my declarations, it becomes necessary for me to explain the matter. Allow me therefore to make a methodical deposition in order to avoid confusion and misunderstanding. The letter the Witwatersrand Native Labour Association's representative addressed to me under the heading "Private and Confidential." This letter you know already. The circular which was ostensibly sent to the officials of the W.N.L.A., recommending the compound managers, this letter I have not in my hands, nor can it interest you very much. In order, however, that you may make a clear idea of the intentions of the said agent when he sent me his letter, now in your hands, I have kept with it which appears to me to constitute sufficient proof. The first is a telegram from the same agent, dated April 7th, from Coguno.

13,567. April 7th of this year?—Yes.

The telegram is as follows:—"Come Coguno at once, urgent, give no passes until you have seen me. Wire me when coming." This telegram was sent when the first compound managers arrived, the two brothers Cochrane and Mr. Munyer, and I received a wire when I was on my way to Coguno, where I was going to receive clear instructions, because in comparing the confidential letter with that circulated, I did not know what to do. The telegram ordered me to go to Coguno for the same purpose, and, in fact, as soon as I arrived there very clear instructions were verbally given me by the said agent with regard to the policy I had to follow with the view to raise as many difficulties as I could with the compound managers. On the 17th April I received a letter from the same agent.

13,568. Mr. EVANS: Who is this agent?

13,569. The CHAIRMAN: You say you received a letter from the same agent. Who is this agent?—It is always Mr. Neergaard.

13,570. He is agent where?—In Inhambane.

Statement continued:—

On the 17th April I received a letter from the same agent dated from Coguno the day before. This letter constitutes the record document. This letter deals with private matters. However, it contains a certain paragraph which is in connection with this matter—

"I expect you to keep your eyes constantly upon Cochrane and Munyer."

I think it quite unnecessary to explain the meaning of this sentence. The fact is that he more clearly reminded me that I had to comply with the instructions received verbally, and it clearly recommended me not to stop the work of spying which had been ordered me a few days before. The third document finally is another letter from the same agent which I received the following day. This letter deals also with private matters, but it refers very explicitly to the compound managers. I will quote this paragraph in connection with the managers. "Munyer sent a telegram to Cochrane, which is here. Cochrane showed it to me and he told me that he (Munyer) was very anxious to take the boat on the 20th for Delagoa Bay, but he had not collected any boys yet, and he was not quite sure that there would be a boat for Delagoa Bay. Do your best to persuade him to leave on the 28th. It will always be one less. If this boy English comes to Cumbana, get hold of him. Great care is needed with the boys. Cochrane has probably ordered to be recruited in Maxixe, Cobane, and Cumbana. There is no doubt that he has sent several of his boys and of Tixeira's old runners to the several territories in order to recruit. I have twice wired to Delagoa Bay concerning him, but I would very much like you to give me clear proof that he is recruiting without a licence. I think this will not be very difficult, and I request you to do your best to give me that proof." I need not point out the importance of that paragraph I have just read, but it becomes necessary to explain. The agent says it was best to persuade him (Munyer) to leave on the 28th. "There will always be one less," he says. Well on the 28th there was no steamer, and this the agent knew very well. What he wanted was to get rid of one of them, as he says, "There will always be one less." I complied with those instructions, and I persuaded Munyer to leave, and the result was that he came back to Inhambane in time to take the boat on the 28th, which never existed in the Machiavellian plans of the agent. So the compound manager had to wait in Natal two days until the boat arrived. Another important point of this letter is the paragraph referring to Cochrane, in which the agent asks me to give him clear proof that he (Cochrane) was recruiting without a licence. I must say that Cochrane was very well known in Inhambane. He had even a certain prestige amongst the natives, and that is why the agent most particularly endeavoured to neutralise him. Said agent alludes also to a telegram he sent to Delagoa Bay concerning Cochrane for the purpose of denouncing the fact that Cochrane was recruiting without a licence. We did not have to wait very long for the result of such wire. The commandant came to my camp about a week afterwards to look for Cochrane in order to order him to leave the district immediately, as he could not remain there any longer. This order could not be fulfilled, for Cochrane had left, on account of ill-health, for Inhambane the day before. From this you will understand the reason why the agent of the W.N.L.A. insisted on my supplying him with a clear proof that Cochrane was recruiting without a licence, when it was a fact that Cochrane was doing nothing else but to comply with the instructions he had received from Johannesburg in agreement with the Association. You can ascertain the truth of my declarations by examining the documents I refer to. You may have some translated, and especially the paragraphs referring to this matter. With regard to the documents

produced by Mr. Perry before this Commission, it is not worth while discussing them, for they are simply documents for publication. You have already had the opportunity of seeing that the Association has, like certain merchants with invoices, two sorts of correspondence—the one “private and confidential,” containing the instructions to its staff, and the other one to show in case of complications. If such documents exist, as I believe, it is not probable that they should be brought before you, for Mr. Perry is certainly the party who is interested that this should not take place. Mr. Perry accuses me of disobedience. It is an accusation which is of very little importance for me, and with which I will not deal at very great length. Mr. Perry is only acting on information received from his agent in Inhambane, who conceived me to be disobedient if I more than once refused to comply with his orders whenever such orders were in opposition to the laws of the country, which I know better than he. The fact I have already mentioned before you that I refused to organise an “indaba” and to call several chiefs together without superior authority is a very clear example. Besides calling me disobedient, Mr. Perry also calls me a bad official. I have no ill-feeling against him for that, for I repeat he is still acting on information received, but I will say, however, that I have received several letters from the Manager of the Association at Lourenco Marques, in which I was praised for services rendered. I regret not having brought these letters with me; but, if you are willing to call the said Manager, Mr. Pickard, now in Johannesburg, I have no doubt he will confirm what I declare. I have in my hands a letter which you may imagine. The letter covered a remittance of £30 given to me as a bonus, and this letter says that I am the only sub-recruiter to whom this bonus is given. Such exception made in my favour does certainly not prove that I was a very bad official. Besides that, I was in charge of the three districts of Maxixe, Guilale and Combane as my recruiting area. I was recruiting between 300 and 1,000 natives. The letter I refer to is as follows:—

A. P. Cabral,

Sub-Recruiter. W.N.L.A., Ltd.,  
Combane.

Dear Sir,—Mr. Nourse, when passing through some time ago, mentioned to me that you were very much dissatisfied with the rate of pay received by results. I must point out to you that if you have suffered, other sub-recruiters have also suffered. On the other hand, if the output had been better, I daresay we should not have heard from you. You will see by the bonus, which no doubt you have received ere now, that the intention of the Association to remunerate its employees for good services rendered. I may also state that you are the only sub-recruiter whom I have given a bonus. I am told by the other recruiters that Mr. Neergaard has mentioned your case particularly, and I have no doubt you will get fair treatment from him. Trusting that you will do as well in the future as in the past,

I remain, yours faithfully,

E. PICKARD.

If everyone of the 20 recruiters of the Association recruited monthly my average the monthly output of Mozambique would be 12,000 niggers. With regard to my resignation, I find it necessary to bring forward some few considerations. In August last I was called to Lourenco Marques, and there I was told by the present Manager of the Association that, owing to incompatibility existing between me and Mr. Neergaard, I could not continue in the service of the syndicate. Then, for the first time, I had knowledge that a syndicate had been started, and that I had been working for that syndicate since April under the illusion that I was working for the Association. When Mr. Lloyd told me this I replied that I did not recognise his right to dispose of me without consulting me previously, for if I was quite prepared to work for the Association, I was in no way prepared to fill the pockets of adventurers. On this occasion I handed to Mr. Lloyd a very minute exposition of the reasons of my incompatibility with Mr. Neergaard, with which report

Mr. Perry is certainly acquainted, and of the said report I am giving you a copy. Mr. Perry declares that since I left the Association the results have been better, and that the number of natives recruited had been greater. I have no idea of the details of the last return, but I emphatically state that there has been no increase in the area under my charge. There has since been a decrease, and my old area is now in charge of these officials of the Association. From amongst the declarations of Mr. Perry, I will take one which, on account of its exceptional seriousness, I have great interest in destroying. That is the one referring to my would-be propaganda against the Association, in which I am supposed to have spread amongst the natives a rumour that emigration had ceased. I challenge Mr. Perry to produce a serious proof of his declaration. Besides, I know that at the request of the Association the Inhambane authorities ordered a very strict enquiry to be made in order to find out whether such propaganda had really taken place. Such enquiry acquitted me completely of such suspicion. I will also declare that as soon as I return to Inhambane I will call the Association to account for defamation before the Court. Now, allow me to explain the intrigue which was formed against me in order to prejudice me before the authorities. One day, when I was going to Inhambane on duty, I was in one of the restaurants with the postmaster and the sub-recruiter Abrantes. A telegram was handed to the latter, which was in English, and, as he could not understand English, he passed it on to me, and asked me to translate it. Although my knowledge of English is less than elementary, I had not much difficulty in translating the same. The telegram, which was for the Agent of the Association at Coguno, said that in compliance with the instructions given already, he was to send Kaffirs to the interior in order to discredit me amongst the other natives. When I translated this telegram to Abrantes, he was in an unpleasant state.

13,571. What do you mean?—He was annoyed and asked me not to take any steps for anything I should do would do him harm, and would make him lose the situation which was his only means of livelihood. I did not move in the matter, and I decided to keep this thing until opportunity arose and then I should make use of this telegram, of which I regret not to have been able to take a copy. Shortly afterwards Abrantes received orders from Neergaard to write him a letter denouncing me for spreading among the Kaffirs that the emigration had ceased. Abrantes very docilely wrote the letter which Neergaard himself dictated. As a reward for his conduct, Abrantes was afterwards placed in my district, while I was called to Delagoa Bay, where the said letter arrived at the same time. I wish to point out that I was not acquainted with the letter, and the Manager did not refer to it in any way. I happen to know of it from private information. These are the remarks suggested to me by Mr. Perry's evidence. I hope I have succeeded in destroying the insinuations. The only thing that remains for me now is to place myself at the disposal of the Commission to answer questions you may find it necessary to put to me. At the same time I thank you for having given me the opportunity of destroying Mr. Perry's evidence.

13,572. In connection with this statement certain letters are attached, I understand?—Yes.

13,573. Are the originals there?—Yes.

13,574. They are attached to the statement?—Yes.

13,575. Mr. WHITESIDE: I think the witness has fairly well established the point which I wish to make. It is true, as Mr. Perry stated, that you were dismissed for unsatisfactory work, insubordination, and particularly because, instead of working in your district, you spend nearly all your time in the town of Inhambane amusing yourself?—The Manager at Delagoa Bay never charged me with anything wrong, and simply told me that I was dismissed on account of incompatibility with Mr. Neergaard. Mr. Neergaard suspended me, and sent me to Lourenco Marques, with a recommend a

tion that I should be dismissed. This was mainly owing to a row I had with him arising out of my having gone away for 10 days without leave.

13,576. Mr. Perry states that you were dismissed with the assent of the Portuguese Government, who were consulted. Have you anything to explain about that?—The Government have nothing to do with that. The Association must have the Government's approval if they want to engage anybody, but, if they want to dismiss a man, they have nothing to tell the Government.

13,577. Mr. Perry says the Government were consulted?—It is true that when I was dismissed, Dr. Pinco Coelho, the Superintendent of Emigration in Delagoa Bay, advised me, before I did anything, to call on Mr. Perry, and he gave me a letter of introduction to him.

13,578. Mr. Perry also made a statement as follows:—"For instance, he told the police boys that there was no more work at Johannesburg, and to turn back any boys coming to the coast." Do you deny that?—Mr. Perry can have no proof of that. Mr. Neergaard charged me with doing that, and the Association asked the Government to make an enquiry about it. The enquiry conclusively proved that I was quite innocent of such evil doing.

NATHANIEL CYRIL UMHALLA, a native, called, sworn and examined.

13,579. The CHAIRMAN: Where do you live?—At King William's Town.

13,580. In the town or in the neighbourhood?—In the district.

13,581. Are you the chief?—I am a son of the chief.

13,582. Is your father alive?—No, he died long ago, about 20 years ago.

13,583. Who is the chief of the tribe now?—I am the chief of the tribe.

13,584. What is the name of the tribe?—The Mdlambe.

13,585. How many people are there in the tribe?—I cannot say exactly.

13,586. Is it hundreds or thousands?—Thousands.

13,587. Is the tribe living in locations?—They are living in locations outside the towns.

13,588. Are those locations part of the town lands?—No; they are Crown lands under the Government.

13,589. Do the people of the tribe pay rent for the ground?—They pay hut taxes.

13,590. How much is it?—12s. per hut per annum.

13,591. Do they pay any other taxes?—No, sir.

13,592. Do any large number go out to work elsewhere?—Yes, they work at the harvest, on the rail, and they come up here.

13,593. Do they work on the farms too?—Yes, and in Kimberley.

13,594. You cannot give any idea of the number that go out to work in any one year?—I was not prepared to give evidence before this Commission: I was only told about it this morning.

13,595. Then do they go out to work in any numbers?—Yes, Port Elizabeth is full of them, and Capetown. There are not so many up here as in those places.

13,596. Do you hear reports as to the treatment they receive here?—Yes.

13,597. Are these reports satisfactory?—They are satisfactory in some cases, and not satisfactory in others.

13,598. What is the nature of the unsatisfactory reports?—That the attitude of managers to their labourers is not sympathetic; so much so that they think that the white people have a secret society which meets every night and in which they are induced to hate the natives.

13,599. Do you yourself believe that story?—Oh, no.

13,600. Do you get any reports as to ill-treatment?—Some say they are ill-treated.

13,601. In what particulars are they ill-treated?—Well, in not paying them wages and being kicked and bullied.

13,602. Low wages, kicked and bullied?—Yes, sir.

13,603. Any others?—Mostly always it is ill-feeling.

13,604. How is the ill-feeling shown, apart from the low wages and being kicked?—I do not know how it is shown, but they are not treated as well as household servants, who are treated very well.

13,605. Your natives working in houses report then that they have been well treated?—Yes, all over the country; that is till they misbehave.

13,606. Were all these complaints made since the war?—Yes, since the war.

13,607. By natives who have returned from the Rand?—Yes.

13,608. Do the natives distinguish between working on the railways or mines and house-building?—I have been told so.

13,609. From what quarters do these complaints of kicking come?—From those that work on the mines.

13,610. Have you examined into the complaints in any way?—Yes, I have asked how they have been treated and I have told them that I have heard reports of good treatment; they would not say distinctly how they had been treated except in reference to kicking and lowering the wages. They say that about two or three months ago the treatment was modified—so much so that they got facilities for getting Kaffir beer. There are complaints because they are not allowed to take drink, but I always tell them that it is for their safety that they are not allowed to have liquor. It is to their own interests, and we should thank the white man for it; as soon as they are allowed to take liquor they will spend all their money here and forget that they left people at home who depend on them.

13,611. What do you think that the wages paid in Johannesburg are?—They say they average from £2 10s. up to £3 or £4.

13,612. In addition to that they get food?—Yes.

13,613. You consider those wages low?—Well, if the food was taken away, I think the labour would still come in; it is the ill-feeling that is felt by the natives and that prevents him coming here. The ill-treatment is nothing as compared with the ill-feeling between black and white.

13,614. You think it is of more influence in preventing natives from coming here than this specific act causes you have given us?—I think so.

13,615. I understand you are going round a number of mines while you are here?—Yes.

13,616. With a view to seeing your people and to seeing how they are treated?—Yes, and to hear how they are behaving.

13,617. You will ask the compound manager about that.

13,618. Mr. DONALDSON: You say there is a certain amount of ill-feeling that prevents boys from coming here. Is it greater or less than it was four years ago?—They say it is greater now.

13,619. Do you know why it is so?—I do not know.

13,620. Is that ill-feeling always in regard to the people of Johannesburg or the people of other places in the Transvaal?—To the people of Johannesburg especially.

13,621. Do you think it is the result of lowering the wages?—Yes.

13,622. Is that the principal reason for the ill-feeling?—Yes, I believe so.

13,623. Are you aware that the wages have been raised again to what they were four years ago?—No, I was not aware of that.

13,624. I think you will find it so on making enquiries?—I am here to make enquiries.

13,625. Is it your opinion that if the scale of pay is as liberal as before the war, the cause of ill-feeling will go away?—Yes, if you take away the ill-feeling that exists you will get any number of natives to come here. You should treat them as you treat the household servants.

13,626. Have you seen any of your own natives since you came?—Not as yet.

13,627. Then you are not in a position to know how they are treated in the mine compound?—No, not as yet.

13,628. Then your opinion is that if we treated them as well or better than before the war, and gave them as liberal a scale of pay, the feeling of distrust and dislike would disappear?—Yes, if you could take away the ill-feeling you would have such an influx of labour as you never had.

13,629. You mentioned just now that the boys from your part of the country disliked the restrictions upon liquor?—Yes, but it is not an important matter.

13,630. They do not attach much importance to it?—None at all.

13,631. Many have mentioned it to you all the same?—It is the jovial fellows that get the money and spend it.

13,632. Are all the people from your part of the country jovial fellows?—Not the most of them; they come here to support their dependents.

13,633. Do you think that if the liquor restrictions were taken away it would induce more boys to come here?—The restrictions are not of much consequence. The natives have petitioned the Government to take away liquor from them.

13,634. Would it have any effect in keeping the boys longer if they were able to get liquor?—I do not think so.

13,635. If they were able to get liquor or to get liquid rations, they would not stop longer?—I would not bring that out as an inducement.

13,636. You think it would not do them any good?—No.

13,637. When they are at home do the natives get liquor?—Yes, they get liquor at home; not so much as they used to in former years.

13,638. They are getting more sober?—They have taken to drink more at some distance outside.

13,639. They go outside to go on the spree?—Yes.

13,640. The natives from your part of the country, when they go to Port Elizabeth or East London, get better pay?—They get better pay at Capetown.

13,641. Then why do they come up here?—I do know Capetown is crowded with them.

13,642. There is not enough work for them to do?—No.

13,643. What pay do they get?—From 4s. 6d. to 5s. a day.

13,644. The demand for labour is in a certain extent limited?—I think so.

13,645. Sir GEORGE FARRAR: You get a great number of complaints?—Yes.

13,646. Have you written to the Magistrate about any particular cases?—I have come to enquire, but I have seen no one yet.

13,647. There are more boys in the towns or on the railways than on the mines?—I do not know.

13,648. Do any boys come to private people or to the railway?—I do not know.

13,649. Are there any other complaints about the private people or about the railways?—No.

13,650. You are going to inquire into the complaints here?—Yes.

13,651. You have written officially about complaints?—Yes.

13,652. But nothing serious has been brought to your notice?—No.

13,653. Mr. EVANS: What is the pay that your people get at East London?—From 2s. or 3s. to 5s.

13,654. What do you think is the average pay?—2s.

13,655. And what is the average pay at Capetown?—4s. 6d. up to 5s.

13,656. Mr. PHILIP: If things are satisfactory, and you can report on them to your people, will they come up here?—I think so.

13,657. Do you think thousands will come?—I think so.

13,658. Mr. WHITESIDE: You are here to inquire into the condition of your people?—Yes.

13,659. In your opinion, thousands would come if you took back a favourable report?—Yes.

13,660. Have you visited any of the compounds?—Not yet; I begin to-morrow.

13,661. You are in a thickly-populated district?—Yes.

13,662. When are you going back?—I do not know yet.

13,663. I trust you will find a happy state of things in the compounds.

13,664. Mr. QUINN: Are your requirements increasing as the days go by?—Yes.

13,665. They require many more things than 20 or 40 years ago?—Yes.

13,666. More clothing?—Yes.

13,667. And household things?—Yes, they are really spending more and therefore the inducement to go out is increasing.

13,668. Is it increasing to a considerable extent?—Yes, to a very great extent indeed. I think during the course of 25 years we have had, I would say, three or four crops of good harvest, and we have been overrun for years with locusts and blighted grain, with no returns at all in crops, therefore they have been obliged to go out to work.

13,669. Have you heard any complaints as to the way in which your people are treated on the railways. We have had a lot of evidence from witnesses qualified to speak on the subject that they have had complaints of the way in which they were treated?—I have not heard myself. We heard some when the railway was worked by contractors.

13,670. But I mean travelling on the railways?—Yes, I have had many complaints, especially as to the Springfontein line.

13,671. They are not allowed sufficient time at the railway stations?—No, and sometimes they are taken out of the third-class and put into trucks.

13,672. You have had a lot of complaints in this direction?—Yes.

13,673. Coming back to the liquor business, would you like to see your people with the right of buying liquor here?—No, I would not.

13,674. Do you think it is right to serve out Kaffir beer under reasonable circumstances?—Yes.

13,675. Would it not be the worst thing that could happen to your people if they could buy liquor?—I think so.

13,676. Mr. PERROW: Do you think your people will come from Capetown, where they can get from 4s. 6d. to 5s. a day, and 9d. an hour for overtime, to work for £3?—I think so. It may seem contradictory, but the natives hate travelling by sea; they would rather come here by land than go to Capetown by sea.

13,677. Mr. EVANS: Is there any railway construction going on in your district?—Yes, there is one line and one had been begun for the Transkei. The Kokstad, I think, is complete.

13,678. Where do the labourers for the railway construction come from?—From our parts and from the Transkei.

13,679. Why have the Cape railway people been recruiting in Basutoland?—I did not know they had been there.

13,680. It has been stated so?—I do not think they have need to do that; I think that Kaffirs take to railway construction readily.

13,681. What is being paid?—2s. 6d.

13,682. Is 2s. 6d. the minimum pay or the average?—The average.

13,683. How are the farmers off for labour in your district?—Well, they have families living on the farms and employ their families.

13,684. They have all the labour they require?—Yes.

13,685. In the Peddie district they have all they require?—That is principally a native district with very few farms.

13,686. The CHAIRMAN: You stated something about the harvest and the trouble with locusts; when you have a good harvest do a less number go out to work?—It used to be that way in former years, but not now, because if they get a good harvest this year they are not sure of a good harvest next year, so they are always working.

13,687. Mr. DONALDSON: Referring to the Transvaal, do you know whether much labour goes on the mines or do they prefer railway work? What percentage goes to the mines? Is it 20 or 50 per cent. or what?—I cannot say.

13,688. You are not in a position to offer an opinion?—No, not on that.

13,689. When the labour goes out of your district, some goes to Port Elizabeth and some to the farms in the Colony. When they are working, how long is it for?—Generally six months, but they generally like to be contracted for three months.

13,690. So for three months they work for themselves. When they get back, how long do they stop?—A very little time.

13,691. If you take the natives in your part between 18 and 45 years of age, able-bodied men, on an average how many months in the year will they be working outside your district?—I would say eight months.

THOMAS ZWEDALA, a native, was called, sworn, and examined.

13,692. The CHAIRMAN: What is your name?—Thomas Zwedala.

13,693. Where do you live?—Glen Grey, in the district of Lady Frere.

13,694. Are you a headman?—Yes.

13,695. Over a large number of natives?—Yes.

13,696. Can you tell us how many people you have under you?—About 1,000 that are directly under me, besides the other headmen in the district.

13,697. Do many of your people go out to work, outside your district?—Yes, many have gone in all directions. Some are still here since the war, some have gone to Capetown, and in all directions they go to work.

13,698. Do you think larger numbers will come here if they get liquor, apart from Kaffir beer altogether?—I do not know.

13,699. Would you approve of them getting liquor served out to them here?—I cannot go into that, because when they go away from their homes they go to work for their children and not to work for brandy.

13,700. Have you had any complaints from people returning who have been working here?—They complain of the treatment, which they say is bad, since the war it was very bad, much more so than when the Boers ruled this country.

13,701. How is it now, do you know?—On my way here this time I met 40 men at Sterkstroom; they say the cat-o'-nine tails was placed on a fellow's back every day without being taken before the Magistrate; the managers do it.

13,702. Who told you this?—These 40 men I met at Sterkstroom.

u 30718.

13,703. Did they all say this, or one or two?—Yes, they all agreed with one another that it was so.

13,704. Do you believe it is true?—Some say that the treatment is a little better now. In travelling along the line it is a little better now.

13,705. Do you believe that story these 40 men told you about the cat-o'-nine-tails; do you believe it is true?—I cannot say; they say that sometimes they are kept a long time only seeing the sky above them and being prevented from going to the shops. That is what they say. I have never been there myself; I shall be able to know something to-day now that I am here.

13,706. Did you take the clothing off any of these boys and see if they were marked with the cat-o'-nine-tails?—No.

13,707. Mr. FORBES: Do your people work much at home? Do they put in much crop for sale?—In good times they take the crops for sale, such as grain, mealies, wheat, forage and other things, and cereals.

13,708. Have they got stock, have they got oxen, do they use ploughs?—Yes, they have oxen and ploughs.

13,709. They do not have to put in the crops with hoes?—No, not with hoes; with the plough and oxen.

13,710. Do the women work in the fields, putting in the crops, or only the men?—The women plough and put in the crops, and sow the crops.

13,711. The CHAIRMAN (to Umhalla): Will you, when you have finished your investigation, send us a letter telling us how you find things in the compounds and elsewhere?—Yes, I will remind Mr. Brownlee.

13,712. Mr. QUINN: It would not take long to have these two witnesses.

13,713. The CHAIRMAN: Perhaps we will be satisfied with one.

13,714. (To Umhalla): If you will see some mines before Tuesday next, the Commission will be sitting on Tuesday morning, and would you kindly come here and tell us what report you are able to give?—Yes, I will ask Mr. Brownlee next Tuesday.

Thank you, we are very much obliged to you for giving your evidence.

Mr. H. H. WEBB was re-called, sworn and examined.

13,715. I understand, Mr. Webb, you asked to be recalled to-day in consequence of evidence led by Mr. Creswell? I understand that Mr. Percy Tarbutt, whose letter of July 3rd, 1902, was put in, is a director of the Consolidated Gold Fields of South Africa?—I believe he is.

13,716. He makes a reference to having consulted the directors of the Consolidated Gold Fields of South Africa in that letter?—Yes.

13,717. You are consulting engineer on the Rand for the Consolidated Gold Fields of South Africa?—The mining work of the Consolidated Gold Fields is under my supervision, and I am consulting engineer to each of the companies.

13,718. I understand you wish to make some statement?—I wish to say, sir, I do not remember to have met Mr. Tarbutt but once, though I may have so, and I have had no communication with him, but I have been in frequent communication, and am at all times, with Lord Harris, the Chairman of the Consolidated Gold Fields, and there is hardly a mail passes that I do not hear, and have not heard from Major Sapse, who was one of the secretaries of the Consolidated Gold Fields, and I wish to state that in no way whatsoever have they ever intimated to me, or have I ever heard, directly or indirectly, that they were opposed to the employment of unskilled whites, or would not welcome the successful result of an experiment of the work on these mines. There never has been any intimation to me of that kind, and it was not very long ago, but a few months ago, that Mr. Fricker in talking to me asked—

Q 4

13,719. Who is Mr. Fricker?—One of the joint managers here. He asked me if I would not make an endeavour to get some of our big shafts going with unskilled whites. As a matter of fact, we have the Cathin shaft of the Jupiter Mine already bailed out of water, and have overhauled the timbering, and were prepared to do that work if necessary to start sinking with unskilled whites, but the managers picked up enough boys to start with native labour. Our experience has been, it is much cheaper to sink with native labour than white. We have demonstrated it and for the size of the shaft it is the best and cheapest course on the Rand.

13,720. Sir GEORGE FARRAR: Mr. Cresswell states, Mr. Webb, "I am of opinion that the consensus of expert opinion laid before you against white labour is largely due to the following causes: That the financial authorities at home"—your Corporation especially—"viewed it at the outset with disfavour, being afraid that the employment of a large number of white men as labourers would make the labour element too strong a factor in economic questions, and when representative Government was given, in political questions." Now, have they endeavoured in any way, directly or indirectly, to politically influence you on your trial with white labour?—They have never endeavoured in any way, either directly or indirectly, to influence me, or to indicate they had any such desire.

13,721. Then he states: "No. 2.—That the leading experts, besides being naturally influenced by these ideas on the part of their employers, had made the success of their careers"—that is, Mr. Cresswell states that you made the success of your career—"here on the old cheap, inferior, race labour system and would be reluctant to admit that a new departure must be made if any way of perpetuating it were possible." Now, you have also worked in America?—Yes.

13,722. You had a career in America before you came to this country?—Yes.

13,723. And you judged both conditions in an unprejudiced way?—Yes.

13,724. And uninterested?—Yes.

13,725. "In these circumstances all arrangements and results adverse to white labour would be welcomed, while those of the other side would be combatted and sifted with a view to proving them fallacious." Is that correct?—No. As far as I am concerned, and I think the majority of the men we employ—our managers—we are interested in the success of the mining ventures of the gold fields. A large proportion of our holdings are deep levels, and they cannot afford to wait, so if we can make them go with white labourers it is to our interest to do it. It does not detract at all.

13,726. Mr. EVANS: Up to the time you heard this letter read, did you know that your people in London held these views?—No, and I have been in constant communication with them, and no work of the kind would be inaugurated if I was not informed of it.

13,727. Mr. WHITESIDE: Mr. Webb, do you remember a memorial which Mr. Rudd wrote to the Consolidated Gold Fields about seven months ago, in which he stated it would not be possible for political reasons to substitute 100,000 white men for Kaffirs, as they would hold the Government of the country in the hollow of their hands? Do you remember anything about it?—No: when was it written?

13,728. About seven months ago?—To whom?

13,729. The Consolidated Gold Fields?—Out here?

13,730. No, at home?—It is entirely now to me.

13,731. It was addressed to the Consolidated Gold Fields and written by Mr. Rudd?—Mr. C. D. Rudd?

13,732. I do not know the gentleman's initials. On the occasion of an annual meeting; do you know anything about it?—I have told you I do not, Mr. Whiteside; I do not know anything about it, and I am under oath.

13,733. Mr. QUINN: I think it is only fair that what Mr. Cresswell stated should be put to this witness, as he stated. Now, while the way Sir George Farrer has put the question is substantially correct, Mr. Cresswell at the same time did not say the Gold Fields especially, nor did he single out Mr. Webb as an instance of those standing on the reputation they have made with cheap labour. He classed the whole together. There are two ways, and I submit it is not with Sir George Farrer's usual fairness. It is not fair to Mr. Cresswell. For my own part, I have no hesitation whatever in accepting anything Mr. Webb says, whether under oath or not, as being true.

13,734. The CHAIRMAN: We are very very much obliged to you, Mr. Webb.

Mr. J. DONALDSON was called, sworn, and handed in the following statement:—

13,735. I have lived a great deal in Portuguese East Africa since 1884, and since then till now have always had business interests there. I know the ports of the country and inland as well, from Lourenco Marques to Inhambane. This country is the principal source of labour supply for the Witwatersrand. It is my opinion that the labour supply from this district will probably decrease, because local demands are increasing and likely to further increase.

To give one instance, in October last year I went to Inhambane and bought some land there, on which I have erected a sugar mill and am planting sugar. The last report I had from my manager is, that he has in employ 842 Kaffirs. A year ago on this ground there were probably not more than an average of 60 Kaffirs employed. The Governor of the district has asked me to go in for sugar planting in that district in another direction, and I feel sure if I do not handle the proposition someone else will, and the demand for labour there will consequently be increased. I know of exceedingly promising prospects of mineral oil, which is being prospected by a Johannesburg Syndicate, and there is every likelihood of their tapping enormous deposits of oil. If successful, this industry must employ a very large number of natives.

The natives from these districts have a wonderfully plentiful supply of liquor, which they get at different seasons of the year, from the marolla tree and the caju; there are also palms there, which they tap and get liquor from.

They are brought up on it, and accustomed to it, and I feel sure that if facilities were given them to get a proper supply of liquor here, they would stay longer here when they do come to work.

13,736. The CHAIRMAN: You have known East Africa since 1884?—That is so.

13,737. Have you lived there any length of time?—I have lived there off and on the whole of that period.

13,738. Is your knowledge of that country confined to the coast, or do you know anything of it inland?—I have been inland and on the coast. I know the whole extent of the coast and a little inland from Mozambique. Probably very few Portuguese have been so far, and I know the southern districts, Lourenco Marques and Inhambane, both inland and the coast, very well.

13,739. You make a point in your statement of the increasing local demand for native labour?—That is so; there is a very considerable tendency to increase the local demands.

13,740. You give an illustration of some planting experiences of your own, where 842 natives are now employed?—That was according to the last letter I had from our manager.

13,741. What indications are there of other persons going in for planting?—The conditions of the sugar industry are such that there is every probability of it. Six years ago there was only one sugar mill in operation in Portuguese territory, the Sucre de Mopea—that is belonging to a company on the Zambesi. Since then the Portuguese Government have offered inducement to planters in the

form of a rebate. The duties on sugar going into Portugal are 120,000 reis a ton, roughly speaking, £22, but for sugar which is grown in their own Colony there is a rebate of the duty of 60,000 reis a ton; consequently there is a differential duty on sugar going into Portugal of approximately £11 per ton.

13,742. How long has this differential duty been in operation?—It came into operation last year, and it was promulgated to be in effect for 20 years. This was done by the Portuguese Government to induce the opening up of industry in her Colonies.

13,743. Do you anticipate an increase in the acreage under cultivation for sugar in these territories?—I think that is unquestionable. The Portuguese Government are anxious to see this industry go ahead, and the District Government of Inhambane have offered me land in another sub-district of Inhambane, which is suitable for growing sugar.

13,744. Can you form any estimate of the number of natives likely to be in the sugar industry, say five years hence?—That I cannot tell. I have also a sugar estate outside Lourenço Marques, in regard to which I wanted an alteration in the title. I had got an edict passed at Lisbon, by which the title is altered, and probably there will be another sugar mill there. I am not the only man who sees where these opportunities occur. I am chairman of one company which has started at Inhambane, and it is possible we may have a mill working next year at the place outside Lourenço Marques. With regard to the ground at Inhambane, which the Governor spoke to me about, if I do not handle it, somebody else certainly will.

13,745. You can only speak of the tendency with regard to sugar?—There is another place I know of being started by the Portuguese on the Limpopo at Chichi, and there is a further company started on the Zambesi, the company Luabo with French capital.

13,745. Are there any other industries there which are likely to increase considerably during the next three years?—It is only within late years that the back country from the coast has been travelled really from end to end, and from side to side. I do not think there is any reason why mineral wealth should not be found in that country. A few years ago, before the power of Gungunjana was broken, there were very few whites indeed went into the interior, and they were almost entirely English. Now, in both Lourenço Marques and Inhambane districts, you have a system of Portuguese Government military stations which are connected by telegraphs. Roads have been opened up, and consequently white people of any nationality have no difficulty in travelling the country. People going into this country, mostly for the purpose of getting cattle, come across indications of minerals from time to time, and some of these I believe are very promising.

13,747. You look for an expansion of the mineral industry then?—I see no reason why minerals should not be discovered and worked there: in fact I know, without having actually been to the spot, that at a place about 50 miles from Inhambane, there are very favourable indications of large minerals or deposits.

13,748. Are there any other causes likely to operate in the near future in absorbing the supply of labour?—Yes, there are in many directions, particularly up the various rivers, where the land is being occupied by the Portuguese, and also in many cases by Arabs. Extensive farming operations are going on. The export from the Province of Mozambique to the Transvaal of mealies exceeds 80,000 bags per year. I know, when we were in business there, my farm used to deal considerably in that, and we have handled as much as 40,000 bags. The tendency is for white men to cultivate more largely, particularly up these rivers which are being opened by steamer service.

13,749. Do you know anything about the suggested construction of railways in that country?—A railway has been authorised from the port of Lourenço Marques to Swaziland, and other railways have been talked about, but I do not know they have been

officially sanctioned. I think, with the natural progress of the country, they are likely to be sanctioned in the course of a year or two. These railways are not confined to the south, but there are some in the north also.

13,750. You wish, by the evidence you are now giving, to suggest to the Commission that the local demands for labour will restrict the exploitation of that labour for this country?—I think undoubtedly so. If the Kaffir can get employment without making a long journey, I think he would rather work near his own people.

13,751. Did you hear the evidence of Mr. Mello Breyner given before this Commission?—I was present.

13,752. He stated that we had in the Transvaal before the war something like 80,000 Portuguese natives. Sir Godfrey Lagden has given evidence to show we have now something like 55,000. Mr. Breyner said that he thought in the course of two or three years, we should get up to 80,000 again, and he also said we should ultimately get from the southern provinces a total number of natives permanently on the Rand of 110,000. Have you any opinion on that subject?—All I can say is that inland in Inhambane 90 per cent. of the boys you meet of 25 years of age and upwards have been in the Transvaal. That being so, if you had 80,000 before the war, I do not think you can expect a very great increase on that number, and still less if there are opportunities to supply them for work locally.

13,753. Mr. Breyner went further and said with regard to the northern provinces, he estimated that once a stream of emigration had been established for a period of five to seven years, we might expect ultimately to get some 60,000 or 70,000 natives from the northern provinces. Have you any opinion upon this?—I think that probably Mr. Breyner is very optimistic. I have no doubt that, as the Portuguese occupy that country in the same way as the southern districts, establish military stations, and bring the chiefs into subjection, the stream of emigration may be established, but I am afraid before these conditions are attained probably many years will have elapsed. We had the evidence here of a gentleman who represented the Native Labour Association at Mozambique, and from his evidence it was apparent that his recruiters were going where the Portuguese Government officials were not able to go with safety. The Portuguese Government have undoubtedly neglected that portion of their land, and I have no doubt that in the course of a few years they will begin to open it up, and when these conditions prevail you will be able to get a considerable supply of labour from there. But I do not think one can estimate how much.

13,754. Mr. WHITESIDE: I understand that you thoroughly believe that a certain quantity of liquor is good for the natives?—Yes, in these low countries there is a plentiful supply of liquor without any trouble. There are tracts of country where you have simply got to insert a reed or tin spout into the palms and it comes out. They are brought up on it. I certainly do not approve of selling liquor indiscriminately, but I certainly think that if facilities for getting liquor, especially to these low country boys who have been accustomed to it from their childhood, they would be very much better satisfied to remain here. I think it could be managed either by issuing it as rations, or in such a way as it could not be abused.

13,755. Are you interested, either directly or indirectly, in the liquor business or distilleries or anything of that description?—Not at all.

13,756. Mr. FORBES: Portuguese East Africa is a real agricultural country, is it not?—Yes, in many parts.

13,757. And will very probably be largely cultivated in the near future?—The tendency is that way.

13,758. Consequently they will require a good supply of labour?—They require a good deal at present. The Kaffirs in these parts do quite a big

business in growing mealies and Kaffir corn for other markets.

13,759. Do you know if sugar is the only exportable article at present?—Well, there are others. There are two or three people in Inhambane district who have gone in considerably for planting india-rubber.

13,760. Do you know the country northward from the Matupo River?—Yes.

13,761. Did you notice the soil there?—There is some excellent soil along the banks of the Matupo.

13,762. It is identical with Constantia at the Cape, is it not?—I cannot say.

13,763. Mr. PHILIP: What wages do you have to pay your natives on the sugar plantations?—I pay them about 2,000 reis a month; it comes to about 7s.

13,764. And do you recruit them in the ordinary way?—In the Inhambane district we have about 500 families on the estate, and we have a right to call these natives out. We find no trouble in getting our labour from the surrounding districts; in fact,

our manager is often asked by natives to allow them to come on our property.

13,765. You find it plentiful at 7s. a month?—Yes, a considerable portion of our labour is done by women, rather more than half.

13,766. Mr. EVANS: In the next few years do you think we are likely to get any substantial increase in the labour supply from Portuguese East Africa?—That is a question I cannot answer. Your recruiting agents will be able to tell you better than I. All I can tell you is that there is a constantly increasing tendency to employ the labour locally.

13,767. And if these local requirements increase the exportation of labour will suffer?—That is so. One other thing I would like to say. I stated just now I had no interest, either directly or indirectly, in distilleries. Some years ago I was interested in the distillation of liquor in the Portuguese territory, but it has been prohibited by the Portuguese Government, and the interest exists no longer.

The Commission then adjourned till Tuesday morning at 10.30.

## THIRTY-FIRST DAY.

Tuesday, 29th September, 1903.

## THE COMMISSION SAT AT 10.30 A.M.

Mr. CRESWELL, recalled, handed in the following statements:—

"A."

August ... ..	23 5·985	226	149	1,019

N.B.—The above columns refer to the following :—

7A. Cost per ton.

7B. No. of skilled whites employed.

7C. No. of helpers and unskilled whites employed.

7D. No. of natives employed both directly and through Contractors including Construction Work, employing 50 to 70 natives (estimated) during the last two months.

## "E."

Estimate of number of Natives who would be required to replace unskilled and partially skilled whites on Village Main Reef Gold Mining Company in Departments specified below.

	May.	June.	July.	August.
Stopping ... ..	192	192	195	237
Developing ... ..	20	25	27	35
Mill ... ..	13 to 17	13 to 17	13 to 17	13 to 17
Cyanide Works ... ..	22	22	22	22

In the above figures Natives are taken at working 90 per cent. of full time.

F. H. P. CRESWELL.

13,769. The CHAIRMAN: When you were here the other day certain returns were asked from you. I understand that you have practically completed these returns?—Yes.

13,770. They were circulated this morning to members of the Commission. The first is headed the "Village Main Reef Gold Mining Company." Then follows the number of returns. Can you give us a better heading for that statement, or will you hand them in in your own way?—The first information asked for was relative to the Durban Roodepoort Deep. That I hand in, having been prepared for me by the company.

13,771. What is that?—It gives sizes of shafts, rate of sinking, total costs exclusive of interest, total wages, including the total cost, white skilled and unskilled labour together, the number of white men employed, and natives, if any. It proved impossible to obtain these figures to any accuracy. Rate of pay of white men, length of stay, and a return shewing the labour cost per foot.

13,772. Dealing with the Durban Roodepoort Deep first?—Certainly.

13,773. Call it "A"?—Yes. The next statement is comparative of the various shaft sinking, labour costs attached to that.

13,774. What is that headed?—It has no head.

13,775. Call it "B"?—Yes.

13,776. That covers the Glen Deep, Rose Deep, etc.?—Yes. The next one is "C" relating to the number of natives employed at unskilled pay from June to October, 1902. The next one, "D," is relative to the cost per ton, the number of skilled whites employed, helpers, number of natives, etc. "E" is an estimate of the number of natives required to replace the unskilled and partially skilled whites on the Village Main Reef. The work of getting them out occupied two of my staff, two clerks and another member of the staff practically all their time since I was asked for them, and this is as much as we could get. It is impossible for me to continue the work at present, and I therefore sent it up to the stage at which we had arrived.

13,777. Will you tell me what you have failed to send in?—As far as I know, on the Village Main Reef the total number of natives employed on unskilled work after October, 1902, scheduled "C," that involved a very large number of shifts being counted up, going through all the time-books and separating the shifts and the money paid. That is as far as we could get.

13,778. Then may I ask you this question?—I have not got a copy of the questions, sir.

13,779. You say you have given the figures asked for from June to October. You were asked to give them for a longer period?—Yes, up to August, 1903, a further 10 months.

13,780. Can you tell the Commission whether the June to October period can be taken as typical?—No, it was the first period when I should say the changes would be greater than they were subsequently or on an average.

13,781. Is there anything else you were asked for?—That is all I have been able to get ready. As far as "A" goes, all the information asked for is given except the number of natives employed. The average numbers monthly employed on unskilled labour I have only been able to get up to October, 1902. How long they stopped is given in Schedule "C" as 41 working days. The white men received 13s. 6d. per shift. To get the other particulars fully is almost impossible. The first question took me up to yesterday to finish. The estimated number of Kaffirs required to replace these labourers I have only answered partially in the departments specified. That "E" is a personal estimate. The information for each month of 1902 to 1903 is given in "D" as nearly as we could get it out in time.

13,782. Mr. PHILIP: Can you tell us what the profits of the Village Main were in 1899?—I think about £23,000 a month.

13,783. Rather over that, was it not?—I expect so.

13,784. The average was about £27,000 for nine months. And for the last six months?—From £10,000 to £11,000, I think.

13,785. You have no figures here for each month?—No, I will see if I can remember them giving them backwards. August, £10,400; July, £10,300; June— I am afraid my memory is not accurate.

13,786. Who is your mine captain?—A man called Turner.

13,787. And drill foreman?—I have not got one. I have four shift bosses.

13,788. Do the makers of drills supply anyone to teach the men to handle them?—Not usually.

13,789. Have they supplied you with one?—The makers of the one particular drill were anxious that I should try it, and I said I would if they would send one of their men to stope and give a lead.

13,790. Is he with you now?—He is gone. He was named Becker, and another one of my shift bosses and who is still with me, is named White.

13,791. The CHAIRMAN: The Commission is very much obliged to you for your evidence.

NATHANIEL CYRIL UMHATJJA, a native, recalled and examined.

13,792. The CHAIRMAN: You are under your former oath?—Yes.

13,793. You promised us when you gave evidence last week that when you had seen some of the compounds and seen your people there you would tell us how they were satisfied with their treatment. Have you been to some of the compounds?—I have been to 15.

13,794. You are speaking of mine compounds?—Yes.

13,795. Not any other?—No.

13,796. Did you see some of the people of your tribe there?—Yes, but very few. They were mostly East Coast natives.

13,797. Very few Cape Colony natives?—Yes, very few.

13,798. Did you hear any complaints as to their treatment?—Yes, where they are contracted the agreement is that they should receive a certain sum, £3 15s.

13,799. Per month?—Yes, but when they come here they are not sent direct to the station to where they were destined.

13,800. What do you mean by that?—The labour tout agrees with these people that they will come up here and go to a certain mine, but when they get here they are met by people whom they do not know and are sent to a different station at a very low wage, £1, £2, to £3. That is the first grievance.

13,801. Can you tell us now who are these labour touts?—One, unfortunately, a notorious man, is Richard Tsiengiwe.

13,802. Is he a native?—Yes.

13,803. Where is he working?—In Queenstown, for Mr. McEwen, but he resides at Colla.

13,804. In what district does he work?—Queenstown, and the Jombwe district.

13,805. Did you hear the names of any other touts who had offered these high wages?—No, sir, no other.

13,806. How many natives did you speak to altogether on this question, or how many spoke to you?—Well, a good many; I did not count them.

13,807. Twenty?—More than 100.

13,808. More than 100 told you they were?—Engaged at £3, and when they came up here it was some months before they got up to £3.

13,809. Had they any other complaints to make?—Yes, they say they are flogged, but the flogging, I think, is just a little, encouraging them to go to work with a shovel, such as you would use with a crowd of young Kaffirs, such as these East Coast boys are.

13,810. But I understood you were speaking of Cape Colony natives?—Yes, the Cape Colony natives also complain of being flogged, but not with a cat-o'-nine-tails, but with a sjambok or kerri.

13,811. Who does this flogging?—From what I could gather, I think the flogging is done mostly by these stupid Zulu police.

13,812. Anything else?—There was no complaint about food, but there were loud complaints about the treatment of sick persons. When they get sick they are not allowed to go home. Kaffirs have a superstitious idea that a man when he gets sick should go home, and, if he is not allowed to go home, he will succumb to the sickness.

13,813. Anything else?—Well, I have not made up my report yet, because last night I knocked off work too late, and did not get into town till after nine.

13,814. Is that all you wish to say to us this morning?—Yes.

13,815. Mr. WHITESIDE: Is this encouraging the boys to work by flogging, general along the mines?—Yes, it is general among the mines, but there were once two special mines that seemed to do it more than others—the Geldenhuis and the Village Main.

13,816. Any others?—All the others gave good treatment indeed to the people; very good treatment, I think.

13,817. I think you told us the other day that if you found conditions satisfactory we could get thousands of boys from your district?—I think so.

13,818. Well, after your experience do you think we are going to get these thousands?—I have not made up my report yet.

13,819. Sir GEORGE FARRAR: You say that the boys object when they get sick to being treated in hospital?—They do not exactly object to that, but they have a superstition that they should be allowed to go home and get their own doctors and that is not allowed.

13,820. You think it is better for them to go home and die on the road?—They say that they should always be allowed one of their companions to go with them as an escort.

13,821. Mr. GOCH: You asked these questions from all the different natives you met?—Yes.

13,822. The East Coast natives also?—Yes.

13,823. What was your object in questioning all of them?—Well, because I wanted to know where the complaints came from.

13,824. How many of your own people did you meet?—I do not think more than 40.

13,825. Was your object to report to your people when you got back?—I have to report to the Government.

13,826. Were you asked by the Cape Government to examine matters here?—Yes.

13,827. You are here in an official capacity?—Yes.

13,828. And the impression you formed is it favourable that they are fairly well treated or not?—Well, as I have said, I have not made up my report yet, but things are not quite so bad as I had heard.

13,829. These little complaints you made about flogging, that is merely encouraging them to work?—Yes.

13,830. And the sickness, do you consider that a serious matter, seeing they are well taken care of in the hospital?—Well, they like to be doctored by their own doctors.

13,831. Did you visit the hospital?—I went to the hospitals in the compounds, but not to the big hospital.

13,832. Are you satisfied with the way in which they are treated in the compound hospitals?—Yes, they are very clean.

13,833. The CHAIRMAN: The Commission is very much obliged to you for your evidence.

Mr. SIDNEY JENNINGS, recalled, sworn again, and examined.

13,834. The CHAIRMAN: The engineers through you made a request to the Commission that you might be heard with reference to the statement of Mr. Creswell?—Yes.

13,835. Do you now hand in that letter addressed to the Commission and dated the 24th September?—Yes.

13,836. The statement was as follows:—

Johannesburg,  
24th September, 1903.

To the Chairman and Members  
of the Labour Commission.

Sirs,—Mr. Creswell, in a written answer to a question, stated:—"I am of opinion that the consensus of expert opinion laid before you against white labour is largely due to the following causes:

1. That the financial authorities at home viewed it at the outset with disfavour, being afraid that the employment of a large number of men as labourers would make the labour element too strong a factor in economic questions, and, when representative Government was given, in political questions.
2. That the leading experts, besides being naturally influenced by these ideas on the part of their employers, had made the success of their careers here on the old cheap inferior race labour system, and would be reluctant to admit that a new departure must be made, if any way of perpetuating it were possible.
3. That in these circumstances all arguments and results adverse to white labour would be welcomed, while those on the other side would be combatted and sifted with a view to proving them fallacious.

"It does not, therefore, seem to me surprising that, approached in this way, an experiment requiring careful handling and resolution to overcome difficulties as they arise should in many cases have been pronounced a failure."

The only possible inference from this statement is that the engineers on those fields are influenced by the ideas of their employers to such an extent as to report contrary to ascertained facts.

To this statement we give an unqualified denial, and offer ourselves individually to give evidence to this effect.

We have never received any communication from the financial authorities at home that would lead us to conclude that they viewed the experiment of white unskilled labour with disfavour on political grounds; and such reasons have never entered into our valuation of the results of the white labour experiment.

SIDNEY J. JENNINGS.  
H. H. WEBB.  
FRED. HELLMANN.  
J. HARRY JOHNS.  
G. E. WEBBER.  
J. R. THOM.  
GEO. J. HOFFMANN.  
FRED. H. HATCH.  
S. C. THOMSON.  
POPE YEATMAN.  
G. A. DENNY.

13,837. Who is it signed by in addition to yourself?—It is signed by H. H. Webb, Fred. Hellmann, J. Harry Johns, G. E. Webber, J. R. Thom, G. J. Hoffmann, F. H. Hatch, S. C. Thomson, Pope Yeatman, and G. A. Denny: practically all the engineers who are now in Johannesburg who signed the former statement.

13,838. To the Chamber of Mines?—Yes, Annexure "D," I think.

13,839. In this statement, after receiving the answer given by Mr. Creswell, you go on to say, "The only possible inference from this statement is that the engineers on these fields are influenced by the ideas of their employers to such an extent as to report contrary to ascertained facts"?—Yes.

13,840. Do you wish to add anything to the statement contained in this letter?—I merely want to add that that is as complete a denial of Mr. Creswell's insinuations as we thought could possibly be made.

13,841. Sir GEORGE FARRAR: Can you tell us, Mr. Jennings, why the theoretical extraction on the Village Main Reef for August is 69 per cent.?—The actual extraction, that is.

13,842. Yes, against an average of 87?—It can be explained in three ways. Either they are doing extremely bad work on the Village Main or the gold as called for by the assays is not being accounted for, or on the tonnage estimate is incorrect. I have some figures which compare for the month of August the Village Main Reef with the Robinson Deep Mine. The average screen sample on the Robinson Deep is 11.97 dwts.; on the Village Main 12.5 dwts. The profit per ton on the Robinson Deep is 20s. 8d., and on the Village Main 11s. 8d., although the grade was practically  $\frac{1}{2}$  dwt. higher on the Village Main.

13,843. And the profit on the Robinson Deep was as you have said?—Yes. The statement showing the tons crushed per stamp, the yield per ton and the cost per ton shows that for the months of July and August and June the Village Main had a sudden increase in the tonnage crushed and the tons crushed per stamp per 24 hours, whereas there was a sudden decrease in the yield per ton, cost per ton, and in the actual extraction. As I said, this might be explained in the three ways above-mentioned. In my opinion the most probable way is that the tonnage has been overestimated.

13,844. How do you account for the Village Main Reef costs going down so suddenly in June, July and August, as compared with the three previous months?—As I said, the most probable explanation is that the tonnage has been overestimated. It is a difficult thing to prove, because the months of June and July are past, but that is the most probable explanation.

13,845. If the profit on the Robinson Deep with 11.97 dwts. was 20s. 8d. and on the Village Main Reef with 12.5 dwts. was 11s. 8d., do you consider what has been done on the Village Main Reef proves anything in favour of unskilled white labour?—No, as I said, the explanations are three; certainly it does not prove, taking the work as a whole, anything in favour of white labour.

13,846. Mr. QUINN: When white labour was first tried about the time when the irregular troops were disbanded, were you in favour of it?—Yes.

13,847. What was the first opinion you formed of its use?—As I stated in my evidence before, I had tried it before the war in 1893 on sinking shafts. From the results I achieved then, I came to the conclusion that the breaking of rock by white labour would increase the cost of the tons broken by that labour, but I thought, by increasing the total of tons milled, the general expense of running the mine being distributed over a larger tonnage, the net result would show a saving and that you would make an actual profit.

13,848. Do you remember whether in August of last year you expressed a favourable opinion as to the use of white labour?—I cannot say whether I expressed it in August; I certainly expressed it in June or July.

13,849. You were favourably inclined to it at that time?—Oh, entirely. That is to say, as I stated before, I was greatly desirous of employing white labour if it was economically justifiable.

13,850. Do you remember your opinion in September?—I have a pretty definite idea. That three months working with white labour proved to me that my original opinion was incorrect and that they could not break sufficient extra tonnage in order to divide general expenses so as to make it even, or anything like even.

13,851. Was any other influence, as far as you can remember, operating on your mind in addition to the facts of the case as you know them?—None whatever.

13,852. What period of the year was Mr. Beit in Johannesburg?—To the best of my recollection, some time in November.

13,853. Did you have any conversations with him on this subject?—Yes, a great many.

13,854. Did you get an expression of opinion from him?—As far as I recollect, he thought that any labour that would show an economical justification should be employed.

13,855. To put that reply in another way, did he mean by that that any imported labour from some other part should be employed?—Any labour available, of any colour, anywhere.

13,856. Do you not think that this influenced your mind to the extent of making white labour appear uneconomical? Can you tell us, Mr. Jennings, whether this opinion of Mr. Beit became generally known amongst these engineers, for instance?—That I cannot say.

13,857. May I ask you now when did your brother, Mr. Hennen Jennings, arrive in the country?—About the end of August. I have no distinct recollection of the exact date, but it was about the 20th.

13,858. Did you have any conversation with him on this question of labour?—Oh, yes, daily.

13,859. What was his attitude towards the white labour trial?—His attitude was that from his experience of work with all classes of labour in different parts of the world, he thought it was doomed to hopeless failure.

13,860. Would it be putting it fairly to say that Mr. Beit's opinion as expressed to you in favour of labour independent of colour which would be most economical for the mines, together with your brother's opinion afterwards, would it be fair to say that these two opinions influenced your mind?—You have not put the attitude as I expressed it of Mr. Beit fairly at all. You say most economical; that was not my expression. He said any labour economically justifiable. Of course everybody agrees that the most economically justifiable labour available here is Kaffirs.

13,861. Leaving that for a moment, and leaving my question for a moment, what did you take it that Mr. Beit meant?—That we were to use every available means to obtain that labour which was economically justifiable—white, coloured or any other.

13,862. Suppose you found an abundance of a class of labour which you are not using now which is very much cheaper than that now used, would that fit in with Mr. Beit's idea?—Yes, if we found it, but we do not pick it up in the street.

13,863. I know that, Mr. Jennings. I do not want to play with words; I want to go straight to the point, but I am prevented by certain rules laid down by the Chairman.

The CHAIRMAN: May I point out that the rules are laid down by the Commission and not by the Chairman.

13,864. Mr. QUINN: Therefore I have to go in curves where my usual way is a straight line. It is not because I want to dodge round the subject. Would it be right for me to take it that Mr. Beit meant, in your opinion, whatever labour the companies considered was cheapest was the labour spoken of as economically justifiable?—No, I have just stated two or three times that any labour economically justifiable, that is, supposing we were then working at a certain rate per ton, any labour that would allow us to work at anything approximate to the rate before the war was supposed to be economically justifiable.

13,865. What have you got in proof of that definition?—Merely my recollection, as I said before, of my conversation with Mr. Beit.

13,866. To come back to this other question, did Mr. Beit's opinion and that of your brother influence your mind at all?—Naturally, as the opinions of people for whose judgment you have respect.

13,867. A letter has been referred to in the report by the mine manager. Do you put it in?—Yes, I can.

13,868. You wrote a letter for the Commission of the three mine managers who were deputed to report on the white labour experiment on the Village Main Reef?—I can put in the letter for the Commission, and the report I wrote to the Board of the Village Main Reef on the same subject.

The CHAIRMAN: I request that it should be put in.

13,869. Have you it with you, Mr. Jennings?—No.

13,870. Mr. GOCH: Have you both of the documents?—I have the report to the Board of the Village Main Reef.

13,871. The CHAIRMAN: You will hand it in?—I will.

13,872. Mr. QUINN: After that report was sent in, did you write letters to the directors of the Company dealing with the question?—I wrote a report. Do you mean did I write on the letter?

13,873. Yes, on the letter?—I wrote to Mr. Hennen Jennings on the same subject.

13,874. And what was the substance of it?—That, after making all the allowances asked for by Mr. Creswell, the Village Main Reef was making a loss of 1,900*l.* with the experiment with white labour.

13,875. Do you mean that they were making a natural loss, or a loss of profit? We have had the profit stated at between 10,000*l.* and 11,000*l.* Do you mean so much loss profit?—I call it loss when you are paying for work, more than what you could have got it at before.

13,876. It does not mean a loss on the working of the mine; it is a loss in the sense that the profit decreased?—Will you allow me to read to you from the table of the total profits for March 1902, to October. The profits in March were 6,569*l.*; in April, 7,110*l.*; May, 7,150*l.*; June, 7,051*l.*; July, 4,550*l.*; August, 6,714*l.*; September, 5,708*l.*; and October, 3,278*l.* In the later period of four months more tons were dealt with than in the former period of four months.

13,877. Did you write a letter or report giving certain advice, with regard to the mine, which was disregarded?—I wrote a letter which gave certain advice—that the white labour should be reduced in the proportion recommended by the three mine managers, as soon as sufficient machine drill men could be obtained, either by educating them, finding them, or engaging them.

13,878. Did you offer certain advice which was utterly disregarded as to the management of the mine?—Yes, I did.

13,879. Did you tender your resignation?—Yes, I did.

13,880. Was it accepted?—It was. The advice I gave was that Mr. Creswell should be discharged.

13,881. When did you tender your resignation?—My resignation was accepted in March. I forget the exact date.

13,882. You held over the tendering of your resignation for some little time before you sent it in?—There were some negotiations between the London Board and the Board here.

13,883. Was it not until Mr. Chamberlain had been here and gone?—Oh, no.

13,884. It was after that?—Yes, considerably after that.

13,885. Were there reasons for sending in the resignation two months before that?—They were accentuated by differences of opinion as to honourable and professional conduct. I thought that Mr. Creswell was guilty of unprofessional conduct.

13,886. That seems to be a mutual opinion?—Exactly so.

13,887. Coming to the statement of Mr. Creswell, would you mind looking at the letter?—Certainly.

13,888. In the last paragraph, after giving us Mr. Creswell's reply in answer to the Commission, it says that the only possible inference from the statement is, that engineers are influenced by the ideas of their employers "to such an extent that they report contrary," and so on. Have you been influenced to report contrary to ascertained facts—you do not think it is correct—"to the extent that all arguments as to the results of trying white labour would be proved fallacious?"—there is no other possible conclusion than the one I have stated.

13,889. You would say that they are not so influenced?—Not in a report on ascertained facts—certainly not.

13,890. How do you account for the difference in the figures supplied by Mr. Creswell and those supplied by Mr. Price and Mr. Spencer? You will remember that Mr. Creswell gave us one set of figures, and on oath stated that when Mr. Price handed in his figures and was asked certain questions by Mr. Donaldson, he made replies which Mr. Creswell stated to be absolutely untrue?—I would like to interrupt you there. I do not think it is quite a statement of the case. Mr. Creswell wrote to these three gentlemen, bringing to their notice certain circumstances which he thought should influence them in their decision. Mr. Price came to the conclusion that the circumstances pointed out did not make any alteration in the facts. Personally, I was rather of the opinion of Mr. Price. As it was possible, however, to make allowance for one of the factors as to rock broken in the stopes, in my report I made such allowance. The other factor of changing the boys in August, I thought the fact that it only made the difference of 400 shifts, put it out of court.

13,891. Well, it simply shows the way in which words impress different people in different ways. It impressed me—I do not wish to do anyone an injury—that he not only denied the fairness of Mr. Price's figures, but denied their accuracy, and said that Mr. Price, when he got on to the figures, knew that there were other considerations which meant a fundamental changing of the position?—The position was this. Mr. Price made a statement of the comparative cost between two periods. He was asked whether he was aware of any circumstances which should be taken into account in order to ascertain the working cost. Mr. Price did not consider that the circumstances mentioned by Mr. Creswell should be taken into account.

13,892. I see. When Mr. Price put in his paper, or, as we call it, his evidence-in-chief, as to the Village Main Reef, did you see it before it came to the Commission?—I did not read it; I have seen it.

13,893. Did you know that Mr. Price was putting in these figures?—I did.

13,894. Did you see the figures?—Yes.

13,895. Have you the report of the three mine managers?—I have.

13,896. If I read on it is as follows: "We consider that by the adoption of such labour (white labour that is) in the foregoing departments with the mechanical labour-saving appliances, the present high estimate of the needs of the industry as regards native labour, would be consistently reduced; for instance, in a mine where rock-drills can be used in the majority of stopes, we say that to run 100 stamps and to do the necessary development 1,000 to 1,200 natives, together with 125 to 150 skilled whites and 75 unskilled whites, should suffice." As the figures which made it appear that the Village Main Reef experiment was a costly failure, were put in, can you tell us why this paragraph was left out?—Certain documents have been handed in by the engineers which work at 20 boys per stamp.

13,897. Here in the report of these competent mine managers—I take it for granted that they must be so—there is no question about it—put in figures, showing that with a certain amount of unskilled labour you can run with 10 boys per stamp. That, however, is left out, while the other part, which appears to be all against Mr. Creswell's

915

experiment, seems to be paraded; well, I will not say "paraded" with that put in?—I do not think that was so. You were given figures that showed that at the present time, taking all the stamps on the Witwatersrand you are only using 13.5 boys.

13,898. That is speaking of the future?—No, I do not think so.

13,899. Anyway it is the one sympathetic paragraph in the report, and it is difficult to believe that it was left out by accident and I must say that that explanation is no explanation at all?—I am not responsible for another man's work.

13,900. Did you know the contents of the report, before Mr. Price came into the box?—Not as a whole. I saw the figures that Mr. Price had taken from a certain set of figures I have handed into these three gentlemen.

13,901. Did these gentlemen use in their report concerning this mine the figures you gave them?—Of course I do not know exactly what figures they used, as I was not present at their deliberations, but their procedure was this way. I wrote them a letter expressing my point of view. Mr. Creswell wrote a letter expressing his point of view. They went through his mine, his surface works, paid one or two visits—I do not remember how many—and then wrote a report. I had one discussion or two with them before the report was written, and Mr. Creswell had a great many.

13,902. Is it not a fact known to you that the identical figures—the identical set of figures—that should have been sent in to the Committee in your letter, Mr. Price handed in to this Commission?—I said so before.

13,903. Is it not the fact, as I put it, that the figures handed to this Commission are the figures stated in this letter of yours?—The figures which Mr. Price used in his statement are the identical figures in that letter.

13,904. Did the Sub-Committee use those figures in reporting on the question?—They did not.

13,905. Did they use them here?—Not that I am aware of.

13,906. Do you know whether Mr. Price went to the trouble of finding out from you where you got those figures, or how you arrived at them?—My recollection is that I stated I got them from the published reports of the Company.

13,907. What I want to get at is that—is it a fair assumption that he took those figures from you, satisfied of their reliability, and put them before this Commission as his evidence?—Well, I do not know. I do not see any reason why he should not have done so.

13,908. I only want to know what are the facts?—Well, I cannot say. You had better ask him.

13,909. Mr. WHITESIDE: Can you tell us what was the value of the rock in the crushed levels at the Crown Reef?—Well, it was a very high value. My recollection is that it was somewhere between £4 and £5.

13,910. That is near enough. Can you tell us what was the reason for putting the white labour in this particular place?—I stated in my evidence before, that the idea was that the white men, being more intelligent, more keenly alive to the danger, would get less frequently and less badly hurt than the Kaffirs.

13,911. Exactly. Put in in another way. It was too dangerous work for Kaffirs to do?—Yes, without serious risk.

13,912. What was the white men's wages?—I do not remember. I gave it in the evidence before—it is in the report. I have not got it in my mind.

13,913. I have not got it in your evidence. Was it not 5s. a day?—Five shillings a day all found. A great many got that—that is to say, they were housed and fed, and there was something else; I do not remember what it was now.

13,914. Practically 5s. a day and their keep; that is what they got?—Yes, that is so.

13,915. Sir GEORGE FARRAR: Mr. Quinn has referred to certain documents which you promised to put in and which I have not had the privilege of seeing. Is there any other document you would like to put in which would throw any more light on the working of unskilled white labour at the Village Main Reef?—I wrote a letter to Mr. Hennen Jennings, in which I gave information bringing the experiment down from October to the end of December, which I think might as well be handed in.

13,916. But nothing else?—No, nothing else.

Mr. W. WYBERGH, called, sworn, and examined.

13,917. The CHAIRMAN: Mr. Wybergh, you are Commissioner of Mines, I think?—Yes.

13,918. How long have you held that position?—About three and a quarter years.

13,919. You were on the Rand previous to the war, I think?—Yes.

13,920. For a long time?—I have been on the Rand for about ten years altogether.

13,921. What position did you hold previous to the war?—I was consulting engineer.

13,922. You were some time in the service of the Consolidated Gold Fields?—Yes, as Assistant Consulting Engineer.

13,923. You know the terms of the reference to this Commission?—Yes.

13,924. It is, first, to ascertain the amount of native labour required for the agricultural, mining and other industries of the country. Have you seen the evidence of the Chamber of Mines with regard to the requirements of the mining industry?—Yes.

13,925. Can you tell us from your last returns the total number of natives employed in the mining industry in the Transvaal?—At the present time?

13,926. Yes?—I have returns here for August. They are, of course, public returns.

13,927. I understand. Will you give us the total of natives employed, with any sub-divisions of the total you may have in the returns?—Yes.

13,928. What month is that for?—For the month of August, 1903, the grand total of whites employed was 12,839 and the coloured men 62,439. Shall I read the totals for the different periods on the mines, or for the different districts?

13,929. You had better give us both particulars?—The total on the gold mines in the Transvaal for the month of August was 12,108 whites and 62,439 coloured. The total for coal mines during the same period is 460 whites and 8,154 coloured. I think I need hardly read through those for chemical, metallurgical and other subsidiary works, because they are too small. I can also give you the totals for the Witwatersrand area. They were for gold mines, 11,437 whites and 56,361 coloured. I have also a tabular statement of the progressive totals of the various employees since October, 1892, which shows a considerable increase, both in whites and coloured.

13,930. Do you know, or can you give similar figures for a period before the war?—Well, of course, I cannot take any responsibility for the figures before the war. I can supply what information we have in the office, which, I think, has already been published by the officials of the late Government, but I cannot say whether the figures are correct or not.

13,931. Will you let us have them?—I will send them down, certainly.

13,932. When you speak of the total employed, does that mean the total on the roll? Can you tell us how the figure is arrived at? You know there has been some controversy with regard to the figures for coloured labourers before the war—as to whether the Government returns represented the men working or the total on the books of the companies. Can you tell us how your figures are arrived at?—I should not like to say at the moment. Perhaps, when I send in the totals, I can make a note saying exactly how they were arrived at.

13,933. Will you please do that?—Yes.

13,934. Have you seen the figures supplied by the Chamber of Mines as to the number of natives required on the Witwatersrand under present conditions?—I have seen the tabular statement.

13,935. Can you give any opinion bearing on that figure?—You mean how far it is correct?

13,936. How far the number of natives per stamp is near the figures?—I would rather not answer that question; but, of course, I am quite prepared to give an opinion as far as I can on the total number required for the Rand, but, in doing so, I should say that, in my opinion, the figure given, or any figure arrived at in the way I conceive these figures have been arrived at, really begs a very important question as to how many white men can be employed, and how far white labour can be introduced, and therefore I do not place any reliance on those figures being an absolute certainty, and I do not suppose those gentlemen who compiled them would maintain them at a mathematical certainty. But it depends on what white labour can be substituted for coloured labour. If you say we must have so many coloured men per stamp, then the accuracy of these figures can only be judged by those people who hold the money-bags in fact, and can say how much money they can put up and how many stamps they are going to start. Those figures have very little value except as indicating the number of stamps the financial authorities will put up, which is purely a financial question.

13,937. The figure given by the Chamber of Mines as the total requirements under present conditions is 129,588 natives, or 18,136 per stamp?—Is that on the basis of the number of stamps now erected?

13,938. The number now erected.—I see. I should like to make a comment on that, to call attention to one fact. I do not think the number now erected should be taken as any basis of calculation, because before the war a number of stamps were erected on mines that were not paying. The figure should be taken on the number of stamps working at that time and not on those erected by any means.

13,939. If that were the basis the figure was founded on, it was a wrong basis?—Yes. They were calculating to run on the basis of those erected. There are thousands of stamps erected in the Transvaal, which would not have been worked under any circumstances, because the mines would not pay.

13,940. This deals with the Witwatersrand only, not with the Transvaal?—There are many mines on the Witwatersrand which have never paid.

13,941. Another condition in these figures is employing the same proportion of Europeans to natives. There is another figure given in the statement, and that is 142,473 natives required on the Witwatersrand?—I beg your pardon, 129,000 are required.

13,942. Under present conditions. That, I take it, means maintaining the same proportion between white and coloured labour. But there is another figure, under the best economic conditions, 142,473. You are acquainted generally with the mining districts in the Transvaal?—Yes, very well.

13,943. Do you anticipate any increased demand in the country districts for coloured labour?—Do you mean at present or in the future?

13,944. I mean at present or in the near future?—I do not anticipate any great increase anywhere.

13,945. In the demand for labour?—Yes.

13,946. That does not agree with a good deal of the evidence we have had?—I have formed my own opinion. I have perhaps had exceptional facilities for finding out what is going on in the various outside districts. I have, since I have been in office, made official tours throughout the country for the purpose of seeing what development was likely to take place; I have consulted with the various local authorities, and with those connected with mining, and talked on all these subjects very freely; and that is the conclusion I have arrived at, that there

is no likelihood of any immediate great increased demand for labour in the outside districts. I am speaking of mining areas.

13,947. Yes, we are dealing with mining only. Witnesses have told us that the only factor likely to influence mining districts outside the Transvaal is the labour factor?—Well, of course, as an engineer, it has often been my business to analyse the reasons given for the non-successful working of mines, and the last reason that was ever given is that the mines do not pay. I should be sorry to make any definite statements about any particular mines, or to give the impression that there is any general idea, or that there is any general effort to make out that mines will pay if they can only get labour, but, in course of my experience, I have found that it is very common for all kinds of excuses to be made or reasons given which may have some weight, perhaps, but have not the great weight which those who put them forward would seem to attach to them.

13,948. Is there anything else you would like to say about your Department and its bearing on our enquiry?—I shall be very pleased to produce figures or statistics bearing on any point which the Commission wishes to have elucidated. I purposely refrained from coming forward and putting in a mass of figures not referring to anything in particular, because they have been published and are available for the Commission, and the Commission has been so deluged with statistics that I thought it as well not to put in any more; but, if the Commission wishes any more figures, and will inform me, I will give instructions to have them prepared.

13,949. Mr. QUINN: Mr. Wybergh, do you know anything of the experiment in the use of unskilled white labour since the war?—Well, I cannot say that I know anything personally about it, because I have not been in the position to have to undertake or not to undertake such experiments myself. I have followed the controversy on the subject with very great interest, and I should not like to give expert evidence on the matter, but I have a general knowledge of the fact that experiments have been carried out to a certain extent.

13,950. Can you give us your opinions, as far as you have formed them, on this question? We have heard you state that you are not in the best position to give an expert opinion at present?—I do not quite understand what precise point you wish me to express an opinion on.

13,951. On the possibility of unskilled white labour being used to a greater extent than it is at present, to supplement native labour?—I can only summarise it by saying that where there is a will there is a way; and, if there was any great desire to extend the employment of white labour, I cannot help thinking it would be done, but I regard it primarily as a political question of great importance. It all depends on the policy we pursue.

13,952. Yes, we have found that out. Have you discussed this question with any of the leaders of the mining industry, with Mr. Hennen Jennings, for instance?—Yes, I discussed it with Mr. Hennen Jennings, and, of course, with many other people. In fact it has been almost the sole topic of conversation for the last six months.

13,953. Yes, we have been living on it here?—I had a long discussion with Mr. Hennen Jennings about a year ago on the subject.

13,954. Can you tell the Commission what his opinions were, or are, on the matter?—I think it would probably be better to get them from himself; but, as he made no secret of his opinions, in discussing them with me, I may say that what he told me was that he did not want white labour, and that he did not believe in it—at least it came to this really, that he did not want it; he objected to it.

13,955. Did he give any reasons for that?—Yes.

13,956. What were the reasons?—It is rather difficult. The principal reasons he gave, as I gathered, were something like this. What he said to me was, "Well, white labour must come; it is absolutely inevitable." "But," he said, "I do not want to

have it come, in the first place, because I am afraid of strikes"—and I may say at the time there was a strike going on at the Village Main Reef—"and in the second place—"

Mr. GOCH: I would like, Mr. Chairman, to draw attention to the exceeding irregularity of this method of cross-examination. Mr. Hennen Jennings has not been before us, and I consider it is highly unfair to elicit from another witness what is in the mind of a man who is absent.

Sir GEORGE FARRAR: I support Mr. Goch. I think we are here to hear Mr. Wybergh, and I think it is most unfair for Mr. Wybergh to give another man's views.

Mr. QUINN: I can quite understand these objections; I am surprised they have not been made before. But I do not agree with them, although I understand them.

Mr. GOCH: I do not think it is open to discussion, nor should Mr. Quinn insinuate motives. I made the objection on the point of order, and I consider it is for you, Mr. Chairman, to rule on the subject.

Mr. QUINN: The motives were first of all insinuated as being on my part. I maintain that I have done this from the start, and I have never been objected to before.

The CHAIRMAN: I do not think it is evidence; it is pure hearsay.

Mr. QUINN: I quite understand. May I ask, Mr. Chairman, when we can have Mr. Hennen Jennings called?

The CHAIRMAN: That is a matter for the Commission to decide—whether they want him, and when they can get him.

Mr. QUINN: The Commission objects, Mr. Wybergh, to your answering the questions I am putting to you as to what Mr. Hennen Jennings said.

The CHAIRMAN: The Commission does not object; the Chairman rules that it is not evidence.

Mr. QUINN: Mr. Goch and Sir George Farrar objected.

The CHAIRMAN: Mr. Goch and Sir George Farrar do not represent the Commission.

13,957. Mr. QUINN: I understand you to say that what would be done in this matter would depend upon the policy. Something to that effect, you said?—Yes, that is so.

13,958. What do you mean by that?—Well, I think the meaning is pretty plain. What I mean is that the question as to whether white labour would be employed or whether local coloured labour would be employed, or whether it would be obtained from elsewhere, depends entirely upon the wishes of the mine-owners. Primarily they had their say, and if they say to their engineers, "We wish you to have white labour, we wish you to make a very great effort to have white labour on the mines, and the man who can show us how to use white labour will be well rewarded," then I think very good efforts would be made to use white labour and that it might be successful. But, suppose mine-owners say, "We would rather not have white labour; we are not keen about it in any case," then I do not think the engineers—I should not as an engineer myself—would have any adequate incentive to put themselves out to try to draw in this white labour by making white labour a success. An engineer is a paid servant whose business it is, politics apart, to carry out orders, or what he considers to be the wishes of his employers. I think it very natural—I do not wish to say anything against engineers, because I am an engineer myself and have a very great feeling for them—but I do think this, that the direction in which an engineer puts forth his efforts depends upon the direction in which his employer wants him to put forward his efforts. And if his employer did not hold forth an adequate inducement for him to put forth his efforts in a particular direction, it is very natural that he will not turn his attention that way, or, if he does, it is in a half-

hearted fashion. I am not speaking of any question of improper influence being put upon engineers, but merely as to the inducements that are held out to them to try experiments in certain directions.

13,959. Have you any reason to suppose that political affairs may influence the position as to the use of white labour?—Certainly, I think it is very largely a political question. In fact, I think it is a political question of the very highest importance.

13,960. You were at one time with the Consolidated Gold Fields. Had politics there anything to do with you seeking new fields?—Yes. It is a thing fairly well known that I had to leave the Consolidated Gold Fields because they wished me to either alter or suppress my political opinions.

13,961. Quite so. Now, since you have been in your present position, have any instances come before you, either concerning yourself or anyone else under you, of political pressure in any direction being brought to bear upon you or them?—It is not a very pleasant question to answer, Mr. Quinn, but I suppose the Commission is entitled to know whether political pressure is exercised in economic matters, and I must say that I have personally been subjected to political pressure.

You have? I am much obliged to you, Mr. Wybergh.

13,962. Mr. WHITESIDE: I believe you took a keen interest in public affairs in pre-war days?—Yes.

13,963. You were President of the South African League, I believe?—Yes.

13,964. Can you tell us briefly what was the policy of the League as regards immigration into the Transvaal?—Of course the policy of every Englishman in the place, I should think, was to get all Englishmen into the country that they possibly could. That certainly was my policy and always has been.

13,965. Would you tell the Commission what you think of the policy that was outlined in Mr. Rhodes' memorial to the Consolidated Gold Fields?—I am afraid I do not know the memorial you refer to.

13,966. We have had evidence before us that this question is one of a political nature?—Which question?

13,967. The white labour experiment. Oh! Mr. Rudd states: "As regards trades unionism, I say encourage married men and co-operation in interests, whether in mining or agriculture; could Mr. Kidd replace the 200,000 native workers by 100,000 unskilled whites they would simply hold the Government in the hollow of their hand." I would like to know what you think with regard to this particular question, also the evidence we have had from Mr. Creswell?—I should prefer not to be asked to endorse or otherwise the evidence given by other people. I am perfectly ready to give my own opinion, and, if the Commission will allow me, I will give my own opinion, but I do not wish to be asked, if I may be excused, to express opinions upon other people's opinions.

13,968. I do not ask for that. I am asking you, as the late President of the South African League, whose objects were to encourage the introduction of white British subjects into this country?—Yes.

13,969. Now, we have it that this question is being looked upon as a political factor in the situation, and that they should be discouraged?—I do not think there is any room for two opinions. If you grant that it is a political question, as I maintain myself, I think there can be no two opinions that the encouragement of Englishmen to settle in this country is an object of the very greatest importance, and should be the object of every loyal man in the country. I go further and say that the matter must be considered apart from the question of loyalty or disloyalty, which is rapidly getting into the background, but from the point of view of making this a valuable portion of the British Empire—that is to say, a place like Canada or Australia, which are really white men's countries and not sinking to the position of, we will say, Jamaica or British Guinea

or other semi-tropical or sub-tropical climates where the white man is the task-master and the bulk of the population are coloured. I will not say they are slaves, but something not very far removed from slaves—I think the whole question whether we are to sink to that position or whether we are to rise into the position occupied by Canada and Australia depends upon making this a country where the bulk of the population at any rate are white men and equal to doing the work of the country. It is the most demoralising thing possible to take up the attitude that where we have not got enough coloured labour in the country we must go and supplement it from some other source. I say supplement it by all means, but supplement it by getting in more white men.

13,970. Thank you, you have answered my question.

13,971. Mr. PHILIP: Have you ever had experience with white labour?—I have not been much concerned with labour on any mines.

13,972. During your experience of the gold fields were you not consulting engineer and employed cheap white labour then?—I had nothing to do with employment of labour at all. I was consulting engineer to give my opinion upon technical matters. I had not the actual management of the mines, and so it was not in my province at all.

13,973. White labour at 10s. a day costs four times as much as native labour?—I beg your pardon. Is that your opinion?

13,974. These are the figures we had given to us?—Yes.

13,975. Can do the same works as four blacks?—That is taking a point which I think you had better get technical evidence upon.

13,976. You say you left the Consolidated Gold Fields owing to political reasons. Was it because you were a better politician than an engineer?—I have never heard that suggestion.

13,977. Sir GEORGE FARRAR: The Gold Fields seem to be rather an unfortunate corporation in their political views?—(No answer.)

13,978. You left them for political reasons?—Yes.

13,979. Was there not a clause in your agreement whereby you were debarred from entering into political matters?—No.

13,980. No clause whatever?—No.

13,981. Now you say that you think it is impossible to give any estimate as to the future here?—No, I do not think so.

13,982. You refer to the figures?—Yes. I think that statement requires a good deal of qualification.

13,983. Will you qualify it?—I say this, that it is possible, I think, for mine-owners to form an estimate of how many stamps they want to put up within a certain time, and it is possible then, if you make up your mind you are going to employ unskilled coloured labour—or if you are going to stick to certain definite proportions between them—it is then possible to make an estimate of the number of natives and the number of white men you want. But I do not think it is possible to do so if you consider it as an open question how far white labour can be substituted for coloured, because that remains to be seen. The experiment has not been fairly tried.

13,984. So practically you have no estimate for the future. It is impossible to estimate. You cannot estimate anything?—I do not say that, but I do say the estimate depends entirely upon the policy of the people who make the estimate. I am not speaking—please do not think that I am saying anything to the effect that the methods of making such an estimate are interested or anything of the kind. Nothing of the sort. I am merely pointing out that the most impartial person in the world cannot make a statement unless he is given a basis upon which to calculate, and the basis in this case must be the basis; are we going to attempt the experiment of trying white labour or are we going to consider it as shut out?

13,985. You think, then, the future is not an economic question, but a political question?—I think it is both.

13,986. Then you mean to say, that I, as a mine-owner, am not actuated by any economic questions, but by political questions?—I did not say it.

13,987. That is what you have said?—The political questions are also economic questions. That is to say, you as a mine-owner—again I am not speaking personally.

13,988. I wish that you would speak personally. We will leave the Gold Fields out this time?—Well, as a mine-owner, in the first place I want to make all the profits that I can. On the large scale politics affect my profits, and if I am going to be hindered by the possibility of strikes, or the possibility of a large working man vote, or the possibility, anyhow, of losing control, or failing to get control, or the policy of the Government, then I say, that, apart from my private reasons, the political question instantly becomes to me an economic question of the first importance to the country as a whole, and that is how it seems to me that an interaction comes in between the position of the mine-owner as a capitalist, and representative of the shareholders, and so on, and his personal views as a citizen of the country.

13,989. Very well. On that point, I take it, that for political reasons I have not given this white labour a fair trial, and you think—you know how interest runs up—you think that the mines are lying idle for political reasons, and that I would sacrifice the shareholders' interest rather than get them to work? I want to be perfectly plain. You have come here and have told us that for political reasons it is impossible to make an estimate of the future, and you have also said that these engineers—you are one of them and should have great respect for them—that these gentlemen, or the employers of these gentlemen, for certain political reasons that influenced them, whereby they have not given a fair statement with regard to the results of the white labour?—I am glad to answer that, because it gives me an opportunity which I think is necessary to say, once and for all, that this is not my view of the question. It is not in any way right. It is what I never intended to say. I do not for one moment say that the engineers have been, I do not think that any engineer would in the slightest degree be improperly influenced by anybody. If you say he has been influenced, then I put it to the Commission—that if we will say for example, a very large and influential firm—Wernher, Beit or any other firm—

13,990. Leave them out. Put it to me, personally?—I would rather not speak of personal questions. Sir George Farrar and other members of the Commission are personal friends of mine.

13,991. Mr. QUINN: May we have the pleasure of listening to the whole of the witness' evidence. He repeatedly gives an answer that is unfinished. I want as far as possible to hear the whole of it.

The CHAIRMAN: Come and sit here. I asked you before to come and sit closer.

Mr. QUINN: It is not that. His evidence is clear enough. I can hear it for myself. I want to point out that Sir George Farrar does not allow the witness to finish his answers. He asks him a question and does not allow him to finish what he has to say. I want to hear the whole of it.

WITNESS (continuing): I want to ask whether I am obliged to answer personal questions? Sir George Farrar and other members of the Commission are my personal friends, and they put questions to me which are based upon my personal views about other personal friends and so on. I would prefer to discuss it upon general lines, and if I use the name of firms or anybody else, then it is only in order to use the name as an illustration. I do not wish to make it a personal question.

The CHAIRMAN: It is better that personal questions should not be put.

WITNESS: I very strongly object to bringing forward any personal questions, and I do not wish

to make any statement upon personal questions. If I may take Sir George Farrar's question as one of general application, I will give an answer. But I wish to make it once and for all perfectly clear that I am not for one moment insinuating that the slightest improper influence has been exercised either by owners on engineers or by engineers upon their employees. I have a sufficiently close acquaintance with the gentlemen who are the leading engineers in this country to be absolutely positive that no such influence would have any effect. In the first place, I am perfectly certain that they would not exercise it if they could. After having cleared the ground in that way, it appears to me quite absurd to suppose that the influence and the wishes of the leading firms, perhaps, in the country should be without effect. It would seem to me to be utterly ridiculous if the fact were established that one of the very leading firms of this place had a distinct policy and wished to carry out that policy, that such a policy should carry no influence. It must carry influence, it must have this effect, this influence. An important firm does not formulate a policy and intend to pursue that policy without its having an effect. I am not ascribing improper influences, I only say it is inevitable that the effect in my opinion, if such a policy has been formulated, is that it will have influence.

13,992. I ask you do you mean that for political purposes this unskilled white labour has not been given a fair trial?—I do not think so.

13,993. You embrace everyone in that?—No. I am not speaking of any person at all.

13,994. You put the whole industry together?—I simply say I do not think that white labour has been tried in the most favourable way possible, nor do I think that the trials that have been carried out with good will.

13,995. Then you express the greatest doubt in regard to the engineers' evidence that we had before use?—You mean?

13,996. Well, practically that these figures are wrong. They have given us certain figures in regard to the employment of white labour as compared with native labour and that kind of thing?—Well, I say this, that I think to a large extent these figures, though given perfectly *bona fide*, are theoretical. That is to say, that the practical trials of white labour in this country has not been carried on on such a large scale or to such an extent as would justify me at any rate in expressing such a very definite professional opinion upon that.

13,997. Have you had any practical experience as a manager?—No, I have not been a mine manager on the Rand.

13,998. Would you do away with all native labour and put in white labour?—I would if I could, but it is not practicable.

13,999. You would not do it?—No.

14,000. Therefore, as soon as you have a large amount of native labour, the practical factors lessen; it is not so great as it would be with white labour?—No.

14,001. That is so. Now you said, in regard to the unfortunate outside districts, that there will be no immediate demand for labour in these outside districts; that is, outside the area of the Witwatersrand? I have not seen anything myself which would in any way warrant me to think that there is a great immediate expansion in view.

14,002. The unfortunate people who hold these claims in the outside districts are in an unfortunate position?—Personally I think too many claims are sometimes held in the outside districts.

14,003. You think generally in the Transvaal districts outside the Witwatersrand there is no expansion?—No, I do not. I think there will be an expansion.

14,004. When?—I cannot say.

14,005. Under what conditions?—As the country gets opened up.

14,006. How is it going to be opened up?—Railways, and by the population coming in.

14,007. And do railways alter the political opinions of the people who control the industry, do you think?

The CHAIRMAN: I think the Commission will now adjourn till 2.30 and give the witness time to think over the answer to the question.

The Commission then adjourned till 2.30 p.m.

14,008. Sir GEORGE FARRAR: I was pointing out to the Commissioner of Mines his opinion that no great amount of labour would go to the outside districts. He explained that he meant in the immediate future and was proceeding to tell us what the future of these unfortunate outside districts would be.—The word "unfortunate" is not mine.

14,009. Can you tell us about railways?—I am speaking purely on general lines. I cannot give any facts on this point of real value except my impression that in future the outside districts would go ahead, but in the immediate future—the next year or so—I do not anticipate any great increase.

14,010. These engineers' estimates are based on the requirements of the next five years. Now, in your opinion, will these districts want much more labour in that time?—Not as compared with the wants of the Rand, but I think there should be some increase.

14,011. Do you think the Rand will want much more labour?—Yes, if you leave out the exact proportion of white to black, but labour of some kind is undoubtedly required in large quantities.

14,012. Yet you expressed a very strong opinion in favour of white labour?—I have said that I do not think the experiment of trying white labour has been carried out with any strength of purpose and my view is that it is very desirable indeed to employ as much white labour as we possibly can. I do not blame anyone for holding a contrary view or impute motives to those who hold views which differ from my own. Anyone who thinks it is not to the advantage of the country to employ white labour, and especially not to employ it on the mines, is not thereby, in my opinion, laying himself open to an imputation of bad faith or anything of that kind. It is an opinion that may be held with perfect good faith.

14,013. But in effect this white labour has not had a fair trial?—When I say fair, to avoid a wrong impression, I should say it has not had an adequate trial. If you use the word fair, you bring in other considerations.

14,014. You have heard it stated that on the Robinson Deep, with an ore value of 11.97 dwts., they are making a profit of 20s. 8d. per ton?—I have no knowledge of that.

14,015. But you have expressed a strong opinion in favour of white labour?—Oh, yes.

14,016. You have not had practical experience as a mine manager?—That is not a technical opinion, but white labour is the object to be aimed at.

14,017. Where do you form that opinion?—It is part of my political conviction.

14,018. But, as Commissioner of Mines, you are talking of an economical condition?—On the contrary, as Commissioner of Mines, I hold strong political views.

14,019. Then do you mean that the industry should raise its working costs in order to meet certain views. You are here as Commissioner of Mines, not as a private individual, and you come here and practically use the phrase that for political motives white labour has not had a fair trial. You must tell us on what you base this view that white labour could be used economically?—I expressed no opinion as to how far it could be used economically.

14,020. But these engineers' estimates, you say, depend upon the use of white labour. You say that the requirements will not be so large?—I say that it has yet to be shown how far it is possible to substitute white labour for black, but I do not venture on an opinion.

14,021. And when these engineers give you definite estimates, definite figures, and definite trials as regards the comparative costs, then you say they are incorrect?—I do not say so.

14,022. Now where did you get your political views from?—I evolved them from my inner consciousness.

14,023. From Mr. Hennen Jennings?—Oh, but I do not say I got my political views from him. They are my own.

14,024. You are very intimate with Mr. Creswell?—I should prefer not to introduce a personal question.

14,025. But you have made a personal attack on the industry?—No, I have said more than once that I have no wish to make a personal attack, and if you will point out any such attack I shall be very pleased to withdraw it.

14,026. Did you see Mr. Tarbutt's letter before it was in the newspapers?—No, never.

14,027. Mr. GOCH: With regard to white labour on the mines, what would you regard as a living wage for such men?—For a white labourer?

14,028. For an unskilled man to displace Kaffirs?—I do not think I can give you expert evidence on that; it varies so very much. I know white men who are working for £6 per month and their food; others for £20; and others for £50, but they all say they are not getting enough.

14,029. But Mr. Creswell stated that the average wage paid to an unskilled labourer on his mine came to 8s. 2d. a day. Do you consider that a fair wage, a living wage on which white men can live?—I really do not know. It entirely depends on the style upon which a man lives. If a man works for that, I suppose he can live on it, otherwise he would starve.

14,030. But with your political views, if the country should be peopled with British workmen, does not this question of a living wage bear on it?—Oh, I see. If I may say so, I think the question of a living wage goes hand in hand with the question of the number of white men here. If we keep this country in such a condition that the white man is always the taskmaster, the head of a gang of workmen, and does not do the work himself, then I think the cost of living will always be high. If, on the other hand, you gradually—I do not say it can be done suddenly—introduce a large working population, then I think the cost of living would be very much lower. Of course, I see the dilemma at once. You say we cannot introduce more white men because the cost of living is so high. Then you say the cost of living is so high because we have so few white men in the country. It is a question of economics. You can argue either way.

14,031. But your wish for a large white population is dependent upon a very much better condition of things here?—Well, by getting that population, you will reduce the cost of living.

14,032. But those who come in the meantime would go on starving wages until this is done?—I do not think it would be wise to make a sudden and subversive move in that direction. It must come gradually. Mr. Jennings said he thought it would come suddenly, but I suppose you do not want Mr. Jennings' opinion.

14,033. The time it would take it is a very important matter. In the meantime the industry would have to hang fire?—I do not think so. I do not think it is possible for the industry in any case to make a sudden leap, nor will such a leap be in the interests of the country. The best we have to hope for is a steady and slow increase of prosperity, a steady and comparatively slow increase. I may point out that from the figures in the Government returns for August it appears that the value of gold produced was £1,162,000, which is at the rate of 14½ millions a year. The maximum production in any one year at the period of greatest prosperity was 16 millions. Of course I hope that it will ultimately be more than 16 millions, but the gap between 14½ and 16 is not so very enormous, and I

anticipate that without any great disturbance of existing conditions the output and the number of stamps dropping will increase.

14,034. Then we should be quite content with the progress we are making?—No, I do not think anyone should be content with the progress they are making. That is a sign of stagnation. By all means let us try and make greater progress.

14,035. But going back to the living wage which is a pressing question, whether your view is a political or economical view, do you think 8s. a day is a sufficient wage for a white man to get?—I have already told you that I cannot give a general answer to that question. It is enough for some men and not enough for others. No man that I have met yet was content with his wages and quite right too.

14,036. Mr. EVANS: Do you remember what the engineers estimated the additional requirements of the outside districts at?—I cannot recall it at the moment.

14,037. Would you consider 9,000 an exaggeration?—Well, it is rather a lot. For what period?

14,038. Take it to be the immediate requirements? The actual number wanted now in excess of what they have, which is between three and four thousand?—Well, I am not prepared to say it is excessive, but I should not have thought myself it was so large.

14,039. Have you formed any idea as to the requirements of the diamond industry?—That is very difficult to say at present.

14,040. But, after all, that would be included?—Yes. If you include the diamond industry, I suppose 9,000 would probably not be too much.

14,041. On what do you base your conclusion that the white labour experiment has not had an adequate trial?—Well, in the first place, as I have said before, I do not think any trial in the nature of things can be adequate unless the owners of the mines in which the trials are made are really anxious that they should be a success. Secondly, I do not think the number of white men employed since the war has been very large. It is quite possible, but I do not know whether it is so, that the working arrangements of the mine would require to be altered and I am not aware of that having been done. The two principal points are—first, that the mine-owners or some of them have not been anxious to make the thing a success; and, second, the experiments, such as they have been, have been on too small a scale.

14,042. What would you consider an adequate experiment? What period should it cover?—About three years. It would depend, of course. It might be possible to come to some conclusion before that.

14,043. But what about the shareholders in the meantime?—Well, I do not know. Their position would depend a good deal upon the success of the experiment.

14,044. Do you know any instance anywhere in South Africa of white men doing unskilled work for any length of time?—The class of unskilled work grades so gradually into skilled work that it is difficult to say.

14,045. Let us say Kaffir work, rough manual labour?—Well, there are a large number of white men on farms who I suppose have done it ever since they were born.

14,046. Where is that?—I suppose they are to be found all over the country.

14,047. Have you seen that yourself?—Yes.

14,048. For any long period?—Well, of course, not being a farmer, I have not had opportunities of checking the periods for which any particular man has worked in a particular place, and it would be a triviality to give the few instances which have come under my own notice. I do not think it is material.

14,049. But do you know any instance of a hatch of, say, navvies being used, on railways or in any other way for any length of time?—Well, I have not enquired; I have never had anything to do with railways.

14,050. But you are expressing a very strong opinion here as to what the mine-owners should do. These experiments on railways, &c., have been going on for a very long period?—I do not know what question you are asking.

14,051. Do you know of any instance which justify the mine-owners in going on with the unskilled white labour experiment?—It has not yet had a fair trial. I demur to your suggestion that adequate experiments have been carried on. I know of no instance in which a proper experiment has been carried on in the mines, and I would not be likely to know if it was done on the railway. Your statement begs the question, because I say the experiment has not been made. The experiment would be one which so far has not failed.

14,052. Have you not heard that the Cape Railway tried white unskilled labour?—No.

14,053. Do you know that the N.G.R. also did so?—No, I do not know anything about railways.

14,054. Then you are making a suggestion, but you have based it on nothing?—No, it is not for me to make suggestions. I have merely stated that the experiment has not yet been adequately attempted. The mine-owners are perfectly entitled to think that they should not attempt such an experiment, but I say it has not been attempted.

14,055. Either on the mines or elsewhere?—Not to my knowledge.

14,056. The CHAIRMAN: The Commission is very much obliged to you for your evidence.

The Commission adjourned until Thursday at 10.30 a.m.

## THIRTY-SECOND DAY AND FINAL PUBLIC SITTING.

Tuesday 6th October, 1903.

## THE COMMISSION SAT AT 10.30 A.M.

The CHAIRMAN: There are certain documents which the Secretary will hand in which the Commission has decided to receive, but for which it is impossible in most cases to get the persons concerned to submit themselves for examination. That fact will be duly entered over the statements of the persons concerned.

Evidence of Mr. F. W. Barber, Grey Street, Grahamstown, *re* Native Labour. (Not called or cross-examined.)

In the hope that every little helps, I am tempted to say a few words on this debatable subject. I say this with some confidence, as I was born in this town, have travelled amongst and know the natives and their countries, their manners and ways, as much as anybody. I have spent the greater part of my life in farming, hunting, and travelling in all parts of South Africa, and my conclusions and firm convictions are, that you will never get sufficient labour for the manifold purposes required in South Africa.

I have a farm 10 miles from Grahamstown, and I have the greatest difficulty in getting labour at all; so much so that I am seriously thinking of giving it up, much as I love farming. What labour I have is "rotten"—a lazy, drinking, thieving, malingering set, and every farmer I meet and talk to says the same thing; and, if it were not that the farms are, as a rule, substantially enclosed with wire fencing, which almost makes the farmer independent of native labour, many of them would chuck up the whole game as not worth the candle; in the towns it is equally as bad, or worse.

How can the mines expect to get native labour down in our south-eastern districts when the farmers cannot, with all the great inducements that they can offer, such as allowing the natives to keep stock, cattle, goats, or sheep, cultivate land for Indian corn, give them plenty of fresh milk, &c.? It is preposterous to suppose that a native, whose national instincts are indolent, and who loves to be with his wives and children, will leave the above desirable employment to go to work in the damp and dangerous mines of the Transvaal.

Or else they can go anywhere along our coasts from here to Natal and squat, pay 10s. per annum hut tax, and make their wives work, while they lie around and sleep, and steal the farmers' sheep when they want a little meat. So you must disabuse your mind of getting any labour worth speaking about among the tribes on the south-eastern borders of the Colony. No native will work under the present law of the country, where he is not required to clothe himself, and does not have to work to live.

The Zulus, Swazis, and Malihili are even worse than other tribes; their earliest traditions are that it is "infra dig" to work; they are warriors, soldiers, fighting men; the women work.

In Matabeleland they require all the labour for their own purposes, and the natives there are a poor lot, so that, after all, you have to fall back on the Shangaans, &c., of Portuguese East Africa. I think the proportion of working men got from there in the past is very good, and could not be increased to any great extent, especially in good seasons.

It is no use my going into the matter of the great extra demand for labour throughout the Colony for railways and innumerable other requirements; so I will simply conclude by saying that if my opinion is of any value to your Commission, I may honestly and candidly state that, much as I am adverse to the importation of Asiatic labour into this country, you will never, under any circumstances whatever, get sufficient native labour in this country for the varied and manifold purposes required.

Copy of Further Communication from the British Consul-General, Lourenco Marques, covering Various Tables of Statistics relative to the Supply of Labour from Portuguese East Africa. (Not called or cross-examined.)

H.C. No. 66.

To the Imperial Secretary,  
Johannesburg.

Sir,—In continuation of my telegram, No. 41, I have the honour to forward certain statistics which have been furnished by the Native Department of the Province.

The tables will, I think, explain themselves. Table No. 6 is instructive. The information has been obtained from the natives as they returned from Johannesburg through Ressano Garcia, and the occupations given are those the natives were actually engaged in immediately prior to their return.

It will be seen from the figures that out of 13,249 East Coast natives employed in the Transvaal, about 30 per cent. were otherwise than in mining. The returns may perhaps be of interest to the Labour Commission.

I have, &c., &c.,  
(Sgd.) J. G. BALDWIN,  
H.B.M. Acting Consul-General,  
Lourenco Marques.

Return of Native Emigrants into the Transvaal since the *modus vivendi* up to the 20th August, 1903.

	Year.	Month.	Gone into the Transvaal.	Passes issued to.
Ressano Garcia	1902	Up to 31st December	38,171	...
"	1903	Up to 20th August	26,494	64,665
Namahacha	1903	Up to 20th August	811	811
Pafuri	1903	From April to August	42	42
Komatipoort	1903	Up to 20th August	798	798
				Total 66,316

RETURN Showing the Number of Contracted Natives already in the Transvaal before the *modus vivendi* and who are supposed to be still in the Transvaal.

Number of natives in the Transvaal at the time of the <i>modus vivendi</i>	-	-	20,072
Number of those who have returned to the Province	-	8,835	11,237
Number of natives contracted	-	66,316	
Number of natives returned to the Province	-	10,444	55,872
Total	-	-	67,109

RETURN of the Total Number of Natives returned from the Transvaal since the *modus vivendi* till the 10th August, 1903.

Number of natives who received passes at Ressano Garcia and who were contracted	10,444
*Number of natives who had emigrated clandestinely	8,833
Total natives returned through Ressano Garcia	19,279

RETURN of Natives registered as Portuguese by the Curator, Ivens Ferraz, in the following Mining Districts in the year 1892.

Johannesburg	-	-	7,175
Krugersdorp	-	-	1,577
Boksburg	-	-	5,009
Heidelberg and Vereeniging	-	-	811
Total	-	-	14,572

RETURN showing the Number of Natives Returned from the Transvaal since the *modus vivendi* up to the 15th July, 1903.

Passed through Ressano Garcia according to information from the Fiscal Department	17,390
-----------------------------------------------------------------------------------	--------

Middelburg, Barberton, Pilgrim's Rest, &c., about

* Natives in military service, at 10 per cent. of 50,000	500
	5,000
Total	20,072

Repatriated at their request to return to the Province, to the Native Curator, and according to the information from the office of the said Curator up to the 15th July, 1903

	14,714
Less	2,676

\* This is only an estimate, but I do not think it is an unfair assumption to say, that of the large number of natives employed by the military during the war, 10 per cent. were from Portuguese territory.

\* This number has been arrived at by examining the papers of natives returning through Ressano Garcia (vide Table No. 2).

Transporters means employed by C.S.A.R.

Evidence of Lieut.-Col. Stone. (Not called or cross-examined.)

Office of the Resident Magistrate,  
Standerton,  
21st July 1903.

The opponents of imported labour base their opposition on the idea that the Government can, and possibly will, compel the Kaffirs to work if labour is not provided for from any other source. They also look at the question principally from the point of view of the immediate provision of labour for the farms, and are unable or unwilling to grasp the fact that, unless labour is also provided for the mines and public works, the farms cannot prosper, and the country itself must go back, and ultimately land values in the country will be depreciated.

As regards providing labour for the farms, there will probably be a consensus of opinion among the witnesses that natives on the farms should be taxed at a considerably lower rate than those living in native reserves and locations; and I am myself of opinion that a rebate of not less than 10s. in the £ to natives living on farms would solve the labour difficulty so far as the agricultural community is concerned.

The most energetic farmers are those who find it most difficult to attract and keep native labour. The idle farmer has little difficulty, as the Kaffirs do practically what they please with him.

(Signed) J. G. STONE, Lieut.-Col.,  
Resident Magistrate.

Evidence of W. H. Brodie, M.D., Johannesburg.  
(Not called or cross-examined.)

I have, for over 10 years, attended the natives at the Village Main Reef G.M. Co., which, previous to the war, employed about 2,000 boys. I have been Medical Officer to the W.N.L.A. since its commencement, and I inspect every native that arrives in their compound.

In the course of an investigation held before the war by Messrs. Rogers, Hamilton, and myself on the one disease more prevalent and fatal than all others combined, viz., pneumonia or meningitis, I had occasion to make myself acquainted with the epidemic of sickness occurring at that time. I can safely affirm that this sickness was more prevalent then than now.

I kept no records of the epidemics which did not come under my own observation, but I took care to substantiate the fact that my own experience of these epidemics was not exceptional.

In July 1898, 93 natives arrived at a mine compound here; a fortnight after their arrival only 16 were working, and some of these were ailing. Altogether, of this batch, eight died. This practically means that the whole gang were infected. I had occasion to observe the recent outbreak among the gang of British Central African natives at the Robinson Deep Mine. It was comparatively mild, but much publicity was given to it. There was an abnormally large percentage of old natives in this gang, and most of the deaths occurred among them.

It is rare now to find natives arriving at the W.N.L.A. compound suffering from colds or pneumooccal infection. This is in extreme contrast to that which obtained before the war, when most of the natives that arrived on the mines—especially during the cold season—suffered from colds, and many from pneumooccal septicaemia. The difference is accounted for by the care now taken of the natives on their journey here. Previous to the war they travelled in open trucks, even in the coldest and wettest weather, practically unclad. Now they are supplied by the W.N.L.A. with Army overcoats and blankets, and travel in ordinary coaches. In the W.N.L.A. compound they are

kept warm and well dieted, and they are sent to the mines well protected against inclement weather. This care must of itself naturally lessen the predisposition of the natives to infection. Amongst other things, care is being taken that they are not exposed at the pit head. Hot soup or coffee is supplied before they descend, and attention is being paid to their being properly clad on coming out of the mine. The compounds are being overhauled, and practicable suggestions made by the medical men are carried out.

I have inspected the Kimberley compounds, having been sent by the Chamber of Mines to investigate as to whether there was anything in their construction and working, or in the care of the natives, that could with advantage be imported to the Rand. I think the Rand compounds, on the whole, compare favourably with those of the De Beers Consolidated Mines.

I have had many opportunities of comparing arriving and departing gangs of natives; they generally arrive in a poor condition of health, and many are of poor physique. Among the departing natives it is rare to find one of poor physique, or one who is not vigorous and in fine physical condition. This would not be the case if the work on the mines were too hard, if their diet were insufficient in quantity or quality, or if the general hygienic conditions in which they live were bad.

That some of the natives are satisfied with their treatment here is proved by the fact that lately, on the Village Main Reef Mine, out of a batch of boys whose period of service of one year had expired, nearly one-half elected to stay on for another six months.

(Signed) W. H. BRODIE, M.D.

Statement of Walter S. Whitworth, Koffyfontein,  
O.R.C. (Not called or cross-examined.)

I have been asked by the Colonial Secretary, Bloemfontein, to forward you a written statement covering any evidence I could give before your Commission.

I am afraid I can give no evidence that has not already been heard, but submit the following statement in case there may be any point of interest in it as representing the case of an outside mine. I am sorry, however, that owing to previous engagements, it is impossible for me to come up to Johannesburg to give evidence in person.

I am the general manager of the Koffyfontein Mines, Limited, in the Orange River Colony. I have been at Koffyfontein since July, 1894, and have been manager of this company since 1896. During the whole of that period my work has kept me in close touch with all the compound and native recruiting work. The company has had as many as 1,500 natives in their compounds at one time (before the rinderpest, when transport was obtainable to a greater extent), but only require 800 to carry on the work able to be done at present, until the new plant is completed. In twelve months' time from 2,000 to 2,500 natives will be required. During the past four months, we have only had from 350 to 450 natives employed, being quite unable to obtain more, the work having only been carried on on a small scale at a loss.

I have no hesitation in stating that this continued scarcity of native labour is affecting the amount of wages being paid to natives. In Johannesburg, where wages can be regulated by a tariff, it may not be the case, to the same extent, but at the outside mines—one independent of the other—there is no doubt that there is a decided tendency to increase native wages, due to the competition between the various mines to keep, and, if possible, entice a better supply of native labour to their compounds. If the outside mines increase their native wages in excess of the Rand tariff, they will always obtain a proportion of the native labour

obtainable, but many of the outside mines would have to shut down if it became a question of competition with the Rand as to who could entice, by high wages, the Kaffir labour willing to work. Such competition, though, would not only shut down some of the poorer mines, but undoubtedly proportionately decrease the amount of Kaffir labour willing to work. The Kaffir, with, one might almost say, no exceptions, does not work to become rich or amass money for future years; he works for one of two objects, to be obtained as quickly as possible; either to obtain drink, or to be able to lead a lazy existence. At one time in Johannesburg, he had plenty of opportunities of obtaining an outlet for his earnings in drink, if so inclined; that, I understand, has been stopped—and without doubt from a moral point of view, rightly—but the consequence, nevertheless, is that the money previously spent in drink is now enabling the native to return home after a shorter period of work, and to enjoy what he terms "a rest" for a longer period. The tendency to increase Kaffir wages will undoubtedly tend in exactly the same direction, and unless there is some counteracting influence in the shape of taxation, any further increase of wages paid to natives will, in my opinion, tend to decrease rather than increase, the amount of South African native labour obtainable for the mines and other works.

The native will not work for the future unless obliged to by present circumstances, and then for a future as near as he can possibly make it.

As regards local natives, there are practically none native to the district—beyond a few scattered farm huts—beyond the requirements of the farmers themselves, who are all short of farm labour. The local town locations are made up of a mixture of members of nearly every tribe and race in South Africa.

The mine obtains its chief supply from Bechuana land, though we also obtain natives from Basutoland and the Transkei and Queenstown districts in Cape Colony.

The natives in the compounds are fed—that is, not left to purchase their food in the compound shop, as at Kimberley, but supplied with daily rations. The chief diet is mealie meal, mealies and Boer meal (unsifted), meat and vegetables being served twice per week. We have had very little trouble from scurvy or any other sickness, the health of the native employees being wonderfully good, though this is partly due, no doubt, to our having no underground workings and the mine being worked as an open quarry.

In December last we obtained a batch of 50 Indians for trial on mine work; but, as there was some misunderstanding between the Indians and the labour agent who sent them (the former refused to contract for any fixed period of service), the trial fell through, and the Indians worked for only one week. During that week, as far as one could judge, the Indians were not able to do as much, or as heavy, work as an ordinary Kaffir labourer, but were much more intelligent than raw Kaffirs are on general work, as opposed to purely navvies' work. The Indians were put in a compound by themselves and paid at the rate of 12s. per week all round to start with, but the cost of feeding on rice was higher than the cost of feeding South African natives on mealies.

I see no reason, however, why Asiatic labour properly indentured should not be satisfactorily employed on the mines where they could be properly compounded, and I believe that they would be more easily controlled than an ordinary compound of South African natives.

If there is any further information that I can give you on any point, and you will advise me of the fact, I shall be glad to do so.

Statement by W. E. M. Stanford, O.B., C.M.G.,  
Transkei. (Not called or cross-examined.)

1. District with which acquainted.—The Transkeian Territories.

2. Duration of such acquaintance.—Thirty-seven years.

3. Character of natives.—(a) Usual work: Agriculture, stock raising, but building; many now own waggons and are carriers. (b) Usual food: Corn, milk, beer, meat (occasionally), beans, sweet potatoes, and other vegetables. (c) Usual pay: Various; for work near their homes they will accept comparatively low wages, 20s. to 30s. a month with food and quarter; as store boys or drivers to waggons, 2s. or 3s. a day. (d) Physique. &c.: Good physique and intelligent; best efforts are shown in piecework. (e) Special conditions affecting Transvaal labour supply: Rate of pay, treatment on railways, food, accommodation, local management. (f) Approximate numbers available: For the six months ended the 30th June last the number of native labourers who have left these territories for various centres is as follows:—

Transvaal	-	-	-	9,667
O.R.C.	-	-	-	953
Natal	-	-	-	8,237
Capetown	-	-	-	8,579
Kimberley	-	-	-	721
Port Elizabeth	-	-	-	1,581
East London	-	-	-	4,026
Other centres (railways)	-	-	-	8,695
				42,459

Approximately, our native population is 800,000. The figures just given, after allowing for Territorial European requirements and work at their own villages, indicate that the people are freely going out to seek employment. The Cape ports and Durban are much in favour. The location at Maitland, near Capetown, has established the value of providing suitable accommodation at a low rental for native workmen and their families. The rents more than cover interest on the outlay, and the people are pleased to have a comfortable location to themselves. It is noticeable that the number of native women in this location is steadily increasing. This proves contentment, and the period of service will thereby be greatly extended.

(g) Local enterprises and number of natives required therefor: Our returns do not show the number of natives employed within the territories by farmers, millers, storekeepers, and others; I should say approximately 10,000.

## NUMBER OF PERSONS AT WORK ON THE WITWATERSRAND GOLD MINES.

Month.	Whites.	Coloured.	Total.
1899, July - -	12,530	91,139	103,669
1900, June - -	WAR PERIOD.		
1901, July - -	1,748	11,119	12,867
1902, June - -	6,588	28,613	35,201
1903, June - -	11,187	53,558	64,745

Johannesburg,  
October 22nd, 1902.

H. R. Skinner, Esq.  
Dear Sir,—At the request of Messrs. George Farrar and Hennen Jennings, a Special Sub-Committee appointed to investigate the desirability of employing white labour on the mines, you, together with Messrs. C. J. Erice and O. H. Spencer, kindly agreed to investigate, in conjunction with Mr. Creswell and myself, how the employment of white labourers on the Village Main Reef affected the cost of production there.

At my request the secretary of the company has prepared the enclosed two tables.

Table No. 2 gives the main results of the working of the company for the months of March to September, 1902, inclusive. This shows the tremendous increase in the white labour costs which took place in June and continued to September. If we consider that the months of May, June, and July were months of transition, when the experiment of working white labourers was only beginning, and compare the results obtained in March and April, with the results obtained in August and September, we find as follows:—

	March and April.	August and September.
Tons crushed - -	18,980	22,650
£	£	£
Total value declared - -	38,214	48,054
Value per ton - -	40/3·07	42/5·16
£	£	£
Total costs - -	24,435	35,633
White labour costs - -	8,234	15,080
Native labour costs - -	3,516	4,032

From this it is seen that during August and September 3,670 tons more were crushed than during March and April, at an extra cost of £11,198, or a cost for the extra tonnage of £3 1s. 0d. per ton; whereas the gold in the rock was only worth 42s. 5 1/2d. per ton. Or, in other words, by the use of white labourers, the Village Main Reef was able to crush about 1,800 tons a month more, at a loss of 19s. 6d. per ton on the extra tonnage, instead of making a profit of 15s. a ton. Thus the experiment is costing the Village Main Reef in round figures £3,000 a month. Table No. 1 shows the labour costs under various departments, and the number of shifts worked in each department for three periods—1st, six months ending September 30th, 1899; 2nd, March, April, and May, 1902; 3rd, June, July, August and September, 1902. The data for the six months ending September 30th, 1899, is not sufficiently full to permit of any valuable comparisons, but is given for what it is worth.

It will be seen that the labour costs for mining for the second period, when practically no white labourers were employed, amounted to—

Whites - -	4s. 4·04d. per ton.
Natives - -	2s. 6·80d. per ton.
Total - -	6s. 10·845d. per ton.

whereas for the third period, when the number of white labourers was large, the labour costs were:—

Whites - -	5s. 7·119d. per ton.
Natives - -	2s. 11·540d. per ton.
Total - -	8s. 6·659d. per ton.

which shows that in spite of the fact of increased crushing, brought about by an increased force of white labourers at an extra cost of 1s. 3·375d. per ton, the native labour costs increased 4·739d., an evidence of the demoralising force on both classes of side by side work.

## VILLAGE MAIN REEF.

Table 3.

Department.	March, April, May, 1902. 29,005 tons crushed.				June, July, August, September, 1902, 41,800 Tons crushed.			
	White Shifts.	White Shifts, per Ton.	Native Shifts.	Native Shifts, per Ton.	White Shifts.	White Shifts, per Ton.	Native Shifts.	Native Shifts per Ton.
Hand Stopping - - - -	62	·00213	1,219	·04203	78	·00186	2,448	·05856
Rock-Drills - - - -	1,739	·05995	11,691	·40307	5,969	·14328	19,191	·45911
Shovelling and Trammung - - - -	613	·02113	22,105	·76211	1,443	·03452	36,341	·86940
Sorting, Crushing, and Transport - - - -	565	·01948	2,815	·09705	4,941	·011820	564	·01349
Boilers - - - -	256	·00883	3,946	·13604	3,919	·09375	2,897	·06931
Total shifts worked, estimated tailings, contractor - - - -	13,438	·46329	58,140	2·00448	43,800	1·04784	72,253	1·72859

On the supposition that the whites and natives employed during the second period were as efficient as those employed during the first period, the

following number of shifts would have been worked:—

Table 4.

	Whites.		Natives.	
	Actual.	Possible.	Actual.	Possible.
Hand Stopping - - - - -	78	89	2,448	1,757
Rock Drills - - - - -	5,989	2,506	19,191	16,848
Shovelling and Trammig - - - - -	1,443	883	36,341	31,856
Sorting, Crushing, and Transport - - - - -	4,941	814	564	4,057
Boilers - - - - -	3,919	369	2,897	5,686
Totals for five departments - - - - -	16,370	4,661	61,441	60,204
Totals for the Mine - - - - -	43,800	19,365	72,253	83,787

Table No. 3 is taken from Table No. 1, and shows the number of shifts of white and black actually worked in five main departments, which employ about six-sevenths of the native labour, and the number of shifts, white and black, worked per ton crushed. I have not been able to include cyaniding in this comparison, as during part of the second period of Table No. 1 the company employed a tailings contractor, and it is not accurately known how many shifts he worked, although an estimate has been made.

Table No. 4 is calculated from Table No. 3, and shows how many shifts in the above five departments, of equal efficiency to those worked in March, April, and May, would have had to be worked in order to crush 41,800 tons during June, July, August, and September, this shows that 1,237 shifts of natives and 11,709 shifts of whites were worked without crushing any more rock; or, in other words, the work of 114 white men and 12 natives for four months has been thrown away in trying to teach white men to become labourers, a lesson they have not yet learnt here. If we examine the number of shifts of white men it took to replace Kaffirs, the best showing in the great departments is in sorting, crushing, and transport, where it is shown that it took 4,941 shifts of white men—564 shifts of natives; total, 5,505 shifts—to do the work that men of the same efficiency as those who worked in March, April, and May would have done by working 814 shifts of white men—4,058 shifts of natives; total, 4,873 shifts. Or, it took 4,127 shifts of white men to do the work that should have been done by 3,495

shifts of Kaffirs. Taking the total shifts worked, as shown in Table 1, and estimating the number of shifts worked by the tailings contractor from the monthly return of the manager, it is seen that during June, July, August, and September 43,800 shifts of whites and 72,253 shifts of natives were worked to crush 41,800 tons. If this work had been done by men of the same efficiency as those who worked in March, April, and May, this tonnage could have been crushed by 19,365 shifts of white men, 83,787 shifts of natives, or it took 24,435 shifts of white men to do the work that could have been done by 11,534 shifts of natives. It therefore took on the average 2·11 white men to do the work of 1 Kaffir.

Having pointed out the tremendous financial loss incurred by the Village in conducting this experiment, I would like you to consider the question from another point of view. Taking into account the question of housing, it can be safely assumed that the cost per shift of a white labourer to the company has been 10s. Do you consider that you can build up a large white population here in any reasonable time, who will be content to work even for 10s. per shift? And I have shown that this rate of wage means a heavy loss to the company.

Even if you could, would you willingly hold up, in a country where the ratio of white to black is as 1 to 5, a class of men who would be willing to work for 10s. per shift, and who would be known as white Kaffirs.

Yours truly,  
(Signed) SIDNEY J. JENNINGS.

The above data are compiled in response to the Consulting Engineer's Letter 16th October, 1902.

Village Main Reef G.M. Co., Ltd.

(Sgd.) J. F. BILBROUGH,

Secretary. 17/10/02.

Johannesburg,  
November 14th, 1902.The Chairman and Board of Directors,  
Village Main Reef Gold Mining Co., Ltd.

Dear Sirs,—I enclose you two tables prepared at my request by your General Manager.

Table No. 1 shows the salient features of the last eight months' working of your company, month by month.

Table No. 2 shows the labour costs, white and native, divided among the different departments, for two periods:—

1st period: March, April, May, and June.

2nd period: July, August, September, October, 1902.

On the face of them, these tables show that your company has suffered a financial loss by the experiment of extending the employment of white labourers.

Your General Manager urges that these tables do not correctly reflect the actual achievements of the

two periods. He states that during the first period, ore was milled that had been broken in the period during the war. I have gone very carefully into the matter with him, and find it impossible to make anything like an accurate estimate of what this factor amounts to. A record was kept of the number of trucks trammed from certain stopes, in which some of the reserved ore was stored, in which no stoping has been done since the resumption of work. Mr. Creswell guesses that at least 50 per cent. more reserve ore than thus shown, was trammed from stopes in which work has been done since January, 1902. From the records, I could find nothing that would either prove or disprove this guess, and, perforce, have had to accept it.

The following Table shows the number of tons crushed from reserve, according to Mr. Creswell's guess, for each of the eight months. It also shows the number of tons crushed that were actually stoped; the stoping costs; the cost per ton actually stoped; the extra expenditure that would have been necessary to have stoped the ore taken from reserve.

	Tons Milled.	Tons from Reserve.	Tons actually stoped.	Stoping costs.	Cost per ton actually stoped.	Extra expenditure to have stoped ore from reserve.	Extra expenditure per ton milled to have stoped reserve ore.
March - - - - -	9,480	2,447	7,033	3,833	10 10·8	1,333 12 4	2 9·8
April - - - - -	9,500	2,721	6,779	3,994	11 9·4	1,603 2 6	3 4·5
May - - - - -	10,025	1,458	8,567	4,598	10 8·81	782 10 2	1 6·7
June - - - - -	9,350	2,524	8,826	3,928	11 6·04	1,451 14 5	3 1·1
Totals - - - - -	38,355	9,150	29,205	16,351	11 2·36	5,170 19 5	2 8·3
July - - - - -	9,800	0	9,800	6,169	12 7·1	—	—
August - - - - -	11,080	393	10,687	5,722	10 8·5	210 8 3	4·5
September - - - - -	11,570	0	11,570	6,471	11 2·3	—	—
October - - - - -	8,727	0	8,727	4,171	9 6·7	—	—
Totals - - - - -	41,177	393	40,784	22,532	11 0·6	210 8 3	1·22

This table shows, among other things, that the actual stoping costs for October were lower than for any month of the eight; due in large measure to hand stoping instead of machine.

If we add this estimated expenditure that would have been required to stop all the ore milled during the first four months, to the actual expenditure, we will get a figure than can be compared with the costs of the succeeding four months.

The following table shows the salient features for the two periods :—

	March, April, May, and June.	July, Aug., Sept., and Oct.
Tons milled - - -	38,355	41,177
Total value declared - -	£78,655	£38,039
Declared value per ton in shillings - - -	41s. 0·168d.	42s. 9·132d.
Actual costs - - -	£50,866	£67,790
Estimated extra expenditure to have stoped all rock milled - - -	£5,171	£210
Total estimated costs with extra expenditure - - -	£56,037	£68,000
Total estimated costs with extra expenditure, per ton -	29s. 2·641d.	33s. 0·336d.
Actual profits - - -	£27,789	£20,249
Actual profits per ton - -	14s. 5·88d.	9s. 10·026d.
Estimated profits if all rock milled had been stoped - -	£22,618	£20,039
Estimated profit per ton - -	11s. 9·528d.	9s. 8·796d.
Suppose the rock in the second period to have been mined at the same cost per ton as in the first period, estimating the extra expenditure necessary to have stoped all the rock crushed, then the total cost would have been - - -	- - -	£60,160
And the total profits - - -	- - -	£27,879

This means that the loss to the company by this experiment has been in four months £7,840.

On page 6 is a table which shows that, after making allowance for rock taken from reserve, and work performed by tailings contractor, it took in the first period 2·05076 shifts of Kaffirs and 0·54467 shifts of white men to crush a ton of rock. Now during the second period 72,748 shifts of Kaffirs were actually worked, and these shifts, when supervised by 19,321 shifts of white men, would have been sufficient to have crushed 35,475 tons; therefore the employment of 24,258 shifts of white men in four months allowed the management of the Village to crush 5,704 tons.

Now if these 35,475 tons had been crushed at the same cost per ton as in the first period, with all allowance for rock from reserve, i.e., 29s. 2·641d. per ton, then the total cost would have been - - - £51,826

The actual expenditure was 67,790

Therefore these 5,704 extra tons cost - - - £15,964  
or - - - 55s. 11·688d. per ton,  
whereas the gold contents were only worth - 42s. 9·132d. per ton,

so that the extra tonnage crushed is crushed at an actual loss of 13s. 2d. per ton, and no allowance for deferred profit can be made. The loss of £7,840, as above shown, is probably a minimum estimate.

A careful inspection of Table No. 2 shows that in no great department of labour have Kaffir shifts been replaced by a materially less number of white shifts. The following table shows this clearly :—

DEPARTMENT.	FIRST PERIOD. Tons Crushed, 38,355.			
	WHITE SHIFTS.		NATIVE SHIFTS.	
	Total.	Per Ton.	Total.	Per Ton.
Stoping - - - - -	3,698	...	17,362	...
Allowance for reserve - - - - -	1,158	0·12660	5,439	0·52447
	4,856		22,801	
Shovelling and tramming - - - - -	746	0·01945	29,854	0·77836
Sorting, crushing, and transport - - - - -	1,353	0·03527	3,291	0·08580
Cyaniding - - - - -	1,458	...	1,355	...
Allowance for Contractor - - - - -	1,610	0·07985	2,262	0·09430
	3,063		3,617	
Boilers - - - - -	1,041	0·02714	5,168	0·13471
Totals - - - - -	11,059	0·28831	64,731	1·68764

DEPARTMENT.	SECOND PERIOD. Tons Crushed, 41,177.			
	WHITE SHIFTS.		NATIVE SHIFTS.	
	Total.	Per Ton.	Total.	Per Ton.
Stoping - - - - -	8,375	...	27,311	...
Allowance for reserve - - - - -	37	0·00090	234	0·00570
	8,412		27,545	
Shovelling and tramming - - - - -	1,194	0·02900	35,682	0·86655
Sorting, crushing, and transport - - - - -	5,741	0·13942	89	0·00214
Cyaniding - - - - -	6,192	...	170	...
Allowance for Contractor - - - - -	...	0·15037	...	0·00412
Boilers - - - - -	6,282	0·15256	2,311	0·05612
Totals - - - - -	27,821	0·67563	65,796	1·59787

On the supposition that the same efficiency could have been got from the men in the second period, as in the first, the following table shows the possible number of shifts with those actually worked:—

	WHITE SHIFTS.		NATIVE SHIFTS.	
	Actual.	Possible.	Actual.	Possible.
Stopping - -	2,412	5,213	27,545	24,478
Shovelling and tramming -	1,194	801	35,682	32,051
Sorting, crushing and transport -	5,741	1,452	88	3,533
Cyaniding - -	6,192	3,288	170	3,833
Boilers - -	6,282	1,118	2,311	5,547
Totals - -	27,821	11,872	65,796	69,492

The only case in which the combined white and black shifts were actually less than they possibly could have been was in the case of cyaniding, where an allowance had to be made for the number of white men used by the contractor, and the records kept by the mine are not very clear on this point.

The consideration of the total shifts worked during the two periods proves that the working of white men as labourers has not only demoralised them and reduced their efficiency, but has likewise demoralised the native and reduced his efficiency. This is shown by the following table:—

	FIRST PERIOD.		SECOND PERIOD.	
	Tons crushed, 38,355.		Tons crushed, 41,177.	
	White.	Native.	White.	Native.
Total shifts on Working Account - - -	18,123	70,966	43,579	72,718
Allowance of shifts necessary to have stoped ore taken from reserve - - -	1,158	5,439	37	234
Allowance of shifts employed by Tailings Contractor - - -	1,610	2,262	...	...
Total shifts - - -	20,891	78,667	43,616	72,972
„ „ per ton crushed - - -	0.54467	2.05076	1.05923	1.77215
If in the second period the workmen had been as efficient as in the first the shifts required would have been - - -	...	...	22,425	84,444

Or, it took 21,188 shifts of white men to do the work that could have been performed by 11,472 shifts of natives—an eloquent testimony to the demoralization of both classes of labour on the Village Main Reef.

During the latter part of September, and all of October, very little machine stoping was done; this accounts in some slight measure for this disastrous showing.

When your manager started the experiment of trying white labourers, he did so with my consent and support. I had hoped that under the trying circumstances of the disbandment of a large number of ex-irregulars, a sufficient number of efficient workers could be picked out from the quantity offering, to enable your manager to crush a larger number of tons at approximately the same cost per ton, as, although I knew the white labourers would cost more, I expected that the spreading of your general charges (which do not increase with increased tonnage crushed) over a greater number of tons, would neutralise this increase. I never anticipated the extent your manager would employ white labour, nor did I foresee that he would get so little work out of them. The experience of the past four months proves to me that the use of white labour to the extent that has obtained on the Village Main Reef will not prove economically possible.

Your manager, however, urges that the past four months' bitter experience has taught him where he has wasted white labour. He has found white labourers to be economically impossible on boilers, shovelling and tramming underground, and has ceased using them in these departments. He claims that he has learnt by his past experience to economise white labour in many ways, and has hopes to get more efficient work out of them. He contends that this would be wasted experience, if he were not allowed to prove that he can show continuously better results than he has done in the past.

No doubt your manager will do better in future months. He is now making efforts to economise labour, and to obtain efficiency, not only from the whites, but also from the natives. For the month of November he should show a decreased cost per ton over October of from 4s. to 5s., due to saving in coal, and increased efficiency in all departments. This improvement would be quite beside the question of the relative advantages of employing white or native labour, and the increased efficiency, which I anticipate will be shown, is one of the good points that can be got out of a very ugly situation.

The problem is complicated by two factors: the strike of the rock-drill miners and the scarcity of such men who are really competent.

Were it not for the first complication, I would recommend that your manager be instructed to run his employment of labour on the lines suggested in the report (a copy of which I enclose) of Messrs. Skinner, Price and Spencer, who were asked by a Committee of the Chamber of Mines to report on the use of white labour at the Village Main Reef, but that would mean either giving in to your miners or closing down a still larger part of your mill.

The scarcity of competent rock-drill miners, and the necessity for training more, makes the time of strike longer than it otherwise would be. Every effort is being made by myself to aid your manager in obtaining more competent rock-drill men. As soon as he has sufficient machines at work to break enough rock to keep 50 stamps going, he should be instructed to gradually dismiss his white labourers to the proportions recommended by Messrs. Skinner, Price and Spencer.

I beg to remain, yours truly,  
(Signed) SIDNEY J. JENNINGS,  
Consulting Engineer.

VILLAGE MAIN REEF G.M. Co., Ltd.,  
J. F. BILBROUGH, Secretary.

19/11/02.

Johannesburg,  
21st January, 1903.  
H. Jennings, Esq.  
Dear Sir,—At your request I beg to bring the information with regard to the working of white labourers on the Village Main Reef down to December 31st, 1902.

Table No. 1 (see page 5) shows the salient features of the working of November and December on the same basis as contained in my report to the directors of the company, dated 14th November 1902.

During these two months, however, two new factors were introduced into the problem, which was sufficiently complicated before. These two factors are:—

- 1st. Decreasing the amount of waste sorted out.
- 2nd. Increasing the proportion of south reef mined.

The following table shows the extent to which these factors have been introduced:—

—	Percentage of Tons Milled sorted out as Waste.	Tons South Reef Mined.	Tons Main Reef Leader Mined.	—	Percentage of Tons Milled sorted out as Waste.	Tons South Reef Mined.	Tons Main Reef Leader Mined.
March - -	24·8	5,876	6,285	August -	20·3	8,785	5,120
April - -	22·3	5,520	6,704	September -	24·0	9,598	5,920
May - -	22·1	5,206	7,659	October -	21·3	8,626	2,172
June - -	22·7	5,385	6,732	November -	15·4	7,672	2,347
July - -	22·5	7,925	4,725	December -	5·8	8,792	2,906

The decrease in the percentage of waste sorted out is brought about by two things—1st, a praiseworthy attempt has been made to mine less waste with the ore; 2nd, Mr. Creswell felt that with so many stamps lying idle it was justifiable to attempt to leave no ore in the waste thrown away, rather than to try to leave no waste in the ore going to the mill.

Whatever the justification for the decreased sorting may have been, the effect on reducing working expenses is just as apparent.

In November 15·4 per cent. waste was sorted out. In December 5·8 per cent. waste was sorted out.

The working expenses in November were 29s. 11·1d. per ton; in December they were 27s. 0·5d. per ton.

What would the working expenses have been if 23 per cent. of waste had been sorted out, which was approximately the average sorted out during March, April, May, and June?

Assuming that the surface expenses would have varied in proportion to the tons milled, which is a very favourable assumption to Mr. Creswell, and only the underground expenses would have been affected by the extra amount sorted out, the following table shows the extra cost per ton milled had the extra percentage been sorted out:—

	November.	December.
	Tons.	Tons.
Tons sent to crusher station	10,019	11,698
23 per cent. waste sorted out would equal	2,304	2,690
Leaving tons to be milled	7,715	9,008
	£ s. d.	£ s. d.
Total underground expenses were	6,615 9 1	7,945 0 11
	s. d.	s. d.
If 23 per cent. of waste had been sorted out, the underground expenses would have amounted, per ton milled, to	17 1·9	17 7·6
Whereas only sorting out the above-named amounts the underground expenses, per ton milled, were	15 5·697	14 6·937
Showing a difference due to diminished sorting, per ton milled, of	1 8·2	3 0·7
In other words had 23 per cent. of waste been sorted out in these two months instead of the amounts actually sorted out, the expenses would have been	31 7·3	30 1·2

It is manifestly unfair to credit any of the reduced working expenses due to the diminished sorting, to increased efficiency of white labourers.

The argument that Mr. Creswell advances that because he stoped a proportionate number of fathoms to the tons milled during the two months, therefore the reduced amount sorted out had nothing to do with the reduced expenses, is manifestly inconclusive. The argument rests on the assumption that it costs more to stop in proportion to width stoped, whereas there exists on such fixed proposition; as in practice, frequently, a wider stoppe can be let on contract for a loss sum per square fathom than a narrow one. The cost of stoping on these fields depends far more on the kind of walls and on the nature of the rock, than on the width stoped. I can find no sufficient justification for the introduction of the second factor into this very complicated problem. The effect of mining a larger proportion of rich south reef would be to allow of a smaller percentage of waste being sorted out without the grade being lowered.

In October a total cost of 34s. 11·6d. was shown. Of this increase about 2s. per ton was due to an adjustment of the coal account. When this is deducted, and the corrections due to sorting less

waste are made, the variation in the cost per ton since starting working white labourers has not been great, with the exception of the first month. Making these corrections, the expenses would then be:—

	s.	d.
July - -	34	5·9
August - -	30	11·4
September - -	31	11·5
October - -	32	11·6
November - -	31	7·3
December - -	30	1·2

During the year 1902 the ore reserves of the mine were decreased 58,000 tons. This is a factor, which, although it does not enter into the working costs, owing to the system of development redemption, cannot be lost sight of, and these decreasing ore reserves, cannot be carried on indefinitely.

Mr. Creswell has thrown into this experiment a tremendous amount of enthusiasm and energy, which has enabled him to gradually increase the efficiency of his labour force, especially native labour, and his plant, but the fundamental difficulties of the problem have not been appreciably diminished.

The average monthly wage paid by the Village Main Reef to all white employees in October,

S s

1902, was £17 15s. 4d., whereas the average for the fields, as shown by Exhibit 14 of the Consulting Engineers' Report, was for the same period £24 10s. 9d. The contentment and efficiency of white workmen on the Village Main Reef cannot

be maintained by such differences in the rates of pay.

Yours truly,  
(Signed) SIDNEY J. JENNINGS,  
Consulting Engineer.

## VILLAGE MAIN REEF G.M. Co., Ltd.,

21/1/03.

The CHAIRMAN: That concludes the public sittings of the Commission. I should just like to say that I think the Secretary should be instructed to write to the Town Council and officially

(Signed) J. F. BILBROUGH,  
Secretary.

thank them for having kindly placed this very convenient room at our disposal for the sittings of the Commission. That is unanimously agreed to, I think. The Commission will now sit in private.

## APPENDICES TO EVIDENCE.

## APPENDIX I.

Enclosure.]

Johannesburg,  
9th December 1902.

Letter from Mr. F. H. P. Creswell and Enclosure.  
General Manager's Office,  
Johannesburg,  
October 5th, 1903.

The Chairman,  
Transvaal Labour Commission.

Sir,—My attention has been called to questions No. 14,476 and following in examination of Mr. S. Jennings, and I deem it right to lay the following facts before you:—

1. The recovery from the Robinson Deep for August, 1903, as per Chamber of Mines published returns was 47·48 shillings per ton.
2. The value of the residues I have no information about.
3. The recovery from the Village Main Reef as per same returns was 35·61 shillings per ton.
4. The average residues discharged during that same month was 3·47 shillings per ton.

I have no reason to doubt that the Robinson Deep residues are as low as ours, and taking them at the same value, the actual gold contents of the ore before milling would be—

Robinson Deep	-	-	51·22s. per ton.
Village Main Reef	-	-	39·35s. per ton.

The implication from the questions put and answers given would be that the Village Main Reef was getting a smaller profit from richer rock than the Robinson Deep. The above figures show that this is not the case.

The actual extraction on the Village Main Reef given as 69 per cent. is not actual extraction, being based on the theory that the screen samples can be relied on as an accurate measure of value of the rock before milling. This is not the case. On this mine this discrepancy has before now been considerable, and is at the present time at my request made some weeks since, the subject of expert investigation.

Writing in December last, Mr. Jennings, then Consulting Engineer to this Company, called my attention to a similar discrepancy, and suggested that it was due to my screen sample being higher than it should be or to my tonnage being over-estimated, probably to both. Investigation by one of his own staff shewed that the screen sample was too high, but that the basis on which our tonnage was determined was *too low*.

With this fact in his knowledge, I do not know on what grounds he bases his present insinuation that my tonnage is now over estimated.

I beg to repeat what I stated in cross-examination, that my tonnage is as near and true a determination as I can arrive at of the number of tons of 2,000 lbs. each milled during the months mentioned, and I have no reason to suppose it to be wrong.

Mr. Jennings has handed in a copy of a report to my Board. I beg to hand in herewith copy of a letter written to my Board by myself, referring to this report, and to inform you that as a result of the investigation made by the Chairman and my own representations, my Board decided that they were justified in allowing me to continue working on the lines which Mr. Jennings in his report recommended that I should be made to abandon.

I should be glad if this letter might be included in the evidence published with your report, so that it may have the same publicity as Mr. Jennings' statements and reports.

I am, Sir,  
Your obedient Servant,  
F. H. P. CRESWELL.

The Chairman and Local Board of Directors,  
Village Main Reef G.M. Co., Ltd.

Gentlemen,—

Mr. S. Jennings' letter to you of November 14th, was handed to me on the 25th November at your last Meeting.

I have gone at great length into Mr. S. Jennings' figures, and although I have devoted to analysing them a great deal of time and labour, and have arrived at results very different from his, I must ask you to allow me to defer a full reply, if you deem it necessary, to some future date, when I can spare the time from the more pressing needs of the present work to checking the results I have arrived at. At present I will content myself with pointing out that deductions drawn from a comparison of the results obtained in the two periods are very apt to be delusive, unless one is very careful to take into account and express numerically the effect of all the different working conditions of the two periods, and, having done so, is also careful to make the necessary corrections correctly. To give two instances:—

Mr. S. Jennings, in his comparisons as to efficiency, notes in passing that the fact of having so many boys on hammers after the strike of drill men, has some effect on the deductions he draws, but clearly he has not analysed how far it affects them. In dealing with the reserve rock, he seems to equalise matters between the two periods so far as this rock goes, but does not really do so in accordance with the facts of the case, the main fact being that our labour supply in the first period being strictly limited to our 750 natives, that reserve rock could not have been stoped at any cost, and had it not been there, our tonnage milled, output and profit would have been materially diminished, our standing costs and surface charges would have been practically unaltered, and our underground charges would have been increased.

Merely taking these factors, which disturb the comparison, and eliminating their effect on the figures, the results will be found to be surprisingly different from those Mr. S. Jennings arrives at.

Therefore, seeing that he takes no account at all of any other matters affecting the comparison I cannot admit that his deductions as drawn from my figures in Tables Nos. 1 and 2 are sound.

I would recall to you the difference in the two working periods. In March, April, May, and June, we had, except the Coronation holidays, practically no exceptional circumstances connected with the working of the mine; but during those months for various reasons, chiefly to tide us over the time until our men got into swing of work again, and in June to make up for these holidays, we were using a good deal of the rock lying ready broken in the mine.

In July, August, September, and October, we had, on the other hand, a number of adverse circumstances.

1st. At the end of July and beginning of August we lost 40 per cent. of our natives, and their places were filled up, though not without an interval, by raw boys.

2nd. In those months we took on most of our white labourers and had to sift out the loafers from those who meant to work.

3rd. In September we had a strike of all our machine men. This was directly the result of using white labour, it is true, but nevertheless it disorganised the work for a time, and in October, in consequence, we had to run our stoping on entirely different lines from the previous months.

The second four months were, therefore, ones of continually disturbed organisation, and all these

causes, viz., the white labour, the change of our natives, the strike of our machine men, and other matters which hindered us getting an increased tonnage through the mill, combined to raise costs and diminish profits.

That getting settled down into using white labour has cost us something, I do not for a moment deny, but I think that the change will have been very cheap at the price if it enables us, as I claim it will, from now on, to continuously increase our output and diminish our costs per ton, without depending on an increase of the native labour supply. That it has cost us £7,000, or that we have been milling rock at 55s. 11d. will not be borne out by investigation.

There are only two other matters that I would like to touch upon at present. The first is what Mr. S. Jennings calls my "guess" at the reserve rock used. When Mr. Jennings asked me by telephone on November 11th for a month by month estimate of this rock, I asked him to come down himself and go into it with me, as I did not wish to give a figure I could not vouch for, under the circumstances. He came down, and after he had seen the difficulties in the way of arriving at an accurate figure, I suggested that 50 per cent. added to our records would probably meet the case, and I understood he adopted that as the best way to get at an approximation to the real figure.

The second is the recommendation with which he closes his letter. Here I would submit that we should be guided by the necessities of the case, and not by any theoretical proportion of black to white based on Messrs. Skinner, Price, and Spencer's report, in which they presuppose for 100 stamps 1,000 to 1,200 natives, while we have only 750.

In our case, if we replace our surface labourers at present by natives from underground, where they are producing rock, we shall be losers thereby, and I would suggest this change being left until such time as we can show that we shall be actually gainers by this change.

I must further contest Mr. S. Jennings' statement that the improvement in November results has nothing to do with the question of black and white labour. It is precisely from the increasing efficiency in the use of white labourers, that I hope to obtain continually improving results in future months.

Yours faithfully,  
(Sgd.) F. H. P. CRESWELL.

#### APPENDIX II.

Extracts from Report of Witwatersrand Native Labour Association, presented at the first Ordinary General Meeting, held on April 2nd, 1903.

In 1900 it was decided to reorganise and extend the work hitherto carried out by the then existing Rand Native Labour Association, Limited, and in September of that year, at Capetown, an agreement was entered into between representatives of the various mining groups comprising the majority of the mining companies of the Witwatersrand Gold-fields, to form a new Association, through which alone it was proposed to derive the native labour supply for the mines, thus putting an end to competition amongst the mines, and doing away with the system of touting and speculating in native labour. The Association was formed under the auspices of the Chamber of Mines as a Department to deal with native labour. Although it was found necessary to establish the Association in the form of a Limited Liability Company, it is not a trading company, and is precluded by its Articles from distributing any profits or declaring any dividends.

Under the agreement mentioned a guarantee fund was established to carry on the work of the Association until such times as business was resumed at Johannesburg, and registration of the Association under the Limited Liability Laws of the Transvaal could be effected.

Owing to the state of war existing in the Transvaal, it was not until March, 1901, that the first allotment to members was made of natives handed

over to the Association by the Imperial Military Railways.

It was impossible, also, to inaugurate any active recruiting operations until August, 1901, when permission was obtained from the General Officer Commanding-in-Chief to recruit natives in the Northern Transvaal, and the Pietersburg Agency was established under Mr. David Erskine.

Every effort was made to obtain permission to operate in Portuguese East Africa, but it was not until the 18th December, 1901, that the *modus vivendi* between the British and the Portuguese Governments was concluded and the country thus thrown open. At the end of December the Lourenco Marques Agency was started, with Mr. G. V. Pickard as District Manager, and the first batch of natives arrived early in February, 1902.

In terms of the Articles of Association, members have been called upon to subscribe for one share in respect of every five natives forming the complement of their mine. Upon each share the deposit of 25s. has been paid, and 2s. called up, leaving a liability of 18s. The balance sheet shows the amount paid, and how expended. Since the end of the year, a further call of 5s. per share was made, viz., on the 17th February last.

As regards revenue, the charge made to members to cover the cost of recruiting and distributing natives was 30s. per capital to the 1st December, 1901, when it was found necessary to raise it to £2, and, on the 8th July, it was modified, it being deemed unfair to charge the same rate for a native whose contract was for six months as for one of 12 months. It was, therefore, decided to fix the price at 32s. 6d. for the former and 65s. for the latter.

It having been found essential that the complement of natives due to each crushing mine should be fixed, the Consulting Engineers of the various groups were invited to make suggestions as to the fairest method of arriving at this result. They decided to base their calculations upon the actual results of working during the first five months of 1899. Subsequently, the complement of non-crushing mines was fixed, and later that of the collieries.

The original arrangements, under which recruiters were paid by salary only has been modified, and a system of payment by results has been substituted in almost all instances, except in the case of district managers and their office staff.

An agreement between the Chamber of Mines and the Government of Southern Rhodesia was entered into at the end of 1901, whereby 12½ per cent. of the natives recruited by the Association in a portion of Portuguese East Africa and the Northern Transvaal were to be allocated to the mines of Rhodesia. For various reasons it was found that this agreement was unworkable, and notice of its termination was given by the Chamber of Mines on the 1st December, 1902, and it therefore ceases to be in operation from the 1st of June next. The Chamber has suggested a modified arrangement which it is hoped will prove acceptable to the Rhodesian authorities, under which the Association will have the right, jointly with the Government of Southern Rhodesia, to recruit labour in Northern Rhodesia and Barotseland.

Portuguese East Coast (South of Lat. 22 deg.)—This country was opened to the operations of the Association in December, 1901, under terms of the *modus vivendi*, and a staff was immediately organised for this Province. A careful selection of the recruiters employed in that country previous to the war was made, and Mr. F. Mello Breyner's services were retained. Although it is difficult to obtain accurate figures of the number of East Coast natives employed on the mines previous to the war, it is probable that this was not less than 70,000 to 75,000. For the 11 months ended December last, 38,631 natives were recruited by the Association, in addition to which it is known that some 13,761 were on the Witwatersrand at the occupation of Johannesburg. Since that period 5,223 have returned home up to 31st December 1902. There were consequently some 47,169 employed by mines and other employers at the end of the year. Up to 28th February last, 41,912 natives were recruited. It was anticipated

that a larger proportion of the natives employed before the war would have returned during the first year, but the following circumstances must be taken into consideration. At the outbreak of the war these natives, many of whom had not been home for years, returned with considerable savings, bought wives and settled down, under far more comfortable conditions than they ever were in before. The continuance of the war preventing their return, they turned their attention to cultivation on a scale hitherto unknown in the country, the result being for the last two seasons, a large surplus of grain available for sale and export. There is also reason to believe that during the latter months of the year the question of wages entered somewhat into the matter, and acted as a deterrent to the return of the old mine natives. At this present moment there is every indication that there is nothing in the minds of the natives operating against their coming out to work, further than their usual procrastination and habit of deferring a start, and delay in arranging their domestic affairs.

## APPENDIX III.

Translation of letter in Dutch received from the Districts of Krugersdorp, Lichtenburg, Marico, Middelburg, and Rustenburg, and bearing the signatures of 192 individuals.

To the Chairman and Members  
of the Labour Commission,  
Johannesburg.

Sirs,

We, the undersigned, inhabitants of the District of Krugersdorp, being unable to appear personally

before your Commission, desire to direct your attention to the following facts, which are of very great importance to us:—

1. On account of the large number of labourers required in the Transvaal since the war, labour is almost unobtainable by us, or solely at a prohibitive rate.
2. We hear that the mines are also in serious want of labour.
3. If the mines, which can afford to pay a higher rate of wages to the native, are unable to obtain sufficient labour, it is evident that the prospect of the agriculturalist is very discouraging.
4. Under the circumstances, and taking into consideration the gravity of the situation, we, the undersigned, request that your Commission may lose no time, but immediately lay your scheme before the Government, by which the agriculturalist as well as the mines may be supplied with sufficient labour.
5. At the same time we request that the Squatters' Law may be put into operation, and that such restrictions may be laid down, that locations may be broken up, so that in consequence thereof the native shall be compelled to work instead of living an idle life on private farms and Crown lands.

Signed: B. B. de Wet, Waterval West; E. J. A. Bierman, Naaauwkloof; P. J. Bierman, Naaauwkloof; E. A. Bierman, Naaauwkloof; J. J. Botha, Lui-paardsvlei; O. T. Prinsloo, Stein Estate; P. A. v. d. Merwe, Dwarsvlei; G. A. Nortman, Doorenbos; G. M. Scheepers, Sterkfontein; John P. Friend, Hartebeestfontein; A. H. Lizamore, Sterkfontein; M. G. Keet.

INDEX TO THE PROCEEDINGS  
OF THE  
TRANSVAAL LABOUR COMMISSION.

OCTOBER, 1903.

NOTE.

In using this Index it should be observed that it is compiled for the purpose of getting the information required in the easiest possible way.

The references will be found in two numbers; those in parentheses indicate the number of the question, and those without parentheses indicate the number of the page.

Where certain information is sought for the same will be found under a number, and the reader should read on from that number where he will probably find the sequence of questions and answers which will give him all the information he requires. This is done to obviate the reiteration of the words *et seqq.*, which would otherwise become unbearably monotonous.

- BOTHA, MR. L.**  
 Evidence of, on Vryheid District and the Transvaal, labour supply of, suggests importation of white labour rather than other, attitude of natives towards Boers since war, (11,181) 501—(11,396) 507.
- BRENTANO, MR. H.—**  
 Evidence of, regarding negotiations with the W.N.L.A. as to his offer to recruit 20,000 Somali natives to be delivered at Red Sea ports, correspondence thereon, telegrams from Commissioner, Somaliland, no supply available, etc., (2,915) 137—(3,095) 143 and (3,102) 145—(3,164) 147.  
 Mr. J. N. de Jongh on, (9,563) 434.  
 Refuted by Mr. Kusel, 499.  
 Mr. F. Perry on, (12,349) 543.
- BREYNER, MR. F. DE MELLO—**  
 Evidence of, as to Portuguese E. Africa, statistics of native population, probable supply, possible increase thereof, local requirements, (612) 26—(735) 31.  
 Recalled, (1,945) 93—(2,229) 102.  
 Sir P. Fitzpatrick on, (2,865) 134.  
 Mr. J. I. Ferraz agrees with evidence of (5,763) 244.
- BREYTENBACH, MR. N. J.—**  
 Evidence of, on labour supply of Ermelo and Carolina Districts, Transvaal, shortage, suggested system of taxation in order to compel natives to work, (8,016) 328—(8,121) 331.
- BRITISH CENTRAL AFRICA—**  
 Mr. P. H. Ross on, (242) 12.  
 Population of, (242) 12, (244) 13, (245) 14, (247) 14, (4,617) 197, (9,477) 432.  
 Occupations of natives, (242) 12.  
 Restrictions on recruiting, (242) 12.  
 Available supply from, (242) 12, (245) 14, (4,613) 197, (8,954) 370.  
 Angoni tribe in, (242) 12.  
 Pay of natives in, (242) 12, (1,172) 58.  
 Tribes of, (242) 12.  
 Diseases of natives, (243) 13.  
 Natives of, as underground workers, (243) 13.
- Missionaries against recruiting in, (246) 14, (1,022) 49, (1,056) 50.  
 Mortality of natives, (246) 14, (1,758) 86.  
 Recruiting in, by W.N.L.A. (746) 31, (888) 44, (935) 45, (1,055) 50, (1,099) 54, (1,171) 58, (1,178) 58.  
 Ditto, hostility to, in, (1,020) 49.  
 Statistics of, (1,086) 53, (1,111) 56, (1,115) 56.  
 Hut tax in, (1,087) 53, (1,175) 58, (4,630) 198.  
 Correspondence on, with Secretary of State, (1,085), 52.  
 Mr. E. Wilson on, 196.  
 No prospect of supply from, (4,614) 197, (4,641) 198.
- BRITISH EAST AFRICA—**  
 Correspondence on, with the Secretary of State, (1,085) 52.
- BRITISH WEST AFRICA—**  
 See West Africa, British.
- BRODIE, DR. W. H., MEDICAL OFFICER TO W.N.L.A.—**  
 Evidence of, on diseases and mortality of natives, Rand compounds compare favourably with Kimberley, 620.
- BROWNLEE, MR. W. T.—**  
 Evidence of, on Transkei, probable increase of supply from, (12,893) 567—(13,082) 574.
- BUFFELSDOORN—**  
 See Klerksdorp.
- BULAWAYO—**  
 Barotses in, (261) 15.  
 (See also Rhodesia.)
- BUNNIA TRADERS—**  
 In Natal (11,057) 495, (11,106) 498.

## C.

- CABRAL, MR. A. P.—**  
 Evidence of, on recruiting in Portuguese East Africa, criticism of W.N.L.A. methods, (12,157) 534—(12,317) 539.  
 Recalled, (13,564) 597—(13,573) 599.  
 Mr. F. Perry on, (12,319) 540.
- CAPE COLONY—**  
 Recruiting in, (746) 31, (908) 44, (943) 46, (1,012) 50, (4,094) 180, (4,501) 192.  
 Population of, (944) 46, (4,150) 182, (4,501) 192.  
 Population of eastern parts, (4,094) 180.  
 Insufficient supply in, (2,744) 128, (4,512) 192, (6,235) 259, (9,713) 440.  
 Effect of reduction of wages on supply from (4,094) 180.  
 Influence of chiefs on supply from, (4,094) 180, (4,120) 182.  
 Supply from, (4,094) 180, (4,136) 182, (4,511) 192, (8,335) 348.  
 Effect of increased wages on supply from, (4,115) 181, (4,126) 182.  
 Requirements of, (4,094) 180, (4,181) 183, (6,238) 259.  
 High wages in, (4,501) 192.  
 Superiority of natives of, (6,056) 253.  
 Natives of, object to underground working, (10,565) 476.  
 Labour supply of, from Transkei, (12,923) 539.  
 Fingoland (see Fingoland).  
 Galekaland (see Galekaland).  
 Scarcity of native labour in, (6,108) 255.  
 Glen Grey Act in, (6,158) 257, (6,264) 260, (12,971) 570.  
 Blue Book, statistics of (8,335) 348.

## CAPITAL—

Of companies in S.A., 421, (9,792) 443.

## CAROLINA—

Mr. N. J. Breytenbach on, 328.

## CARR, W. ST. JOHN, DEPUTY CHAIRMAN JOHANNESBURG MUNICIPALITY—

Evidence of, shortage and wastage of labour, methods of recruiting, numbers employed by, effect of shortage on public works, replacing natives by whites, etc., by the Johannesburg Municipality, (1,218) 61, (1,422) 66.  
Recalled, (6,328) 262, (6,457) 272.

## CENTRAL AFRICA—

Recruiting in, (746) 31, (888) 44, (935) 45, 404.  
Supply from, (2,813) 132.  
Impossible increase of supply from, (9,151) 381.  
Population of, (8,931) 368, (8,920) 366, (9,133) 379, (9,524) 433.  
Fallacious estimate of population of, (9,150) 380.  
Slavery in, (9,152) 381.  
Mortality of, natives of, (9,152) 381.  
Natives of, not a success on Rand, (9,724) 446.

## CENTRAL TRANSVAAL—

Supply from, (5,524) 232, (5,530) 235, (5,503) 238.  
Population of, (5,524) 232.  
Squatting, in, (5,524) 232, (5,547) 236, (5,680) 240.  
Higher wages in, not conducive to increased supply, (5,524) 232, (5,543) 236, (5,642) 239.  
Shorter contracts conducive to increased supply, (5,533) 235.  
Insufficiency of supply for farm work, (5,538) 235.  
Effect of increased taxes on supply from, (5,541) 236.  
Pay of natives on farms in, (5,554) 236.  
Analysis of population of, (5,579) 237.  
Wealth of natives in, (5,599) 237.  
Natives of, employed in Pretoria, (5,668) 240, (9,268) 397.  
Taxation of natives in, (5,694) 241.  
Polygamy in, (5,731) 242.  
Mr. W. M. Edwards on Krugersdorp, 290.

## CHAMBER OF MINES—

Relations with the W.N.L.A., (790) 40, (2,617) 119, (2,654) 124, (2,753) 129, (9,648) 437.  
Report for 1897, on reduction of wages, (3,846) 171.  
Report of, to Commission, (9,443) 401.  
Sub-Committee reports of, (9,444) 401.  
Statement of sources of African supply, and number of labourers to be drawn therefrom, 401.  
Demand for labour exclusive of agriculture now and five years hence, 402, 421, (9,480) 432, (9,489) 432, (9,768) 442, (9,880) 450.  
Position of mining industry and problem it has to solve, 403.  
Average value of ore on Rand, 403.  
Effect of employment of white labour on dividends, 403, (9,946) 453, (9,785) 443.  
White labour as compared with black, 403, 420, (9,491) 432, (9,593) 436, (9,739) 440, (9,812) 444, (9,880) 450, (9,914) 452, (11,944) 526.  
Stamps erected and working, 403, 405, (9,504) 433, (9,580) 435, (9,727) 440.  
Ditto in five years time, 403, 420, (9,580) 435.  
Loss to mining industry through shortage of labour, 403, 407, (9,506) 433, (9,751) 442, (10,470) 472.  
Importation of unskilled labour necessary, 403.  
Statement of population of South and Central Africa, 404, (9,524) 433.

CHAMBER OF MINES—*cont.*

Recruiting in South and Central Africa, 404.  
Ditto, restrictions on, 404.  
Available supply of South Africa, 405, (9,529) 433, (9,766) 442.  
Percentage of increase of native population, 405.  
Food of South African natives, 405.  
Finances of mining industry, 406.  
Increase of native labour implies increase of white, 406, (9,753) 442.  
Statement of labour requirements for agriculture, etc. in Natal, Basutoland, Cape Colony, Transvaal, and Bechuanaland, 407.  
Statement of labour requirements of public works, municipalities, and semi-public companies, such as waterworks, etc., 408, (9,470) 431.  
Report of sub-committee on mining, 420.  
Number of natives employed on mines before war, 420, (9,825) 444.  
Estimated requirements of the Witwatersrand, 420, (9,635) 439.  
Number of rock-drills employed before and since war, 420.  
Mechanical underground tramming, 420.  
Crushing capacity per stamp, 420.  
Requirements of coal mines, 421, 429.  
Requirements of other mining industries, 421.  
Nominal issued capital of companies in S.A., 421, (9,792) 443.  
Requirements of native labour in South Africa now and six years hence, 421, (9,880) 452, (9,997) 455.  
Result of employment of unskilled white labour on East Rand Proprietary, 422.  
Report on the use of white labour for shaft sinking on the New Goch, 424.  
Analysis of the cost of sinking, 424.  
Unskilled white labour on the Lancaster, 428.  
Ditto on the Central Geduld, 428.  
Ditto on the Crown Reef, 429.  
Ditto on the Village Main Reef, (13,083) 574, (13,262) 586.  
Estimated population of Portuguese East Africa, (9,457) 431.  
Labour requirements increased beyond supply, (9,476) 432.  
Population of British Central Africa, (9,477) 432.  
Shortage of labour in South Africa, (9,483) 432.  
Available supply from Portuguese East Africa, (9,545) 434.  
Mr. Hugo Brentano's offer of supply from Somaliland, (9,563) 434.  
Shortage of labour on railways, 409, (9,566) 435, (9,739) 440, (9,812) 444.  
Number of boys required per stamp, (9,581) 435, (9,654) 438, (9,739) 440, (9,812) 444, (9,864) 450.  
White men per stamp on Australian mines, (9,592) 436, (9,758) 442.  
Cost of imported labour, (9,636) 437, (9,679) 438.  
Reduction of native wages, (9,656) 438.  
Wages of natives before and since war, (9,693) 439.  
Shortage of labour on farms, (9,698) 439.  
Ditto in Cape Colony, (9,713) 440.  
Ditto in Natal, (9,714) 440.  
Central African natives not a success, (9,724) 440.  
Shortage of labour on Rand, (9,749) 441, (9,780) 443, (11,831) 522, (12,018) 528, (12,116) 533.  
Values of mines in other countries, (9,759) 442.  
Influence of drink on labour supply, (9,763) 442.

- CHAMBER OF MINES—*continued.*  
 Increase of stamps implies increase of local expenditure and profits, (9,800) 443.  
 Shortage of labour before war, (3,847) 171, (9,862) 450, (9,945) 453, (11,808) 520.  
 Influence of W.N.L.A. on supply, (9,843) 445.  
 Maximum pay of boys on mines, (9,856) 450.  
 Piece work on mines, (9,857) 450.  
 Shortage of boys regarding mining, (2,631) 121, (2,849) 133, (3,800) 169, 403, 407, (9,506) 433, (9,751) 442, (9,867) 450, (10,470) 472, (10,761) 484, (11,658) 516.
- CHARLTON (MINE)—  
 See General Mining and Finance Corporation.
- CHARTERED COMPANIES—  
 See Rhodesia and Portuguese East Africa.
- CHIEFS—  
 Influence of, on supply of labour, (363) 19, (966) 46, (979) 47, (1,437) 67, (2,149) 100, (2,239) 103, (2,249) 103, (2,295) 105, (2,309) 105, (3,152) 146, (3,100) 143, (3,171) 147, (3,341) 134, (3,407) 155, (3,454) 157, (3,477) 158, (3,630) 163, (4,094) 180, (4,120) 182, (4,432) 191, (4,523) 192, (5,277) 221, (5,501) 231, (6,573) 276, (6,638) 278, (7,256) 299, (9,097) 540, (10,999) 493.
- CHINA—  
 See Chinese Labour.
- CHINESE LABOUR—  
 Embassy sent to China, (840) 42.  
 Cape Colony farmers approve of importation of, (2,744) 128.  
 Importation of, (2,905) 136, (8,087) 330.  
 At Réunion, (2,998) 139.  
 Importation of, on West Coast Africa, (9,434) 400g.
- CLARK, Mr. W.—  
 Evidence of, natives squatting on farms, influence of on supply of mines, supply of liquor conducive to increased supply of labour, (5,065) 214—(5,274) 221.
- CLIMATE—  
 Influence of, on labour supply, see Labour Native Supply.
- COAL MINES—  
 Labour requirements of, (2,626) 121, (2,733) 128, 421, 429, (10,020) 457.  
 Mr. E. Hopper's evidence on, 457 (*vide pp.* 429–430).  
 Labour supply sufficient for, (10,023) 457.  
 Preference of supply to, (10,024) 457.  
 Coal required per stamp per month, (10,027) 457.  
 Coal consumption of mines per month, (10,031) 457.  
 Requirements of railways, (10,033) 457.  
 Coal consumption three years hence, (10,040) 457.  
 Labour requirements three years hence, (10,050) 457.  
 Labour saving appliances in, (10,052) 458.  
 Labour employed on, in Natal (12,565) 550.
- COERCION—  
 Of native labourers, (8,430) 350.
- COHEN, Mr. L.—  
 Evidence of, on Portuguese East Africa, habits of natives of, Gazaland natives taking to trade and agriculture, improbable increase of supply from except Mozambique, results of free recruiting before war, advocates free recruiting, antipathy of boys to W.N.L.A., (3,627) 163—(3,748) 167.
- COILLARD, Rev. F.—  
 Evidence of, re Barotseland, improbable increase of supply from, (250) 15—(330) 19.
- COLLIERIES—  
 See Coal Mines.
- COMMISSION, LABOUR, TRANSVAAL—  
 Terms of reference, constitution of, members of, government notices 470 and 484, powers of, chairman's opening statement, advertisement inviting evidence, 1, 2.  
 Proceedings of:—  
 First day, 1.  
 Second day, 15.  
 Third day, 19.  
 Fourth day, 31.  
 Fifth day, 51.  
 Sixth day, 70.  
 Seventh day, 95.  
 Eighth day, 107.  
 Ninth day, 119.  
 Tenth day, 137.  
 Eleventh day, 147.  
 Twelfth day, 167.  
 Thirteenth day, 184.  
 Fourteenth day, 202.  
 Fifteenth day, 226.  
 Sixteenth day, 251.  
 Seventeenth day, 273.  
 Eighteenth day, 286.  
 Nineteenth day, 312.  
 Twentieth day, 331.  
 Twenty-first day, 360.  
 Twenty-second day, 379.  
 Twenty-third day, 401.  
 Twenty-fourth day, 457.  
 Twenty-fifth day, 472.  
 Twenty-sixth day, 492.  
 Twenty-seventh day, 514.  
 Twenty-eighth day, 537.  
 Twenty-ninth day, 559.  
 Thirtieth day, 586.  
 Thirty-first day, 605.  
 Thirty-second day, 618.  
 Suggested coercion of probable witnesses, (3,931) 174.  
 Chairman's assurance as to protection of witnesses, (4,225) 184.  
 Alleged bias of, (7,880) 324.  
 Report of Chamber of Mines to, (9,443) 401.
- COMPARATIVE—  
 Cost of navvies and natives for railway work, (7,439) 307, (7,650) 317, (7,749) 320.
- COMPOUNDS—  
 On the Rand, condition of, Rev. F. Suter suggests improvement, (299) 17.  
 Former management of, (490) 22.  
 Recreation in, (491) 23.  
 Condition of, on the Rand, (1,900) 92, (1,908) 93, (8,205) 339, (10,553) 476, (10,765) 484.
- COMPULSION—  
 Of labourers suggested by Mr. P. Cronje, (6,571) 276.
- CONGO FREE STATE—  
 Chairman W.N.L.A. on, (752) 34.  
 No exportation of labour from, (938) 46.
- COOLIES—  
 See Indian Labour.

- CORONATION SYNDICATE—**  
Evidence of Mr. J. H. Johns, (10,252) 465.  
Shortage of labour, (10,253) 465.
- CORRESPONDENCE—**  
Between the W.N.L.A. and H.B.M. Consuls, Madagascar, 34.  
And the Secretary of State, re British West Africa, 36, 37.  
And Mr. Alec Hewitt, re Portuguese South-West Africa, 38.  
And the Secretary of State, re recruiting natives, 51, 52, 53.  
With Mr. W. Wyndham, secretary for native affairs, 383.  
With Sir G. Lagden, (9,222) 383.
- CORYNDON, MAJOR R. T., ADMINISTRATOR OF NORTH-WESTERN RHODESIA—**  
Evidence of, state of labour in, available supply from not large, criticism of Mr. Coillard's evidence, (1,423) 66—(1,526) 70.
- COST OF LIVING—**  
Reduction in, (3,873) 173.
- CRESWELL, MR. F. H. P.—**  
Evidence of, on experiment with white labour on Village Main Reef, (13,083) 574—(13,563) 595.  
Recalled (13,768) 605—(13,791) 607.  
Mr. S. Jennings of, 609.  
Denial of insinuations of, (13,840) 609.
- CREUX, REV. E.—**  
Evidence of, on Northern Transvaal, population of, habits and grievances of natives, advocates keeping natives of same tribe together on mines, improvement in conditions of compounds conducive to increased supply of labour, (143) 7—(241) 12.
- CRONJE, MR. P.—**  
Evidence of, suggests legal compulsion to make natives work, also bringing the influence of Government to bear upon chiefs, (6,565) 276—(6,611) 277.
- CROWN DEEP—**  
Mr. C. J. Price on, (10,742) 482.  
Native labour supply on, (10,745) 482.  
Shortage of on, (10,745) 482, (10,758) 484, (10,788) 485.  
White labour compared with native on, (10,745) 482, (10,789) 485, (10,851) 487, (10,879) 488.  
Cost of white labour as compared with coloured, (10,745) 482.  
Shortage of labour retarding mining on, (10,761) 484.  
Bonus to re-engaging natives, (10,777) 484.  
Rock drilling on, (10,791) 485.  
Shortage of labour preventing sorting, (10,829) 487.  
Native wages on, (10,854) 488.
- CROWN LANDS—**  
Natives on, (1,717) 83, (10,693) 480, (10,732) 481.
- CROWN REEF—**  
Shortage of labour on, (10,548) 476, (10,611) 478.
- C.S.A.R.—**  
See Railways.
- DE BEERS—**  
Bechuanaland, supply to, (4,549) 194, (4,566) 195.
- DE JONGH, MR. J. N.—**  
Evidence of, as representing Transvaal Chamber of Mines, reports of sub-committees on supply and finance, agriculture in certain South African Territories, on labour employed on and required by public works, municipalities and some public companies or bodies such as waterworks, railways, &c.; on labour requirements for mining in South Africa at the present time and five years hence, a descriptive and statistical statement of the Gold Mining industry of the Witwatersrand, (9,442) 401—(9,876) 450.
- DE KAAP—**  
See Barberton.
- DE LA REY, GENERAL—**  
Evidence of, on shortage of native labour on farms, effect of Squatters' Law on supply of labour, (6,458) 273—(6,564) 276.
- DEEP LEVELS—**  
Portuguese natives in, (3,630) 163, (3,653) 164, (3,661) 165, (3,712) 166.
- DELAGOA BAY—**  
See Portuguese East Africa.
- DENNY, MR. G. A.—**  
Evidence of, on shortage of labour on the mines under the control of the General Mining and Finance Corporation, white labour as compared with black, the development of mines regulated by available labour supply ridiculed, (12,071) 532—(12,156) 535.
- DESERTIONS—**  
Of native labourers, (443)21, (489) 22.  
Chairman of W.N.L.A. on, (855) 43, (1,747) 84, (1,760) 86.  
Of Somalis in Rhodesia, (3,072) 142.
- DEVELOPMENT—**  
Of Nourse Deep in 1898 and now, (3,735) 169.  
Retarded by shortage of labour, (9,867) 450.
- DIAMOND MINES—**  
Labour supply of, (498)-23, (3,821) 170.  
Wages in, (505) 23.  
And gun running in 1874, (3,831) 170.
- DICKE, MR. B. H.—**  
Evidence of, Zoutpansberg district, Transvaal, natives' habits and customs, no prospect of increased supply, influence of polygamy and chiefs, population and supply, requirements of natives, (5,275) 221—(5,415) 226.
- DICKSON, MR. J. Q.—**  
Evidence of, on Orange River Colony, farmers' requirements, native population of, improbable increase of supply from, (11,459) 509—(11,497) 510.
- DONALDSON, MR. J.—**  
Evidence of, on East Coast natives, advises supply of liquor for, (13,735) 602—(13,767) 604.
- DRINK—**  
And native labour, (468) 22, (517) 23, (520) 23, (548) 24, (989) 47, (2,717) 127, (2,870) 134, (3,505) 159, (4,400) 189, (4,510) 192, (5,159) 218, (5,847) 246, (8,647) 358, (9,763) 442, (10,151) 461, (10,169) 462, (10,228) 464, (10,294) 466, (10,315) 467, (10,552) 476, (10,584) 477, (10,783) 485, (11,132A) 499, (13,754) 603.
- DURBAN—**  
Statistics of natives in, (310) 17.
- DURBAN ROODEPOORT DEEP—**  
Cost of shaft sinking on, (13,768) 605.

645

**DYER, Mr. F. D.—**  
 Evidence of, on Portuguese East Africa, system before war, methods of W.N.L.A., improbable increase of supply from Portuguese East Africa, (6,710) 280—(6,836) 286.

**DYKE, Rev. R. H.—**  
 Evidence of, on Basutoland, population of, number employed before and since war, confidence of natives in Rand shaken, agriculture and industries, demand for labour greater than supply, (1) 2—(142) 7.

**E.**

**EAST AFRICA, BRITISH—**  
 See British East Africa.

**EAST AFRICA, GERMAN—**  
 See German East Africa.

**EAST COAST—**  
 Recruiting on, (393) 20.  
 (See also Portuguese East Africa).

**EAST GRIQUALAND—**  
 See Cape Colony.

**EAST RAND—**  
 Natives and drink on, (468) 22, (520) 23.

**EASTERN CAPE COLONY—**  
 See Cape Colony.

**EASTJEBIGH—**  
 See Klerksdorp.

**EDENBURGH—**  
 Population of, 509.

**EDWARDS, Mr. W. M.—**  
 Evidence of, on Krugersdorp and Transvaal, natives on farms and shortage of labour, squatting on farms and polygamy, suggests tribal distribution of native labourers (7,035) 291—(7,351) 302.

**EGYPT—**  
 Chairman W.N.L.A. on, (752) 34.  
 Native labourers in, (7,577) 313.

**ENGINEERS—**  
 Rand mining, deny Mr. Creswell's insinuations, (13,840) 609.

**ERASMUS, Mr. P. J. D.—**  
 Evidence of, on scarcity of native labour among farmers in the district of Bethal, white labour on farms, suggestions for increasing taxes of, or paying rent by natives on Government lands, as means of compelling natives to work, (8,694) 360—(8,843) 364.

**ERMELLO—**  
 Evidence of Mr. N. J. Breytenbach on, 328.

**ERSKINE, Mr. D.—**  
 Evidence of, on Northern Transvaal, successful recruiting in, probable increase of supply from, influence of increased wages and better treatment conducive to better supply, (3,261) 152—(3,402) 155.

**ERSKINE, Mr. M. S.—**  
 Evidence of, on Cape Colony, recruiting in, population of and numbers sent to Rand, local requirements of, chiefs have little influence, probable increase of supply, influence of increase of wages, (4,091) 180—(4,224) 177.

**EVERARD, Mr. THOMAS—**  
 Evidence of, as to farm requirements, states not sufficient labour for farmers, farmers want pass legislation, squatting, wages on farms, &c., (551) 24—(611) 26.  
 30718.

- EXPORT TAX—  
 On labour natives, (1,469) 68, (8,220) 340.

## F

## FARMERS—

- Labour requirements of, (553) 24, (2,625) 121, (3,942) 175, (4,654) 199, (5,990) 251, (6,238) 259, (6,459) 273, (8,753) 363, (9,369) 400b, (10,657) 479, (10,668) 479, (11,485) 510, (12,630) 554, (12,721) 559, (12,812) 563.  
 Insufficiency of labour for, (555) 24, (590) 25, (610) 26, (8,035) 329, (11,190) 501, (11,276) 504, (11,404) 508, (11,485) 510.  
 Numbers of natives wanted by, (556) 24, (585) 25.  
 Treatment of natives by, (589) 25.  
 Legislation wanted by, (562) 25, (591) 26, (604) 26.  
 Agreements of, with native labourers, (6,479) 273, (6,665) 279, (8,351) 346.  
 Requirements in Orange River Colony, (10,657) 479, (10,668) 479.

## FARMS—

- Native Families on, (557) 25, (2,626) 121, (5,088) 216, (5,283) 222.  
 Wages of natives on, (561) 25, (598) 26, (606) 26, (6,660) 199, (5,145) 217, (5,177) 218, (5,554) 236, (6,483) 273, (5,619) 273, (8,020) 328, (8,897) 366, (10,679) 490, (11,455) 509, (11,784) 520, (12,618) 553, (12,723) 559.  
 Number of natives on, in Transvaal, (1,706) 82, (1,792) 88, (6,463) 273, (6,616) 278, (6,665) 279, (12,606) 553.  
 Squatting on, (577) 25, (586) 25, (1,708) 82, (1,780) 87, (1,803) 89, (1,899) 92, (2,868) 134, (4,705) 200, (5,234) 220, (5,289) 222, (5,524) 232, (5,547) 236, (5,680) 240, (6,473) 273, (6,497) 274, (6,623) 278, (6,889) 286, (6,938) 288, (6,974) 289, (7,008) 292, (8,696) 366, (8,827) 364, (10,659) 479, (10,692) 480, (11,200) 501, (11,534) 511, (11,640) 515, (12,746) 560.  
 Supply of labour for, from Fingoland and Galekaland, (5,990) 248.  
 Scarcity of labour for, in Cape Colony, (6,108) 255, (6,196) 258.

FARMS—*cont.*

- Private locations on, (1,708) 122.  
 Native taxes on, (4,662) 199, (4,745) 201, (6,471) 273, (6,515) 274, (6,598) 277, (8,050) 329, (10,706) 481, (11,211) 502, (11,266) 504.  
 Swazis employed on, (2,365) 107.  
 Basutos employed on, (46) 5, (105) 6, (3,184) 149.  
 Effect of mining on supplies of labour to, (4,677) 199.  
 Shortage on, (555) 24, (2,625) 121, (6,466) 273, (6,485) 273, (6,622) 278, (7,055) 291, (7,247) 298, (8,020) 328, (8,035) 329, (8,696) 366, (9,698) 439, (11,417) 508.  
 Natives on, in Krugersdorp, (7,037) 291.  
 White labour on, (8,717) 361, (8,830) 364.  
 Natives on, in O. R. C., (11,473) 510.

## FAURSMITH—

- Population of, 509.

## FERRAZ, Mr. J. I.—

- Evidence of, on Portuguese East and West Africa, estimated population of and supply from Angola (Port. W. Africa), agrees with evidence of Mr. De M. Breyner, (5,759) 243—(5,987) 250.

## FERREIRA MINE—

- Sufficiency of labour on, before war, (10,263) 465.  
 Shortage on, since war, (10,266) 465, (10,411) 470.  
 Profits of, (10,457) 471.

## FICKSBURG—

- Population of, 509.

## FINGOLAND—

- Mr. M. W. Liefeldt on, 251.  
 Supply from, (5,990) 251, (5,999) 252, (6,043) 253, (6,081) 254, (6,201) 258, (6,274) 260.  
 Farming in, (5,990) 251.  
 Population of, (5,997) 252, (6,040) 253, (6,085) 254, (6,201) 258, (6,274) 260.  
 Influence of failure of crops on supply from, (6,006) 252, (6,128) 256.  
 Supply of labour from, before war, (6,011) 252.  
 Wages of natives of, (6,012) 252.  
 Possible increase of supply from, (6,018) 252.  
 Better treatment on railways of natives travelling from, (6,022) 252.  
 Complaints of natives of, (6,026) 252, (6,189) 258.  
 Shortening of contracts conducive to increased supply from, (6,051) 253.  
 Effect of increased wages on supply from, (6,060) 254, (6,093) 255, (6,230) 259.  
 Glen Grey Act in, (6,158) 257, (6,264) 260.  
 Native taxes in, (6,162) 257.  
 Scarcity of farm labour in, (6,108) 255, (6,196) 258.

## FITZPATRICK, Sir P.—

- Evidence of, regarding state of native labour supply and the retarding of the mining industry thereby, affirms that it is now conclusively proved that there is not sufficient labour in South Africa for the requirements of the industry, that the basis of the prosperity of South Africa is the gold mining industry, and that the country is in no better position now than in 1896 as regards supply of labour whereas the liabilities of the country have largely increased, cheap labour must be obtained if the mining industry is to prosper (2,614) 119—(2,914) 136.

## FORBES, Mr. DAVID—

- Evidence of, in regard to Swaziland, states that Swazis disinclined to work on the mines, Swazi Queen and chiefs bringing influence to bear on people, natives have no ambition to earn more than bare living, pessimistic as regards supply, (2,230) 103—(2,366) 107.

- FRANKFORT, O.R.C.—**  
Population of, 509.
- FRASER, Mr. D. H.—**  
Evidence of, on Basutoland, natives prefer working nearer home rather than going to mines, are a pastoral and agricultural race, enormous demand for labour in Basutoland and no hope of mines obtaining an increased supply from that country, (3,166) 147—(3,260) 152.
- FREE RAILWAY TRAVELLING—**  
For native labourers, (3,777) 169.
- FREE RECRUITING—**  
In Portuguese East Africa, (640) 28, (672) 29, (674) 29, (827) 41, (832) 42, (2,021) 97, (2,221) 102, (2,374) 107, (2,468) 112, (2,497) 113, (2,612) 119, (3,649) 164, (3,664) 165.  
Chairman W.N.L.A. on, (746) 31, (1,157) 57.  
In Swaziland, (2,262) 104.  
In Hectorspruit, (3,539) 160.  
In Komatipoort, (3,539) 160.  
In Gazaland, (3,544) 160, (3,547) 161, (3,570) 161, (3,720) 166.  
Opposed by Mr. M. S. Erskine, (4,117) 181.  
Opposed by Mr. McGarry, (4,369) 189.  
Opposed by Mr. W. Clark, (5,084) 216, (5,132) 217.  
Opposed by Mr. W. Grant, (3,406) 349.  
In Lydenburg, (11,527) 511.
- FRENCH SENEGAMBIA—**  
Chairman W.N.L.A. on, (752) 34.
- G**
- GALEKLAND—**  
Mr. M. W. Liefeldt on, 251.  
Supply from, (5,990) 251, (5,999) 252, (6,043) 253, (6,081) 254, (6,201) 258, (6,274) 260.  
Farming in, (5,990) 251.  
Population of, (5,997) 252, (6,040) 253, (6,085) 254, (6,201) 258, (6,274) 260.  
Influence of failure of crops on supply from, (3,006) 139, (6,128) 256.  
Supply of labour from, before war, (6,011) 252.  
Wages of natives of, (6,012) 252.  
Possible increase of supply from, (6,018) 252.  
Better treatment on railways for natives travelling from, (6,022) 252.  
Complaints of natives, (6,026) 252, (6,189) 258.  
Shortening of contracts conducive to increased supply from, (6,051) 253.  
Effect of increased wages on supply from, (6,060) 254, (6,093) 255, (6,230) 259.  
Native taxes in, (6,162) 257.  
Scarcity of farm labour in, (6,108) 254, (6,196) 258.  
Glen Grey Act in, (6,153) 257, (6,264) 260.
- GAZALAND—**  
See Portuguese East Africa.
- GEDULD PROPRIETARY MINES—**  
Mr. H. B. White on, (10,902) 489.  
Shortage of labour on, (10,902) 489, (10,943) 491.  
White labour as compared with coloured on, (10,902) 489.  
Preference of W.N.L.A. for stamping mines, (10,920) 490.  
Increase of native labour implies increase of white, (10,956) 491.
- GENERAL MINING & FINANCE CORPORATION—**  
Natives employed by, (12,079) 532.  
Shortage of, (12,080) 532.  
Mines of, crushing, (12,081) 532.  
Stamps erected and dropped by, (12,083) 532.
- GERMAN EAST AFRICA—**  
Chairman W.N.L.A. on, (752) 34.  
Hostility to recruiting in, (1,020) 49.
- GERMAN SOUTH WEST AFRICA—**  
Chairman W.N.L.A. on, (752) 34.  
Recruiting in, (1,055) 50.
- GERMAN WEST AFRICA—**  
Recruiting in, (1,097) 54.
- GIELGUD, Mr. VAL—**  
Evidence of, on Rhodesia, no prospect of increased supply from, (1,527) 70—(1,670) 74.
- GILMOUR, Mr. D.—**  
Evidence of, (*vide* p. 408), requirements of public works now and three or five years hence, white labour as compared with coloured, pay of labourers, (10,066) 458—(10,106) 460.
- GLEY GREY ACT—**  
Effect of, on native labour supply, (6,158) 257, (6,264) 260, (12,971) 570.
- GLYNN'S LYDENBURG—**  
Shortage of labour on, (11,553) 512.  
Not member of W.N.L.A., (11,553) 512.
- GOLD—**  
Production of, in Transvaal yearly, (2885) 135.
- GOLD COAST—**  
See West Africa (British).
- GOODWIN, Mr. J. P.—**  
Evidence of, on Mozambique, character of natives of, difficulties of recruiting, numbers recruited, influence of chiefs, possible gradual increase of supply, slavery in, etc., (3,403) 155—(3,536) 159.
- GOODYEAR, Mr. C.—**  
Evidence of, on Bechuanaland, supply of Bechuanaland to De Beers, etc., influence of chiefs, population and available supply, estimated supply to Rand, (4,520) 192—(4,597) 196.
- GOVERNMENT LOCATIONS—**  
In Transvaal, (1,713) 83, (1,718) 83, (1,812) 89, (11,200) 501, (11,252) 503, (11,418) 508.
- GRANT, Mr. W.—**  
Evidence of, on South African supply, criticism of W.N.L.A., effect of wages and war on supply, improbable increase of supply from Swaziland and Natal, improvement of conditions of natives in compounds and travelling on railways, statements of Colonial Magistrates on native question, (8,122) 331—(8,693) 366.
- GRIQUALAND EAST—**  
See Cape Colony.
- GRIQUALAND WEST—**  
Evidence of Mr. Thos. Maxwell, (382) 19.  
Sufficient supply from improbable, (411) 20.  
Recruiting in by W.N.L.A., (911) 45.
- GROGAN, Mr. E. S.—**  
Evidence of, on the native population and supply of South Africa, squatting on land and taxation of natives as affecting supply, diseases of natives in Central Africa, influence of tribal system on supply, Cape to Cairo railway, fallacious ideas of the African native population, (8,918) 365—(9,204) 383.

## GUN RUNNING—

And native labour in Kimberley in 1874, (3,831) 170.

## H

## HALL, Mr. H. J.—

Evidence of, on native labour on farms in the Transvaal, increase of hut tax on farms detrimental to supply of labour, (4,648) 198—(4,755) 201.

## HAMILTON, Mr. J. A.—

Evidence of, loss to mining industry through shortage of labour, influence on finances and commerce of Transvaal, increase of coloured labour implies increase of white, (10,467) 472—(10,538) 474.

## HARDING, COLONEL—

Evidence of, regarding North West Rhodesia (Barotseland), improbable source of supply for Rand, (3,096) 143—(3,101) 145.

## HARNACH, Von Mr. R.—

See Von Harnach.

## HARRISMITH—

Population of, 509.

## HECTORSPRUIT—

Recruiting in, (3,539) 160.

## HEIDELBERG—

See Transvaal Central.

## HEILBRON—

Population of, 509.

## HELLMANN, Mr. F.—

Evidence of (*vide* p. 422), on white labour as compared with coloured, comparative cost of rock drilling and hand work, advocates restricted supply of liquor to natives, (10,107) 460—(10,242) 465.

## HOLTERHOFF, Mr. W.—

Evidence of, on Gazaland and Portuguese border, experiences of free recruiting before war, numbers recruited by free recruiters, antipathy of natives to W.N.L.A., Portuguese control of natives, estimated results under free recruiting at present time, in favour of re-establishment of free recruiting, (3,537) 160—(3,626) 163.

## HOOPSTAD—

Population of, 509.

## HOPPER, Mr. E.—

Evidence of, on the native labour requirements of the coal industry, coal consumption now and three years hence, requirements of railways (*vide* pp. 429, 430), (10,015) 457—(10,065) 458.

## HUGHES, Mr. H.—

Evidence of, on labour supply of Lydenburg district, shortage, various bodies recruiting in, (11,498) 510—(11,549) 512.

## HULETT, Sir J. L.—

Evidence of, on Natal, Indian labour in, scarcity of native labour, Arabs and Banyans, improbable increase of supply from, (10,977) 492—(11,133) 499.

## HULLEY, Mr. S. J.—

Evidence of, on Barberton, native wages in, available supply from, Squatters' Law in,

shortage of labour in, population of, effect of taxation in, (6,887) 286—(7,034) 291.

## HUT TAX—

In Portuguese East Africa (622) 26, (1,966) 95, (2,214) 102, (2,224) 102, (2,527) 114, (3,630) 163.

In British Central Africa (1,087) 53, (4,639) 198.

In North West Rhodesia (1,482) 69.

In Transvaal (159) 9, (209) 11, (1,716) 83, (1,888) 92.

In Basutoland (15) 4, (101) 6, (1,838) 90, (4,759) 202, (4,768) 204.

In Swaziland (2,239) 103, (2,242) 103, (2,252) 104, (2,298) 105, (2,302) 105, (2,316) 105.

In Natal (3,982) 176, (11,009) 494.

On Farms (4,662) 199, (4,745) 201.

In Zoutpansberg (125) 7, (5,289) 222, (5,321) 224, (5,367) 225.

In Bechuanaland, (5,417) 226.

## I

## IMMORALITY—

Of Barotse natives in Kimberley, (275) 16.

Of Zulu tribes, (401) 21.

Of Northern Transvaal natives, (182) 10, (229) 11.

## IMPORTATION OF LABOUR—

From outside Africa (1,153) 57, (2,704) 126, (2,744) 128, (3,991) 176, (8,087) 330, (8,302) 344.

Cost of (1,154) 57, (9,434) 400g, (9,636) 437, (9,678) 438.

Necessary for mines, 403.

## IMPORTATION OF WHITE LABOUR—

Suggested by Mr. Louis Botha, (11,317) 505.

## INDIA—

Mining in, (10,282) 466.

Cost of mining in, (10,336) 467.

Arrangements of Natal with Government of, (11,100) 497.

## INDIAN LABOUR—

In Natal, (435) 21, (447) 21, (533) 24, (2,705) 126, (4,053) 179, (8,302) 344, (8,466) 351, (10,981) 492, (11,011) 494, (11,107) 498, (12,507) 549.

Effect of, on native supply, (533) 24.

Pay of, in Natal (11,030) 494.

Shortage of, in Natal, (11,076) 496.

Traders, in Natal, (12,575) 550.

## INHAMBANE—

See Portuguese East Africa.

## INGLE, Mr. F.—

Evidence of, the state of the labour supply, wasteful use of labour, suggestions for improvement of supply in the way of greater facilities for communication, general native policy in South Africa, suggestions that more white skilled labour be employed to displace black, comparisons with Australia, shortage of supply due to spurious demand, neglect to foster inventions for labour saving appliances, suggested coercion of probable witnesses, (3,749) 167—(3,933) 175.

## INNES, Mr. H. W.—

Evidence of, on Nigeria and Liberia, population and habits of natives, possible supply from, (4,958) 211—(5,064) 214.

## J

- JACOBSDAL—**  
Population of, 509.
- JAMES, Mr. R.—**  
Evidence of, on British West Africa, improbable increase of supply from, importation of Chinese labour for, (9,404) 400—(9,440) 400r.
- JENNINGS, Mr. S.—**  
Evidence of, on statements of Chamber of Mines, details of number of natives per stamp, experiments with white unskilled labour, labour requirements of mining industry, tonnage as compared with Australia, use of rock drills in mines, requirements of Rand in five years' time, (9,877) 450—(10,014) 456.  
Recalled, (13,834) 608—(13,916) 611.
- JOHANNESBURG—**  
Barotses in, (260) 15.  
Number of natives employed in town of, (773) 40.  
Municipality, labour employed and recruited for, 61.  
Ditto, ditto, efficiency of, (1,225) 61, (1,246) 62, (1,265) 63, (1,334) 64, (1,354) 65, (1,366) 65, (1,380) 65.  
Number of natives in employ of municipality, (1,232) 61.  
Methods of recruiting of municipality, (1,234) 61, (1,358) 65.  
Pay of boys employed by ditto, (1,239) 61, (1,277) 63.  
Offers to recruit for, (1,242) 62.  
Wastage of labour in, (1,248) 62.  
Effect of shortage on public works, (1,257) 62.  
Local recruiting for municipality, (1,255) 62, (1,288) 63.  
Railway fares of boys paid by municipality, (1,260) 62.  
Places recruited by municipality, (1,272) 63.  
Treatment of natives, by municipality, (1,274) 63.  
Municipality of and the W.N.L.A. (1,296) 63, (1,399) 66.  
Native population of, (1,311) 64.  
White population of, (1,314) 64, (2,832) 133.  
Municipal works in, (1,320) 64.  
Prospective requirements of, (1,328) 64, (1,368) 65, (1,413) 66.  
Boys employed before war by municipality, (1,349) 64.  
Recruiting in Bechuanaland, Pondoland and Basutoland for municipality, (1,382) 65, (1,387) 65, (1,388) 65.  
Effect of cold weather on natives, (1,405) 66.  
Probable increase of population in, (1,411) 66.  
Figures of Mr. Carr doubtful, (1,416) 66.  
Replacing natives by white men by municipality, (1,418) 66.  
Increase in valuation of, (2,878) 135.  
Expansion of, (2,880) 135, (2,893) 135.  
Mr. St. John Carr's amended statistics of and correspondence with native labour agents, 262—272.
- JOHNS, Mr. J. H.—**  
Evidence of (*vide* p. 420), as regards requirements of Witwatersrand now and five years hence, shortage of labour on Coronation Syndicate properties, mining in India and cost of, (10,243) 465—(10,352), 468.
- JONGH, DE, Mr. J. N.—**  
See De Jongh.

## K

- KHAMA—**  
On drink and recruiting, (994) 47.  
Restrictions on recruiting by, (4,551) 194.
- KHAMA'S COUNTRY—**  
See Bechuanaland.
- KIMBERLEY—**  
Barotse natives in, (260) 15, (274) 16.
- KLERKSDORP—**  
Mr. H. A. Rogers on, 468.  
Shortage of labour in, (10,363) 468.  
Number of stamps in, (10,363) 468.  
Shortage in retarding mining on Buffelsdoorn and Eastleigh, (10,363) 468.  
Increase of native labour implies increase of white, (10,363) 468.  
Drink and natives in, (10,385) 470.  
Shortage of labour retarding mining, (10,408) 470, (10,437) 471.
- KOMATIPOORT—**  
Recruiting in, (3,539) 160.  
Mr. F. W. Dyer on, (6,710) 280.
- KROOMEN—**  
See Liberia and Nigeria.
- KROONSTAD—**  
Population of, 509.
- KRUGERSDORP—**  
Mr. W. M. Edwards on, 290.  
Natives on Farms in, (7,037) 291.  
Shortage of Labour in, (7,055) 291 (7,247) 298.  
Requirements of Farmers in, (7,057) 291.  
Squatting on Farms in, (7,037) 291, (7,082) 292.  
Polygamy in, (7,037) 291, (7,086) 292, (7,106) 297.  
Distribution of Native Labourers, (7,088) 292.  
Recruiting in, (7,126) 294.  
Compulsion of Native Labourers in, (7,249) 298.  
Influence of Chiefs on supply from, (7,256) 299.  
Pay of natives in, (7,269) 299.  
See also Transvaal Central.
- KUSSEL, Mr. J.—**  
Evidence of, on Somaliland and Abyssinia, refutes evidence of Mr. Brentano, population and probable supply from Abyssinia, Abyssinians and Somalis in Rhodesia (11,134) 499—(11,189) 501.
- L**
- LABOUR AGENTS—**  
See Recruiting.

- LABOUR, NATIVE, SUPPLY OF—**  
Barotseland, 14, (270) 15, (3,100) 144.  
See also Rhodesia.  
Natal and Zululand, 16, 18, 19, 21, (2,639) 122, (2,702) 126, (8,147) 336, (8,332) 345, (10,981) 492.  
South Africa, (475) 22, (895) 44, (2,667) 124, (2,744) 128, (4,962) 211, (5,003) 213, (7,823) 322, 405, (9,529) 433, (9,766) 442, (12,024) 523.

- Farmers' requirements, (533) 24, (3,942) 175, (4,654) 199, (6,616) 278, (8,793) 363, (11,190) 501, (11,276) 504, (11,404) 508, (11,485) 510, (12,721) 559, (12,812) 563.
- Insufficiency of, on farms, (558) 25, (590) 25, (610) 26, (2,625) 121.
- Grievances of Boers as to, (562) 25.
- Portuguese East Africa, (622) 26, (645) 28, (1,106) 55, (1,951) 95, (1,962) 95, (1,980) 96, (1,982) 96, (2,001) 97, (2,121) 99, (2,141) 100, (2,190) 101, (2,201) 102, (2,204) 102, (2,374) 107, (2,482) 113, (2,534) 114, (2,552) 115, (2,570) 115, (2,727) 127, (2,739) 128, (2,745) 128, (3,407) 155, (3,430) 157, (3,445) 157, (3,456) 158, (3,486) 158, (3,632) 164, (3,643) 164, (3,693) 165, (4,376) 189, (4,388) 189, (5,770) 244, (5,837) 246, (5,974) 249, (6,710) 280, (8,976) 372, (9,545) 434, (10,588) 477, (12,291) 539.
- Statement by chairman, W.N.L.A., (746) 31.
- Total monthly increase, (900) 44, (940) 46, (1,072) 51.
- Shortage of, (850) 42, (896) 44, (941) 46, (1,186) 58, (1,225) 61, (1,246) 61, (1,255) 63, (1,334) 64, (1,354) 65, (1,366) 65, (1,380) 65, (1,437) 67, (2,620) 119, (2,639) 122, (2,656) 124, (2,672) 125, (2,761) 129, (2,788) 131, (2,799) 131, (3,858) 172, (3,906) 174, (4,523) 192, (5,224) 219, (6,914) 287, (6,945) 288, (8,035) 329, (8,696) 360, (9,412) 400e, (9,483) 432, (9,566) 435, (9,739) 440, (9,812) 444, (10,253) 465, (10,266) 465, (10,363) 468, (10,470) 472, (10,548) 476, (10,611) 478, (10,745) 482, (10,758) 484, (10,788) 485, (10,902) 489, (10,943) 491, (11,500) 510, (11,553) 512, (11,618) 515, (11,940) 525, (11,974) 527, (12,030) 530.
- Ditto on farms, (6,466) 273, (6,485) 173, (8,035) 329, (9,698) 439, (11,417) 508.
- Ditto retarding mining, (2,631) 121, (2,849) 133, (3,800) 169, 403, 407, (9,506) 433, (9,751) 442, (10,470) 472, (10,761) 484, (11,658) 516.
- Ditto on Rand, (9,749) 441, (9,780) 443, (11,831) 522, (12,018) 528, (12,116) 533.
- Ditto before war, (3,847) 171, (9,862) 450, (9,945) 453, (11,808) 521.
- Ditto on public works, (10,081) 459.
- Ditto in South Africa, (895) 44, (2,667) 124, (2,745) 128, (18,662) 516, (12,024) 530, (12,647) 554, (12,857) 564.
- Ditto on General Mining and Finance Corporation properties, (12,080) 532.
- Effect of improved organisation of, (996) 47.
- Railway facilities for, (993) 48, (1,039) 50, (1,116) 56, (3,777) 169, (3,892) 173, (3,911) 174 (4,368) 189.
- Mortality and health effect on, (649) 28, (1,007) 43, (1,750) 85, (1,784) 87, (3,171) 147, (3,460) 158, (3,661) 165, (3,630) 163, (3,667) 165.
- W.L.N.A. estimates of, (1,012) 48.
- Return to old system deprecated (1,016) 48.
- Hostility to recruiting, (246) 14, (1,020) 49, (1,056) 50, (1,502) 69.
- Effect of drink on, (468) 22, (517) 23, (520) 23, (548) 24, (989) 47, (2,718) 127, (2,870) 134, (3,505) 159, (4,400) 189, (4,510) 192, (5,154) 218, (5,847) 246, (8,647) 353, (9,763) 442, (10,151) 461, (10,169) 462, (10,228) 464, (10,294) 466, (10,315) 467, (10,385) 470, (10,552) 476, (10,584) 477, (10,783) 485, (11,132a) 499, (13,754) 603.
- Restrictions on recruiting, (373) 19, (885) 44, (913) 45, (1,053) 50, (1,120) 56, (1,468) 68, (1,500) 69, (1,503) 69, (3,936) 175, (4,551) 194, (12,451) 547.
- Effect of increased wages on, (761) 39, (1,045) 50, (1,705) 82, (2,360) 106, (2,465) 112, (2,566) 115, (2,620) 119, (2,652) 123, (2,756) 129, (2,907) 136, (3,244) 151, (3,263) 152, (3,284) 153, (3,379) 155, (4,033) 178, (4,077) 179, (4,115) 181, (4,126) 182, (4,410) 190, (4,434) 190, (4,583) 195, (6,018) 252, (6,060) 254, (6,099) 255, (6,230) 259, (6,587) 276, (6,619) 278, (6,745) 281, (8,197) 338, (8,327) 345, (8,368) 347.
- British Central Africa, (242) 12, (245) 14, (1,111) 56, (1,115) 56, (1,171) 58, (8,954) 370.
- From outside Africa, (1,153) 57, (2,704) 126, (2,744) 128, (8,017) 330, 405.
- Total requirements of Rand (896) 44, (1,198) 58, (2,620) 119, (2,627) 121, (2,716) 127, (2,728) 127, (2,773) 130, (2,799) 131, (2,854) 133, (9,308) 399, 420, (9,695) 439, (9,896) 451, (14,011) 615.
- In Johannesburg, 62.
- Ditto, Mr. St. John Carr's amended statistics, 262.
- Employed by and recruited for Johannesburg Municipality, 61.
- North-West Rhodesia (1,433) 67, (1,437) 67, (1,449) 68, (1,507) 69.
- Requirements of North-Western Rhodesia (1,437) 67.
- Chiefs North-West Rhodesia against emigration, (1,437) 67, (3,100) 143.
- Zambesi (1,463) 68.
- Influence of North-West Rhodesia Chiefs on (1,502) 69, (3,100) 143.
- Rhodesia, 71.
- Ditto, sufficient for, (4,426) 190, (4,272) 185, (4,338) 187, (4,346) 188.
- Improbable increase of, from Rhodesia, (1,559) 71, (1,563) 71, (2,737) 128, (5,575) 237.
- Insufficient for requirements in Rhodesia, (1,562) 71, (1,565) 72.
- Not increased by higher wages in Rhodesia, (1,587) 72.
- Estimated future requirements of Rhodesia (1,655) 74, (1,662) 74.
- Transvaal statistics of, Sir G. Lagden's evidence on, 74.
- On Witwatersrand, (1,683) 81.
- Effect of squatting on, (1,709) 83, (5,289) 222, (6,473) 273, (6,497) 274, (6,623) 278, (7,037) 291, (7,082) 292, (8,060) 329, (8,696) 360, (8,985) 372, (9,278) 398, (10,659) 479, (10,692) 480, (11,200) 501, (11,437) 508, (11,640) 515, (12,746) 560.
- Available in Transvaal, (165) 9, (916) 45, (1,683) 81, (1,729) 84, (3,263) 152, (3,314) 153, 3,325) 153.
- Estimated progress of, (1,740) 84.
- Desertions, (443) 21, (489) 22, (855) 43, (1,747) 84, (1,760) 86, (3,072) 142.
- Sir G. Lagden's calculation of, (1,781) 87, (1,800) 88, 9,308) 399.
- Swaziland, (1,775) 86, (2,239) 103, (2,249) 103, (8,042) 329.
- Distribution of, in Transvaal, (1,706) 82, (1,719) 83, (1,789) 88, (1,804) 89, (1,818) 89, (7,088) 292.
- Not available from Basutoland, (1,773) 86, (1,817) 89, (3,171) 147, (3,186) 149, (3,193) 149, (3,252) 151.
- Influence of increased wants on, (1,821) 89, (3,204) 150, 3,834) 171.
- Fluctuation in, (1,822) 89.
- Details by Sir G. Lagden of Basutoland, (1,814) 89.
- Area of land occupied by natives, (1,877) 91.
- Influence of occupation of land by natives on, (1,877) 91, (3,220) 150, (4,889) 209, (8,752) 362.
- Influence of polygamy on, (100) 6, (422) 21, (451) 22, (1,831) 90, (1,884) 92, (2,299) 105, (2,328) 106, (3,171) 147, (3,630) 163, (3,698) 166, (3,974) 176, (5,277) 221, (5,731) 242, (7,037) 291, (7,082) 292, (7,196) 297, (8,069) 329.
- Influence of taxes on, (1,838) 92, (2,818) 132, (3,982) 176, (5,324) 224, (5,380) 225, (5,475) 233, (6,162) 257, (6,471) 273, (6,515) 274, (6,598) 277, (6,624) 278, (8,091) 330.

- Effect of deductions from wages on, (1,894) 92, (4,042) 178, (6,982) 289.
- Effect of reduction of wages on, (3) 3, (227) 11, (1,896) 92, (2,031) 97, (2,520) 114, (2,660) 124, (2,713) 127, (3,846) 171, (3,904) 174, (4,094) 180, (4,594) 196, (8,497) 352, (9,244) 393, (9,656) 438, (10,182) 462, (11,646) 516.
- Suggestions of Mr. Breyner for increase of, (2,039) 98.
- Influence of chiefs on, (966) 46, (979) 47, (1,437) 67, (1,502) 69, (2,149) 100, (2,239) 103, (2,249) 103, (2,295) 105, (2,309) 105, (3,100) 143, (3,171) 147, (3,341) 154, (3,407) 155, (3,454) 157, (3,477) 158, (4,094) 180, (4,120) 132, (4,482) 191, (4,523) 192, (5,277) 221, (5,501) 231, (6,573) 276, (6,638) 278, (7,256) 299, (9,097) 377 (10,999) 493.
- From Basutoland to Jagersfontein and Kimberley. (17) 4, (32) 4, (40) 5, (49) 5, (3,171) 147.
- Basutoland to Cape Colony, (37) 5.
- Demand in Basutoland greater than, (2) 2, (75) 6, (121) 7, (3,186) 149, (4,759) 202, (4,790) 205.
- Effect of war on, (128) 7, (595) 26, (6,548) 275, (8,154) 336, (8,712) 497, (9,237) 395.
- Influence of failure of crops on, (416) 66, (2,325) 106, (3,188) 149, (3,237) 151, (3,498) 159, (4,872) 208, (6,006) 252, (6,128) 256, (6,507) 274.
- Insufficient for requirements of mining industry, (Sir P. Fitzpatrick), (2,610) 119, (2,748) 128.
- For coal mines, (2,622) 121, (2,734) 128, 421, 429, (10,020) 457.
- Compared with profits of mines, (2,635) 121.
- Recruiting by C.S.A.R., (2,639) 122.
- Improbable increase of from Portuguese East Africa, (2,739) 128, (3,630) 163, (3,643) 164, (3,702) 166, (8,976) 372.
- In Cape Colony, insufficient for requirements, (2,748) 128, (4,512) 192.
- To non-stamping mines, (851) 42, (2,769) 130, (10,920) 490.
- Increase of, would increase demand for white labour, (2,794) 121, (2,863) 134, 406, (9,753) 442, (10,164) 462, (10,363) 468, (10,525) 474, (10,956) 491, (11,898) 524.
- Future requirements of South Africa, (2,794) 131, 421.
- Asiatic compared with African, (2,809) 132.
- Of Central Africa, (2,813) 132.
- Should not be dependent on foreign Government, (2,874) 134, (2,898) 135, (3,691) 360.
- Chinese, (840) 42, (2,744) 128, (2,905) 136, (2,998) 139, (3,087) 330.
- From Abyssinia, (2,920) 137, (11,134) 499, (11,156) 500.
- From Somaliland, (2,920) 137, (3,072) 142, (3,094) 143, (3,120) 146, (11,134) 499, (11,141) 500.
- Ditto, telegram from Commissioner of Somaliland on, stating no supply available, (3,095) 143.
- Ditto, influence of chiefs in, (3,152) 146.
- Shortening of contracts conducive to increased labour supply, (3,171) 147, (3,190) 149, (4,759) 202, (4,782) 205, (4,937) 210, (5,533) 235, (6,051) 253, (6,751) 281, (6,773) 282, (6,817) 284.
- Ditto inadvisable, (3,407) 155.
- Possible increase from Northern Transvaal, (3,283) 153, (3,293) 153.
- Ditto from Mozambique, (3,534) 159.
- Before War, by free recruiters at Hectorspruit and Komatipoort, (3,541) 160.
- Before War, by free recruiters in Gazaland, (3,544) 160.
- From Gazaland, (643) 28, (658) 28, (3,544) 160, (3,551) 161, (4,360) 188.
- Portuguese Control of, (982) 47, (3,544) 160, (3,563) 161.
- From Gaza and, 1896-1898, (3,596) 162, (3,630) 163, (4,371) 189, (4,437) 190.
- From Mozambique, (645) 28, (653) 28, (660) 28, (927) 45, (1,951) 95, (2,147) 100, (3,407) 155, (3,430) 157, (3,445) 157, (3,456) 158, (3,486) 158, (3,630) 163.
- Influence of climate on, (246) 14, (1,008) 48, (1,801) 89, (3,407) 155, (3,436) 157, (3,653) 164, (4,146) 182, (8,964) 371.
- Influence of free recruiting on, (641) 28, (746) 31, (1,157) 57, (3,544) 160, (3,649) 164, (3,664) 165, (3,720) 166.
- Effect of continuity of service on, (3,759) 168.
- Influence of labour-saving appliances on, (3,767) 168, (3,900) 173, (9,902) 451, (10,052) 458 (10,268) 465.
- Proposed legislation in regard to natives on lines of common policy in S.A., (3,774) 168.
- Wasteful use of, (3,752) 167, (3,783) 169, (9,942), 453, (11,876) 523.
- Of Kimberley in 1874, (3,830) 170.
- Suggestions of Mr. F. Ingle for increasing, (3,843) 171.
- Facility of communication as affecting, (3,777) 169, (3,853) 172, (3,906) 174, (3,936) 175.
- Improbable increase of, from Natal, (410) 20, (449) 21, (3,936) 175, (3,955) 175, (3,962) 176, (8,361) 346, (10,998) 493, (10,981) 492, (10,990) 493, (11,084) 497.
- From Natal before war, (3,952) 175.
- Cape Colony, (4,094) 180, (4,136) 182, (4,501) 192, (4,511) 192, (8,385) 348.
- Bechuanaland, (382) 19, (412) 20, (746) 31, (4,094) 180, (4,523) 192, (4,540) 194, (4,572) 195, (8,385) 348.
- From Lourenco Marques (4,373) 189.
- Ditto, improbable increase of supply from, (4,375) 189.
- To De Beers from Bechuanaland, (4,549) 194, (4,566) 195.
- B.C. Africa, (242) 12, (848) 42, (1,111) 56, (1,115) 56, (1,171) 58, (4,613) 197.
- B.C. Africa, no available supply from, (4,641) 198.
- Supply for C.S.A.R., (1,811) 89, (2,639) 122, (2,679) 125, (4,559) 194, (4,791) 205.
- Improbable increase of supply from Basutoland, (4,790) 205, (4,824) 206.
- Basutoland, (4,759) 202, (4,867) 208, (4,874) 208.
- From Liberia, (4,962) 211, (4,994) 213, (5,011) 213.
- From Nigeria, (4,962) 211, (4,994) 213, (5,011) 213.
- Telegram from Secretary of State on supply from West Coast, 36, (5,020) 213.
- Statement of British Consul on supply from West Coast, 36, (5,063) 214.
- Zoutpansberg, (5,277) 221, (5,343) 224.
- Ditto, improbable increase of supply from, (5,343) 224.
- Bechuanaland, (5,422) 228, (5,438) 229, (5,447) 229, (5,453) 230.
- Diseases of Bechuana, as affecting, (5,449) 229.
- Central Transvaal, (5,524) 232, (5,530) 235, (5,603) 238.
- Insufficiency of, in Central Transvaal, (5,538) 235.
- Effect of increased taxation on, (5,541) 236.
- Probable increase of supply from Portuguese East Africa, (715) 30, (3,534) 139, (5,792) 245.
- Portuguese West Africa, (5,804), 245, (5,869) 247, (5,923) 248.
- Fingoland, (5,990) 251, (5,999) 252, (6,043) 253, (6,081) 254, (6,201) 258.
- Galekaland, (5,990) 251, (5,999) 252, (6,043) 253, (6,081) 254.
- Fingoland and Galekaland before war, (6,011) 252, (6,274) 260.

- Fingoland, possible increase of, (6,018) 252.  
 Effect of better railway accommodation on, (4,038) 178, (6,022) 252.  
 Scarcity of, in Cape Colony, (6,108), 255, (6,235) 259.  
 Glen Grey Act in, (6,158) 257, (6,264), 260.  
 Influence of town locations on, (6,184) 258, (6,314) 262.  
 Improbable increase of supply from Transvaal, (6,729) 281.  
 Effect of tribal organisation on, (6,638) 278 (8,898) 366, (9,077) 376, (10,697) 480, (11,092) 497, (11,289) 504, (11,444) 509, (12,783) 562.  
 Barberton (6,889) 286.  
 Shortage of, in ditto, (6,914) 287, (6,945) 288.  
 Shortage of, on C.S.A.R., (7,561) 312, (7,618) 314.  
 Pay of natives on C.S.A.R., (7,732) 320.  
 Ermelo, (8,020) 328.  
 Carolina, (8,020) 328.  
 Improbable increase of, from Swaziland, (8,042) 329, (8,141) 336.  
 Surplus of, in 1896, (8,248) 342.  
 Desire for work of natives from Natal, (8,332) 345.  
 Waterberg (Transvaal), evidence of Mr. J. J. Van Staden on, (8,844) 364.  
 Improbable increase from Central Africa, (9,151) 381.  
 British West Africa, (9,410) 400e.  
 Improbable increase of, from British West Africa, (9,412) 400e.  
 Chamber of Mines, Statement of, 401.  
 Estimated of, exclusive of agriculture, now and five years hence, 402, 421, (9,480) 432, (9,489) 432, (9,763) 442, (9,880) 450, (9,997) 455.  
 Influence of W.N.L.A. on, (9,843) 445.  
 Sufficient for coal mines, (10,023) 457.  
 Preference of, to coal mines, (10,024) 457.  
 Of coal mines three years hence, (10,050) 457.  
 Requirements of farmers in O.R.C., (10,657) 479, (10,668) 477.  
 Requirements of public works, (10,066) 458.  
 Ditto, in three and five years hence, (10,035) 459.  
 Of Crown Deep, (10,745) 482.  
 Improbable increase of, from Wakkerstroom, (11,420) 508.  
 Improbable increase of, from O.R.C., (11,461) 509.  
 Allotment of natives to mines by W.N.L.A. in May, 1902, (12,024) 528.  
 Total requirements of mining industry, (12,087) 532.  
 Ditto in five years hence, (12,089) 532.  
 White labour as compared with black, 403, 420, (9,491) 432, (9,593) 436, (9,739) 440, (9,812) 444, (9,880) 450, (9,914) 452, (11,944) 526.  
 Sufficiency of, in Natal for Colony, (12,456) 547.  
 Compulsory, in Natal, (12,466) 547, (12,519) 549.  
 Of Cape Colony from Transkei, (12,923) 568.  
 Probable increase of, from Transkei, (12,968) 569.  
 Suggested compulsion of labourers by Mr. P. Cronje, (6,571) 276.
- LABOUR SAVING APPLIANCES—**

 Desertions of, (443) 21, (489) 22, (855) 42, (1,747), 84, (1,761) 86, (3,072) 142.  
 Underground workers, (243) 13, (296) 17, (334) 18, (402) 20, (430) 21.  
 Drink and, on East Rand, (468) 22.  
 Supply of, in South Africa, (475) 22, (895) 44, (2,667) 124, (2,744) 128, (4,962) 211, (5,003) 213, (7,823) 322, 405, (9,529) 433, (9,766) 442.  
 In town of Johannesburg, (512) 23.  
 Treatment of, (3) 3, (25) 4, (77) 6, (168) 9, (193) 10, (196) 10, (214) 11, (517) 23, (730) 21, (3,439) 157, (4,038) 178, (6,022) 252.  
 Drink and, (577) 25, (520) 23, (548) 24, (989) 47, (2,717) 127, (2,870) 134, (3,505) 159, (4,400) 189, (4,510) 192, (5,153) 218, (5,847) 246, (8,647) 358, (9,763) 442, (10,151) 461, (10,169) 462, (10,228) 464, (10,294) 466, (10,315) 467, (10,385) 470, (10,552) 476, (10,584) 477, (10,783) 485, (11,132a) 499, (13,754) 603.  
 Requirements of farmers, (553) 24, (4,564) 195, (6,459) 273, (6,616) 272, (7,057) 291, (9,369) 400b, (11,190) (11,276) 504, (11,404) 508, (11,485) 510, (12,630) 554, (12,721) 559, (12,812) 563.  
 Shortage of, on farms, (555) 24, (2,625) 121, (6,466) 273, (6,485) 273, (6,622) 278, (7,055) 291, (7,247) 298, (8,020) 328, (8,035) 329, (8,696) 360, (9,698) 439, (11,417) 508.  
 Pay of, on farms, (561) 25, (570) 25, (598) 26, (606) 26, (4,660) 199, (5,134) 217, (5,177) 218, (5,554) 236, (6,433) 273, (8,895) 366, (10,679) 430, (11,455) 509, (11,784) 520, (12,618) 533, (12,723) 559.  
 Treatment of, by Boer farmers, (589) 25.  
 Legislation required by farmers in regard to, (562) 25, (591) 26, (604) 26, (3,774) 168.  
 Squatting on farms, (557) 25, (586) 25, (1,768) 82, (4,705) 200, (5088) 216, (5,134) 217, (5,234) 220, (5,283) 222, (5,289) 222, (5,524) 232, (5,547) 236, (5,680) 240, (6,473) 272, (6,497) 274, (6,889) 286, (6,938) 288, (6,974) 289, (7,008) 292, (7,037) 291, (7,082) 292, (8,985) 372, (9,278) 398, (10,659) 479, (10,692) 480, (11,200) 501, (11,437) 508, (11,640) 515, (12,444) 546, (12,746) 560.  
 Effect of war on, (128) 7, (595) 26, (6,548) 275, (8,712) 361, (9,237) 395, (11,198) 501, (11,244) 502.  
 In Portuguese East Africa, 26.

- Available from ditto, (622) 26, (671) 29, (1,178) 58, (1,954) 95, (1,962) 95, (1,980) 96, (1,982) 96, (2,001) 97, (2,190) 101, (2,201) 102, (2,204) 102, (2,374) 107, (2,534) 114, (2,552) 115, (2,570) 115, (2,739) 128, (2,745) 128, (2,865) 134, (3,407) 155, (3,430) 157, (3,445) 157, (3,456) 153, (3,486) 158, (6,710) 280, (10,588) 477.
- Number from ditto, before war, (632) 27, (643) 28, (657) 28, (2,189) 101.
- Mortality of natives from ditto, (649) 28, (1007) 48, (1,749) 84, (1,784) 87, (3,460) 158.
- Requirements of, in ditto, (687) 29, (696) 29, (1,984) 96.
- Employed in Lourenço Marques, (689) 29, (3,630) 163, (3,659) 165.
- For Rhodesia (718) 30, (1,562) 71, (1,655) 74, (1,662) 74.
- For Madagascar (722) 30.
- From Mozambique and Zambesi (727) 30, (927) 45, (3,407) 155.
- Education of, in compounds, (26) 4, (728) 30, (4,069) 179.
- No complaints of Rand from Portuguese boys, (729) 31.
- W.N.L.A. and, (746) 31.
- Ditto system of recruiting, (746) 31.
- Ditto contracts with (746) 31, (1,935) 94.
- Districts recruited from, (746) 31.
- Distribution of, by W.N.L.A., (746) 31, (1,091) 54, (1,181) 58, (3,777) 169.
- Madagascar, (752) 34.
- German East Africa (752) 34.
- Egypt, (752) 34.
- French Senegambia, (752) 34.
- Morocco, (752) 34.
- British West Africa, (752) 34.
- Congo Free State, (752) 34.
- Portuguese West Africa (Angola), (752) 34.
- German South-West Africa, (752) 34.
- Increase of pay of, (761) 39, (1,046) 50, (1,705) 82, (2,360) 106, (2,465) 115, (2,566) 115, (2,620) 119, (2,648) 123, (2,710) 126, (2,756) 129, (2,907) 136, (3,244) 151, (3,263) 152, (3,284) 153, (3,329) 150, (3,936) 175, (4,033) 178, (4,077) 179, (4,115) 181, (4,126) 182, (4,410) 190, (4,474) 191, (4,523) 193, (6,018) 252, (6,060) 254, (6,230) 259, (6,587) 276, (6,619) 278, (6,745) 281, (8,197) 333, (8,327) 345, (8,368) 347.
- Decrease of pay of, (3) 3, (227) 11, (1,896) 92, (2,081) 97, (2,520) 114, (2,660) 124, (2,713) 127, (3,846) 171, (3,904) 174, (4,094) 180, (4,594) 196, (8,497) 352, (9,244) 396, (9,653) 438, (10,182) 462, (11,646) 516.
- Better treatment of, since war, (765) 40.
- Railway facilities for, (998) 48, (1,039) 50, (1,116) 56, (3,777) 169, (3,892) 173, (3,911) 174, (4,368) 189.
- Employed on C.S.A.R., (1,811) 89, (2,679) 125, (7,353) 302.
- Required for railway construction in Transvaal, (2,637) 122, (2,912) 361.
- Number of, at work on Rand before the war, (769) 40, (3,487) 158, (9,825) 444, (9,862) 450, (9,945) 453, (11,803) 520, (11,868) 523.
- Number of, but not employed by members of W.N.L.A., (772) 40.
- Number of, employed in Johannesburg (773) 40.
- Ditto, by Johannesburg Municipality (1,232) 61.
- Cost of recruiting, (774) 40, (829) 41, (876) 43.
- Fixing time of service, (794) 41.
- From Zambesi, (845) 42.
- From British Central Africa (242) 12, (848) 42, (1,111) 56, (1,115) 56, (1,171) 58, (4,614) 197.
- Shortage of, (850) 42, (941) 46, (1,186) 58, (1,246) 62, (1,265) 63, (1,334) 64, (1,354) 65, (1,366) 65, (1,437) 67, (2,620) 119, (2,639) 122, (2,656) 124, (2,671) 124, (2,788) 131, (2,799) 131, (3,858) 172, (3,906) 174, (4,523) 192, (5,224) 219, (6,914) 287, (6,945) 288, (7,055) 291, (7,247) 298, (9,412) 400e, (9,483) 432, 409, (9,566) 435, (9,739) 440, (9,812) 444, (9,862) 465, (10,253) 450, (10,226) 464, (10,411) 470, (10,363) 468, (10,548) 476, (10,611) 478, (10,745) 482, (10,758) 484, (10,788) 485, (10,902) 489, (10,943) 491, (11,553) 512, (11,618) 515.
- Ditto, on Rand, (9,749) 441, (9,780) 443, (11,831) 522, (12,018) 528, (12,116) 533.
- Ditto, retarding mining (2,631) 121, (2,849) 133, (3,800) 169, 403, 407, (9,506) 433, (9,751) 442, (9,867) 450, (10,470) 472, (10,761) 484, (11,658) 516.
- Ditto in North-Western Rhodesia (1,437) 67.
- Ditto, on Rand before war, (3,847) 171, (9,862) 450, (9,945) 453, (11,808) 520.
- Ditto, on West Rand, (11,940) 525, (11,974) 527.
- Ditto, on Randfontein Group, (12,030) 530.
- Ditto, on General Mining and Finance Corporation properties, (12,030) 532.
- Ditto, in Rhodesia, (1,502) 71, (1,568) 72.
- Ditto, in Johannesburg (see Johannesburg Municipality).
- Ditto, on public works, (10,081) 459.
- Distribution of, to non-stamping mines (851) 42.
- Total number recruited by W.N.L.A., (854) 42.
- Supply by W.N.L.A. for six months, (873) 43.
- Cost of recruiting before war, (877) 43.
- No prospect of increasing monthly gain of, (902) 44.
- Supply from Natal, Zululand and Tongaland (913) 45.
- Ditto from O.R.C., (914) 45, (1,779) 87.
- Ditto Transvaal, (165) 9, (916) 45, (1,683) 81, (1,729) 84, (3,314) 153.
- Ditto Swaziland (920) 45, (1,775) 86, (2,239) 103, (2,241) 103, (3,325) 153.
- Ditto Rhodesia, (929) 45, (932) 45, (1,533) 76, (1,559) 71, 1562, 71, (1,587) 72, (3,310) 153.
- British West Africa, (931) 45.
- From Basutoland, (46) 5, (105) 6, (1,773) 86, (1,814) 86, (1,817) 89, (3,171) 147, (3,193) 149.
- Causes affecting supply of, (955) 46, (964) 46, (2,620) 119, (3,204) 150.
- Expenditure of wages by, (961) 46, (3,840) 171.
- Influence of chiefs, on supply of, (966) 46, (979) 47, (1,437) 67, (1,502) 69, (2,149) 100, (2,239) 103, (2,249) 103, (2,295) 105, (2,309) 105, (3,407) 155, (3,454) 157, (3,477) 158, (4,094) 180, (4,120) 182, (4,482) 191, (4,523) 192, (5,277) 221, (5,501) 231, (6,573) 276, (6,638) 278, (7,256) 299, (9,697) 377, (19,999) 493.
- Effect of British rule on, (981) 47.
- Portuguese control of, (982) 47, (3,544) 160, (3,563) 161.
- Organisation of supply of, (996) 47.
- Railway facilities for (998) 48, (1,039) 50, (1,116) 56, (3,777) 169.
- From Quilimane, (1,006) 43.
- Influence of climate on, (246) 14, (1,008) 48, (1,801) 89, (3,407) 155, (3,436) 157, (3,653) 164, (8,964) 371.
- Area of land occupied by, (1,877) 91, (8,725) 361.
- Free railway travelling for, (3,777) 169.
- W.N.L.A. estimate of supply of, (1,012) 48.
- Hostility to recruiting of, (246) 14, (1,020) 49, (1,056) 50, (1,502) 69.
- Returning to homes, (1,070) 51, (1,139) 57.
- Correspondence with Secretary of State, (1,085) 52.
- Discharged, remaining in towns, (1,135) 56.
- Repatriation of, (1,146) 57.

- Districts open for recruiting of, (1,148) 57.
- Importation of, from outside Africa, (1,153) 57, (2,703) 126, (2,744) 128, (3,391) 176, (8,087) 330, (8,302) 344.
- And sleeping sickness, (1,085) 52, (1,164) 9.
- Restrictions on recruiting, (372) 19, (885) 44, (913) 45, (1,053) 50, (1,120) 56, (1,463) 68, (1,500) 69, (1,503) 69, (3,936) 175, 405.
- Total requirements of Rand, (896) 44, (1,198) 58, (2,620) 119, (2,627) 121, (2,716) 127, (2,728) 127, (2,773) 130, (2,799) 131, (2,854) 133, (9,308) 399, 420, (9,695) 439.
- In employ of Johannesburg Municipality (see Johannesburg Municipality).
- Recruiting of, by ditto, (1,242) 62, (1,234) 61, (1,358) 65, (1,255) 62, (1,288) 63, (1,272) 63, (1,382) 65, (1,387) 65, (1,388) 65.
- Ditto, in Natal, (884) 44, (913) 45, (3,982) 176, (4,010) 177, (11,009) 497, (12,473) 547.
- In North-Western Rhodesia, 66 (see Rhodesia).
- Ditto, export tax in, (1,469) 68.
- Influence of chiefs on, in ditto, (1,502) 69.
- Employed in mines in Barotseland, (1,513) 70.
- Emigration from Rhodesia, (1,545) 71.
- Transvaal natives going to Rhodesia, (152) 8, (1,647) 74.
- No. at work in Transvaal, (1,706) 82.
- Distribution of males in Transvaal, (1,706) 82, (1,719) 83, (1,759) 83, (1,804) 89, (7,088) 292.
- Number working outside own districts, Transvaal, (1,721) 83.
- In Transvaal, available supply of, (1,729) 84.
- On farms in Transvaal, (1,706) 82, (1,792) 88, (6,463) 273, (6,616) 278, (6,665) 279, (12,606) 553.
- Territorial analysis of, in Transvaal, (1,724) 83.
- Mortality of, in Transvaal, (1,749) 84, (1,784) 87.
- Ditto, from pneumonia, (1,756) 85.
- Ditto, from scurvy, (1,757) 86.
- Ditto, from malaria, (1,758) 86.
- Registration of, in Transvaal, (1,759) 86.
- Employed by C.S.A.R., (1,811) 89, (2,679) 125.
- On Government locations in the Transvaal, (1,713) 83, (1,718) 83, (1,812) 89.
- Dangers of working on mines, (1,749) 84, (1,894) 92.
- Deductions from wages of, (1,894) 92, (4,042) 178.
- Number employed on public works twenty years ago, (1918) 93.
- Ditto, to-day, (1,923) 93.
- Reduction of wages in Portuguese East Africa, (2,031) 97.
- Liberty of, in Portuguese East Africa, (2,101) 99.
- Best tribes for working mines, (2,139) 100.
- From Mozambique Company's territory, (2,158) 100.

Labour supply of, (311) 17, (326) 18.
- MASHONALAND—**  
Statistics of, (1,533) 70, (5,575) 237 (see also Rhodesia).
- MATABELELAND—**  
Statistics of, (1,533) 70 (see also Rhodesia).
- MAXWELL, Mr. T.—**  
Evidence of, *re* Griqualand West, Bechuanaland and Zululand, does not think sufficient supply can be obtained for, from Griqualand West, Zululand, (381) 19—(549) 24.
- McEWEN, Mr. E. G.—**  
Evidence of, on Cape Colony, no prospect of increased supply from, (4,498) 191—(4,519) 192.
- McGARRY, Mr. H. L.—**  
Evidence of, on Gazaland, system of recruiting in by W.N.L.A. superior to old system of free recruiting, no probability of any greater supply from, greater expense of recruiting before war to mining companies, chiefs have no influence, (4,357) 188—(4,497) 191.
- MEDICAL ATTENDANCE—**  
See labourers, native.
- MICKLEM, Major H. A.—**  
Evidence of, on requirements of C.S.A.R., shortage of labour, comparison of cost of white labour and native labour for construction and maintenance, shortage of native labour as affecting employment of whites, (7,556) 312—(7,688) 318.

## MINERAL OILS—

In Portuguese East Africa, (13,735) 602.

## MINES—

Not members of W.N.L.A., (1,194) 53.

Working of, retarded by want of labour, (2,631) 121, (2,849) 133, (3,800) 169, (9,867) 450.

Profits of, compared with labour supply, (2,635) 121.

White labour on, (2,680) 125, (2,695) 126, (2,824) 133, (2,840) 133, (3,800) 169, (3,865) 172, (3,903) 173, (4,258) 185, 423, 427, 429, 429, (10,118) 460, (10,745) 482, (10,799) 485, (10,851) 487, (10,899) 489, (10,902) 489, (11,833) 522, (11,940) 525, (11,944) 526, (11,992) 527, (12,036) 531, (12,133) 534, (13,929) 611, (13,949) 612.

Profits of, (2,681) 125.

Capitalisation of, (2,637) 125.

Australian, white labour on, (3,870) 173, (3,895) 173, (4,259) 185, (4,283) 186, (4,306) 186.

In Rhodesia, sufficient labour for, (4,226) 184.

Australian, white wages on, (4,293) 186.

Ditto, tonnage of, compared with South Africa, (4,317), 187, (10,007) 455.

Ditto, weight of stamps in, (4,336) 187, (12,124) 533.

Number of natives employed on, before war, (769) 40, 420, (9,825) 444.

Number of rock-drills employed before and since war, 420, (9,976) 454.

Mechanical underground tramming in, 420.

Crushing capacity per stamp, 420.

Analysis of cost of sinking, 424.

Number of boys required per stamp, (9,581) 435, (9,654) 438, (9,739) 440, (9,812) 444, (9,864) 450, (9,959) 454, (11,940) 525, (11,960) 527, (12,024) 528, (12,064) 532.

Ditto, white men on Australian mines, (9,592) 436, (9,758) 442.

Value of, in other countries, (9,759) 443.

Piece work for natives, (762) 39, (2,648) 123, (9,857) 450.

Coal required per stamp per month, (10,027) 457.

Consumption of coal per mine per month, (10,031) 457.

Rock-drills, as compared with hand work, (10,214) 464, (10,791) 485.

Indian, (10,286) 466.

Ditto, cost of, (10,336) 467.

Estimated number of stamps on, in five years' time, 403, 420, (9,580) 435, (11,854) 523, (12,113) 533.

Economy of white labour on, 573.

Number of natives employed on mines of Witwatersrand, (769) 40, (384) 19, 420, (9,825) 444, (9,862) 450, (9,945) 453, (11,808) 520, (11,808) 523, (13,929) 611.

White labour as replacing coloured, on, (2,840) 133, (3,800) 169, 173, 420, (9,491) 432, (9,593) 436, (9,739) 440, (9,812) 444, (9,914) 452, (10,138) 461, (10,745) 482, (10,799) 485, (10,851) 487, (10,879) 488, (10,902) 489, (11,833) 522, (11,940) 525, (11,944) 526, (11,991) 527, (12,036) 531, (12,647) 554, (13,846) 609.

Randfontein Group, stamps erected and running on, (12,030) 530.

General Mining and Finance Corporation, crushing, (12,081) 532.

Stamps erected and dropped by ditto, (12,083) 532.

White labour on, as compared with black, 403, 420, (9,491) 432, (9,593) 436, (9,739) 440, (9,812) 444, (9,880) 450, (11,944) 526.

Coal, see coal mines.

## MINING INDUSTRY—

Efforts of leaders, genuine (Sir P. Fitzpatrick), (2,767) 130.

Extension of, (2,779) 130.

The basis of South African prosperity, (2,875) 134.

Loss to, through shortage of labour, 404, 407, (9,506) 433, (9,731) 442, (10,470),

Finances of, 406.

Increase of stamps by, implies increase of local expenditure and profits, (9,800) 443, (10,478) 472.

High tonnage per stamp on Rand, (9,910) 452.

Proposed regulation of development of, by supply of labour available in South Africa, (10,161) 462, (10,523) 474, (12,117) 533.

Labour requirements of, (12,087) 532.

Ditto, five years hence, (12,089) 532.

## MISSIONS—

Swiss, (144) 7.

Paris Evangelical, (253) 15.

## MISSIONARIES—

And natives, (279) 16, (280) 16.

Hostility to recruiting, (246) 14, (1,022) 49, (1,056) 50.

Complaints of, (1,061) 51.

## MOROCCO—

Chairman, W.N.L.A., on, (752) 34.

## MORTALITY—

Among Portuguese East Africa natives, (649) 28, (1,007) 48, (1,748) 84, (1,784) 87, (3,460) 158.

Among natives in Transvaal, (1,749) 84, (1,784) 87.

Among Swazies, (2,239) 103, (2,248) 103, (2,275) 104.

Among British Central Africa natives, (246) 14, (1,758) 86.

Causes of, (1,756) 85, 380.

From scurvy (1,757) 86, 380.

From pneumonia, (1,756) 85, 380.

From malaria, (1,758) 86, (9,223) 394, 380.

From phthisis, 380.

From respiratory diseases, 380.

From meningitis, 380.

From enteric fever, 380.

From dysentery, 380.

From accidents, 380.

Other diseases, 380.

Report of, on mines on the Witwatersrand, 380

Among Basutos, (3,171) 147, (3,250) 151.

Among Central Africans (9,152) 331.

Of labourers in Transvaal, 530, (9,900) 451, (9,251) 396.

## MOZAMBIQUE COMPANY—

Territory of, in Portuguese East Africa, (622) 26, (2,068) 98, (2,156) 100.

Supply from, (645) 28, (658) 28, (660) 28, (927) 45, (1,951) 95, (2,147) 100, (3,407) 155, (3,430) 157, (3,445) 157, (3,456) 158, (3,486) 158, (3,632) 164.

Mr. J. P. Goodwin on, 155.

Natives of, (3,407) 155.

Recruiting in, (3,407) 155, (3,428) 157, (3,476) 158.

Influence on chiefs on recruiting in (3,407) 155, (3,454) 157, (3,477) 158, (9,097) 377.

Diseases of natives from, (3,407) 155, (3,436) 157.

Influence of climate on natives from, (3,407) 155, (3,436) 157, (3,653) 164.

Character of natives of, (3,424) 157.

Probable gradual increase of supply from, (3,512) 159.

## MULLER, GENERAL—

Evidence of, on scarcity of labour on farms, question of wages as affecting supply, (6,612) 278—(6,709) 280.

## N.

## NATAL—

Population of, (309) 17, (312) 17, (518) 23, (3,949) 175, (8,152) 336, (11,018) 494, (12,363) 543, (12,484) 548.  
 Supply of, (309) 17, (314) 17, (369) 19, (8,154) 336, (8,332) 345.  
 Natives on railways in, (400) 20.  
 Rev. F. Suter on, 16.  
 Native wages in (303) 17, (3,936) 175, (10,981) 492, (12,500) 548.  
 Natives employed in, (310) 17.  
 Industries in, employing natives, (325) 18.  
 Improbable increase of supply from, (410) 20, (449) 21, (3,936) 175, (3,955) 175, (3,962) 176, (8,361) 346, (10,998) 493.  
 Supply from, to Rand, detrimental to, (529) 24, (542) 24.  
 Zulus not working in (540) 24.  
 Restrictions on recruiting in, (834) 44, (913) 45, (3,936) 175, (12,451) 547.  
 Mr. C. Acutt on, 174.  
 Higher wages conducive to better supply, (3,936) 174, (4,077) 179.  
 Supply from before war, (3,952) 175.  
 Causes affecting supply from, (3,967) 176.  
 Polygamy in, (3,974) 176.  
 Imported labour in, (3,991) 176 (see also Indian labour in).  
 Requirements of, (4,002) 177, 407.

 In Abyssinia, (11,134) 499.  
 In Transkei, (12,974) 570.

## NATIVES—

On Crown lands, (1,717) 83.  
 On farms, (557) 25, (586) 25, (1,706) 82, (1,780) 87, (1,792) 88, (1,808) 89, (1,899) 92, (2,868) 134, (4,705) 200, (5,088) 216, (5,234) 220, (5,524) 232, (5,547) 236, (5,680) 240.

## NEALE, MR. A. L.—

Evidence of, on labour supply of Lydenburg, shortage, number of boys per stamp required, various bodies recruiting in, (11,550) 512—(11,605) 513.

## NEWCASTLE—

Labour supply of, (311) 17, (326) 18.

## NEW GOCH—

See General Mining and Finance Corporation.

## N'GAMILLAND—

See Bechuanaland.

## NIGERIA—

Mr. H. W. Innes on, 211.  
 Supply from, (4,962) 211, (4,994) 213, (5,011) 213, (5,060) 214.  
 Population of, (4,962) 211.  
 Telegram from Secretary of State, on supply, 36, (5,020) 213.  
 Kroo boys in Rhodesia, (4,962) 211, (5,050) 214.  
 Statement of British Consul, Congo State, on supply from West Coast, 36, (5,063) 214.

## NORTH-WESTERN RHODESIA—

Colonel Harding on, 143 (see also Barotseland).  
 Labour supply of, (1,433) 67, (1,437) 67, (1,449) 68, (1,507) 69.  
 Major R. T. Coryndon on, 66.  
 Population of, (1,437) 67, (1,439) 63, (1,595) 69, (3,100) 142.  
 Recruiting in, (1,437) 67, (1,158) 68.  
 Shortage in, (1,437) 67.  
 Mines in, (1,437) 67.  
 Labour requirements of, (1,437) 67.

U c

- Chiefs against emigration from, (1,437) 67.  
 Natives of, liable to disease, (1,437) 67.  
 Pay of natives, (1,437) 67.  
 Natives of, at Victoria Falls, (1,437) 67.  
 Supply of, from Zambesi, (1,463) 68.  
 Restrictions in, (1,468) 68, (1,500) 69, (1,503) 69.  
 Influence of chiefs in, (1,502) 69.  
 Export tax on natives in, (8,220) 340, (1,469) 68.  
 Idleness of natives in, (1,477) 69.  
 Hut tax in, (1,482) 69.  
 Number employed on mines in (Barotseland), (1,513) 70.  
 Dowry, customs in, (1,496) 69.  
 Wankie Coalfields, (1,515) 70.  
 Major Coryndon on Mr. Coillard's evidence on Barotseland, (1,147) 57, (1,507) 69.  
 Mr. Val Gielgud's evidence on, 70.  
 Customs of natives of, (1,533) 70.
- NORTHERN TRANSVAAL—**
- Population of, (149) 8, (158) 9, (3,263) 152, (3,285) 153.  
 Natives of, on Rand, (150) 8.  
 Recruiting in, (919) 45, (945) 46, (1,042) 50, (3,263) 152, (3,282) 153, (3,330) 154.  
 Mr. D. Erskine on, 152.  
 Better treatment of natives of conducive to increased supply from, (3,263) 152.  
 Probable increase of supply from, (3,283) 153, (3,293) 153, (3,369) 154.  
 Zoutpansberg, see Zoutpansberg.  
 Pietersburg, see Pietersburg.
- NOURSE DEEP—**
- Wasteful use of natives on, (3,752) 167, (3,783) 169.  
 Development on, in 1898 and now, (3,785) 169.
- NOURSE, MR. H.—**
- Evidence of, impossibility of obtaining sufficient native labour supply in South Africa, impracticability of substituting white labour for black, (12,854) 564—(12,892) 567.
- NYASSA—**
- See Portuguese East Africa.
- O**
- OLIVIER, GENERAL.—**
- Evidence of, on farming in the O.R.C., sufficiency of farm labour, effect of tribal system and squatting on Crown lands on supply, taxation of natives on farms in, (10,651) 479—(10,741) 482.
- ORANGE RIVER COLONY—**
- Recruiting in, by W.N.L.A., (746) 31, (914) 45, (1,042) 50.  
 Native population of, (1,778) 87, (11,461) 509.  
 No available supply from, (1,779) 87.  
 Demand for Basutos in, (2) 2.  
 Mr. D. H. Fraser's evidence on, 147 (see also Basutoland).  
 Basutos on farms in, (3,184) 149.  
 General Olivier on, (10,651) 479.  
 Farmers' labour requirements in, (10,657) 479, (10,668) 479, (11,485) 510.  
 Squatting in, (10,659) 479, (10,692) 480.  
 Sufficiency of farm labour in, (10,675) 480.  
 Pay of natives on farms in, (10,679) 480.  
 Effect of tribal organisation on supply, (10,480) 480.  
 Taxation of natives on farms in, (10,706) 481.
- Railway construction in, (10,718) 481.  
 Natives on Crown land in (10,693) 480, (10,732) 481.  
 Mr. J. Q. Dickson on, 509.  
 Native population of each district of, (11,461) 509.  
 Improbable increase of supply from, (11,461) 509.  
 Natives on farms in, (11,473) 510.
- P**
- PANZERA, LIEUT.-COLONEL F. W.—**
- Evidence of, on Bechuanaland and Ngamiland, habits and customs of tribes, increase of taxation as producing increased supply a fallacy, (5,416) 226—(5,523) 232.
- PARALYSIS—**

 Ditto, Lourenco Marques, (3,630) 163.  
 Ditto of Inhambane, (1,976) 96, (2,057) 98.  
 Ditto, of Zambesi, (1,977) 96.  
 Ditto of Mozambique, (2,168) 101, (3,407) 155, (3,416) 156, (3,465) 158.  
 Ditto of Portuguese Chartered Companies, (2,168) 101.  
 Slavery in, (3,426) 157.  
 Treatment of natives of, (3,440) 157.  
 Zambesi Company's territory in, (2,072) 98.  
 Nyassa Company's ditto, (2,080) 98.  
 "Prazo" system in, (2,082) 98, (2,090) 99, (2,485) 113, (2,516) 114, (2,599) 116.  
 Translation from "Journal das Colonias," (1,107) 55, 59, (2,089) 99, (2,096) 99.  
 Statement of British Consul on "Prazo" system, (2,101) 99.  
 Ditto, on commerce of, (2,114) 99.  
 Revenue of, influence of recruiting on, (2,116) 99.  
 Comparison of Portuguese natives on Rand in 1899 and to-day, (2,203) 102, (2,434) 111, (2,459) 112.  
 Statistics of natives officially recruited in, (2,374) 107, 108, (2,400) 111, (2,434) 111.  
 Licences, recruiters', in, (830) 42, (2,374) 107, (2,387) 110.  
 Free recruiters endeavouring to induce natives not to come to Rand from, (2,221) 102, (2,612) 119.  
 Inefficient natives from, (2,727) 127.  
 Improbable increase of supply from, (2,739) 128, (3,630) 163, (3,643) 164, (3,702) 166, (8,976) 372.  
 Shorter contracts inadvisable, (3,407) 155.  
 Drink and natives of, (3,505) 159, (8,647) 358.  
 Influence of failure of crops on supply from, (3,498) 159.  
 Supply from Gazaland, 1896-1898, (3,596) 162, (3,630) 163.  
 Evidence of Mr. L. Cohen, 163.  
 Improbable increase of supply from Gazaland, (3,630) 163.  
 Antipathy of natives to W.N.L.A., (3,544) 160, (3,650) 164.  
 Shangaans in, (36,695) 166.  
 Supply from Lourenco Marques, (4,377) 189.  
 Improbable increase of supply from Lourenco Marques, (4,375) 189.  
 Dyer, Mr. F. W., on, 280.  
 Natives of, emigrating to Barberton, (6,949) 288.  
 Failure of expeditions in, owing to scarcity of native labour, (8,930) 372.  
 Sugar cultivation in, (13,735) 602.  
 Mineral oils in, (13,735) 602.  
 PORTUGUESE GOVERNMENT—  
 Relations of W.N.L.A. with, (865) 43, (1,956) 95.  
 Relations of Transvaal with ditto, (1,933) 94, (9,240) 395.  
 Native Labour Department of, (2,469) 112.  
 PORTUGUESE WEST AFRICA—  
 Chairman W.N.L.A., on, (752) 34, (939) 46.  
 Supply from, (5,804) 245, (5,869) 247, (5,923) 248.  
 Slavery in, (5,944) 249.  
 Project for supply from, 250.  
 "PRAZO" SYSTEM—  
 In Portuguese East Africa, (2,082) 98, (2,090) 99, (2,435) 113, (2,516) 114, (2,599) 116.  
 PRETORIA—  
 See Transvaal Central.  
 PRIVATE LOCATIONS—  
 On farms, (1,708) 82, (1,723) 83, (1,808) 89.  
 PRICE, MR. C. J.—  
 Evidence of, on labour on Crown Deep, shortage, white labour as compared with coloured, bonuses to natives re-engaging, shortage of labour-retarding mining, (10,742) 482—(10,901) 514.  
 Report of, on white labour on Village Main Reef, (13,083) 574.  
 PRICE, MR. T. R.—  
 Evidence of, as regards native labour on the C.S.A.R., number of natives employed on cost of, comparative statement of cost of native and white labour, and result of same, (7,352) 302—(7,555) 302.  
 Further statement of, 400c.  
 PRITCHARD, CAPT.—  
 Evidence of, on native labour supply of C.S.A.R., natives at work on new construction, preference of natives for railway work as against mining, comparative cost of native and white labour, (7,689) 318—(7,817) 322.  
 PUBLIC WORKS—  
 Mr. D. Gilmour's evidence on (*vide* p. 408), (10,066) 458.  
 Labour requirements of, (10,066) 458.  
 White labourers on, (10,079) 458.  
 Shortage of labour for, (10,081) 459.  
 Labour requirements of three and five years hence, (10,085) 459.  
 Pay of labourers on, before and since war, (10,845) 459.  
 White labourers compared with coloured, on, (10,092) 459.  
 Ditto, on railways, (10,093) 459.

 Evidence of Mr. J. Stuart on, 184.  
 Mining in, sufficient labour for, (4,226) 184, (4,272) 185, (4,338) 187, (4,346) 188.  
 Experiment with Koo boys in, (4,962) 211, (5,050) 214.  
 Natives of Zoutpansberg going to, (152) 8.
- RHODESIA, NORTH - EASTERN AND SOUTHERN—  
 See Rhodesia.
- RHODESIA, NORTH-WESTERN—  
 See North-Western Rhodesia.
- ROBERTSON, MR. A. G.—  
 Evidence of, on Piet Retief and Wakkerstroom districts, squatting in, Government locations in, tribal system, population of, suggested remission of taxation to working natives, (11,397) 507, (11,458) 509.
- ROCK DRILLS—  
 See Mines.

## ROGERS, Mr. H. A.—

Evidence of, on Klerksdorp district, insufficiency of labour supply retarding mining, (10,353) 468—(10,464) 471.

## ROODEPOORT UNITED—

See General Mining and Finance Corporation.

## ROSS, Mr. P. H.—

Evidence of, on Central Africa, customs and habits of tribes of, population and statistics, improbable increase of supply from, climate of Rand too cold for natives of, (242) 12—(249) 14.

## ROUXVILLE—

Population of, 509.

## S

## ST. LUCIA DISTRICT—

Labour in, Rev. F. Suter on, (291) 16.

## SALISBURY—

See Rhodesia.

## SAMUELSON, Mr. S. O.—

Evidence of, on Natal, labour employed on coal mines, labour passes issued in Natal, compulsory labour in Natal, population of (white and native), (12,354), 543—(12,596) 552.

## SOURVY—

Mortality from, (1,757) 86.

## SENEKAL—

Population of, 509.

## SHANGAANS—

In Portuguese East Africa, (3,695) 176.

## SHORTAGE OF LABOUR—

(850) 42, (896) 44, (941) 46, (1,186) 58, (2,620) 119, (2,656) 124, (2,761) 129, (2,788) 131, (2,799) 131, (5,224) 219, (9,483) 432, (10,303) 466.

In Johannesburg Municipality, (1,225) 61, (1,246) 62, (1,265) 63, (1,334) 64, (1,354) 65, (1,366) 65, (1,380) 65.

In North-West Rhodesia, (1,437) 67.

In Rhodesia, (1,562) 71, (1,568) 72.

On railways, (2,639) 122, (7,384) 304, (7,561) 312, (7,618) 314, 409, (9,566) 435, (9,739) 440, (9,812) 444.

In Natal, (2,672) 125, (3,936) 175, (3,955) 175, (3,962) 176, (9,714) 440.

Retarding mining operations, (2,631) 121, (2,849) 133, (3,800) 169, 404, 407, (9,506) 433, (9,751) 442, (9,867) 450, (10,470) 472, (10,761) 484, (11,658) 516.

On Rand before war, (3,847) 171, (9,862) 450, (9,945) 453, (11,808) 520.

Causes of, (3,858) 172.

Result of spurious demand, (3,906) 174.

In Bechuanaland, Griqualand West, and Western Transvaal, (4,523) 192.

On farms, (555) 24, (2,625) 121, (6,466) 273, (6,485) 273, (6,622) 278, (7,055) 291, (7,247) 298, (8,020) 328, (8,035) 329, (8,696) 360, (9,698) 439, (11,417) 508.

In Barberton, (6,914) 287, (6,945) 288, (11,618) 515.

As causing loss to mining industry, 404, 407, (9,506) 433, (9,751) 442, (10,470) 472.

In South Africa, (9,493) 432, (10,303) 466, 553.

In Cape Colony, (2,744) 128, (4,512) 192, (6,235) 259, (9,713) 440.

On Rand, (9,749) 441, (9,780) 443, (11,831) 522.

On public works, (10,081) 459.

On Coronation Syndicate's properties, (10,253) 465.

On Ferreira Mine, (10,266) 465.

In Klerksdorp, (10,363) 468.

Retarding mining in ditto, (10,363) 468, (10,408) 470, (10,437) 471.

On Crown Reef, (10,548) 476, (10,611) 478.

On Crown Deep, (10,745) 482, (10,758) 484, (10,758) 485.

Preventing sorting, (10,829) 487.

On Geduld, (10,902) 489, (10,943) 491.

Of Indians in Natal, (11,076) 496.

In Lydenburg (11,553) 512.

On West Rand, (11,940) 525, (11,974) 527.

On Witwatersrand, (9,749) 441, (9,780) 443, (11,831) 522, (12,018) 528, (12,116), 533.

On Randfontein Group, (12,030) 530.

On General Mining and Finance Corporation properties, (12,080) 532.

In British West Africa, (9,412) 400c.

## SIERRA LEONE—

See West Africa, British.

## SKINNER, Mr.—

Report of, on white labour on Village Main Reef, 573.

## SLAVERY—

In Barotseland, (257) 15, (3,100) 143.

In Mozambique, (3,426) 157.

In Portuguese West Africa, (5,944) 249.

In Central Africa, (9,152) 381.

## SLEEPING SICKNESS—

(1,085) 52, (1,164) 57.

## SLOLEY, Mr. H. C.—

Evidence of, on Basutoland, improbable increase of supply from, statistics as to imports of dutiable goods, exports of produce and passes issued, different agencies recruiting in, (4,756) 168—(4,957) 211.

## SMITH, Mr. F. B.—

Evidence of, on farm labour in Transvaal, (12,597) 553—(12,645) 554.

## SMITHFIELD—

Population of, 509.

## SMUGGLING—

Of boys by Rhodesian mines, (2,424) 111, (2,442) 112.

In Gazaland, (3,544) 160, (3,614) 162.

## SOMALILAND—

Supply from, (2,920) 137, (3,094) 143, (3,120) 146.

Supply of natives to Madagascar, (2,928) 138.

Somalis, as underground workers, (3,010) 139.

Recruiting in, (3,049) 141.

Ditto, cost of, (3,102) 145.

Somalis for Rhodesia, desertion of, (3,072) 142.

Conditions of recruiting in, (3,080) 142.

Telegram from Commissioner, stating no supply available, (3,095) 143.

Influence of chiefs in, (8,152) 336.

Kusel, Mr. J., on, (11,134) 499.

Somalis unfit for mining, (11,134) 499.

Failure of Somalis in Rhodesia, (11,134) 499, (11,141) 500.

## SOUTH AFRICA—

Supply of labour from, (475) 22, (895) 44, (2,667) 134, (2,744) 128, (4,962) 211, (5,003) 213, (7,823) 322, 406, (9,529) 433, (9,766) 442.

- Insufficient supply in, (695) 44, (2,667) 124, (2,744) 128, (11,662) 516, (12,024) 528, (12,647) 554, (12,857) 564.
- Future requirements of, (2,795) 131, 422.
- Prosperity of, dependent on mining industry, (2,875) 134.
- Abnormal demand for native labour in, (8,179) 338.
- Population of, (2,700) 126, (7,977) 327, 405, (9,524) 433.
- Recruiting in, 405.
- SOUTH-WEST AFRICA, GERMAN—**  
See German South-West Africa.
- SPELONKEN—**  
Natives of, (152) 8.  
Natives of, going to Rhodesia, (152) 8, (1,647) 74.  
Distribution of natives of, on mines, (152) 8.  
Hat tax in, (152) 8.  
Population of, (158) 9.  
Complaints of natives of, (168) 9, (5,411) 226, (12,726) 559.  
Immorality of natives of, (182) 10, (229) 11.  
Mr. B. Viljoen on, (12,705) 559.  
Farmers' requirements in, (12,721) 559, (12,812) 563.  
Pay of natives on farms in, (12,723) 559.  
Recruiting in, (5,336) 325, (12,731) 561.  
Squatting on farms in, (5,239) 222, (12,746) 560.  
Tribal system in, (12,783) 562.  
See also Zoutpansberg.
- SPENCER, Mr. C. H.—**  
Evidence of, on West Rand, number of stamps on idle and at work, boys required per stamp, shortage on, white labour as replacing black, (11,938) 525—(12,017) 528.  
Report of, on white labour, Village Main Reef, (13,083) 574.
- SPRINGFONTEIN—**  
Population of, 509.
- SQUATTERS' LAW—**  
See Squatting.
- SQUATTING—**  
On farms (557) 25, (586) 25, (1,708) 82, (1,781) 87, (1,808) 89, (1,899) 93, (2,865) 134, (4,705) 200, (5,234) 220, (5,524) 232, (5,547) 236, (5,680) 240, (6,473) 273, (6,497) 274, (6,623) 278, (6,889) 286, (6,938) 283, (6,974) 289, (7,008) 290, (7,037) 291, (7,082) 292, (8,867) 365, (9,273) 393, (10,659) 479, (10,692) 480, (11,200) 501, (11,437) 508, (11,534) 511, (11,640) 515, (12,444) 546.  
Effect of, on labour supply, (1,708) 82, (1,897) 92, (5,289) 222, (8,060) 329, (8,696) 360, (8,985) 372, (9,278) 393, (12,746) 560.
- STADEN, VAN, Mr. R. J.—**See Van Staden.
- STAMPS—**  
Erected and working on Rand, 404, 406, (9,504) 433, (9,580) 435, (9,727) 440.  
Estimated ditto, in five years time, 404, 421, (9,530) 435, (11,854) 525, (12,113) 533.  
Crushing capacity of, 421.  
Number of boys required per stamp, (9,581) 435, (9,654) 438, (9,739) 440, (9,812) 444, (9,864) 450, (9,959) 454, (11,940) 525, (11,960) 527, (12,024) 528, (12,064) 532.  
White men per stamp in Australia, (9,592) 436, (9,758) 442, (10,007) 455.  
Increase of, implies increase of local expenditure and profits, (9,800) 443, (10,478) 472.
- High tonnage per stamp on Rand, (9,910) 452.

Central, supply from, (5,524) 232, (5,530) 235, (5,603) 238.  
Ditto, population of, (5,524) 232.  
Ditto, squatting in, (5,524) 232, (5,547) 236, (5,680) 240.  
Ditto, higher wages in, not conducive to increased supply, (5,524) 232, (5,543) 236, (5,642) 239.  
Ditto, shorter contracts conducive to greater supply, (5,533) 235.  
Ditto, insufficiency of supply for farm work, (5,538) 235.  
Ditto, effect of increase of taxes on supply from, (5,541) 236.  
Ditto, pay of natives on farms in, (5,554) 236.  
Ditto, analysis of population of, (5,579) 237.  
Ditto wealth of natives in, (5,599) 237.  
Ditto, natives of, employed in Pretoria, (5,668) 240, (9,268) 397.  
Ditto, taxation of natives in, (5,694) 241.  
Ditto, polygamy in, (5,731) 242.  
Improbable increase of supply from, (6,729) 281.  
Krugersdorp, Mr. W. M. Edwards on, 291.  
Requirements of, 407.  
Suggested compulsion of labourers, (7,249) 298.  
Finances and commerce of, (10,498) 473.  
Number of natives on farms in, (1,706) 82, (1,792) 88, (6,463) 273, (6,616) 278, (6,665) 279, (12,606) 553.

- TRANSVAAL G.M. ESTATES—  
 Shortage of labour on, (11,553) 512.  
 Not member of W.N.L.A., (11,507) 511.
- TRIBAL ORGANISATION—  
 Effect of, on labour supply, (6,638) 278, (8,984) 373, (9,077) 376, (10,697) 480, (11,092) 497, (11,290) 504, (11,444) 509, (12,783) 562.
- U**
- UGANDA—  
 See British Central Africa.
- UMHALLA, N. C. (a native).  
 Evidence of, (13,579) 599, (13,691) 601.  
 Recalled, (13,792) 607—(13,833) 608.
- V**
- VAN RIJYN—  
 See General Mining and Finance Corporation.
- VAN STADEN, Mr. J. J.—  
 Evidence of, on native labour in the Waterberg district, native population of, native wages in, squatting in, (8,844) 364—(8,917) 366.
- VILJOEN, Mr. B.—  
 Evidence of, on Spelonken and Northern Transvaal, labour supply of, suggests policy of taxation in order to compel natives to work, (12,705) 559—(12,853) 564.
- VILLAGE MAIN REEF—  
 Experiment with white labour on, (13,083) 574, (13,262) 586.  
 Total number of individuals employed on unskilled work, 606.  
 Estimated number of natives to replace unskilled and partially skilled whites, 606.
- VON HARNACH, Mr. R.—  
 Evidence of, on shortage of labour on Crown Reef, effect of drink on efficiency of native labour, (10,539) 474—(10,650) 479.
- VREDE—  
 Population of, 509.
- VREDEFORT—  
 Population of, 509.
- VRYHEID—  
 Evidence of Mr. Louis Botha on, (11,181) 501.  
 Requirements of farmers in, (11,190) 501, (11,276) 504.  
 Effect of war on natives in, (11,198) 501, (11,244) 502.  
 Squatters' Law in, (11,200) 501.  
 Government locations in, (11,200) 501, (11,252) 503.  
 Native taxes on farms in, (11,211) 502, (11,266) 504.
- W**
- WAGES, NATIVE—  
 See labourers, native, pay of.
- WAKKERSTROOM—  
 Evidence of Mr. A. G. Robertson on, (11,397) 507.
- Requirements of farmers in, (11,404) 508.  
 Scarcity of labour in, (11,417) 508.  
 Government locations in, (11,418) 508.  
 Improbable increase of supply from, (11,420) 508.  
 Population of, (11,397) 507.  
 Squatting in, (11,437) 508.  
 Tribal system in, (11,444) 509.  
 Pay of natives on farms in, (11,455) 512.
- WANKIE COALFIELDS—  
 See Rhodesia.
- WAR—  
 Effect of, on native labour supply, see Labour, Native, Supply of.
- WASTE—  
 Of native labour, (3,752) 167, (3,783) 169, (9,924) 453, (11,876) 523.
- WATERBERG—  
 Evidence of Mr. J. J. Van Staden on, (8,844) 364.  
 Population of, (8,873) 365.
- WATTS, Mr. J. W.—  
 Evidence of, on Barberton, shortage, state of labour market generally, statistics of population no indication of labour supply, (11,606) 514—(11,802) 520.
- WEBB, Mr. H. H.—  
 Evidence of, on native labourers employed on mining on Rand before war, estimated number of stamps on Rand in five years time, white population on Rand, increase of native labour implies increase of whites, (11,803) 520—(11,937) 525.  
 Recalled (13,715) 601—(13,734) 602.
- WEPENER—  
 Population of, 509.
- WEST AFRICA, BRITISH—  
 Chairman, W.N.L.A., on, (253) 15.  
 Recruiting in, by W.N.L.A., (931) 45.  
 Evidence of Mr. R. James, (9,404) 400D.  
 Supply from, (9,410) 400E.  
 Shortage of labour in, (9,412) 400E.  
 Improbable increase of supply from, (9,418) 400F.  
 Importation of Chinese labour in, (9,434) 400G.
- WEST AFRICA, PORTUGUESE—  
 See Portuguese West Africa.
- WEST COAST (AFRICA)—  
 See Liberia and Nigeria.
- WEST RAND—  
 Number of stamps on, (11,940) 525.  
 Ditto, idle, (11,940) 525.  
 Ditto, working, (11,940) 525.  
 Number of boys per stamp on, (11,940) 525, (11,960) 527.  
 Shortage on, (11,940) 525, (11,974) 527.  
 Mr. O. H. Spencer, on, 525.  
 Pay of natives on, (11,983) 527.  
 Labour requirements of, (12,098) 532.
- WESTERN TRANSVAAL—  
 Shortage in, (4,523) 192.  
 Recruiting in, (4,523) 192.
- WHITE, Mr. H. B.—  
 Evidence of, shortage of labour on Geduld Proprietary Mines, preference of W.N.L.A. for stamping mines, (10,902) 489—(10,976) 491.

## WHITE LABOUR—

- On mines, (2,680) 125, (2,694) 126, (2,824) 133, (2,840) 133, (3,800) 169, (3,865) 172, (3,903) 173, (4,255) 185, 424, 427, 428, 429, (10,118) 460, (10,745) 482, (10,799) 485, (10,851) 487, (10,899) 489, (10,902) 489, (11,833) 522, (11,940) 525, (11,944) 526, (11,992) 527, (12,036) 531, (12,133) 534, (13,929) 611, (13,949) 612.
- On railways, (2,673) 125, (10,093) 459.
- Demand for, increased by increased native supply, (2,794) 131, (2,863) 134, 406, (9,753) 442, (10,164) 462, (10,363) 468, (10,525) 474, (10,956) 491, (11,898) 524.
- As replacing coloured labour, (2,840) 133, (3,800) 169, 403, 420, (9,491) 432, (9,593) 436, (9,739) 440, (9,812) 444, (9,914) 452, (10,138) 461, (10,745) 482, (10,799) 485, (10,851) 487, (10,879) 488, (10,902) 489, (11,833) 522, (11,940) 525, (11,944) 526, (11,991) 527, (12,036) 531, (12,647) 554, (13,846) 609.
- Skilled, for sinking and stopping, (3,812) 170, (3,912) 174, (4,258) 185.
- On Australian mines, (3,870) 173, (3,985) 176, (4,259) 185, (4,283) 186, (4,306) 186, (12,123) 533.
- Effect of, on dividends, 403, (9,496) 433, (9,785) 443.
- Proportion to black, (3,903) 174.
- Economy of, (3,913) 174, 573.
- Wages of, in Australia, (4,293) 186.
- Comparison of, with native labour, cost of, (7,439) 307, (7,650) 317, (9,830) 450, (10,745) 482.
- As affected by shortage of natives, (7,682) 318.
- On farms, (8,717) 361, (8,830) 364.
- Result of employment of, on new Goch, 424.
- Ditto, on Lancaster, 428.
- Ditto, on Central Geduld, 428.
- Ditto, on Crown Reef, 429.
- On public works, 10,079) 458.
- As compared with coloured on ditto, (10,092) 459.
- Importation of, suggested by Mr. Louis Botha, (11,317) 505.
- Report of Messrs. Price, Skinner, and Spencer, on Village Main Reef, 573.
- Comparison of, with natives on Village Main Reef, 577, (13,263) 586.
- Tonnage mined by, (13,357) 589.

## WHITE LEAGUE—

- Evidence of Mr. H. M. Zeffertt, 322.
- Mr. Zeffertt an unwilling witness, (7,819) 322.
- Methods of W.N.L.A. and, (7,819) 322, (7,849) 323.
- Allegation of ample supply of labour by, (7,823) 322.
- Inability of Mr. Zeffertt to explain why he has not been able to place natives which he alleges are on offer, (7,865) 323.
- Allegation of refusal of W.N.L.A. to take boys (7,873) 324.
- Alleged bias of the Native Labour Commission, (7,880) 324.
- And the W.N.L.A., (7,909) 325.
- Estimates of native population in South Africa, (7,977) 327.
- Free recruiting advocated by, (7,994) 328.

## WHITWORTH, Mr. W. S.—

- Statement of, 620.

## WILSON, Mr. E.—

- Evidence of, on British Central Africa, natives of, not good labourers, improbability of increase of supply, local requirements, (4,598) 196—(4,647) 198.

## WINBURG—

- Population of, 509.

## WIRTH, Mr. FRITZ—

- Evidence of, gives statistics of native population and distribution of Portuguese East Africa, supports the system of recruiting being carried out by a central organisation rather than by independent agents and generally supports the evidence of Mr. Breyner (see Breyner), (2,367) 107—(2,613) 119.

- Sir P. Fitzpatrick on, (2,865) 134.

## WITWATERSRAND—

- Total labour requirements of, (396) 44, (1,199) 58, (2,620) 119, (2,627) 121, (2,715) 127, (2,728) 127, (2,773) 130, (2,799) 131, (2,854) 133, 420, (9,695) 439, (9,896) 451, (14,011) 615.
- Number of stamps on, (2,620) 119, 403, 405, (9,504) 433, (9,580) 435, (9,727) 440.
- Coal mines, requirements of, (2,622) 121.
- Extension of mining operations in, (2,779) 130.
- Increased native labour supply would increase demand for white, (2,794) 131.
- Average value of ore on, 403.
- Report of mortality among natives employed on the mines on the Witwatersrand, 380.
- Shortage of labour on, (9,749) 441, (9,780) 443, (11,831) 522, (12,018) 528, (12,116) 533.
- Number of natives employed on, in mining, before war, (769) 40, (3,487) 158, 420, (9,825) 444, (9,862) 450, (9,945) 453, (11,808) 520, (11,868) 523, (13,929) 611.
- Number of natives employed on, present day, (11,826) 522.
- Estimated number of stamps on, in five years' time, 403, 420, (9,580) 435, (11,854) 523, (12,113) 533.
- White population of, (11,884) 524.
- Selling value of organised properties on, (12,018) 528.
- Shortage of, before war, (3,847) 158, (9,862) 450, (9,945) 453, (11,808) 520.

## WITWATERSRAND NATIVE LABOUR ASSOCIATION—

- Methods of, (425) 21, (4,117) 181, (4,452) 191, (5,083) 216, (6,763) 282, (7,819) 322, (7,849) 323.
- Mr. T. Maxwell condemns methods of, (425) 21.
- System of, (436) 21, (484) 22.
- Recruiting by, (484) 22, (492) 23.
- In Portuguese East Africa, (622) 26, (1,064) 51, (1,123) 56.
- Evidence of Chairman, 31.
- Statement of ditto, 31.
- Formation, object, and organization of, (746) 31, (786) 40, (2,749) 129.
- Extracts from Articles of Association of (see annexures).
- District managers of, (746) 31.
- Recruiting system of, (746) 31, (4,094) 180, (4,369) 154.
- Native contracts with, (746) 31, (1,935) 94.
- Managers of, (746) 31, (754) 39.
- Annual meeting of (see annexures).
- Districts working in, (746) 31, (934) 45.
- Relations with Natal, Rhodesia, Barberton, Swaziland, and Portuguese Chartered Companies, (746) 31, (1,106) 55, (1,177) 58.
- Relations with recruiters, (746) 31.
- Distribution of labour by, (746) 31, (798) 41, (1,091) 54, (1,181) 58, (8,204) 339.
- Wages paid by, (777) 39, (880) 44.
- Relations with Chamber of Mines, (788) 40, (2,617) 119, (2,654) 124, (2,732) 129, (9,648) 437.
- Fixing of wages by, (787) 40.
- Contracts with Rhodesia, Swaziland, and Barberton, (811) 41.

- Pay of recruiters, (803) 41, (857) 43, (1,027) 49, (2,005) 97.
- Supply from Swaziland before war, (823) 41.
- Recruiting in Northern Portuguese territory not satisfactory, (816) 42.
- Zambesi boys on Rand, (847) 42.
- Shortage of labour, (850) 42.
- Distribution of labour to non-stamping mines, (851) 42, (2,769) 130, (10,920) 490.
- Number of natives recruited by (854) 42, (9,332) 400.
- Wastage and desertions, (855) 43.
- Relations with Portuguese Government, (865) 43, (1,034) 49, (1,956) 95.
- Results of recruiting in Basutoland, (19) 4, (71) 5, (887) 44.
- Ditto before war, (890) 44.
- Cost of recruiting by, (891) 44, (1,027) 49.
- Causes affecting supply of labour, (955) 46, (964) 46.
- Influence on chiefs on supply, (966) 46, (979) 47.
- Effect of British rule on authority of chiefs, (981) 47.
- Portuguese control of natives, (982) 47.
- Drink and natives, (989) 47.
- Organisation of labour supply, (996) 48.
- Railway facilities for travelling natives, (996) 47, (1,039) 50, (1,116) 56.
- Mortality and health of natives, (1,007) 48.
- Estimate of supply of natives, (1,012) 48.
- Return to old system deprecated, (1,016) 48.
- Dissatisfaction of agents at Lourenco Marques, (1,043) 50.
- Alleged dissatisfaction with agents, (1,049) 50.
- Missionary complaints against, (1,061) 51.
- "Notes on Recruiters' Records," (1,081) 52, 59.
- Memoranda and correspondence with Secretary of State in reference to British East Africa and Uganda, (1,085) 52.
- And German West Africa, (1,097) 54.
- And British Central Africa, (746) 31, (888) 44, (935) 45, (1,055) 50, (1,099) 54, (1,011) 48, (1,815) 56.
- Disagreement with Rhodesian authorities, (1,101) 55, (1,120) 56.
- Available labour supply from Rhodesia, (1,132) 56.
- Repatriation of natives, (1,146) 57.
- Districts open for recruiting, (1,148) 57.
- And imported labour, (1,153) 57.
- And the Johannesburg Municipality, (1,296) 63, (1,399) 66.
- Recruiting of Swazies for Barberton, (2,305) 105.
- Recruiters' licences in Portuguese East Africa, (2,387) 110.
- And Mr. Brentano's offer to supply 20,000 Somalis and Abyssinians for labour on Rand, (2,920) 137, (3,114) 146, (9,563) 434.
- Ditto, correspondence on, (3,016) 139.
- And Basutoland, (3,189) 149.
- Shortening of contracts conducive to greater supply, (3,171) 147, (3,190) 149, (3,359) 154, (4,759) 202, (4,782) 205, (4,937) 210, (5,533) 235, (6,051) 253, (6,751) 281, (6,773) 282, (6,817) 284.
- Ditto, inadvisable, (3,407) 155.
- Antipathy of Portuguese East Africa natives to, (3,544) 160, (3,650) 164.
- Mr. Ingle's criticism of, (3,890) 173.
- Natal natives object to methods of, (4,016) 177.
- Methods of, superior to free recruiting, (4,117) 181, (5,083) 216.
- And the White League, (7,819) 322, (7,849) 323, (7,909) 325.
- Refusal to take boys by, (7,873) 324.
- Mr. W. Grant on, (8,122) 331.
- Destroying confidence of natives, (8,167) 337.
- Original prospectus of, (8,212) 339, (8,518) 353.
- Influence of W.N.L.A. on supply, (9,843) 445, (11,660) 516.
- Results of Barberton, (11,660) 516.
- Allotment to mines in May, 1902, (12,024) 528.
- Mr. Cabral's criticism of, (12,226) 537.
- Mr. F. Perry (recalled) on Mr. Cabral's evidence, 539.
- Ditto, on Mr. Brentano's evidence, (12,350) 543.
- WIVES OF NATIVES—  
See Polygamy.
- WYBERGH, MR. W.—  
Evidence of, on labour supply of Witwatersrand, experiments with whites in (13,917) 611—(14,056) 617.

## X Y Z

- ZAMBESI—  
See Portuguese East Africa.
- ZANZIBAR—  
Recruiting in, (1,193) 58.
- ZEFFERT, MR. H. M.—  
Evidence of, as member of the Executive Committee of the White League; opinion of, as to number of Kaffirs in South Africa, number available for work, methods of W.N.L.A. and allegations of ample supply in South Africa by White League, (7,818) 322—(8,015) 328.
- ZOUTPANSBERG—  
Mr. B. H. Dicke on, 220.
- Supply from, (5,277) 221, (5,343) 224.
- Polygamy in, (5,277) 221.
- Native customs of, (5,277) 221.
- Influence of chiefs in, (5,277) 221.
- Postal orders for natives, (5,277) 221.
- Natives on farms in, (5,823) 246, (12,812) 563.
- Native taxes in, (5,289) 222, (5,321) 224, (5,367) 225.
- Influence of taxation on supply, (5,324) 224, (5,380) 225.
- Population of, (5,326) 224, (5,331) 224, (5,401) 226.
- Recruiting in, (5,336) 224, (12,731) 560.
- Improbable increase of supply from, (5,343) 224.
- Squatting on farms in (5,289) 222, (12,746) 560.
- Complaints of natives of, (168) 9, (5,411) 226, (12,726) 559.
- Distribution of natives of, (5,411) 226.
- Mr. B. Viljoen on, (12,716) 559.
- Farmers' requirements in, (12,712) 559.
- Pay of natives on farms in, (12,723) 559.
- Tribal system in, (12,783) 562.
- See also Spelonken and Northern Transvaal.
- ZULULAND—  
Population of, (293) 16, (394) 20, (518) 25, (2,639) 122, (8,144) 336.
- Native labour in, (294) 16.
- Natives leaving for work elsewhere, (295) 23.

## EXHIBIT No. 1.

## NATIVE WAGES.

Year.	No. of Natives employed.	Average Rate of Wages.	Remarks.	Remarks.
1889	15,000 to 17,000	60/-	No. includes those working in town.	
1890	15,000	51/3	Average for five months.	In October an Agreement was signed by 66 Companies to effect a reduction in the August rate, 63s. 1d.
"	"	44/-	-	December rate of Native Wages according to an agreed rate. A reduction of approximately 25 per cent. was effected.
1891	14,000	48/8	—	
1892	25,858	57/6	—	
1893	29,500	58/10	-	Suggestions were put forward by a Committee of the Association of Mine Managers, which closely resemble the lines on which the W.N.L.A. is run.
1894	40,885	61/1	—	
1895	50,648	63/6	-	During the early part of the year supply in excess of the demand, at the end of the year labour shortage acute, development retarded and Stamps hung up.
1896	70,000	60/10	-	Executives of Chamber of Mines and Mine Managers' Association considered it necessary to reduce the rates of pay. Reduction made from October and Wages fixed maximum, 3s. per day, minimum, 1s. 9d., 5 per cent. Special, the length of shift, food allowance was determined at this time.
1897	70,000	48/7	-	In March, 1897, the supply was greater than the demand. In time the Chamber of Mines and Association of Mine Managers decided to reduce Wages 30 per cent., making maximum 2s. 6d. per day and minimum 4s. Special rates to 7½ per cent. Special Schedule of Wages was issued.
1898	88,627	49/9	—	
1899	96,704	49/9	August, 53/9	Mines worked under Boer regime were allowed 20s. per man per calendar month, i.e., if 1,000 Natives employed, Wages 1,000l.
1901	18,177	31/1	War Period	Decided maximum be 35s. per month, minimum, 30s., Special rates to 7½ per cent. Shaft sinking non-producing Mines, 50s., producing Mines, 40s. System of recovering monies for passes, taxes, travelling expenses to be abolished.
1902	42,587	33/-	—	
1903	64,454	54/4	June only	In January, 1903, the rate established in 1897 was introduced, with the exception that no deductions were to be made on account of passes, &c.

The above refer to Witwatersrand Gold Companies only. Up to the year 1897 payment was four weeks. Thereafter payments made on completing 30 working days. In all cases, in addition to wages paid, Housing, Food, Hospital attendance and Medical attendance, are provided by the Companies free of cost.

## EXHIBIT No. 14.

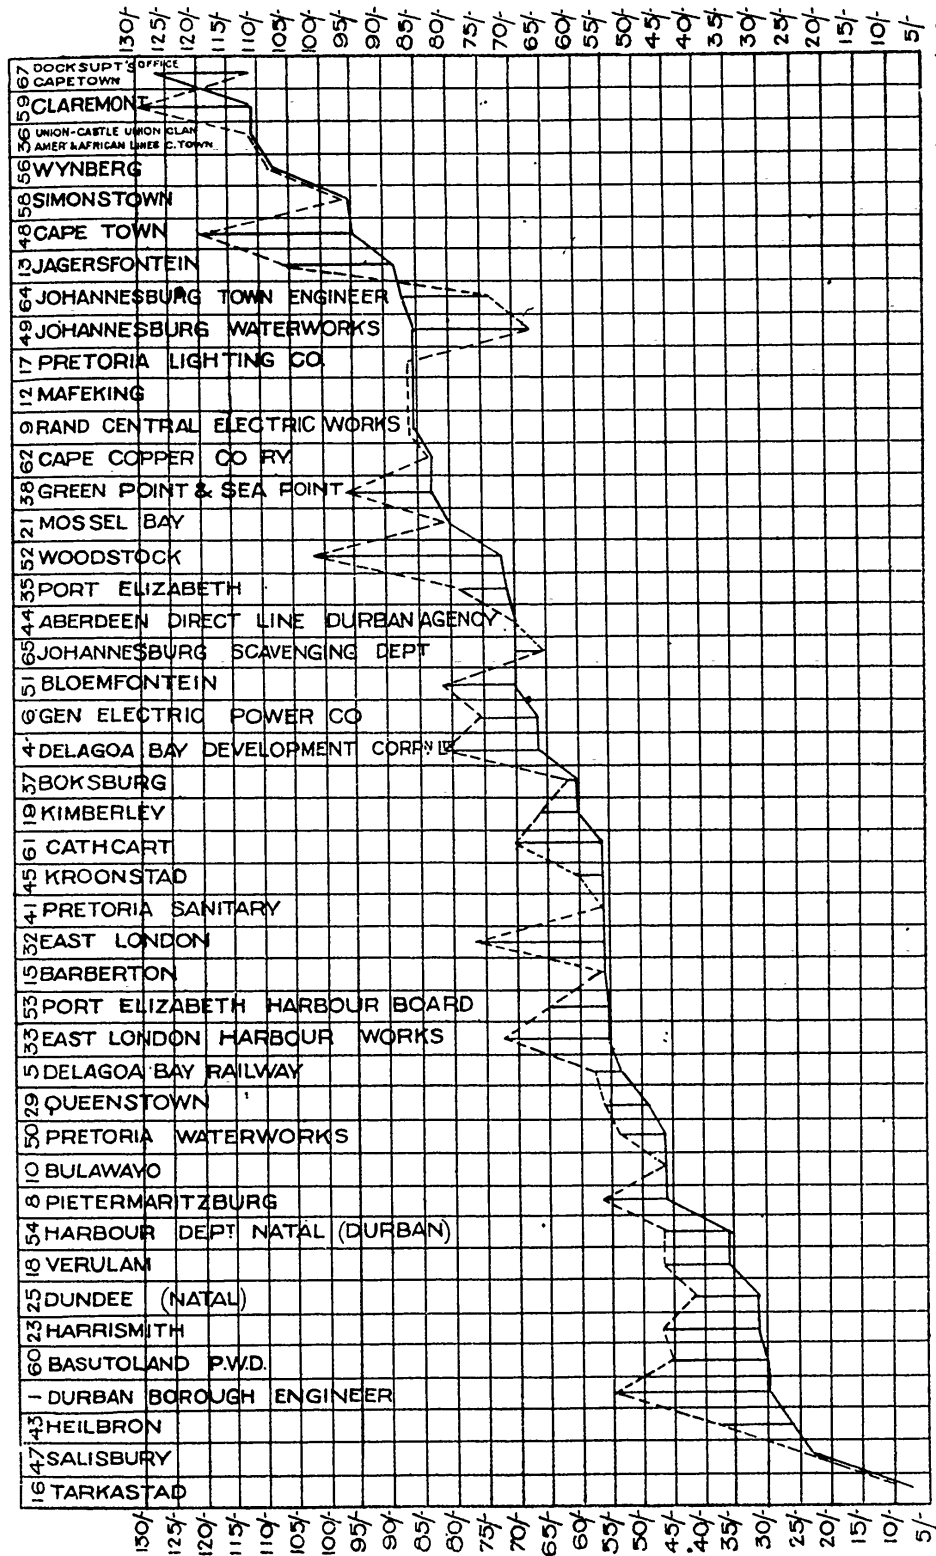

## AVERAGE NUMBER OF ROCK DRILLS IN USE, TRANSVAAL.

		Average Number.	Tons Mined.			Average Number.	Tons Mined.
1896	-	1015	4,403,214	1902, December	-	1004.0	450,096
1897	-	1351	5,930,714	1903, January	-	1069.0	481,585
1898	-	1850	8,327,699	February	-	1113.5	454,334
1902, July	-	699.8	361,299	March	-	1201.6	523,028
August	-	775.1	387,959	April	-	1244.7	543,704
September	-	889.9	403,672	May	-	1282.3	565,904
October	-	907.8	439,550	June	-	1339.7	588,747
November	-	938.9	427,691				

DIAGRAM ILLUSTRATING FIGURES IN ANNEXURE B.

All above figures are actual wages paid to natives in 1899 and 1903 in the various towns and public works from which returns have been received. (See Annexure B.)  
 The dotted line represents pre-war pay. The full line represents present pay.  
 5s. per month has been added for food, and 1s. per month for lodging, where these are provided free.  
 Where pay has been returned per day, 28 days have been taken to equal 1 month; and where pay has been returned per week, 4 weeks have been taken to equal 1 month.

N.B.—The cost of white labour in excess of native labour, i.e., 7,744*l.* 4*s.* 3*d.*, is a loss due to the employment of white labour. The loss per ton milled is not figured on the total loss, but only on that portion that enters into the actual cost of mining and treating the ore, i.e., 6,071*l.* 13*s.* 11*d.*

STATEMENT No. 2  
(181 WORKING DAYS).

COMPARISON OF WHITE AND NATIVE LABOUR DURING PERIOD JANUARY TO JUNE 1903.
