GOVERNMENT NOTICE No. 674 OF 1903.

LABOUR COMMISSION—APPOINTMENT OF.

IT IS HEREBY NOTIFIED for general information that His Excellency the Lieutenant-Governor has been pleased to approve of the appointment of a Commission to enquire what amount of labour is necessary for the requirements of the Agricultural, Mining, and other Industries in the Transvaal, and to ascertain how far it is possible to obtain an adequate supply of labour to meet such requirements from Central and Southern Africa; and to approve of the appointment of the following gentlemen as Members thereof:—

A. MACKIE NIVEN, Esquire, Chairman.  
Sir GEORGE FARRAR, D.S.O.  
Lieut.-Colonel J. DONALDSON, D.S.O.  
J. C. BRINK, Esquire.  
W. LESLIE DANIELS, Esquire.  
S. EVANS, Esquire.  
DAVID FORBES, Esquire.  
\*S. W. FURSEY, Esquire.  
GEORGE H. GOCH, Esquire.  
E. PERROW, Esquire.  
J. W. PHILIP, Esquire.  
J. W. QUINN, Esquire.  
C. F. TAINTON, Esquire.  
P. WHITESIDE, Esquire.  
P. J. MACDONELL, Esquire, Secretary.

By command of His Excellency the  
Lieutenant-Governor,  
W. E. DAVIDSON,  
Colonial Secretary.  
Colonial Secretary's Office,  
Pretoria, 2nd July, 1903.

GOVERNMENT NOTICE No. 695 OF 1903.  
LABOUR COMMISSION.

WITH REFERENCE to Government Notice No. 674 of the 2nd instant, it is hereby notified that His Excellency the Lieutenant-Governor has been pleased to confer the powers, jurisdiction and privileges granted by the "Commissions Powers Ordinance, 1902," on the Labour Commission.

By Command of His Excellency the  
Lieutenant-Governor,  
W. E. DAVIDSON,  
Colonial Secretary.  
Colonial Secretary's Office,  
Pretoria, 9th July, 1903.

The CHAIRMAN: I might explain that these are the same powers as are conferred upon the Supreme Court with regard to the summoning of witnesses and requiring witnesses to produce for inspection all books and documents which the Commission may think necessary. With regard to Mr. Donaldson,

207  
a member of this Commission, I have a letter from him, in which he expresses regret that owing to illness he is unable to be present here to-day. As members will know, Sir George Farrar and Mr. Brink are still engaged in their duties on the Legislative Council in Pretoria, and it does not appear to me likely that we will have the advantages of these two members' services until next week. Mr. Tainton left town last week and asked me to explain that he would be unable to be present this week, but he hopes after this week to be present regularly. Before we proceed to examine witnesses, I should just say a word or two on this first sitting of the Commission. We have had two private sittings to arrange procedure and discuss matters of detail; I need hardly say much with regard to the circumstances which have resulted in the forming of this Commission. I suppose everybody anticipated that when the war was finished and peace proclaimed we should have a large influx of natives for the various industrial pursuits and requirements of this country. Very few months, however, showed that that expectation which was so general was not to be fully realised, and in consequence a considerable amount of discussion has resulted in the press and elsewhere on this question of an ample supply. The community of this town, of this Colony, and in fact of South Africa generally, has rapidly formed itself into two camps on the question, the one camp holding the view that, having made considerable efforts to secure an ample supply, and these efforts having partially failed, that that of itself is evidence that an ample supply cannot be got. The other camp or division has taken the view that the result of these efforts does not in any way establish the fact that the available supply is not sufficient, urging that if proper means are taken to bring the available supply to the work it will be sufficient. I think all will admit that few persons are capable of forming a sound opinion on the information as yet available. Consequently the Government has decided that, to set this matter at rest, a Commission should be appointed to enquire fully into the whole question. The scope of the enquiry with which we are entrusted is divided into two heads; the first is with regard to the amount of labour necessary for the agricultural, mining and other industries of the Transvaal. That side of the enquiry is one which is probably the easier of the two. The second subject of enquiry is whether there is an adequate supply available in Central and Southern Africa. With regard to the first subject, what amount of labour is necessary for the various industries of this country, we shall be able to get reliable information from what I may call the principal industries of the country, the mining industry, for instance, which is so organised as to be able to lay before the Commission definite and reliable information of the requirements of this industry. Then we have the railway requirements. The railways, too, should be able to lay before the Commission definite information as to their requirements. With regard to the agricultural requirements owing to the lack of organisation, which is natural in such an industry, it will probably not be so easy to get reliable and accurate information, although no doubt we shall be able to get a good

NOTE.—Mr. Fursey resigned before the first public sitting of the Commission.

deal of information dealing with the first division of the enquiry, and, speaking generally, I think that all will admit we shall be able to get such information with regard to the three principal industries as will satisfy all reasonable men as to, approximately, the numbers required. The next division of the enquiry with regard to the supply available in Central and Southern Africa is a very much wider subject and one about which it will be more difficult to obtain reliable information. Johannesburg is a centre which seems to attract people from all parts of South Africa, and, without going at the present moment into the question as to whether it will be necessary to go outside Johannesburg to hold sittings, I think there is very little doubt we will be able to get during the next few weeks of the sittings a very large amount of information, not only from the Transvaal, the Orange River Colony, and other Colonies of South Africa, but also from Central Africa and from the country generally, which will enable us, in a few weeks time, to form some opinion as to how long it will take us to finish our enquiry and publish our report. With regard to the steps taken to secure information both on the first and second heads of the enquiry, first of all we have inserted an advertisement\* in every newspaper in South Africa of importance right from Capetown to Beira, touching every coast town and inland town right up to Bulawayo. These advertisements will be continued for some time, and, possibly, after a lapse of time will be renewed again. In addition, we are communicating with every Government in South Africa and with the Magistrates and Native Commissioners. We are taking every step possible to secure qualified persons as witnesses. It is the wish of this Commission and of the Government that this enquiry should be of the fullest and freest character, and that the utmost liberty should be given, whether to individuals or representatives of important interests, to give evidence before us. We are naturally anxious to avoid taking up the time of the Commission with hearsay evidence, but all persons who have an acquaintance with facts bearing on the enquiry, or holding information as the result of their experience likely to help us to formulate a report which will be of a conclusive character, will be welcomed by this Commission. The convenience of witnesses will be, as far as possible, consulted. The present arrangement is that we shall sit three days a week—Tuesdays, Wednesdays and Thursdays—and witnesses who are anxious to appear have been invited to communicate with the Secretary so that a time may be arranged for their attendance at their own convenience. I am well aware of the great interest that is taken in this subject all over the country, and there is a very natural desire that the Commission shall report as soon as possible. It is, however, impossible to say, or to give an approximate idea when the Commission will be concluded. It is, however, the desire of the Commission that no unnecessary delay shall take place, but what we are aiming at is that a full and proper enquiry shall be made. It will not be possible for

the Commission to follow the logical sequence as set out in the Ordinance appointing the Commission; but it will be the business of the Commission when the enquiry is finished to sift the evidence given by each witness and then to arrange the report in the logical sequence as cited in the Ordinance. As to to-day's evidence, we learned that some missionaries were in town in connection with a missionary conference sitting on Saturday last. We immediately put ourselves in communication with them, and as a result we have been able to arrange for the attendance of Mr. Dyke, Mr. Creux, and Mr. Coillard, and these will be the witnesses whom we will hear this morning.

The Rev. R. H. DYKE, called, sworn and examined.

1. The CHAIRMAN: You are the Rev. R. H. Dyke, of Basutoland?—I am, Sir.

2. Will it be convenient for you, Mr. Dyke, to make a statement to the Commission, or would you prefer me to put questions to you?—Well, Mr. Chairman, the district from which I come is Basutoland. I have been there the greater part of my life, was born in the country, and have been engaged in missionary work for 26 years or more. The character of the Natives, it is needless for me to describe, as the Basutos are well known. The usual minimum pay in Basutoland for a man is one shilling per day, but those employed by masons get from 1s. 6d. to 2s. per day. More skilled labour is still higher paid; there is a mason now working who uses Basuto labour, and is paying Natives at the rate of 4s. per day as stone cutters. They have to find themselves upon this, but, living, as they are, in their own country, it costs them little. The physique I do not think it is necessary for me to describe here, and I will pass on to (e) section of your advertisement as to the "Special Conditions, if any, affecting labour supply which would (a) induce, (b) deter from willingness to come to the Transvaal to work." Before entering on this subject, I think it would be well for me to give you a few figures which I laid before the Missionaries' Conference the other day. It may be as well to repeat that we believe the population of Basutoland is about 262,000, and Basutoland has always figured largely in the supply of labour for mining, agricultural and other industries. Then we must remember that there is always a great demand for Natives in the Orange River Colony on farms. Farmers absorb a large number of the Basutos as ordinary workmen and there are few who are skilled. When I passed the railway line, I was informed from good sources—and the Resident Commissioner told me—that there were 1,000 Basutos then working on a small section of the line, the last section terminating at Modderpoort. The number of passes issued for Native labourers before the war was about 60,000, while the number for the year ending June 30th, 1902, according to the books, was 43,000. With regard to these points, I do not know whether you would like me to go

\* The following Advertisement has been circulated throughout South Africa by post and by insertion in all prominent South African Newspapers:—

- (1). The Commission invites the attendance of all willing to give evidence, who are acquainted with the requirements of the Transvaal in the matter of labour for its Agricultural, Mining and other Industries, and with the amount of labour available
- (2). The Commission likewise invites the attendance of all acquainted with the native inhabitants of South and Central Africa. The matters as to which evidence is desired are, inter alia, as follows:—
  - (i.) District with which witness is acquainted.
  - (ii.) Length of time during which witness has known such district.
  - (iii.) Character of Natives of such districts.
    - (a) Usual Work.
    - (b) Usual Food.
    - (c) Usual Pay.
    - (d) Physique, Aptitudes, Special Ailments (if any).
    - (e) Special conditions (if any) affecting labour supply which would (A) induce, (B) deter from, willingness to come to Transvaal to work.
    - (f) Approximate numbers available.
    - (g) Enterprises, Agricultural and Industrial (if any) managed by Europeans in such districts, and number of natives required for such enterprises.

It is requested that intending witnesses will communicate with the Secretary of the Commission, Address—Box 2645, or 31, Plein Street (near Park Station), Johannesburg, as to their willingness to appear and give evidence; their addresses whether notifications may be sent them; and, if possible, a short statement as to the evidence they are willing to give, specifying those points they consider of particular importance.

Witnesses whom the Commission decide to call, will receive their reasonable expenses.

It is also requested that those who know of suitable witnesses will send the names and addresses of such persons to the Secretary.

on, or whether the Commission would like to put questions. I think, perhaps, it would be better to go on.

The CHAIRMAN: Yes.

3. Rev. R. H. DYKKE: Of course, as a missionary, I am not thrown in direct contact with these matters; we could only gather information as it comes before us, sometimes in a direct manner by complaints, and at other times, by entering into conversation with those who have come from the goldfields. I would like the members of your Commission to understand that any statement I may make is not intended as controversial, or in any way to criticise what has been done. You want evidence, and I shall simply repeat what I believe to be facts which I have gathered from people who have been there. The one great thing at the present time in Basutoland against labour on the Rand is that the confidence of the natives has been shaken owing to there having been changes in the system. They were paid before the war at different rates. I believe before the formation of your Mining Council immediately after the war, when they expected that their labour would be more remunerative than it was before, they were surprised to find they were offered 30s. per month, in other words, 1s. per day, because the month was to be reckoned at 30 working days—and this, of course, they do not consider as sufficient inducement to take them away from their country—the consequence was that few responded. A certain number enlisted, and I know the chiefs undertook to almost order their people to go, at first, as a proof of goodwill. But those who were independent laughed at the idea of going for a shilling a day, especially as Kimberley, at that time, was paying double that wage. The bad impression thus caused has not been altogether removed—when a native gets an idea into his head it takes a long time to remove that impression—the consequence is that there has been ill-feeling brought about, and, although the matter has been regulated, it has not removed all the bad impressions. Then they complain that although 50s. per month has been offered, it is not 50s. a month, and here they consider there is a kind of, well I may say, sharp practice in the matter. The month being paid at 30 working days, when they come to the end of their contract of six months, they find they have to work 24 more days.

This has had a very bad effect because it leads them to think there is something wrong. They say "We counted our months by the lunar month of 28 days. We have quarrelled with our fathers and others upon this matter, not being able to understand how a month was more than a lunar month, and now we find the white man has made the month by a measure of a month we do not understand." You will all appreciate the point, I think, and understand that it is at any rate calculated to make these people feel that there is an injustice perpetrated upon them. And that grievance rankles in their minds, and they say "We would rather go to Kimberley." I am merely pointing this out as a matter that has created ill-feeling and which may be profitably removed. There are a great many other points that they speak upon, but I would like to touch upon the six months question. We quite understand the necessity of having labourers here who remain for a long time because it takes them time to get acquainted with the work they have got to do. But I may explain that six months fits in badly with the Basuto natives' conditions. The idea that they go back to their homes to loll about and do nothing is erroneous. If you realize, Sir, that those Basutos who remain at home raise nearly a million muids of grain, you at once understand that there is a great outlay of labour expended on their own country by a small people. Besides the raising of this large quantity for their own use, they also raise large quantities for the requirements of the trading population and others in the country and for export; the number of bags on an average which are exported in ordinary years is 200,000 of various kinds, that is, mealies, wheat, and kaffir corn. They also produce wool and mohair, which requires labour. Again, they raise stock of various

kinds, so, what with the raising of these various needs, the building of their own houses and so on, it takes them a great part of their time. Sometimes, of course, a traveller finding them resting at a certain part of the day, gains the impression that they do nothing but loll about all day, whereas, as a matter of fact, they have done six or seven hours' work before he comes. It is an erroneous idea to think that these people are always lolling about. Now, the point I think I was making for, was the six months' arrangement. Why does the Basuto object to six months? They generally work in pairs. One man goes off to labour abroad, we will call him "A," and "B" remains at home and looks after the cattle and attends to the sowing of wheat, and, when "A" returns in three months "B" goes abroad to labour and "A" remains at home to attend to the sowing of mealies and kaffir corn. "B" returns at the end of three months in time to reap his wheat and "A" will return in time to reap his crops. So that their methods of labour fit in in greater facility for three months than six months; that is the reason, which many do not understand. Thus the six months' contract is generally objected to, and when they can get a three months' contract, they will go, with the exception of unmarried young men, who would rather accept a lower wage to act as herdsmen (wages 15s. per month) and they may even go and labour on farms and will go for 30s. a month, but refuse to come here at 50s. a month, and these boys are willing also, to remain for a longer period; they would probably remain for a year if there were no contract. Now, then, a grievance they complain of is that they are sent up and obliged to work where they are treated like machines. They are engaged by the tout, who sends them up, perhaps with the understanding that they are to work above ground, and when they come here they are sent underground, and the Basuto objects to go underground. And here I may explain the difference between the Native from the warmer climate and the Basuto. The Native coming from the warmer part prefers to work underground because it is warmer. The Basuto, on the other hand, is used to the fresh air, and consequently he prefers to be above ground. They say also that they are compelled when they come here to go to certain mines against which they are prejudiced. They would like to have a certain amount of choice in the matter of the mine in which they are to work. They say also that they are treated with a great amount of indignity, not perhaps by heads of departments, but by those who are immediately over them, they are kicked about and so on. And then another matter is that when they are maimed for life there is no compensation whatever given to them. A man comes up and loses a limb and goes away maimed for life and no compensation is given to him. Another objection is the general state of health of the natives employed on the Rand, and this question was taken up by the chief himself, who threw it out several times and complained to the Resident Commissioner that his people died here, and he did not want them to go away if it meant losing their lives. They complain that although doctors are provided very little attention is given to them. Although there are hospitals for those very seriously ill, they complain that many become seriously ill through want of attention at the beginning of their illness. Then when they feel they must get to their homes and begin to feel homesick there is no possibility of getting away because arrangements are not made for them to be accompanied by their own people, and this is a matter which I think would pay the employer of labour to see to, that when a man is really ill and has to go home one of the others should be allowed to go with him and if possible arrangements should be made to bind the other to come back. A young man died on one of the mines the other day, a son of one of the chief's principal men. I am afraid that that will be made a grievance. He was not allowed to have a companion to take him home. Had the point be conceded he might have died on the road, and the Rand would not have got the credit of it. Of course there have been improvements, and they admit there are; one of them is that their money

is now secured to them and they are not robbed on the road. This is one of the improvements which they admit, and there are restrictions which have been removed which were very demoralizing. I believe also that the housing has been improved, but in this connection I would here suggest that there should be some kind of provision made for these labourers where they could spend their evenings in a proper way, that halls should be provided for them and some means also of spending their Sundays. These are suggestions I would like to throw out. I think now that if I were questioned I could convey to your Commission some further information.

4. The CHAIRMAN: May I ask a question with regard to the labour passes issued in 1899, they are given here as 60,000; would you call that a fair average for a year?—Yes, possibly it is.

5. Taking the time which these boys remain away from home at work in the country, speaking generally would three months be a fair average to take?—That is more or less a calculation—that is taking into consideration that many of them work for a year; and others for six months, coming up to the mines. Others come for a much shorter period.

6. My question is this, would three months or four months be a fair average to take?—Yes.

7. From your knowledge of the country, would you say the number working outside the country at any one time, would be between 15,000 and 20,000?—Yes.

8. Have you any idea now whether the number leaving the country to work outside exceeds the average of previous years; would it be 60,000 or less?—I should think this year would be more than that, because of the want of food; the crops have failed this year.

9. And this induced a larger number to go outside than previously?—Yes.

10. Then you speak, Mr. Dyke, of a considerable number of the natives, not only working for themselves in the fields, but working in Basutoland in other industries for which they receive four shillings a day?—Yes.

11. Are there very many employed at that?—That is rather exceptional than otherwise. Take one and sixpence and two shillings per day; there are a fair number employed at that rate.

12. Would that number run into thousands, or what would it amount to?—There are a fair number employed.

13. You say a fair number?—Well, from a shilling to two shillings a day, it might run into a thousand.

14. You speak of usually having on the Rand about 5,000 working. That is from hearsay?—Yes.

15. Mr. QUINN: Mr. Dyke, can you tell us how the population is estimated? The estimated population of Basutoland was 260,000. Can those figures be relied upon?—The census is supposed to be made for 10 years. I am not quite certain when the last census was made, but the Government can ascertain particulars as to the increase of population by the Hut Tax.

16. Now can you give us any information, approximately at all events, as to the number of Basutos who came to the Transvaal for work before the war; immediately preceding the war?—No, I can only speak with regard to the number that went out from Basutoland.

17. Why do they prefer Kimberley to Johannesburg?—Well, I have put before you several of their grievances with regard to the Rand, and these grievances have told.

18. With regard to this number, 5,000, that you think come to the Rand, you have no means of testing that?—It is simply a rough estimate.

19. Can you give us any information as to the results of recruiting—of the new method adopted by the Native Labour Association? Before the war there was what is called free recruiting. Have you

made any observations on the new system as compared with the old system and its results?—I cannot say that I have. I have come into contact with the men who have been recruiting, but certainly cannot make any comparison.

20. Then would it be correct to say, that in your opinion the main reasons why the Basutos do not look upon this part of the country favourably, as a place for earning money, is that first there is not sufficient inducement. Then the question of wages; the enormous reduction in wages must have had an effect?—The wage of 30s. per month certainly did.

21. Another serious difference is that the boys are not allowed to choose their own employers. That is a serious grievance?—Yes.

22. And another grievance is that they have no proper attention when sick?—Yes.

23. And another grievance is the new system of payment adopted?—Yes.

24. Then it is your opinion that the bad impressions caused by these things, that I have enumerated, have not yet been dispelled. They still exist in a measure amongst the Basutos?—Unfortunately they take a long time to dispel.

25. Then it is your impression that on many of the mines the better rate of pay and the other improvements that have been carried out will improve the supply from Basutoland?—Certainly, I think it will.

26. Then you draw attention to the question of the way the Kaffirs live on the mines, that is to say, there is nothing for them but work and sleep. You think that if they had schools, or something by way of teaching them to read and write, that that would be beneficial, would have a beneficial effect if it were instituted along the Reef?—Yes, at Kimberley, they have these advantages which they have not here.

27. Mr. WHITESIDE: Mr. Dyke, have you any experience of recruiting methods previous to the war, that is with regard to those employed as recruiting agents?—No, I have just met them now and again.

28. It has been very generally stated that the Basuto chiefs are recalling all their boys. Do you know anything about it?—I saw in a paper that the whole of the statements in connection with that were false. I never heard of it.

29. You stated that there were a few of the boys receiving 4s. per day. The few receiving that amount do not affect the supply to the mines?—Not at all.

30. Does Jagersfontein get the whole supply from Basutoland?—No.

31. The bulk of them then?—I know they get a great many.

32. Can you tell us whether Jagersfontein has any difficulty in getting them?—I do not know.

33. You said in your evidence that Kimberley was supplied almost exclusively from Basutoland in its early days. Does that apply to the present?—They did at first because there was no railway communication. Basutoland was the nearest market.

34. Can you tell us where they get their labour at the present time, if not from Basutoland?—No.

35. I think we may take it from your evidence that the continual changes taking place, such as alterations in the rate of pay on the Rand, has inspired a great deal of want of confidence in the native mind, and, if there is a fixed rate, it will have a beneficial effect on the supply?—I think so. Take these periods of three and six months.

36. In regard to the latter that would also have a beneficial effect on the supply. The reason that we do not get more Basutos from Basutoland is simply owing to the bad conditions prevailing?—That has deterred a great many.

37. Can you tell us, Mr. Dyke, how many boys come to Aliwal, to the northern parts of Cape Colony, from Basutoland?—There are a great many, I cannot say as to the number.

38. Can you give us any reason why they go there?—It is quicker for one thing. The South Basutoland boys almost all go to Cape Colony. There are the facilities for travelling.

39. In the northern parts of Cape Colony the boys have better conditions?—Yes, and that induced them to go.

40. Mr. FORBES: How did you ascertain in the early days that Kimberley got most of its labour from Basutoland?—I found out by being about the country.

41. That is in Basutoland, but not at Kimberley?—I was at Kimberley in the early days, and it was an undisputed fact that the majority had come from Basutoland and Natal.

42. Is it not a fact that a great many Kaffirs came from the North, from Mashonaland way and the north of the Transvaal, the Zoutpansberg District?—It was admitted then, in the early days, that the Basutos formed the bulk of them. Now there was a certain proportion of them that came from these various parts.

43. Mr. EVANS: I think you say that about 5,000 boys take service up here. Do most of them take service as house-boys?—The Municipality engaged a great many. They prefer to have this employment.

44. The bulk of the Basutos take employment in either the Free State or Cape Colony?—Why they prefer the Municipality work is because there is a great deal to do with horses and animals and that is what they have been accustomed to in the early days.

45. Do you accept Mr. Sloley's report as fairly accurate as far as the figures and statistics are concerned?—Yes.

46. I have the report here for 1898-99, ending June. He gives the number of natives leaving for visiting as 56,653, and as labourers 37,371. I take it that the figures you have just given us refer to both?—The labourers would be those who are definitely engaged in Basutoland to go abroad as labourers. Visiting would be those who go out with the idea of accepting all labour on farms, and in towns, and so on. Those who go without engagements.

47. 37,371 are put down as labourers in the year ending June, 1899?—I think the number I quoted was for the previous year. It was 60,000.

48. It gives here 5,970 in regard to the Rand. You say out of that the majority go to domestic service or to the Municipality?—I do not know the proportion, but that has been the employment they prefer.

49. Kimberley is given as 1,000, Jagersfontein 4,500, farmers and domestic service 24,000. These figures we can rely upon?—I should think so.

50. Can you give us some idea of the age at which the Kaffir goes to work?—They start at 14 or 15 years of age.

51. And at what age would he cease leaving Basutoland?—Between 50 and 60 years of age.

52. What do you consider the age of the majority of them?—I have not gone into the matter.

53. Our experience on the mines is that they are all comparatively young, in the neighbourhood of from 20 to 30, is that correct?—The older ones will accept farm work. There are the terrors of the journey to the Rand, that always deters a good many of the older men from coming. Those of 14 or 15 years of age go as herds on farms. When they get to the age of 17 or 18 they go to the mines. Most of them coming here\* would be from 17 to 30 years of age. The older ones go to employment more conducive to their age.

54. Now why do they come here?—Because of the labour market. They come to gain money. They cannot earn enough in their own country.

55. Has Jonathan been opposing the Basutos leaving their country at all?—I have not heard of it in Basutoland, I heard of it after I left.

56. Now would you advise us to take the evidence of some of these chiefs; do you think it would be of service to us?—I think it would be advisable to ask the Government to choose a certain number of men who would be sufficiently enlightened to give evidence.

57. You say that the wages are a shilling there. Since when has this been the wage of a labourer? Has it been long?—I have paid a shilling a day for many years.

58. And that means?—Garden and other work.

59. Are the present wages that we are paying here, viz., 50s. surface and 60s. for underground work, satisfactory? As a minimum is that a satisfactory wage?—It seems reasonable.

60. What effect will that have upon boys who come to farmers?—Those who wish to come to farmers would rather accept 30s. on a farm at ploughing work than come here at 50s.

61. How are the farmers off in the Free State for labourers?—Everything has been so upset.

62. We are constantly hearing of reports that they cannot get labour?—It is very possible that that is so. The rebuilding of their farmhouses has taken up a great many natives. Then the putting up of the fencing. There is a very large demand for labourers for that class of work. There has been a great deal of destruction of property and all that has to be put up again, and that absorbs a very large number of labourers who would otherwise be working on the mines.

63. Do you consider this high wage we are paying here is in the interest of the country?—It must absorb a certain amount of labour that would otherwise be idle.

64. You mentioned about schools and churches on the mines here. Have you been round any of the mines?—I have not been through the compounds.

65. Well, I think you will find that in a great many of these mines there are places where these people can hold worship. Have you not heard of Mr. A. W. Baker's efforts?—I have had the pleasure of meeting him. There are mines where there is no provision at all. The natives not being allowed to choose their compounds are obliged to go to certain places where there are no such privileges.

66. Can you give me the name of any mine, so that we can enquire?—I am not sufficiently conversant with the mines, I am only a visitor here.

67. Then you said that the natives were not allowed to choose their mine. Is that a recent arrangement, or is not that an old arrangement?—I believe that that is since the war.

68. Does that exist to-day, now?—I merely repeat what has been said to me.

69. Can you tell me what the railways are paying on the Basuto border?—Fifty shillings.

70. And feeding and housing I suppose?—The housing is very, very indifferent. There may be a few tents, and so on. Of course they are nearer home, and another thing is the climate, and they can get away home when they desire to do so.

71. Do you know any of the representatives of the Native Labour Association in Basutoland? Do you know Mr. Fraser?—Oh, yes; it is only lately that he has taken up that work.

72. Do you think that the Association have made a good choice?—They have the possibilities of getting labour because they have over 100 stores. They are associated in that work with Mr. Charles Stevens.

73. Do you think the action of the Association in choosing these two men as the chief men for recruiting work in Basutoland is a wise course?—I cannot speak as to the wisdom of it. They have greater facilities than others because they have their shops which ought to be recruiting stations throughout the country.

74. Mr. Fraser explained the other day in a report in the newspapers that he was not able to recruit many boys, because for every boy that wanted work there were three people to employ him. Can you confirm this?—I do not know whether there might be two or three.

75. Do you think that the demand in Basutoland is greater than the supply?—Yes, I think so. I have already stated the re-building of the farms has taken up a great deal more labour than formerly.

76. There has been a suggestion repeatedly made that boys should be given an opportunity of staying on the Rand by bringing their families here, and so forth. What do you think of that? That locations should be arranged in the neighbourhood of these fields; that the boys should be induced to bring their families here?—With regard to Bastuos, I do not think we should advise it, as Missionaries.

77. You have spoken about the better spending of Sundays. The boys are all free to do whatever they like on Sunday?—They think they are.

78. What is the grievance?—Well, for them to come into town and roam about with an indefinite object. I do not think it would be advisable. It would in no way better them. At a certain hour they are free to go away.

79. Would you suggest that a certain restriction should be imposed on their movements on Sundays?—No, I do not think so.

80. Now they are perfectly free to go to any church or chapel they like?—The distance may be great.

81. Is not that the fault of those who should provide accommodation for them?—Yes. But with the large number there is in each compound it seems to me that it would be far better if there was some place that they felt was their own. They come up here and do not know where to go to. If they had their own place in the compound it would be an inducement to come here.

82. You say that they prefer Kimberley. That seems to indicate that they prefer this compound system where they are closed in?—I do not know.

83. Do you think the opportunity of getting diamonds has something to do with their preference for Kimberley?—I do not think so.

84. You have heard of no complaints about touts prior to the war?—I heard of reports of touts misleading the natives. There was a want of reliability about them. They induced the natives to come upon certain conditions and the natives found when arriving that they were utterly misled. That was the general complaint in the olden days.

85. Another point you made was about this month of 34 days; has not that always been the case?—I am not sure.

86. Do you not know that the arrangement here is payment by shift? When the boy has completed his thirty shifts he gets paid?—Not according to the month.

87. Do you not think that that is a fair arrangement, payment by shift?—It is not fair; they are told that it will be fifty shillings a month. The great point is, the simpler the arrangements with the native the better.

88. Was not this arrangement in force before?—I have not heard of it before. It is only of late that I have heard of this agreement.

89. This complaint you have about the boys not being allowed to go to the mine that they preferred. Is that a recent one?—I do not know. Of course I have not been going into the thing practically or definitely. I have my own work to go into.

90. You have not heard of the recruiting conditions in Basutoland at present, that the boy can be engaged there to go to a particular mine?—No.

91. But you think that that is an improvement?—Certainly.

92. Do you think that it is possible to get the boys to come for a longer period than three months?—Their preference is for three or four months.

92A. Do you think that this is a thing that cannot be very well changed?—I think that three months would attract them, but I think that many of them would re-engage after their three months were up, especially if they found, at the end of the second period, that they could engage where they liked.

93. When a boy has been here once how long should he stay away before he comes back again?—The great thing is to induce them to return, and especially those who begin to come here. I have heard it said that the difference between these and the Coast boys is, that the Coast boys do not repeat their journey very frequently.

94. Now supposing a boy comes here and is here for four months and goes away again, when can we expect him back again?—They may come twice a year. They are almost certain to come twice a year.

95. As to the complaints about the death rate here. Have you any figures on the question of the death rate?—I have nothing definite.

96. Our information is that there is a less amount among the Basutos than among the East Coast boys?—Yes, owing to the climate being more akin.

97. Mr. GOCH: Could you form an estimate, Sir, as to the size of families in Basutoland. Take the head of the family, how many would there be depending upon him?—It is generally divided by five.

98. You take five as a fair proportion?—Yes.

99. Is the five depending upon the one man?—I think that would be a fair thing.

100. That would make for this man five depending upon him?—If you take the Government Blue Book for this year, that should give you the number of huts, and that should indicate the number of families. The number of polygamists in the country is 17 per cent.

101. I understand that the "Hut" tax amounted to about £60,000?—Yes.

102. Taking 17 per cent., how many huts would belong to the polygamists?—About 12 per cent. would belong to the two-wife men, the others would depend upon the position they held in the country: the polygamous chief, of course, has more.

103. The families of these polygamists would be larger?—Not necessarily.

104. You have a population of 262,000. I see that is stated in your paper. That is an official record, a census taken?—I said 260,000, or more.

105. If we divide that by six we get 47,000 adults—able-bodied men upon whom the rest depend?—But then the larger number begin their work at the age of 15.

106. That is with regard to farmers and so on. When they come to the age of 17 they come to the mines, and up to the age of about 30. That is our experience. Of the 47,000 able-bodied men, therefore, we can only draw a certain proportion for labour?—You must add on those ranging from 17 to 22 years of age who form a considerable bulk of the men. And these do not figure in the 47,000 you calculate.

107. Yes, but they contribute something towards the support of the family?—Yes, but they would not count among the others that you divide by six or five.

108. I understand from you that Basutos are very industrious agriculturists. They must be because they raise such a very large quantity of grain. You state one million sacks have been raised in one year?—That is in a good year.

109. In addition to that, of course they raise stock?—Yes.

110. They also produce wool and mohair. They are also farmers?—Yes.

111. And according to the production stated they ought to be well-to-do farmers?—Except that they are so crowded that their ground has to be tilled with a great deal of care to produce what it does and their stock is overcrowded, so that the increase is not what it would be if they were in better conditions.

112. Taking it, then, that those who are in possession of land are doing the best they can with that land, that is why the land is so crowded, and therefore a very large number of them must be employed by farmers?—They are.

113. The men available for labour outside Basutoland?—They are all in possession of land on tribal tenure, and every man can get a certain amount of land, but it depends upon the position of the land that he gets.

114. It may not follow that the men who are not doing well as farmers come out for labour?—Not exactly; say a family consists of four sons, one remains at home and look after the farm whilst the other three go abroad. They all belong to the same family, and all have the rights to these plots of ground.

115. One in three of the men, you state, always remains?—Possibly; I consider that one should remain at home to look after the interests of the farm.

116. You seem to think that probably between 15,000 and 20,000 would be the most that would be out for labour at one time, allowing for them to come back?—Of course that is simply an opinion.

117. The available labour in Basutoland may be put at that figure?—I think so, and I think that Blue Book returns will show that.

118. And the rest would be on the farms in the Orange River Colony?—No, I am referring to mines.

119. When you say 15,000 to 20,000, you think that that would be the total number at one time?—Exactly.

120. However, that would supply the farms in the Orange River Colony also?—We have 5,000 engaging themselves as labourers on these mines.

121. Mr. QUINN: In reply to Mr. Evans, who suggested to you that the demand in Basutoland was greater than the supply, you said that it was stated that the passes issued to labourers before the war were 60,000?—We have something more definite in that report there.

122. The passes issued to the year ending 1902 were 43,000, a difference of 17,000 less. In 1899, 60,000 labourers' passes were issued and three years later 17,000 less were issued. How comes the demand to be greater than the supply?—Because that year was before the end of the war. There was not a farm employing labour right throughout the country. Those who would go into farm labour were in Basutoland.

123. If they were not employed, then there must have been more labour available when it was wanted?—This proves that you must go back twelve months. It is more than twelve months or eighteen months ago. That is the period ending June, 1902, and peace was only concluded at that time.

124. But you have no definite figures to show. You quote nothing at all in answer to what was suggested to you by Mr. Evans. It is impossible to have figures at all in the matter? It is an expression of opinion?—Yes.

125. Then, with regard to the farms, do the women work on the farms in Basutoland?—Yes.

126. So it would be quite possible for the whole of the able-bodied women to work on the farm and the men might be away?—The women never put their hands to a plough or carting home produce and so on.

127. Still, they do a large amount of work on the farms?—Yes.

128. Mr. EVANS: Can you tell us what has been the effect of the war as far as the Basutos are concerned? Has it made them much wealthier than they were before the war?—Certainly, but

not only from employment. It was the sale of cattle and horses that enriched them and they also got high wages from the military.

129. Have you any idea what number were employed?—No, that you can get better from the statistics; they are available.

130. What were the natives paid?—The least they were paid was £1 per month, that is the ordinary men. The better men got £4 and £5 per month.

131. The wealth, too, would in some way account for the smaller figures in 1902?—I should take it that the smaller figures would embrace the number on military work. I do not think that the wealth they got at that time would change matters, because they lay by for an evil day. If you look at the Blue Book for this year, you will see the amount of duty on imported stuff amounted to £33,000 of European products. That means that they are large consumers.

132. Now, in Basutoland, do the farmers on the borders not find it very difficult to get labour?—Yes, I have answered that question before.

133. Mr. WHITESIDE: Is it a fact that the Basutos have facilities for learning skilled trades?—We have industrial schools. We only have about 40 young men, and about 40 girls, who are learning industrial trades properly.

134. You have suggested that the evidence of the chiefs should be taken. Could you inform the Commission of the names of the chiefs who would have the greatest knowledge of supply?—I think you would be better to get your information from other quarters.

135. After the many years you have lived in Basutoland, I should think that your opinion would have some weight?—Perhaps the most valuable men, and men whom I would like to see here, could not come. Men who are rather old and not able to travel so far.

136. Could you see your way later to send in some names to the Commission?—I think the Resident Commissioner is a most valuable and obliging man, and I think he would be able to do all you require in that way.

137. Can you tell us how long the present Resident Commissioner has been in Basutoland?—16 or 18 years.

138. And you have been there 26 or 27 years?—26 years.

139. Personally, I should like to have your opinion as to the name of the chiefs. I would like you to submit some names to the Commission?—I would not like to do it at the present time at any rate. It is a very delicate matter, but, if you urge the point, and the Secretary will drop me a line when in Basutoland, I will be quite willing then to act. There is no hurry. I will be back there again on Friday of this week, I hope.

140. The CHAIRMAN: Are the Basutos fairly contented now? Is there any danger of trouble at all?—None whatever.

141. There have been at different times rumours of trouble in the newspapers?—Unfortunately rumours got up by men who are far away from the country and who are not capable of judging.

142. The Basutos are quite contented?—Certainly; there is no possibility of trouble.

Rev. E. CREUX, called, sworn and examined.

143. The CHAIRMAN: You are from the district of Spelonken?—Yes, I have been working in this district of Spelonken from 1875 until the war. Then I went Home, and I came back again. Since then I have been in Pretoria, as a kind of representative of our men. I went there to take charge of all our young men who come to work in Pretoria and who pass there and probably come to Germiston. As a Commission, you are probably acquainted with the Swiss Mission.

144. You know the object of this Commission?—Yes, Sir, I have read the advertisement in the papers.

145. Probably it would be more convenient to you if you made a statement to us as to your views on the two questions that the Commission are considering, or rather on the main question, the question of the supply of labour from your district?—I should rather answer questions as far as it is in my power to do so. And I can only say this, I have been absent from South Africa for four years, so that my statements cannot be as strong as they might have been if I had just come from the district. I went to the Spelonken about three months ago and had a talk on the subject of labour with all my brethren there and especially those who would be the men to speak on this question. There is one man who has a great deal to do with the men and who came back from the mines and who attends to medicines.

146. What is his name—Yengoe.

147. You suggest that he would be a very valuable witness?—He would certainly be the best man to induce the natives to come to the mines. He has the most to do with them. I only hear of those who are coming from the Rand now and who come here and go back to the Spelonken.

148. Still you are meeting these natives on their return regularly, and are able to speak of their feelings?—Yes, some of them.

149. What is the population of the district of Spelonken?—It was computed before the war of from 35,000 to 40,000.

150. And have they been in the habit of leaving the district and working in other parts of the country in numbers?—They generally came to Johannesburg or Pretoria. Before that they all went to Kimberley. There was a young man who did not go to the mines then. Since the Rand has been opened up they have come to the mines in great numbers. But we have heard many complaints that were made before the war which prevented a great many from coming to the mines then. I cannot tell you if those complaints have been removed, or if there are more of these people coming from the Spelonken to the mines. The Labour Commissioner, Mr. Godfrey, would be better able to tell you about it, and also the Native Commissioners who are there on the spot.

151. We have before us a few notes of evidence that you are likely to give to us and one of these notes reads as follows:—"Now the District has become rich, so only those go who are forced by want of money." Have you any idea of those who left the District before the War?—I have heard that 10,000 was the number coming from the Spelonken yearly, but, of course, I have no information.

152. Do you know if they are coming as freely now as they did then?—I believe now they come much more freely than before the war. Before the war they were brought by the Native Commissioners and many touts who were in the country. We had touts then all over the country with lots of brandy, and they managed to get the natives—of course it was not the best class of natives—but many of those they got in that manner ran away. But there was a great objection then in the country by the natives against coming to the Rand, because they all said "We are going to the Rand as slaves, and not as free men." When I left the country before the war there was an emigration going on to Mashonaland and there were touts who came from Mashonaland to recruit boys for the mines in Rhodesia, and even people from our stations said "No, we won't go any more to the mines, because it is only because we are obliged to go there and we do not know the conditions." If they are enforced, however, they say they would prefer to go to Mashonaland, and people go away from the Spelonken to Mashonaland. We have even had some our people who went there and never returned. They found the country to their taste and some of them died there. The mines had a very bad reputation before the war, but since the war I have not been long enough in the Spelonken to know the feelings of the boys. However, there was a very strong feeling against going to the mines. Our people generally,

in the Spelonken, if they cannot come of their own accord, without being bound by agreement to the Labour Agent, they prefer to come as store boys, or kitchen boys, or working boys in the districts, and so on, because they say they are in that way freer to look for better pay and that they have more freedom, and that they are more in contact with their own people in the Spelonken. It is easier for them to write to their families and to send money, and so on. That is what they always say. These people are very clannish and when they come to any place, they like to go where they know that they may find others of their own tribe. It would be advantageous if that spirit could be encouraged in the mines, if, for example, all the people of one chief could be brought together to work in one mine, they would come much more willingly, because, if one is sick among them, they could get help. They never get any help from other tribes. If a native is in trouble he must always have some people of his own tribe to help him. If he does not find them, he feels very faint-hearted and miserable. He never knows, if something happens to him, that his money will be sent to his family. That is the great point that I have always noticed, and I tried when I was in the Spelonken to gather all the people of one chief together, that they might be sent to one place, to one mine, and if they were in one mine, there would be a sort of tie between these people and their families. If, for example, there was one who was a kind of overseer of all these boys and who wrote their letters and let their families know in what state they were in, and when they would go back home and send the letters from one chief or one station that he might let all those people know and might interest them about their families, it would be a great point. With reference to the separation, when they were forced to go and be distributed amongst all the mines, that told very much against their going. I have known a quantity of natives who ran away for that very reason and who would not come to the mines. If they were obliged to go, on account of having to pay a "Hut" tax under the old Government, they ran away. When they came here they were allowed to come near their own people and one thing that I find now is the change that has come over all these tribes. A great many of these young men want to learn to read and to write. They have come to know that it is a very good thing to be able to read a letter and to write other letters, and it is an improvement for the boys who can already do this. The boys consider it as a boon to have a book in their hands and to cast themselves together with their families. That is why they willingly pay for it. These evening schools that are in almost every town now; we find that they willingly pay their share for the School Mission Teachers, and everything else, because they find that it is a great boon. I think that they ought to be encouraged, and if the natives feel that an employer has a certain regard for that feeling, they will feel encouraged to go on in that direction. Of course, as a missionary, I may say it will not do any harm. Although the people say that they learn to forge cheques, and things of that kind, I think that it is not in these schools that they learn it. We, as well-wishers of the country, and of the natives and their welfare, and of their going forward and not remaining simply animals and brutes, but as human beings who have the same rights as we have before God, think that there ought to be a change in the way in which they are considered and treated in some places. We have ample proof that there is a change in that way, but we think that it ought to be more general than it is now. Then there is the question of the manner in which they were housed before the war. I saw the compounds then, and knowing what the natives told us and how they spoke to us, found that the housing of the natives lead to fearful corruption and contamination and to the spread of a great many sicknesses. In fact, in some of these mines, a lot of these natives fell ill constantly, because of the crowded way in which these people live, and I have been thinking that if the housing in the

mines could be changed in the way that there should be berths instead of long rows of bedding, where they are all crowded together, it would be beneficial; for instance, if every one of them might have his little berth. Of course, it would be difficult, but if they could have the choice of it, it would lead them to a little more self-respect. Anything that tends to give them the feeling and to make them think that they are looked after, has a very beneficial effect on their minds and also on their bodies, and they will work more willingly and they will be more joyful, and I believe that the work itself would be benefitted by it.

153. Mr. GOCH: Do you know, Sir, how far the District of Spelonken extends. Is it all the north of Pietersburg, is it not?—Yes.

154. Does it extend to the boundary of the Portuguese territory on the one side?—Yes, when I was there, it was the District of the Native Commissioner and it extended from the end of the range to the Limpopo. I know that Captain Shields believes that there are in this District very large tracts of country which are thinly populated. There were a number of small Chiefs to whom we allotted certain tracts of country.

155. When you speak of the Spelonken District you mean the whole of the north of the Transvaal, the Limpopo and the Portuguese territory on the other side, and how far south?—Then the Commissioner of the next District was Captain Dunn, who had part of the great Spelonken and as far south as Leydsdorp; that was another District which was sometimes called the Great Spelonken.

156. Then to the west, how far do you go?—As far north as the end of the range.

157. That would be up to the Zand River?—Yes.

158. Then in that whole District you think that there is a population of between 35,000 and 40,000 natives?—I think myself there is more. According to what I have seen, there should be at least 50,000. Because the country is so large and it is well populated in some parts and thinly populated in other parts; then it changes. When the natives have grievances in the Portuguese territory, they come into the Transvaal, and they reverse.

159. You would probably take 60,000 as a liberal estimate?—Yes, I think it is. I know that it has been computed; that you could always make some figures out of the last "Hut" tax. The last taxes that have been taken have been computed at £100.

160. How long do those boys that come out stay away?—Do they stay longer than three or four months?—Not one of them comes for less than six or eight months. Most of them remain one year and many two years.

161. The district is also a farming district?—They are all farming.

162. They raise a lot of grain there?—Yes, a lot of grain when there is no drought.

163. Generally speaking, they are well to do?—It depends upon what people would call well-to-do.

164. They raise their own food there?—Yes, but almost all those who go to work have to buy food. They send money to their families to buy food, that is, to those who do not go to work. The whole of the food for which they arrange comes from a very fruitful country. It was a market for the Boers in the District.

165. Supposing there were 60,000 people, men, women and children included, you would take one in six as a proportion of able-bodied men there?—Yes, I think so.

166. Then the estimate that 10,000 go out to labour would prove rather a large one?—No, as I said at the beginning, I believe that the Native Commissioner would be much better able to give information than I am.

167. I suppose that the men who do go out for labour leave a certain member of the family behind them to look after the families?—Yes, that is

a law. They must leave one man to look after the grounds, to repair the house and to look after the matters of the family generally.

168. Mr. EVANS: You have spoken of the housing and bad feeding before the war. Have you heard any complaints since?—I have heard the conditions upon which the natives were engaged were not always fulfilled. It may be that the natives do not understand this. If you speak too quickly with the natives, and do not repeat it many times, until they are convinced, they always say that they were deceived. So it is rather risky to say that they have been deceived and that it was a case of defrauding. It is a thing that all the Labour Commissioners should bear in mind; that things should be thoroughly explained to the natives. Of course we missionaries hear many complaints, but of course we cannot see the cause of them, but we can depend upon the natives.

169. You said that the mines had a very bad reputation before the war; was that due to the Government officials up there, or was it due to the treatment on the mines here?—Both. Of course the natives expressed to us their minds about the mines, whether they were good or bad places, but the thing is they considered the places they were sent to when they did not want to go, and where people could not be got because of the treatment that they had received before.

170. In your statement you say that the natives came to the mines pretty much as prisoners?—Yes, they came as prisoners before the war.

171. That was before the war. Has that been changed now?—Yes.

172. You speak also of better accommodation upon the Rand. Are you speaking of before the railway was completed, or since?—I was speaking of before it was completed. Now I have seen too little since the war to be able to speak of what it is now.

173. Have you any specific cases of complaint lately?—I have heard of specific cases, but I took no written notice of these.

174. That is recently?—Some months ago.

175. What kind of complaint would that be?—That the natives did not receive the pay that they were promised.

176. You are not speaking of the class of complaints that you were mentioning before; going there with money and giving it to the chiefs, etc. Has that occurred lately?—I have not heard it since. But I can say that the people have great objections to coming to the mines. There are many risks in connection with it. There are many things that could be put into practice and which would take that fear away from the natives. I have tried when I was a missionary before the war to get all our people to gather together and work there for a certain time, and I have tried to get into communication with some of the mine managers, etc., but I found it rather difficult. The natives in objecting to go to the mines say, "We can get better wages by going after our own employers."

177. Supposing there were locations here in the neighbourhood of the Rand, do you think the natives would be satisfied to move their families and come down and settle here?—No, they would never bear the climate here. Their wives would be unhappy without having their gardens to dig, and I think they would suffer too much from the cold here.

178. If the land here produced all their wants, would they come down here?—Some would come, but I think there would be very few that would come. They are attached to the lands and high mountains and their country, and, of course, they would feel more liberty there in their own lands than they would here.

179. Mr. PHILIP: You say they come more freely to work since the war?—Yes.

180. Before the war, used these touts to pay the Chiefs for getting these men?—Yes,

181. So that the men were forced to come by their chiefs?—Yes, as far as the chiefs were able to force them.

182. You have spoken about the immorality that they learn here. Are those practices not common all along the Eastern Border?—There is a kind of immorality, of course, which we missionaries know pretty well.

183. They would not naturally have learned such practices here?—They did not learn immorality, but learned other practices of immorality.

184. Are they not the practices of immorality that you mentioned in your statement?—No.

185. Are not many of the natives syphilitic up there?—Yes.

186. There are many of them who would be physically unfit for work?—I do not think it has such a bad effect upon the natives, because their blood is much weaker and prevents disease; but it prevents them from working. There are different kinds of this disease, and it takes a great many forms, and it is only doctors who are used to such diseases who know about it.

187. The disease is very widespread up there, and has been so for many years?—Yes, it was taken by the natives coming down, and since then it has never ceased.

188. It did not originate, then, with Johannesburg?—No. It originated at the Diamond Fields. Every missionary is a bit of a doctor there. We have been many years without having a doctor nearer than in Pretoria.

189. The boys up there were provided to come here for their work as house-boys?—Yes.

190. Mr. FORBES: In the early days of Kimberley, the Spelonken boys came to Pretoria yearly to work?—Yes.

191. One grievance, I think, they had at that time was being robbed on their way home?—Yes.

192. So much was that the case that they got into the way of going to a storekeeper and getting him to forward all their valuables by transport wagon to the main station?—Yes.

193. Now that grievance has disappeared?—It has disappeared, but it is not long ago. Because last year when I was in the Spelonken it was not that they felt there was danger from some of the tribes, but from the farmers on the way, who made the natives pay for going through their farms on the highway. And then the natives told me stories about their being obliged to stay three months on a farm simply for the right of going through the farm. Others had to pay heavy taxes to the owners of the farms for going through these farms, and I can even give evidence of a white man having engaged a white man to rob the Kaffirs when coming from Johannesburg. One of my boys has been robbed of £50 in that way, and the man has been found out, but we could never get anything from him. That man was just a highway robber, and in a gang who rob in the Makapans country. He robbed the natives as they came home, and he was paying these natives just as common employees or labourers. We complained to the Government about it, but we could never get any redress. Our Mr. Baker said that he had written 22 letters to the Government, and never got any answer. Now that has ceased. What I wish to obtain, is this, there should be more care taken with the boys when they pass through Pretoria. I have seen quantities lying there in the mud and in the rain, and in the cold, and with no shelter, and these natives were obliged to remain there. They were not allowed to go and try and find a shelter in the town. I asked the Commissioner of Police that our people from the Spelonken should be allowed to go to my station there, and I would provide them with a shelter so that they would not get sick coming from the Spelonken to the Rand. It is a great want, and I have seen boys coming from the Rand and Mafeking lying at Pretoria without having any help there at the station. They were

dying and there they were obliged to go and lie down close to the station without having any shelter.

194. In these early days the Spelonken natives turned out early without touts going into the country to recruit them; they came of their own free will to Kimberley?—Oh, yes; they came without touts. There were no touts then.

195. Mr. WHITESIDE: You said, sir, that the bad conditions in the pre-war days prevented the boys from coming to the Rand—that they went to Mashonaland in preference?—Yes.

196. You have given us a general idea of the complaints made by these boys. Then you think that if the general conditions were improved all round, we would have a largely increased supply?—I think so. Because the natives tell each other where there is good agriculture, and where they can find good money and good treatment. The best touts and the best labour commissioners are the natives themselves. Everything is known, especially by some tribes or some clans. If the chief comes to trust such a man or such a place, then he will direct his people to go there.

197. Therefore the principal reason for the restricted supply of Spelonken, is owing to the bad conditions?—That is my opinion, and the fact that the natives can get better wages at other work.

198. What are these better wages?—£4, £5, and £6, if they know many languages, and are in stores where they can trust the natives to buy. Those are the best wages in Pretoria. In the railway shops they usually get from £3 10s. to £4.

199. But the boys that are able to earn these wages are in a very great minority, I understand?—They are what you call the raw Kaffir, who does not get more in such places. In situations he does not get more than 50s.—from £2 to £2 10s. But if they have to provide for themselves they never get less than £3.

200. But the Commission may understand it is your opinion that the number of boys who earn these higher amounts are in a small minority?—They are in a minority, but I should not say a small minority. I have got people coming to me from Pretoria and asking me for boys for farming purposes, or teaching purposes, and they always say they are willing to give £3, or, rather, to give from £2 to £2 10s., and they say if satisfied they will give £3.

201. The boys that earn over £3, you say their qualifications are that they must know several languages?—Generally, but not those that are working in the railway workshops.

202. What do they receive?—£3 17s. 6d. That is the current wage of these boys.

203. Do they get food with this?—No.

204. You are also of opinion that the indiscriminate drafting of boys of different tribes has a very bad influence on the supply?—It has.

205. Therefore, if some arrangements were made for the boys from the Spelonken to be drafted by themselves, it would have a good influence on the supply?—It would, the boys always try to go where there are others of the same tribe. It becomes a kind of tradition amongst them—where they get good wages and good treatment.

206. I understand that you were 25 years in the Spelonken before the war, is that correct?—Yes, I arrived in 1875 and remained until the beginning of the war, and I go Home for 12 months after a year or two. So that I was there from 1875 until the war broke out.

207. Could you suggest the names of the chiefs in the Spelonken district within your knowledge who would have any influence on the supply?—In the Spelonken things are not as they are in other places. There is no location there. All the chiefs are simply chiefs whom you can call "Indunas," and they have not so much power over the Shangaans as the Basutos have with their people. It would be more a matter of influence than otherwise. As for names, I know some of the names of

the chiefs who have got the different tribes around them, for example, there is the tribe of Mashanbe, that is a tribe of Basuto. I cannot say that they are all equal in their influence.

The Commission adjourned until 2.30 p.m.

The Commission resumed at 2.30 p.m.

[Rev. E. CREUX's examination continued.]

208. The CHAIRMAN: When we adjourned for luncheon, Mr. Whiteside was examining you, Mr. Creux?—About my residence in the Spelonken, I would like to correct my previous statement. I have been 31 years a missionary, but I have been in the Spelonken 19 years.

209. Mr. WHITESIDE: You told us this morning, Mr. Creux, that it was estimated that something like £100,000 had been collected in Zoutpansberg?—Yes.

210. That, at a rate of £2, would make 50,000 boys available. Do you think that there is any possibility of this tax having been evaded by any considerable number of the boys?—No, I do not think so. But, then, you see, sometimes there is a much larger district than the Spelonken. The Spelonken is perhaps a third part of Zoutpansberg. There are some locations in Zoutpansberg that are perhaps more populated—where the natives are gathered together more thickly than in the Spelonken, where the natives are scattered. There are no locations there.

211. What I am trying to arrive at is this: Is there any considerable number of boys who do not pay their "Hut" Tax? I do not think it is possible for them to evade it. It was stated this morning that about 1 in 5 was about the number available for labour. Now I think that you would bear me out that that is hardly a reliable estimate, inasmuch as the family can very easily consist of several young men amongst that five. It is not reasonable to estimate that they are babies, etc.; it is quite reasonable to estimate that of each of these families there might be a considerable portion that would be available for labour?—They would be available for labour, but in many places the chiefs want them to remain. Where there are big chiefs, as in the Zoutpansberg, and in other places the white farmers want a good number for their own work. In many of these farms the natives are obliged to work one, two, or three months a year. Then besides that work there are always boys that are obliged to remain in the house as servants. Still the fact remains that there is a considerable number who would be available for doing the work at home.

213. Mr. QUINN: Mr. Creux, is it possible to form any idea of the number of natives in your district who have lived there permanently and have gone over to live in Mashonaland?—It is impossible for me to say, because I just left when they began to leave for Mashonaland, and I have not been long enough in the Spelonken to enquire. Dr. Laves would be able to give information on that point. If you ask him he would give you some information about the Spelonken.

214. I think that you told us this morning that you had some personal knowledge of the compounds along the Witwatersrand before the war?—Yes.

215. Was that an extensive knowledge?—No.

216. Simply a few mines?—Yes.

217. I understood you to say the state of things you found there from the native point of view was extremely bad?—Yes, I was astonished. And especially when I knew the natives were dirty themselves. More care should be taken so that they should not live in such dirt.

218. I think you said something this morning about writing to some particular mine manager as to the treatment meted out to boys in some particular mine?—No, what I meant was this. We tried in the Spelonken to enter into communication with some of the mine managers of the Rand so that our

boys should come from our farms and stations direct, and that they should get good treatment and be well cared for. That is all that I meant to say.

219. Did you get any replies to your communications?—That was through an agent who was in the Zoutpansberg district. Then, that agent was not trusted by the natives sufficiently after the experience that they have had, and I did all I could with the boys. They would not go with him; they would not even trust him, and not even me.

220. Has any attempt, as far as you know, ever been made by your missionary friends to bring the question of the indifferent treatment, if not ill-treatment of natives, before the Chamber of Mines, or some responsible body in this centre. Has there been nothing of the kind done?—I only know of things since I came here.

221. Not before the war?—No.

222. This morning you said that originally when natives began to leave this part of Africa to go to distant labour fields, they went out upon their own accord, without being touted for?—Yes.

223. I take it for granted that they went out to get money?—Yes.

224. Now, do you think if the conditions generally such as you have been enlarging upon this morning were improved, that is to say, if something in the shape of social life, schoolrooms, and more accommodation in compounds was provided, and all these changes were brought about, that it would have a very great influence upon the supply?—It would take some time.

225. I mean eventually?—Yes, eventually.

226. It would be most unreasonable to expect that after years of indifferent treatment, followed by an attempt to cut down wages to a ridiculous figure, the impressions which have been carried and spread over the different labour markets would be eradicated immediately, it would take a long time before that is done?—Yes.

227. Would you say, according to your judgment, the shortage at present of boys is largely owing to the reduction in wages immediately after the war, when the market was empty?—Certainly.

228. That you are convinced of?—Yes.

229. Mr. PHILIP: Mr. Creux, you estimated that a large proportion of the population up there was syphilitic. Do you think that it is fair that we should allow syphilitic natives to come down here and live among natives here?—Certainly not. It is one of the grievances of our people, when we think about it and talk about it. Our people ought to undergo an examination in the present state of matters. But there are more boys who go back to their homes contaminated than there are of those coming from the interior, because when they are sick at home they go to the doctors, and they themselves know plenty of medicines to deal with such sickness, and they also go to our doctors to be treated.

230. Mr. EVANS: Can you tell me what is the highest wage paid to natives on the railways at Pretoria?—The highest that I have seen is £4. I do not think that I have heard of any higher wage. That is the highest that I have heard of.

231. What wages do your natives get in domestic service in Pretoria?—In Pretoria the common wage is 10s. per week.

232. And food?—Yes, and food.

233. And housing, of course?—Yes. That is just the common boys. Some of the younger ones get 7s. 6d.

234. In what employment do your boys get the best wage?—It is at the railway and the night work.

235. Now supposing that all your recommendations were adopted here on the Rand, how many more natives could we get?—It would be rather difficult for me to tell the number. I could not do so; it is impossible.

236. Now, considering the competition that is going on for domestic servants and other servants, railway hands, etc., are we likely to get a great

many more boys from your district?—It all depends upon the reputation the mines will get this year and next year in the centres.

237. What age do you consider the natives leave your place for service?—At fourteen years of age.

238. Up to what age do they continue to come to work?—Up to the age of about 50. I have even seen some about 60 coming to work.

239. What do you consider the ages of those coming to the Rand, or, say, between what ages?—Between 17 and 18 and between 30 and 35 years of age.

240. Mr. QUINN: With regard to the boys who get this disease, syphilis. Do you know whether there is any proper treatment on the mines? You are a doctor, I believe?—No, I am not a doctor. I cannot tell you. Our doctor will be prepared to speak about it in a medical way.

241. Is it within your knowledge that 700 to 1,200 or more boys get medical attendance only by a visit from a doctor who lives in the town. He is supposed to look after from 700 to 1,000 or more natives?—It is what I have heard from the people who seem to know.

Mr. P. H. ROSS, called, sworn, and examined.

242. To the CHAIRMAN: My name is P. H. Ross. I came down with the 300 odd natives who were recently brought to the Robinson Deep Mine, as an experiment, and am at present acting as compound manager and interpreter at the Robinson Deep Compound, and generally looking after and bossing up the natives. I refer to the 300 odd natives who were brought from British Central Africa. I have lived in different parts of Central Africa for the past five years. Any statistics which I may give to the Commission are merely approximate. I do not know where to obtain official statistics; all I can give is a general idea. I am acquainted with about six different tribes of natives in British Central Africa, but, as stated, the figures I shall give you will be only approximate ones. I arrive at the figures from my personal observations whilst travelling about the country, and going about the different villages in that section. The first tribe I am acquainted with occupies practically the whole of the valley of the Zambesi for about 400 miles. This part covers about 100 miles in length from the junction with the Zambesi and the Shiré. The distance from the Shiré to the junction with the Zambesi is about 240 miles. The number of natives in the Port Herald district of British Central Africa is about 40,000; the tribe is known as the Sena tribe, and is what is called a river tribe. This estimate, which is the largest estimate I know of, has been obtained from one who lives in that district, who obtained the figures from the collector of the hut tax. The usual occupation of this tribe is working on the steamers belonging to the several transport companies. The natives are engaged as bargemen, cooks, and stokers in the employ of the companies. Probably some 300 or 400 are also engaged there on plantations; altogether probably some 1,500 are working on the river. They usually work about one month and then rest three months. Some of the best of the natives, however, who are employed in the more responsible positions, work for as much as six months at a stretch. Most of these are engaged as pilots and stokers, and having the best positions, they seem to remain longer at their work; others of these natives work on the French sugar plantations, which, for the most part, are situated about 90 miles from the coast. The Sugar Company employs, I should say, roughly, about 500 natives. Another company (a British company) employs, say, 300 or 400. On the sugar plantations I should say about 1,000 were employed altogether. As far as I am aware this tribe does not engage in any other occupation beyond digging in their own gardens, and in fishing on the river. Both the men and women attend to the gardening. Of recent years some 300 to 500 per annum have been leaving the district, in small batches, to work in the mines in Rhodesia and on the Rand. I may say that, until the recent experiment of bringing these 300 odd natives to the Rand from British Central Africa, the natives were not allowed to leave

the country to go to work in any other parts; the 300 to 500 per annum who left, got out surreptitiously, and most came from the port territory. I personally had nothing to do with the recruiting of the 300 natives who have recently been brought to the Robinson Deep Mine. Previously, as far as I am aware, there have been no large numbers coming to the Rand to work; but previously attempts have been made to get the natives out, with the result, as stated, that some of them have been taken to the mines, in Rhodesia principally. The food of the Sena tribe is principally rice, but they eat fish and whatever animal food they can lay their hands on; in fact, they will eat anything from a crocodile to a locust. In physique this tribe is fairly strong, but certainly not generally so muscular as some of the tribes from higher altitudes; in fact, as a rule, they are rather flabby, but on the whole pretty strong. As a class I should say they are hardly equal to the Zulus. I believe that Mr. Nourse, when he went up there to recruit the 300 natives, experienced no difficulty in obtaining the number he required, but he was only allowed to take away the 300 odd. At the present rate of wages for native labour obtaining on the Rand mines, I believe as many as 10,000 annually could be induced to leave for work in the mines here. None of the very numerous villages throughout the district contain less than 100 natives each, and the valley of the Zambesi is thickly dotted with such villages.

There is another tribe I am acquainted with. It is known as the "Angoni" tribe. They are a branch of the Zulu race. The numbers would be about 40,000, and about 20,000 of these would be males. These people are principally used on the coffee plantations. I base this estimate of 40,000 from the fact that in the recent war it was commonly reported that the northern part of the tribe alone could put 40,000 men into the field. That was the Government estimate at the time. The main body of these men are employed as carriers, carrying provisions, as there are no railways there; but a large number are employed on the coffee plantations. Usually, I should say, about 1,000 are employed in different parts of the country as carriers. A large estimate of those employed on the coffee plantations would be 3,000. There are only some 300 white men in the country altogether, mostly engaged in coffee growing; probably 200 are planters. These natives are a tribe much stronger than the Sena natives; they live in a country from 3,000 to 3,500 feet above sea level. Some of them are thin, but as a rule they are well developed and muscular. They have never been out of the country. I have never heard of any of them having gone to Kimberley some 10 or 12 years ago. I do not think there would be any difficulty in getting them to come to the Rand to work. The rate of pay ruling here would be a great inducement to them. Working on the plantations they receive about 2s. 6d. per month. No doubt the plantation owners would offer serious objections to the natives be allowed to leave for work in the mines. At present there are Government restrictions on their leaving the country. The permission recently granted only applied to some 300. These 300 odd natives on the Robinson Deep Mine are mostly belonging to the Sena tribe; there are no Angonis amongst them, but some 50 of them belong to another tribe living in country of a higher altitude. The food of the Angoni tribe is similar to that of the Sena tribe, but they do not get any fish diet. They live on rice to some extent (although rice is rather a luxury with them), on mealie porridge, and on pumpkins.

I know of another tribe called the Yaos. They are of a much superior type of intelligence to the Sena tribe. The Yaos are a good deal employed as artisans. They are also known as the Chieundas. They work as blacksmiths, etc., having been taught the trades by the missions. Any estimates I may give the Commission as to their numbers I cannot vouch for the accuracy of. There are probably about 15,000 of them. I state this estimate simply from my own observations when I was travelling through their villages. I have travelled through

their country a good deal. The estimate is my own. Probably some 300 males are employed as artisans. Some of the others work on the plantations, probably some 2,000 of them being thus employed. Many of the boys are employed as overseers over the Angonis, on account of their superior intelligence. The balance are principally employed at hoeing and the like. When I gave the figure of 15,000, I was speaking of the tribe as a whole. I reckon that practically all the males are employed. They work for a month or so, and then go back and dig in their own gardens. At times some of them have stolen down the river, and have got down to Beira, and got work on the mines in Rhodesia, but I do not think in any large numbers. I think a large number of them could be got for work in the mines, provided the British Government offered them encouragement for so doing. That is to say, provided no difficulties were placed in the way by the Government authorities.

I know of another tribe on the western shores of Lake Nyassa; they are known as the "Atongas." There are, I should say, about 20,000 of them; that, I think, is a low estimate. They are employed similarly to the Angonis. Probably some 200 of them have been taught trades, and are employed as artisans. They have been taught by the missions. These men are working mostly as carpenters, blacksmiths, and the like, and some of them are engaged as telegraph operators and clerks. They have been taught from the Bandawe Mission Station, which exercises considerable influence in that part of the country. A large number of them, however, work on the plantations. Altogether, I should say, roughly, that from 3,000 to 5,000 of them are engaged on the plantations and as carriers. In physique, they are generally well built, combining the physique of the Angonis with the sleekness of the Senas. They are very strong. The only three or four I have ever known to leave the country are now on the Robinson Deep Mine. They are not permitted to leave the country.

There are other tribes in the port territory. I may mention specially the Chipeta tribe. These natives are very ill paid, working for a few yards of calico. They do not know the value of money. I should say there are about 5,000 of them. I have travelled through the port territory somewhat, but I cannot form a very good idea of the numbers there, as I did not stay in that part long. They are employed mostly as carriers and hoers on the plantations. Not many of them come out to work. Recently the Portuguese authorities seem to be restricting them from so doing. Some five or six years ago many of them went into British territory to work, but of recent years, since the Commission was appointed to regulate the boundaries, the natives are prevented from going over the boundaries unless payment is made to the Portuguese authorities for the native supply. This tribe is not an important factor. They have, some of them, been acting as household slaves to the Angonis. I do not know of any other tribes in British Central Africa.

There is a tribe in Portuguese Eastern Central Africa, about a day's journey off, which is called the Anguru tribe. I do not know how many there are of them. I have not passed through their country. I have met 200 or 300 of them as carriers in British Central Africa.

The foregoing are all the tribes I am at all ultimately acquainted with; but I have heard of other tribes in the Congo Free State and in other parts, but, of my own knowledge, I know nothing of them.

243. To Mr. QUINN: I have actually lived in the country I have been speaking of, and the figures I have given have been gathered from my own personal observation of the peoples. The shipping companies I referred to, pay the natives from 8s. to 10s. per month for non-skilled labour. I am of opinion that the wages offered on the Rand would induce the natives to come here to work; that is to say, if they did not get a scare by too many of the new arrivals dying soon after they arrived here. The batch recently experimentally brought to the Robinson Deep Mine numbered, I think,

364 or 384—I am not quite sure of the exact figure. Since the party arrived here, 17 of them died. At present there are some 29 of them in hospital. The most of them at any one time in the hospital has been, I believe, 56. In my opinion, no one with the slightest knowledge of that particular tribe would have thought of bringing them here at this particular time of the year. It was a very bad time of the year to bring them down. The boys who have been brought down have undoubtedly been subjected to a very severe test. I say that in my opinion these people could not have been brought here at a worst time of year. Most of them who have travelled down have contracted very severe illnesses, principally a sort of influenza, developing into pneumonia. We have certainly lately had an epidemic on the mine of influenza and pneumonia, but these Central African boys have suffered most from it. Out of the boys on the Robinson Deep Mine, other than these Central Africans, only some three or four have died from it, and there are some 1,200 boys on the mine altogether. The proportion of deaths amongst those other than the ones recently brought from British Central Africa has been very much smaller. Had the boys brought here experimentally been brought in summer weather, it would undoubtedly have given them a better chance. The sickness is now gradually disappearing from amongst them. The number of sick has greatly decreased during the last fortnight. No deaths have occurred during the last three days. These new boys have the best houses in the compound. They are undoubtedly being well looked after and attended to, and every effort is being put forth for their care and housing. As a rule, there is only one doctor in attendance on the whole of the compound, but during the recent epidemic of sickness, we have had four doctors in regular attendance. My opinion is that if these boys had been brought down during the summer they would have a chance to get acclimatised, and when the winter came on they would have been able to withstand the severe weather. Of those who are well, it is a fact that they are not doing nearly as much work as had been expected of them. It must be remembered, however, that these people are accustomed to a lazy existence. The Mine Captain at the Robinson Deep has told me that these new boys only do about half the work that the other boys do—instead of drilling about three feet of a hole per day, many of the new boys only do one and a half feet of a hole per day, and in fact some of them do no more than six inches. With the exception of about 30, all of them are working underground. Some 80 of them were put in prison, and when they came back, nearly all of the boys wanted to go underground. The reason of this was not that the rest were afraid of being imprisoned if they did not go underground, but just at first one man died underground suddenly, and thinking they would all die suddenly if they went underground, a scare against underground work was created, but this gradually wore away as they found others went down and returned safely, and when they got to know that it was warmer working underground than on the surface, they all wanted to go below.

244. To Mr. WHITESIDE: I have stated that I estimate the Sena tribe at 40,000; of those 1,500 are engaged on river work, the French Company employ about 500, and I should put the total at work at about 2,000. There are accordingly large numbers available for outside work. Several small batches have migrated to the mines in Rhodesia. As to the result of these migrations, it was generally favourable. I myself have met numbers of them returning from those mines, with trunks full of clothes, and they gave it out generally to those who had remained behind, that the mines in Rhodesia were places where they could make plenty of money, and the impression created in the general mind was a favourable one. The attempts I have referred to to get the boys away to work were made before the war. When I stated there were large numbers of villages, each containing not less than 100, that statement was made from my own observations. I travelled the country thoroughly. I have been very careful in stating

numbers to give a low estimate in every case. If the present restrictions were removed, I have no doubt but that a considerable number of natives would be available for outside work. It is true that the new boys on the Robinson Deep Mine are not doing as much work as the other boys; but most of the older boys have had considerable experience. Many of the Shangaans have been coming to work in the mines here for a considerable time past, and they return and tell the other natives who have not been to the mines, all about the work, so that when new ones of the same tribe come down, they know a great deal about the work before they arrive here, so that it is to be expected they will be able to do good work. It is not fair to compare the work of these new boys with the others. The mine authorities do not expect the same amount of work from new boys as from old ones; but even so, it is a fact that the work so far done by these Central African boys has been disappointing. Personally I am not myself surprised at this; I think that under the circumstances they are doing fairly well. They are undoubtedly lazy as a class. These new boys were principally recruited from the Sena tribe. There are other boys who would, in my opinion, suit the purpose much better.

245. To Mr. PHILIP: I have stated that there are roughly about 40,000 Senas, 40,000 Angonas, and about 20,000 in Portuguese territory; or a total of about 100,000 altogether. Of these I should estimate that probably some 30,000 are fit for work, that is to say, I should put down the number as available for work at 30,000; 10,000 of these are at present, we will say, at work, leaving 20,000 still available; large numbers are engaged in their own gardens. It is not a very large proportion of the total.

246. To Mr. EVANS: Yesterday there were three hundred of the new boys working at the Robinson Deep Mine. In physique, with the exception of a few old men who were badly chosen, they are, as a whole, equal physically to the other boys on the mine. In the statistics I have given, I admit that I am not going by official figures. I should certainly consider that figures supplied by Sir Harry Johnston would be more correct than those supplied by myself. There is considerable opposition amongst the European population of British Central Africa to the natives from that part coming to mines on the Rand to work. Usually the planters there require the natives to work in the wet season, which is just the time that the natives want to work in their own gardens; and if the natives are taken away for work in these mines, the planters will naturally suffer. The coffee industry in that part is, however, of late declining rapidly. This is not, I believe, owing to any scarcity of native labour. I have heard of the planters meeting with some difficulty at times in getting native labour, but the difficulty has never, I believe, been so serious that it could not be got over. Newspaper reports would naturally reach the planters. Missionaries, as a whole, I believe, are against the natives coming to the Transvaal and Johannesburg, as the opinion seems to be held that the boys are demoralised by coming here. I think the best time to bring boys here from British Central Africa would be about the end of August. If a batch came here in October they would have a better chance than had the last batch which came down. I have never heard that natives were brought here from British Central Africa in the months of September, October, and November, and that half of them died. Certainly I believe that the altitude, and the climate generally here have a bearing on the question of bringing the natives to Johannesburg. The natives are very careless as to their clothing, and are very subject to cold. I admit that the altitude would be no different in August to what it is at any other time of the year. In British Central Africa proper, all round about Blantyre, there is a great variation in climate, but from the part these boys came from there is little variation. The valley of the Zambesi is always warm. I cannot say whether the heat here in summer would be likely to tell on the natives. The batch of new boys I have been referring to have been here about a month, and out of them 17 have died. At this rate half of them

would die within a year. It is my opinion that these natives have been brought down here under very unfavourable conditions, and they have been subjected to a very severe epidemic. I admit that in this epidemic the white population in Johannesburg has suffered as well as the natives. One cannot at all compare the mortality amongst the batch of new boys with the mortality amongst the remaining boys in the Robinson Deep Compound. Of the latter, some 1,200 in number, only four or five died. I consider that surface work is the better class of labour for these new boys; but as I have said, they themselves prefer, now, to work underground. If, on the surface, they would endeavour to avoid the variations in temperature, they would, I believe, have better health on the surface than underground, but they like underground, as it is warmer to them.

247. To Mr. GOCH: The area I have been specially speaking of to-day is Central Angoniland, I have been over all that part south of Lake Nyassa, and up and down the valley of the Zambesi. I have not been up as far as Blantyre. I have been half way up the Lake. The south-western boundary is the Murchison Range, which divides British Central Africa from Portuguese territory, and the southern boundary is the river, called the Ruo, and part of the Shiré. I went out to the 32nd degree of longitude; that is as far west as I went. I went north up to the 12th degree of latitude. Within that area I think there are about 120,000 natives, including men, women, and children. I think about 30,000 would be able-bodied men, and if the restrictions were withdrawn, possibly 20,000 could be drawn from there for work. That would only give one in four able-bodied men, and there would not be very many left behind. That number might be induced to come to work every six months, leaving part at home. This would make about 10,000 available at a time.

248. To Mr. PERROW: A fair average of the work done by the new boys at the Robinson Deep Mine is about 1½ feet of drilling per day, but some of them have done as much as the three feet per day looked for from them. If they complete the three feet they cease work. As far as I am aware, the boys I mentioned as doing only six inches of drilling per day have been in good health. Some of the boys are bigger than others, but it is not always the biggest boys who drill the biggest hole in a given time. Some of them are more willing to work than others.

Mr. QUINN: Perhaps the witness could supply the Commission with the names and addresses of persons with whom he is acquainted who he is aware have a close knowledge of the part of the country which has been the subject of enquiry to-day?

249. The CHAIRMAN (to witness): Do you know anyone who could supply the Commission with additional information on this part of the subject?

WITNESS: There are only two men I know of who are readily available. One is a man named Williamson from the port district. He is at present in Johannesburg, but I understand is leaving in about two days' time. The other is Mr. John Gibbs, late manager of the Lakes Corporation. He is, I believe, in Pretoria, but I do not know his exact address. The best authority on the subject is Sir Alfred Sharpe, who is the Commissioner for the country. He is, as far as I know, in British Central Africa at the present time, but he may be in London. You might question Dr. Lawes, of the Livingstonia Mission Station, with reference to the Atonga tribe. He is an undoubted authority on that tribe. Dr. Henry Scott, of the East Africa Mission, could speak as to the Yao tribe. He is stationed at Zomba. Dr. Heatherwick, also of the East Africa Mission, at Blantyre, might also be able to supply you with information.

The CHAIRMAN then thanked the witness for his attendance, and witness withdrew.

The CHAIRMAN then announced that the Commission would deliberate in private, and that the public sitting of the Commission was adjourned till 10.30 a.m. the following day (Wednesday, the 22nd July).

The Commission then adjourned accordingly.

## SECOND DAY.

*Wednesday, 22nd July, 1903.*

THE COMMISSION SAT AT 10.30 A.M.

The Rev. F. COLLARD, called, sworn, and examined.

250. To the Chairman: You are the Rev. Mr. Coillard?—Yes.

251. You are from Barotseland?—Yes.

252. How long have you been in Barotseland?—I have been there since 1884.

253. With what mission are you connected there?—With the Paris Evangelical Mission.

254. Previous to going to Barotseland you were for some years in Basutoland, I believe?—Yes, I was in Basutoland for 25 years.

255. So that you know both countries very well?—Yes, I suppose so.

256. Can you tell the Commission what the population of Barotseland is?—We estimate it at 60,000 souls, but of course no census has been taken; the figures are only approximate.

257. How are the natives employed there?—We have slavery in Barotseland, and naturally the people work for the chiefs; they are engaged in agriculture.

258. Is there no work done there outside of agriculture?—Building and attending on the chiefs is about all that is done.

259. Is there any white population there at all?—No, with the exception of a few people who come only in the season.

260. Do any of the natives leave the country to work elsewhere?—Yes, many of the younger people go out to work in the mines; there is hardly any young man who has not, at some time or another, gone to work in the mines; they used to go to Kimberley; I do not know how many of them come to Johannesburg to work; I have no means of judging of the number who may come here; at first the King and the chiefs tried to prevent their people from going to work in the mines, but the natives were so anxious to do so that they generally went without permission, so that now the King and chiefs grant permission for them to go. We have had labour agents come here from Bulawayo and from Kimberley to engage boys for the mines, but without the agents the boys themselves are very anxious to go out to work. I said in Johannesburg the other day at a meeting we had that I thought about eight-tenths of the younger population go to the mines to work, that is approximately. I may now say that the great majority of the young men go to the mines to work. There are very few men there now who have not been at the mines; and so much is this so that the chiefs have at times found it difficult to obtain sufficient labour to attend to local wants; practically everyone goes to the mines.

261. Have you formed any idea how many go away to work?—No, I could not give you the numbers, even approximately; I suppose the Magistrate could do so; I can only say that they come out in very great numbers, more especially now that they are better cared for on the mines and in coming and going. Formerly it was very difficult for them to get to Bulawayo and Kimberley, because no provision was made for them on the trip, but, since some agents have come there, provision for their care is now made. I believe numbers go away to work on railways; others go straight to Bulawayo, and from there I do not know where they get to.

262. When you speak of "young men," between what ages do you mean?—Well, from 17 to about 35 years.

263. Do you know how long they usually stay away?—Generally for a year or more, but for never less than a year, as far as I am aware.

264. Have the chiefs any real power to prevent them from going away?—They tried to prevent them from going, but failed, and had to give in because when the people came back they gave tribute to the chiefs, and now the chiefs finding that it is to their own interest that the natives should go away to work, they raise no further objections.

265. How do these Barotseland natives compare, as regards physique, with other South African natives that you know of?—They compare very advantageously; they work well, and are accustomed to work; they are very industrious; from all I hear they are very well liked as workmen. I visited some of them at their work some years ago in Kimberley, and although it was during the day time and they were at their employment, I saw a good many of them and they seemed to be happy; many of them returned to work on their own land, and afterwards returned to the mines and took new boys to the mines with them.

266. Are they grain feeders, or fruit feeders?—They are grain feeders.

267. Do you think there is any probability of getting any considerably greater number to go to work in the mines than at present?—As I have stated they come out, at present, in very large numbers to work; I do not think the numbers could be increased very much; but there are some other tribes further on which may be tapped, but some of them work under the power of the King of Barotseland; I do not know whether there are many of those other tribes I refer to who go out to work; I doubt whether there are many of them who go out to work; I think there may be a few, but I think not many; with the Barotses proper, it is different, being slaves at home, and receiving no wages, the inducements offered to them to come out to work where they can receive high wages and become wealthy are very great.

268. What are the other tribes you have just referred to?—All the tribes under the King of Barotseland; two of them are known as the Mam-bunda and the Baluluc; they are higher up the Zambesi; I do not think any great number of them go out to work.

269. Have you any idea of the numbers of those people?—No, I could not give you any idea; I have visited them, but they are very much scattered about the bush and on the river, and I could not say anything as to their numbers.

270. Mr. PHILIP: You reckon there are about 60,000 of a population in Barotseland; how many out of that number would be young men? About 6,000?—I suppose so; there is, of course, a very great difference of opinion as to the number, but the figures I have given are the estimates of travellers like Major Goold-Adams and Major Dibbens; they estimated the population at that, and that is the estimate which is generally accepted; there has been no census.

271. Mr. WHITESIDE: I should like to ask you, Mr. Coillard, whether you have had any experience, in the past, of recruiting agents, that is in the pre-war days?—I have only seen anything of recruiting agents since I returned from Europe in 1899, but they used to come; the boys, however, go to work without any recruiting; still the agents do recruit at times for their own purposes.

272. You have had no experience of recruiting agents since the war? That is to say, within the last 12 months?—No, I do not know any of them.

273. You have stated that the boys there are fond of going out to work; do you think that if they were recruited properly any large number would be induced to come out in addition to those who come out at present?—No, I do not think so; they do not need to be recruited; I know of only one or two recruiting agents who have come as far as the Capital of Barotseland, and they have not, I think, got more boys than they would have got on the road.

274. We may take it that the bulk of the young men have previously gone to Kimberley and to Rhodesia?—Yes.

275. Can you tell us whether they have brought back good reports?—Yes, some of the reports brought back are favourable, but of course some are the reverse; the good reports are that they are well paid for their work, and are satisfied with the pay; I am not now speaking of Johannesburg; I don't know anything about the opinions which may have been formed of work in the mines here; I think only a few have come here to work, but generally those who have returned from Kimberley and from elsewhere seem to be well satisfied, so much so that many of them go back there to work again, and take new boys back with them. But, on the other hand, ill reports are brought back, and some of these reports are very offensive to their chiefs; the reports I now refer to are of immorality and corruption obtaining where the work is carried on; we have of course a good deal of immorality in Barotseland itself, but one thing which has astonished many of the boys, and which surprises them very much in their own country, is the fact of houses of prostitution being established in the vicinity of the mines, and this refers to Bulawayo especially; that is what is offensive to the chiefs, who are sorry for their young men. I have met few of the Barotseland natives who avail themselves of night schools; there are some who do so, but not many. Those who generally do so are those who have been under the influence of the missions, and when they go to Kimberley and elsewhere they avail themselves of the teaching; but a great many of them who go away to work get ten times worse than they were before leaving Barotseland, and this is due in a great measure to the houses of prostitution to which I have referred, and this is a great source of trouble to the chiefs.

276. For what period do the boys usually stay away?—Some have remained away for many years, but generally it is for a year or so; never for less than a year.

277. You have stated that out of an estimated population of 60,000 only some 6,000 are available for work; how do you arrive at that proportion?—I cannot bind myself down to those figures.

278. You simply use the figure of 6,000 because it is suggested to you?—I do not bind myself to the figure.

279. Mr. QUINN: I have only one or two questions to ask you. What is the attitude of the missionaries towards the natives going away to work in the mines? Are they in favour of the boys going, or do they endeavour to influence them against going, on account of the evils they meet with when away, as mentioned by you?—The mission is a new one, and we have no occasion to exercise our influence. The boys go away without seeking our advice. They depend for the most part on the advice of the chiefs, but often run away in spite of the chiefs' advice to the contrary. But the missionaries would naturally, if they saw the boys going to the places where the evils are said to exist, try to persuade them from going to such places.

280. Have you any knowledge of the missionaries in other places than your own district, or of their attitude in such matters?—No, but the young men under our direction are usually fond of remaining and being taught.

281. I understood you to give the population as 60,000. Is that so?—Yes, we think the population is about that.

282. That estimate is, however, only a rough guess? It may be 40,000 or even 100,000?—I think that 60,000 is a maximum; the country is sparsely populated.

283. Mr. EVANS: Could you give us the name of any good witness who could come here and give us evidence as to Barotseland?—I do not know anyone here; there have been traders in Barotseland from time to time, but I do not know of anyone in particular that you could depend on. The Magistrate, Mr. Sykes, at Victoria Falls, could give you good evidence; also Mr. Aitkens, the Resident Magistrate, could do so.

284. How do the boys going to Kimberley stand the climate there?—A good many of them have died, many on the way either going or coming, particularly, I think, from exhaustion.

285. Is there a great difference in climate between Johannesburg and Barotseland?—Yes, a very great difference. I do not know what height above sea level Johannesburg is, but Barotseland is from 3,000 to 3,500 feet above sea level. Barotseland is a very hot climate. I have myself suffered exceedingly since coming to Johannesburg, and not only so here but also in the Cape Colony; I should suppose the natives would also experience the change judging from the experience of a native boy I myself have.

286. Mr. WILTESIDE: You have stated that the natives of Barotseland are, as to physique, of a good class; does that also apply to the natives of the other tribes you referred to?—Yes, but they do not work as hard as the Barotse boys, but, judging from their physique, they should be quite able to do so.

287. Do you think that if recruiting agents were sent to those other tribes referred to, any considerable number of boys could be got from amongst them?—Yes, I think so, if the recruiting agents went in, through the medium of the chiefs; no recruiting agents have been there yet so far as I am aware.

288. The CHAIRMAN: In the memorandum we have before us giving a summary of the evidence you could offer, reference is made to your long previous connection with Basutoland; do you wish to make any statement as to Basutoland?—I left Basutoland in 1877, so that anything I may say as to that part would be out of date. Such information would not be new.

The CHAIRMAN then thanked the witness for attending, especially considering his poor state of health, and the witness withdrew.

The Rev. F. SUTER, called, sworn, and examined.

289. The CHAIRMAN: Your name is the Rev. F. Suter, and you are a missionary?—Yes.

290. You are acquainted with the St. Lucia District?—Yes.

291. Do you reside in that District?—No, I am a resident of Durban, but I know the District; I have been there several times. We have missionaries there from whom we receive reports continually. I have not resided there, but have only travelled, at times, through the District.

292. Would you like to make a statement to the Commission as to a supply of natives from that District, or would you prefer that I should ask you questions?—I should prefer that you ask me the questions.

293. Have you any idea of the native population of the District?—Of Zululand, the population is about 250,000; I mean that as applying to the whole of Zululand, men, women and children; the population of Zululand and Natal taken together is about 750,000.

294. The ordinary work of the Zulus is of course agriculture?—Yes, in that country there is nothing

else, except a few Zululand gold mines which do not absorb much labour; the new coal fields will, however, before long require a good deal of labour.

295. Do large numbers of natives leave Zululand to work elsewhere?—Yes, large numbers leave; I could not say how many; but I suppose there is scarcely a kraal in the whole of Zululand that someone has not gone from at some time or other to work outside.

296. Do you know whether any large number leave for work on the Rand?—I could not speak as to this, since the war; before the war a very large number went to the Rand; as is well known, the Zulus object to working underground; a good number work here in the stores, and as domestic servants, and some on the mines, but I could not say how many.

297. Have you heard what sort of reports were brought back to Natal by the natives who had been to the Rand to work, as to how they had been treated there?—They did not speak very well of the place; they speak of its discomforts, especially that section of them who worked in the mines; the conditions of work here are of course very strongly in contrast with the conditions of work in their own country; the life on the mines is of course far worse than it is at their own homes; any comparison would be odious.

298. Do they specify what the discomforts are?—Principally that the sleeping quarters are bad, and the like.

299. Are you acquainted with many of the compounds on the Rand?—I have visited a number of them; I think they might be greatly improved; under improved conditions in many of the compounds here, I think many more of the boys might be induced to come here to work; and such improvements might be in the direction not only of the compounds themselves but also in the matter of food.

300. What improvements in the compounds would you suggest?—I think better provision might be made in the matter of housing of the boys. It is true that some of the compounds are very nice and comfortable, but some are distinctly otherwise; I do not think many of the sleeping quarters are anything like comfortable in many of the mines, while in others they are much more comfortable, and when the boys are sick, I think they might be afforded much better attention than is the case at present in many instances. I have seen sick boys lying about apparently without any attention worth speaking of. I think that better hospital attention and accommodation should be provided. They would have a better opinion of things if they found themselves better cared for.

301. Then you made reference to the food?—Yes, in their own homes they have quite a variety of food; many people seem to be under the impression that the native, in his natural life, lives exclusively on mealie meal porridge, but as a matter of fact I myself have seldom seen them eating porridge; they certainly mix pumpkin and other fruits up and make a sort of porridge sometimes, but as a rule porridge is not often partaken of; they have beans, and nuts, and different kinds of roots, a kind of potato, sweet stuffs, and kaffir corn from which they make beer, and the children live on a porridge made from kaffir corn, and with such a variety naturally they grumble at being kept constantly on mealie meal porridge, and nothing else; all the natives grumble at that. I have visited some of the compounds here quite recently, and find that on some of the mines this exclusive mealie meal diet is being abandoned; I know one compound in which the boys are receiving very good food and quite a variety of it.

302. With regard to the pay here, do you think the rate is sufficient to induce a supply of labour?—I do not know that I am very well acquainted with the rates of pay ruling here; I think that 50s. per month should be a satisfactory rate.

303. What are they paid in Natal?—At present house boys receive from 30s. to 50s. per month; in some cases as high as £4 per month, but this

rate does not obtain in very many instances. Some of the boys working in the stores and around the docks receive from 15s. to 20s. per week; a little while since they got 23s. per week, but under those rates they feed themselves.

304. There is a reference in the summary of your evidence to the ailments the natives suffer from?—Nearly all of them suffer more or less from intestinal worms, many from bronchitis, whilst a good deal of consumption is amongst them, and undoubtedly this last has of recent years been greatly on the increase.

305. It is asserted that the calling of 'ricksha pulling is responsible for much of the lung trouble, and also heart trouble, amongst them?—There is no doubt whatever in my opinion as to the correctness of that.

306. You say consumption is prevalent amongst them; is that amongst those of the boys who return from work elsewhere?—Yes; I have not been able definitely and positively to attribute the lung trouble to 'ricksha pulling, but I have strong opinions on it. The natives are of course more or less subject to cold under all conditions; they take cold occasionally in their own countries, also bronchitis and asthma; these seem to lead to consumption; unquestionably consumption is spreading rapidly amongst them, but I could not put it down entirely to 'ricksha pulling.

307. Are there more Zulus out at work at the present time than is usually the case?—I think so; this is on account of the late failure of the crops, owing to the dry season last year. Reports generally state that the natives are in a bad way for food; this is undoubtedly so in parts of the Colony of Natal; the recent rains, of course, caused some green stuff to spring up, but this is now pretty well exhausted.

308. I understood you to say that there was not sufficient labour in Zululand?—I was asked the question whether I thought the labour supply was adequate; my own opinion is that there is not sufficient labour to meet the demand.

309. What demand do you mean?—I mean the demand throughout South Africa; for all purposes the native is needed. Dealing with the two Colonies of Natal and Zululand, my impression is that out of a population of about 750,000, only about three-eighths are males—the women are certainly in the excess. I think if you deduct the women, the boys under 15, and the old men who have to stay at home to look after things, you will be limited to, roughly, 80,000 men available for work. One must remember that in Natal the majority of natives are situated on private lands and they have to fulfil certain contracts with the farmers, owners of the land on which they are located. This condition keeps the boys to a great extent from seeking work at a distance. When this is considered, the number, apart from the farmers, is reduced to an appreciably low figure. I suppose the same conditions will to a certain extent apply to the Transvaal and to other parts of South Africa.

310. Are you in a position to state anything as to the numbers employed in Natal?—I could not speak definitely as to this; I should suppose there are about 18,000 in Durban alone; I should think there would be pretty nearly that number.

311. And in other parts?—I could not say definitely, but would estimate about 10,000 in Pietermaritzburg, 40,000 in Ladysmith, and say 3,000 in Newcastle. Then there are other industries employing native labour, such as brick works, sugar plantations, engineering shops and the like, which would absorb numbers of boys.

312. Mr. QUINN: Where do you get the figure of 750,000 as the population of Zululand and Natal from?—From the Natal Blue Book.

313. I suppose you would admit that those are the only absolutely reliable figures you have given us to-day; that is, the only figures for which you have any real authority; the rest are merely rough estimates?—Yes.

314. The figure of 80,000 as available is simply your own estimate?—Yes.

315. And your figures for the numbers employed in the various towns which you have given, those are on the same lines?—Yes.

316. Then the only figures you have given upon which we can place any degree of reliance are those of the total population, which are issued by the Natal Government?—Yes.

317. Is it within your knowledge that about a year ago a large number of natives died off from scurvy?—Yes.

318. And that this was brought about largely owing to bad food?—Yes.

319. Since then there has been an improvement in the food supplied to the natives by some of the mines?—Yes.

320. Is it your opinion that it was on this account, namely, the herding in compounds, the bad food supplied, and poor sleeping accommodation provided by some of the mines, that a bad impression was caused, which influenced the natives greatly in refusing to go to work in the mines?—There is no doubt about it.

321. And that a great deal of our present trouble in the matter of shortage of labour supplies is due to these causes?—Yes.

322. Zulus do not care to work underground?—No.

323. Do you think that if a radical improvement were effected in the matters we have just been speaking of, the natives would be induced to go to the mines in greater numbers?—Yes, I think it would be a powerful inducement to them to do so.

324. To Mr. WHITESIDE: You have stated in your evidence that you estimate about five-eighths of the population to be females?—I say possibly there is that proportion, as the women are known to be considerably in excess of the males, but it is only my own personal opinion. I think you could get the proportion as nearly exactly as it is possible to arrive at it from the Natal Blue Book, and had I known that I was going to give evidence before this Commission, I should have provided myself with the official figures. I am only a visitor to Johannesburg.

325. In your evidence you spoke of certain industries requiring labour. Those industries are not yet started, I take it?—Some of them have not, such as the coal fields, the railway is, however, partly in operation; other industries are not yet commenced.

326. In your judgment, there are about 18,000 natives employed in Durban, 10,000 in Pietermaritzburg, 3,000 in Ladysmith, and about the same in Newcastle; do you consider that a fair estimate?—Yes.

327. Then what would be a fair estimate for others employed in the engineering shops, etc., you spoke of—about 6,000?—Perhaps so.

328. At any rate it would be equally as reliable as the other figures you have mentioned?—Yes, I suppose so.

329. That would give us a total of, say, 40,000, and you estimate 80,000 available; would that not leave only 40,000 available?—No, you must allow for a large proportion employed on private lands, and who are not in native locations at all; they are under contract to the farmers. They have to work on the farms on which they reside for eight or nine months in the year.

330. They could put in from three to six months' work in the year elsewhere?—I do not think you could rely on six months' work outside.

331. You stated that the demand for boys is greater than the supply?—Yes.

332. That is your judgment?—Yes.

333. Do you mean the demand in Natal only?—No, in South Africa.

334. Mr. PERROW: You have said that the Zulus prefer working on the surface to working underground; and that you have visited several of the compounds and found some good and some bad?—Yes.

336. And that some of the boys were lying about sick in their houses?—Yes.

337. Were there any hospitals on those properties?—From what I have seen in Johannesburg, I will say that I have seen boys sick receiving, apparently, but little attention; sick in their own houses, and in such places I have not seen anything in the shape of a hospital. I say the boys were apparently being neglected.

338. Are you aware that the Zulus employed on the mines would rather, when sick, lie about in the open, in the sun, than remain in a hospital?—I know that any sick native would rather lie out in the sun than remain indoors.

339. Are you aware that in many cases the sick natives will not go into hospital in spite of the compound manager's orders?—I am aware of it.

340. Mr. FORBES: Do the Zulus turn out in the fields and assist in the cropping?—Yes.

341. And does the Zulu in the upper country grow the grains you spoke of?—Yes, in ordinary seasons it is one of the best grain-growing districts there is. The natives there are distinctly Zulus. North of the Lake, when you come to the Zepondas country, then the natives are more mixed. In British Tongaland they are also mixed. The native in Natal would be offended if you called him anything but a Zulu. I have met some of them in Johannesburg during the last fortnight whose fathers were Zulus; some of these come from east of the Sunbau's district.

342. Mr. PHILIP: You estimate the numbers at 80,000, with a large proportion on the farms, leaving 40,000 readily available?—Yes.

343. The natives on the private lands have contracts with the farmers to carry out, which occupy them from six to nine months in the year?—Yes.

344. When their contracts have expired they have land of their own to work on?—Yes.

345. That is to say the balance of the year would be taken up working in their own gardens?—Yes.

346. But they might be induced to go away to work at short distances?—Yes.

347. When you saw the sick natives in the compounds, did you question them about their treatment?—No, I merely mention what I have seen.

348. Was this during your present visit to Johannesburg?—No, on this occasion I have not visited many of the compounds.

349. Mr. EVANS: How long have you spent on the Rand?—I have not stayed here for more than a month at any one time. This is my third visit here. I have spent altogether perhaps from three to four months here at the outside.

350. How many compounds have you visited recently?—I could not say definitely. During the last fortnight not more than perhaps two or three.

351. What length of time have you spent in the compounds?—Perhaps two hours at a time.

352. Was it recently you saw the boys sick?—No, not recently, but I have seen them sick previously.

353. And neglected?—I am not speaking of the present time.

354. When you saw them sick and neglected, did you mention the matter to anyone in authority?—No, I did not consider it was any business of mine to interfere.

355. But did you not think it was your duty to do so in the interest of the natives?—No, being a missionary, I feared that if I spoke I should be prevented from further entering the compound.

356. Has anything occurred to cause you to think such a thing would happen?—Not to myself personally, but I am aware that some missionaries have at times had considerable difficulty in gaining access to compounds.

357. Recently?—Yes, recently.

358. Can you state a definite instance?—I would prefer not to do so. There are compound managers who do not like missionaries going into the com-

pounds. I know of one compound manager in particular who has expressed his objection to the missionaries entering the compound, and difficulties are sometimes placed in the way. The missionaries are told that they can come now and then to conduct service, but otherwise their visits are discouraged. I do not speak so of compound managers as a whole, but I am aware that missionaries have complained of treatment in this connection.

359. Have you seen any boys in compounds recently badly fed?—Not recently.

360. As to the housing accommodation in the compounds you visited recently, was that unsatisfactory?—I think so.

361. Suppose all your recommendations for improvement were adopted, how many more natives do you suppose we should be able to get for the mines from Zululand?—That would be very difficult to estimate, but I think you would get quite an additional number.

362. But "quite a number" is rather vague, is it not?—It would take time for the knowledge that improvements had been effected to reach the natives generally, but it is my opinion that if the improvements were made, greater numbers would gradually come forward. I think you might get anything up to 10,000, that is not from Zululand alone, but from Natal also.

363. How do the chiefs view their boys coming to work in the mines? Do they favour their coming?—I do not think they mind at all.

364. Do you consider the official figures generally trustworthy so as to the number of natives, and do you think we could rely on them as a safe basis for calculation?—Yes.

365. If Magistrates say that labour is scarce in their districts, could we accept those statements as reliable?—Yes, I think so.

366. Who would be a good witness to give us evidence as to the Zulus?—I think the Chief Magistrate of Zululand.

367. What is his name?—Saunders; I do not remember his initials.

368. How long have you been in Natal?—Over 16 years.

369. You think about 40,000 would be the proportion in Natal available for work on the Rand?—I think so. I do not see why they could not work on the Rand, but the short period for which many of the natives employed for part of the year on farms would be able to work outside, would be against their coming here.

370. How many would be required to remain on the land to attend to the natives' own land?—Not very many, mostly the women do the cultivation.

371. How many do you think?—I really could not estimate the number. It would be difficult without having actual figures to arrive at any definite conclusion on the point. I do not think very many

would come to Johannesburg. Of course they would consider the cost of getting here and of returning; there would be no sufficient inducement to bring them here for a short period. It would cost them more than it would be worth. They would earn probably just about sufficient to bring them here and back.

372. The CHAIRMAN: Can you tell us what sort of reports the Natal natives bring back with them as to work and conditions on the Rand?—They seldom or never speak very favourably of working at Johannesburg. They don't confine their expressions to the mines alone, but speak of the conditions generally; the life for them here is so different from anything they have previously been accustomed to. Before the war, complaint was made that there was no law up here, and they used to complain of the drink up here. That is to say, they used to complain of the law allowing them to get drink here. They would in many cases take the drink when they could get it, but on coming to their senses would complain of having been allowed to get it. They appreciated the fact of drink being denied them in Natal, and I believe would have likewise appreciated the denial of it to them here. Those were the opinions I have heard expressed before the war. I cannot say what opinions have been expressed since the war. As a matter of fact, I believe that since the war they have not been allowed to come here from Natal at all.

373. There were no restrictions against natives coming here from Natal, I believe, if they came of their own accord?—Perhaps not.

374. Do the natives in the districts you refer to pay tribute to the chiefs?—No, not unless the chiefs impose it on them.

375. Can the chiefs impose tribute on them?—Not legally, I believe.

376. Do the chiefs impose tribute, even illegally?—I fancy it is so in some instances.

377. Mr. WHITESIDE: You are satisfied that if the conditions on the mines here were improved, a greater number of Zulus could be got to come here to work?—Yes, if the present wages were maintained—the Zulu will go anywhere for money.

378. Mr. GOCH: You say if the conditions on the mines were improved, further numbers would be induced to come here?—Yes.

379. But would not that deprive Natal of the labour?—Certainly.

380. Then we should be getting any further labour supply here, from the districts you refer to, at the expense of Natal?—Yes, that is my private opinion.

The CHAIRMAN then thanked the witness for attending, and the witness withdrew.

The Commission then, at 11.50 a.m., adjourned till the following day (Thursday, the 23rd July) at 10.30 a.m.

### THIRD DAY.

*Thursday, 23rd July, 1903.*

THE COMMISSION SAT AT 10.30 A.M.

Mr. THOS. MAXWELL, called, sworn and examined.

381. The CHAIRMAN: You are Mr. Thomas Maxwell?—Yes.

382. You are well acquainted with the Districts of Griqualand West, Bechuanaland, and Zululand?—Yes.

383. You are acquainted with Kimberley, Barkly West, Taungs and Eshowe?—Yes.

384. You have been acquainted with these Districts for a great many years?—Yes.

385. You know the native character and language very well?—The language moderately, and the character fairly well.

386. Previous to the war you were an employer of labour on the Rand?—Yes, as a general mining contractor.

387. Had you many natives in your employment?—Yes, between 1,500 and 2,000.

388. Were these natives working on any particular mine or on a number of mines?—On a number of mines.

389. Did you recruit these natives yourself through agents, or how did you recruit them?—Through agents throughout South Africa.

390. You recruited them through agents throughout South Africa?—Yes.

391. Were these agents employed by yourself?—Yes.

392. They were your paid agents and your own paid men?—Yes.

393. Where did you get the bulk of your labour from?—The bulk was from the East Coast Territory.

394. Dealing first with Natal, Mr. Maxwell, and Zululand, do you know the native population of Zululand?—I cannot speak accurately as regards statistics because I have never gone into them to any extent, but I have always understood that Zululand was about 250,000.

395. And Natal?—I cannot say in regard to Natal.

396. Did you recruit any boys from Natal?—Yes, and from Zululand, and the Northern Transvaal; also from the Cape Colony.

397. Have you any idea what number of natives are available in Zululand and Natal for service outside these countries?—Speaking statistically, no. I could give no accurate information on such a question but only generally from my experience as a railway contractor and recruiter. In Zululand we have found that it is difficult at times to get enough labour for our purposes in the Colony.

398. In Zululand it is?—Yes.

399. Are you speaking of recent times?—I am speaking of 1900 and 1902.

400. You were employing natives on railway construction then?—Yes, on railway construction in Zululand.

401. Since 1902 have you any idea whether the supply is ample for railway construction purposes there or not?—I understand that it is sufficient.

402. You said that previous to the war you recruited in Zululand for working on the mines. Did the natives you recruited work underground?—Yes, at tramming.

403. Have you any idea as to whether it is customary for the natives from Zululand and Natal to work underground? Is it usual?—The percentage is small of underground boys that you get in recruiting from Zululand, say 20 per cent.

404. Twenty per cent. of 100 would work underground?—Yes.

405. You know that there is a considerable scarcity of natives for mining work on the Rand at present?—I understand so, and prior to the war it was generally looked upon as a difficult question. I know because I was largely employed by different companies. I was for two years supplier to the East Rand Proprietary Mines, including Kleinfontein, Angelo, the Driefontein Comet, the Cinderella, and the Blue Sky. I was the supplier of labour to them and General Compound Manager.

406. You were General Compound Manager for the whole group?—Yes, for a period of two years.

407. Did that position include that of recruiting?—Yes, in 1899 I was General Mining Contractor. I was Advisor of Native Affairs to the Netherlands Railway, and practically had charge of their compound at Springs. I also had an arrangement with the Olydesdale Colliery, and I ran contracts at the Bamoral, Robinson, Porges Randfontein and Glencairn. I was also employed as Advisor to the French Rand Mines on Native

Affairs. From 1884 to 1896 I was in charge of the Native Labour at Bultfontein Mine; I was Compound Manager and Labour Supplier, also Floor Manager. In 1893 I was a Searching Inspector at Jagersfontein. From 1876 to 1882 I was at Kimberley at De Beers, Du Toits Pan, and Bultfontein Mines, and all that time I was in charge of and procuring natives for mining purposes. In fact, from 1876 to 1902 I have been in charge of and controlling natives and procuring them for the mining companies.

408. Then you are fully qualified to speak on the mining question which this Commission has been asked to consider, viz., that of the available supply of labour?—I hope so. At any rate I shall give my opinion and shall give it frankly.

409. Do you think, dealing with Zululand, that the Transvaal can look to Zululand for any large number of labourers, taking into consideration not only all the mines, but the industrial demands generally?—I do not.

410. Do you think the Transvaal can look to Natal for a large number of native labourers?—I do not think so.

411. Do you think that the Transvaal can look to the District of Griqualand West for any large number of boys?—No. Griqualand West has to go outside of its own district to get sufficient native labourers. Kimberley has to recruit from other sources to keep up its supply.

412. Do you think that we can look to Bechuanaland for any large number of boys?—No; speaking of the Taungs District, I should say not. They are mostly small cultivators.

413. From your experience of compounds on the Rand, can you make any suggestions which would render the work on the mines more attractive to the natives?—I would suggest that cleanliness might be more considered than it is at present; sanitation and the hospital question. I am speaking now of prior to the war. I do not know what has happened since. I am speaking generally, and as a suggestion would say, cleanliness, improvement in the food, and hospital accommodation.

414. Greater attention to these things than was given before the war would make it more attractive?—Yes.

415. Do you think the question of pay influences the supply to a very great extent?—Not to any great extent. In reply to that, I might say that this question of native supply—based upon my experience—is one of successive phases. I remember the time when you could not obtain a native supply unless it was a question of one's personality, unless the native knew you thoroughly and trusted you; subsequently it went into the phase of higher wages, and then it seemed to change into one, not of the higher wage so much as the maximum of comfort and pay for the minimum of work. You could get for easy classes of work numbers of natives at a low rate of pay, and for other classes of work, where it was a question of the boy's health, no matter what the work or pay was, you could not get the natives. Those are the three phases of the question I have passed through in my experience, and I think it will pass into the phase of comfort, teaching, hospital accommodation, housing and recreation for the natives. I think that is what it will pass into for the purposes of procurement, and, of course, possibly it may be from sources where the boys are required, and they (the employers) will have to come up to that standard to retain them if they want the natives again.

416. Do you think that the failure of the crops in many Districts has influenced the number of boys who are now coming up to work?—Yes, it always does; when food is plentiful the boys are indifferent; when food is scarce, they have to come; it is not optional. They also talk to one another about where they can go to work.

417. In the heads of your notes we have before us, Mr. Maxwell, you use the expression, under the heading of "Special Conditions": "Inducing

"Natives to come to Mines; Increased Wants; Taxation; Higher Pay, but this would only enable them to retire from work sooner." From your experience will you tell the Commission what you mean by that?—It is merely a question of proportion. If natives earn in three months enough money to keep them for 18 months, at £3 a month, if you give them £4 a month, it only enables them to stay away for two years.

418. In making that statement are you referring to any particular tribe of natives, or to the South African natives generally?—To the South African natives generally, and the Zulu and Bechuanaland natives in particular.

419. What length of time does the Zulu and the Natal native usually engage himself to work in the Transvaal?—They do not like to exceed four months.

420. In your experience does any large number of them re-engage for a further period after serving that time?—No. At times, in summer time, they do not mind re-engaging for another two months.

421. Again referring to the headings of your notes, under "Enterprises, etc.," you use the expression "Laxer moral code (due to European Administration)." Can you explain what you mean by that?—Under the native code the moral laws were stricter. They always have the appeal now to European Magistrates. Then, generally speaking, things have become much more lax, and fathers who as a rule valued their daughters at a high price for so many head of cattle, feeling that they have got no hold on them, will let them marry the man of their choice on credit, with a promise that the "lobolo" will be paid in time. Those practices were unknown in the purely native code. Formerly a man had to go up and work to purchase cattle for his wife; now possibly he gets one by arrangement, and the one great necessity for his going to labour is done away with. But that is not a general practice. Speaking generally, the moral code is not as strict now as it used to be.

422. But if wives are now to be had on credit, as you say, Mr. Maxwell, does not the duty devolve on the husbands to pay one day or the other?—Yes, but he may pay it out of his breeding cattle in the course of time.

423. So that with that powerful inducement an amount of labour is being done away with partially?—Yes.

424. You know that the recruiting for the mines is done through the Witwatersrand Native Labour Association?—I understand so.

425. Have you any experience of their methods?—I have none whatever, except that I understand that the native has no choice as to where he is to work. From my experience I should say that that is a fatal thing. I say it with an open mind, but as a man with experience.

426. You mean that a native does not like to be recruited for any number of mines, but for a particular mine?—Yes, he should be treated as one who has a right of choice; this would give the best results, otherwise the results will suffer.

427. Have you seen any returns as to the numbers that have been recruited by the Native Labour Association?—Merely generally from the public Press.

428. Have you any opinion as to whether they have been fairly successful in the number they have recruited, or otherwise?—No, I could not give an opinion.

429. Is there anything else you would like to say to the Commission on the question generally, Mr. Maxwell?—No, Sir.

430. Mr. EVANS: You said just now, Mr. Maxwell, that 20 per cent. of the Zulus would work underground. Do you mean 20 per cent. of 100 Zulus employed on the mines, or of 100 Zulus employed here generally?—100 Zulus recruited. Assuming I recruited 100 Zulus in Zululand tomorrow, you would get 20 or 30 of them to go underground.

431. Speaking generally, how would you distribute those Zulus when bringing them up here? How many would go to the mines, domestic work, stores, etc.?—I would put 20 per cent. of them underground, 40 per cent. on the surface, 20 per cent. in stores, and 20 per cent. to domestic work. That is taking it from an ideal standpoint; that is letting the native satisfy his inclination as to where he is to work.

432. Now, in your opinion, the effect of high wages is to shorten the period of the native's stay here and lengthen the period he stays at home?—Exactly. He only has to work for £4 for six months and is in funds for two years.

433. Can you give us any idea of the effect of high wages, as far as agriculture is concerned?—The high wage would attract the boy. The low wage would not, merely because he views it as an existence, and can always get his existence out of his own labour. In the one case you get him for a short while, and in the other you do not get him at all.

434. You know a good deal about Natal, I suppose?—Well, I did.

435. Was it because they could not get natives to work that the people of Natal imported Indians?—That is so; at any rate at their price.

436. Now, in the system of recruiting, what do you think of the present system as compared with the old one; that is, the organised system of the Association as compared with the other system?—The new system I have not gone into.

437. What would you consider the defects of the old system?—The defect of the old system was the fierce competition.

438. What did that lead to?—It led to misrepresentation firstly, and high bonuses secondly.

439. Were there any natives stolen from one mine and sold to another?—It was very considerable.

440. What was the highest you paid for natives in your experience before the war?—£1 a head, I think, was the highest.

441. And the contract was for how long?—Only as long as they cared to stay.

442. A mine might pay £4 and the native might only stay a week?—That is so. They had to accept them on the terms they could get them.

443. Did you in your experience suffer much from desertions?—I think I am right in stating, so far as my memory serves me, that we suffered less than most others.

444. Was that because you were rather isolated?—I think it was largely a question of the Administration. The desire of the Directorate was that the native should be strictly and justly treated, and the native appreciated that.

445. Have you any idea as to the number who were engaged as touts collecting natives before the war? Was it very large?—I always understood it to be very large. The successful ones were very few.

446. What has become of the successful ones now? Are most of them employed by the Native Labour Association?—I understand so.

447. Mr. PHILIP: What necessitated the introduction of Coolies into Natal?—I think that you could get that information from a better source than from myself.

448. You do not know much about the Indian question?—No, except in a general way from Natal talk.

449. Mr. FORBES: I think you said, Mr. Maxwell, with regard to these Districts that you are acquainted with, that there is no great number that can be expected and especially from Natal?—I think those Districts simply suffice for their own wants as far as the supply is concerned. The supply will just about meet the demands of the Districts.

450. There could not be many more expected to come from there to the Rand?—No. Speaking generally, they are required for their own District.

451. You spoke of the Kaffirs and natives getting their wives on credit?—That was with regard to the Zulus.

452. Is there not a custom that a man gets his wife on credit and pays for her in future years by one of his prospective daughters?—There are so many practices coming in that I would not be surprised to hear that such a procedure did obtain, but it did not occur under the old native laws.

453. Mr. PERROW: I think you said that Zulus work in the mines?—Yes.

454. I think you mentioned that they were tramping boys?—Yes.

455. Did you mean shovelling and tramping?—Yes, for both.

456. Not for breaking ground?—No. The percentage of Zulus for breaking ground is very small; they are for tramping and shovelling principally. Being big and heavy men, I found it always paid me better to put them on to tramping. One big boy will do more than two or three small ones for tramping.

457. Mr. WHITESIDE: You said just now that you recently employed 1,500 to 2,000 natives. In what year was that?—It was during the year 1899.

458. Did you have sufficient for your requirements?—Yes.

459. You also stated that you obtained those boys principally through paid agents?—Yes, through agents paid and employed by me.

460. Therefore you think you had sufficient for your requirements, and therefore it is logical to assume that that system was satisfactory so far as you were concerned?—Certainly.

461. You also state that you recruited boys for the mines from Zululand? How did you get those boys?—Through my paid men.

462. Did you get them in any numbers?—No, the Zululand supply was very slow; it used to come in small numbers—in fives, tens and so on.

463. Would that not be through the Natal Government disapproving of recruiting for the Transvaal?—I do not think there was any attempt on the part of the Natal Government to interfere with the natives at that time.

464. Recruiting was allowed at that time?—Yes.

465. What did you pay your boys in 1900 and 1902?—It was principally task work; the average ran out at about 2s. a shift, or £3 a month.

466. The CHAIRMAN: Are you not confusing 1899 with 1902?—This was in 1899, the year before the war. In 1900 to 1902 they used to average 40s.

467. Mr. WHITESIDE: That included their food?—Yes.

468. You have also told us you had a great deal to do with the native supply on the East Rand. Can you give the Commission any figures of your experience of boys being incapacitated through drink and so on?—I could not give you any accurate statistical information.

469. All your figures are hypothetical to a great extent?—It was usually put down at 25 per cent.

470. I have heard that it was stated at 40 per cent., that is boys incapacitated through drink for the first two or three days of every week?—I should not like to put it too high.

471. Did you ever hear it stated that any considerable number of boys were incapacitated for a week at a time through liquor?—I have heard it stated.

472. Have you met with it in your own experience?—Yes.

473. You said that you do not think there is a sufficient supply of labour for South Africa, yet you are only acquainted with Griqualand West, Bechuanaland and Zululand?—Yes.

474. A witness stated that from the tribes beyond Barotseland a considerable amount of labour could be obtained if recruiters were sent there. How do you base your opinion on three Districts?—I was asked by the Chairman in a general way to give my opinion. I did not say there was not sufficient labour. I said that there was ample labour, but it was with regard to the available supply.

475. Personally I cannot say that your evidence is of much value. It seems to be the opinion of the average man in the district as regards the supply of labour. We want facts and figures. You say that there is not sufficient labour in South Africa?—I said that there were ample natives in South Africa.

476. You have also stated that in your opinion, if the conditions generally were improved, it would increase the supply. Do you think it would have any great influence on the supply?—If the conditions were improved generally, it would have an appreciable effect on the supply.

477. You stated just now that boys working three months were apt to be idle for at least eighteen months, that is to say, boys getting up to £4 per month. You think that £12 is sufficient to supply a native with what he wants, and enable him to be idle for 18 months. Are you satisfied that your figures are right?—They are mine. But it is merely a question of the native's paying his tax.

478. He wants a wife and other comforts, I understand?—Yes.

479. You adhere to those figures you have given?—Yes.

480. With regard to the Zulus, you say that the natives engage for three or four months and that they are not likely to re-engage. Will you give us your reasons? In the summer time they usually engage for another two months?—Yes, but they were exceptions.

481. You might take it as a rule?—In the summer months.

482. But why is there a general disinclination to re-engage?—Because they want to get back to their homes.

483. Possibly I may have misunderstood your answer, viz., "It does not follow, although they "work for three or four months that they would "come back at some future time." You think they do come back?—Yes, after 12 or 18 months at home.

484. You have stated that you do not approve of the indiscriminate recruiting and that consequently you do not think that the representatives of the Witwatersrand Native Labour Association are wise in this respect, and that the results suffer. The general recruiting of boys is mixed up and they are drafted out as though they were so many cattle?—That is a bad thing.

485. And consequently the Native Labour Association forming this system are wrong. You think their methods are bad in this respect?—Yes.

486. You further stated that under the old system it was a matter of competition, and it gave bad results, and it was therefore undesirable?—Yes.

487. Now I should be inclined to think that enquiry would have the effect of forcing down the price per head of boys under the recruiting system. Do you not think that is possible?—I always thought the greater the number employed as recruiters, the greater division there would be in the profits accruing.

488. But still the mines would have the advantage by the increased supply?—Possibly.

489. There was some discussion about desertions from the mines and so on. Do you not think that a good deal of the fault might be attributed to the laxity of the system under the old regime?—Yes.

490. And also, do you not think that a good deal of it had to do with the former management of the compounds?—I would not like to say that, though it is probably connected with the desertions of the pass system.

491. You also think it possible, if means of recreation were provided for the natives, and so on, that it would have a beneficial effect on the supply, that is, if it is wanted?—In some cases the mines have been found wanting, but not in all cases.

492. You said earlier that you knew nothing of the Native Labour Association's methods of recruiting?—Yes.

493. You have also stated that the successful recruiters under the old system are now employed by the Native Labour Association?—I understand so.

494. How do you reconcile the two statements? How do you know of it?—I do not quite follow you.

495. You have admitted twice that you know nothing of the Native Labour Association?—Yes.

496. You have since stated you believe the successful recruiters under the old system are employed by the Native Labour Association?—I know nothing whatever about their methods.

497. How did you get to know that these successful recruiters were employed by the Native Labour Association?—The men have told me that they were working for this Association. I never stated what the result or effect was, and so on.

498. Mr. QUINN: Mr. Maxwell, I understand that you are well acquainted with the conditions obtaining in the diamond mines, and have been for many years?—Yes.

499. Could you tell the Commission what proportion of the boys employed there, say 10 or 12 years ago, were Zulus?—The percentage of Zulus employed in the mines was small.

500. Were you acquainted with the De Beers Compound twelve years ago, or are you acquainted with it now?—I was Compound Manager and Labour Supplier for Bultfontein Mine from 1884 to 1896.

501. Take the year 1888. Do you know what proportion of the Zulus were employed at Bultfontein and the De Beers Mines?—About 10 per cent.

502. Is that your opinion, or are you speaking from memory?—There was a goodly number employed as guards and as general workers.

503. I am speaking, too, of underground boys?—Take the guards that were employed, you might put them down at from 15 per cent. to 20 per cent.

504. Now one statement that was made was this. You said the pay did not influence the supply to any extent?—Yes.

505. It will be within your knowledge that the moment the wages were brought down in February last, depopulation took place. Then the gain was double for the following month. Do you know that?—Yes.

506. Does not that seem to point in the opposite direction to your opinion?—I qualified my opinion. There was the time when pay had that influence. I do not think it has so now, nor will it continue to have it.

507. Take another view. Do you know immediately after the war, when recruiting began under the new method adopted by the Native Labour Association, it was practically impossible to get natives at all for many months, until people were positively forced to go back to the old rate of pay. Does not that upset your opinion? Has it not been proved the world over that the rate of pay affects the supply of labour. Pay influences the supply or it seems an extraordinary state of things, especially in view of the fact that you could not get boys at the rates and the moment it was put back to the old system the supply was doubled?—I think that is merely a phase of the question.

508. Let us take another phase of it. You said that if a native worked for a given time, say three or four months, and got fairly well paid, he would lie up in idleness until that money was gone and he was then compelled to come back to work. Do you maintain that that is a sound opinion?—It is based on sound experience.

509. Is it not an economic condition the world over that you create wants. You create a want for

them and after their being here for a few months they learn to buy shoes, clothing and so on, and come back again?—I admit that there is a good deal of theoretical soundness in your idea, but when you reduce it to practice you will not find it so.

510. Have you put it into practice?—You can offer a native work in Zululand and he will not take it.

511. We are talking of the natives who come here and get money. They have got the same nature as a white man, and they come back again and again?—That is a phase that is growing on the natives, but when you come to compare it with the growth of demand it is nothing; it is infinitesimal.

512. You have had a wide and valuable experience limited to the periods you talk about. Don't you know in the towns—take this town for instance—that a very large number of the Zulu boys oppose your theory altogether by remaining here a year and going away and coming back and remaining another year? In the stores, etc., are there not Zulu boys employed in large numbers?—These are not the Kaffir boys who come for a few months and go away and come back again. That is the experience of the past 15 years. Would you say that during the 15 years they would work more than half of it?—Yes.

513. Instead of their being content to work for three months either on the mines or anywhere else, they are influenced in the other direction. New wants are created and they come back. That is your opinion?—Yes.

514. You said the native character is a peculiar one, and to successfully deal with him you must deal with him as kindly as possible and gain his confidence?—Yes, he should have the strictest of strict justice.

515. Don't you think that after the war was over, when boys were required in great numbers, to take away a great many recruiters who had been known to these boys for many years, and to substitute for them other recruiters and other methods was a mistake, especially as many of the boys had got rich during the war. Don't you think that was the worst policy that could be adopted by sensible men who wanted to keep up the labour supply?—I always doubted the wisdom of that policy.

516. However, seeing the old rate of pay was reverted to in February last, do you think, with your intimate knowledge of the native character, that sufficient time has been allowed for the improved rate of pay and improved conditions, for all these things to be thoroughly understood by the natives; that is to influence the supply?—No, I do not think there has been sufficient time.

517. Now I did not intend to touch on the non-efficient question, but, as Mr. Whiteside mentioned it, perhaps it would be as well to put another question to you. You were asked whether it was within your knowledge that on Mondays and Tuesdays sometimes 30 per cent. of the labour was inefficient owing to drink. Has it come before your knowledge that people well competent to judge, and whose evidence will be given later, are prepared to state that from Monday to Tuesday, not 25, but 60 per cent. of the labour has been wanting, and that the average for the week has run into 20 per cent. at least?—There may be exceptions, but I was stating it as a rule, you see.

518. In giving an opinion as to the supply, and telling us that you knew nothing reliable as to the population in Natal, and giving us the population for Zululand, which is not in accordance with that given to us by other witnesses, do you not think it unwise to express an opinion upon the available supply?—The available supply was in regard to the particular district which I was cognizant of.

519. I admit that readily, that you were speaking of Natal generally.

520. Mr. EVANS: Is it possible to get from the East Rand the exact records as to the percentage of boys incapacitated through drink before the war?—That can be got.

521. And for other mines?—Yes.

522. Now in what district have you had touts out recruiting for you? I understood you to say you used to have a great many on your staff?—Yes, throughout South Africa.

523. Then, having regard to these touts, would your knowledge of the labour supply in South Africa be limited to the districts particularly mentioned?—When you take it as applied to Southern Africa my opinion would be largely based upon the opinions of the men employed by me.

524. They were the best men you could get?—Yes.

525. Were the wages paid before the war high enough?—I never heard the complaints before the war that have been heard since the war.

526. Now, in your opinion, was the high price paid for natives before the war clear proof of the insufficiency of the supply? Do you think the mines would have paid it if there was plenty of labour?—It always appeared to me that the demand was very fierce. I always had more work in the contracting line than I could take. The work used to come and look for me.

527. Mr. GOCH: You said that the time the news took to disseminate was not sufficient to spread the news amongst the natives about the increase of pay which took place since February, here. Take recruiting in Zululand, how long would it take to spread the news there?—It is not the time it would take to spread the news, but the time it would take for the native to accept it as reliable. He would want proof by some returning brother.

528. You say that in Zululand, which should be reached in two or three days, that six months' time was not sufficient?—No, not until some of the boys had returned and had experienced the pay.

529. Do you think that when they grasp that thoroughly in Zululand that we can depend upon a considerable supply from there?—I do not know. You might get a supply, but it would be to Natal's detriment, and to the railways' and coal mines' detriment.

530. It would be entirely at the expense of Natal if we drew any labour from there?—To a considerable extent.

531. Would you consider 10,000 drawn from there an excessive amount?—It is quite enough.

532. Do you think that Natal would really feel the pinch if that were done?—Yes, I am inclined to think it would.

533. You have stated that Natal could not get natives to work because Indians are employed there, and the natives will not work for the same wage; you remember that?—Yes.

534. That, of course, was the condition that existed there for several years, was it not?—But I also stated that I did not think my evidence would be of any value on the Indian question.

535. Generally, I think, you were of the opinion that the natives could not be got to work in Natal because they would not work for the same wage that the Indians got?—I merely suggest that the Indian was introduced because he was a cheaper worker.

536. Was it not your opinion that the natives were thrown out of work through the Indians coming there?—No.

537. In spite of the Indians coming there, they have an ample opportunity of getting employment?—Yes.

538. And at the wage they want?—Yes.

539. Locally in Natal?—Yes.

540. Mr. QUINN: When we talk, Mr. Maxwell, of the labour available in Natal, and of the Natal people having to import Indians, do you know that there are a very large number of natives in Natal who refuse to work for anybody, as statistics will prove?—Yes.

541. Therefore, to say that if we in this part of South Africa, by offering inducements to Zulus, that are not offered in Natal, can manage to draw from

there 10,000, 20,000 or 30,000 natives, would not that be advantageous to Natal, seeing that a very very large number do not work for anybody?—If they did not work for anybody, it would not keep the supply up in Natal.

542. If all the boys in Natal were employed in Natal, and the Natal people were offering them better inducements, we should not be doing the Natal people an injustice. But to draw from Natal thousands of natives who idle their time away and do not work for anybody would be doing Natal a favour. If we give the natives inducements to work, we are doing Natal a service, because we send back to Natal and Zululand the money that these natives would earn. It is notorious in Natal that there are very large numbers of natives that won't work for anybody?—Well, I can only give a sort of parallel of my experience in the Eshowe district. When I went there several years ago, the inhabitants were getting labour at about 10s. to 15s. a month. Then the railway construction started and they were giving 30s. The townspeople lost their labour supply and had to come up to the price of the railway supply to get labour, and it seems to me, based upon experience like that, the same would apply in a larger sense. If you take 10,000 natives out of Natal, it would suffer, except, of course, that you would be sending a large amount of money back again.

543. Do you admit, for instance, of your own knowledge, that there are in Natal to-day a very large number of Zulus, or in Zululand, who do not work for anybody, and who are not available for either Natal, the Transvaal, or any other place?—Yes.

544. If our people draw from Natal, we must be drawing that class of natives, and, therefore, in taking away 10,000 or 20,000 natives of that description, we should not be doing Natal an injury, but a service?—That is a matter of opinion, Mr. Quinn.

545. It is a reasonable proposition, is it not? But I will not press the point.

546. The CHAIRMAN: I think some confusion has probably arisen as to what you mean by the agents you employed to recruit for you. Were these men paid employees?—Yes.

547. They were not touts in the ordinary sense?—No.

548. On the question of the number of natives incapacitated by drink in the early part of the week, can you give the Commission your own personal experience with regard to the 1,500 or 2,000 you employed, on the Monday?—20 per cent.

549. And on the Tuesday?—Say 15 per cent., and 10 per cent. on Wednesday, and then they would fill up towards Thursday, Friday, and Saturday.

550. That was your experience with your employees?—Yes, that was my experience.

Mr. THOMAS EVERARD, called, sworn, and examined.

551. The CHAIRMAN: You are Mr. Thomas Everard?—Yes.

552. Where do you reside?—I reside at Leeuwpoot, in the Carolina district.

553. Have you resided there for some years?—I have had a farm there for the last fifteen or twenty years, but I have not always resided on the farm; I have another occupation.

554. You carry on business there as well as farm?—Yes, but not latterly. I breed horses.

555. You know one of the objects of this Commission, viz., to enquire into the requirements of the agricultural industry of the Transvaal. Can you give the Commission any information as to the requirements of your district?—The native labour has never been sufficient in the district; it has been the principal trouble of the farmers that they could not get sufficient labour.

556. Can you give us the average number of natives which each farm requires?—The average

number is from eight to ten or from eight to twelve, according to the size of the farms. They require that number for each farm. They are inconvenienced if they do not have that number to work on the farms.

557. Are the farms in your district those on which the natives reside?—Yes, most of the farmers have natives residing on their farms. Latterly, not more than five families of natives are allowed on each farm. If it were not for this, many of the natives would leave the farms on which they are engaged, and accumulate on other farms, the owners of which have a reputation for being more liberal in the matter of pay, and for treating the boys better.

558. Is there a sufficiency of labour for farming purposes in your neighbourhood at the present time?—Do I understand you to mean: Have the farms a sufficient supply?

559. Yes.—No.

560. Do you know what wages are paid to the natives by the farmers?—I know what I pay myself.

561. What is that?—I pay one boy £3 per month, but that is an exceptional case, as he is a particularly good boy. The ordinary Kaffir I pay 30s. a month, and from that down to 10s. for umfaans who have only just come to work. They have grazing rights in addition to that. Then I get odd ones who come along and want work. These I engage from time to time on the same terms. Living on the farm is not considered by these last-named to be any particular privilege. Still they like to live on the farms, because as a rule, the owner or the farmer of the farm affords them a certain amount of what I may call "patriarchal" protection.

562. Is there anything else you would like to say, bearing on the agricultural requirements?—No; only that amongst the Boers it is one of their principal grievances at the present time they have not enough labour. They want legislation to enable them to get more Kaffirs and to keep them. This is a great trouble with them. From time to time I receive letters which show that the labour question is a very great trouble with them.

563. Is it greater now than before the war?—Yes, I think it is. There is a great tendency amongst the Kaffirs on the Boer farms to go away and work in Johannesburg and other places where they can get better wages than the farmers are able to pay them.

564. Mr. QUINN: Mr. Everard, how long have you lived in this country?—Since 1873.

565. Do you farm your own land?—Yes.

566. I understood you to say you had a store?—I had a store until the end of the war.

567. Did you farm at the same time?—Yes.

568. Are you a cattle or produce raiser?—Cattle and horses.

569. Yours is somewhat of a stock farm?—Yes.

570. You told us in speaking of the wages that you paid a responsible man as much as £3 per month?—Yes, but that is an exceptional instance.

571. And as low as 10s.?—Yes, for little boys coming to work for the first time.

572. Can you tell us the ruling rates of pay on the farms amongst the Boers?—Some pay nothing at all.

573. Just so, that is the ruling rate, I believe?—I cannot quite say that.

574. In your district are not the Kaffirs allowed to farm portions of the land in consideration of their giving a certain amount of labour; and in some instances do not the better class of farmers give the natives a few shillings and some old clothes at the end of the work?—Yes, that is done on many of the farms.

575. In face of that, I should like to see your answers to the letters spoke of receiving complaining of the want of labour. Is it to be surprised

at that if a few miles away boys can earn wages, there is an insufficient supply on those farms where they get no wages at all?—No.

576. Would it be fair to say that on most of the Boer farms the natives get very little or nothing at all?—No, not on very many. They receive help from the farmers in the matter of ploughing their land, but in many cases they do not receive very much.

577. What did you mean by saying that the farmers afforded to the natives living on the land a certain amount of "patriarchal" protection?—It was very vague, I allow. What I meant to convey was that in such cases if a native had his cattle stolen or any other apparent injustice was being done him, the owner of the farm would assist him in obtaining his rights, and would see that he was not unjustly oppressed.

578. You say they complain more now than before the war. Before the war was there not a system in vogue known as the apprentice system, under which the farmers got boys for no wages at all, but in consideration for teaching the natives farming?—(No reply.)

579. Do you remember the Malapoch boys being brought down?—Yes.

580. Is it not a fact that the bulk of the farmers pay practically nothing to the boys, but that they employ the natives under this apprentice system, a system which, I might call by a different name which might be objectionable to some of the members of the Commission. Leaving that for a moment, I will ask you another question. How many acres of ground do you farm?—I have about 7,000 odd acres in all, about one-fifth of which is enclosed for farming purposes.

581. You probably farm more than the bulk of your neighbours?—No, less. As I have not been living much on the farm myself, having another occupation, I have probably given less attention to my farm than others do to theirs.

582. What proportion of his land does the ordinary Boer farm?—What do you mean by farm? Do you mean cultivate?

583. Yes, by farming the land I mean cultivating the land. What is the proportion of a Boer farmer's holding which he usually cultivates?—I think, on the average, perhaps about one-sixtieth part of the whole farm is cultivated.

584. What is done with the balance of the farm?—Cattle are usually run on it.

585. Mr. WHITESIDE: Mr. Everard, you said that from eight to 12 Kaffirs are required for each farm; this seems to me rather vague, as farms would naturally vary in size. What is the average size of a farm requiring, say, from eight to ten Kaffirs?—In giving those figures I had in my mind the ordinary farm consisting of about 3,000 morgen.

586. You said something about natives living on the farms and of the farmers only being allowed to have five families squatting on their holdings?—Yes.

587. Would this not have a deterrent effect on the supply available for the farmers; in other words, would it not have an adverse effect on the supply?—The Kaffirs living on the farms?

588. I mean allowing them to only have five families?—Yes, in some cases, but if this rule were not in force it would mean that the Kaffirs would leave the farms on which they were not liberally and well treated, and go to other farmers who had the reputation of treating their boys well.

589. What is your opinion of the relations between the Kaffirs and the Boer farmers?—My experience is that, as a whole, the Kaffirs are very well treated by the Boers, except, perhaps, in the matter of insufficient pay, otherwise they are well treated. Kaffirs who have grown up amongst Boers do not dislike the Boers. I, myself, always like to get a Kaffir who has grown up amongst the Boers.

590. You said, I believe, that there was a sufficient number of Kaffirs in the neighbourhood, but that the farmers could not get them?—No, I do not think I said that.

591. I understood you to say that there was sufficient labour, and that the Boer farmers wanted legislation to compel the Kaffirs to work on the farms?—Yes, they want legislation for that purpose.

592. But you did not say that there was sufficient labour in the neighbourhood, but that they would work on the farms?—No, I did not say so. I cannot say definitely, but I doubt whether there is sufficient labour in the neighbourhood.

593. Is it not more or less a practice to pay the Kaffirs in kind?—Yes, in cattle and the like.

594. It is a general practice?—Yes.

595. Mr. EVANS: Has the war made the Kaffir more independent and wealthier?—It has had a different effect on different classes of the natives. Those who went with the army, of course earned good wages and became wealthy, comparatively speaking, but those who remained on the land suffered a good deal from the war, owing to the soldiers taking their cattle; and the Boers took them also.

596. Can we rely now on labour from the native who was employed by the army?—I think the native will always go where he can get good pay.

597. Can you suggest the name of a good witness who could give us further information as to your district and the natives there?—There is the Field Cornet of the district. His name is W. H. de Villiers.

598. Mr. GOCH: I would like to ask you what in your opinion is the maximum rate of pay the farmers could afford to give the Kaffir?—I think they might pay £1 or even 30s. per month for good Kaffirs; 30s. would be an outside rate. I think a fair average would be £1 per month, and food.

599. Above that rate would farming not be profitable?—I do not see how the farmer could afford to pay more than that unless the Kaffir worked more generously than he usually does.

600. With regard to the suggestion that a great many Kaffirs work for the farmers for nothing, is it not a fact that Kaffirs living on the farms get land to work on shares; that is the general practice in the Transvaal, is it not?—They get the land to work for themselves, not on shares. In consideration of their working for the farmer without pay, they get land, without rental, to work for a certain part of the year for themselves, and in some cases the farmer affords the natives a certain amount of assistance in the direction of ploughing the land, etc.

601. That is to say that they actually pay their rent by way of labour?—Yes.

602. Accordingly, they do not work for nothing?—No, they live on the land for nothing, or, rather, pay for living on the land by labour.

603. Does that practice prevail largely in the Transvaal?—Yes.

604. On what lines do the Boers require legislation to induce the Kaffirs to work for them?—They require something in the way of the pass system, viz., that no native should be allowed to work for another employer until he has a pass from his last one.

605. That is a similar system to that in vogue on the mines here?—Yes, much the same kind of thing, I understand.

606. Would that not be rather difficult to arrange in the cases of natives getting no actual wages? In the case of men who did not get wages, would not that be in the nature of compulsion to work?—No, I hardly think so; the native, even if he receives no actual pay, is being repaid for his labour in other ways; in fact he is under contract.

607. What is wanted, I understand, is strict legislation to this end?—Yes, they want a law that no native shall pass from one employer to another without a pass from the former.

608. That could not apply to the whole of the year?—No, it could only apply to part of the year.

609. Mr. PIERROW: You told the Commission that you paid one of your boys £3 per month, and small boys 10s. per month?—Yes.

610. Have you sufficient labour on your own farm to-day?—No.

611. Mr. WHITESIDE: We had some evidence given to us by one of the missionaries the other day that in some instances farmers required from natives passing over the farms as much as three months' labour by way of toll or tribute for so doing; have you yourself met with anything of that sort?—Many years ago my brother was down in the Komati district, and he saw an old farmer come out of his house one morning, who, finding that a certain number of natives had slept on the farm the previous night, tried to claim from them 6d. per head for having slept on the farm, but other farmers coming up and crying shame at the proposal, the claim was not proceeded with. That is the only instance of anything of the sort I have heard of.

The CHAIRMAN then thanked the witness for attending, and the witness withdrew.

The Commission then, at 12.15, adjourned till 2.30 p.m. the same day.

Mr. F. DE MELLO BREYNER, called, sworn, and examined.

[Mr. Breyner gave his evidence in Portuguese, which was translated to the Commission by an interpreter.]

612. The CHAIRMAN: Your name is Mr. Mello Breyner?—Yes.

613. I understand that you represent the Witwatersrand Native Labour Association at Lourenco Marques?—Yes.

614. For how long a time have you represented the Association there?—Since the new Association commenced.

615. Have you resided in Lourenco Marques or in Portuguese East Africa for any length of time?—in East Africa since 1887, or say, for 16 years.

616. Have you been engaged in business there?—From 1887 until 1895 I was a Government official, being Mayor of Delagoa Bay; next I was Native Superintendent in Gazaland, and since 1895 I have been in private business as a merchant.

617. Do you occupy any official position at the present time?—I am a member of some Commissions, having been appointed thereto by the Government, but I do not act at present in any official capacity.

618. Have you, during the time you have been in the country, been engaged in connection with native labour in any way?—I have done practically nothing else since 1895. I was first engaged securing native labour for the Ferreira Mine, then I became agent for the old Rand Native Labour Association, and later became agent for the present Witwatersrand Native Labour Association.

619. From 1895 up to the war you were agent for the Ferreira Mine and for the old Labour Association?—I was first agent for the Ferreira Mine, then agent for the old Labour Association until that Association became merged into the present Native Labour Association.

620. Then you must have a very good knowledge of the whole question of recruiting native labour in Portuguese East Africa?—I am bound to.

621. You have prepared a statement which is before the Commission. Have you a copy of it before you?—Yes.

622. Are you agreeable that this should be taken and put in as your evidence-in-chief?—Yes, and I am open to discuss it and to add to it any further particulars as the Commission may desire.

STATISTICS.—Official statistics give us a number of 363,036 adults from 15 to 50 years old in the district directly administered by the Government, that is Lourenco Marques, Gazaland, Inhambane, Mozambique, and the Crown Lands of the district of Quili-

mane. These statistics, although official, may be less than the truth, seeing that they are founded on the payment of taxes by the natives; but we know that there are considerable districts where very little is received in taxes from that source, owing generally to the great distances at which the authorities are situated. The Administration of the other part of the province belongs to three companies—Mozambique, Nyassa, and Zambesi Companies. In the delta of the Zambesi there is a special form of administration, viz., that of the "Prazos." These territories, at any rate those of the companies of Zambesi and Nyassa, are very populous, and perhaps we may fairly put their total population as equal, if not greater, than that of the country under the direct administration of the Portuguese Government.

On this basis, we should have a total male population of working age (between 15 and 50 years) of 726,072, or in round numbers, between 700,000 and 800,000.

EMIGRATION.—We have as basis the above number of 700,000 to 800,000 men of working age in the Province of Mozambique. Taking into account the natural disposition of the native to indolence, we cannot count more than one-third of them as being available, that is, roughly speaking, a quarter of a million. From this figure we must deduct from 80,000 to 100,000 required for the internal needs of the Province of Public Works, for the municipal service of the towns, for agriculture and mines, for the service of the ports, for the needs of the coastal service, for military service, for various industries, and for domestic service. That leaves 150,000 available for emigration to work on the mines of the Transvaal. It must be remembered that this estimate of the available number includes the whole of the Portuguese territory in East Africa, including the territories of the companies of Nyassa, Zambesia, and Mozambique, and the districts of Mozambique and Quilimane.

NOTE.—Projects are on foot for constructing three lines of railway in Portuguese East Africa, viz., the lines to Swaziland, Quilimane, Ruo and Pemba to Nyassa. These lines are likely to be built in the more or less near future, and it is estimated that their construction will require at least 60,000 labourers. This number must, therefore, be deducted from the number available for emigration in the event of the construction of the railways.

METHODS OF RECRUITING.—The work of establishing the current of emigration among the natives of the Province of Mozambique, and directing it to the mines of the Transvaal is much more difficult than might be supposed. Of all the systems that which is actually in force and practised by the Native Labour Association seems to be the best for attaining this end. It consists in the maintenance in the province of a number of recruiters resident in the country, working under the control of a single central administration. The existence of recruiters belonging to different associations or different companies, working against one another, would result immediately not only in a great increase in the expense of recruiting, but also in a great confusion being set up in the minds of the natives and in continual conflict with the petty authorities in the interior. This state of things existed before the war. As far as the districts of Lourenco Marques, Gazaland, and Inhambane are concerned, the current of emigration has already been established, but no one knows how many years it took to set it up. Before even the existence of Johannesburg, there was emigration across the frontier to Kimberley and Barberton. These three districts have furnished to the Rand in the past as many as 80,000 workmen, that being the number, roughly speaking, which was on the Rand at the outbreak of war. The remaining districts of the Province of Mozambique might come to be in a position as indicated above to furnish an equal number, thus making up the total of 150,000 which I have indicated. It must be remembered that the current of emigration has not yet been established in the whole of the northern part of the province, and that this has to be done. It can best be done

by establishing a system of recruiting, similar to that which is maintained in the southern districts. Nevertheless it will require some years. I do not say as many as were required for establishing the current in the districts of the south, because in those districts the natives began to emigrate without any organisation or facilities being established such as are now set up in the northern districts. I calculate that with the establishment and maintenance of an organisation to facilitate recruiting, it would take at least from five to seven years before the northern provinces are in a position to furnish to the Rand a complement of 60,000 to 80,000 labourers, which, on the above calculations, they may be able ultimately to supply.

NOTE.—Of the three railways projected, that of Swaziland is in the southern part of the province. If the construction is begun in the near future, it is likely to diminish the existing emigration from the southern provinces to the mines. In such a case it might be difficult to reach the figure of 80,000 from the southern province which was attained before the war.

I have nothing to add to the foregoing, and should prefer the Commission to proceed.

623. Mr. EVANS: For what other mines did you recruit labour in addition to the Ferreira which you have mentioned?—All the boys I recruited were handed in to the Ferreira. I think some of them were distributed to other mines, but I have no knowledge of what particular mines they were.

624. Was there any difficulty before the war, in getting the labour you required?—At that time I had no difficulty.

625. Was that for all periods prior to the war?—I am speaking now of 1896; at that time I had no difficulty.

626. Up to 1899 were you not recruiting for the Ferreira Mine?—I am speaking of the end of 1895 and 1896; during that period I engaged boys for the Ferreira Mine, and for a few months afterwards I recruited for the old Labour Association.

627. When you were recruiting for the old Labour Association, did you get all the boys you required?—Since I joined the old Labour Association, I have given up the work of recruiting myself, and engaged native recruiters to do that part of the work for me; I also engaged white recruiters to do part of the work. The organisation was more or less similar before the war to what it is at the present time.

628. Did you obtain all the natives asked for by the Association?—I used to send on all the boys I could get hold of; whether they were sufficient or not I could not say. I sent on all I could get.

629. Had you been able to get more, would the Association have taken them?—Yes, certainly.

630. Then the districts were exhausted before the war?—The Association used to accept any number of boys I sent them. I never received intimation that I was sending too many.

631. Did you do your best to get all you could?—Certainly, I did my best to get all the boys I could, and if desired I can supply statistics of the number of persons I employed to assist me in the work. I used to employ eleven white recruiters—

632. All right, we will come to that later on. Can you tell me anything as to the number sent in during previous years? In 1899 I understand there were something like 80,000 on the Rand?—That was the official number of boys working on the Rand mines at the outbreak of the war, say, 80,000.

633. Are there any statistics at Delagoa Bay of the number of boys sent here before the war?—The figure of 80,000 I have given is supplied by the Portuguese Curator of Natives in Johannesburg.

634. Can you tell me the number sent here in 1898?—I am speaking now of the number at work in 1899 at the time the war broke out.

635. Can you give us any rough idea of the rate of increase in the number of boys sent up, as from year to year?—I am not prepared to do so at this moment, but could do so later, perhaps to-morrow.

636. What I want to get at is the rate of increase in the numbers prior to the war; for instance, if there were so many in, say, 1895, and the total in 1899 was the 80,000 you give, we should then have some idea of the increase covering a certain period?—I cannot give you the numbers in 1895 or in 1898, but I can give you 1897 and 1899.

637. That will do. What are the numbers in those years?—From the beginning of March, 1897, to the 11th October, 1899, some 42,000 boys were sent up. I would desire to mention that that number covers the period when free recruiting was allowed.

638. I want to know what the rate of increase was?—To answer that question I should require to make some calculations, which I will do for you later on.

639. Very well. Now, can you tell us something about the old system of free recruiting which was in vogue? You refer to it in your evidence-in-chief, and I should like to have your further views as to it?—You mean the free recruiting?

640. Yes?—Free recruiting was tried before the war, and as far as I am concerned, my opinion is that the result was very bad. As soon as free recruiting is allowed, the immediate result is that competition sets in and an increase takes place in the price which has to be paid to secure native labour, and the continual dissension amongst the native agents causes the labourers to run from one recruiting agent to another. I would like to point out to the Commission that the old Labour Association employed 11 white recruiting agents, and besides these, some 28 outside recruiters were engaged, and the total number of boys recruited by these 39 agents was about 25,000 a year.

641. You state that one of the results of free recruiting is an immediate increase in the price of the labour supplies, but what I would like to know is: would it not increase the number of boys obtained?—I am talking from my own experience, and I am persuaded that it would not mean an increase in the numbers of boys obtained. Free recruiting means a sort of war amongst the recruiters, and this has a bad effect on the natives, as they always endeavour to avoid what seems to pertain to "war" of any kind: the native accordingly at those times keeps away from the recruiting centres.

642. How do the authorities at Lourenco Marques view this aspect of the question? Do they favour free recruiting?—I am in a position to state that the authorities in Mozambique (which includes Delagoa Bay) prefer that the natives should be recruited by some one body; in other words, that it should be centralised, as it is much easier for them under those circumstances to control the business.

643. You state that in 1899 there were 80,000 boys on the Rand: how many of these came from the country north of latitude 22 degrees?—By north of latitude 22 degrees, I understand you to mean from the Gazaland district?

644. How many came from north of that?—Very few; only, I think, some 2,000.

645. Have you any idea how many out of those 2,000 have returned? They were here in 1899, how many of them have returned since?—I could not say, of course, how many returned, as the war broke out, but I should like to point out that these 2,000 boys were not actually recruited from the northern territories; they were for the most part in Delagoa Bay, in the streets, and were picked up there and sent on to the Transvaal.

646. Then there was no recruiting in the northern territories prior to the war?—There was some recruiting in those northern territories, but not very much.

647. What was the result of that recruiting?—About 300 boys were obtained in the Quilimane district, and some 400 in the Mozambique district, that is to say, more or less.

648. Do you think they can stand the climate here?—It is very difficult for me to form an idea; experience alone can tell.

649. Do you know anything of the following circumstances: In 1898 a batch of boys was recruited in the Quilimane district, comprising, I think, about 300, but of the number I am not quite sure. On the 26th August, 1898, some 182 of these boys were delivered to the Crown Deep, and on the 10th November following the manager of the mine reported that half of them had died; that is to say, they had lost one-half in three months, and at that rate of mortality the whole lot would have died off in six months?—I am aware of the case quoted; but at the same time I am not surprised at the result. That was the first batch of boys recruited from the Quilimane district, and the object of the recruiters was to pick up the boys with the least possible trouble, so that instead of going into the country for them, they picked up what are called the "town" boys, who, it is well known, are afflicted with many ailments, and they would be specially liable to show a heavy mortality rate. Had the boys been recruited from the hinterland or country districts, where the boys are in better health, the results would no doubt have been very different.

650. Do you know of any other lot of boys from those districts sent here, so that we can have them traced and see what the result in their case was?—No, I do not think I know of any other lot.

651. Would you call the inland district, south of Lake Nyassa, the hinterland? Would you consider that boys brought from an altitude of from 3,000 to 4,000 feet above sea level would stand a better chance in this climate?—I have no knowledge as to that. I simply referred to the special circumstances in the case quoted to show that it does not prove that all Zambesi boys would be liable to the same high death-rate. I know that the boys you refer to belonged to the same races as the Zambesi boys.

652. Then you do not know of any further batch of boys being brought here from the hinterland, so that we could trace them and see what the result was?—There was a lot recently, that is, this year, 1903; some 432 boys were sent to the Transvaal then, who were recruited from the Quilimane district, the same place. It is possible that some of these 432 boys were "town" boys, but the great majority of them were certainly from the country.

653. You have the date when these boys were sent up?—I have not the exact date, but I know the month in which they were sent here.

654. However, you could procure the date and let us have it later on?—Yes.

655. Have you had any experience of the hinterland in the north?—Do you mean the country north of Inhambane?

656. What experience have you of the country north of the 20th or 22nd degree of latitude; that is to say, of the territories of the Zambesi and Nyassa Companies?—I have been round these parts, along the river, which is the only way of travelling there. I was for two months in those parts.

657. Of the 80,000 boys who were here in 1899, where did the majority of them come from?—From Gazaland and the Inhambane district.

658. How many out of the 80,000 do you suppose came from those two districts?—Speaking very approximately, I should say the 80,000 would be made up about as follows: Say, 35,000 from Inhambane district; 35,000 from Gazaland; and 10,000 from the Delagoa Bay district.

659. So that practically none of them were got north of Sofala?—A few must have been sent. However, they were not recruited direct in their own country, but were amongst the boys recruited in the three districts.

660. What is the farthest point north that any recruiting was done prior to the war?—The town of Mozambique, in latitude 15 degrees.

661. When was that recruiting done?—In the year 1899.

662. How many boys were got from Mozambique?—About 300 or 400.

663. Then apart from 300 or 400, the whole of the 80,000 were got south of the Zambesi?—Yes.

664. In your evidence-in-chief, you mention a population of 363,000 adults, which I understand to mean "males," what population do you refer to by that?—I mean the population of Gazaland, Inhambane, and Lourenco Marques.

665. How did you arrive at the figure?—They are official figures obtained from the collectors of the hut tax.

666. Can you give me the total population of the districts which contain the 363,000 adult males?—I have not got the figure here. I only took in the figures required for my calculations. The figures I have given are drawn up by the Government; they are the best statistics available. No doubt you could get from the Government authorities the total population of the districts referred to.

667. Mr. EVANS: In these northern districts—Mozambique, Nyassa and Zambesi—is the population as large as in German East Africa?—I do not know German East Africa.

668. You give the population of the Northern territory as equal to that of the Southern. Why do you do that?—At the very least that is so.

669. How do you know?—The Zambesi District is the most populated district in the whole Province. After that comes the Mozambique District. The Gazaland territory has also a very dense population, so, if you calculate it is half of it, it will be a rough, but certainly an approximate calculation. Besides that, they have the territories of the Nyassa Companies, which are also very much populated.

670. These are rough estimates. They are not based on any exact figures of any kind?—That is so.

671. What makes you think that we should be able to get from the northern territory as many labourers for the Rand as from the southern territory?—My opinion of the matter in that respect is based on the number of the population.

672. Well, how is it that we have not heard of these people going anywhere? How is it that free touts did not get up to the Northern territory if there were so many of them?—All work has to be established first before they get it; it takes a long time to establish before they can go on and get access. A certain current of emigration must be established first.

673. Up to the present the current amounted to something like 400 per year?—To establish that current of emigration you must necessarily spend a lot of money and waste a lot of time before you get any footing, and, as the free recruiters were small emigration merchants, they certainly did not invest any capital in exploiting the district, when they should get immediate benefit in the Southern territories.

674. The free recruiters charged a lot for their boys and got it. Would not that be an inducement for them?—Yes, certainly. They paid a big price for the boys and got that price from the mines.

675. What is your idea as to the rate of progress in opening up that country? Is it going to be more accelerated than in the past?—The Northern territory will be a very nice source of immigration, but it will take a long time and will require very careful work.

676. Now, as a matter of fact, where can you recruit in the Northern territory to-day?—My opinion is that one should start in the Zambesi, in the Nyassa country, and the Mozambique District.

677. Why have you not started?—It has been started already on a small scale.

678. Can you go and recruit in those territories now?—No recruiting can take place now in the territories of the Nyassa Company because the Company has not allowed it. Negotiations are now

proceeding with the Zambesi Company for recruiting, and of course recruiting is free in the Mozambique District.

679. With the results that we have heard, so far as recruiting is concerned. It is open for you to send recruiters there and get boys if you like?—There are some recruiters there already.

680. How long have they been there?—For a year.

681. And they have recruited how many?—About 900.

682. That has been done in a year?—Yes.

683. Now, as a matter of fact, these figures that you give us as to the probable number that we can get from the Northern territories are pure guess-work, is not that so?—Yes, simply hypothesis.

684. Simple guess-work based on no previous results?—Do you mean the estimates of the boys that can be got?

685. I mean from the Northern territory—that we are likely to recruit in the future?—I base my opinion on the fact that apparently the Northern population is equal to the Southern population.

686. The population is there, but whether they will come out or not is mere guess-work?—It is merely an hypothesis.

687. Have the labour requirements of Delagoa Bay and these Southern territories increased since the war—the Southern Districts?—They have increased.

688. What do you roughly estimate that they are using now in boys in addition to what they were using in 1899? How many more natives do they employ there themselves?—I can give you the exact figures of the boys working in the town of Lourenco Marques last Saturday.

689. Give us the total figure?—7,463.

690. Does that include those working on the railways and on the new quays?—Yes. It includes the railway boys working in the city, but not outside on the line.

691. Does it include the new quays? They have some harbour works going on there, have they not?—It includes also the boys employed on harbour works, but those boys are not very numerous.

692. What does this 7,000 include?—Forwarding, Landing and Shipping Companies, 2,320; Custom Houses, 1,298; Public Works and Municipality, 450; Harbour Works and Railways, 650; Builders and Contractors, 555; Brick Fields and Stone Quarries, 350; Domestic Servants, 1,870; this makes a total of 7,463.

693. How do you get at these figures?—Last Saturday was the pay-day, and I had the enquiries made at all the public offices and commercial houses.

694. How do you arrive at the domestic requirements?—That is the only one which is not quite correct; still there are the Municipal statistics. It is a calculation made according to the population of the number of houses in the town.

695. There is no registration of these people?—Oh, yes, there is. The figure is from the Town Council. It may be 50 more or less, but it is a very good average.

696. You say in your statement here that roughly there is a quarter of a million in the two territories; then you say from this figure we must deduct 80,000 or 100,000 required for the internal needs and public works. How would you distribute these 80,000 to 100,000? Where would they be required; give it to me roughly, in what parts? Under "Emigration" you say, "From this figure we must deduct from 80,000 to 100,000 required for the internal needs of the province of public works for the Municipal service of the towns, for agriculture and mines, for the service of the ports, for the needs of the coastal service, for military service, for various industries and for domestic service." How many of that 80,000 would be required in Lourenco Marques, Gazaland, Inhambane, and

Mozambique. Half, three-quarters, or how many?—I am certainly not prepared to say. I think it is impossible to give you the exact number of them.

697. I am asking for an estimate?—I estimate one-third, say 20,000 boys, are required for agricultural purposes in the Zambesi District, that is speaking roughly; 6,000 for the mines for the Mozambique Company; about 3,000 men for military purposes; these are for what you call War Companies.

698. How many are required, say, taking the country from the latitude 20 southwards. You give a rough estimate of from 80,000 to 100,000 for public works, etc. How many would be required from that latitude?—Do you mean 80,000 from the whole Province?

699. Would it be sufficient to say from 40,000 to 50,000 from that district?—It is very difficult to say, but I will say that it is much less than half, because the northern district requires much more labour than the southern.

700. Will you give us a figure roughly?—Two-thirds for the northern district and one-third for the southern.

701. That would make from 25,000 to 30,000?—Yes.

702. Now you tell us that, roughly speaking, there would be a quarter of a million available in the whole of the Portuguese territory, of which half, 125,000, would be available in the southern territory. Is that so?—I calculate that 80,000 boys—of course these are merely rough figures—I calculate that 80,000 from the southern districts would be available for the mines.

703. You could not say after deducting what is required for public works?—Yes.

704. Then as a maximum in the territory south of latitude 20, in your opinion, there are not more than 90,000 available for the mines. After deducting the other requirements now going on south of latitude 20?—South of latitude 20 the maximum number of boys that can work here is 80,000 to 90,000.

705. That is the maximum number that we can get from there under present conditions?—Yes, under present conditions.

706. Now, you state that there are three lines of railway in Portuguese East Africa in contemplation, one to Swaziland, one to Quilimane, Ruo, and one to Nyassa from Pemba. How many labourers would the Swaziland line require? You say 60,000 for the three? Would it be fair to take 20,000 for each?—I think if you take the number at 20,000 it would be a maximum.

707. How long will it take to construct this line?—I do not think it would take more than one year to complete. It is a short line. Of course I mean in the Portuguese territory.

708. The line from Delagoa Bay to the frontier. They will only employ 20,000 boys for the year?—That would be the maximum.

709. What would be the minimum?—I cannot very well say. It is only a line of from 40 to 50 kilometres, and the number of boys is a matter for the engineers to judge.

710. You have given 60,000 for the three lines; supposing they employ 20,000 on this line for that year in that territory there will only be from 60,000 to 70,000 boys available for the mines. Is that right?—Yes, naturally, as long as the railway is being built.

711. Now, have they any other public works in contemplation in the neighbourhood of Delagoa Bay, etc.?—I have no knowledge of any very important works that are in contemplation; of course I cannot answer for the future. Of course there will be in the immediate future.

712. If this line is constructed I suppose you look forward for a great extension of business in Delagoa Bay?—I think so, but I think at the same time that this increase of business will not affect the point now under consideration, for it will not require more than 2,000 or 3,000 boys.

713. Is that all they will require?—Yes.

714. When this line is in preparation you will also require boys to work it?—Yes, certainly.

715. Then, of course, the position is this. Instead of being able to expect a larger supply in the future from south of latitude 20, we may have a reduction?—I would like to confirm what I mentioned. Recruiting work in the three districts has already been organised. It is done, and emigration that can be expected from these three districts can increase, but not to a very large extent. It can be a little more or a little less. I would like to point out that although the market is being tried in these territories, so to speak, still the emigration in these districts can increase by some means. By the increase of the number of recruiters and so on, or by some system. But it can also decrease, if further public works are contemplated.

716. That is, if this railway is constructed, we may have a diminution? I mean the Swaziland Railway?—Yes, naturally there will be a diminution. The greater the necessity for labour in Delagoa Bay, of course the less number of boys will be available for the Transvaal.

717. Are boys recruited there for any other place besides the Transvaal? Are they recruited for Natal?—There is no recruiting for Natal, nor for any other territory.

718. Where do they get their boys in Rhodesia?—From the territory of Mozambique and some of them from the high Zambesi.

719. Have you any idea how many boys have been recruited for Rhodesia?—No recruiting has taken place. They calculate that about 6,000 boys have gone to Rhodesia, but these boys have been smuggled. No proper recruiting has taken place. They go of their own accord.

720. That is, there has been no proper recruiting?—Yes, because the Mozambique Government does not allow it; they prefer the boys to go of their own accord.

721. Are the mines of Rhodesia free to recruit anywhere upon this territory?—There is nobody there working for the Rhodesian mines.

722. Why is that? Have any boys been recruited in Portuguese territory for Madagascar?—Formerly, yes, but not now. There is not one boy who wants to go out there.

723. When did the recruiting for Madagascar take place?—Recruiting was done long ago. It was stopped, and then they recruited some boys during the war, but just a few; those who wanted to go.

724. Can you tell me roughly what ages these boys are that come here? You have given here between 15 and 50. At what age would the majority of the boys come into the country?—Between 20 and 40 years of age.

725. The majority would be of that age. I mean the majority of those who come here?—Yes, the majority. Many more boys would be coming to the Transvaal if they were allowed to recruit the picanninies also, the young ones, but neither the Transvaal Government nor the Portuguese Government wishes to have these boys.

726. At what age would you recruit them at?—At about 15 years. A boy 15 years old is already a man and can easily work.

727. Coming back to these Mozambique boys, do they work in their own country?—Yes, they certainly do, but of course they are a better class of boy. The boys of Mozambique are very good workers. The Zambesi boys are inferior.

728. Did you hear one of the missionaries who gave evidence here say that schools would be a great attraction to boys; schools in the compounds, churches and so forth? Do you think the establishment of schools and churches in the compounds of the mines would be an attraction?—It might be the case, but I do not think that that would be an absolute necessity.

729. Have you heard any complaints as to the treatment of boys up here?—No; on the contrary, all the boys are satisfied with the treatment they have received up here.

730. What do you think about their housing?—From what I have seen here on the mines, my opinion is that the boys are very well housed and fed.

731. As well as they are at their own homes?—Better. The only thing is, I think, when the different class of tribes are taken into account the mines might vary their food. But this is not a necessity, though it would please the boys. For instance, a special sort of mealie ought to be given to the Zambesi boys and so on. They ought to vary the food according to the districts the boys belong to, but this would be only to meet their wishes. It is not necessary; they would be quite satisfied without it.

732. Would any change of that sort materially influence the supply of boys?—It is a very difficult thing to affirm, to guarantee, but as they are satisfied now already, they would be more satisfied by having more facilities.

731. But how many more will come?—I cannot answer that question.

735. Do you think that many more would come?—That would be natural, but of course I do not know, but I think that more boys would perhaps turn up, because I am of opinion that I would prefer to go to a place where I was very well fed than to a place where I was insufficiently fed.

736. Have you anything to say on the wages question?—I think the boys are very well paid.

The Commission adjourned at 4.40 p.m. until the following Tuesday morning, the 28th July, at 10.30 a.m.

Note by Mr. Mello Breyner.—The figures given for population and for the number of boys available for the mines must be taken as a *minimum*. Those given for numbers required for the internal wants of the province must be taken as a *maximum*. The latter figures will probably never be reached by the contemplated public works.

#### FOURTH DAY.

Tuesday, 28th July, 1903.

THE COMMISSION SAT AT 10.30 A.M.

Mr. F. PERRY, called, sworn, and examined.

737. THE CHAIRMAN: Mr. Perry, you are Chairman and Managing Director of the Witwatersrand Native Labour Association?—Yes.

738. How long have you occupied that position?—Since the 1st of February.

739. Will you tell the Commission what position you held in this country previous to your taking your position?—I was Imperial Secretary.

740. For what period did you occupy that position?—Since August, 1900.

741. You have resided in South Africa since that date?—Yes.

742. And previous to that, what was your experience?—I was in the South African Department of the Colonial Office since 1896.

743. While acting as Imperial Secretary, did this question of the native labour supply for this Colony come under your notice?—Yes, in this way. In the negotiations with Foreign Governments and with other British Governments; this all passed through my hands.

744. You have been good enough to prepare a statement which I think is in your hands?—Yes.

745. This statement is headed Mr. F. Perry's evidence?—Yes.

746. Is it your wish to hand this statement in to the Commission as your evidence-in-chief?—Yes my statement is as follows:—

The Native Labour Association was formed at Capetown in 1900 by a coalition of all the principal mining groups on the Rand, and of nearly all the independent mines. Its object was to enable the mines to recruit their own native labour through a central organisation or labour bureau. A partial organisation of the same kind had been in existence for some years previous to the war, but this only included a part of the mines. Under the Transvaal Law the Association could only be incorporated as a Limited Liability Company, and accordingly its constitution was drawn up in this

form. A copy of the Articles of Association is put in as an annex to this evidence. I should like to bring two points to the notice of the Commission. The first is that the Articles of Association preclude the Association from making any profits. It is bound merely to cover its expenses, and cannot distribute any dividends among its members. I mention this as the Association is frequently referred to as a profit-earning company, as if it were an independent commercial undertaking, run to make profits and make dividends. The second point is, that the Association is entirely a voluntary one between the various mines on the Rand. It is often referred to as a monopoly, and it is stated that it has secured special privileges from the Transvaal Government. This is not the case. In fact, the Association is merely a co-operative society, all the members of which are shareholders. All the members agree to deal with the Society only. The only penalty for breach of this agreement is exclusion from the Society. Any individual member is perfectly at liberty to secede from the Society and deal elsewhere if he thinks it to be in his interest to do so. The Government has nothing to say in the matter, nor does it give any special privileges to the Society. Such co-operation is not usually regarded as illegitimate, even when it applies to the ordinary commodities of trade. Of course, it eliminates the private trader or middleman. But the consumer is thought to be justified in pursuing his own interests by co-operating if he thinks fit. If co-operation is justifiable for the direct purchase of ordinary articles of trade, it is still more justifiable for the direct engagement of labour, which is not, as a rule, a subject of barter, or one which calls for the intervention of middlemen. In most countries the employer deals directly with the labourer. The labourer is on the spot, and there is no question of employing a third party to obtain him. On the Rand there is no resident labouring population to meet the requirements of the mines. The labourers have to be brought from a distance. The most obvious way of doing this is by means of a central labour bureau, the expenses of which are borne by the

employers who need labour. This is what the Association is. The outline of the organisation of the Association is as follows:—

District Managers are stationed at central points in the various territories where a supply of labour is available. Each district manager is in sole charge of the recruiting in his own district. It is his business to engage recruiters to work in the territory for which he is responsible; to establish receiving stations at convenient points; to take over at these stations labourers who are willing to contract for work on the mines; to arrange for transporting them to the Rand, and for feeding, and where necessary for clothing them, on the journey. In all these matters a great latitude is left to the district managers. The labourers enter into contracts in the districts where they are recruited. The minimum period of contract is six months. They contract to work either on a particular mine or on the mines in general. In the latter case they are allotted on arrival to the mines needing labour. The order of allotment is determined on a system which I will explain later on. Then there is a General Manager, with his headquarters at Johannesburg. For a time there were two Joint General Managers. Over all, the control of the Association is vested in a Board of Management, consisting of representatives of all the Mining Groups, and of a certain number of co-opted members. The Board sits once a week. I am Chairman of the Board and also Managing Director of the Association. I have only a second-hand knowledge of the working of the Association previous to the 1st February last. On this part of the subject I should like to put in as an annex to my evidence a copy of the report presented at the Annual Meeting of the Association in April. Mr. Macfarlane, the General Manager of the Association, and the various District Managers who will give evidence before the Commission, will probably be able to supplement the information contained in the report on any points that may be required. Since the 1st February, 1903, when I became Chairman of the Board of Management, the Association has been operating in the following districts:—Portuguese East Africa, excluding the territories of the Mozambique, Nyassa, and Zambesi Companies, the Transvaal, the Orange River Colony, the Cape Colony, Basutoland, the Bechuanaland Protectorate, and Swaziland. The Association is prevented from working in Natal and Zululand by the Natal Law of 1901, which prohibits the engagement or recruiting in those countries of native labour for work outside Natal. It has been prevented from operating in Rhodesia by an agreement made in 1900 between the Transvaal Chamber of Mines and the Rhodesian Government. That agreement was denounced six months ago, and expired in the middle of June, but negotiations were started some time ago for its renewal on a modified basis. A similar agreement with the Barberton Chamber of Mines excluded the Association from recruiting in Swaziland till a short time ago, when a modification of the agreement was obtained. Recruiting in the territory of the Portuguese Companies has, up to the present, been prohibited by those Companies. I have made a separate statement as to the position there and in Rhodesia. I have also made a statement dealing with the efforts which have been made since the formation of the Association to obtain permission to recruit in other parts of Africa. Up to the present the result has been to obtain permission to recruit 1,000 labourers in the B.C.A. Protectorate and in German South-West Africa respectively. The districts in which the Association operates are divided as follows:—There is a District Manager at Lourenco Marques, who manages the recruiting in Portuguese East Africa. There is one at Queenstown whose sphere is the eastern part of the Cape Colony. There is one whose headquarters are at Pietersburg. His sphere is the Northern and North-Eastern Transvaal. There is one at Mafeking, whose sphere is the Bechuanaland Protectorate, the Western Transvaal, and Griqualand West. There is one in Swaziland. Then we have our Basutoland Agents, who also recruit in the Eastern part of the Orange River Colony. In other parts of the country, such as the

South-Eastern Transvaal, where the labour supply is not sufficient to warrant the establishment of a District Manager, we have various individual recruiters working for us. The district organisation varies according to the district. In Portuguese East Africa, where the Government insists on a strict control, all the recruiters are constant employees of the Association, and follow no other occupation. In the Northern Transvaal and the Cape Colony, we have a certain number of regular recruiters, who are constantly in our employment. In addition to this we have a considerable number of people working for us on commission, many of whom follow other employments as well. In Basutoland our sole agency is in the hands of Messrs. Fraser and Stevens, who are very large traders, and have stores all over that country. They employ some men on recruiting work alone, and, of course, use also their numerous agents who conduct their trading business. In Swaziland, where we have only just started, we have so far only regular employees although the District Manager, Mr. David Forbes, Jun., has other large interests there, and can only give us a part of his time. In this connection, I should like to draw the attention of the Commission to the question of what is called "free recruiting." It is frequently stated that the supply of labour would be much increased if the Association would receive labourers from any agent who offered them at a fixed rate of commission. This is precisely what the Association has been doing for a long time past in the Northern Transvaal. Besides its regular employees who work for it constantly, and in consideration of their giving their whole time to it, receive a small retaining salary in addition to a commission, there are also a considerable number of other people who have contracted to recruit for the Association on commission only. In most of these cases we pay for the licence and find the guarantee money of the recruiters. Of course this is not done unless we think that his services will be useful, but if a man is prepared to pay for his own licence and find his own guarantee money we are always prepared to take boys from him at any of our recruiting stations at the same rate of commission as we pay to our own recruiters. No offer of this kind is refused as a matter of principle. As a matter of fact such an offer is not very often made. In five cases out of six, men offering to recruit want a more or less considerable advance of money. This, of course, we use our discretion in refusing. Sometimes the man is prepared to pay his own expenses, but wants special terms of commission. There again each case has to be judged on its merits. If we put up the rate of commission for one man, it is plain that we must do it for all in the same district, and there is no use in doing this without some assurance that there will be a corresponding improvement in the recruiting. For instance, we may be getting 500 boys a month recruited in a certain district on a commission, say, of £1 per head. A man comes and says to us, "I can get you 200 boys a month in that district, but I want £2 a head commission." Evidently the result of accepting this offer would be that he would be able to go to the district to take away from the recruiters already working there 200 boys, leaving them with only 300. We should pay him double prices and get no more natives than we did before. Moreover, the other recruiters would naturally refuse to work at the lower rate of commission side by side with a man who was working at the higher rate. They would either stop working and leave the whole district to him, or we should have to give them the same commission. The net result would be that we should double our expenses in the district, without obtaining a single boy more than we did before. Nevertheless, if there are reasonable grounds for making special terms with a man, we are always ready to do so. If, for instance, in the case just referred to, the man offered to supply 2,000 natives a month from the district where we were getting only 500, on condition of receiving an increased rate of commission, his offer might probably be accepted. Naturally, some guarantee would be required that his side of the contract would be

fulfilled. You may say, therefore, that free recruiting does exist and has existed in the Northern Transvaal for many months past. In the first place, anyone who can obtain a licence from the Government can recruit labour for any employer with whom he can come to terms, and it must be remembered that the mines are not the only employers. In the second place the Association, that is, a co-operative society of most of the mines of the Rand, will also take boys from him at any one of their receiving stations at a fixed commission. What I have said of the Northern Transvaal applies also to the Cape Colony. As regards Basutoland, there was, for a considerable time, absolutely no other system than the above. The Association not only took boys from independent recruiters, but depended upon them entirely. The Association merely maintained a single agent at Maseru, and receiving stations at Thaba N'chu and Winburg. It offered to take boys from anyone at either of these stations at a fixed rate of commission per head. This was maintained for some months. The results were most unsatisfactory. Although the Association was paying a higher rate of commission than, I believe, any other employers of labour, the total number of Basutos recruited from all the independent agents during five months from December to April was only 511. Then on the advice of the persons best acquainted with the country, a change was made in the system, and the business of recruiting in Basutoland for the Association was placed solely in the hands of Messrs. Fraser and Stevens, who are large traders in that country. As a matter of fact, it has been found that independent agents who offer to supply labour in large quantities are unable to do so even when their terms are accepted. I will give the Commission two or three instances. They are all instances where the agent making the offer had in fact, or at any rate we thought so, some special qualifications, when in consequence special terms which he asked for were given him conditionally on his carrying out his promises. I believe that in every case the agents were "bona fide" and believed that they would be able to do what they promised, but in none of the cases have come anywhere near it.

The first case is this. Mr. X. approached the Association some months ago. He had been, I believe, an official of the late Government in the Northern Transvaal, and was strongly recommended from a responsible quarter as having great influence with certain tribes and Chiefs. He declared that he could bring a minimum of 2,000 natives per month to work on the mines. He said that he would want a commission of £3 a head delivered at Johannesburg or £2 8s. 0d. per head delivered at Pietersburg. This was very much in excess of the commission which we were paying for boys recruited in the Northern Transvaal. Nevertheless it was felt that if Mr. X. could supply 2,000 boys a month from that District, which was largely in excess of its former output, it might be advisable to accept his offer. He was prepared to pay his own expenses, but not to find any guarantee that he would carry out his contract. Accordingly we offered to make a contract with him in this form. We undertook to pay him £1 per head as commission on all natives engaged by him in the Northern Transvaal and brought to any of our delivery stations. This commission was paid on delivery. In addition we undertook to pay him a further 28s. per head on all natives recruited by him in any month in which he recruited 2,000 or more. He said he was satisfied with these terms. The only other request he made was that he should be allowed to engage the boys for particular mines where they desired to go to them. This was agreed to. The above contract was made with him four months ago. So far he has not recruited any boys at all.

The second case refers to the Cape Colony.

In February, Mr. Y., a gentleman holding a good position in the Eastern part of the Cape Colony, made an offer to the Association. He said that he could guarantee to supply 500 natives a month from the District in which he lived to work on the Transvaal mines. The 500 was a minimum, and he was confident he could increase it to a much

greater number by degrees. We made enquiries from official and other quarters, and ascertained that Mr. Y. was looked upon as a person of very good standing and influence among the natives. He asked considerably higher terms than we were paying to other recruiters in the Cape Colony. We pointed out to him that it would not be fair to give him special terms unless he was really in a position to supply an exceptional number of natives. We offered him a commission for each native recruited by him to be paid on delivery at one of our stations in the Cape Colony. In addition to this, we offered to give him a large bonus in any month in which he delivered 500 or more. The result of this arrangement would be that, if he could carry out the terms of delivering 500 natives per month, he would get terms equivalent to those he asked for. He agreed to this. He has been working for us now since the beginning of March. In March he recruited 104 natives, in April 91, in May 69, and in June 78; a total of 342 in four months, instead of the minimum of 500 a month which he promised. He has admitted since that he was entirely mistaken in the quantity of labour available. I may add that his want of success is, in spite of the fact that the natives' wages on the mines had been raised to a considerably higher level than they stood at when he originally offered to recruit.

The third case also relates to the Cape Colony.

A man who was connected with one of the native newspapers in the native territories, and was also strongly recommended for his knowledge of the natives, offered to recruit for us a minimum of 400 boys a month. He wanted special terms. Here again we explained to him that we could only give the ordinary terms, but offered to give him a bonus in any month in which he delivered over a certain number—I think it was 200—at a particular delivery station. He has been working for us for four months and has only recruited 56 boys.

The fourth case relates to Griqualand West.

A firm of professional labour agents, who stated they had supplied considerable quantities of labour before and during the war to various employers, offered to recruit for us, undertaking to deliver a minimum of 500 boys a month. They asked for a high rate of commission. Here again we accepted the offer conditional on their carrying out their part of the bargain. That is to say, we paid them part of the commission on delivery, retaining the rest to be paid to them in the form of a bonus in any month in which they delivered the number promised. They worked for us a little over a month, in which time they recruited 168 natives. Then they asked leave to withdraw from the contract, as they said that they saw no prospect of earning the bonus by supplying the number which they had promised. They have since arranged to work for us in the same district on ordinary commission.

The above are typical cases, and the most favourable I can find to the labour agents. In all cases the parties were, I believe, bona fide, and believed they could do what they promised, but they found, when it came to actual recruiting, that available labour was much scarcer than they had supposed. A number of other instances could be given, in some of which the Association has suffered loss by advancing money or paying for licences for men, who, after making great promises, were only able in the end to recruit few natives or none at all. A great point has been made of the statement that natives recruited for the mines are divided from their brothers and friends, and are not allowed to go to the mines on which they have worked before. I will state, for the information of the Commission, the facts in this matter. In the first place, as regards natives choosing their mines. All the District Managers have for some months had authority to contract natives for any particular mine if the natives express a wish to go there. Unless the natives do express such a wish, they are contracted for the mines in general. Any natives contracting for a particular mine have the name of that mine marked on the contract ticket, which is issued to

them in the district where they are engaged, so that there can be no possible mistake about their reaching the mine for which they engage themselves, unless, indeed, they change their minds on the journey up and destroy the contract ticket, as they have been known to do. On arrival here, any natives who produce tickets marked with the name of a particular mine are, of course, sent to that mine. In addition to this, if a native has worked on any mine before and expresses a wish to return to that mine, he is sent there.

It does not seem practicable to go further than this. If all natives were asked after arriving here to choose their mine, there would be no possibility of distributing the labour on any system at all. Moreover, this would certainly lead to attempts being made to reach the natives on their journey here and get them to choose some particular mine. Nor is it clear that there would be any advantage to the native. If he desires to engage for a particular mine, he has the opportunity of doing so at the time he enters into his contract. All natives who have a real choice in the matter can be satisfied in this way. The additional permission given to any old boys to return to their old mines even if they have not contracted specially for it, ought to meet all legitimate complaints. Of course difficulties frequently occur. For instance, there is sometimes a gang of 50 or 60 which has in it two or three old boys of some mine who wish to return to it, but at the same time do not wish to be separated from the gang. The remainder of the gang has no particular choice in the matter of mines. It is plainly unfair to give a mine which has already its fair proportion of labour a large gang simply because two or three boys in it wish to go there. In such a case the old boys are given the choice of going back to their old mine or of remaining with the gang and being allotted to some other mine. Again, it also happens that a gang may have in it old boys belonging to two or more mines. They none of them wish to leave the gang, and all wish to go back to their old mine and take the whole of the gang with them. As the gang cannot be sent to two mines at once, some of them have either to leave the gang or to desert their old mine. As regards the splitting up of gangs, all pains are taken to avoid this. On arrival here the natives are told to divide themselves into gangs under their own headmen and the gangs are allotted as a whole. In addition to this in districts where the chiefs retain authority, the District Managers have discretion to engage boys belonging to any particular chief in a body with their own headmen on a promise that they shall be kept together. For instance, in Basutoland any chief who will send up 50 boys is allowed to nominate a headman to come with them, who is promised a place as police boy for the whole gang on the mine to which they may be allotted. As regards distribution, the system is as follows:—The complement, or total requirement of each mine was fixed by the Consulting Engineers when the Association started operations. With the exception of a few individual mines, the mines are then divided into groups according to the firms which control them. The sum of the complements of the mines of a group makes the complement of that group. The first claim on the available labour is that of the collieries. Then come the mines which started crushing before the end of the war; it was agreed from the beginning that these mines should be kept up and should have the prior call on all labour available. When these are satisfied, the available labour that remains for distribution is distributed among the groups in proportion to their total complement. That is, the aim is to keep each group at approximately the same percentage of its total requirements as the other groups. It is for the group itself to determine to what mine or mines of the group the labour which is allotted to the group shall go.

747. The CHAIRMAN: Mr. Perry, we have also before us another statement which is marked "Mr. F. Perry's Evidence" (Provisional and Confidential.) Do you wish this to be handed in also?—Yes, Mr. Chairman, with one or two deductions. On page

3 I should like to cross out the last four words, viz., "Brentano's offer. Rhodesian experiment."

748. The CHAIRMAN: Is that the only exception?—On page 5 there are two telegrams, one from the High Commissioner, Johannesburg, to the Secretary of State, London, and the other from the Secretary of State, London, to the High Commissioner, Johannesburg, inserted as an annex to my evidence. These telegrams were sent to the Chamber of Mines, and I therefore laid them before the Commission. But I think it is not usual to publish telegrams of this sort without obtaining the permission of the Governments between whom they were despatched, and therefore before they are published as an annex to my evidence, and put in by me, I should like to ask the Commission to obtain the permission of the High Commissioner to publish them.

749. There should be no difficulty in getting that permission?—No. I should think not.

750. Is there anything else in the statement you wish to delete?—On page 9, I notice on the fourth line from the bottom, the word "Santhona." This should be "St. Thomas."

751. Then you wish to hand that in as an additional portion of your evidence-in-chief?—Yes.

752. Mr. Perry's additional statement was then put in, and reads as follows:—

#### MADAGASCAR.

Enquiries were instituted in September, 1902, as to the possibility of obtaining labour from Madagascar. Letters were received from the British Consuls at Antananarivo and Tamatave, dated November 10th, 1902, and November 4th, 1902, respectively. Both report that there is no prospect of any labour being obtained for emigration in Madagascar. In April, 1902, the Association communicated with a Mr. Lewison, who has large interests in Madagascar, and who had done considerable business between that country and South Africa recently in the way of importing cattle. Mr. Lewison expressed some hope that he might be able to obtain permission either from the local Government, or the French Government in Paris, to recruit men in Madagascar for work on the Transvaal mines on certain conditions. An arrangement was made under which the matter was put in his hands, conditional upon his obtaining the required permission. Up to the present permission has not been obtained. The Governor-General of Madagascar is strongly against allowing any emigration, and the French Government is guided by his advice in the matter. From another source, the Association has received information which goes to shew that, even if permission could be obtained to recruit in Madagascar, it is very improbable that any very large quantity of labour could be procured there for work on the mines. An extract from a letter on the subject is annexed:—

(Copy) His Majesty's Consulate,  
Antananarivo,  
November 10th, 1902.

Sir,—In reply to your enquiry, No. 994/02, of 6th October, I have the honour to state that there is no prospect of recruiting Malagasy labourers for mining work in the Transvaal.

The scarcity of labour in this Island is one of the great difficulties the Administration has to contend with. In every Department requiring skilled or unskilled native labour—agricultural, mining, railway construction, and road-making—the supply is unequal to the demand, and has to be supplemented by the introduction of foreign workmen. Under existing circumstances, therefore, it would be useless to approach the Government of this Colony with a view to recruiting natives.

I have the honour to be,

Sir,

Your most obedient, humble servant,

(Sgd.) E. P. PORTER,

His Majesty's Consul.

His Majesty's Commissioner  
of Native Affairs,

Transvaal Colony (Johannesburg).

(Copy.)

British Consulate,  
Tamatave,  
November 4th, 1902.

Sir,—Your letter, Native Affairs No. 1956/02, of 6th October last, reached this Consulate on the 2nd inst., and in reply I beg to report as follows:—  
(1) Natives of Madagascar are exceedingly lazy and indolent, as a rule, and, in my opinion, are not suitable for mining work.

(2) The population of this island is far from dense, and on that account the French Government would most probably hinder recruiting, as they themselves very much want natives to work at the railway and other public works, where these latter get good food, pay, lodging, and medical attendance. (3) And, lastly, emigration out of Madagascar cannot be allowed without the leave of the Governor-General, and companies or agencies for Colonies or Countries which are not French are bound to furnish a security of at least forty thousand francs, or one thousand six hundred pounds.

I have the honour to be, sir,  
Your most obedient servant,  
(Sgd.) ANATOLE SAUZIER,  
H.B. Majesty's Consul.

Translation of Extract from a letter dated 19th April, from M. Borureau to M. de Ferrieres respecting the prospect of obtaining labour from Madagascar.

My telegram of to-day is not so precise as you might have wished, and as I should have liked it to be in a matter of business, but my brother, who has a personal experience of Madagascar, is away (he is in Egypt, whence he will probably proceed straight to Madagascar). I could not consult him, and I, therefore, preferred to say less. Taking my telegram point by point. As far as my memory serves to recall what I have heard from my brother, the native of Madagascar, as a rule, is a good workman, obedient and skilful, but lazy. He is not used to underground labour, but he would quickly become used to it, as is proved by the ease with which he has learnt to quarry rock in road and railway making. His fitness may, therefore, be taken for granted, but it is extremely doubtful whether he would consent to expatriate himself even for a short time. He doesn't mind leaving his village to go to the public works in the island; formerly he was compelled to do so by Government requisition in exchange for a wage of almost nothing. To-day the requisitions are abolished in theory. We now have free recruiters, who, with the support of the civil and military officials, recruit labourers for the contractors. The engagements are at a low rate of wages and for short periods. The customs of the natives in Madagascar differ essentially from those of the Kaffirs, and I think it is very unlikely that the temptation of a sum of money to buy wives and cattle would induce the Malagasy to leave their country, cross the sea—that is to say, to travel what to them is an insupportable distance—above all, to go to a country where they will be told that they will be less well treated than under the "paternal" administration of the French, which does not include the "compound system." To sum up, you may easily find recruiters, but your recruiters will have difficulty in finding recruits. As regards the opposition of the present or future Governor and other officials of the Colony, it is fatal. The island is wanting not in population (for there are great masses of Hovas who are absolutely idle), but in workmen. It has several times been necessary to import at great expense foreign labourers to finish public works; it is silly to suppose that a Governor would allow the labourers whom the Colony supply to leave it particularly to let them go to a country where the occurrence of difficulties between British subjects (whether white or black) and French subjects, such as Malagasy, might bring on international complications. It is practically impossible. My brother is definite on the point. However, even admitting the contrary, admitting also that the natives can be induced to emigrate, the duration of the contracts would have to be short, though it might be possible to provide facilities for renewal.

It is hard to guess what monthly pay would be needed to persuade the Malagasy to expatriate themselves, seeing that there is no precedent. The question of food is also of importance. The Malagasy are in the way of eating meat often, as it is cheap in the island. The local pay varies according to the kind of labour. At Tananarive the unskilled labourers earn from 1 franc to 1fr. 50c. per day. Workmen even of the commonest craft earn twice as much. My brother has spoken to me of industries in which native miners, masons, etc., earn 4fr. and even 5fr. a day. I do not suppose that one need contemplate such figures as these. It is certain, however, that wages will have to be raised for service abroad. My brother has spoken to me of the best tribes, but you know there are very good, moderate, and detestable ones, but I have not kept their curious names in my mind. I will give them to you later on. The cost of gathering natives at a central point for embarkation would be heavy, because the districts where it would be necessary to recruit are very much scattered and far apart. In my telegram I say, "You will receive details direct from Tananarive." I wrote to my nephew there by this mail, sending him a copy of your telegram, and explaining it, and telling him to send you direct, as soon as possible, all the information he can obtain. I have the greatest confidence in his judgment. When my brother returns from Madagascar, he will complete this information if necessary.

#### GERMAN EAST AFRICA.

Mr. Brakhan, of Goerz and Co., was asked to interview the German authorities on his way home. He writes, under date February 5th, 1903, saying that he called upon the Acting Governor at Dar-es-Salaam, and found him very unfavourably disposed to the notion of emigration from German East Africa. The Governor stated that they had only just succeeded in obtaining a sufficient number of natives to work on the plantations. The major portion of the Colony was sparsely populated, and, moreover, with nomads unfit for work. Some of the districts in the interior, near the Victoria Nyanza, were more thickly populated, and the Governor said he would certainly advise his Government not to allow recruiting in that district, even supposing they were disposed to allow recruiting at all. Moreover, a considerable part of this country is very little under control, and even were recruiting allowed, no use could be made of the permission.

Mr. Brakhan promised to enquire, while at Berlin, whether there was any prospect of the German Government consenting to allow emigration from German East Africa. They have also been approached through another channel, without any result.

#### EGYPT.

The question of obtaining fellaheen from Egypt was originally raised in 1898. Negotiations were resumed at the end of 1902. The Manager of the Ottoman Bank, from whom enquiries were made in writing on the subject, stated that the fellaheen were quite unaccustomed to mining work, and it was doubtful if their constitution would stand it. They would, however, make excellent workmen for irrigation works, and Egyptian contractors might be induced to visit South Africa with the view of undertaking such works. The subject was not pursued, as obtaining labour for irrigation works is not within the scope of the Association.

Mr. Bettelheim, who was asked to inquire into the prospects of obtaining labour from Egypt and the Soudan during his visit to that country, reports, writing from Cairo under date 9th February, 1903, that it would be absolutely impossible to do this, as labour in the country is not sufficient for its own requirements.

NOTE.—The Government applied to the Egyptian Government some months ago, asking if fellaheen could be recruited for railway work in the Transvaal. This was refused by Lord Cromer, on the ground

that there was a scarcity of labour in the country, and that he was obliged to import native labour already for building the Soudanese railways.

#### FRENCH SENEGAMBIA.

A Mr. Webber has made an offer to the London House of Wernher, Beit, and Goerz and Co., to supply a certain quantity of labour from Senegambia. He mentions 5,000 as the number to be obtained. The wages which he states would be required, together with recruiting expense, would bring the cost of these labourers to 2s. 6d. a head per diem, exclusive of food and housing. They are absolutely untried as miners, and the offer, therefore, was declined at once.

#### MOROCCO.

An offer has been made by Mr. L. Wills to supply labour from Morocco. These would be of Arabic, or Berber nationality, and are said to resemble Southern Italians. Mr. Lionel Phillips has been asked to discuss terms with Mr. Wills.

#### BRITISH WEST AFRICA.

A certain amount of information was brought before the Association with regard to the supply of labour from British West Africa in the latter part of 1902. No steps were taken at the time, partly on account of the unfavourable opinion expressed by Consul Casement as to the prospect of obtaining or using labour from West Africa generally, partly because it was known that the West African Colonies, where a mining industry existed, were themselves in difficulties over the labour supply.

Later on, however, it was determined that an effort should be made to exploit this source of native labour also. Accordingly, the Government was approached in the matter. On the 12th May, 1903, the High Commissioner telegraphed to the Secretary of State stating that the Chamber of Mines was anxious to send a mission to West Africa, particularly to the Hinterland of Lagos and Nigeria, to ascertain if suitable native labour could be obtained for the mines, and if the result was favourable to bring back an experimental batch of one thousand labourers on conditions to be determined by the local authorities.

Meanwhile steps were taken towards securing a suitable person to proceed on the mission.

After the matter had again been pressed on the attention of the Government, a reply was received towards the end of June to the effect that there was no prospect of obtaining any labour from the West African Colonies mentioned. The British Government could not support or sanction any attempt to recruit labour in these territories, and therefore there would be no advantage in sending such a mission as proposed.

The definite refusal of the British Government to assist, or countenance, recruiting in West Africa puts out of the question the possibility of obtaining labour from the interior. It has been stated, however, that there is a certain floating population on the coast whose services might be obtained. Although it is doubtful whether this class of labour would be at all suitable for mining work, and is, moreover, practically certain that no great numbers of this class would be available, it is thought that it might, perhaps, be practicable to obtain a small supply, which in the present condition and the future prospects of the mining industry here should not be neglected. Accordingly, an offer which was made in London a little time ago to one of the principal mining groups to obtain and bring to South Africa a certain number of natives from the Kroo Coast, on fairly reasonable terms, has been accepted. It remains to be seen whether the person making the offer, who certainly has a considerable knowledge and experience of the West African Coast, will be able to carry it out.

From High Commissioner,  
Johannesburg.

To Secretary of State,  
London.

No. 135.

May 12th.

Chamber of Mines anxious to send mission to West Africa, viz. ; Hinterland of Lagos and Nigeria, to ascertain if suitable labour can be obtained for mines. In order not to lose time, would you agree to Mission of Enquiry proceeding at once, with the object (1) of obtaining information ; (2) if information favourable, of bringing back experimental batch of, say, 1,000 labourers, on conditions to be determined by local authorities?

(Copy.)

From Secretary of State,  
London.

To High Commissioner,  
Johannesburg.

No. 1.

June 23rd.

Referring to your telegram of May 12th, No. 135, your telegram of April 27th to Sir R. Moor, conveying message from Lagden, was repeated here as Moor was on leave. I have referred matter to Moor, in whose judgment I have great confidence, and have informed him that I desire to assist Transvaal labour market by every means in my power. He has replied that in his opinion experiment if made would be entire failure unless backed by strongest Government personal influence and pressure, and in any event could not lead to establishment of labour market for South Africa. He pointed out that Southern Nigeria is hopelessly underpopulated owing to recent slavery and internal dissensions. Labour not half sufficient for needs of country, and no labour market exists. Interior tribes only just merging from a state of perpetual civil war and slave raiding, and it would be regarded as recrudescence of slavery if Government brought pressure on labourers to leave country. Government has guaranteed effective support of house system to both coast and inland tribes, and to hold out any inducement to natives to go to South Africa without consent of chiefs would amount to breach of faith. Experiment would certainly cause much ill-feeling, and would alienate friendly chiefs and tribes. In the face of this opinion, I am reluctantly obliged to say I see no prospect of advantage in such an enquiry as it was proposed to institute in Southern Nigeria. After communication with Governor, Lagos, I regret that there is no hope of obtaining labour from that quarter.

#### CONGO FREE STATE.

On the 31st July, 1902, a letter was addressed by the Association to Roger Casement, Esq., H.B.M. Consul in the Congo Free State, making a number of enquiries as to the possibility of obtaining in that State labour for work on the Transvaal mines, and as to its suitability for the purpose. Steps were also taken, through the High Commissioner, to ask the British Government to assist in obtaining permission to recruit labour there. The London representatives of the Chamber of Mines were also instructed to take the matter up with the British Government, and with the King of the Belgians.

A reply was received from Consul Casement, dated 21st October, in which he stated that there was no prospect of the Congo State affording a field for the recruitment of natives for work on the Transvaal mines. He stated that the Governments exercising authority in that part of Africa did not, as a rule, permit their native subjects to quit their territories ; that the native population was far too scanty for carrying on the local work and satisfying the vital needs of the local Administrations, and that obtaining labour for West Africa was an absolute impossibility.

A further letter was received from Consul Casement, dated 25th November, in which he amplifies his former statements.

He pointed out: (1) That the population of the Congo State was small, and yearly diminishing owing to the ravages of sleeping sickness; (2) that the natives of West Africa were accustomed to a fish and vegetable diet, and certainly could not subsist on a diet consisting wholly or principally of mealie meal; (3) that the Governments both of the Congo Free State and of the French Congo, were in the habit of absolutely prohibiting the departure of natives from their territory, except to a very limited extent, and that these restrictions would certainly be maintained owing to the "prevailing dearth of humanity" in these countries.

Following on this the London agents of the Chamber of Mines reported that they had approached the French Office to support their representations to the King of the Belgians, and that the Foreign Office had refused to give any assistance in the matter.

NOTE.—Area of Congo Free State, 802,000 square miles; estimated population, 14 to 15 millions.

(Copy)

British Consulate,  
Congo Independent State,  
21st October, 1902.

Sir,—I have received your letter of the 31st July, making enquiry as to the possibility of obtaining native labour from this part of Africa for work in the Transvaal mines, and in reply I have to state that there is no prospect of the Congo State, or, I might add, any part of West Africa, affording a field for the recruitment of natives for that object.

Apart from the fact that the majority of Governments exercising authority in this part of Africa do not permit their native subjects to quit their territories, save with an individual licence, which is but rarely granted, there is a far too scanty native population for carrying on the local work, and for satisfying the vital needs of the local Administrations.

In view, therefore, of the absolute impossibility of obtaining native labour from West Africa, I refrain from answering any of the questions you have appended to your letter, for they are, in fact, all answered by the very comprehensive negative, that there is no labour at all, either on the Congo or elsewhere in West Africa, for export to South Africa, or any other quarter of the globe.

I am Sir,  
Your obedient servant,  
(Sgd.) ROGER CASEMENT,  
Consul.

Extract from letter from Roger Casement, Esq.,  
Consul, Congo Free State, 26th November, 1902.

With reference to your letter of 31st July last, enquiring as to the possibility of your Association being able to recruit natives in the Congo State for service in the Transvaal mines, and to which I sent a hurried reply when on the point of embarking for home, I would wish, when now more at leisure, to amplify the reasons already given which induced me to write in so discouraging a spirit.

Perhaps I can best do this by replying to your questions in their order.

1. The natives of the Congo Basin are physically suitable for employment in the mines, but I do not think they would, even if allowed a choice, take willingly to that kind of work. The population of the Congo Basin is not so great as has been often asserted, and scanty as that population already is, it shews a yearly tendency to diminish. This diminution is due to various causes, chief among which I put the ravages of the disease known as sleeping sickness.

2. The climatic conditions of the Transvaal—save in the low veld—are unfavourable to the natives of the Congo Basin during a considerable portion of the year. Still I do not think this an insuperable objection, for the effects of climate may be modified by proper housing, and suitable food and clothing.

17133

3. The staple food of the South African native—viz., mealie meal—would scarcely suit the West African or Central African populations. These are accustomed to, I believe, a more sustaining diet, consisting chiefly of plantains, cassava, rice and yams, with other vegetable products, along with which palm oil (and wherever possible, fish) plays a conspicuous part. It would be impossible to feed West or Central African natives in the Transvaal as they are accustomed to be fed, but it should not be difficult to provide them with rice and dried or smoked fish, and in time, no doubt, they would accommodate themselves to a changed diet, although not, I think, to mealie meal alone.

But, in answer to the fourth question, I fear a well nigh insuperable difficulty lies.

The Government of the Congo State would not, I believe, under any circumstances, allow its native population to leave the country. At the present moment no person is allowed to take a native of the Congo State out of its territory save by the permission of the Governor-General, and the deposit as security for that native's good treatment and repatriation of a sum of £100.

So far, only a handful of boys and girls—servants of officials, or scholars of missionary establishments—have been taken home from the Congo, but I am convinced the authorities of the State would view with disfavour any attempt to induce emigration of the natives from the country.

The neighbouring Government of the French Congo Colony goes further, and prohibits natives of its territory from quitting their own soil, even at their own spontaneous wish. The reasons for these restrictive measures are not far to seek—they all lie in the prevailing dearth of humanity which afflicts so large an area of tropical Africa and in the fact that what that population chiefly needs it still finds readily at hand by following old time agricultural habits in an easy village existence, which is much more attractive than anything European employment substitutes for it.

Transvaal Chamber of Mines,  
21st October, 1902.

The Most Honourable  
The Marquess of Lansdowne, K.G.,  
The Foreign Office,  
Downing Street, S.W.

My Lord Marquess,—The Witwatersrand Native Labour Association has approached the Transvaal Chamber of Mines, in Johannesburg, on the subject of recruiting natives from the Congo Free State, and the Executive Committee of this Institution have agreed to approach His Majesty the King of the Belgians, with the object of ascertaining whether permission to recruit in the Congo territory could be obtained; accordingly we, as the London representatives of the Chamber in question, beg respectfully to ask you, in referring the matter to you, whether we are approaching the proper quarter, and, if so, if you would kindly bring this matter before the consideration of His Majesty the King of the Belgians.

Awaiting the favour of a reply,

We are, My Lord Marquess,  
Yours faithfully,  
(Sgd.) A. BARSDFORD, & Co.  
29th October, 1902.

Messrs A. Barsdorf & Co.,  
Wool Exchange, Coleman Street,  
London.

Gentlemen,—I have laid before the Marquess of Lansdowne, your letter of the 21st inst., respecting the proposal to recruit natives for labour in the Transvaal mines from the territories of the Congo Free State, and I am directed by His Lordship to inform you that the project has already been brought to his notice by His Majesty's Secretary of State for the Colonies.

As Lord Lansdowne felt unable to sanction the recruitment of such labour in the Protectorates under the administration of this Department, he

C 3

did not consider that he was in a position to ask the Government of the Congo Free State to give the Rand Native Labour Association assistance in the recruiting of native labour.

His Lordship therefore regrets that he is unable to comply with your wishes in the matter.

I am, Gentlemen, etc.,  
(Sgd.) FRANCIS BERTIE.

PORTUGUESE WEST AFRICA  
(ANGOLA).

In the year 1899, Messrs. Russell Bowker and Goddard were sent by the Consolidated Gold Fields of South Africa, Ltd., to the District of Mossamedes, in Portuguese West Africa, to investigate the possibility of obtaining labour thence. Their reports stated that there is a considerable quantity of labour in the country, and that if confidence could be inspired in the natives, and they could be induced to leave their country on a long engagement, they would probably prove suitable for mining work.

They were prevented from taking any active steps towards recruiting, as the Governor of the Province of Angola, after referring to Lisbon, received instructions to forbid recruiting on any account.

In August, 1902, Mr. Alec Hewitt was sent to Mossamedes to obtain, if possible, permission to recruit labour from Portuguese West Africa. Letters of introduction to the local Portuguese Government were obtained for him from the Portuguese Curator here, and from the Portuguese Consul at Capetown. At the same time, quotations were obtained from Shipping Companies for the conveyance of natives from Mossamedes and other parts on the Portuguese West Coast to Delagoa Bay.

On arrival at Benguella, Mr. Hewitt interviewed the Governor-General of Angola, who refused permission to recruit.

Mr. Hewitt stated in a letter, dated 17th November, that the Governor-General gave as his reason that a new law had been passed in Lisbon prohibiting all emigration of natives from Portuguese West Africa. The Governor-General also expressed himself as unfavourable personally to emigration.

Mr. Hewitt stated that at that moment the Portuguese were carrying on military operations to the north-east and south-east of Benguella, which would probably extend to the south-east of the District of Mossamedes, and that this would make it impossible to recruit at the moment, even if permission were given.

On receiving Mr. Hewitt's first telegram, the Association at once made representations through the Chamber of Mines, in order to get the matter represented at Lisbon. In compliance with this request, the High Commissioner telegraphed the Secretary of State on the 24th November, asking that the Foreign Office would obtain leave from the Portuguese Government for an agent of the Association to investigate the prospects of recruiting labour in the Portuguese West Africa, and, if the results were favourable, to arrange initial steps for recruiting.

No reply was received from the British Government at the time.

On the 17th April, and again on the 24th (after seeing Mr. Hewitt after his return here) I sent telegrams to General Gorjao, the Minister of the Colonies at Lisbon, asking whether the Portuguese Government would be disposed to allow emigration of native labour from Angola for service on the mines, if repatriation were guaranteed. A reply was received through the Governor-General of Lourenco Marques, dated the 5th May, stating that the Minister could not authorise the recruiting of native labour for the Transvaal in the Portuguese possessions on the West Coast of Africa, on account of the crisis which existed for want of labourers in these possessions.

I addressed General Gorjao again privately on the subject on the 18th June. Meanwhile further representations had been made to the Government, and the Secretary of State telegraphed to the High Commissioner on the . . . June, stating that the British Minister at Lisbon had been instructed to endeavour to obtain facilities for an agent of the Association to pursue enquiries in Portuguese West Africa, with a view to the recruitment of labour there.

Note.—Local want of labour.  
Export of labour for Portuguese plantations.

St. Thomas, etc.  
Difficulties caused by their method of recruiting.  
Absence of a "quid pro quo."

Area of Angola, half a million square miles; estimated population, 3½ millions.

German South-West Africa,  
17th November, 1902.

The Secretary,  
Witwatersrand Native Labour  
Association, Ltd.,  
Johannesburg,

Dear Sir,—I beg to inform you that the Governor-General of Angola (Monchado) will not give permission to recruit in that territory. He states that a new law has been passed in Lisbon, prohibiting the export of natives even to their own possessions. He is himself against allowing natives to leave.

At present the Portuguese are carrying on war against natives to the N.E.E. and S.E. of Benguella, and I was informed that they intend to extend their operations to S.E. District of Mossamedes. So, as matters now stand, it would be useless attempting to recruit, even if permission were obtained.

Yours faithfully,  
(Sgd.) ALEC HEWITT.

Lourenco Marques,  
May 5th, 1903.

Translation No. 52/1638.

His Excellency the Minister for Marine and Colonies having been asked to authorise the recruiting of native labourers for the Transvaal from the Portuguese possessions on the West Coast of Africa, and being unable to grant the required permission in view of the crisis owing to want of labourers felt in those possessions, I am directed to inform the W.N.L.A. of his resolution, which I beg your Excellency to be good enough to communicate to the Directors of the Association.

(Sgd.) THOMAZ ANTONIO GARGIA ROSADO,  
Acting Governor-General.

H.B.M. Acting Consul-General,  
Lourenco Marques.

(Copy) Department of Native Affairs,  
Transvaal,  
30th June, 1903.

The Secretary,  
Witwatersrand Native Labour  
Association, Ltd.,  
Box 1198, Johannesburg.

Sir,—With further reference to your letter of the 21st April last, I am now directed to inform you that His Excellency the High Commissioner has received a telegram from the Secretary of State for the Colonies to the effect that His Majesty's Minister at Lisbon has been requested to endeavour to obtain facilities for an agent of the Native Labour Association to pursue inquiries in Portuguese West Africa, with a view to the recruitment of labour there.

I have the honour to be,  
Sir,  
Your obedient servant,  
(Sgd.) W. WINDHAM,  
Secretary for Native Affairs.

## GERMAN SOUTH-WEST AFRICA.

In August, 1902, Mr. Alec Hewitt, a gentleman who had resided and traded for several years in German West Africa, and in Portuguese West Africa, was engaged by the Association to proceed to these countries, in order to endeavour to make arrangements for the recruiting and exporting of native labour.

Mr. Hewitt reached German South-West Africa in September, and proceeded to Windhoek, where he had several interviews with the Acting Governor. The Governor was favourable to allowing an experiment to be made, and drew up a sketch of conditions on which he would allow a limited emigration of labour. One condition was the deposit of £10 on account of every native engaged. Another stipulation was that the Government might withdraw permission to recruit at any time. This was strongly objected to by Mr. Hewitt, who asked that six months' notice might be given.

After despatching a report to Johannesburg, and sending out agents to test the feeling of the Damaras and Ovampos, Mr. Hewitt proceeded to Portuguese West Africa to carry out the other part of his mission. (V. Supra, p. 54.)

He returned to Swakopmund at the beginning of November, and while waiting a reply to his communications endeavoured to obtain from the Governor some modification of the conditions proposed, particularly in respect of the condition which allowed recruiting to be stopped without notice.

On the 4th December, the Association telegraphed to Mr. Hewitt, authorising him to accept the Governor's conditions, with the exception of the £10 per head deposit.

The Imperial German Consul-General at Cape Town had been approached personally on the subject by one or two members of the Board of Management, and he had promised to telegraph to the Governor of German South-West Africa explaining the position of the Association, and suggesting that a guarantee would be sufficient.

It may be stated that the German authorities finally agreed to accept the guarantee of the Chamber of Mines as a substitute for the actual deposit of £10 per head for each native emigrating. This sum was to be paid to each native on his return to German South-West Africa at the expiry of his contract, being treated as part of his wages. This point being settled, the Association telegraphed to Mr. Hewitt on the 18th December to begin recruiting at once. He began to make arrangements, but was stopped in a few days by the Governor, who informed him that he had to withdraw the permission given to recruit. The reason he gave was the action of the Government of the Cape Colony in prohibiting the export of cattle from German territory. He said that this action, which was due to the alleged presence of rinderpest in German territory was unnecessary and damaging to German interests; that he had made representations on the subject to the British authorities, and that until the matter was settled, he would not allow recruiting. On receipt of Mr. Hewitt's telegram, representations were made here through the Transvaal Government, and the High Commissioner, both to the Cape Government and the German Consul-General at Cape Town. The Cape Government did not see its way to remove the restrictions complained of. It was pointed out to the Consul-General that the mining industry of the Transvaal could not fairly be held responsible for the action of the Government of the Cape Colony, and he consented to make representations to the Governor of South-West Africa. This resulted in the Governor finally concluding an agreement with Mr. Hewitt on the 17th January, giving the Association permission, to hold good for one year, to recruit 1,000 natives of German South-West Africa for work on the Transvaal mines under contract for two years. The Governor desired the contract to be signed by the Directors of the Association. Accordingly, as the best season for recruiting was now over, Mr. Hewitt himself returned to Johannesburg bringing the contract.

The contract was signed in Johannesburg on the 13th March, and arrangements were made with Mr. Hewitt to return to South-West Africa in May, as he stated that the months of June, July, and August would be the season in which there would be the most chance of inducing the natives to emigrate.

Mr. Hewitt, who left Cape Town in May, proceeded first to Mossamedes, and thence to Damaraland, which he expected to reach at the end of June, and to carry on the recruiting operations through July and August.

The total population of German South-West Africa has been estimated at a quarter of a million (Whittaker).

753. THE CHAIRMAN: Do you wish to make any further statement before the Commissioners put questions to you?—I told the Secretary that I wished to make a further statement relating to several other matters. I hope to get in some evidence, and will hand in that additional statement to-day. It is quite unconnected with the evidence I have already given, however, and it will be possible for the Commissioners to examine me on the statements I have already put in.

754. Mr. QUINN: Mr. Perry, will you please tell us how many Managers your Association has had since it started?—The first manager was Mr. Goodwin, I believe; Mr. Nourse was appointed Assistant Manager some months after Mr. Goodwin's appointment. Then Mr. Goodwin resigned, and Mr. Macfarlane was appointed General Manager. Mr. Nourse was made Joint General Manager with Mr. Macfarlane. That is all. Mr. Nourse has practically resigned. That is to say he resigned some time ago, but he remained on for a certain time in order to complete the Central African experiment, which he had taken up from the start.

755. Could you tell us why Mr. Goodwin resigned?—I know nothing of that.

756. Can you tell us why Mr. Nourse resigned?—I believe he was not satisfied with his position. I understand that when Mr. Macfarlane was brought in—of course, Mr. Nourse had been in the Association before—he was brought in in a senior position and at a higher salary, and Mr. Nourse was never very well satisfied with that position of affairs.

757. In the Articles of Association that have been handed into us this morning—there has not been time to go into them yet—is there anything said there with regard to paying wages; how much is to be paid to the natives?—I cannot say.

758. Can you tell us then what the amount of wage was that was decided upon at the commencement of the Association's existence?—I believe it was 30s. per month, but, of course, I am speaking at second hand.

759. We might take it that in the statement presented to Mr. Chamberlain, on the gold mining industry, by the Secretary of Mines, this information will be correctly stated?—I suppose so. I am not a competent witness on that point.

760. Have you any knowledge of the rate paid before the war?—Less than most people here.

761. Now how often has the rate of pay been changed since the Association commenced its work?—It has been changed twice, I believe. There has been one change since I became connected with the Association. When I became connected with the Association I found that there were 45s. per month being paid, which was supposed to be the same rate as obtained previously—before the war. Since then the rate has been put up to 50s. for surface work and 60s. for underground work.

762. As far as you know, there was only one change before that?—As far as I know. There were some alterations in the way of the introduction of piece-work, but I do not know whether you can call that a change in the rate of pay.

763. I understand—according to the Press—that there was some difference of opinion about the rate of pay having been raised last time, that is, amongst your Association?—Yes.

764. Can you tell us the nature of that difference of opinion?—Well, some people thought that, in the first place, it was very doubtful whether the increased pay would bring any increased number of natives, and, in the second place, it was very doubtful whether the mines as a whole could afford it. For the mine working on a narrow margin it would be rather hard, and it would make its position precarious. Others—who turned out to be in the majority—thought it was a matter which must be pushed to the extreme, that the want of labour was so great, and the damage that was done by continuing short of labour was so great, that it was worth while to go to the very extreme in wages which the main groups could afford to pay in order to get the labour in as quickly as possible. If we increased the amount of labour coming in, it was worth while. They also said that the rate of wages had gone up all round, and that if the mines wanted to get the same proportion of labour as they got before the war, they would have to raise their wages.

765. I suppose you are aware, Mr. Perry, that since the war great changes have taken place on some mines; the boys are treated better, in regard to their food, etc.?—I believe that that is so on most of the mines.

766. Have any changes taken place in that direction since you have been acquainted with the work?—Yes, I think that improvements in the way of better food, and more careful provision in the way of clothing for the natives, have been and are being made.

767. Do you know whether a lot of this was done at the instigation of Sir Godfrey Lagden?—I think it is a matter he has always taken an interest in.

768. Would it be right to say that these changes commenced with the beginning of his time of office here, from when he was in charge of Native Affairs?—I do not know.

769. Can you tell us what is the number of natives that work on these fields and what was the number before the war?—It is given in one set of statistics. It is given in the Chamber of Mines' Report as 97,000 for the last year before the war, but lately some calculations have been made, and it was found to be considerably greater than that. I have not gone into this carefully, and consequently am not in a position to judge which set of figures is correct.

770. The set of figures given to Mr. Chamberlain for the whole of the mines—producing and non-producing—both inside and outside, was 90,306. That was the total number given to him?—I think that must be incorrect, because the Chamber of Mines Report gives it—for the last six months before the war—at about 97,000, and it is said that these figures leave out a certain number.

771. You cannot speak definitely on these figures?—No.

772. Can you tell us how many natives are employed on the mines who are not members of the Association at present?—My impression is that it is something like 5,000, but that is only an impression. The Native Affairs Department would be the people who have the statistics for that.

773. And I suppose you cannot tell us how many boys are employed in town?—It is between 40,000 and 45,000, I think.

774. Can you give us the cost per head of recruiting now?—The average, counting 12 months, 6 months, and "voluntary" boys altogether, is about £3 per head. It varies, of course, from month to month.

775. Do you think that the fair average would be £3?—Yes.

776. In these figures given to Mr. Chamberlain the cost of recruiting there is said to be 59s. 4d. So that there is just a little difference now, if these figures are correct?—For how many months of service is that?

777. The heading is "Nine months to the end of September, 1899; average cost per head,

"59s. 4d."?—Yes, but that does not really give any information, because it does not state how long the engagement is for. You have to spread it over so many months. If you recruit a native for three months, the cost is double as against that of a native recruited for six months.

778. In those days, at all events, whatever terms they were recruited upon, that happened to be the amount, and it is given as 59s. 4d.?—When I say £3 I mean the average for nine months' service. The better way of putting the cost of recruiting would be at 6s. 8d. per month.

779. What is the relative cost between recruiting now, under your present system, and recruiting under the old system which has been so frightfully expensive?—I cannot speak with regard to the cost before the war. Some mines paid more and others less.

780. Seventy-five mines in this statement give their average as the figures I have given you. What is your cost now?—6s. 8d. per month, roughly speaking.

781. Can you give us the average rate of pay now of the whole thing per head?—I believe it is supposed to work out at about 63s. Of course the present rate has not been in force long enough to tell accurately.

782. Are there any statistics—anything official—showing how that figure is arrived at?—Yes, in this way. When the rates of pay were introduced, the Mine Managers were asked to make calculations as to what it would amount to. They knew the number of boys on each mine, and how many of each kind would be working in their mines, and they knew what was the rate for surface and underground boys, and what was the higher rate of pay for skilled work, and they worked the average out at 62s. 6d. or 63s.

783. These returns would not come into your office, but to the Chamber of Mines?—Yes.

784. I will reserve that for the Chamber of Mines!

785. Now, coming to this evidence of yours printed on these long sheets of paper, you compare the position of the Native Labour Association to a Co-operative Society?—Yes.

786. But was it not one of the main ideas of this Association to bring down wages?—I should not have said so. However, I am not really a good witness, because I know nothing about the Association, or rather its history of the formation.

787. What I mean is this, the main idea of this Association, of which you are now the head, is to keep wages within bounds?—No. It was always laid down that the Native Labour Association had nothing to do with the wages. The Chamber of Mines fixed the wages which had to be fixed.

788. When we compare the names of the Executive of your Native Labour Association which are given here, with the names of the Executive of the Chamber of Mines, we find that it is practically the same people?—It is all the groups.

789. I mean for all practical purposes it is the same people?—Yes, it comes to that.

790. So that the Chamber of Mines, which decides the wages of the natives, and your Association, which is not concerned about wages, but only acts as a Co-operative Society, are one and the same thing?—I think not. The Chamber of Mines has always decided the amount of wages to be paid before there was any organisation of recruiting.

791. My point is this, in examining the names of the representatives of the various groups on the Board of Management of your Association, I find that they are identical with and almost in the same proportion to the Managers of the various groups on the Chamber of Mines?—Oh, yes, but I do not see that there is any necessary connection of reduced wages with the Native Labour Association. The reduction of wages would have taken place by the Chamber of Mines without any Native Labour Association having been formed.

792. Now you stated in connection with the co-operative society, the idea was to eliminate the useless and expensive middlemen?—Yes.

793. What is your Association; does it not fill exactly the same office? Are you not in the position of the middleman?—Yes, but surely any Co-operative Association is.

794. In this printed sheet you state that the Association decided that the minimum time of service for which they would recruit would be six months. Do you adhere to that?—Yes.

795. In your opinion does not that keep you from getting an amount of labour you would otherwise get?—I think it does to a certain extent. But you see it is a question of wages. There is the initial cost in bringing the natives from a distance.

796. It is a question of cost?—Yes.

797. Which mainly influences the supply?—Yes. We considered it best to raise the wages rather than shorten the term of contract.

798. Now I understand from this evidence that natives are now allowed to state, when being recruited, what mine they prefer to go to?—Yes, if they state they want to go to a special mine, they are allowed to contract themselves to that mine, and are not forced to serve on any of the mines on the Rand.

799. How long have they been allowed to exercise that right?—Between four and five months.

800. Prior to that four months, the system was, boys were recruited in numbers and sent where you thought fit to send them?—No, I would not say that. You had better ask Mr. Macfarlane.

801. Now what is the rate of pay, Mr. Perry that you pay to your recruiters?—Oh, it varies enormously. Some of the people are paid on salary, some on salary and commission, and some on commission alone. On the East Coast, when the recruiters were paid on salary alone, the average was £70 to £80 per month.

802. How are they paid to-day?—On the East Coast, in some districts—those districts where, as Mr. Breyner told you the other day, the flow of emigration is established, they are paid on commission.

803. What do they get?—They get so much per head, say 15s. per head, and there are certain expenses which we bear too. In the other districts which are not opened out and where we are trying to establish a current of emigration, we have to pay salaries, as it would not be worth anyone's while to work those districts on commission. There the salary for full recruiters remains from £70 to £80 per month.

804. What is meant by a full recruiter?—There are full recruiters and assistant recruiters. The assistant recruiters get, I think, £40 per month.

805. And the Managers?—There is only one District Manager. At Lourenco Marques there are Joint Managers, Messrs. F. de Mello Breyner, F. Wirth, and G. Pickard.

806. What do they receive?—I have no objection to answer that for the information of the Commission. I will write it down and give it to you.

807. You will hand it to the Commission?—Yes.

808. Will you also hand a note of the salaries paid to the other Managers besides yourselves and the District Managers, and the number of recruiters, etc., that are working all over the country?—Yes.

809. Can you tell us how many recruiters there were estimated to be engaged in this work before the war?—I have not the least idea.

810. Could you find out for us and give it to us with the other information?—We may be able to get statistics.

811. Now you refer, Mr. Perry, in one of these printed sheets to the terms of a contract, or an agreement, between the mining people here and Rhodesia and Swaziland?—Yes.

812. Were those contracts with each of these places the same?—I do not understand the question.

813. There was an understanding, or agreement, between the Native Labour Association and Rhodesia with regard to recruiting?—Yes.

814. Was that understanding or agreement the same as the one with Barberton about Swaziland?—Yes. The general effect was the same. The effect in the one case was to reserve Northern and Southern Rhodesia for local needs, and the other, to reserve Swaziland and a portion of the Eastern Transvaal for Barberton.

815. That has been altered?—Yes. In the case of Barberton it has been agreed that they allow us to recruit everywhere except on the proclaimed gold-fields of the Barberton District.

816. How long is it since that change was made?—In the middle of April. I went down to Barberton and arranged it.

817. Have you received any natives since you made that arrangement?—Mr. David Forbes was asked to go to Swaziland for us. He has not got any yet.

818. Does the same thing apply to Rhodesia?—The agreement has not been altered.

819. How many of the 1,000 boys that were to come from British Central Africa have arrived?—386.

820. And the balance?—One of our managers is there recruiting the balance at present.

821. You have not got it?—No.

822. Did this agreement with the people in Swaziland exist before the war?—I never heard of it.

823. Can you tell the Commission how many labourers were got from Swaziland before the war?—I have heard that there were about 5,000, but that, I think, is nothing but guesswork. There are no statistics.

824. Still there are a number that you do not get now?—We have a certain number because a certain number of the boys have come back to their old mines.

825. Would it be fair to say that this arrangement has deprived you of a number of natives?—I think we might have got a few from Swaziland if we had been working there before.

826. You deal at considerable length in page 3 of your notes with the question of open recruiting. You give several instances of it in these printed sheets?—Yes.

827. Have I read you rightly when I say you do not give any instance of permission having been given to free recruiters to recruit in Portuguese territories?—Yes.

828. In all of these districts, as far as I remember, where you gave this permission to recruiters, the natives were extremely difficult to obtain?—Well, there used to be a considerably larger supply from the Northern Transvaal than we have at present. And there are more loose natives there, so to speak. We get all the natives out of the Portuguese territory that there are.

829. Why has permission been given to recruiters to recruit where the boys are not to be recruited? You have given permission to recruit where your own men could not get them, but we are told, that where 80,000 boys came from before the war, twice that number can come from there to-day. You have limited that territory to your own service?—In the first place, you have to have people who work there constantly. You have to pay a heavy licence, which amounts to £100, and you have to pay another deposit of £100. Then the Portuguese Government will only give a licence to a limited number of people. If we apply for a licence, we have to guarantee for the payment and the conduct of these people. Secondly, we cannot take up anyone who comes unless we are prepared to take him into our regular employment. We must have a man who lives there all the year round—not a man who wants to live there for a couple of

months in the cold season and to come out for the rest of the year. That would upset our arrangement; therefore we have to pick the best people we can get and take them into our regular employment.

830. If you were to agree to any recruiter applying for a licence, he would get his licence all right?—No, I do not think he would. The Portuguese Government have the very strongest objections to having people who are not residents. They ask the Chamber of Mines to be responsible.

831. If Sir Godfrey Lagden gave his assent to any particular individual going down there to recruit, as far as the Portuguese Government are concerned, there would be no objection on their part?—I should say there would be a very great objection. The Governor-General told me he had the greatest objection to miscellaneous recruiting.

832. Was not independent recruiting done there before the war?—Yes, to a certain extent. But I believe, then, most of the recruiters were formed into two syndicates, who divided the country between them and then these independent agents who came down simply bought from them so many boys.

833. The bulk of your recruiting in these territories was when you were getting a great many more boys from there than you are getting to-day?—We were getting fewer.

834. Mr Mello Breyner said you were getting 80,000?—He stated there were 80,000 on the Rand, but that you never got more than 30,000 in one year.

835. The net result of that recruiting was that you had more boys than you have now and you got them as cheaply?—You have compared 10 years of one kind of recruiting with only 18 months of another kind. The net result of the 10 years was that you got 80,000 boys on the Rand. There is no doubt that the boys never came in before the war at anything like the rate they are coming in now from Portuguese territory, in any one year.

836. The reason of that is that they went back home quite prepared to come back again?—Yes, very likely.

837. Your figures of what has been done in 18 months, as against 10 years, are hardly correct. You draft back a stream of labour before the war is over and naturally it must come back quicker?—Yes, I quite admit that.

838. Now in this document which has been given to Mr. Chamberlain, it stated that the boys who came to your Association, could be distributed to the mines upon a certain basis, which was to be determined by the Engineers?—Yes, I accept that.

839. How do they decide the certain number of boys a mine is to have. Is it by "stamp" or by the amount of development that is being done?—I believe it was settled on the stamping power as it existed, but I suggest that you might ask one of the Engineers that question.

840. Who sent the embassy to China; was it the mines or your Association?—As far as I remember, the formula was "of the Association under the aegis of the Chamber of Mines."

841. Do you know who is paying the expense of that trip?—Yes, but is this in order?

842. The CHAIRMAN: I think it is going outside the terms of our reference.

843. The CHAIRMAN: Mr. Perry, you might hand the Articles of Association in. I think you refer to these in one of the two documents you have already handed in. Will you hand them in as an additional document?—I think that if you look at the first paragraph of this evidence I have put in, you will find that it annexes a copy of the Articles of Association, and reads as follows:—"The Native Labour Association was formed at Cape Town in 1900 by a coalition of all the principal mining groups on the Rand and of nearly all the independent mines. Its object was to enable the mines to recruit their own native labour through a central organisation of labour bureau. A partial organisation of the same kind had been in

"existence for some years previous to the war, but this only included a part of the mines. Under the Transvaal Law the Association could only be incorporated as a limited liability company and accordingly its Constitution was drawn up in this form. A copy of the Articles of Association is put in as an annex to this evidence."

Thank you, I am much obliged to you for your evidence.

844. Mr. WHITESIDE: Are the boys recruited by your Association for six months' engagements?—Yes, that is the minimum.

845. Have you any experience of the Zambesi boys being willing to enter into engagements for longer periods than that?—They are usually engaged for a year.

846. Do the Zambesi boys give satisfaction?—We have had some 1,200 boys from northern Portuguese territory during the last year, and I am told by many of the mine managers that the boys do not do well; some of the managers state that when these boys settle down to work they do all right, but the majority of the managers do not speak well of these boys. The mortality amongst them is greater than amongst the ordinary boys; they come from a hotter climate, and are accustomed to considerable variety in the matter of food. For that reason we give them rice and other things to eat, but in spite of all we can do for them in this and other respects, it is much more difficult to meet their requirements in the matter of food and health generally.

847. I understand that on one of the leading mines at Johannesburg there are a number of Zambesi boys who have remained at work there for as long as 12 years; do you know anything of it?—I have never heard of the case; I should think there must be a very small number of them.

848. But it goes to show that they are more or less accustomed to stay on the mines for lengthy periods?—On all of the mines you will find exceptional cases where boys from all parts of Africa remain on the mines for long periods. I know of cases where boys from the northern parts of British Central Africa have remained here as long as eight years. The boys sometimes fall into the work and the life, and having remained so long away from their own part of the country, in time they appear to have no inclination to return there, but these are quite exceptional cases.

849. Can you tell us the names of the Mining Companies between the Springs and Randfontein who have not become members of your Association?—No, but I will provide the information for the Commission, if desired. I understand you refer to gold mining companies, and only to the working companies.

850. Will you also advise us whether those mines are suffering from a shortage in labour, and if so, in what ratio as compared with the subscribers to your Association?—I will obtain that information for you if possible, but it would of course depend upon whether the companies are willing to supply such information.

851. Just so. Are you distributing boys to non-producing mines?—Do you mean by that, non-stamping mines?

852. Yes?—Certainly, but we are not doing so directly; the only mines we are distributing the boys to, as mines, are those which began crushing during the war; the only mines the Association distributes boys to directly are crushing mines.

853. Can you tell us what number of boys were on the present crushing mines before the war, that is to say, in 1899?—No, I could not give you that figure.

854. Can you tell us the number of boys recruited by your Association since it began operations?—Yes, I can put in that figure. Up to the end of February last it was 82,839; from then to the end of June it was 31,544, or a total of say, 113,000. Then you must add about 7,000 for the present month, giving a gross total of, in round figures, 120,000.

855. What proportion has to come off that for wastage, desertion, etc.?—Desertion accounts for very few, perhaps only 2 or 3 per cent. As to boys taking their discharge, I cannot say exactly from memory, but you can, of course, arrive at it by taking the number of boys on the mines at the present time, say, 70,000; deduct that from the 120,000 recruited.

856. Considering the greater efficiency in the mines at the present time, are you of opinion that, if the whole of the boys were sent to the producing mines, we should by now have reached our pre-war position?—I could not say; the engineers would be in a better position to answer that question.

857. Very well, I will leave it till they come along. I understand you pay your recruiters a salary, and that you pay others by results?—Yes, but there is not very much paid by way of salary.

858. Do not the great majority of them receive a small salary and a commission besides?—I should not like to say that that applies to the majority, but a number of them receive a salary of £10 per month, as a sort of retaining fee, and a commission; those are men who give the whole of their time to the work of recruiting.

859. How long it is since this system of paying commission came into force?—Six months, or more.

860. Then before that they were on salary?—I believe so.

861. What was the object in introducing the commission system?—To endeavour to increase the zeal of the recruiters, I believe.

862. If you thought the payment of commission would increase the zeal of the recruiters, how is it you did not introduce that system at the commencement of the Association's operations?—That is a question you must ask the persons who were connected with the management of the Association at the start.

863. Have you at present recruiting for you any persons who were working for you formerly?—Yes, many of them—Messrs. Mello Breyner and Wirth, who used to work on the East Coast; Mr. McGarry, Mr. Broekhuizen, Mr. George Gray, Mr. Holgate, Mr. Mancini, Mr. Santos, were all of them well-known recruiters before the war, and there are others still employed whose names I do not remember. In the Northern Transvaal, Mr. David Erskine is still employed by us. He was recruiting before the war; Mr. Zühr, Mr. Tom Clark, and Mr. Godfrey are others whose names occur to me, and I know there are a number of others also. In Cape Colony there is Mr. Montagu Erskine, also Mr. Lange and Mr. McEwen. I may say, perhaps, that anticipating that this question might be put to me, I recently sent out forms to our agents asking them to fill them in with particulars of their previous connection with the recruiting, stating how long they had been employed before the war, and giving other detail information. I have made a precis of the replies so far to hand which the Commission, or Mr. Whiteside, may like to have.

864. I should like to have the particulars?—Very well, I put the paper in as one of the documents.

865. Has the Association any agreement with the Portuguese Government?—None.

866. I asked the question for the reason that I have been informed that there is an agreement, and that licences are refused to free recruiters on that account?—There is no agreement between the Portuguese Government and the Association. The Portuguese Government took up the attitude that it would not have irresponsible recruiters working in their territories, but would only recognise recruiting done by the Chamber of Mines, which body would be held responsible for the recruiting agents' actions. When a reply was sent to the Government that the Native Labour Association answered the same purpose as the Chamber of Mines, in this respect, the matter was allowed to drop.

867. Was any question in this respect raised by the Association at the commencement?—Not the least, so far as I know; the suggestion referred to came from the Portuguese Government.

868. Are the members of your Association allowed to take boys from outside your Association?—No, that is the agreement; in other words, they agree to recruit through the Association only.

869. I know, on excellent authority, that the Ferreira Company was offered 100 boys, but the man who made the offer was not even asked the price. These boys could have been delivered at £3 per head. I understand the average cost of the Association's boys is £3 per head, is it not?—Yes. Were these boys you refer to six months' boys?

870. I am not sure.—Our six months' boys do not cost £3 each. The proper course in the case you refer to would have been for the manager of the mines to refer the matter to the Association.

871. Would you have taken the 100 boys for six months at £3 per head?—Probably not, it would depend upon where they had come from, and whether that price would have been as reasonable as our ordinary terms for boys from that part of the country. I may explain that it is not our practice to take boys delivered at Johannesburg. We take them in the district where they are recruited, by this means we can get the boys cheaper, because we have standing arrangements on a large scale for the conduct and care of the boys to the mines, and this means cheapness to us. For obvious reasons, we only take the boys in the district in which they are recruited. We should never refuse an offer of boys in the district if the offer was on reasonable terms.

872. So that it is of no use recruiting agents offering you boys delivered in Johannesburg?—No, they must tell us where the boys are to come from, and we will take delivery in the district.

873. How many boys have been got by your recruiting agents during the last six months?—On an average about 7,000 a month.

874. Has your Association not recently called on the shareholders for a contribution of 5s. for each of the boys in the compounds?—There has recently been a call on the shareholders on account of capital expenditure. It was a call of 5s.; but it was not per boy, but per share.

875. Why was the call made?—To meet expenditure on capital account. In Central Africa we have had exceptionally heavy expenditure. It cost a great deal opening up a new district to get boys, and these preliminary expenses are charged to capital account.

876. Will that not bring up the cost of the boys?—Certainly. We could not go on paying £10 per head for boys as we have to do when first starting in a new district sometimes. This money is spent in the hope of exploiting a new section of the country from which large numbers of boys can ultimately be obtained at a cheap rate, but the initial expense is, of course, heavy.

877. Was not the average cost of recruiting under the old system something about £3 per head?—I do not know that there are in existence any full statistics to show what the average cost was. I think, however, it was rather more. One group of mines which did in some measure keep figures, told me that in the two years prior to the war their average cost was about £3 12s., and two-thirds of those boys were six months' boys.

878. What is the recruiting fee paid to the Portuguese Government?—Altogether 13s. 6d.

879. You told Mr. Quinn that the boys receive 60s. per month. Is that the standing wage, or is it for piece work?—It is the standing wage for all boys with the exception of raw boys coming from the East Coast. The latter do not necessarily receive the minimum wage of 60s. per month, but they do receive 45s. when they first come up; later on, as they get into the work, they rise to the 60s. per month. The boys from the northern Transvaal, able-bodied boys, receive 60s. at the start. Boys coming from the East Coast are very often very poor in physique, and for some months are not competent workers.

880. What was the lowest rate of pay offered to the boys by the Association?—As far as I know, 30s. per month.

881. What was the saving estimated to accrue from the reduction in wages to 30s. per month?—I do not know. I do not remember having heard the figure.

882. Has any effort ever been made by the Association to go back to free recruiting?—No effort is necessary; any member of the Association can withdraw at will.

883. Do you know of any attempt having been made to dissolve the Association?—No, not to my knowledge.

884. Mr. PHILIP: Is it a fact that the Government of Natal prevents any recruiting from that Colony?—Yes, under the Act of 1901.

885. And does Natal cover Zululand, and thus prevents recruiting from Zululand?—Yes.

886. You say that your Association does not refuse the services of any responsible recruiting agent if he gives security for the proper performance of the work?—No, not if his terms are reasonable.

887. And in your printed evidence you state that independent recruiting agents in Basutoland sent only 500 boys in five months?—Those were independent agents employed by ourselves. The whole result was 500 boys.

888. You say the cost of getting the boys from Central Africa was £10 per head. Would you have included the Manager's salary in that?—Mr. Nourse has been up there on special work, and some part of the expenditure will at any rate be charged to capital account. Part of the expenditure may be put to current working cost. We do not regard the cost of opening up a district as working cost.

889. According to your evidence, I take it that there is no chance of obtaining boys from Madagascar and the other countries you name in your evidence?—As to Portuguese West Africa, the difficulty arises from the action taken by the Portuguese Government; otherwise it might be possible to obtain some from there. We obtained permission to get 1,000 from South West Africa, but there is no large population in that section.

890. Can you tell us the average number of boys recruited before the war, monthly?—It is very difficult to arrive at that. I should say it might be set down at from 5,000 to 6,000 fresh boys per month.

891. Mr. GOCH: You arrive, I understand, at 6s. 8d. per month, per boy, as the average cost of recruiting all round; that means £4 per annum. I understand, further, that the employers have to pay the boys' registration fees, whereas before the war the boys paid those fees themselves. I believe those fees cost something like 30s. per annum (that is made up by a payment of 2s. per month pass money, and some registration fee), and the rate of wages is now 60s. per month, so that the expense on the employers is greater now than before the war?—So I understand.

892. The boys now not only receive higher wages, but are relieved of the payment of the 30s. per annum pass and registration fees. From your knowledge you could state, I suppose, that the cost of food is now higher than it used to be?—I am told that it is more than doubled; but that is only second-hand information, and what I am told by Directors and others.

893. As regards the positions of the boys, there are, therefore, many additional advantages which they gain now, compared with the condition of affairs before the war?—I believe so.

894. And employers have gone to greater cost to obtain the boys?—Undoubtedly.

895. In spite of all these efforts you find yourselves unable to meet the demand?—The supply does not meet the demand by any means.

896. What, according to the information at your disposal, might be the difference between the present demand and the supply?—It all depends upon

what you set the demand at. I understand that the complement for full work has been set at from 140,000 to 145,000; but the mines could probably do with considerably less. That does not take into account many mines who are anxious to work. We have 60,000 or 65,000 natives, and the numbers increase at the rate of about 3,000 monthly. That is the net monthly gain in round figures. That increase may go on for some time, but it will in all probability sink to a lower figure. The increase before the war was about 18,000 per year, or, say, 1,500 monthly.

897. Is the figure of 145,000 a conservative estimate?—I do not know quite as to that. I do not know that I can put it in that way. I think myself it is a very liberal estimate for the mines which are at present working. It does not include mines which want to work in the future.

898. There are no new mines included in that estimate?—Only the mines which were working before the war are included.

899. Taking it that we have now 65,000 boys on the mines, there is a shortage of 80,000, then?—Yes.

900. What was the net increase for last month?—Two thousand; before that, it was, roughly, about 3,000 monthly.

901. Then if you do not improve on this rate of progress it will take you two years and two months before you reach the figure of 145,000?—Yes.

902. Have you any hope of increasing the monthly averages stated?—It is very difficult to say. I cannot think there is much prospect of increasing the monthly gain by much over 3,000. It must be remembered it is equal to 36,000 per annum. It is a greater increase than existed prior to the war. I do not think we should have got so many except for there having been a reserve of labour in the country sent back there when war broke out, and on which we have been drawing. The only way the position can be improved is by the boys remaining longer at work in the mines, except by drawing from fresh districts. All the fresh sources I am acquainted with do not promise any sudden inrush of labour. The old sections must become worked out gradually.

903. Your best hope, then, is to maintain a net increase of 3,000 monthly?—Yes, I consider we should do very well could we maintain that.

904. You have given us a very clear statement as to the parts you have been recruiting from, with the names of your agents, or such of them as were engaged in the work prior to the war. Are you satisfied that you have the best possible service in this recruiting business?—I do not say I am satisfied. One must either improve or go back. I think matters may be improved in that respect.

905. If you improve the service, can you increase the monthly 3,000 net gain?—Not a great deal, I think.

906. Can you now take us over the whole of the ground your recruiting covers? Take Cape Colony, for example, and the southern portions in particular. Where are your recruiters stationed there?—Generally in the Eastern part of the province. We have district managers under whose direction the whole of the operations are conducted. You will be able to get the details from them when they are called before you.

907. I do not want to trouble you with details, what I want from you is a general view of the position of affairs. You are recruiting in the Eastern Province?—We have a manager in Queens-town, and his duty is to put a man or men in any part where he thinks labour can be drawn from.

908. The CHAIRMAN: Perhaps Mr. Perry would take the map before him for reference?—The field operated upon varies from time to time. You may put a recruiting agent in one district and keep him there for, say, three months, and if no particular good results from his being stationed there,

you take him away and send him somewhere else. We have 30 persons recruiting with Queenstown as the centre.

909. Mr. GOCH: Have these persons tried Pondoland?—Yes.

910. Have they tried all the districts in Cape Colony from which natives are likely to be drawn, or where natives are known to live?—Yes, I think so.

911. Is Griqualand district included in that section?—No; we have a District Manager stationed at Mafeking who controls Griqualand. There are something like a dozen recruiters in that part of the country, but I cannot speak for certain as to this; the District Manager himself will be called, and he can supply you with full details. He does a good deal of recruiting through native scouts, and I do not know how many he employs.

912. You cannot, then, supply the numbers of the men working recruiting there?—The District Manager will tell you.

913. Then take the Eastern side of Natal and Zululand. Do you recruit there?—No, the law there is against us doing so. Natal, Zululand, and Tongaland are closed against us.

914. Are there any Kaffir locations in the Orange River Colony from which you obtain labour?—I do not think there is much labour got from the locations in that Colony. The natives there, for the most part, have land of their own to work.

915. How many recruiters have you in Basutoland, including the Orange River Colony?—I think there are about eight who give their whole time to the work. The head agents, Messrs. Fraser and Stephens, control nearly all the stores in the country, and they have scores of employes who work in the business of recruiting natives for us.

916. Then we come to the Transvaal. Where do you recruit in the Transvaal?—We have an agency at Pietersburg, which works the Northern Transvaal—that includes the Spelonken district and up to the Rhodesian border.

917. How far north do your operations in this part extend? Up to the Crocodile River?—I think up to about there.

918. On the west of Pretoria and south of the Crocodile River?—Yes, and one or two independent agents are working in the south-eastern parts.

919. When you speak of the northern parts of the Transvaal, do you go up to the Crocodile River in the west?—Yes.

920. Then, taking the portion east of the Transvaal, you have Swaziland. Have you native recruiters there?—Yes, Mr. David Forbes started in Swaziland some two months since.

921. West of Swaziland to Pretoria, are there any Kaffirs there, and do you work there?—We have three or four independent agents working there, but there has never been a large labour supply in that part.

922. How many men have you employed in the whole of the Transvaal?—I would rather give you the figures afterwards.

923. Next as to Portuguese territory; you recruit, I understand, from the southern portions, where you obtain a considerable number of boys; up to what degree of latitude do you work?—Up to about 22 degrees, the southern boundary of the Mozambique Company.

924. And the number of men you employ there?—I could not say offhand; I will supply you with the numbers later on; a great deal of the work there is done by native runners; some hundreds of native runners are employed, I understand.

925. You don't expect much from the northern parts of the Portuguese country?—No, only some 300 were got before the war; they were got from the Quilimane District. There seems never to have been much recruiting done there. We have been recruiting there for some 10 months, and have spent some £15,000, and altogether I believe some 1,200 boys have been got. We sent up there the

best men we had, and some Portuguese, thinking they would best be able to influence the supply, and the result is what I have mentioned. We have men there still, working continuously.

926. Does that dispose of the whole of the Portuguese provinces?—No, it does not include the territories of the Chartered Companies. You will see the territories of the Companies marked on the map. If you take the country round Quilimane and draw a half-moon round the mouth of the river, that triangle will give you the parts open to us. We have men working there. Then if you take an arc of country from Membre Bay, north of Mozambique, right into the interior, and down again, you have what are called the Crown Lands. We got two-thirds of the 1,200 from there in 10 months. The country north of that is the Nyassa Company's territory.

927. The number you have in Mozambique territory is what?—About 12. The result was 800 boys in 10 months. The natives there have hardly ever seen a white man. The difficulties in recruiting are very great. The country is more or less in a state of rebellion.

928. A previous witness stated that it would take from five to seven years to prepare this country for a stream of emigration of labour. Do you agree with that statement?—I should think that was a very sanguine estimate, considering the time it has taken in other parts.

929. Rhodesia; do you operate there?—No, we are not allowed to do so. The law is not against us, but there is an agreement between the Rhodesian Government and the Chamber of Mines which prevents us from working that part. There is a tax there of 5s. It is feared that we should disturb the labour market. The tax is 5s. per month or 60s. per annum as against 13s. 6d. in Portuguese territory.

930. Then we do not get much assistance from our brethren?—No.

931. As to British West Africa, is there any possibility of working there?—There are difficulties; we cannot recruit there.

932. The agreement you referred to as in force in Rhodesia is necessary, I suppose, in the interests of the Rhodesian requirements for labour?—They say it is. They want all the labour themselves. Their objection is that they do not want a higher rate of wages to come into force. They say if we get the men here and pay them our rate of wages, it makes the others dissatisfied with their rates. Several of the countries from which labour might possibly be drawn complain that if we get the native here and pay him 50s. or 60s. per month, he goes back later and tells the others and they want the same where they are. I was told the other day that this is the result of natives coming to Johannesburg to work, from many of the farming districts. They then want £3 per month for working for the farmers.

933. Do you think these complaints are well founded?—Well, it seems to have had that effect on the natives.

934. Then the rate of wage we pay here controls the rates everywhere?—Well, the rate we pay gets known and it influences the natives in working for different rates elsewhere.

935. As to Central Africa?—Mr. Nourse went there. We got men from there who cost us £10 per head; that is, of course, because a lot of capital expenditure was incurred in preparing the ground; writing the preliminary expenses off capital account, the cost of obtaining the boys might be about £6 per head.

936. In order to prepare the field you have to incur large capital expenditure?—Naturally.

937. And it is likely to be five years or more before a field is open sufficiently to draw very much labour from it at a reasonable rate of expense?—Yes, before you get a really large supply. There is, of course, no rule as to the length of time it takes to open up a district, or the number of boys you get within a given time. Boys may come

in in considerable numbers after the first year or so. On the other hand, the time required might be considerably extended. No one can say definitely how long it takes. It all depends on the disposition of the natives.

938. Now, we have travelled right up to the 8th degree of latitude, near the Congo State. I see in your statement that you think it is hopeless to expect any assistance from there. The Belgian Government will afford you no assistance?—No, we can do nothing there; the British Consul reports that there is no chance of labour being exported from there.

939. As to Portuguese territory in the west of British South Africa, to the west of Barotseland?—That is where we tried to get permission to recruit, but were refused. The refusal came from Lisbon. They have a certain export of labour for the plantations. They send some labour to the plantations.

940. Then, after covering the whole of the field, and employing as you do a very large number of recruiters, the best hope that you have is to be able to sustain a net increase of about 3,000 boys per month?—Yes, I should think that we would do very well if we can manage to maintain that average. Even if the northern territories open up well, it is probable that by that time the supplies from other parts will have fallen off, and I should not be surprised later on to see the increase fall away to the 1,500 monthly which it was before the war. By the time one district is opened another often falls away.

941. May I suggest that you must have a singularly sanguine idea if you ever hope to make the supply meet the demand?—The estimated demand for the mines working before the war is 145,000, I think you said?

942. Yes. That does not include new enterprises of any kind?—No. I assume that the general demand for labour does not largely increase. It increased before the war, and may increase much more rapidly now. If new industries, new railways and the like, spring up, of course it will upset all calculations.

943. Mr. TAINTON: You say you have a District Manager at Queenstown, who is dealing with the whole of the Cape Colony. What is the entire native population?—I think it is estimated at something like a million.

944. Yes, it is more than that; and you have about thirty recruiters?—Yes.

945. How many have you in the Northern Transvaal?—I should say about 20. I can get you the exact figures.

946. And the population there, what is it?—It is very difficult to tell. I should think it is considerably more than half a million, that is according to the latest estimates.

947. And in Basutoland?—There we have six or eight recruiters constantly employed, working all their time.

948. How do you determine your estimates for any one district?—Do you base them on the population?—No, it depends on the labour supply. The District Manager is supposed to know the district, and we go by what he says.

949. Then you get a varying supply from different districts?—Yes.

950. Is that variance dependent on the number of natives in the district?—No.

951. What is it dependent on?—It is very difficult to say. For instance the numbers of natives coming from Portuguese territory, and of those coming from the Northern Transvaal, do not correspond with the numbers of the population.

952. Then you think that various causes affect the labour supply. Can you explain the difference in supply between, say, Basutoland and Portuguese East Africa?—I expect the demand for labour from other sources has a great deal to do with it, and the habits which have been obtaining in past years.

These Portuguese natives have been accustomed to work on the mines for the past 15 or 20 years, while natives from Basutoland have been accustomed to agricultural work.

953. Assuming the Basuto is the more advanced native, his wants are greater?—Of course, their numbers are smaller. There are probably not more than 50,000 men of working age in Basutoland. Then they have the Kimberley Diamond Mines, and O.R.C., and they have an extremely rich country. It has more cultivated land in proportion than any other country in South Africa.

954. If we have a prosperous agricultural year, how will it affect your labour supply for natives—this 3,000 estimate of yours?—It is impossible to say. If we had an extra prosperous year for the whole of South Africa, it might, of course, fall off, but I was speaking of permanent prosperous agriculture, such as they have in Basutoland.

955. Then would you give that as one of the causes affecting the labour supply, the amount of land and its quality owned by the natives?—Yes, it means that they have more than one means of livelihood.

956. Are there any other causes?—The demand for labour supply in Cape Colony—I mean as far as it affects the docks at Cape Town—has removed from the natives the necessity of coming to the mines here. Employment in agriculture in Basutoland, or on the railways close here, has also removed the necessity of coming to the mines here.

957. I was speaking of causes that would influence the whole of the labour supply?—I can give no further causes, except that of the position of the natives with regard to the land and agriculture.

958. You said just now that you hoped to open up new districts. What reasons have you for supposing that you could induce those natives to come to work?—It is the temptation of money, and to a great extent the temptation of curiosity.

959. Do you mean people that come here to work out of curiosity?—I am told that they do that.

960. And when that curiosity is satisfied, they generally go back and do not come again?—Well, then they have acquired the habit of coming back.

961. And what do they do with the money?—Spend it with traders.

962. Is the use of European manufactured goods one of the levers by which you hope to open up these new districts? Is that a rapid process to turn all the natives in that direction?—No, it is a very slow one.

963. How long would it take to create a demand for European goods?—That depends on the disposition of the natives. In any case it is a question of years.

964. How far has this drought affected your labour supply?—As far as I can judge from the reports of the District Managers, it does not seem to have had a great effect upon it. It never has been severe—towards actual starvation.

965. Is that the report you have?—Yes. It was worse in Basutoland, but there the Basutos had an accumulated stock of mealies and cattle. It is a fact that there has been a general decrease of mealie crops. On the other hand, it has injured us in this way. The native is said to be unwilling to leave his family unless he is assured of their sustenance while he is away. He won't go unless there is good provision made for them.

966. Among the causes noted in your operations, as affecting the labour supply, how far does the authority of the chiefs come in? Do you make any use of them?—Yes, as far as we can.

967. Are they paid?—Yes, in various ways.

968. Do they receive that from the recruiter, or in what way are they paid?—Presents are made to them. They are not paid in any systematic way, except that I believe the Queen of Swaziland is a recruiter at £30 per month.

969. But these presents, are they of any large amount?—I cannot say. In the aggregate they come to a considerable sum.

970. What is the effect on the chief?—To enlist his goodwill. Another thing is to invite him to visit the mines, where he can see for himself where any of his tribe are working. This is useful in this way. Some of the natives have a grievance, and when they go back it is the general rule to exaggerate it as much as possible, and spread it over the country. When the chief has been to see for himself, he is able to contradict, and deal with these reports.

971. Is the authority of the chief recognised by the present Government?—To some extent it is, I believe.

972. Have you any knowledge of the influence of the chiefs on the labour supply under the old Government—before the war?—I understand that their power was used in getting labour for the mines.

973. With the authority of the Native Commissioners?—Yes, certainly.

974. The CHAIRMAN: Mr. Perry, you have stated that you are going to supply the Commission with some further information. If we adjourn until 3 o'clock will it enable you to bring the information then?—Some of it I can get, but I am afraid I will not be able to obtain the whole.

975. Mr. QUINN: I should like some further information got.

The CHAIRMAN stated that further opportunity would be given for cross-examination, and the Commission adjourned until 3 p.m.

976. The CHAIRMAN: Mr. Perry, before the luncheon adjournment, you were asked to get certain information for the Commission. Have you got it?—A part of it I have given to the Secretary of the Commission. The other part is being compiled, that is, the number of recruiters in the various districts and the mode of distribution in the last month.

977. What information have you got?—The only information I have actually brought is the information in regard to the District Managers and the Managers. That I have given to the Secretary.

978. That is not for the public?—No.

979. Mr. TAINTON: I think, Mr. Perry, before the luncheon adjournment you were showing that under the old Government the chiefs exercised a certain amount of compulsion in the matter of labour?—That is what I have understood.

980. Do you think that that condition of things will continue?—No, not under the present Government.

981. Do you think the effect of British rule will be to free the British native from the authority of the chiefs?—Gradually, and certainly on the question of compulsory labour.

982. Are you acquainted with Portuguese legislation on native questions?—No, not in detail.

983. The natives there are more under the control of their chiefs, are they not?—In Gazaland, Inhambane and some other parts, where we have had our principal recruiting grounds, they are less under authority.

984. Does the Portuguese Government take direct control?—They are under the command of the Commandants. In the northern parts they are under the authority of the chiefs in some districts, and I have always heard and read there are considerable chiefs. For considerable tracts of country, each village is independent. It is like that through a great part of Central Africa.

985. Would these local officials or Commandants have any influence in the direction of sending natives to the labour market?—Yes; but the greatest help they could give would be by not interfering at all, because their authority is not continually exercised. If they attempt to exercise compulsion they may get natives once, but the next time when they come around the village is deserted.

986. You have no personal knowledge of the conditions obtaining in Portuguese territory in regard to obtaining natives and the influence and authority exercised upon these natives?—I have never recruited there myself, but have had accounts from the people who have.

987. You have had some experience now, and do you think that increasing wages has had a proportionate effect upon the amount of labour forthcoming?—I should say it would not have a very great effect upon the total amount of labour forthcoming, but would tend to bring labour from one employment to the other. If the mines, instead of paying £3 were to pay £5, they would undoubtedly get more labour than they do at present, but the greater part would be simply obtained from other employments.

988. One of the effects of this rise of wages has been to attract natives here who have probably migrated from other employment?—Certainly in the Transvaal and in the Cape Colony, and to some extent in Basutoland.

989. Have you any knowledge of the effects of the recent liquor legislation upon the native supply?—Only from hearsay. I have heard that the natives complain of not being able to get liquor on the mines.

990. In this recent liquor legislation has the prohibition of the sale of spirits had a beneficial effect or otherwise?—It is very hard to say. I do not think that there are really any materials to form a judgment. Obviously, so far as the natives are not incapacitated by drink, it has had a beneficial effect. On the other hand, equally obviously it has removed one source of attraction—I mean for the natives coming here. As long as this was the only place where they could get whisky, a certain number of the natives would stay here year in and year out.

991. Have you had any information from your recruiters on this subject?—No, except that my recruiters have said that the natives have told others that they cannot get drink now. I have not had any general statements on the subject.

992. You said just now that you thought that the natives left the mines after a much shorter period of service than before the war?—Yes, as far as I can make out from the present statistics, that is so. The East Coast natives, who, before the war, would probably re-engage to the extent of 50 per cent., only re-engage after their first year to a smaller percentage. The first year of East Coast natives began to expire last February, and 70 or 80 per cent. have been going back. That is a greater proportion than went before the war.

993. Do you think that the liquor legislation has affected the question, in this way, that they save their money now, and thus accumulate a larger sum more rapidly, and then leave? Do you think that is one of the causes affecting their return?—I think that has a great deal to do with it. There is no doubt a native does save a sum of money more quickly, now that he does not spend his money on drink. Of course that does not prevent him coming back again.

994. Is there any evidence that the natives prefer to have this prohibition of the sale of liquor, and that they come here more readily now that it is prohibited?—I do not think there is any direct evidence of that. I imagine the natives have no collective opinion in this matter. Khama, the Bechuanaland chief, has an opinion, and always had it. I believe he is now inclined to help us as far as he can. He is much less averse to recruiting amongst his people for the mines on the Rand than before the war.

995. I was referring to the attitude of individual natives on this question?—I have never heard any individual native express an opinion in that way.

996. Apart from the disputed point of the effect of your organisation on the labour supply, I suppose we may take it that you have improved the means of communication, and bettered conditions generally?—Very much so. One of the chief advantages of

putting recruiting under one hand, is that you have supplies of food for the natives, and we have fixed points on the railways for collecting the natives, and can have white conductors travelling up and down with them on the trains, which is very necessary to look after them, because they cannot look after themselves on the railways.

997. In that direction you think this organisation has had a good effect on the supplies?—It makes the natives very much better off. It is much more convenient for them to travel now, than before.

998. Do you get any special facilities from the railways—from the Government?—We get reductions on natives travelling on the Central South African, the Portuguese, and the Cape Government Railways. The Natal Railways make no reduction.

999. These natives must be sent to special stations in order to obtain this advantage, must they not?—No; I think it is only a question of their travelling in large numbers.

1,000. What would you call large numbers?—Over 20 at a time.

1,001. It is not within your knowledge, then, that special rates are charged to Elandsfontein?—No. I should think it very likely. The fare from Komatipoort to Braamfontein is so much for so many natives in large numbers.

1,002. One of the effects of this improvement has been to concentrate the natives on the mines by offering them certain advantages?—Yes, but the natives do not pay their own railway fare.

1,003. If the Association gets a remission on the rate, that would naturally assist the mines, would it not?—Yes, but it does not affect the natives whether we pay 15s. or whether we pay 10s.

1,004. But it would affect the relative position of other competing industries, as against the mines which are given an advantage?—Yes, but of course any other industry that could bring up natives in large quantities would get the same rate.

1,005. You do not know of cases where natives, outside of the mines, have been charged full rates?—No, I have never heard the question brought up. If we bring up natives in less than 20 at a time we have to pay the ordinary rates. We bring up 400 or 500 at a time and get special rates.

1,006. You got some boys from Quillimane. Has that been a successful experiment; are they good workers?—The opinion on the matter is divided. The majority of my Managers say they are very troublesome and not healthy. All the Mine Managers agree that they are troublesome, but two or three have said that after a time they become satisfactory workers.

1,007. Has there been much mortality amongst them?—Greater than the average of East Coast boys.

1,008. The influence of the climate here upon Central South African boys is not favourable?—No. As one would expect, the hotter the climate they come from, the more this climate seems to affect them. The boys from Basutoland and the Cape stand this place better than those from the Northern Transvaal; those from the Northern Transvaal better than the Portuguese and especially than those from the northern parts of Portuguese East Africa.

1,009. Have you any figures of the mortality percentages?—I can put these figures in before the Commission.

1,010. To summarise then, I understand that you have not based the working of your labour organisation upon the numbers of natives in any one district?—No, rather upon the supply that has been previously obtained.

1,011. And that supply is influenced by various factors other than mere numbers?—Yes.

1,012. Then these estimates which we are all familiar with—the estimates of the number of natives for supply, and the population of the natives south of the Zambesi; these are subject to considerable qualification, are they not?—Of course you cannot

base the estimates of labour supply on the population. You must take the local demand and the area of the country and the disposition of the natives. For instance, in Natal and Zululand, which have a native population of from three-quarters of a million to a million, there has never been in that country a very large recruiting organisation and very large labour supply.

1,013. Mr. EVANS: The Association has been compared to middleman. Does the Association make any profits?—No, that is one of the Articles of the Association that it shall make no profits.

1,014. Do you pay the members of your Board?—No, the only people who are paid are the people who are associated in the management, the profits going to the benefit of the members.

1,015. That is, you have fixed your charges for the boys just to cover the cost?—Yes, it is varied from time to time.

1,016. Now, what in your opinion would be the effect of the return to the old system in recruiting?—My own opinion is that it would probably diminish the supply, if taken for any lengthy period, say from one year's end to another, because the territories we are now working are constantly worked with the same energy. We also get new districts that have to be opened up, and are being opened up, and we get these worked at the same time. Then there is another point, the question of free recruiting, that is in the way that boys are brought here on the Rand from another agent. What appears to have happened before the war was that the districts where a flow of labour was already established, and where it was easy to obtain boys, were crowded with agents, the result was that the natives passed through several hands before they came to the mines. In Portuguese East Africa and other territories recruiting is done in the first place by native agents or runners. These agents or runners, as a rule, will simply give the boys to the men that pay them the most money. If they are employed by a man who pays them 5s. per head, and another native agent comes along and gets 7s. 6d. per head from his employer, he takes the boys over and gives half of the extra 2s. 6d. to the first runner. In that way the boys are generally passed through several hands before they reached the point where they were actually contracted. On the Portuguese East Coast, just before the war, the price per head paid to the native runners was 15s., and the greater part of the runners were not occupied in getting new boys, but stealing boys from one another. Of course, all that is a waste of money and energy. By having one organisation it seems to me that you can use the profits earned in more settled districts where there is comparatively little expense in getting boys in working the outlying districts where the boys cost a great deal to get per head.

1,017. You can cover more recruiting ground with the same amount of money than otherwise?—Yes. Under free recruiting, it would not be worth anyone's while to go, for instance, to the Portuguese territory immediately south of latitude 22, or to many parts of the Northern Transvaal, so long as he could come to the country around Inhambane or Pietersburg and get natives there from someone else.

1,018. Why is it so little progress is being made in opening up the northern portions of the Portuguese and the Zambesi territory generally?—Well, of course, the greater part of the country we have not had permission to work in; that is, the Chartered Companies. We have only worked in Mozambique and Quillimane; it is a very large area. The only reason I can give for it is that the natives have never been used to work, and when you go to a practically savage tribe and ask them to come and work in a country they have never seen or heard of, it is very difficult to get them to do so. We have put men there acquainted with the country, and have spent something like £15,000 in establishing stations all over the country, not only for the purpose of transport, but for advertising, and of course in that country £15,000 represents a good deal more than it does here, because everything is very cheap.

1,019. The result, of course, has been meagre?—1,200 boys in the time. Considering that the district has never been tapped before, it is all that you could expect, and the sparsely-populated country—some say 3,000,000 for the east of Portuguese East Africa and 4,000,000 or 5,000,000 for the west. That sounds large as compared with our population, but you have to consider the area. I think in one case you have four or five to the square mile, and, in the other, seven or eight, and that is a very thin population indeed.

1,020. In the northern parts of Portuguese territory have you encountered much hostility to your recruiting?—There is a good deal in two or three ways. First of all, of course, with the local commandants and the traders; naturally they dislike anything which puts up wages. They employ a certain amount of labour for which they pay practically nothing, and as soon as other people are offering high wages it makes the natives discontented. Then in Portuguese territory they are very jealous of the northern part of this territory and the people of other nationalities going into the country, or even the people of their own nationality who have influence with the natives. They are in a constant state of warfare. They are always having expeditions against one chief or the other. There are a certain number of traders and hunters who have always kept good friends with these tribes, who are constantly in a state of rebellion, but the moment we attempt to employ any of these people, the Portuguese authorities naturally say: "No; these men are friendly to the tribes fighting against us. We are not going to let them bring natives out." I think any Government would act in the same way. Then in British Central Africa and German East Africa the hostility is put on many grounds, but I think the main reason which appears under it all is the fear of the rise of wages, which undoubtedly would take place if we established any considerable emigration from there. It is not so much the scarcity of labour as the fact that the labour which remains, although it might be sufficient for them, would have to be paid for at a higher rate than at present. There are very full reports of the meeting held at Blantyre to protest against Mr. Nourse's mission. I can supply these newspaper reports. The impression you get is that that is the main point.

1,021. Are there really any of the white inhabitants who are willing to be helpful either in the northern part of Portuguese territory or British Central Africa?—Practically, only as far as we make it worth their while to do so. If we can give the man an order for a certain amount of food or stores he will naturally back us up. But as long as he gets nothing out of it personally, he naturally is hostile to our offering 30s. or 40s. to natives to whom he has been paying 3s. or 5s. a month to work for him.

1,022. What is the trouble with the missionaries up there?—The missionaries have been hostile without exception.

1,023. To recruiting?—Yes.

1,024. That is in British Central Africa and Uganda, I believe?—Yes. Of course they have the same opinion as everybody else, viz., that they do not want a rise of wages, but the reason which they have given is not so much that as what they call the corruption of the natives. They say that the natives escape from their influence both in Central and East Africa; the missionaries were there a long while before anyone else. They struggled in the same way against the establishment of even an Administration. They had great trouble in Nyassaland and other places. They established little settlements, and the natives were a sort of family retainers to them. As a native emancipates himself, and goes to outside employment, of course they lose all that, and it is not pleasant to them either.

1,025. There has been a question also of the diet affecting their health?—Yes, and especially in Uganda. The Bishop raised the question of diet there.

1,026. The CHAIRMAN: In speaking on the cost of recruiting, may I ask is that the cost of the administration?—Yes, absolutely everything.

1,027. Will you tell the Commission what commissions are paid by the mines for boys engaged for six months' and 12 months' service?—For boys engaged for 12 months, £1; and for boys engaged for six months, £2.

1,028. And that you estimate on the business you are now doing brings the Association out without loss?—Yes.

1,029. Have these commissions not been recently increased?—Quite recently; last month.

1,030. From what figures?—Before that I think they were fixed—about the middle of last year—at £3 5s. 0d. for boys for 12 months, and £1 12s. 6d. for six months boys.

1,031. You found these figures did not bring you out?—They have not within the last six months, because the recruiting has been pushed in a good many districts where it is not remunerative, where the boys cost a great deal more per head than we get for them.

1,032. Has not the system been introduced recently of offering boys a bonus after they have finished their period of service in order that they may be engaged for a further period?—That was agreed to at the same time as the increase of wages. There was a resolution of a joint Committee of the Association and the Chamber of Mines were told to offer the boys £3 for 12 months' re-engagement, and 30s. for six months'.

1,033. Do you know if these bonuses have been taken advantage of by the natives to any appreciable extent?—Very little, I believe. Of the number of natives taking their discharge, a very considerable portion of them are entitled to these bonuses. Not many boys re-engage.

1,034. You are to hand in a return shewing the names of the recruiters you are employing in the various districts, or giving the numbers. Do you know of any considerable numbers of persons engaged in this business before the war, who are not employed by the Association—any important persons?—There were two recruiters on the East Coast who did very well before the war who are not employed by the Association, and the reason is that during the course of the war they ran up against the Portuguese Government. I think they were in an irregular corps at one time on the border, and the Government afterwards refused to give them licences. I cannot remember having heard of any other particular instance. Of course, there are a good number recruiting in the Northern Transvaal because there was always, I think, a good deal of miscellaneous recruiting going on there—not only for the mines, but for other industries and employers.

1,035. You have referred to the preference of the Portuguese authorities for only employing recruiters who are representing an Association such as yours, or the Chamber of Mines?—Yes.

1,036. Was there any arrangement of that kind previous to the war?—Previous to the war there was an organisation which, I think, was called The Rand Native Labour Association, and which was formed by a number of the groups. They established a very strong footing in Portuguese territory, and for a couple of years at any rate, previous to the war, they did, as far as I can gather, about five-sixths of the actual recruiting there. When anyone else came in, they generally found that they had to come in under an arrangement with them, but still, besides these people, there were a number of independent agents. A few who remained in the country, more or less constantly, and a number of others who got licences, and went down for a few months at a time, and then came away again.

1,037. I have a recollection that Dr. Leyds went to Lourenco Marques at one time to fix up an agreement with the Government with a view of only admitting recruiters into their territory who were

D

engaged by the Association or the Chamber of Mines. Have you any knowledge of it yourself?—No.

1,038. You have heard the statement made by some member of a deputation which waited on Lord Milner on the question of native supply recently, that your Association were not putting forward reasonable efforts to get labour. Is there any justification in your experience for that statement?—No, none whatever. In fact I never met a person connected with the Association in any way who was not anxious to get all the labour he could.

1,039. Do you wish to give the Commission the impression that the railway authorities make special terms to you which they do not make to anyone else in bringing up a number of boys?—No. The terms the railway authorities make are simply terms for a quantity. They would make the same terms to anyone else who dealt with them on a sufficiently large scale.

1,040. Do you know whether there is any reduction as between 20 boys and 100, or any large number?—I think we get no reduction beyond that for a number over 20. I think the railways, merely on commercial grounds, should make larger reductions than they do in our case.

1,041. It has been stated very generally, Mr. Perry, that the Association does not engage individual recruiters. What is the attitude generally towards any person coming and offering you a supply of labour?—The first thing we ask him is, "where do you propose to recruit them?" Then, if he tells us that, we tell him our general terms in that district—our general terms of commission. If he wants anything beyond that, or to be taken into our employment, we ask what his general references are, if he was recruiting before the war, and for any other information which shews he is a man of influence, and then we do our best to get hold of him. But if we cannot find out anything about him, we say to him, "There are our terms in that district, and we will take boys on those terms, but cannot give you any special terms." I am not speaking of Portuguese East Africa, where we take on men regularly or not at all. It is a question there of whether the man will enter our regular employment, whether he is the best man we can find, and whether we have a place for him.

1,042. Has the Association ever put any hindrances in the way of people recruiting in the Transvaal, the O.R.C., or the Cape Colony, for persons outside mines?—No, I do not remember any instances.

1,043. In a local newspaper there was an account recently of a meeting of your agents in Lourenco Marques, which gave the impression that they were dissatisfied with your terms and conditions?—Yes.

1,044. Were you present at that meeting?—Yes.

1,045. Was there anything to justify the colour given to it in the papers?—It was an entire misrepresentation. The meeting was the outcome of a proposal I made myself about three months ago. Of course, all sorts of questions are coming up between the recruiters and at the office at Lourenco Marques. And when it is a question of general policy, it is very difficult to deal with it by correspondence. Three months ago I met some of the recruiters, and at the time I made a suggestion that we should have regular conferences of the principal recruiters, who might come in from the country to Lourenco Marques, and that some one (either Mr. Macfarlane or myself) should go down, and that all points arising or likely to arise should be discussed. This was the first of those meetings.

1,046. Mr. QUINN: You are aware that an increase of wages to native labourers was brought into force about the end of February last, and that for the immediately following two months the supply of labour was doubled?—I do not know as to the supply doubling. The old rate of wage was reverted to in January, and the supply during the last six months has been about 7,000 monthly. Whilst not admitting that the supply has doubled, I admit there has been a great increase over the numbers recruited last year.

1,047. Do you think if the wages were still further increased, it would have a similar result?—I think that if you increase wages sufficiently high you will always draw labour from elsewhere where it is remunerated at a lower rate, but whether you would thereby increase the total amount of labour is a different matter, and may be open to question.

1,048. You joined the Native Labour Association in February last, I believe?—Yes, on the 1st February.

1,049. Was there not some dissatisfaction as to the manner in which the work of the Association had been previously conducted?—I am not aware of it. I joined the Association as Chairman of the Board, a position previously occupied by Mr. Harold Strange. I never heard any dissatisfaction expressed at the way Mr. Strange had conducted affairs, but he had other business to attend to, and could not give his time to the Association any longer.

1,050. I am not referring to Mr. Strange, but in a speech made by Sir Percy Fitzpatrick, amongst other reasons given for the failure of the Association was one of incompetency, I understood. Do you know anything about it?—I do not think Sir Percy Fitzpatrick gave it as his own opinion, but that he had heard that opinion expressed elsewhere.

1,051. He gave a number of reasons, and that was the last one?—I do not think he was correctly reported.

1,052. The reporters again?—Yes, the reporters again.

1,053. Referring to those parts of South Africa in which you are not now allowed to recruit, were there similar restrictions before the war?—I do not know whether anyone tried to recruit there before the war.

1,054. For instance, were there any legislative restrictions in Natal before the war?—No, recruiting was permitted in Natal before the war. The restrictions have been imposed since. At the Bloemfontein Conference the representatives of Natal undertook to endeavour to have the restrictions removed, but were not successful, a Bill for that purpose having recently been rejected.

1,055. Then, in spite of the very strong position in which the Native Labour Association finds itself, you have not been able to get any of the restrictions removed?—Some restrictions have been removed. We got the restrictions removed in some of the districts of the Portuguese Eastern territories. We have facilities there which we had not previously; we have also now certain facilities in British Central Africa; also in German South West Africa; I do not know that the position is very much changed now in this respect to what it was before the war. Previously the negotiation about recruiting of labour was in the hands of the Chamber of Mines, and to all intents and purposes it is now, although it acts through the Labour Association. We do not approach the Governments of those countries directly, but through the Transvaal Government.

1,056. You stated, in reply to Mr. Evans, that in your experience the missionaries are, almost without exception, opposed to the emigration of native boys to the mines?—As far as I know that is so.

1,057. On what is that opposition based? We had missionaries here giving evidence before the Commission, and they denied it.—I was speaking of Eastern and Central Africa, the new territories where practically no recruiting has previously been done; not to the older recruiting districts. My opinion was based on reading and on conversation and correspondence with officials and other residents in those countries. In England the missionary societies have written to the Press against drawing the native labourers to the mines.

1,058. You refer to other missionaries, then?—Yes, those in the new sources of supply.

1,059. Is there any foundation for your statement that the missionaries regard the boys as sort of family retainers, and selfishly keep them for their own purposes?—I did not say that they did so.

1,060. No, I admit that the term "selfishly" is my own?—The opinion was based on reading and on other accounts emanating from the territories I have referred to.

1,061. Have you ever heard of complaints having been made by the missionaries of the treatment meted out to the boys in the compounds on the mines?—The only instance was that of a missionary from the Northern Transvaal who called on me. He was a doctor, and represented that in his opinion it was not correct that the boys in the compounds should be attended to by doctors who had no knowledge of native diseases. He said that native diseases were different from others, and should be attended to by doctors who had resided amongst the natives.

1,062. I sent him to you. Did he complain of the hospital accommodation?—I do not remember that he made any such complaint. I asked him if he was prepared to accept an appointment to the Mines, but he declined, as he had to return to his district.

1,063. Did he suggest any way in which improvements might be made to increase the comforts of the natives in the compounds?—I do not remember that he did so. The only point I think he made was the one I have referred to, namely, as to having doctors who were specially acquainted with native diseases to attend to natives in the compounds.

1,064. Can you tell us how many recruiters you have engaged in the Northern Portuguese territories?—I think 11 or 12.

1,065. Mr. Mello Breyner stated in his evidence that in three territories belonging to the Mozambique, Nyassa, and Zambesi Companies there was a very large native population. He said, I believe, that there were somewhere between 700,000 and 800,000 people, and about half of them, he believed, were to be found in the northern provinces, and that there might be a good many more?—That is only an estimate, no census has been taken.

1,066. And in that populous country you have only some 11 or 12 recruiters?—Most of the country you refer to is closed against us. Where we have the 11 recruiters is on the Crown Lands of Mozambique. The part I refer to is only about one-quarter of the territory you refer to.

1,067. From Mr. Mello Breyner's evidence, I understand he makes out that in the three northern provinces, recruiting has only just been commenced?—Yes; but only in part of the territory in the Crown Lands; the others are not being recruited at all.

1,068. In those territories he reckons there are some 400,000 men?—I think he meant the territories of the three companies, not the Crown Lands round the Mozambique and Quilimane districts. In

those districts we did get permission from the Portuguese authorities, after some difficulty, to recruit; but they are only one-fourth of the whole, although still a large territory. We have 11 recruiters there.

1,069. You have only 11 recruiters amongst a population of four hundred thousand?—No; only amongst about a quarter of that population.

1,070. Mr. WHITESIDE: What is your opinion of the reason why so many natives return to their homes at the end of their working engagements?—I do not think I can give any opinion on that point. There have been several reasons given. The one which appears to me to be most plausible is that at the end of short engagements they have accumulated sufficient money for their purposes. I do not mean to say that I am convinced that this is all. If I were asked, I should be inclined to say I do not know the reason.

1,071. Is the Portuguese Government disposed to give permission to recruiters to work in their territory who are not connected with your Association?—They have always expressed themselves strongly on this point, and have given us to understand that they wanted the whole of the recruiting to be done under a single organisation, and that such recruiters were to be constantly employed by such organisation, so that they could always easily control such recruiters.

1,072. Mr. FORBES: You tell us that the present rate of increase is about 3,000 per month?—Yes, I think it works out at that for the last six months.

1,073. And you think 145,000 are required for the mines?—Yes, that is the estimate.

1,074. Then it would take about two years for the supply to reach the demand?—Yes, at the rate of 3,000 per month, it would take about two years to reach 145,000.

1,075. Do you think there is much chance of that rate continuing for two years?—I do not think so. When you get up to about 100,000 I don't see where you are going to get very much increase beyond that, unless new sources come in. Before the war the increase was about 18,000 per annum. Still, there are new sources of supply; they may come in and keep up the present rate of progress, or they may not.

1,076. Mr. PERRROW: I see you employ a large number of recruiters?—Yes.

1,077. Do you think your recruiters are doing their best to engage all the labour you require?—I think so; it is to their interest to do so.

The Commission then adjourned till the following morning, Wednesday, July 29th, at 10.30 a.m.

## FIFTH DAY.

*Wednesday, 25th July, 1903.*

### THE COMMISSION MET AT 10.30 A.M.

[Mr. F. Perry's Examination continued.]

1,078. The CHAIRMAN: When the Commission adjourned last night Mr. Perry was giving evidence. Have you, Mr. Perry, been able this morning to hand round some additional information we asked for yesterday. Will you tell us what the different pieces of information are that you have been able to supply us with this morning?—Last night, before I left the Commission I gave to the Secretary four additional statements relating to British East Africa,

British Central Africa, and the Portuguese Chartered Companies. I also handed to the Secretary the statement showing the number of recruiters in the various districts. Then I sent round to the Secretary, after I left the Commission, a statement shewing the specimen distributions of the last six gangs of natives that came in, and another statement shewing as far as we know the names of the mines between Springs and Randfontein which do not belong to the Association.

1,079. Well, seeing we have only had these statements since we came into the room, I would ask the Commission if they propose to go through them now, or if the Commission would prefer to call Mr. Perry again on these matters.

1,080. Mr. TAINTON: I suggest that we take Mr. Perry's evidence as far as we can get it, and that if there is anything we want to further cross-examine him on, Mr. Perry can be recalled.

Mr. Tainton's suggestion was agreed to by the Commission.

1,081. The CHAIRMAN: The first statement I have here is "Notes on Recruiters' Records." It is divided into the Northern Transvaal, the East Coast, Swaziland, Cape Colony, Basutoland, Bechuanaland Protectorate, and Miscellaneous?—Yes. I should like to explain how that statement was compiled. I thought that the Commission might probably want information as to the experience of the men who have been recruiting, so, soon after the Commission was appointed, I caused forms to be sent to all the recruiters in our employment asking for all that information. In all cases, of course, they have not been returned, but two days ago I had the information contained in all the forms that had been returned summarised. It does not contain a complete record of all our recruiters, but it contains a record of all those we asked for as they came in.

1,082. You have referred in your statement by number. These numbers, I take it, refer to individuals?—Yes, the names could be supplied.

1,083. The CHAIRMAN: Would the Commission like those notes read?

MEMBERS OF THE COMMISSION: No.

1,084. The CHAIRMAN: There is another statement of yours, Mr. Perry, which is headed "British East Africa and Uganda"?—Yes.

1,085. I suggest to the Commission that that statement should be read. Will you read it, Mr. Perry, please?—Yes. I might explain that these are notes of the different facts of Mr. Macfarlane's mission in September and October, 1902. They are as follows:—

#### BRITISH EAST AFRICA AND UGANDA.

Mr. Macfarlane's mission in September and October, 1902. Repeated application to the Foreign Office to allow first enquiry, then recruiting of a limited number by way of experiment. Objections raised by Foreign Office. Negotiations in London. Final determination not to give permission to recruit until after Mr. Chamberlain's visit to South Africa. Copy attached. Letter to Mr. Chamberlain of the 21st January, 1903 (copy annexed), and his reply of the 23rd January (copy annexed). The matter was brought up again on the 29th of February, 1903, by the Native Labour Association to the Department of Native Affairs (copy attached). A telegram was sent by the High Commissioner to the Secretary of State for the Colonies in the sense of this letter. A reply (copy annexed) dated 3rd of April, stating that H.M.G. would await result of experiment in British Central Africa before considering the question of authorising recruiting in British East Africa or Uganda. The Secretary of State stated that his personal opinion was that no supply could be obtained from East Africa at present. Then there is the first letter from the Native Labour Association to Mr. Chamberlain, which is as follows:—

Witwatersrand Native Labour  
Association, Limited.  
Johannesburg.  
21st January, 1903.

To the Rt. Hon. J. Chamberlain,  
M.P., P.C., etc.,  
Secretary of State for the Colonies.

Sir,  
NATIVE LABOUR FOR TRANSVAAL  
MINES.

At the request of the Executive Committee of the Chamber of Mines, I beg to address you with reference to the subject of the joint deputation to you

yesterday and ask for your assistance in obtaining from His Majesty's Government the desired facilities for recruiting in Africa, on behalf of this Association, in terms of understanding arrived at, that we should ask direct questions as to areas, to enable definite replies to be made. We ask that the Witwatersrand Native Labour Association, Limited, shall be granted the necessary consent to recruit natives in the following territories, in which, hitherto, no permission have been obtained, under such safeguards as the Government shall deem fit: (1) The Uganda Protectorate; (2) British East Africa Protectorate—(A) in the portion south of Kavirondo; (B) in the other portions; (3) in the British Central Africa Protectorate; (4) in North-eastern and North-western Rhodesia, in so far as Government assistance is necessary to enable the Association, if possible, to propose and conclude arrangements with the Administration of Rhodesia. As regards the Foreign States in Africa, considerable assistance has been rendered by the Portuguese Government to our recruiting operations in that portion of the Mozambique territory south of latitude 22 degrees, and permission has also been obtained for recruiting in the District of Mozambique north of the Zambesi (hinterland of the town of Mozambique). As to other Portuguese territory, negotiations are in process directly between us and the Chartered Companies, and with the Zambesi Companies. The same success has not been obtained in the Portuguese West African Province of Angola, where a definite refusal has been met with. In the German province of South West Africa permission has just lately been obtained from the Governor there to recruit 1,000 natives. As regards German East Africa, hitherto our operations have not met with success, but endeavours are still being made to obtain permission. The assistance of His Majesty's Government is desired in supporting the representations which the Association will continue to press, and, if such support can be granted, we shall, from time to time, ask for the assistance of His Majesty's Government, through His Excellency the High Commissioner and the Commissioner for Native Affairs. In the Congo Free State, we hope at a later date to be able to operate, and in this case also seek the support of His Majesty's Government. Questions of regulations and precautions we shall be prepared to submit in due course and as necessity may arise.

I have the honour to be

Sir,

Your obedient servant,

(Sgd.) HAROLD F. STRANGE,  
Chairman.

Then there is a letter from the Secretary of State for the Colonies to the Secretary to the Transvaal Chamber of Mines, which is as follows:—

Potchefstroom,  
23rd January, 1903.

Secretary of State for the Colonies.

Sir,—I am directed by Mr. Chamberlain to acknowledge receipt of your letter of the 21st instant, in which you ask, on behalf of the Witwatersrand Native Labour Association, certain facilities to enable you to recruit natives. In reply, Mr. Chamberlain desires me to say that he will have pleasure in making representations on the subject to the Foreign Office, and will do so immediately by cable. He proposes to recommend that facilities be given your agents to visit Tembwe, Kavirondo, and the Uganda Protectorate, with a view of seeing whether labourers can be obtained from those districts, and also whether there is any danger of importing the "sleeping sickness." Until these points are decided, it would seem impossible to do more in these districts. He cannot recommend that facilities be given for enlisting labour between Mombasa, Kavirondo, in the territories along each side of the railway. He is also prepared to recommend that your agents be allowed to recruit natives in the British Central Africa Protectorate, subject to such conditions and regulations as may be decided upon. He will be happy to render any assistance in his power through Lord Milner, to secure satisfactory arrangements

between yourselves and the authorities of North-eastern and North-western Rhodesia. As regards Foreign States, Mr. Chamberlain feels sure that all possible diplomatic support will be given to enable you to extend your operations in Portuguese and German territory, but he understands that in regard to these, as well as to the Congo Free State, you will make representations from time to time with full detail; and that you do not at the moment desire any special assistance. Mr. Chamberlain trusts that this will be satisfactory.

I am, Sir,  
Your obedient servant,  
(Signed) H. W. JUST.

To the Secretary  
to the Transvaal Chamber of Mines.

Then there is a letter to Mr. Windham, Secretary for Native Affairs, Johannesburg, which is as follows:—

Witwatersrand Native Labour  
Association, Limited,  
9th February, 1903.

W. Windham, Esq.,  
Secretary for Native Affairs,  
Johannesburg.

Sir,—With reference to paragraph two of Mr. Chamberlain's letter of the 23rd ultimo, addressed to the Secretary to the Chamber of Mines, in which he proposes recommending facilities be given us to visit Tembwe, Kavirondo and the Uganda Protectorate, I have the honour to state that I am instructed to inform you that we have already, through one of our Joint General Managers, made the investigation and enquiries referred to, and satisfied ourselves that native labourers can be obtained, and it does not appear that any further advance can be made until we are allowed to recruit a number of natives experimentally. I have, therefore, to beg that the Commissioner for Native Affairs will take the necessary steps to obtain permission for us to recruit from 1,000 to 2,000 natives from these districts. As regards "sleeping sickness," we shall, of course, take every precaution against its possible introduction by means of medical examination, quarantine, or both; and I am directed to state that we shall welcome the advice and assistance of the Local Authorities in dealing with this matter.

I have the honour to be,  
Sir,  
Your obedient servant,  
(Sgd.) H. W. STEEDS,  
Secretary.

Then there is the telegram from the Secretary of State, London, to the High Commissioner, Johannesburg, which is as follows:—

[Telegram.]

From the Secretary of State,  
London.

To High Commissioner,  
Johannesburg,  
April 3rd, 1903.

After full consideration and in view of "sleeping sickness" in East Africa, and strong objections from Administrator and others, His Majesty's Government find themselves obliged to await result of experiment in British Central Africa, where circumstances are more favourable, before considering question of authorising recruiting in British East Africa or Uganda. My personal opinion is that no supply of the least importance can be obtained from East Africa at present.

That telegram was sent in reply to a telegram sent by the High Commissioner containing the gist of what I have just read.

Then there was the agreement made in 1900 between the Transvaal Chamber of Mines and the Rhodesia Labour Association, the substance of which is as follows:—

An agreement was made in 1900 between the Transvaal Chamber of Mines and the Rhodesia

Labour Association. This was afterwards taken over by the Rhodesian Government. By this agreement the W.N.L.A. was bound not to recruit in Northern or Southern Rhodesia. This agreement was denounced at the beginning of the year on six months' notice expiring in June. Negotiations have been going on for some time for its renewal. Up to the present the Rhodesian Chamber of Mines refuses to agree to our recruiting independently in their country. All natives engaged in Southern Rhodesia for employment outside that country are subject to a tax of five shillings per head for each native of the engagement, which has to be paid by the employer when the contract is made before the local authorities.

Then there are the notes with reference to the British Central Africa Protectorate, which are as follows:—

Negotiations to obtain permission to recruit in this Portuguese Protectorate were going on for the last six months of the year. There was a considerable opposition on the part of the local community, and the Foreign Office at first refused its consent to recruit.

The matter was brought before Mr. Chamberlain, on his visit to this country, and he promised to recommend favourably to the Foreign Office the proposal to recruit an experimental batch of 1,000 labourers.

The Joint General Manager of the Association was sent up at once to that country, but the final permission of the Foreign Office was not given until some months later.

A part of the natives in question have been recruited, and are already here. The remainder are in process of being recruited.

STATEMENT.—I attach a statement supplied by Sir Alfred Sharpe, the Commissioner of the Protectorate, showing the number of men who paid hut-tax in the Protectorate last year.

There is strong local opposition amongst missionaries, planters, and traders in B.C.A. against recruiting labour to emigrate to the Transvaal.

Then there are notes with reference to Portuguese Companies, which are as follows:—

PORTUGUESE COMPANIES.—So far permission to recruit in the territories of the Mozambique Company, the Nyassa Company, and the Zambesi Company has been refused us. After long negotiations we have succeeded in making proposals with regard to the Nyassa and Zambesi Companies which are agreeable to the local authorities. It is necessary, however, for them to be sanctioned by the authorities in Lisbon, and at present they are under consideration there. In the case of the Mozambique Company, we have not been so far able to make any acceptable proposals, the local authorities stating that they find a shortage of labour for their own mines and industries, and are averse to allowing any emigration. In regard to the Mozambique Company, Mr. Chairman, I discussed the matter some time ago with Colonel Arnold, who is Director of Exploitation for the Mozambique Company, and Head of the Public Works in their territories, and he was against allowing any recruiting there, except on the conditions that we would undertake no organisation establishment there, and that we would undertake to supply, not only their mines, of which they have a certain number, but also the labour required for their agriculture, farms, and plantations before any of the natives went out of the country. And that was a matter which it was impossible to do, owing to the difference in the rate of wages to be paid. For some years Colonel Arnold has been attempting to establish there tropical industries, plantations, etc., of various kinds.

1,086. The CHAIRMAN: On page 8, Mr. Perry, marked Treasury Department, Zomba, British Central Africa, there are certain statistics?—Yes. Those are the statistics which Sir Alfred Sharpe gave me.

1,087. The CHAIRMAN: Will you summarise those to me, Mr. Perry?—Yes. Some years ago a hut tax of 3s. was instituted in the Central Africa Protectorate. Then the coffee plantations were

being advertised. It was not very long after they were started that they had difficulties in obtaining labour, and I think, for that among other reasons, the hut-tax was doubled for natives who could not produce a certificate shewing that they had worked for a European employer for one month for one year. The taxation in the Protectorate is 6s. for a native who cannot produce a certificate shewing that he has worked, and 3s. for a native who can produce a certificate shewing that he has worked one month in the year. This tabulated statement gives the number of natives who paid taxes last year. There were 150,000 natives who produced certificates shewing that they had worked one month in the year. There were 12,578 natives who did not produce any certificate, and therefore paid the 6s. tax. In addition to that, of course, there are a certain number who escaped the tax altogether. The control of the natives is not so close in the northern part of the Protectorate as it is in the southern part, although now it is fairly close all over. That may be taken as an official estimate of the adult male population.

1,088. Does this first item, which reads "Number of Natives Worked One Month," mean that these natives have worked one or more months in the year?—The number of natives who produced this certificate shewing they had worked at least one month in the year. I understood from Sir Alfred Sharpe that in the vast majority of cases they simply work one month and get their certificate.

1,089. Then in pages 10 and 11 of your statement. Will you explain what these figures are?—These are a summary of the number of recruiters in large districts. For instance, "East Coast (Portuguese), south of latitude 22, District Manager and Agents' salary and commission." There are twenty recruiters, some on salary, some on commission only. There are nine recruiters in Mozambique, and one agent and three recruiters in Quilimane; also four clerks and one compound overseer and 12 conductors. Of course, this refers entirely to the white staff. I should like to explain as regards the northern part of the East Coast, owing to the nature of the Coast, it is impossible to maintain a very large white staff there and practically all a white man could do for the greater part of the year is to build a camp in the most healthy part, and to travel about when he is not laid up with fever. The advertising and bringing in natives has to be done by native conductors and native runners—either ordinary runners or special boys. These are what they call black captains. They correspond to headmen.

1,090. Then do you wish to say that this memorandum headed "Recruiters" refers to European recruiters only?—Yes. There is no statement of the native recruiters; they are very much more numerous. In the District of Mozambique one agent had over 70 native runners in his employment.

1,091. What other statements were you asked to hand in, Mr. Perry?—You asked me to hand in a statement showing the distribution of gangs of natives that have come in lately. I told my men to work out a statement of the boys from the Northern Transvaal and the East Coast of the Colony. There is a gang of 450 East Coast boys. You will see it under the heading of the 6th July, in my typewritten statement. One hundred and twenty of those were boys with "special" tickets. They were boys who had contracted for a particular mine down on the East Coast. Their tickets were marked with the name of that particular mine, and, of course, they went to it. Of the remainder, 39 asked to go to some particular mine, and they proved to be old boys of that mine and were allowed to go there. The remainder, 252, were distributed in small gangs: 48 were sent to the Brakpan Colliery, 21 to the Langlaate Estate. Each of these lots may have consisted of one or more gangs; 92 were sent to the Crown Deep, and 91 to the Ferroira Deep. These were probably two or more gangs.

1,092. By a gang you mean boys recruited to go to one mine?—Yes, the boys are separated when they come up. They generally fall into groups and

are kept together. If we wanted to send 80 boys to the Crown Deep, and there was a gang of 60, they would go there; if there was another gang of 30, they would also go there, we could not take 10 away. Well, there is the next distribution of a gang of 549 on July 2nd: 91 of those boys came up with special tickets for some particular mine given them on the East Coast; 62 are boys who asked to be allowed to go to some particular mine, and they were allowed to go there. Both the "specials" and boys selecting their own mines are split up in over a dozen mines in very small numbers. The 396 who remain over were again divided into four gangs—189 were sent to the Witbank Colliery, 153 to the Rose Deep, 37 to the New Modderfontein, and 17 to the New Heriot. Then there is the distribution of the last two gangs that came in from the Northern Transvaal. On the 6th of July, 45 came in. They were sent to the Langlaate Estate. On the 7th July 108 were sent to the Vereeniging Estates. On July 3rd 27 came in. They were all boys with "special" tickets—18 had "special" tickets for the Wit. Deep, and 9 were engaged specially for the C.S.A.R. On July the 8th, 28 came in, and they were all sent to Champ d'Or. Then there are two Bechuanaland gangs. On the 4th July 68 came in; 46 had tickets and were sent to South Randfontein and 22 to the C.S.A.R. Before the war the great majority of the Bechuanaland boys went to the Randfontein group, owing to the West Rand being closer to their homes, and most of them now ask to go there again. Again, on the 10th of July 67 came in, all "specials"; 46 asked to go to one of the Randfontein Mines, and 21 to Roodepoort U.M.R. They all went there specially for these two mines. Of a distribution of two Basutoland gangs of boys, they all asked to work at the Simmer and Jack Proprietary Mines, and were sent there. On July 10th, 28 came up, all of whom had "special" tickets: 13 were sent to the West Roodepoort Deep and 15 to the Wit. Deep.

1,093. I suppose the mines are known to the natives by some particular name?—Yes; I believe they have their native names for them. Of course, the recruiters have them, too.

1,094. Are these all the statements the Commissioners asked you to furnish them with, Mr. Perry?—There was a statement which Mr. White-side asked for of the names of the mines not belonging to the Association between Springs and Randfontein. There were three mines. The important part of the information we have not been able to get yet—whether there is a shortage of boys—but we will try and get it.

1,095. Were there any other statements asked for, Mr. Perry?—I think that is all.

1,096. Is there anything else you wish to say with regard to the question generally?—I think not, thank you.

1,097. On page 2 of your statement you say, "In the German Province of West Africa, permission has just lately been obtained from the Governor there to recruit 1,000 natives"?—Yes.

1,098. What steps has the Association taken to recruit these?—We have an agent there at present—or, rather, he left for there three months ago, and ought to be recruiting. I have not been advised of his arrival there yet. He started from this country in May. He is the same man who has conducted negotiations with the local authorities.

1,099. I do not remember whether you answered the question bearing on this matter on page 5 of your statement yesterday. Mr. Steeds, in writing to the Native Commissioner, states that "We have already, through one of our Joint General Managers, made the investigation and inquiries referred to and satisfied ourselves that native labourers can be obtained, and it does not appear that any further advance can be made until we are allowed to recruit a number of natives experimentally in Tembwe, Kavirondo, and the Uganda Protectorate." Have you got permission to recruit there?—No.

1,100. You gave some evidence yesterday?—The permission was refused by this telegram dated the 3rd of April, which is as follows:—

[Telegram.]

From Secretary of State,  
London.

To High Commissioner,  
Johannesburg,  
April 3rd.

After full consideration and in view of "sleeping sickness" in East Africa, and strong objections from Administrator and others, His Majesty's Government find themselves obliged to await result of experiment in British Central Africa, where circumstances are more favourable before considering question of authorising recruiting in British East Africa or Uganda. My personal opinion is that no supply of the least importance can be obtained from East Africa at present.

The situation was modified after Mr. Strange's letter of the 23rd January. It was before Mr. Chamberlain returned to England that this question of recruiting in East Africa and Uganda was ventilated. There was a great deal of opposition. The Bishop of Uganda wrote letters to the papers, and the London Missionary Society held several meetings on the matter. There was a deputation to Lord Lansdowne, and finally it was said in the House of Commons that the Government would not allow any recruiting in East Africa until the result of the Central African experiment was seen. That decision was repeated in this telegram of the 3rd of April sent to the High Commissioner at Johannesburg. The visit to Uganda was undertaken by Mr. Macfarlane. He was sent there with the permission of the Foreign Office to make enquiries. On arrival he reported that a certain amount of labour could be obtained, and that he was in a position to bring out 2,000 natives at the time, and the Foreign Office was pressed very strongly through the Government to give permission to do that; however, they absolutely refused, and, after waiting for some considerable time, he (Mr. Macfarlane) was obliged to come back, and for that reason we pointed out to the Government in regard to Mr. Chamberlain's letter of the 23rd January, that it was no use asking us to make further enquiries. We had already made exhaustive enquiries, and the only way we could get any further was to see if the natives would come, and that could only be ascertained by attempting to enlist them and bring them out.

1,101. On the same page of your statement, reference is made to the Chamber of Mines' "Agreement with the Rhodesia Labour Association," which agreement you say was denounced at the beginning of the year on six months' notice expiring June?—Yes.

1,102. Is the Association taking any steps to recruit in Northern or Southern Rhodesia now?—No, the agreement has for some time been with the Rhodesian Government, which took over the functions of the Labour Association, I think, in 1900. Well, the existing agreement was not satisfactory to us, and, after vainly trying to work it, we gave six months' notice, which was required, in the middle of last January. At the same time the Chamber of Mines, which was dealing with the matter, set negotiations on foot with the Rhodesian Government to renew it on terms which would be more satisfactory to us. There has been a deal of correspondence and one or two meetings on the subject. We do not accept the Rhodesian proposals, and the Rhodesian people do not accept ours. In the middle of June the notice expired, but, of course, as the negotiations were still going on, we had not actually attempted to recruit there. We heard that there was surplus labour there for surface work (about six weeks ago), and we understood that the Rhodesian Chamber of Mines might not be adverse to our recruiting that labour. We sent our District Agent at Mafeking up to Bulawayo, and applied to them to allow us to recruit this labour. They said the surface labour had all been absorbed, and that they strongly objected

to our recruiting there. The Chamber of Mines and the Administrator both objected at Salisbury. We said, "do you mind our trying to get what surplus labour we can in Rhodesia?" They both strongly objected, and they proposed that they would form a Labour Board there, which they would run themselves, and, after supplying their mines, would turn any surplus labour there might be over to us. That we were satisfied to accept as regards Southern Rhodesia, but we were not satisfied with their proposals regarding Northern Rhodesia, which was made a part of the same agreement.

1,103. Has any agreement been arrived at on this question?—No.

1,104. It is at present a matter of negotiations?—Sir George Farrar, who is visiting Rhodesia, has been asked to finish it.

1,105. You say the Association is agreeable to a proposal of that kind with regard to Southern Rhodesia, but not Northern Rhodesia. Why is that?—The proposal, you see, is that we should form a General Board to work Northern Rhodesia; that we should put up half the capital, and that the labour should be divided. Of course, if the natives were willing to come, half should be enlisted for service here and half for Rhodesia. But then the Rhodesian Government put in a stipulation that the needs of Northern Rhodesia should be supplied first, and that only the surplus should be divided between the Transvaal and Southern Rhodesia. That we objected to, because we thought, if we find half the capital, we should get half the labour. We asked for it to be divided between the Transvaal and Rhodesia—half for the Transvaal and half for Rhodesia. That did not seem to us to be an unfair arrangement. Of course, I may say, that in practice it would be impossible to recruit on a large scale either in Northern or Southern Rhodesia, without the consent of the Government; certainly in Northern Rhodesia, because the only white men of any standing there are the Administrative Officers and the Police; if they were hostile, there would be no chance of success on a large scale, even apart from legislative restrictions, I mean.

1,106. Coming to Portuguese Companies, referred to on page 9 of your statement, you say there that, "After long negotiations you have succeeded in making proposals with regard to the Nyassa and Zambesi Companies, which are agreeable to the local authorities"?—Yes.

1,107. Also that "It is necessary, however, for them to be sanctioned by the authorities in Lisbon and at present they are under consideration there." Have you any idea whether the Lisbon authorities are likely to approve of the arrangements you have made with the local authorities?—It is very difficult to prophesy in the matter. In ordinary circumstances I should have every hope that they would. I mean that the proposals are reasonable in themselves. They have been thoroughly discussed with the representatives of the Companies, and the only reason why they should be rejected by the Lisbon representatives, is the general opposition which exists there in the same way as it does in England to recruiting for the Rand in these territories at all. The other day an article in the Portuguese paper, which I will put in as an annexure, was shewn to me.

1,108. Where was it published?—It was published in Lisbon in "The Journal of the Colonies." It denounces the proposals to recruit labour in the Northern Portuguese territories, especially in Zambesi. That feeling is the only adverse factor; the only thing which can prevent these agreements going through.

1,109. The fact that the Portuguese authorities allow recruiting south of latitude 22, would not that indicate if the authorities in Lisbon have now to decide the question, that they are likely to agree?—We are assured of the support of the Portuguese Government. It is the Board of the Companies, like the Board of the Chartered Company in London. I do not know how much they

are under the influence of this feeling, which to some extent is a philanthropic feeling, and to some extent may be based on what they suppose to be their own interest, in developing the agriculture of their own provinces. Still, I think the probabilities are that the agreement will go through.

1,100. Assuming the agreement to go through, I take it we will hear from Mr. Mello Breyner, what, in his opinion, is the prospect of getting a supply. He is a better authority than you are on this question?—Oh, yes.

1,111. Mr. QUINN: On page 8 of your statement, Mr. Perry, you give us the number of natives who are working for one month or more in British Central Africa as 150,000?—Yes.

1,112. And the number of natives who do not work as 12,578, totalling 162,578?—Yes.

1,113. Did I understand you to say that these might be taken as official figures?—They were supplied by Sir Alfred Sharpe when he was here.

1,114. Did I understand that a considerable number more might be added to these?—He said there were some.

1,115. Now, Mr. Chairman, I would ask the attention of the Commission to these figures. Mr. Ross, who gave his evidence on the first day that the Commission sat, dealt with this very part of South Africa. These figures are now given to us by Mr. Perry as official figures to deal with. I have been going through Mr. Ross's evidence here. Mr. Ross, in answer to Mr. Whiteside, said: "I have been very careful in stating numbers, to give a low estimate in every case." The total of his estimate available, in Central Africa, is exactly 187,000. He estimates the Sena tribe at 46,000; the Angonis at 50,000; a tribe called the Yaos at 20,000; and another 5,000. These figures are given by this gentleman, who lived there, as 120,000, and here we get them as an official estimate as at least 162,000. This only shews how reliable the witness's (Mr. Ross) evidence was. He is 46 odd thousand on the right side, and yet the Commission will remember that I drew attention to the way that man's evidence was treated in the newspapers; it was stated that he was absolutely wrong. We find on examination from this witness that he (Mr. Ross) was exactly 33 per cent. on the right side.

1,116. I think Mr. Perry, you told us yesterday that in bringing natives to the Rand, except from Natal, your Association secured some refund or rebate on the fares from the railway authorities?—It is not exactly a question of refund; if natives travel singly and individually they are charged recognised fares, but, if they go in batches, there is a reduction in the fares.

1,117. Then, I suppose, when the boys return from work in the mines, they go in batches and at the reduced rates?—Yes, and the Association assists them in this respect.

1,118. I am glad to hear that; when the boys finish their engagements, does your Association insist upon their returning to where they originally came from?—No, we have not power to do so.

1,119. If they like to do so, they can remain in the town?—Yes.

1,120. We have heard from you of some restrictions on obtaining labour from Rhodesia?—Yes.

1,121. The conditions there are ruled by the Chartered Company, I believe?—Yes, entirely.

1,122. Are not the people interested largely in the Chartered Company also largely interested in the gold fields?—I have heard that it is so.

1,123. I hope you do not doubt it. Would it be fair to assume that if a certain labour policy were decided upon by the leaders of the mining industry here, it would not be a very difficult matter to get that same policy adopted in Rhodesia?—I do not think it would be fair to assume that at the present time.

1,124. Why not?—As a matter of fact, the persons who control the interests of the Chartered Company at the present do so, entirely without regard to the interests of the Transvaal; were Mr. Rhodes alive at the present time it might not be so.

1,125. But Mr. Rhodes was alive when your Native Labour Association was formed, I believe?—Yes.

1,126. So that in any arrangement so vitally affecting the interests of South Africa as a whole, it is reasonable to suppose Mr. Rhodes would have considered the interests of the Transvaal at the time?—I admit that I think Rhodesia has been too liberally treated in the matter; the agreement, in my opinion, was too favourable to Rhodesia.

1,127. My point is that, given a desire to obtain labour from Rhodesia, there should not be much difficulty in getting the Rhodesian authorities to agree?—I cannot agree with that idea; I have at times discussed the matter with Directors of the Chartered Company, and they take a very different view of their interests.

1,128. Referring to the Northern provinces, the territories of the Mozambique, Nyassa, and Zambesi Companies—do I understand you to say that although you have succeeded in making arrangements satisfactory to the local authorities (at any rate of the Nyassa and Zambesi Companies), it is necessary for these arrangements to be sanctioned in Lisbon, and that no boys can in the meantime be drawn from there?—Yes, we have not yet begun recruiting there.

1,129. These three parts are those referred to by Mr. Mello Breyner in his evidence when he says that the numbers there would probably be larger than in the other three parts in which you do recruit?—Yes.

1,130. So that these three provinces have not been tapped at all?—No.

1,131. So that the enormous increase in numbers, resulting from your recruiting has been brought about without any assistance from these new parts, in fact they are untouched fields?—Yes.

1,132. Mr. WHITESIDE: You refer to a certain amount of labour being available from Rhodesia; are you able to give us any estimate of the probable number of boys?—I might say that I referred to a telegram which we received from an agent stating that some boys were available from there; when we enquired into the matter we found it only referred to a batch of 100 boys who were ultimately taken up elsewhere; nearly all the Rhodesian mines are supplied from outside sources, from the Northern Transvaal and from other parts.

1,133. Has the Chamber of Mines any representative on the Rhodesian Government?—No, I know that they have not; there is, of course, a Legislative Council in Rhodesia, the members of which are elected by the different districts. I believe there is one member of that Council who is a member of the Chamber of Mines, but he is there on account of having been elected for his particular district, and in no way owing to his connection with the Chamber of Mines.

1,134. But the interests of the Chamber of Mines are represented, in a measure, by at least one member of the Legislative Council there?—Yes, but the Chartered Company can do practically what it thinks right.

1,135. You told Mr. Quinn that the boys on the termination of their engagements could remain in the town if they thought fit to do so?—Yes.

1,136. Have you any information whether many of them do so remain?—No, it is almost impossible to obtain statistics on this point; when a boy is discharged from a mine and comes into the town, we lose sight of him.

1,137. I take it we could obtain that information from the Department of Native Affairs?—You may be able to do so.

1,138. The boys would have to have passes to remain here?—Yes.

1,139. Mr. TAINTON: With regard to a question put by Mr. Whiteside, I understand you to say you have no means of finding out the number of boys who may remain in the town after their engagements on the mines had expired; have you any means of ascertaining the number of boys whom you return to Foreign States when their time here is up?—Well, we know as to the Portuguese boys, because we make the arrangements for their return; we get a white conductor to take them back, and we arrange for their food, etc., on the way, but a great number of the boys go back of their own accord, individually.

1,140. But a certain proportion undoubtedly remains in the Transvaal?—I think so; as far as we can gather, a certain proportion do; not necessarily permanent, but they probably work in the town for a year or two and then return.

1,141. I take it then that the tendency of your Association is to increase the numbers of natives coming into Africa from outside parts?—The only natives we bring here from north of the Zambesi we return; all the Governments insist on our returning the boys.

1,142. And as to the supply from northern Rhodesia?—It does not apply at the present time, as we do not recruit from there. It might not apply in that case at any time as the boys can get back overland.

1,143. Are these tribes allied to the South African tribes in race, colour, language, etc.?—I understand so; amongst the boys of the northern Portuguese territory there is, I believe, a sprinkling of Arab blood.

1,144. If the natives insisted on remaining here, could you force them to go back?—We have no power to force them to go back.

1,145. So that the tendency of your Association is to increase the numbers of boys here from north of the Zambesi?—Yes, I suppose the tendency is to increase the numbers.

1,146. No difficulties would, I presume, be likely to arise in connection with repatriating these people?—I should think not, except in the case of very large numbers.

1,147. You have given us this morning evidence of having conducted negotiations with a considerable numbers of States in Africa?—Yes.

1,148. What parts of Africa are open to you outside of the Transvaal, for recruiting without negotiating with their Governments?—The Free State, Cape Colony, the Bechuanaland Protectorate, and Basutoland; these are open on payment of the necessary licensing fees.

1,149. Are Cape Colony and the Protectorate open to you?—Yes, the laws there allow any one to recruit upon taking out a licence.

1,150. What generally are the results of your negotiations with other Governments?—Generally the attitude taken up is hostile; where we have obtained permission to recruit it has usually only been after much difficulty and after bringing to bear what one might describe as pressure.

1,151. Then, if you extend your recruiting operations further afield, it will only be after negotiating with other European Governments?—From my statement you will see that we have already tried nearly all of the other Governments.

1,152. You will make this labour question a sort of international question?—It might certainly come to that if there arose a large emigration, but it is not likely to attain such a figure.

1,153. Assuming that you succeeded in obtaining large supplies outside Africa, it would tend to introduce a disturbing factor?—Certainly it might happen here as it has happened elsewhere, that, owing to quarrels, emigration has been stopped.

1,154. Should you be able to obtain the labour from the foreign parts alluded to, have you any idea what it would cost to get it here?—In any

case it would naturally be considerable, but what it would amount to ultimately would, of course, depend on the scale on which you worked.

1,155. That is, the expense of getting them here?—There would also be the expense of taking them back. If they come from south of the Zambesi, they go back at their own expense. It would cost more to bring and return others. There are cases where a number of free recruiters go into a country and smuggle the natives out, but, as they are generally stopped at the ports, this aspect of the matter does not assume large proportions.

1,156. So that negotiations to deal with Foreign States are absolutely necessary?—Yes, if we are to obtain permitted emigration.

1,157. If such negotiations were opened through the Government here, what do you think the attitude of the other Governments is likely to be towards free recruiting?—I do not think there is the least chance of such Governments looking at any such proposals; in fact I do not think our own Government would make such proposals.

1,158. You think this Government would not make such proposals?—I do not think any Government would make such a proposal.

1,159. Is it not a fair proposal for this Government to make to another Government that free recruiting should be allowed to go on in its territories?—Not in any of the native states in Africa. In other places, where there is a white population, and where the country is settled, it might be quite different.

1,160. You have always endeavoured to choose the best recruiters, and those acquainted with the natives and with their language?—Yes, it is to our interest to do so.

1,161. Then there is no foundation in fact for any rumours which may have gone abroad that you have selected unsuitable persons for recruiting purposes?—There is no foundation for such statements.

1,162. I suppose you could give us the proportion of your recruiting agents who are acquainted with the natives, and who speak their language?—I should say that the whole of them are in that position. A District Manager would, I take it, scarcely be likely to choose as an agent one not able to speak the language. It is to the Manager's interest to employ the most suitable recruiters, and those best able to induce a supply of boys.

1,163. Referring to your letter of the 9th February to Mr. Windham, the Secretary for Native Affairs, you stated therein that you had already made inquiries through your Joint General Managers. They will be called before us, I presume?—I was referring to Mr. Macfarlane. I presume the Commission will examine him as to his visit to Uganda.

1,164. In that letter you raised the question of the sleeping sickness. Why did you raise that question?—Because it has been referred to in the Press as one reason against introducing labour from the Uganda Protectorate; the sickness was stated to be very deadly and to have a hold on Eastern Africa, and if introduced here might have a serious consequence locally.

1,165. And you were inclined to get labour from there in spite of this danger?—We thought that such danger might be avoided by taking certain precautionary measures, such as by bringing the natives from the high lands, having them examined and kept in quarantine, and in other ways exercising care. In that way there might really be less danger from any importations arranged by us than at present in the ordinary course of trade. There are already a number of natives here from Zanzibar.

1,166. Do you know that the sickness is said to be invariably fatal?—I do not know that I have seen any reports to that effect, but I believe it is so stated.

1,167. What effect on the native labour supply of the Rand would be likely to follow the introduction of the sleeping sickness here?—Certainly if

it took a hold here it would be likely to have a very disturbing effect on the local supply, but it is said, I believe, that it only obtains in certain latitudes.

1,168. Would it not be likely to paralyse industries other than the mining industry?—Certainly.

1,169. Referring to the labour agreement with Rhodesia, is it within your knowledge that the late Mr. Rhodes addressed a letter to Mr. Chamberlain, requesting permission to extend the railway to Central Africa?—I do not remember having seen a copy of the letter, but I seem to have heard of it.

1,170. Do you know that one of the reasons given for the construction of such a railway was to secure labour?—I have heard it so stated.

1,171. In a list with which you have supplied us from British Central Africa, from the Commissioner there, it stated that 150,000 natives worked for one month, and that 12,500 did not work; I presume those figures are reliable?—Yes.

1,172. Then that means that 92½ per cent. of the natives worked for Europeans?—Yes, but they only worked for one month. In those parts money is very scarce amongst the natives, and they can only obtain it by working for the Europeans. They work at anything—carrying loads, for instance. They only work for a month, and pay 3s. instead of 6s.

1,173. Are they not allowed to pay in kind?—I am not quite sure. At one time they were, I believe, but I am not quite sure as to how the matter stands at present.

1,174. So that, as there is no money in the country, we may say the imposition of the hut-tax there is of a compulsory character—that is, it compels the natives to work to obtain the money for the tax?—Yes, it has that effect.

1,175. In fact, it is rather a clever device?—Yes; perhaps it was intended to have that effect. I apprehend, and they were allowed to pay in labour. If the native in the northern districts wants to pay his tax and is willing to work, he applies very often to the Magistrate, who constitutes himself a sort of Labour Bureau, and tells him where he can find work.

1,176. In view of that condition of affairs, they have "compulsory labour"?—I should hardly call it compulsory labour; it is very much the same as the Glen Grey Act.

1,177. Now, as to the Portuguese Companies. You had a conversation with Colonel Arnold, I believe?—Yes.

1,178. He said it was difficult to get labour there?—Yes, in the Mozambique Company's territory. I have heard that that is the most thinly populated country of the three sections.

1,179. Did he tell you what the difficulties were?—On account of the thinness of the population, I understood.

1,180. He gave no other reason?—No.

1,181. Now with regard to these papers you have read respecting the boys with whom special contracts were made giving them a right to select the mines on which they should work, can you tell us the percentage of boys who have exercised such a choice? I could not gather it from your figures. It is a very large percentage, is it not?—Yes, it is 124 out of 415 in one instance.

1,182. Do you find that this option is being exercised at an increasing rate?—Yes, I should say it is increasing.

1,183. When did you introduce this system?—It was not introduced into all the districts at the same time, but, generally speaking, it came into force about four or five months ago.

1,184. Before the introduction of this system there seem to have been some grounds for the complaint that the absence of it affected the labour supply?—Possibly, but so far as I know everything possible was done to allot the boys to the mines

they wanted to go to. It was not possible to do so in all cases. As a matter of fact, even when boys choose their mine, you do not know whether it is a genuine choice, based on some substantial reason, or whether he picks that mine merely from something he has been told by one of the boys, possibly in the train on the way up here.

1,185. Did you receive any reports from your recruiters that this change was a desirable one to make?—I never saw any such reports, but I was not with the Association at the beginning of this year. I have never read amongst the old reports, which I perused any reports dealing with the point, but I cannot say authoritatively that there were none.

1,186. Mr. PHILIP: How many boys are required in the Rhodesian mines?—I think about 12,000.

1,187. And they find difficulty in getting more than half that number locally?—They don't get anything like that number locally; they only get about 1,000 locally.

1,188. Then you don't expect to get many from Rhodesia?—No, but some boys may be had from there.

1,189. Not in any large numbers?—No.

1,190. You mentioned that the 1,200 boys from northern Portuguese territory cost about £12 per head?—Yes, so far.

1,191. And do you expect to recruit many more of them?—I think there may be a gradual increase.

1,192. But not to any large extent?—Not for some time to come; it will take some years.

1,193. Are there good numbers of boys obtainable from Zanzibar?—No, the largest supply is in the hinterlands where we have been refused permission to recruit. We could get a few boys from that direction, but it would scarcely pay to bring them here. The work is very expensive to start with, and there are very few there.

1,194. The CHAIRMAN: Mr. Perry, I have here a list of the mines between the Springs and Randfontein which have not joined your Association; it comprises only three; they are the West Rand Central, the Saxon, and another.

1,195. Mr. EVANS: Have you any estimate of the number of boys you are likely to get from the three Portuguese territories to which reference has so often been made?—No; no estimate can be formed; not a great many could be got at first, because they are parts from which no emigration has taken place. The work would be very slow at first.

1,196. Do you think the numbers would make any material addition to our supply here? That is to say, if the countries were quite open to us, how many boys do you think we could get?—I could not expect any better results than we have obtained from the eastern districts, viz., 1,200 boys, at a cost of £15,000.

1,197. In your opinion, these large figures of population given us by Mr. Breyner are no guide?—Not as to the number of boys you are likely to get away to work. Those are only the figures as to the total population. If you were asked how many workers could be got here out of the United Kingdom, it would be no guide to say that there was an adult male population of eight millions.

1,198. Reference has been made to 145,000 as the complement of natives required by the mines here. Are all the details in this printed report you have handed in?—I think that shews the complement for the mines.

1,199. I take it that there are some Companies to add to this. Have you not some Companies which have come in since this was prepared? What would be the total now?—I could not say offhand what the exact official estimate at present is, but it would be 145,000 or perhaps a little more.

1,200. Then you have the Coal Companies?—I believe that the estimate does not include the Coal Companies.

1,201. Mr. QUINN: I rise to a point of order. Yesterday Mr. Goch tried to get out some evidence and was ruled out of order on the ground that he should get it from another witness. Now it seems to me, Mr. Evans is trying to get from our present witness evidence which he should obtain from the representatives of the Chamber of Mines. I ask the Chairman's ruling.

1,202. Mr. EVANS: I am merely asking the witness questions based on a document he has himself put in, namely, the Annual Report of his Association.

1,203. Mr. QUINN: That has not been distributed amongst the members of the Commission.

Mr. PERRY: A single copy was handed to the Secretary of the Commission.

1,204. The CHAIRMAN: It was not handed in to the Commission, I think. I have myself seen the copy, but I do not think it has been formally tendered to the Commission, and until that is done, I think no questions can be asked based upon it. Mr. Perry, do you now tender this document?

Mr. PERRY: Yes.

1,205. The CHAIRMAN: Very well, the Commission accepts it. Now as to Mr. Quinn's point of order, I think, Mr. Evans, you might perhaps defer your questions based on this document until an opportunity has been had of distributing copies of it amongst the members of the Commission.

1,206. Mr. EVANS: I am quite willing it should stand over. I was only desirous of eliciting information for the Commission.

1,207. The CHAIRMAN: Very well, Mr. Evans will allow his questions to stand over.

1,208. Mr. TAINTON: Is it desirable to accept single copies of any documents?—The members of the Commission cannot well have the opportunity for the reading of such evidence.

1,209. The CHAIRMAN: I do not think we can refuse to accept as evidence a document simply because there happens to be only a single copy of it.

1,210. Mr. QUINN: I would suggest that copies of the document just put in by Mr. Perry be made as soon as possible, so that we may all be able to read it.

1,211. Mr. EVANS: I suggest that it is not necessary to copy the whole of the report, but only such parts as are of importance. Mr. Perry might be able to give a much more recent statement as to numbers than that contained in the report.

1,212. Mr. QUINN: I have no objection to just so much or so little of it being copied and put in as may be decided upon. All I want is that the information at the disposal of any one member of the Commission shall be available to all of the members.

1,213. The CHAIRMAN: The Commission will decide later how much of the report should be circulated.

1,214. Mr. TAINTON: I think we should exercise some care in the number of documents we admit and have printed with the report. If every witness adds a large number of statements to his evidence, the report, which in any case will be very voluminous, is likely to assume enormous proportions, and we are likely to exceed the amount of £500, to which we are limited for the work of the Commission.

1,215. The CHAIRMAN: I am not aware that we are limited to such amount.

1,216. Mr. EVANS: I suggest that it is not necessary to print the Articles of Association we have before us.

1,217. The CHAIRMAN: The Commission will decide these points later on.

The Commission then adjourned till 2.30 the same day.

ANNEXURE TO MR. PERRY'S  
EVIDENCE.

Journal das Colonias,  
Lisbon,  
20th June, 1903.

(Translation of the article referred to in questions 1,107 and 1,108.)

NATIVE LABOUR IN THE COLONIES.

Be it be neglect or "bona fide," our ways in the Colonies are often so strange, and so very much in opposition to the vital interests of the country, that it is permissible to suspect that we are preparing the loss of what is ours, and of the capital which is trying to further the value of our Dominions.

Everyone knows that Portuguese East Africa is not very densely populated, and that, particularly in the Zambesi, there exists a chronic labour crisis. Those who succeed in obtaining labourers keep them carefully, and endeavour to avoid all means of their deserting or abandoning their estates. One should grasp that all our efforts should be directed towards avoiding the dispersion of the natives, and, rather, to attract them to the rural work, so that they may assist the land-owners, and the latter may thereby find a guarantee of their capital, and their labours justly remunerated.

But this is not the case. We need, in the Zambesi, people to work, cultivate, and improve the soil, and, instead of meeting such needs, we exercise all possible means to bring about the scarcity of labour by tolerating abuses, and even encouraging the recruiters to do acts which are on a par with those punishable by law.

After the conclusion of the Transvaal war, we undertook to permit the emigration of our natives to the Rand mines upon certain conditions. We shall not now argue whether such concession was done willingly, or whether we have been compelled thereto by reason of the interests of international policy. The Government received the request, granted it, and think now that they are controlling such emigration. And we say that "they think," for the fact is that they are watching badly, or not at all, what is going on on the East Coast.

Emigration to the mines, everyone quite understands, must necessarily be voluntary. Only those natives who are willing should emigrate, but to compel them to leave, that is a thing which, we presume, is not within the powers vested in the recruiters. And this is precisely what we wish to draw the attention of the Colonial Minister to.

It is known that the "raid" on the natives in order to induce them to go to the mines, has taken such enormous proportions; and that the recruiters are working so freely, that complaints are already beginning to be heard from the establishments in the Zambesi, and in the Inhambane District. The abuse goes further. In the so-called "Leases" (prazos), the hut tax is at present farmed out to various people who undertake to pay in cash the proportionate amount of this tax, and these people now find the number of their natives diminishing considerably, with a corresponding reduction in their own income. So as the contribution paid to the State is derived from the density of the population, one sees that emigration represents a blow to the capital of the leaseholder. The latter pays the State according to the number of inhabitants of the "prazo," and, naturally, takes the risk of unforeseen circumstances. But what certainly is not legal is that the State should permit the recruiters to "raid" for labour, the amount of which should be guaranteed by the State. If things go on in this way, the "prazos" that have been farmed out will soon become completely depopulated, or will be inhabited only by a floating population, without the habits of agricultural life, from whom it will be impossible to collect the hut-tax. The emigration will have yet another drawback, considering the well-known tendency of the natives to devote only the minimum of their strength to regular work. Thanks to various genuine Portuguese initiatives, agricultural colonization has already been established on the Zambesi and in the last

few years the impulse given by Companies and Societies having strong interests in that region has been really remarkable. Therefore, if we allow of the natives being taken from these regularly established agricultural settlements, that part of Portuguese East Africa where national capital has been most freely employed will soon decline in value or will pass into the hands of the speculator. All colonial countries preserve their populations with the greatest care, for they are the great assistants which cannot be dispensed with in the work of colonization. And we, with an epidemic of generosity, go so far as to allow the recruiters to "raid" the farms, the leaseholders of which pay the State a certain amount of money which is calculated according to the number of inhabitants contained therein. And while we are acting thus in the East Coast our Ministerial moralists show an uncommon energy in opposing the emigration of labourers from Angola to S. Thomas, a Portuguese Colony, where they are treated better than any Portuguese workman is in the metropolis!

#### ANNEXURE TO MR. PERRY'S EVIDENCE.

##### NOTES ON RECRUITERS' RECORDS. NORTHERN TRANSVAAL.

- 1.—Born in South Africa; 15 years in Zoutpansberg; speaks two languages.
- 2.—25 years in South Africa; 14 years in Zoutpansberg; recruiting for three years before the war; speaks two native languages.
- 3.—Six years in Zoutpansberg; recruiting all the time; before that 10 years a compound manager; speaks two native languages.
- 4.—Born in South Africa; 10 years in Zoutpansberg; recruiting before the war.
- 5.—Born in South Africa; 14 years in Zoutpansberg; recruiting before the war; speaks local language.
- 6.—27 years in South Africa; principally in Basutoland; was intelligence officer in the Northern Transvaal for 15 months during the war; since then recruiting; speaks local language.
- 7.—Born in South Africa; 15 months in Zoutpansberg; recruiting labour in the Northern Transvaal and Zululand territory for the past six years; speaks local languages and Zulu very fluently.
- 8.—Born in South Africa; 12 years in Zoutpansberg; speaks local language and Zulu; recruiting labour before the war.
- 9.—Born in South Africa; compound manager for five years; recruiting in Zoutpansberg before the war; speaks local language and Zulu.
- 10.—25 years in South Africa; recruiting for 12 years in the Northern Transvaal, Rhodesia and Zululand territory; speaks Zulu and local language.
- 11.—24 years in South Africa; 15 years in Waterberg; recruiting before the war; speaks local language.
- 12.—22 years in South Africa; 15 years in Zoutpansberg; recruiting for 2 years before the war.
- 13.—Born in South Africa; 2 years in Zoutpansberg and Waterberg; speaks Zulu.
- 14.—Born in South Africa; acquainted with the Northern Transvaal for many years; recruiting labour there before the war; speaks all South African native languages.
- 15.—12 months in Zoutpansberg District, trading.
- 16.—8 years in South Africa; 2 years in the Northern Transvaal; speaks native languages.
- 17.—20 years in South Africa; 12 years in Waterberg; recruiting before the war; adviser to large Chief in that district; speaks local language.
- 18.—5 years in South Africa (Rhodesia); five months in Zoutpansberg; speaks local languages.
- 19.—Born in South Africa; 4 years in Zoutpansberg; speaks native languages fluently.

##### EAST COAST.

- 1.—English; 11 years in East and Central Africa; recruiting before the war; speaks two East African languages.
- 2.—Portuguese; 3 years in East Africa; leader of expedition in northern territory under Portuguese Government.
- 3.—Italian; 8 years on the East Coast; recruiting for 5 years before the war; speaks two local languages.
- 4.—English; 15 years in Rhodesia and Transvaal; 18 months on the East Coast; speaks two native languages; has travelled in Central and East Africa.
- 5.—English; born in South Africa; recruiting on the East Coast before the war for one of the largest groups; speaks three native languages.
- 6.—English; 2 years on the East Coast; speaks local language.
- 7.—English; born in South Africa; recruiting on East Coast since 1898; speaks local language.
- 8.—Portuguese; 12 years on the East Coast; recruiting since 1897; speaks Zulu; knows southern part of the East Coast thoroughly.
- 9.—Portuguese; four years on the East Coast; first trader, then assistant recruiter; speaks local language.
- 10.—Portuguese; nine years on the East Coast; trading and Government service; speaks Zulu.
- 11.—English; six years on the East Coast; recruiting before the war; speaks Zulu.
- 12.—Portuguese; three years on the East Coast; speaks local language.
- 13.—English; 16 years on the East Coast, recruiting nearly the whole time; speaks all local languages; great influence with Chiefs.
- 14.—English; 13 years on East Coast; three years trader, 10 years recruiter; speaks Zulu.
- 15.—English; born in South Africa; six years on East Coast; recruiting the whole time; speaks two native languages; knows the country thoroughly.
- 16.—English; ten years in South Africa; 18 months on the East Coast; recruiting in various parts of South Africa for the last eight years.

##### SWAZILAND.

- 1.—Twenty-six years in South Africa; 12 years in Swaziland; speaks Zulu.
- 2.—Forty years in South Africa; travelled in Swaziland for many years; speaks language.
- 3.—Sixteen years in South Africa; 15 years in Swaziland; speaks language fluently.

##### CAPE COLONY.

- 1.—Born in South Africa; 12 years in Pondoland; compound manager on the Rand; recruiting before the war; speaks four native languages.
- 2.—Born in South Africa; 4½ years in his district; recruiting before the war; speaks all local languages.
- 3.—Twenty years in South Africa; the whole time in his district; recruiting before the war; speaks two native languages.
- 4.—Twenty-five years in South Africa; 20 years in district; recruiting labour for 17 years; speaks native languages fluently.
- 5.—Forty years in South Africa; speaks native language.
- 6.—Eleven years in South Africa; four years in district; speaks language.
- 7.—Thirty-nine years in South Africa; 4½ years in district; recruiting before the war; speaks three native languages.
- 8.—Forty-five years in South Africa; three years in district.

9.—Thirty years in South Africa; three years in district; recruiting the whole time; recruiting before the war; speaks local language.

10.—Born in South Africa; always lived in district; recruiting since the war; three native languages.

11.—Born in South Africa; recruiting in several districts before the war; three native languages.

12.—Born in South Africa; whole time in district; speaks local language.

#### BASUTOLAND.

1.—Born in South Africa; 12 years in Basutoland; knows language thoroughly.

2.—Eighteen years in South Africa; 12 years in Basutoland; recruiting before the war; speaks Sesuto.

3.—Native of Basutoland; well-known headman.

4.—18 years in South Africa; 12 years in Basutoland; speaks several native languages.

5.—In Basutoland before the war; speaks languages; well known to Chiefs.

6.—Seventeen years in Basutoland; speaks language.

7.—Born in O.R.C.; speaks two languages.

8.—Eleven years in Basutoland; speaks Sesuto.

#### BECHUANALAND PROTECTORATE.

1.—Twenty years in South Africa; labour agent before the war.

2.—Born in South Africa; 28 years in district; recruiting before the war; speaks language slightly.

3.—Twenty years in South Africa; compound manager for four years; speaks native language fluently; resident in district.

4. Fifteen years in district; speaks language fluently.

5.—Born in South Africa; two years in district; recruiting whole time; two native languages.

#### MISCELLANEOUS.

1.—Born in South Africa; three years in district; recruiting before the war; speaks local language.

2.—Twenty-three years in South Africa; 20 years in district; recruiting before the war.

3.—Born in South Africa; 15 years' experience in recruiting and managing natives.

Mr. W. ST. JOHN CARR, called, sworn, and examined.

1,218. The CHAIRMAN: You are the Deputy-Chairman of the Johannesburg Municipal Council?—Yes.

1,219. How long have you held that appointment?—Since the 11th May, 1901.

1,220. Your position requires your presence at all committee meetings of the Council?—Yes.

1,221. The Public Health Committee has within its reference all questions affecting the supply of native labour for all departments, I believe?—Yes.

1,222. You are, therefore, acquainted with the number of men employed, and the efforts made in getting labour?—Yes.

1,223. You have a memorandum, I understand, giving certain figures, etc., which you are willing to put in as your evidence-in-chief?—Yes. The first page shews the number of boys recruited during the six months ending June, 1903, the number of boys required to work the municipality at the present time, the number of boys we are short, at present, and the number, additional, which we shall require during the next six months; the next statement shews the number of boys recruited in Pondoland from January to June, 1903; the next

shews the number of boys recruited in Basutoland from January to June, 1903; the next is a statement shewing the number of boys recruited in Bechuanaland from January to June, 1903; the next is a statement shewing the number of boys recruited by the Witwatersrand Native Labour Association for the Municipality from January to June, 1903; the next is a statement shewing the number of boys engaged locally from January to June, 1903; and the final statement is a summary which gives the total number of boys recruited, the number of six months' boys, the average number of boys employed during the first week of each month, the cost per head, the number of boys discharged each month, the number missing and in gaol, the number sick, and the number who have died.

1,224. Referring to the first statement shewing the number of boys recruited?—Yes.

1,225. You state that there is a deficiency of 60 boys in the Sanitary Department and 150 in the Town Engineer's Department?—Yes.

1,226. How long has there been a deficiency of boys there?—For the past four months.

1,227. Previous to that had you a sufficiency of boys?—Well, we have had to increase our staff from time to time, and have found difficulty in getting the boys for the increased work we had in hand.

1,228. It is stated here that you require a further 250 boys for the Sanitary Department and a further 200 for the Engineer's Department during the ensuing six months in order to work additional plant?—Yes.

1,229. Referring to the Sanitary Department increase, are those required on account of undertaking the mines' sanitation?—Yes, additional plant is required for that purpose.

1,230. And as to the Town Engineer's Department?—The additional boys will be required for the additional work we are about to put in hand.

1,231. Can you tell us what period is reckoned as a month in the Municipality in connection with the payment of native wages?—The term used here is "per month;" we have evidence from the mines that their month consists of 30 working days; of how many days does the Municipal month consist?—You could get that better from Mr. Abrahams, who will follow me; he can give you the particulars as to that.

1,232. Do you know how many boys were in the employ of the Municipality in May, 1901?—I think about 1,000; that is as well as I can recollect; I have not looked up the figures.

1,233. And the total employed in June of this year was?—2,160.

1,234. Can you tell us from what sources the increased demand has from time to time been met?—We first tried doing our recruiting through the Native Labour Association, as they had agents in all parts, but we found we did not get all the labour we required from Pondoland. We wanted a certain class of boys (Basutos) for the Engineering Department, and we appointed our own agents. We also wrote to Natal and tried to get labour from there, but were not successful. For a long time we worked through the Native Labour Association.

1,235. Have you many agents now in different parts of the country?—We have agents in Basutoland and in Pondoland, and we are now establishing an agency in the Pietersburg district.

1,236. Have the agencies in Basutoland and in Pondoland been established for some time?—Yes, we took over the agents from the Native Labour Association; I think it is about 12 months ago.

1,237. Have those been satisfactory agencies for the Municipality?—We have done fairly well, but still we do not get the number of boys we require.

1,238. Have you heard from your agents any reasons why you cannot get all the labour you require?—One reason given is that the rate of wages we pay is not high enough.

1,239. What rate are your agents empowered to pay?—They are empowered to offer 50s. per month,

but the rate paid by the Municipality ranges from 50s. to 75s., the last-named for drivers, carters, and those classes of boys.

1,240. Do your agents report that they have to face competition in securing the labour?—Yes, they have reported to that effect.

1,241. Who does your agent find in competition with him for the Basutos?—I cannot recollect at the moment, but I know there was a good deal of competition for them, and they could not often be got for us at the wage we were offering.

1,242. Has the Municipality had offers of boys from other than its own agents?—There have been many offers, and much negotiation, but we have never succeeded in arriving at business; anticipating such a question from the Commission, I have had certain particulars prepared shewing what these offers have been, and what they have amounted to, and I will read these to the Commission if you so desire.

1,243. Will you do so, please?—Yes. Mr. John Buckley, of Indwe, offered to recruit boys for the Municipality, and we are now endeavouring to arrange the matter with him; the terms proposed are 17s. 6d. per head delivered in Johannesburg, the contractor supplying food to the natives till they reach here. The wages to be paid are 50s. per month, and the period is six months' contract; as stated we are now in negotiations on this basis. Some time since one Hulley, a labour agent, asked for particulars as to what we would pay for boys. The information was supplied to him, but nothing further came of the matter. Van Byk offered to recruit boys, particulars were furnished, but nothing further came of it. R. Renard, of Durban, wanted to make an arrangement with the Municipality, under which he was to get £2 per boy supplied, the Municipality to pay railway fares, and supply food till their arrival here, the boys to be engaged on a six months' contract. These terms were not considered good enough and a reply was sent to Renard accordingly.

1,244. Do you know what the railway fare from Durban to Johannesburg is?—No. Messrs. N. and W. Flemming asked to be allowed to recruit boys from Basutoland; they were asked to state their terms, but nothing further passed. An advertisement appeared in the "Leader" of the 11th July, stating that the advertiser had 1,000 Kaffirs for surface work; a letter was written for further particulars, but without eliciting any reply. Messrs. Harding and Co., of Kimberley, in March last offered to supply 300 boys, at a commission of 45s. per head delivered in Johannesburg, and an arrangement was made with them to do so. At the time it was understood that the 300 boys were to be delivered in six weeks, although this was not guaranteed. Well, on the 4th April, 82 boys were supplied, also 76 on the 17th and 88 on the 30th of the same month, or a total of 246. The firm was pressed to complete the engagement, and let us have the remainder of the boys to make up the 300. On May 6th they replied that they would do their best to complete the order, but that we had not let them know whether we would take more than the 54 remaining out of the 300. They said it would not pay to send the 54 by themselves. They were informed that we were willing to take more boys, and, although pressure has been brought to bear, no further number has been received since April 30th. Many of those actually received were too young for the work. Charles Ngayitschahi, a native, communicated with us asking to be allowed to recruit natives; it was arranged for him to call so that we could see if it was worth while engaging his services; an arrangement was made with him, under which he should recruit under conditions specified. He required more than the 15s. per head arranged and the Manager of the Sanitary Department told him that an increase in the price would be considered when he had shewn that he was in a position to recruit. The district he proposed to work was that formerly worked by Mr. Howes, in Pondoland, the results from which had been discouraging. Those are the cases in which we have tried to get natives from other than our own agents.

There was another case, that of Mr. Franks, of Mount Fear. A letter appeared in the press that the Municipality would not accept labour. This was not true.

1,245. Is there any other statement you would wish to make before you are examined by the members of the Commission?—No, I think that is all.

1,246. Mr. GOCH: It would appear from your figures that you are short of your requirements by 860, that is according to the first page of your statements?—Yes, including our requirements for the next six months.

1,247. You require 3,120 boys to make up your complement?—Yes, including our requirements for the next six months.

1,248. I understand that the number required to be recruited monthly to make up for time-expired boys, desertions, etc., is 160 for the Sanitary Department and 150 for the Town Engineer's Department; I find that for the past six months you have averaged 388 per month recruited. If you take your column headed "Discharged" and add it up, you get a total of 2,712, which divided by 6 gives an average of 452 per month for leakage, wastage, etc. You have, therefore, a leakage of 452 monthly, against only 388 per month recruited, so that instead of making headway during the last six months, you have apparently been losing on the average at the rate of 64 boys per month. Now on the 1st January of this year you apparently started with 2,107 boys, and in June you had 2,116, from this you had a larger number in June than in January, and yet as I have shewn you have been losing during the six months at the rate of 64 boys monthly; how do you account for the discrepancy; it seems to me that you should have 384 less in June than you had in January? There seems to be a mistake in the figures somewhere, does there not?—Yes, from the figures you give it would appear so.

1,249. However, passing that, your position is that you are 860 boys short of your requirements, and instead of making progress, you are going back?—At the present time we cannot get the labour we require.

1,250. According to the statements, you have exerted yourselves to obtain boys, and without success?—We have not been successful.

1,251. Supposing, now, that you cannot increase the recruiting of boys, will it not have a bad effect on the works you have in contemplation in the municipality?—Yes, we must keep the sanitary work going, and we should have to stop road-making and the like.

1,252. You cannot stop the sanitary work, and would have to stop road construction, tramway construction, and sewage construction, and other important construction work?—Yes, they would have to suffer.

1,253. Naturally, you are very anxious, viewing this possibility?—It is no doubt the desire of all members of the Town Council to push ahead with new work.

1,254. Anyway, it is not a happy position to be in, is it?—No, it is not.

1,255. Mr. EVANS: How is your local recruiting conducted?—Mostly through boys whose engagement have expired re-engaging and local boys offering.

1,256. Do you pay anything for it?—No.

1,257. You referred to a Mr. Buckley, of Indwe, recruiting native labour from that part and sending it to Johannesburg; what guarantee have you that the boys would come from Indwe at all, and that they were not really picked up locally?—None whatever.

1,258. To whom do you pay the railway fares—to the labour contractor?—No, to the railway authorities.

1,259. Is there any certainty as to that?—I am not quite certain.

1,260. Would it not be possible for this contractor to pick his boys up here and pretend that

he had brought them from Indwe?—I am not in a position to answer that. As far as I am aware, all railway fares are paid to the railway authorities, and if we contracted to pay the railway fares, and did pay them direct to the railway authorities, that would be a check.

1,261. Does the Municipality obtain any reduction in the railway fares in connection with boys brought here for their service?—No special reduction, I think, only the same rate as is available to the Native Labour Association; that is, in the case of a large number being brought, a reduced rate is given.

1,262. Can you supply us with particulars of an offer made of labour by Mr. Mortimer Zeffertt. He seems to have an enormous supply of surplus native labour?—I can give you no further particulars to what are contained in the statements which I put in. We understood from the correspondence that there was a large supply available. He refers to his agents, and we followed matters up with them, but without success. He refers to Mr. H. E. Franks, of Mount Fear, in his letters. All the particulars I have, you will have put in in evidence.

1,263. You have seen statements in the papers from Mr. Zeffertt offering to supply a large number of boys?—Yes, we were prepared to take the boys, but apparently he was not able to supply them.

1,264. Can you tell us what number of boys the Native Labour Association has supplied you with altogether?—I have not the figure with me, but will undertake to supply them to the Commission later on, should the Commission desire.

The CHAIRMAN: We shall be glad if you will do so.

1,265. Mr. PHILIP: You have always been short of labour since the war?—Yes.

1,266. Have you ever reduced your wages?—No.

1,267. Then that cannot be the reason for your difficulties?—We have had it stated by our agents that the rate we were paying was considered low.

1,268. But you have never reduced your rates?—No.

1,269. So that the fact of the mines reducing their rates should have given you a more liberal supply?—Yes, it would seem so.

1,270. When you take over the mines' sanitation, will you not want more like 3,000 than 500?—No, I think only about 200 additional.

1,271. Those figures include the service attached to the mines sanitation?—Yes, of those mines within the municipal boundaries.

1,272. In what parts have you had recruiters?—In Pondoland, Basutoland, and in Griqualand West.

1,273. Have you not had anyone in Bechuanaland?—We had an arrangement there with an agent to get natives, but he was not successful.

1,274. Your boys have every possible comfort, I understand; they are very well treated; you feed them well; you give them a variety of food, meat and vegetables. Do they complain at all?—I hardly know as to that of my personal knowledge; Mr. Abrahams would be able better to advise you as to that; I understand that they are well treated, and that the sickness is reduced to a minimum.

1,275. You have tried your very best to get boys?—Yes.

1,276. Have not the boys in the employ of the Municipality written letters to their friends at a distance advising them to come up to work for the Municipality?—I do not know as to that.

1,277. You pay 50s. per month to new boys, and your rates range from 60s. to 75s.?—To 75s.

1,278. Drivers get 75s.?—Yes.

1,279. Some of the boys get even a higher wage than that?—Those are Cape boys.

1,280. Don't you give the boys in your employ some inducements in the way of prizes?—

Yes, prizes are offered for competition amongst the boys connected with the animals, for the best kept teams.

1,281. Only the boys engaged on the sanitary work are employed on Sundays, are they not?—Yes.

1,282. And for the most part they are not working on Saturday afternoons, are they?—No.

1,283. You are paying higher wages than the mines, your boys are working six days in the month less than on the mines?—I am not sure whether they are paid by the working day or not, but I think it is by the month.

1,284. So that really your boys only work 24 days in the month?—I suppose so.

1,285. The work is congenial to them?—I think they do as a rule prefer surface to work underground. The sanitary boys' work, of course, they do not like.

1,286. I know; there is only one class of the boys like the sanitary work, and they seem to fatten on it; you have never had a full supply?—No.

1,287. You have had to fall back on the Native Labour Association during the last two months?—When they have boys available we try to get them.

1,288. You recruit a large number of boys on the spot. Is your success in that direction not due to the more congenial nature of the work?—I do not know.

1,289. Some one, no doubt, has at some time had to pay for recruiting the boys you pick up in the town here. Do you suppose it may be the Native Labour Association which has paid for them? Do you not think you get these local boys at the expense of the Native Labour Association?—It looks something like it.

1,290. I understand it is the Public Health Department of the Town Council which looks after the native labour supply?—Yes.

1,291. Are you the Chairman of that Committee?—No, Mr. Quinn is.

1,292. Do you provide schools in your native compounds?—No.

1,293. Do you not provide amusements for the boys?—No.

1,294. Have you not swimming baths for their use?—No.

1,295. Then it is not that which induces them to remain?—No.

1,296. Mr. TAINTON: You stated that previously you had an arrangement with the Native Labour Association?—Yes.

1,297. Why did you not continue it?—The recruiting was not very effective, and they could not always give us the class of boys we wanted for our work; our main difficulty was to get boys for the sanitary service. We want a special class of boy for that work, and we engaged an agent of our own to recruit them; they are known as "Bacas."

1,298. What was your rate of pay?—I think it was something like £2 10s.

1,299. That was the rate offered on your behalf by the Native Labour Association for a special class of boy?—Yes.

1,300. Did you find the cost of procuring boys under the Labour Association higher than under your own organisation?—The arrangement with the Labour Association was, I think, that we paid half of the recruiting agent's charges.

1,301. Did the cost, on an average, come out higher than under your own organisation?—No, I think it was lower.

1,302. What was the reason you discontinued the arrangement with the Labour Association?—We could not get the boys we wanted, and thought that perhaps we could do better ourselves.

1,303. What is your opinion now on that subject?—We appeared to be certainly more successful working with our own agents; it appeared under

the recruiting by the Labour Association that the mines had first selection from the boys, and that we took what was left.

1,304. What proportion, roughly, of your boys are employed in the sanitary service?—We shall require 1,260 and 1,000 in the Engineer's Department.

1,305. The sanitary service is not congenial work to the average man?—No, some of the kaffirs will not do that work.

1,306. What do you pay for that work?—About 50s.

1,307. Is that lower or higher than the mine rates?—I have not followed what the mine rates are.

1,308. What is the rate in domestic service?—That is much higher..

1,309. Are boys induced by that higher rate of pay to enter domestic service in preference to remaining in the employ of the Municipality?—Yes.

1,310. What is wrong then is that your rate of wages is too low?—It may be so; it is considered a fair rate for that work.

1,311. Can you give us, roughly, the number of natives residing within the Municipal limits? I mean the natives other than on the mines?—Do you mean excluding the mines within the Municipal area?

1,312. Yes?—Something over 30,000.

1,313. Could you get the exact figures?—Yes.

1,314. What is the white population?—Over 80,000, but it is very difficult to say exactly.

1,315. Would you consider Johannesburg to be a fair average South African town in respect of the relative proportions of natives to whites?—As regards the native population, excluding the natives on the mines, I should think so.

1,316. There is a good deal of building going on here now, I believe?—Yes.

1,317. And that would increase the ratio?—Yes, it would.

1,318. A good deal of building is also going on in Cape Town?—No doubt, but I scarcely think there is a town in South Africa in which more building is going on at the present time than in Johannesburg.

1,319. And the proportion would be slightly higher here?—On that account, yes.

1,320. You propose to raise a large sum of money for municipal works, I believe. How much is it?—£3,000,000.

1,321. How do you propose, roughly, to expend it?—£1,100,000 for the purchase of the Insanitary Area lately expropriated, and for laying it out; £1,200,000 for tramways; £300,000 or £400,000 in connection with a sewage scheme in portion of the municipal area; and a certain portion, amounting to some £600,000, is to be spent in liquidating the old liabilities of the Stadsraad.

1,322. So you have an expenditure on Public works before you amounting to some 2½ millions sterling?—Yes, about that.

1,323. A large proportion of that money will be expended in wages?—Yes.

1,324. Will natives be employed on these works to a considerable extent?—Yes, I take it, for all unskilled labour.

1,325. Have you formed any idea of the number of additional labourers that will be required on those accounts?—I have not considered the matter.

1,326. Do you expect to be able to supply that demand by means of your present labour organisation?—I presume it would mostly be contract work.

1,327. You will leave the contractors to engage their own native labour?—Yes.

1,328. Will this mean a large additional demand in the way of native labour, whoever has to get it?—Yes.

1,329. You cannot give the rough figures of that probable demand?—No, I would not like to guess at it.

1,330. Mr. QUINN: Did you compile the figures you have furnished to the Commission to-day?—No; they were got out by the manager of the Scavenging Department.

1,331. What Committee of the Council is responsible for the labour supply?—The Public Health Committee.

1,332. Have these figures been placed before that Committee?—Not in their present form. I gave Mr. Gavin an idea of what information I thought this Commission might require, and he put the figures together.

1,333. The figures have not been before any Committee of the Council?—No.

1,334. Referring to the summary at the end of the statements you have submitted, Mr. Goch has already drawn attention to discrepancies which show that the figures are entirely unreliable. I consider the figures worthless. I understood you to say that the Municipality had always been short of native labour?—Yes, with the exception of a short period in the early stages.

1,335. For how long were you not short?—It might have extended over three or four months.

1,336. I understood you to say in answer to a question that the present deficiency had lasted for four months?—Yes, that is what I said.

1,337. I think, Mr. Chairman, I shall have to give evidence on these matters myself.

The CHAIRMAN: The Commission would be delighted, I'm sure.

1,338. Mr. QUINN: Now, has this deficiency obtained until the last month—you are invariably present at every meeting of the Town Council Committee?—Yes.

1,339. Within your knowledge has this shortage ever been to the Public Health Committee within the last month?—It has only been spoken of in a general way.

1,340. Now, Mr. Goch used a set of figures, 350, 200, and 60, as being the present shortage?—In accordance with statement on the first page, I took Mr. Goch to mean that he included the 200 as additional boys required.

1,341. How can that be the present shortage?—No, I mentioned that at the time.

1,342. It is not the present shortage?—Yes.

1,343. Sixty being short for the sanitary requirements, there are 160 short there?—Well, that I could not tell you.

1,344. Three hundred and fifty short in the Town Engineer's Department. How long have they been short for that department?—I heard the figures 350 mentioned for six weeks back.

1,345. Mr. Carr, when the Works Committee find they are short of boys, do they refer that to the other Committee?—No; that is what they ought to do.

1,346. Have they ever done it?—No, there has been no notification at all.

1,347. I believe it is going to be done to-night?—I think so.

1,348. Now, I understand, in answer to a question by Mr. Goch, or, rather, I understood Mr. Goch to say to you, that if these boys could not be got, the sewerage and tramway business would have to be stopped. Now, Mr. Carr, 860 boys are put down in this paper as being short. If we had them here to-morrow could we give them work?—No, not this extra number. We could only employ 640, if you take this current six months as being the present requirements.

1,349. How many boys worked for the Town Council before the war?—About 1,200.

1,350. And we are now engaging in work 2,316?—Yes.

1,351. Now, in reply to another question, I think you said that we would want a considerable number of boys for the Department of Mines' Sanitation?—Yes.

1,352. Is there not a considerable number of boys doing that work to-day; there must be?—Under the contract, yes.

1,353. I take it we should do it in a more complete manner. You mean we would require more boys?—Yes.

1,354. How many boys would you want for it altogether?—I think it means an addition of about 150.

1,355. How many has the contractor got to-day?—I do not know.

1,356. Whatever we have if we are not using them, they are available for something else?—That is so.

1,357. So that is not another demand?—No.

1,358. Now we come to this recruiting question?—Have we ever employed for any length of time a recruiter solely for our use?—Oh, yes, in Pondoland.

1,359. For how long; give me quite a recent instance?—I think he has been employed for some eight months.

1,360. Does he recruit for anyone else?—Not that I know of.

1,361. Does Mr. Hulley recruit for anyone else, other than for the Council?—Oh, yes.

1,362. The Municipality took over Mr. Hulley from the Native Labour Association, and he did the work for us. Does he recruit for Kimberley at the present time?—I could not tell you.

1,363. Have we ever had any settled recruiters anywhere?—Not beyond what I have stated.

1,364. What is the reason that we want a considerable number more boys at the present moment?—Is it not that we are increasing our work?—Yes.

1,365. Then the Engineering Department is going in for some more work, streets, etc.?—Yes.

1,366. Sixty boys are supposed to be short in the Sanitary Department, that is for the ordinary sanitary requirements?—Yes.

1,367. Is it within your knowledge, Mr. Carr, that Mr. Hulley has written to us more than once saying that he could get boys if we took them on for shorter terms?—Oh, yes, that is so. He also mentioned about the rate of wages, too.

1,368. Now supposing we want a considerable number of natives for tramways and sewers. When the tramways and sewers are finished, we shall not only be able to do without these boys, but also without a very large number required on the night-carts. The requirements will then be very much less?—Yes.

1,369. You are aware of the Town Council putting up refuse destructors?—Yes.

1,370. Are they calculated to do with very much less labour?—Yes.

1,371. So that within the next two or three years, instead of our wanting a very much larger number of natives, we shall want a very much less number than to-day?—I think so.

1,372. Now questions were asked with regard to our boys' comfort. Is it not a fact that a large number of them have been living in tents?—Yes; we had not accommodation for them. I had overlooked that matter.

1,373. We are supposed to feed them particularly well?—Yes.

1,374. Do we feed particularly well?—Well, I understand, in comparison with the way Kaffirs are fed, that they are getting good food.

1,375. How often do they get meat?—Twice or three times a week.

1,376. However, the treatment is nothing exceptional?—No.

1,377. And the question of work; is it not within your knowledge that these boys have got to work

on Saturday afternoons and overtime?—That is not within my knowledge.

1,378. You will notice that the Health Department engage or employ more than half the boys of the total?—Yes.

1,379. We have managed since the war—from June, 1900—to keep the sanitary plant going all the while in spite of the disagreeable work?—Yes.

1,380. Mr. WHITESIDE: Mr. Carr, in your summary you state that in April 473 boys were recruited, and that you engaged in June 182, which is the least for the six months. Can you give us any reason for this deficiency—this deficiency of 291?—I could not tell you off-hand, but what I suggest may be the reason is that in the winter season there is a greater difficulty in recruiting than in any other season.

1,381. It is something abnormal, is it not? You have a difference of 291 between the June month and your greatest month, 473, in April?—The recruiters could not get boys in June.

1,382. In your statement showing the number of boys recruited in Bechuanaland, we have for April 158. Has there been no attempt to get any more since April?—All our recruiters then failed us. We could not get any more from there.

1,383. Have you had any correspondence from recruiters on this matter?—I have not got it here.

1,384. Have you got Mr. Hulley's correspondence?—No. Do I understand you want the correspondence with regard to recruiting in Bechuanaland?

1,385. Mr. WHITESIDE: Yes.

1,386. The CHAIRMAN: I suggest that Mr. Carr be recalled to give us the information. He can bring the correspondence, and be questioned on it.

1,387. Mr. WHITESIDE: We have a statement of a number of boys recruited in Pondoland, Mr. Carr. Your great deficiency was in June, while in April you had 56 boys, in June you only had 21. Do you attribute the same reason for this deficiency as before?—I think that is the only reason. I know of no other reason beyond that.

1,388. Again, in the statement showing the number of boys recruited in Basutoland, we have two extremes. Between January and June there is a deficiency of 94?—Yes.

1,389. Have you ever offered any terms to free recruiters, Mr. Carr; what I mean is independent agents, who make a business of recruiting?—We never advertise for free recruiters to come along and get boys for us. But in every instance in which we have heard of the possibility of getting an agent, we have always inquired into the matter, in order to see if we could do anything by employing him. Of course, we started by working in harmony with the Witwatersrand Native Labour Association, so as not to create an amount of competition for boys.

1,390. Did Mr. Buckley offer to send any number of boys from Kimberley?—Here is his letter: "In reply to your letters of the 1st inst., I have the honour to state that I am prepared to enter into an engagement, and send you as many boys as I can get, but you must please understand that I must supply the Repatriation, and until I am finished with that Department, there is no chance of recruiting boys here, as the natives prefer wagon and oxen work, which is an easy, idle life, and the pay is better than that you offer. However, I have a splendid white collector, whom I could send out. If I understand your letter correctly, I think that the Repatriation Department has been supplied, and I do not expect that they will require boys after the end of next month. I will be able to supply you with about 200 monthly." That is the point you want to get at, Mr. Whiteside. You will understand that we are negotiating with this man now.

1,391. Have you any information, Mr. Carr, as to the number of boys this Mr. Buckley is supplying the Repatriation Department with?—No.

1,392. My object in asking the question is to elicit whether this man is meeting with any success as a recruiter?—I will try and get the information for you.

1,393. Does Mr. Greenhardt make any specific offer about any particular number of boys?—No, he only talks about batches.

1,394. Can you tell us, Mr. Carr, what date this native recruiter with the unpronounceable name, was engaged?—This agreement is dated July 22nd, 1903.

1,395. Consequently there has been no opportunity yet to gauge what results are going to be obtained?—No.

1,396. Do you know where you are going to recruit?—It is in the district at present worked by Howes; that is, Pondoland.

1,397. Do you employ any number of Cape boys?—We try to get them as drivers.

1,398. Is that supply limited, do you think?—Could you get more if you wanted them?—I do not think so.

1,399. You said, in answer to Mr. Tainton, that the recruiting of the W.N.L.A. was not very effective?—It was "successful" I meant. You see the position was this, they were badly in want of every boy they could get, and such boys as we got from them were not a good stamp of boy for our work, and a lot of them were youngsters.

1,400. Still their recruiting was not very successful?—No.

1,401. Mr. QUINN: On the first page you state the average number required to be recruited monthly to replace time-expired, deserters, sick, and in gaol—at 150 in each department?—Yes.

1,402. On the second page, and adding up the six months' recruiting, you find you are recruiting 380, so you are recruiting 38 per month more for the six months of the year?—You must take into consideration that, perhaps, there are a lot of these boys who appear here who are recruited twice over—of course, I am only suggesting this.

1,403. In the first page we are told 300 is required monthly, and we are told of the great loss, and in the next page we find they are getting 380.

1,404. Mr. PHILIP: You only recruited in June 182 boys?—Yes.

1,405. You have stated that your opinion is that it is owing to the winter months that there was such a shortage in June. Is it not because the supply of labour is becoming scarcer?—I could not say more than generally, Mr. Philip. I take it that there is a great deal more work going on in the country, and consequently labour would be scarcer. There is a greater turnover. The reason outside of that is that Kaffirs, in these cold months, do not care about coming up here to work.

1,406. One reason of your not having a sufficient number of boys after the war was because the military had detained a number of Kaffirs here, and Kaffir labour was unobtainable?—I do not think we recruited from that class of boys.

1,407. Have you not tried native runners to try and recruit boys for the Municipality?—That would be done by the agents.

1,408. You have not done it by yourself?—No.

1,409. Did not Mr. Harding represent you in Bechuanaland?—Messrs. Harding and Co., of Kimberley.

1,410. They recruited for you in Bechuanaland, did they not?—Yes.

1,411. Mr. TAINTON: I think that you are framing your estimates for future expenditure upon the basis of a much larger population, are you not, Mr. Carr; you expect a larger population?—We expect a great deal more will have to be done for the existing population.

1,412. Do you think the Municipal requirements will be satisfied with this loan for three millions—

that there will be no further Municipal loan?—That is only a comparatively small proportion of the work; it is only, perhaps, a third.

1,413. Then the demand for natives is liable to increase when this is finished?—Not for the Municipal work; but for the work for the construction of these sewers, etc., there will no doubt be a large increase.

1,414. You have no intention of discontinuing Municipal work when this work is finished? Are we to understand that this satisfies all your requirements? Is there likely to be any further Municipal expenditure when this is finished?—Of course, we are sure to have a lot of road-making.

1,415. Then your demand is likely to be continuous?—With regard to the departmental work of the Town Engineer's Department it is likely to be continued.

1,416. A good deal of doubt, Mr. Chairman, has been thrown upon the figures Mr. Carr has given. I am not at all satisfied that the criticism to which they have been subjected is well founded, and I would suggest that before incorporating these figures in the proceedings we give Mr. Carr an opportunity of replying, and if necessary correcting them. We want accurate information?—I will have these figures revised.

1,417. Mr. QUINN: We will, then, of course, have a re-examination on the revised figures?

The CHAIRMAN: Yes, Mr. Carr will be recalled.

1,418. Mr. Evans: Has the Town Council tried to economise native labour by employing white men?—That is, with a view of insuring better care being taken with the animals and having more intelligent drivers. We have about 10 drivers.

1,419. You have not tried to replace natives by white men?—Oh, no.

1,420. There was a reference to 200 men a month. That was a promise, I understand?—Yes.

1,421. It has gone no further than a promise?—No.

1,422. Mr. WHITESIDE: I would like to ask you, Mr. Carr, if you have any knowledge of the results of this month's recruiting, so far?—No, but I can get those particulars for you.

The CHAIRMAN: Thank you, Mr. Carr, we are much obliged for your evidence.

Major R. T. CORYNDON, called, sworn and examined.

1,423. The CHAIRMAN: You are Major R. T. Coryndon?—Yes.

1,424. Administrator of North-Western Rhodesia?—Yes.

1,425. Will you please tell us what district that covers?—It runs from the junction of the Zambesi. You see the Zumbo about the centre of the Zambesi; it is the end of the Portuguese country. About an inch and a half to the left of that the Kafue runs in. North-West Rhodesia runs west as far as the bend of the Zambesi, and it runs north to the Congo border.

1,426. This covers Barotseland?—Yes.

1,427. Shortly stated, then North-West Rhodesia is Barotseland?—Yes, it is practically the basin of the Upper Zambesi.

1,428. Is Barotseland a comprehensive name for the territory?—Yes, for North-West Rhodesia.

1,429. How long have you been in that country, Major?—Six years.

1,430. Is your appointment from the Chartered Company or from the Imperial Government?—From the Imperial Government.

1,431. You know the purposes for which this Commission is sitting. It is first of all to enquire into the requirements of the agricultural, mining and other industries of the Transvaal. I take it that that is a subject on which you are not prepared to give evidence?—No.

1,432. You are not prepared to give evidence on that?—No.

1,433. The second division of our enquiry is the available labour supply in Central or Southern Africa. I take it that you are prepared to give us evidence on the available supply from Barotseland?—Yes.

1,434. You have seen the advertisements which we have published?—Yes.

1,435. I understand that you have come here at some inconvenience and that you have not had time to prepare any written statement?—Yes.

1,436. I also understand that you are prepared now to make a verbal statement and that you are willing after that to be cross-examined by members of the Commission?—Yes.

1,437. Would you therefore please make a statement as to the available supply of labour from Barotseland?—Well, I must begin by saying that the country is a very thinly inhabited one. I should think that the total population would not exceed 300,000, although it is extremely difficult to give statistics because the Government posts extend only over a portion of the country, and we only know approximately the numbers of the natives within reach of our own stations. But I should say that it would not be more than 300,000 and I suppose that the available adult population would be probably less than a third of that, say about 80,000. That is, able-bodied adults who are capable of working, but I do not think that the whole of that 80,000 could be got as available labour throughout their own country, because it is a long journey and a great many people in the country could not undertake the journey out of it; or say a portion of them could not do so. At present, I think, that about 4,000 or 5,000 come down every year, although we have no statistics. There is no Government Department to control or to tabulate the exodus, but I should not think that more than 5,000 came down, and I think that with careful recruiting this number might be increased. I do not know to what number, but possibly it might be increased to 7,500. That was the position, until two years ago, when we began to find mineralised areas in North-West Rhodesia and now we find that we have considerable difficulty in supplying our own mines up there. That is for various reasons; the natives are unaccustomed to white men; they are not at all accustomed to work; they are very idle naturally, and probably as idle as any other savage nation, and we find it extremely difficult to get them to undertake work in the mines at all. And of late, we have been discovering mineralized areas and opening up the country to a certain extent, and we have 30 or 40 mines working now that take up a good deal of the available labour. That is in the neighbourhood of the mines. Of course it must always be remembered that there are large areas that we have very little control over. They are not brought actually under the influence of the Government; that is the Kafue and Kasempa districts, and it is quite possible in years to come these figures that I have given you as to the available supply might be largely increased. It is also to be remembered that in those years our own needs will probably increase; the needs of the country itself. I wish the Commission to remember that these figures are only very approximate. It is difficult to judge of the population of a very large country. It is very thinly populated. But I do not think that I am very much out in the figures that I have given. And another thing to be remembered is that the natives do not like leaving their country to work. They are not accustomed to it—to leave the Zambesi; and before the last six years there had been very little connection between the Upper Zambesi natives and the South. A very few of them were accustomed to go to work in Kimberley and very few indeed to Johannesburg, and those that did go, came from a certain district only. That is the country on the Zambesi between the Victoria Falls and the Kariba Gorge. Those are the people that are known down there as Zambesi boys, and who have from two to four teeth missing in the upper jaw. They have been accustomed to come to a certain extent but not very much; but beyond these Batongas the inhabitants of Barotseland have

not been accustomed to work at all before the last five or six years, and one cannot induce the people of an enormous area to work suddenly. And another cause which has prevented natives from coming down in any large numbers is that the local chiefs have set their faces against it very largely. The Chief Lewanika does not like his people to leave the country. He would much prefer that they should work in our local mines now, and he gives various reasons for that. One reason is that the boys very often stay down here; they settle here. Large numbers of them never go back. I think he is also afraid of them contracting the vices of civilization which they do not possess in their own country yet, to a very large extent. And that reason, together with a natural disinclination to work and the enormous distance from their country to the mines, has always prevented any large number coming down. I think the number might be increased, but it would have to be very careful recruiting, and then, as I say, a point also to be remembered is that our own needs are growing rapidly. Personally, I should very much dislike to see the people come out in large quantities, because we shall want them there very soon ourselves. There are other reasons, too, which will militate against their coming, and that is the liability to pneumonia and chest diseases. Their country might be described as a very much more tropical country than this, and those natives who live on the lower Zambesi, where it is very hot, might suffer very much from these diseases and a great many of them have, as their staple food, a root called "mwanja," and I rather think that may prevent them from coming willingly, but that is a detail; I do not think that is really of much importance. Now, as to the rate of pay, in their country it is, of course, very much less than here. The further you go north the less you pay the natives. There are some mines working at the source of the Kafue, whose average pay is about 6s. 6d. per month. The natives are perfectly satisfied with that, and coming further south the Northern Copper Company's mines average rate of pay is not much more than 7s. 6d. to 10s. per month, and in the Administration—that is the natives we employ ourselves—our Police Court and Civil messengers are paid 10s. a month, and 12s. 6d. a month for the second year's service. They serve for two years, with some small increases, for instance, corporals get an increase of 2s. 6d. and so on. At any rate, the pay is not more than 12s. 6d., taken as an average. We have, however, a highly trained Native Police Corps, and a very efficient Messenger Corps, and they only receive that pay. At the Victoria Falls, skilled labour, such as canoe-men, wood-cutters, etc., do not receive at any time more than £1 per month; 15s. is the average pay, so that our pay varies from 6s. 6d. to 15s. per month. It is either paid in cash, or in trading goods to that value, and the country has only very recently been opened up, and I do not think that we can expect very many natives to come at this early stage. I should think that it would take some years to make a native population over a large area like that acquainted with the idea of work especially work that they are not accustomed to, such as mine work, and I do not think at this early stage of the country's development that we can really expect a very large proportion of labour from them. The people that I have mentioned on the Lower Zambesi have been accustomed to come down for some time. For the last five or six years and before I went up six years ago, a certain number used to come down from the Victoria Falls. There were not very many from that particular district. You can take these people to be the labourers and a few people from the plateau in the north, but there were not very many. As to the country to the north-west of Victoria Falls—the Barotse Valley—the natives work very little. It is a long way from there to the Falls and a long way to the mines in Matabeleland. They are not accustomed to go up and down very much. The same applies to the people 200 miles north of the Falls. The Northern Copper Company, for instance; they are not accustomed to go there because it is such a long journey. And I believe the Managers

of the Northern Copper Companies Mines are already complaining of the difficulty of getting boys in the neighbourhood of their own mines to work on their mines locally. It is not the rate of pay the natives object to, but it is because they object to work at all. They are not accustomed to work; they are raw, so to speak. I think that is, roughly, the position at present. Of course that country is not quite the same as these countries down here. Barotseland, that I have just been speaking of, is painted pink on the map. The very large area which is painted a grey colour is presumed to belong to Portugal. It is beyond our provisional boundary, and, therefore, I do not refer to it at all. I refer only to the country that is painted in pink; that is the country to the upper waters of the Zambesi, upon the source. Is there anything that the Commissioners would like to ask me, Mr. Chairman.

1,438. The CHAIRMAN: Yes.

1,439. Mr. QUINN: This number of 300,000 natives that you have given us as a total. It is, of course, a rough estimate?—Yes.

1,440. There is no means of testing it in any way?—No.

1,441. Why did you decide upon it as 300,000 instead of 400,000? Some error might have got into your figures?—No, I do not think so. I have got those figures from returns sent in by different District Commissioners, from the neighbourhood of Kalomo; that is the south-eastern part of the country, though it would apply to the whole country as a rule. I do not think, if you take district by district, one is more populous than the other.

1,442. That applies to the whole area?—The whole of the area under the name of Barotseland.

1,443. Then this next figure of 80,000; that is an ordinary calculation on the 300,000; that is also an estimate?—Yes.

1,444. How is the 80,000 arrived at? It seems a very small proportion of the 300,000. I understand you to say you might have 5,000?—I arrived at the 5,000 from the returns from the Native Labour Agent at the Victoria Falls—the number of boys that passed through his hands the last year. He gave me the number and I worked out the 5,000 from that. There are three main drifts that the boys are liable to cross before they reach the Zambesi, and I took the Agent's figures and trobled them. That brought it out at about 5,000 for the last year.

1,445. That 5,000 you speak of, were they bound for this part of the world, or Kimberley, or where?—I think that most of them were for Rhodesia, Matabeleland, I think.

1,446. What is the pay on the mines in Southern Rhodesia?—I do not know.

1,447. Do you know Mr. Coillard?—Yes.

1,448. He has been giving evidence before this Commission. Take the district he is acquainted with so far as you know, is it the same as the one you are acquainted with?—Yes, I should think so, possibly it is more heavily populated than mine.

1,449. He said without the agents' efforts the boys themselves are very anxious to come to work. He said in Johannesburg, at a meeting, that we had, he thought, about eight-tenths of the younger population coming to the mines to work. That is approximately. He might now say that the great majority of the young men go to the mines to work. There were very few men there now who had not been at the mines, and so much was that so that the Chiefs had at times found it difficult to obtain sufficient labour to attend to local wants; practically everyone went to the mines. Now, Major Coryndon, do you not agree with that?—No. That may possibly be the case in the district Mr. Coillard refers to, but it is certainly not the case for the whole district.

1,450. Is that the district he refers to?—He spoke of it as Barotseland.

1,451. The CHAIRMAN: Will you give the name of the district you meant, Major Coryndon?—From the Victoria Falls to the Zambesi—the Batonga District.

1,452. Mr. QUINN: The tribes he referred to are known as the "Mambumda" and the "Bazilulus"?—I do not think so.

1,453. Do you know the "Mambumda"?—Yes.

1,454. The whole of his evidence is in the direction that you could not keep them back. You disagree with that?—Yes.

1,455. Have you seen many of the boys who have been down and gone back again?—I have seen a good many.

1,456. What are the reports the boys spread as far as you know?—I have seen very few that have come from Johannesburg. I think that they are satisfied with their work in Southern Rhodesia, because you find them willing to go back again the next year—that is, boys who have been down before.

1,457. Is the stream of labour increasing in that way by those going back and coming back again?—I have no doubt it is increasing and will have a beneficial effect.

1,458. Mr. WHITESIDE: Have you any knowledge of any recruiters going amongst those boys in Barotseland?—No, I do not think there are any agents up there now that I know of. There are a few for the railway work, that is to obtain boys to work on the construction.

1,459. Do you know a mine called the Ayrshire?—Yes, I know of it.

1,460. I have been informed that they have abandoned all labour there. Can you say whether that is true, or not?—I cannot say from my own knowledge, but I know that the Ayrshire is to the north-west of Mashonaland and nearest to the district that I have mentioned.

1,461. So it is quite possible that the boys would have abandoned all work there?—Yes, it is quite possible.

1,462. You have told us, Major, that a few come from the Zambesi district. Can you tell us if there is a very large population up there?—I refer to the boys on the river, where the boys are willing to go and work. The population is fairly heavy along there.

1,463. Do you think it would be possible to get any large number from there to come to the mines here?—I think that a large proportion of the natives would be willing to come to work, but I think that the total number that could be obtained would not be very much for you in Johannesburg.

1,464. What would you estimate would be the number we might get from that part of the district?—I should say, of course, the natives are more willing to come down one part of the year than the other. Take the whole area there, you might get, possibly, 4,000, from that particular district—that is, those available for labour and are willing to work.

1,465. Mr. TAINTON: How long do these boys stay at work—for how long are they engaged?—I think on an average of three months.

1,466. So it is quite possible that a considerable proportion of the population has been engaged in mining work?—Yes, of that district I should say a considerable portion.

1,467. Then the statement made by a former witness to the effect that a very large proportion has been so engaged, is not contradictory to what you know?—Not with reference to that district.

1,468. What is the attitude of the Government to agents from other States recruiting in your territory?—Hitherto the Government has placed no restrictions on agents collecting labour, but I should be inclined to think that in the future, seeing that our own wants are increasing, that the Government would rather set their face against a large number of natives leaving the country.

1,469. Is there any export tax on natives leaving?—No, none.

1,470. Would you be quite willing for recruiters to come in from the Transvaal for labourers?—No, I do not think I should be at all willing for the reasons that I have given, of course.

1,471. You wish to keep the labour for your local work?—Yes, and other reasons are the difference in pay, the liability of the native to disease, and the fact that a certain proportion of them do not return.

1,472. Why do they not return?—I presume that they get a liking for the life. They are well looked after; very well paid and fed, and they get a liking for the life.

1,473. Is there not greater freedom south of the Zambesi than the north? Less interference with the chiefs?—I do not think that I could make a comparison. I think the natives who work in the mines are willing to come back. They are quite willing to come to the mines again.

1,474. Then one of the effects of the establishment of this mining industry here is greatly to draw the natives from various parts of Africa into the territory south of the Zambesi?—I should think that is so.

1,475. The effect, then, would be to increase the native population of South Africa. That is, south of the Zambesi?—To the detriment of the population of the north.

1,476. And increase the disproportion between the white population here and the black?—Yes, but probably there would be no difficulty.

1,477. You said that the chief difficulty was that the natives objected to work. What information do you found that conclusion upon?—I think it is recognised amongst the people who deal with what you may call the raw natives—natives who are unaccustomed to deal with whites in any way. The native is only an idle person, and would prefer to do no work at all.

1,478. Have you any explanation for that idleness?—I think it is only idleness.

1,479. Then you would not base your calculations as to the amount available in a given district upon the number of natives in that district?—I do not think that I should go entirely by that. Some natives are more willing to work than others.

1,480. These tribes in your range of observation are in your opinion indolent?—Except, as I say, those that have been to work before.

1,481. Have they any need for money?—Very little as yet.

1,482. What do they do with their money?—I think they hoard it for the most part. Probably they will have to pay a hut-tax later on, and may be they are conserving it for that. Hitherto they had no reason to hoard it.

1,483. Is money at all plentiful in your district?—No; very much the reverse amongst the natives.

1,484. It is not used as the medium of exchange?—No.

1,485. Then, if you impose hut-tax will you require that tax to be paid in money?—Yes.

1,486. That will compel the natives to obtain money?—Yes.

1,487. Where will they get it from—ourselves?—Local mines and ourselves.

1,488. So the native hut-tax compels the native to go where he can get money?—Yes.

1,489. You do not allow him to pay in kind—in grain?—I think at first they will probably be allowed to pay in kind or money, a portion of their arrears.

1,490. Is there no great demand for European goods amongst them?—The demand is increasing, and with the increase there is more wages given to them. Gradually they are requiring a great amount of money.

1,491. Is the demand increasing rapidly?—It is for parts of the country. Over large areas it is not increasing at all.

1,492. Could you give us the rough figures of that demand, based upon the number of traders' stores in your territory?—I could not give you those figures at once.

1,493. How many stores have you to-day?—I should say a dozen in different parts of the country.

1,494. Is the turnover much?—No. There are a dozen stores and a certain number of hawkers who travel about from place to place trading with natives. The turnover up there is not very large all through.

1,495. They have no need for money for dowry purposes?—No, not at all.

1,496. What is the usual dowry?—Cattle, three or four oxen in a country where there is no "fly"; then, native hoes, assegais, mats, canoes, and so on; natives' curios of all sorts.

1,497. Did the rinderpest affect your district much?—It spread over the whole district except Barotseland. The cattle have decreased very largely.

1,498. What was the dowry in the interval when cattle were scarce—money?—No, it was never money.

1,499. Then these natives who come out to work, what do they do with the money they earn?—They spend a good deal of it before they return. When one sees gangs of boys returning they are carrying boxes, boots, clothing, and umbrellas, etc., that they have purchased. I do not think that they bring back very much money with them. What they do bring back with them they hoard, because they know that the hut-tax will be imposed later.

1,500. It has been suggested that the Government there does not encourage recruiting; is there anything in that suggestion, that you are opposed to people recruiting for the mines?—No, I do not think that that is the case.

1,501. Are you acquainted with negotiations with the Home Government respecting the construction of the railway north of the Zambesi?—No.

1,502. You said you anticipated very little help from some parts of that district, nor expected the labour supply to increase. Does the influence of the chiefs prevent the natives from leaving their territory?—Very much so.

1,503. To what extent does that apply?—Chiefly in the neighbourhood of Lealui, in the Barotse Valley, but the influence extends to a certain extent over the whole country. The influence is to prevent the natives leaving, but if the natives want to work, the chief's influence would not prevent them very much.

1,504. The authority of the chiefs is not effective?—No.

1,505. Mr. PHILIP: The population is about 300,000, and you mention that the available working population is 80,000. Is that not rather a large estimate out of the available population?—I do not think so.

1,506. In the first place, does not the estimate include the junior and adult population? Out of, say, 150,000 male adult population, you would not get 80,000 at least?—No.

1,507. So that the number available, at least, would be less than you state?—Probably, when Mr. Coillard stated the population of Barotseland as 150,000, he may have only been speaking of one part of the country.

1,508. He stated that there would be 60,000 men, and that would bring the increase up to about what you state. Do you think there is any chance of our getting any native labour from your part of the country?—I do not think there is very much.

1,509. The Government of Southern Rhodesia does not allow recruiting?—I cannot tell you.

1,510. There is no objection on the part of the Government, so far that they do not prohibit it?—No.

1,511. Mr. EVANS: Can you give us some idea of the extent of Barotseland in square miles?—I

should say, including the portion to the west of Lealui, which is now in neutral territory, the area would be about 140,000 square miles.

1,512. The population is very sparse in that case?—It is very sparse over that portion of the country.

1,513. Have you any idea how many natives are now employed in the mining industry in Barotseland itself?—I should say the local industry would use about 1,800 boys a year.

1,514. Have you any rough estimate or idea of your future requirements as the local demand increases?—No, that depends on the discovery of mineral ores. It might develop very rapidly.

1,515. Is the Wankie Coalfield near Barotseland?—Yes.

1,516. Is that likely to absorb a large number of natives?—Yes, it will.

1,517. When the railway reaches the Wankie Coalfield do you think there is likely to be considerable development?—Yes, very much development.

1,518. And that will mean considerable employment of natives?—Yes.

1,519. I understood you to state just now that we might possibly get here 4,000 boys a year from Barotseland. Are you taking into account your own requirements?—No, I think I have rather over-estimated.

1,520. Having regard to the possible requirements of your own country, and the mines in the immediate neighbourhood, what are our chances?—I should say the chances would be very small for any large number.

1,521. Can you give us an idea?—It would depend on the local Government. The local Government might refuse to allow the recruiting of native labour. The probabilities are that very few Barotse boys would come to Johannesburg.

1,522. Do you know where they go to?—They go to various mines in Matabeleland.

1,523. You mentioned just now that a considerable number of the boys did not return. Do you think the high mortality here might account for them not returning?—I know a certain number die, but you are in a better position probably to give figures than I.

1,524. You have not heard anything about the high death-rate among Barotses in Kimberley?—Yes, I know the death-rate is high there.

1,525. Is it not the case that they gave up recruiting for the Kimberley mines?—I hear that they have. Probably the death-rate accounts for it.

1,526. At what age do they come to the mines?—About 20 up to 40 to 45 years of age.

The CHAIRMAN then intimated that the Commission would continue its sitting in private, and that the public sitting would be adjourned until 10.30 a.m. the following day.

## SIXTH DAY.

*Thursday, 30th July, 1903.*

THE COMMISSION SAT AT 10.30 A.M.

Mr. VAL GIELGUD, called, sworn and examined.

1,527. The CHAIRMAN: Your name is Mr. Val Gielgud?—Yes.

1,528. The CHAIRMAN: You are from Rhodesia, I understand?—Yes.

1,529. Have you resided there for any length of time?—In Rhodesia, yes; I have resided there continuously since 1896.

1,530. Have you held any official position there?—I was a Native Commissioner in Zambesiland, but during the last three years I have been on a special mission to the north of the Zambesi.

1,531. What is the nature of that special mission?—I was sent up to report on the country, and generally to look after matters, while the boundaries were being defined.

1,532. Do you occupy any official position at the present time?—No.

1,533. We have before us a memorandum headed "Evidence of Mr. Val Gielgud." Do you wish to put this in as your evidence-in-chief?—Yes, it is as follows:—

I have the honour to submit for your information the following figures regarding the adult male population of the natives inhabiting Southern Rhodesia: Matabeleland, 32,157; Mashonaland, 82,517; total, 114,674. Allowing that 60 per cent. of this total is available for work, then 68,804 work for some portion of the year. The duration of the period for which natives of Southern Rhodesia work rarely exceeds three months; the majority are exceedingly averse to underground mining. The two

districts with which I am most intimately acquainted are the Zambesi Districts, Mafungabuzi, Sebungwi, and Wankie, and also the country to the northward known as the Hook of the Kafue, which is inhabited by the Abatshukulumbwi, or Abaiyila, and the Walengi tribes. On the Zambesi the Batoka natives are good workmen, and go out for periods varying from three to five months. These natives readily find employment in Matabeleland, and (with the exception of the Shangaans) are the only class of labour in Rhodesia which has proved itself satisfactory for mining work. The great drawback to the employment of these natives is the fact that they are extremely susceptible to pneumonia and other chest complaints when employed in the colder climate of Matabeleland. The official return estimate the number of these natives living in Southern Rhodesia at 3,463, of which about two-thirds appear to have worked for three months of the year. The fact that the railway is being constructed from Bulawayo to the Victoria Falls, and that the Wankie Coal Fields are being actively developed has, no doubt, had the effect of absorbing the greater part of the Batoka labour supply, for both these enterprises are in close proximity to the Zambesi, and so to a great extent depriving the Matabele mines of labour from this source. As regards the Hook of the Kafue, the Hook of the Kafue was, when I first entered it in 1900, in a state of the most primeval savagery. The natives, especially in the Abaiyila, has never come under the influence of any white Administration; to the northward the slave trade still flourished. Since then, the Northern Copper Company have actively pushed forward the development

of their mining properties in this locality and are able to obtain labour, although in quantity insufficient for their requirements in the district. The Abaiyila, a truculent tribe of natives owning cattle, are not for the most part inclined to labour of any sort, and when they do work, prefer to do so for the shortest time possible, generally one "moon," or 28 days. In some cases they are induced to engage for three months, but if during this period they become bored with their work they have no hesitation in deserting. I believe, when they are induced to work, that they do not show any particular timidity about working underground, but they are very lazy. They are, in my opinion, the same race as the Batoka, inhabiting the Zambesi, and will no doubt develop the same traits when they have been brought more in contact with civilization and its methods. The Baluba are a race inferior in physique and spirit to the Baiyila, but more docile and easily managed. Living in the tsetse fly country, they are very poor, and work to procure blankets, beads, etc., with which they buy wives. These people were at war with the Baiyila in 1899 or 1900, by whom they were defeated. They have never recovered from their defeat, living in small communities throughout the more secluded and remote parts of the district. The Walengi are a more intelligent and virile race than the Abaluba, but have been up to the establishment of administrative posts in the country under the influence of the West African slave traders. A very small percentage of any of these tribes go to work. No hut tax has ever been collected in this district, nor has any census ever been taken. The numbers, therefore, given below of natives available for work are merely approximate: Abaiyila, 4,000; Baluba, 2,000; Walengi, 3,000. Certainly the percentage of these men who work is much below 60 per cent. All these natives from the north are extremely susceptible to cold, and suffer very much from chest complaints, especially pleurisy and pneumonia.

1,534. In the first paragraph of your statement, you make the adult population to be, of Matabeleland 32,157, and of Mashonaland 82,517, or a total of 114,674?—Yes.

1,535. How do you arrive at those figures?—They were obtained by the Government for the Bloemfontein Conference.

1,536. Can you, from any official source, supplement this, by giving us the full total population of those countries? The figures you give are of the adult male population; can you give us the gross population without any exclusion at all?—In the report of the Chief Native Commissioner for Matabeleland of the 31st March, 1903, many figures are given bearing on these points.

1,537. What I want is some official record of the total population of those countries?—The report I refer to gives the total population of Matabeleland as 187,152; I have no similar figures as regards Mashonaland.

1,538. You say, allowing that 60 per cent. of the total adult male population of the two countries are available for work, we should have 68,804 who work for some portion of the year; can you explain that?—What I mean is that, taking the total adult male population of the two countries, viz., Matabeleland and Mashonaland, to be 114,674, 60 per cent. of that total would be 68,804, who may be taken to do some work.

1,539. But those people do not work all through the year?—No, some only work for one month in the year, others work for as much as three months.

1,540. What do you suppose would be the average length of time for which they work, taking them all round?—I should say two months on the average.

1,541. Then the total available for work at any one time would be, say, one-sixth of the figures of 68,804?—Yes.

1,542. That would be 11,466?—Yes.

1,543. Why do you take the basis of 60 per cent.?—I understand that that was accepted at the Bloemfontein Conference as a fair basis in such cases.

1,544. Where do the natives from Matabeleland and from Mashonaland principally work?—In Southern Rhodesia.

1,545. Does emigration exist to any great extent? Do many of the natives leave the country to work elsewhere?—Very few from Southern Rhodesia; I think practically none.

1,546. You speak of a certain tribe on the Zambesi, the Batokas, who work for from three to five months; what is the population of that tribe?—The Native Commissioner living there, on the south bank of the Zambesi in Southern Rhodesia, gives the number of native adults as 3,463.

1,547. That is the number of that tribe?—Yes, of that tribe.

1,548. In making reference to the susceptibility of these natives to pneumonia and other chest complaints, to what tribes do you specially refer?—I refer particularly to the Batokas, and more generally to kindred tribes inhabiting the valley of the Zambesi.

1,549. Do you wish to supplement the statement you have made, in any way, before the members of the Commission examine you?—I do not think so.

1,550. There is no other information which occurs to you at the moment that you could give to the Commission?—No.

1,551. Mr. WHITESIDE: I think we may take it from your evidence that you have a good opinion, as a whole, of the Zambesi boys as mine labourers?—Yes, but of the Batokas especially.

1,552. In your statement you refer generally to several different tribes, by the term "Zambesi boys"?—Yes.

1,553. Have you any estimates of the total populations of the several tribes?—The total populations given in the reports of the Native Commissioners of the several districts are as follows: Of the Sebungwi and Mafungabusi, together, 19,135; of the Zankies, 2,200.

1,544. That gives a total of 21,000 odd?—Yes.

1,555. Have you any idea of the approximate number of natives employed in the mines of Rhodesia?—The figures given by the Chamber of Mines for the Bloemfontein Conference, such figures having been collected by the Government from various sources, was: For mining alone, 16,335; for other requirements, 19,500.

1,556. Could you give us any idea of the population of the tribes in the Hook of the Kafue?—There has been no census. I may say that the numbers of the three tribes given by me, namely, 9,000, as possibly available for work are entirely approximate.

1,557. Is the figure of 9,000 you refer to, on page 2 of your statement?—No, on page 3.

1,558. Oh, yes, I see; so you estimate as available for work from the three tribes some 9,000?—Yes, I think about that.

1,559. Mr. PHILIP: Do you think there is any possibility of our getting any addition to our labour supply from the districts you have referred to?—I think the possibility is a very small one.

1,560. From Southern Rhodesia?—None from Southern Rhodesia.

1,561. Mr. EVANS: In your opinion how would the natives from north of the Zambesi be likely to stand the climate here?—I think they would suffer very much from chest complaint.

1,652. If we made a great effort to get natives down here from those districts, how many do you think we might be likely to secure—any considerable number?—At present in Southern Rhodesia they have not sufficient labour to go on with, therefore any natives who wanted work would be most likely to obtain it in Southern Rhodesia.

1,563. Taking the whole of Rhodesia, can we look for any possible addition to our supply from there?—I think that, at present, you cannot look for any increase such as would do you any good; you might get a few hundred boys.

- 1,564. They employ some 16,000 in the mines there?—Yes, and 19,000 in other directions.
- 1,565. Could you give us any idea of what their additional requirements are likely to amount to?—From figures supplied to the Bloemfontein Conference it appears that it was estimated that the additional requirements would be: 25,000 for mining, and 30,000 for other industries.
- 1,566. From where do they hope to get them?—I do not know.
- 1,567. Is there any chance of their own requirements being supplied from Rhodesia?—I do not think they can be supplied from there.
- 1,568. Where do the boys at present employed in the Rhodesian mines come from, and in what proportions?—55 per cent. of the boys at present employed come from outside territories.
- 1,569. From where?—From Portuguese East Africa, and from the north of the Transvaal.
- 1,570. What percentage comes from Portuguese East Africa?—The figures given in the report of the Chief Native Commissioner mention as coming from Portuguese territory some 55 per cent.; 10 per cent. from the Northern Transvaal, and 15 per cent. from the Northern Zambesi; they do not quite agree with the figures supplied to the Bloemfontein Conference, which put the number of alien boys employed at 55 per cent.
- 1,571. Then 55 per cent. come from Portuguese territory?—Yes, from 55 to 60 per cent., say.
- 1,572. Are the mines permitted to recruit in Portuguese territory?—No.
- 1,573. Have they at any time been allowed to recruit there?—I do not know.
- 1,574. What is the position to-day?—They expect to lose their Shangaan labour, as the natives are no longer coming in.
- 1,575. Have the Portuguese authorities taken steps to prevent them?—I could not say for certain; I am not in a position to know.
- 1,576. How then do they propose to make good their loss of supply?—The present intention, I believe, is to organise a Labour Bureau in Rhodesia, and to try and recruit in Rhodesia in order to make up for losses in the outside supplies.
- 1,577. Do you think they will succeed?—I think it very doubtful.
- 1,578. Have any attempt been made to get native labour for Rhodesia from parts other than Portuguese territory?—Yes.
- 1,579. What was the result?—I do not know.
- 1,580. Where did they try?—They tried, I believe, to recruit from amongst some people they called Arabs, I think, at Aden, but I am not quite sure about this.
- 1,581. From Somaliland?—I do not know.
- 1,582. Do you know what was the result of the experiment?—I believe the natives they wished to recruit were not obtained; the experiment was not successful, and I believe the efforts were abandoned.
- 1,583. You have referred to the reports of the Native Commissioners; do you consider the figures given in such reports are reliable, and about the best evidence we are likely to obtain?—Quite the best, I should say.
- 1,584. Can you mention any reports which are available to us?—In the report of the Native Commissioner of Matabeleland, from which I have quoted, there are contained, I should think, about all the figures and information available in connection with that country dealing with the natives; there is, I believe, a similar report applying to Mashonaland, but I have not a copy of it. The figures in both of these reports would, I think, be the best you could get.
- 1,585. Can you tell us anything about the rates of wages ruling in the districts with which you are acquainted?—The average wage paid for mining work last year was 37s. 6d.
- 1,586. Do you think an increase in the wage rate would bring out a larger number of boys?—If might have some effect; I am doubtful if it would have very much.
- 1,587. Do you not think higher wages have a tendency to increase the supply of labour?—Speaking of Southern Rhodesia, I think not necessarily; in that part the native will only work as a rule for some specific purpose, to obtain some particular thing he requires; if he finds it necessary to work in order to pay his hut tax, he will do what is necessary to get money for that purpose, and will do no more; in other cases he may want a blanket and must work to get one, but he will do no more than is really necessary.
- 1,588. Do you know the Ayrshire Mine?—Yes.
- 1,589. How are they off for labour?—At present, I think, they have sufficient.
- 1,590. Do they employ many hands?—I do not know.
- 1,591. Where do they get their labourers from?—From Portuguese territory, I think; they get a certain quantity from the North; I mean from the Portuguese territory to the north of the Zambesi, not from the Eastern Portuguese territory.
- 1,592. Should the Portuguese succeed in effectually preventing the supply from coming out, your position will be that you will have not half of the labour you have now?—Yes, that is so, according to the figures.
- 1,593. Are you getting any natives from the Transvaal?—The number employed in mining work last year coming from the Transvaal is given as 10 per cent. of the total employed in the mines.
- 1,594. They would be principally Shangaans, I suppose?—Yes, Shangaans who have settled down in the Transvaal.
- 1,595. Do the Mashonas and the Matabeles work underground?—Very little; the Mashonas especially do not care to go out of their own country.
- 1,596. Mr. GOCH: I take it from the percentages you have given that of the 16,300 men recruited for mining purposes only some 5,700 are recruited locally?—The Chief Native Commissioner states in his report on Matabeleland natives that 55 per cent. of the labour comes from Portuguese territory, and that nearly all of those natives work underground, their service averaging from six to eight months each, and that 10 per cent. of the labour comes from other parts, chiefly from the Northern Transvaal. If we take 55 per cent. from Portuguese territory, 15 per cent. from North of the Zambesi, and 10 per cent. from the North of the Transvaal, that makes 80 per cent., which would leave 20 per cent. as being got locally.
- 1,597. Perhaps we might say that, roughly, 5,000 is the number recruited locally for mine work?—It may be so.
- 1,598. You give as your estimate of the numbers available for work, on the third page of your statement, only 9,000; I find that one-sixth of the total population of Matabeleland and Mashonaland amounts to about 19,000—you only think 9,000 would be available for work?—The figure 9,000 only refers to the district known as the Hook of the Kafue and not to Southern Rhodesia. There is no estimate given of the total population of the Hook of Kafue.
- 1,599. Allowing for them to work for two months at a time?—No; 9,000 is the total number estimated as available in the Hook of Kafue.
- 1,600. You said that there were employed for other purposes than mining in Rhodesia some 19,500; are they recruited from Matabeleland and from Mashonaland?—I have no figures to shew where they are recruited from.
- 1,601. The 19,500 are absorbed for purposes other than mining in Rhodesia?—Yes.
- 1,602. So far from Rhodesia being a field from which we might be able to recruit labour for our purposes in the Transvaal, it would appear that you yourselves in Rhodesia will require 55,000 additional

to what you can already get?—Yes, the additional requirements are estimated to be 55,000. That is for the next two years.

1,603. Is it not quite hopeless, therefore, for us to suppose we can get any labour from there?—I should say so; that is, in any number to influence the conditions here.

1,604. Mr. QUINN: I understood you to give it as your opinion that the native would only work for such time as was sufficient to earn money to pay his hut tax, or to provide himself with any special article he required; on what do you base that opinion?—On my observation of the native. It appears to me that it is the custom of the native in that part at any rate to work only to get a blanket or any other particular object he desires, and when that aim is accomplished he goes back to his kraal.

1,605. Is not the native likely to acquire further wants from time to time?—Matabeleland has been occupied since 1896, and so far the native there has shown no particular desire to increase his wants since then. By raising mealies, etc., he can to a certain extent raise what little money he ordinarily requires.

1,606. Where new labour fields are opened, is it not the experience that the natives come in to those fields slowly at first, but later come in in increasing numbers?—My own knowledge is confined to cases where new industries are established and certainly such usually absorbs the native labour available.

1,607. Is it not a fact that in Portuguese East Africa at first only few natives were available, but later on the numbers increased?—I have no knowledge of Portuguese East Africa; so far as my experience goes, the natives do not come in to work in increasing numbers under normal conditions; they came to Rhodesia in greater numbers during the war.

1,608. So that you are of opinion that the native does not, like other people, increase his wants?—The Matabeleland natives do not appear to me to have acquired fresh wants.

1,609. Mr. TAINTON: Labour is scarce in Rhodesia?—Yes.

1,610. For how long has it been scarce?—Mine labour is always scarce there.

1,611. Has there been any increase in the labour requirements?—I should say so, but I have no figures as to such increase in the past. As stated, mine labour has always been scarce. At times there has, I believe, been sufficient labour for surface work.

1,612. Your requirements: have they increased?—I imagine they will increase.

1,613. They will increase further?—Yes, I have already given the figures shewing what the estimate of the increased requirements is for the next two years.

1,614. Have you recruited in Portuguese East Africa?—Not that I am aware of; some native supply has come in from there, but so far as I am aware there has been no organised recruiting there.

1,615. What system of recruiting obtains in Rhodesia?—Some years ago a native labour organisation was formed, but it was not very successful; they found that the natives came in voluntarily as fast as they did when recruited.

1,616. Was there not a proclamation issued with regard to recruiting through the Chiefs?—Not that I am aware of, but for the last three years I have been away from Bulawayo.

1,617. Then you are not aware of any such proclamation?—No.

1,618. Did you ever make use of the chiefs in recruiting?—I have never been employed in recruiting.

1,619. But from your position as Native Commissioner you would have some knowledge of what is done in such cases?—I think the recruiters usually went direct to the natives themselves, making speeches to them, and generally endeavouring to persuade them to come to work.

1,620. How are the natives accommodated on the land in Rhodesia; are they on Government land?—Some are on Government land, and some on private land.

1,621. You do not know the proportion on the different classes of land?—No, but there may be some statistics bearing on the point.

1,622. What is the tax on natives on Government farms?—10s. per head.

1,623. On private farms, is there any tax?—There is a system of rent; agreements are made with the farmers as to payment of rent. But all adult natives pay a tax of 10s. whether they live on private or on Government ground, in addition to the rent paid to the farmers.

1,624. What is the amount of the rent?—It varies.

1,625. Roughly?—I think about £1, but I could not say exactly.

1,626. Is that because the Government land is scarce?—No, Government reserves exist.

1,627. Can you give us the acreage, per head, of Government land?—I could not.

1,628. Could we get the figures anywhere?—You might be able to do so if you apply to the Government. I do not know that any exist.

1,629. You said that the natives of Southern Rhodesia would only work to acquire a specific object, or for a specific purpose; did you intend that to include the natives of Rhodesia generally?—I was referring specially to the natives of Matabeleland and Mashonaland.

1,630. And others, what do they work for?—I do not know that they work at all.

1,631. Has the native food supply ever been scarce?—Yes.

1,632. What effect had that on the labour supply?—Doubtless, it had the effect of inducing more natives to go to work.

1,633. They would go out to earn money to buy food?—Yes.

1,634. Have there been any special causes affecting the labour supply, such as droughts, etc.?—The Chief Native Commissioner reports that the crops have recently failed and that the labour supply latterly has improved somewhat in consequence.

1,635. Have you been troubled with rinderpest?—Yes.

1,636. Did it destroy the cattle?—Yes.

1,637. You have another disease amongst the cattle there now, I believe?—Yes.

1,638. Are the people there wealthy in cattle?—No.

1,639. What is the system of dowry in existence there?—In Rhodesia it varies; in Northern Rhodesia often a few beads or Kaffir hoes. I cannot say what is the custom in North-Eastern Rhodesia; in Southern Rhodesia sometimes cattle or money, varying from £1 to £10.

1,640. In order to secure the money necessary for this, do not the young men go to work?—Not to any great extent. In many cases the old people waive their rights in this respect. The custom is not very strictly observed in Southern Rhodesia.

1,641. Are you bothered with locusts up there?—Yes, I understand so, but I have not been in Southern Rhodesia for the last three years. I am not able to say to what extent.

1,642. Seeing that the natives will work for specific objects, can you express any views which would assist us in arriving at the numbers which might be made available to us for local purposes?—No, I think I have given you all the figures I have.

1,643. The labour supply there fluctuates a good deal, owing to various causes, does it not?—I do not think it fluctuates to any very great extent.

1,644. If we had prosperous years, would that affect the supply at all?—I suppose the tendency would be to cause less natives to work. They would have more grain to sell.

1,645. So that estimates based on figures do not hold good from year to year?—Not necessarily, but approximately, I think, yes.

1,646. Mr. FORBES: You mentioned the average wage rate, in mining, as 37s. 6d., I believe?—Yes.

1,647. Have you any idea of the reason why the native of the Transvaal goes over the border into Rhodesia to work for a less rate than he can get in the Transvaal itself?—I do not know what they get in the Transvaal; but it does not follow that every boy gets 37s. 6d. That is stated as the average. The statement of the Chief Native Commissioner, I think, gives some of the different rates of pay. Yes, I find that the Inspector of Compounds says that the rates vary, the very lowest rates paid to small boys employed as cooks and scavengers, who receive from 7s. 6d. to 15s. a month. Natives working on the surface at windlasses, emptying trucks, etc., get 20s. to 40s. a month; underground boys receive from 35s. to 60s. a month. The majority of these are classed as first, second and third class workers, and are paid accordingly. A few natives on every mine who are classed as specially skilled, e.g., blacksmiths, pump boys, drivers, etc., receive from 60s. to 120s. a month.

1,648. The ordinary mine boy, then, receives less than he does in the Transvaal?—I do not know the Transvaal mine rates.

1,649. Why do they prefer to go to Rhodesia?—I think it may be because it is closer for them.

1,650. Mr. WHITESIDE: If the Zambesi boys were brought here early in the summer months, do you think they would get acclimatised?—I do not think they would, but, of course, I could not say for certain that they would not.

1,651. You said that you thought they would suffer from chest complaints if brought here?—Yes, but they suffer in that way in Matabeleland.

1,652. You do not mean the Commission to understand, then, that you think they would suffer from such complaints more here than there?—Well, it is colder here. The complaints are contracted here, or, I should say, would be contracted here, in my opinion, more from coming out of a warm air in the mines to a colder air on the surface, rather than from the actual temperature or climate here, above ground. I should think the extra liability to such disease would be due to the conditions of their work here.

1,653. Could you give us any progressive figures as to mining during the last five years?—No.

1,654. Is it a fact that Rhodesia has not progressed in the same ratio as the Rand did in its early days?—I could not say.

1,655. You state the estimate of the future requirements is 55,000. Are those figures derived from the Chamber of Mines' estimates?—The figures were collected by the Government for the Bloemfontein Conference from various sources.

1,656. I think you said they emanated from the Chamber of Mines?—No, I referred to other figures; the estimate of 55,000 was obtained for the Bloemfontein Conference.

1,657. Where from?—The figures for the Bloemfontein Conference were obtained from various sources by the Government; from mining officials and other Government officials, such as Native Commissioners and others.

1,658. What was the reason for stating you doubted the success of the Labour Bureau which it is suggested shall be established in Rhodesia?—Because the native there does not need to work at all; he can raise the amount of his hut tax so easily that he does not need to go to work in the mines to earn it.

1,659. How long have you been in Rhodesia?—I was in Rhodesia in 1890; I left it for two years,

and I have been in the Tati Concession. Since 1891, I have been in Rhodesia, 10 or 12 years in all.

1,660. Do you know of any attempt having been made to induce imported labour into Rhodesia?—Just as a matter of common knowledge; I have no particulars of it.

1,661. Are you able to tell us why that attempt was not successful?—No.

1,662. Mr. QUINN: As to that figure of 55,000 which you gave from the report as an estimate of the future requirements, had you found it printed as 155,000 you would have given it as the latter just the same?—Yes, as they were collected from reliable sources.

1,663. As far as those figures go, you do not know whether they are correct or not?—No, not personally.

1,664. Mr. PERROW: Your rates in the mines range from as low as £1 to as high as £6 per month, I understand?—The latter is for special boys.

1,665. It is the first time I ever heard of such a high rate being paid; what sort of boys do you get for £1 per month?—I do not know.

1,666. What sort of boys do you get for £6 per month?—The report says they are employed as pumpmen and in other similar capacities.

1,667. Have you ever heard of complaints from the boys who receive only £1 per month?—No.

1,668. Do you think if the boys in Rhodesia got to know of the high rates we pay here, they will be inclined to come here to work?—It is my opinion that in Matabeleland and in Mashonaland the rate of pay does not carry much weight with the boys; they do not care to leave their country.

1,669. The CHAIRMAN: You have quoted from the report of the Chief Native Commissioner of Matabeleland; are you prepared to put that report in?—I have no authority to do so, but I will telegraph for authority, and, if it is forthcoming, as I quite expect it will be, I shall be glad to do so.

1,670. You have referred to a similar report as applying to Mashonaland; could you assist the Commission to obtain a copy of it?—I shall be glad to do so; I will telegraph and endeavour to secure a copy for the information of the Commission.

Thank you, if you will be so good. The Commission is much obliged to you for attending and giving evidence.

The witness then withdrew.

SIR GODFREY LAGDEN, called, sworn, and examined.

1,651. The CHAIRMAN: You are Sir Godfrey Lagden?—Yes.

1,672. You are Commissioner of Native Affairs for the Transvaal?—Yes, sir.

1,673. How long have you held that position?—I was appointed in December, 1900.

1,674. You had some experience in the Transvaal previous to that?—Yes, I was here during the British occupation in 1881. I was here for about 4½ years.

1,675. Did you hold an official appointment during that period of 4½ years?—Yes. I was first of all Principal Clerk to the Colonial Secretary at that time, and afterwards I was appointed Private Secretary to the Governor, which position I held until the retrocession took place in 1881. When that took place and the Governor left the country, the Royal Commission sent out from England also left the country, leaving behind a Sub-Commission consisting of Sir J. de Wet, Chief Justice Kotze and the British Resident, Mr. Hudson. I was appointed Secretary to that Sub-Commission, and our duties were to investigate all the claims for compensation in the Transvaal and to pay them off. I was engaged several months in this work, and, having completed it, I left the country in 1882. I think it was early in 1882, to be correct.

1,676. Then what South African experience had you between 1882 and your taking up this appointment in December, 1900?—After a period of service on the West Coast of Africa, I came back to South Africa in March, 1884, as Secretary to the Government of Basutoland, and subsequently became Resident Commissioner in that territory until 1900. During the interval I was sent up to Swaziland as British Commissioner. I was up there for one year.

1,677. Did you then return to Basutoland?—Yes.

1,678. So that you have had, can I say, about 25 years' experience in South Africa, and the greater portion of it has been in connection with native administration?—Yes.

1,679. Your Department has been busy getting up certain statements to lay before this Commission?—Yes.

1,680. The Commission's enquiry is divided into two heads, one is the requirements of the agricultural, mining and other industries of the Colony. Are you able to give us any evidence on the requirements of these industries?—The second division of the Commission's enquiry has to do with the available supply of labour in Central and Southern Africa.—I do not think it would be wise for me to offer evidence on the subject of requirements. I have my opinion, but I think there are many others whose opinions are much more valuable than mine in that respect. On the question of supply, I can give you information.

1,681. We have before us a blue-print headed "Diagram shewing particulars concerning the estimated population of the Transvaal (excluding Labour Districts in Mining Areas)" (v. pp. 118, 119). We also have before us a document headed "Sir Godfrey Lagden's Evidence"—"Memorandum of the Estimated Population of the Transvaal" (v. pp. 106-117). This document runs into 12 pages. Is it your wish to hand these documents in as your evidence-in-chief?—It is my wish to hand it in as the evidence that I produce in the matter of population and distribution; but I wish it clearly understood that it is not a census in any sense, but an approximation only, which is believed to be fairly correct.

Sir Godfrey Lagden's statement was then put in and read as follows:—

**MEMORANDUM TO ACCOMPANY RETURNS OF THE ESTIMATED NATIVE POPULATION OF THE TRANSVAAL.**

IT APPEARS from these returns that, apart from other mining centres of the Transvaal, there are on the Witwatersrand Area alone 125,177 coloured labourers (excluding Asiatics) employed at the present time on mining and other works, 21,466 of whom are domiciled in the Transvaal; and that the immigrant population may therefore be taken to be about 100,000.

It should be understood that the return of population, exclusive of Labour Districts, cannot be accepted as an actual census, as the figures have only been compiled from information obtained during the collection of the General Native Tax. Particulars could not be gathered concerning a considerable number of men who were absent at work, and have not yet paid their tax.

It may be, therefore, that the total population of the Transvaal (excluding Swaziland) might amount to 620,000, whereas 20 years ago it was estimated at 800,000, and has been quoted at that number ever since.

**NOTES UPON THE DIAGRAM SHOWING PARTICULARS OF THE POPULATION EXCLUDING LABOUR DISTRICTS IN MINING AREAS.**

**COLUMN "H."**

It is assumed that the 39,503 adult males available, but not now at work, will be ready to replace a portion of the 55,477 who are shown under Column "F" to be in service at the present time.

**COLUMN "J."**

Natives domiciled on farms are not, generally speaking, available for other work.

**COLUMN "R." (1.)**

As the total number who were at work beyond their Districts during the past year, as enumerated from passes issued, amounted to 69,427, and the number residing in locations is 31,481 (Column "L"), it may be taken that the greater proportion of location natives went to work during the year, allowance being made for the fact that as a rule the period of service is limited to six months at a time.

(2.)—It should be observed that the percentage of men at work during the year (viz., 50.36) represents for the most part those who are not farm residents, of whom the percentage is 56.68 (Column "J"). This shows that a certain number of farm natives went to work elsewhere in addition to those from locations and Crown Lands.

**COLUMN "S."**

The number available for service beyond their districts in any one year appears to be 36.75% of the total adult population of 137,839, which is equivalent to about one-third.

Native Affairs Office,  
Johannesburg.  
24th July, 1903.

COMPARATIVE SCHEDULE SHOWING TERRITORIAL ANALYSIS OF LABOUR EMPLOYED AND MORTALITY ON MINES AND WORKS.

	Portuguese.	Cape Colony.	Transvaal.	O.R. Colony.	Natal and Zululand.	Rhodesia.	Basutoland.	Swaziland.	Bechuanaland.	B.C.A.	Not Classified.	Total.
No. of Natives employed on Mines and Works.	49,470	4,256	7,764	169	1,465	280	1,874	517	1,474	368	125	67,782
Percentage .. .. .	72.99	6.28	11.46	.25	2.20	.41	2.76	.76	2.17	.54	.18	—
Mortality—Mines and Works 1st Nov., 1902, to 30th June, 1903.	2,186	26	171	4	17	5	10	23	10	2	4	2,458
Percentage .. .. .	83.93	1.05	6.95	.16	.09	.20	.40	.03	.40	.08	.16	—
Mortality— Below Average .. .. .	—	5.23	4.51	.09	1.51	.21	2.36	—	1.77	.46	.02	—
Mortality— Above Average .. .. .	15.94	—	—	—	—	—	—	.17	—	—	—	—

Note.—(1) Statistics of total labour employed on Mines and Works as shown in above Return are compiled up to and including 24th July, 1903, and includes all Districts—Johannesburg, Krugersdorp, Boksburg, Germiston, Springs, Heidelberg, Klerksdorp and Vereeniging. Mortality statistics as above show all deaths during period 1st November, 1902 to 30th June, 1903, but do not include Heidelberg, Klerksdorp and Vereeniging. For purposes of comparison it is not considered that the Return is materially affected by their non-inclusion.

Note.—(2) The above comparison would appear to demonstrate that while Natives coming from Cape Colony and those belonging to this Colony are the healthiest, the Portuguese are practically the only Natives whose death-rate is abnormal—in their case it is excessive.

N.B.—This Statement does not include:—

(1.) The districts of *Wolmaranstad* and *Bloemhof*, in which there are no representatives of this Department, and no returns have been obtainable; the Population of these Districts may be estimated at 5,000.

(2.) The natives other than "imported labourers" who have become domiciled in Labour Districts, amounting approximately on Farms to 12,000; in Locations 10,000.

The addition of these figures, which includes women and children, would show a total Population of about 605,000.

PREPARED IN THE NATIVE AFFAIRS DEPARTMENT,  
24th July, 1903.

1,682. Would you mind reading the three first paragraphs of this document, marked No. 1 (v. p. 106)?—Yes. They are as follows:—

1,683. "It appears from these returns that, apart from other mining centres of the Transvaal, there are on the Witwatersrand area alone 125,177 coloured labourers (excluding Asiatics) employed at the present time on mining and other works, 21,466 of whom are domiciled in the Transvaal; and that the immigrant population may therefore be taken to be about 100,000. It should be understood that the return of population exclusive of Labour Districts, cannot be accepted as an actual census, as the figures have only been compiled from information obtained during the collection of the General Native Tax. Particulars could not be gathered concerning a considerable number of men who were absent at work and have not yet paid their tax. It may be, therefore, that the total population of the Transvaal (excluding Swaziland) might amount to 620,000, whereas, 20 years ago it was estimated at 800,000, and has been quoted at that number ever since."

1,684. Now I understand that this blue diagram (v. pp. 118, 119) has been prepared in anticipation of the Commission requiring the evidence from you?—Yes, sir; it has been put together. I should not say it has been compiled for this Commission. The necessity for it was emphasised, because when we met at the Conference at Bloemfontein, the delegates discovered that none of them had any reliable statistics regarding the population in their various territories; no information that they could put their hands upon and say, "Certain things are facts, certain numbers are positive." I had set enquiries in motion a year ago, after the war was over, to ascertain the native population in the Transvaal and its distribution, but the necessity for doing it in an elaborate way was brought home to me very forcibly at this Conference at Bloemfontein, which was conspicuous for the absence of positive figures. After that Conference I gave specific orders that we should gather information which would enable us to put forward authoritatively a return like this. My design was to do it in conjunction with the tax collection. That is to say, when each man came up to pay his tax, he should declare to the tax-collector what his family consisted of. That has been carried out very well indeed, but there remains a certain number of men who were at the different centres of labour who have not yet paid their tax, and information concerning whose families we have only been able to arrive at from the information of other members of the kraal, and we have derived the information in the best way we could. I do not think we can have missed any large number. I should not have put these statistics out at the present time, nor until the tax collection had been completed, were it not that this Commission had been appointed, and I felt that the first information you would want to know was, what the population was, where it was, and how it was made up. For that reason I have hurried this forward, and should like to have had another six weeks or two months to have completed it. It is not after all a pure census. If it may be desirable to print these statistics in connection with your information here, I should ask the Commission and members to bear in mind that it is not quite complete, although it is very nearly complete. The proportion, I think, may be taken as correct.

1,685. I see that the total figures you give make the population 605,000?—There are two or three districts where I have no officers attached to this department, and I have been unable to get any statistics of population, but have been obliged to estimate it.

1,686. You say in your memorandum (v. p. 106), "It may be, therefore, that the total population of the Transvaal (excluding Swaziland) might amount to 620,000"?—Practically it is so. We know that there are 605,000, and in consequence of some having failed to pay tax we can get further information when the men who are at work return and pay their tax. When we get that information I think it will bring us to a total of 620,000. But 605,000 is the practical base as a certainty.

1,686A. Apart from the question of total population, your diagram shews many useful sub-divisions of population into men, women, and children; the distribution of adult males, and so on. Then you have worked out here the percentage of the total population under all these different heads. Do you think that when you get in, during the next six weeks, the additional information from the tax-collectors, that these percentages will be materially altered in any way?—I think the percentages will be almost unaltered, that is the proportion of one to another.

1,687. Then do you tell the Commission that in arriving at these sub-divisions into men, women and children, and so forth, that you have been guided by the statements made to your officials by the natives as they paid their tax?—Yes.

1,688. Did you give the tax-collectors a schedule of the questions which they had to put to every native?—Yes.

1,689. In your experience in South Africa have you ever seen in connection with any Government Department a table so exhaustive as this seems to be?—No, I never have. I should have been glad to have seen something of the sort. It would have been a guide to me in obtaining it. It may be that I have left out some useful particulars that others have already got, but I have heard of nothing of the sort before.

1,690. What information is usually compiled by Colonial Governments in regard to the native population?—The most complete work that was done, I believe, was in the Cape census of 1891. I think that they had a very complete census in the Cape, and in that census, which is a most comprehensive one, they have a great many more details than I have got here. They counted the number of waggons, horses, mules, and pigs, and everything the natives had got. Well, that was for one year, and I presume they also took the number of polygamists and the number of wives, but I am not quite certain. This census is the nearest approach to anything of the sort, it is peculiar to the Cape Colony, and I do not think any other State and certainly no Republic would tackle it in such a comprehensive way.

1,691. From your experience, do you think statements made by natives in reply to the questions put by men acting as tax-collectors, with regard to their families, can be relied on?—If they are questions put by men to whom they are responsible and whom they look upon as their officers, I have always found that they give their answers very nearly correctly. They have nothing much to gain by holding back anything or in exaggerating.

1,692. What tax is now placed on the natives of this country?—Every full-grown man—able-bodied adult male—pays £2, and if he has more than one wife, for the second and succeeding wives £2 each for them.

1,693. Would that tax not induce certain natives to give false information in order to save themselves the additional £2?—Well, it might.

1,694. Have you any check on it?—Yes, in the process of collection. The first stage is to call the men together and let them tender their payments, then to ask them the questions. Subsequently the value of the native police attached to my department is that they go round and ascertain whether the men are hanging back, and, secondly, whether they were giving false information as to the number of their wives. Then the heads of the kraals are held responsible for the bringing up of the natives to pay, and are present in most cases when the natives make their statements and are called upon to say whether they are correct or not. I do not think the margin of misstatements is very great. In the Transvaal, this is the first systematic statement that has been made. It might be that there are defaulters. It may be that to a small extent we have been deceived. But my men are experienced, and have been associated with other territories. In Zululand, Basutoland, and such places that are exhaustively recruited from, every man, with very few exceptions, pays what he ought

to pay. There is a public opinion in the matter, and if a man gives wrong information someone rounds upon him and tells the native police or officers that that man has "humbled" them, and he has to be looked after.

1,695. You have some check?—Yes.

1,696. Now, dealing with the diagram (v. pp. 118-119), your memorandum gives some explanatory information with regard to the sub-heads or columns. The first head is "Population divided into men, women, and children"?—Yes.

1,697. Then you have "Adult males" as your next heading?—Yes.

1,698. The second sub-heading is "Adult males unable to work"?—Yes.

1,699. You have a total in the Transvaal of 18,412, or 13·35 per cent. of the males unable to work?—Yes, 13 per cent., Mr. Chairman.

1,700. Now, from what cause?—Probably old age. If we think of the European people among whom we are living, 13 per cent. is not a very large percentage of men unable to go out and do hard physical work, though they may be capable of mental work. Thirteen per cent. are considered to be unable for physical reasons to do hard work.

1,701. And these physical reasons are old age?—Yes.

1,702. Then under the same heading, "Adult males," you have a column, "Available, not now at work," 39,503, or 28·65 per cent. of the population?—Yes. Did you ask me a question on that?

1,703. No, I wished to emphasise that figure 28 per cent.—I think that I may speak at once about that. It will be noticed that the number now at work in the first column of that heading was 55,477. It will be remembered that men in this country and in most of the countries all over Africa, except on the East Coast, work for short periods, as a rule not exceeding six months. Therefore, out of the 55,477 at work at the end of next month a considerable number may return home, and a considerable number of the 39,503 will be required to replace those already at work, that is, from month to month.

1,704. Therefore, this column, "Available, not now at work," amounting to 39,503, is a reasonable reserve?—Yes, as work goes, seeing that men work for small periods, and seeing, also, that the rate of pay has so materially affected the whole labour situation, and that men now work for a much less period than they formerly had occasion to.

1,705. Do you wish the Commission to understand that in your opinion the rate of pay affects the period the native may work?—I think it is the one thing in my evidence to be put in large print. The rate of pay prevailing throughout South Africa has done more than anything else to affect the labour supply. Perhaps you would like me to say why I think so. Before the war there was practically a standard wage throughout South Africa, on the land and in the towns. The mining centres and labour districts, that is, the Witwatersrand in particular, stood by themselves. It was different work to anything else, and the reasons were the great cost and difficulties of locomotion, the great dangers of being robbed; and the risks to life and health; and the pay on paper was high. In one or two other towns in South Africa, perhaps Cape Town, the rate was also high, as high as Johannesburg, if not higher. For the rest of the dominion of South Africa the general rate was certainly not more than half. I doubt if it was more than one-third of what is paid to-day. It has resolved itself into this very important result, that the volume of labour in circulation has been reduced in proportion. This is to say, if a man required to earn a certain amount of money, say, £9, in times passed he would have to work six or nine months, in almost any part of South Africa, except the Witwatersrand. I would go so far as to say that 30s. a month was more or less a standard wage throughout South Africa for good workmen and for young men, less; and the native had to work from six to nine months to realise what he wanted for the year. Now, at the

present time, it is almost an exception to find natives working anywhere for less than £3 per month. This is the result, it has reduced the volume of labour one-half or perhaps more. I have not got the figures of other territories in this matter, I have only got my own opinion. The actual volume of labour in circulation has been most materially reduced by the high rate of wage paid all over the dominion, because the native can, in half the time he used to work, earn, what he used to earn in a much longer time, to satisfy his wants.

1,706. The next main division of your diagram (v. pp. 118-119) is headed, "Distribution of Adult Males." The first sub-division of that is "No. on Farms," which is given as a grand total of 73,001, or 56·58 per cent. of the total population dealt with in this diagram?—Yes.

1,707. Have you any information as to what proportion of that large number are at work on these farms?—That sub-division, sir, is one that, I am sorry to say, I have not yet received data to make; it is, of course, in preparation. Your question refers to actual labouring work on terms with farmers, I suppose?

1,708. Yes; those who are working or simply squatting?—I am not able at the present moment to give you that exact information. I will have it a little later. It may be thought that where natives are on farms they are not in excess of the reasonable number that a farmer requires for agricultural developments and general developing purposes, and that they are all working. There exists in the country a certain number of farms—I am sorry to say there are too many—where natives are allowed to squat, and though they pay a rent for squatting, or they produce something in which they go halves with the farmers, I think it is a very bad system, and hope it will be put a stop to. I cannot say that it exists to a very large extent, but to a considerable extent to-day. There is a Squatters Law which was enacted by the late Transvaal Government and the Free State Government. They entered into an understanding to adopt the same law. They both discovered that there were very good reasons why this inordinate squatting of natives on private lands should be put a stop to, and they made a law limiting five families to each farm, unless a substantial reason was shown by the farmer that he required more, and it was optional for a Government officer to agree to more. In many cases he had more. In many cases he was allowed more if he went in for fruit-growing, irrigation, etc.—then he could have any number he wanted. The law was directed at the suppression of what I call private locations, the same as existed in Natal years ago, and exist to-day, where a land-owner farms natives for high rent instead of farming the land. It led to the collection on these farms of a considerable number of natives who were not available for labour supply throughout the territory. It was an attractive sort of life to the native. He got a hut, was allowed wood and water, and a certain amount of land for pasturage, and a certain amount for agricultural purposes. He was allowed to put up large villages, and generally speaking, it resembled very much a Government location, except that it was not controlled by the Government as the Government locations are. It became an abuse. There are some such farms in this territory, which I hope before very long will be carefully looked at, and that a redistribution will take place, which will give farmers who are in want of labour what they want, and will deprive those who are farming for mere rents of what they do not want. It is an unhealthy and an unwholesome system, these private locations on the land. Therefore, this 73,000 on farms includes those who are employed by the farmer for every-day work to the number of five or more families. It includes also those who are settled on farms as squatters on easy terms, and I think if this Commission goes on for another month or six weeks, I might be able to give it further information on these points, information concerning which is in course of collection. That is one of the reasons that I said that this was a tentative paper of statistics, because I did not get all the information I wanted to get.

1,709. Then your objections to the private locations are the two you have mentioned—the want of proper control, and what I may call the selfish securing of a larger number of natives than the farmer requires?—Yes.

1,710. Then, in these private locations, do you think there would be realised any appreciable number of natives to work elsewhere?—I do not think the number so realised would make a very appreciable difference to the supply required for the mines, but that it will affect the distribution on the land. Would you like me to give you some sort of figure as a guide?

1,711. Yes. You say there would not be an appreciable number?—No, not a very appreciable number.

1,712. That seems rather contradictory to what you have already said; you said a very large number squatting on these lands paying rents?—I think I said a certain number.

1,713. Do you wish to give any explanation with regard to the next sub-division, "Number in Locations"?—Those are Government Locations. The word "Government" has been put in in pencil. There are certain locations in the country, which are called locations, on private farms. These numbers which you see (34,481) are in locations which have been set apart and demarcated by the Government for the natives.

1,714. For the exclusive use of them?—Yes.

1,715. Do they pay any ground rent?—No.

1,716. They contribute nothing more than their £2 per head for hut-tax?—No, nothing more.

1,717. Do you wish to give any explanation of the "Number on Crown Lands," 19,061?—Well, according to the evidence of the late Government, the locations in the country were not large enough for the wants of the natives, and some of them went and squatted on Crown Lands themselves. They were not actually placed on Crown Lands themselves. Others were allowed to do so by the late Government, and therefore they are in this number 19,061. They do not pay any rent. They pay there about the ordinary tax. As this Crown Land becomes absorbed, or requires to be absorbed for settlement purposes, naturally the natives, except so far as they are wanted for farming purposes, will have to leave.

1,718. Are the Government locations large enough to accommodate this number that would be turned off the Crown Lands?—Unquestionably, no. The late Government, which was not very liberal, held that the existing locations were not large enough. They asked that no natives should be allowed to be removed from Crown Lands, because they were very useful for recruiting purposes. And the late Government appointed a Commission to inquire into this very matter, and they gave an instruction to this Commission to remove all natives from Crown Lands. The Commission went into the matter very carefully, and eventually recommended the Government to do nothing of the sort. They said, if you harass these people, and drive them away to Crown Lands, it is true that some of them go on to farms, where they are wanted, but there is no room for them in the towns, because, if more than a certain number of natives went into a town, the town would be swamped with more labour than it required. Now they feared more than anything else that if the natives were driven off the Crown lands, they would leave the territory and either go to Rhodesia, Zululand, or Portuguese territory, or other places, and that this territory might lose the advantage of their labour and their presence. It was in that position in 1899, according to the correspondence now in my possession, that the late Government left it. The last appeal was to the Executive Council to rescind its order that they should be removed, because it was felt by the Commissioners who inquired into it that it would have an injurious effect upon the country generally.

1,719. Your next column which I wish to refer to is "No. of men between the age of 18 and 45, 110,034," or a percentage of 79.89 of the male

population dealt with under the diagram. Have you any reason for fixing these ages as between 18 and 45?—My reason is, they are the ages between which men can, and do, go out for foreign work. Of course, a man in his own district, and at his own home, works before that age, and for many years afterwards, but, as a rule, a man before 18 and after 45, seldom goes abroad. When I say "abroad," I mean he does not go to work outside the district where he lives, say to the mines, or to any great district. That is why I wanted to ascertain what numbers there were between those ages, if possible, so as to ascertain what labour might be expected to be available for foreign fields, especially, natives for the Witwatersrand, where the demand is so great. We have only been able to make an estimate of these ages because no native has his age registered, and it is very hard to tell sometimes. Grey hairs are no guide—at 45 years of age they do not have any grey hairs. The only time that a man is able to tell you his age is when some historical event marks the birth of a child. For instance, the Boer War, the 1881 War, the Retrocession of the Transvaal, or the death of Queen Victoria. Perhaps, all children born in those years are marked down, and you can tell them, but in no other case amongst the population can you arrive at a native's age.

1,720. Except by some historical event?—Yes.

1,721. You have a note here in the column of the diagram (v. pp. 118-119) in regard to "Number at Work beyond their district during year to June 30th, 1903"?—Yes.

1,722. Will you explain that note of yours?—The total number at work beyond that district during the past year amounted to 69,427, and the number residing in locations is 34,481. It may be taken that the greater proportion of natives went to work.

1,723. Then in your memorandum (v. p. 106), column "R" (1) you say: "As the total number who were at work beyond their districts during the past year, as enumerated from passes issued, amounted to 69,427, and the number residing in locations is 34,481 (column "L"), it may be taken that the greater proportion of location natives went to work during the year, allowance being made for the fact that as a rule the period of service is limited to six months at a time."—The number 69,427 in column "R" is the total number of passes issued for labourers to go to work during that 12 months. Well, presuming they went to work for six months each. Go back to that other column "L" and you multiply that 34,481 by 2, and it will give you 68,962, so that if every native in a location went to work for six months in the year the 69,427 would account for them, plus others working on farms. These labour passes do not as a rule refer to those who work in their own district—it is where a man gets the boys to go out of the district. Many might work in their own districts without passes. These are actual passes issued for labour beyond their natural districts. I wanted to say with regard to the location natives, that presumably all of these who are fit for work have gone out for a period of six months or more during the year, so it rather points to the fact that the location men have been out to work, that is the Government locations. But not the natives of the locations on private farms, because I do not think they go out to work very largely.

1,724. But would this figure, the number at work beyond their district during the year ending 30th June, not include passes issued to natives residing on Crown lands, namely, 19,061?—It might include some of them. I do not mean to draw any positive conclusion from it, because it was merely meant to draw attention to the fact that 69,427 passes were issued and there were 34,000 in locations, and I think the greater number of these passes referred to location people. It would have taken in some from farms as well.

1,725. And possibly some from the farmers?—Yes.

1,726. Then some of the 34,481 living in locations would have been too old to go out to work?—Yes, 13 per cent. were too old to go out to work. The assumption is that the location natives have gone out to work very well in my opinion.

1,727. You think on the average for six months each?—Yes. I should say that they have gone out well.

1,728. In the remarks in your memorandum (v. p. 106)—referring to column "R"—you have a note which reads as follows: "It should be observed that the percentage of men at work during the year, namely, 50.36, represents for the most part those who are not farm residents, of whom the percentage is 56.68, column 'J.' This shews that a certain number of farm natives went to work elsewhere in addition to those from locations and Crown lands." You have dealt with that?—Yes. The number available for service beyond that district during any one year is 50 per cent.; that is what you are alluding to.

1,729. You have a note with regard to column "S" which reads as follows: "The number available for service beyond their district in any one year appears to be 36.75 per cent. of the total adult population of 137,839, which is equivalent to about one-third." How is a statement like that arrived at; the 50,666?—The number available for service beyond that district appears to be 36 per cent. of the total adult male population. If you go back to column "I," you will find the adult male population stated at 137,839. The number available for service beyond that district is 50,666, which is a percentage of 36.75, or, roughly speaking, one-third of the adult male population that are available to go out of their district during the year.

1,730. Well, now, leaving the diagram, Sir Godfrey, and coming back to page 2 of the Memorandum, which is headed "Estimated Native Population of the Transvaal"? (v. p. 107).—Yes.

1,731. And on page 3 the heading is as follows, "Statement shewing number of natives (excluding Asiatics) employed in labour districts, including Johannesburg, Krugersdorp, Germiston, Boksburg, Springs, Heidelberg, Vereeniging and Klerksdorp on 24th July, 1903?" (v. p. 108).—Yes, that is the statement.

1,732. At the bottom of that page, on the 6th line, you have "Total number of natives and coloured people (excluding Asiatics) employed in labour districts, 125,177." and you go on to say, "Total number of coloured people employed in other mining areas." Do you mean including natives?—Yes, the coloured people other than natives are very few.

1,733. Practically you mean natives?—Yes.

1,734. Now on page 4, the heading is "Territorial analysis of natives employed in labour districts as on the 24th July, 1903?" (v. p. 109).—Yes, that is a very important statement.

1,735. Do you wish to say anything about it now?—I wish to say that it is the first time there has been an attempt to take an analysis shewing the places where the natives come from and where they are now stationed. It is the first time that that return has been made. I do not know that I wish to say anything unless there are any questions to be asked about it. It speaks for itself. It shews that on mines and mining works there are so many and that the remainder are employed in domestic work, contractors' work, and every other service, other than mining.

1,736. I see in the percentage line at the bottom that 46.91 come from the Portuguese territory, 10.13 per cent. from the Cape Colony, 18.36 per cent. from the Transvaal, and 1.62 from the Orange River Colony. Now, Sir Godfrey, will you give us this territorial analysis in its natural order?—It is quite immaterial how you take it.

1,737. You take first the diagram shewing particulars concerning the estimated population of the

Transvaal (v. pp. 106, 107, 108)?—That is No. 2. The memorandum is No. 1.

1,738. The third is the statement shewing the number of natives (excluding Asiatics) employed in labour districts, including Johannesburg, Krugersdorp, Germiston, Boksburg, Springs, Heidelberg, Vereeniging, and Klerksdorp?—Yes.

1,739. The fourth is the territorial analysis of natives employed in labour districts? (v. pp. 109-111).—Yes, for Johannesburg, Krugersdorp, Boksburg, Germiston, Springs, Heidelberg, Klerksdorp, and Vereeniging.

1,740. Will you tell us, Sir Godfrey, about the heading "Territorial analysis of natives employed in labour districts?" (v. pp. 109-111-112).—The next page, No. 5, should be the one shewing the progressive increase of native supply on mines and works during the year ending 30th June, 1903.

1,741. We have a statement which is headed "Labour districts only; total labour wastage" (v. p. 117)?—Yes.

1,742. Then follows the "Territorial Analysis of Mortality among Natives Employed on Mines and Works" (v. p. 114). Let us take that. You give a classified summary at the foot which shews the percentage from each Colony for South Africa?—Yes.

1,743. On page 7 (v. p. 112) you have a statement shewing the progressive increase of labour supply on Mines and Works during the year ended 30th June, 1903. In the first column you give the net increase per month for the 12 months?—Yes. These are taken from the official mining returns. I am unable to verify these figures, but they are put in.

1,744. Can you give any explanation of the small net increase in November, December, and January?—The numbers recruited during those months were either very much less or there was greater wastage.

1,745. Is there any explanation that you can suggest for that?—Well, in November, December, and January, I think, it was due to the smaller numbers coming up from Portuguese territory.

1,746. Do you know why that was?—I am afraid I could not give you any answer to that. It is not quite within my knowledge. It might be misleading if I were to offer an answer to that. I have nothing to do with recruiting and only know what returns were sent to me.

1,747. On page 8 (v. p. 113) your heading is, "Desertions from Mines and Works." The percentage of desertions is given in Johannesburg at 3.87 and the total percentage of desertions as 3.27 per cent. That is the average for the four districts. Have you any knowledge of what that was before the war under the late Government?—None whatever. It has been the greatest difficulty to get any statistical information from the late Government records. It was with them as it has been with us, a matter of conjecture about their statistics. There are no books of any sort; there is no correspondence. What I have heard is that the rate of desertions was terrific at times. One hears frequently of whole gangs going to one mine and deserting within a night or two.

1,748. You have no knowledge yourself?—No, only what I have been told by various mine managers and so on.

1,749. Have you any comments to make on page 9 (v. p. 114), the heading of which reads as follows:—"Territorial Analysis of Mortality among Natives Employed on Mines and Works, from November 1st, 1902, to 30th June, 1903"?—What I may draw attention to is the apparently very inordinate death rate among those coming from the East Coast. In fact, it is striking; the percentage is 88.934 of the whole mortality. It is one of the things that struck me most forcibly when I came here, the very great mortality amongst the natives on the mines. I had heard of it often in Basutoland; it was a frequent expression. The Paramount and other chiefs used to say, "we do not like our men to go to Johannesburg, because

they go there to die." I did not in those days know what it really meant. I now know it meant a very large mortality, and ever since I have been here I have devoted considerable efforts to try and improve the living of the natives on the mines, believing profoundly that the better—within reason and without any idea of pampering the natives—we can make the conditions attractive in so far as labour can be made attractive, so a larger proportion of natives may be expected to seek labour at the Witwaters- past, I do believe has militated against a considerable number of men coming here to work. The condition of things obtaining to-day compared with what it was a year ago is very changed. It is changed for the better. I have had many communications, deputations, interviews, and correspondence with all the mining authorities, who have lent themselves to all proposals to better the conditions on the mines. Latterly, it was arranged that all the mine doctors should meet in my office and have a conference together with a deputation from the Chamber of Mines to hear their views and to ascertain if they knew for a fact what caused the great mortality and to hear their explanations and recommendations as to how that mortality might be alleviated, and what might be done for the health department of the native in each of the mines. That body of doctors, consisting of about 20, resolved themselves into a committee of seven, and after two or three months' investigation brought out a very valuable report. They reviewed the whole question of health conditions, and made a certain number of recommendations, which in their opinion, would tend very largely to reduce the death-rate and produce a better state of things. I concur very largely in their opinion. That report has not been published. It has been sent to the Chamber of Mines, who have got it under consideration at the present time, but many of the recommendations made by this Medical Commission, I am glad to say, have already been carried out by degrees during the past 12 months on some mines, but it is not of general effect. The value of the medical report is to concentrate attention to the subject, and to effect general reforms. I do believe that if more attention is paid to the general hygienic conditions upon the mines that the native mortality can be reduced and that the effect of it will be most beneficial.

1,750. Is this title not rather misleading, viz., "Territorial Analysis of Mortality among Natives Employed on Mines and Works?" (v. p. 114). You have drawn attention to the fact that the death rate is 88.934 per cent. of natives coming from the Portuguese territory. I take it that that is apart from the total number of natives who die?—No, it is the percentage of whole death rate amongst Portuguese boys to the whole death rate of the Rand.

1,751. You do not mean 88 per cent.?—If you take number 10 (v. p. 115), you will see that the percentage of deaths of Portuguese boys is 88 per cent. of the number employed. The first column on page 10 (v. p. 115).

1,752. Could you give a clear statement of what that means, Sir Godfrey?—I have only just come back from Pretoria and this statement has been prepared in my absence. I will look through it in the adjournment hour.

The Commission adjourned until 2.30 p.m. the same day.

The Commission resumed at 2.30 p.m.

1,753. The CHAIRMAN: When the Commission adjourned for luncheon, I asked you a question with regard to page 9 of your memorandum; I find since that pages 9 and 10 (v. pp. 114, 115) should be taken together; the point I wished to make has been made clear. As to the high rate of 88 per cent. mortality amongst the Portuguese natives, perhaps you would like to offer some explanation?—No. 9 (v. p. 114) is a useful return, and shows the comparative mortality rates in the various labour districts of the Witwatersrand; it might be useful where there was a heavy death rate to be

able to fix on the spot so that we have divided the death rates off into districts, Johannesburg, Krugersdorp and Boksburg. No. 10 (v. p. 115) shows that out of 67,782 the mortality amounted to 2,458, and the percentage of the Portuguese is 88,934.

1,754. That was above the mortality of the other natives?—Yes, 15.84 above the average.

1,755. The death rate amongst the Cape Colony natives was below the average?—Yes, all are below with the exception of the Swazis, which was 0.17 per cent. above the average. At the present time when we are groping for the cause of the mortality it may be of great advantage to the community to know amongst whom the death rate occurs; that was the object of compiling the returns.

1,756. Then on page 11 (v. p. 116) you have put in a statement shewing the cause of death amongst the Portuguese natives employed on Mines and Works; would you care to make any statement as to that?—We have divided the return into two divisions because the percentage of deaths amongst those natives who suffer from pulmonary complaints has been so extraordinarily marked. It has been our endeavour during the last six months in particular to discover to what this great number of deaths from pulmonary diseases has been due. With the help of the mine doctors, and with the facilities afforded us by the mining representatives, we have been able to discover a great many of the causes. I did not think you would ask me to enter into those causes, although I shall be prepared to answer any questions on the subject. It is a great thing for us to establish the fact that a great proportion of the deaths is due to one thing, and that is diseases of the respiratory organs. I need hardly say that the sudden change from living in places of low altitude, where the weather is warm, and the changes in temperature but slight, and coming to the Witwatersrand at an altitude of over 6,000 feet, where changes in temperature are rapid, and the weather at times very severe, account for a great deal. It must be plain, without demonstration, that these radical changes conduce to a high mortality rate here, and that this state of things must to a certain extent continue in spite of the efforts we may make, and the improved conditions which we may set up to counteract it. Our investigations led us, amongst other things, to enquire into the condition of affairs at Kimberley, and we found that the mortality amongst the natives there from the same cause—respiratory organs—amounts to a figure almost identical with that which obtains at Johannesburg. That goes to show that there is nothing very exceptional in the death rate at Johannesburg compared with Kimberley, although it is very exceptional compared with the death rate in other parts of the world. It is my belief that measures now being taken to prevent the native from exposing himself to the risks he ordinarily does, may have very beneficial results in reducing this mortality rate. Just like children accustomed to live in warmer latitudes, they do not recognise danger, and coming to a place like this, where in early hours of the morning the air is very keen and there is an enormous difference in temperature, they are inclined to pass from their work underground without taking precautions; they take a chill, and perhaps in 48 hours they are dead. We are endeavouring to bring these facts home to the native, and are endeavouring to get those responsible for shift work on the mines to preach it to him. We have suggested, and the suggestion is being carried into effect, that when the boys come from the warm temperature underground to the cold air above ground they should be provided with and made to put on clothing, and also provided with something to put into their stomachs to help them to resist the effects of this change in temperature. I believe that in nearly all of the mines these changes are being effected, and that alone will, I think, do more than anything else to reduce the high mortality rate. We must get both employers and employees to recognise that these dangers exist. There are also many other things which may be done—and are in some cases being done—to prevent the spread of infection from pneumonia. It has been established to the satisfaction of the medical profession that

pneumonia, which in many other countries is not believed to be communicative, is communicative here on account of a great number of causes and on account of the conditions under which people here are situated. In many of the habitations where the natives live the floors are of a soft character with a quantity of dust about, and the natives are used to spitting on them. This spitumen is believed to convey infection. There is a general movement throughout the mines to have impermeable floors which can be cleaned and which will not retain the sources of infection. This is another factor by which we should be able to reduce this mortality which has done so much harm among the people.

1,757. I notice from your statements under the heading of "Scurvy" (r. p. 116) that a considerable number of deaths is shown to have occurred from November of last year to February of this year, when a sudden remarkable falling off appears to have occurred. Do you know of any reason why the death rate was so high within that period, and can you account for the sudden improvement?—So far as I have been able to learn, in the past it was the custom to feed the native absolutely and entirely on one article of food, namely, mealie meal; it was thrown to him, he cooked it, ate it, and suffered. The natives for a considerable time suffered from a want of variety of diet and from the want of vegetable food. This is another matter which has been seriously talked over during the past year, and especially during the past six months. At the present time I think that almost without exception the mines are directing their attention to supplying the natives with the most nutritious kinds of food suitable to their work, are varying the food, and are giving the boys considerable quantities of vegetables. These things in my mind have contributed to a reduction in the death rate from scurvy to which you have drawn my attention.

1,758. There appears to have been a very considerable comparative increase during the last three months in deaths from malaria; is there any explanation of that?—I think that perhaps during the last two months it may have been slightly, but very slightly, caused by certain mortality amongst some natives brought here from British Central Africa, some of whom were suffering from malaria when they arrived. I beg your pardon, I am wrong in stating this. I find that the boys I referred to did not come till later; I am afraid that I can offer no explanation of the apparent increase on this account. It is rather a question for a doctor to answer.

1,759. I understand that you have a very complete system of registration for natives in force now?—Yes, we have.

1,760. And yet it seems that during the half-year no less than 1,977 natives deserted and were not recovered by their employers?—That is so during the half-year.

1,761. Is it easy for a native to get a fresh pass issued to him?—In some respects, yes, it is easy enough. When the natives on the mines desert from their employ they can go out on the farms to work or can go to any part of the country to get work, and there are few people who will bother themselves very much about whether a native has a pass or not. If a boy presented himself at a farm and said he wanted work, if the farmer wanted a hand, I do not think, in most cases, the farmer would refuse to take the boy on just because he did not happen to have a pass.

1,762. In such a case how could the native get another pass?—He would probably say that he had lost his former one.

1,763. There is no punishment for this deception?—There are laws and regulations as to such matters, but it must be remembered that ours is not a Police Department. The recovery of deserters falls rather upon the Police Department. Another fertile facility for desertion is the railway. When a native applies for a railway ticket, according to the regulations, no ticket shall be issued to him

unless he is in possession of a properly discharged pass, but railway officials are sometimes hurried, and are not, I think, always quite so careful in this respect as they are supposed to be; they issue tickets and away the native goes without his pass being in order. In this way we know natives get away. We cannot blame our Department, as the boys are out of our control. We have a system for registering them coming in, and are prepared to register them outwards. If they slip away, it seems to be a matter for the police force to discover them.

1,764. That is all I have to ask you with regard to your statements. With regard to the issue of recruiters' licences generally for the Transvaal, can you tell us how many are current at the present time?—I cannot tell you from memory, but will have the information supplied to you later.

1,765. Are any obstacles put in the way of persons getting licences to recruit natives in the Transvaal?—Absolutely none.

1,766. Do you require reference as to character?—Yes, if that is an obstacle, then there is an obstacle; we require applicants to conform to certain regulations; we require that when they are going to recruit labour they shall be employed by some one, either a firm, or a corporation, or some similar body of a responsible nature. If the man satisfies us as to his "bona fides" he gets his licence.

1,767. Then a man cannot get a licence to recruit in any district in the Transvaal unless he can show that he is going to recruit for some special employer?—Specific, not special. No, we won't allow a man to go out and recruit generally all round, and then hawk them about and sell them. If he can show that he is going to recruit for some one, and he is a respectable man, he gets a licence. We require generally that he shall show he is a responsible man.

1,768. I understand the applicants for recruiting licences must have some guarantee, lodge money, or that some one shall stand surety for them?—That is the law, not peculiar to the Transvaal; it prevails in Natal, in Cape Colony, and here.

1,769. What deposit does a recruiter require?—£100.

1,771. Then he has to deposit £100 or find someone to stand surety for him to that amount?—That is so.

1,772. I understand you are prepared to supply the Commission with any information at your disposal with regard to Basutoland, Swaziland, and the Orange River Colony?—Yes.

1,773. Do you think that the Transvaal can look to Basutoland for any appreciable number of native workers?—To-day, no.

1,774. What do you mean by "to-day"?—I think the demands made on Basutoland from local sources, and the conditions of local work so much more attractive that few would come to the Rand for work. There is a demand for labour for the construction of railways all along the valley of the Caledon River, which is the boundary; the boys can engage for short terms; they would be close to their homes; they would receive a high wage; have comfortable work above ground. In Johannesburg, on the contrary, the comparison is all against them; they have to engage for long terms (six months or more), and they have to go underground. Altogether the comparative attractions are against their coming here.

1,775. Then with regard to Swaziland, do you think we can look there for any large numbers of native workers for the Transvaal?—When you say "we," whom do you mean? Do you mean for mining?

1,776. I had in my mind the special purposes for which the Commission was appointed, namely, to enquire into the available supply for agricultural, mining, and other industries; I was thinking to a certain extent of railways?—The Swazi boys usually first supply the requirements in the way of work of

places like Barberton, as it is quite close, and they don't care about going too far in search of employment. The Barberton field always means from 3,000 to 5,000 boys continuously employed. Then there are certain coal mines in the Middelburg district to which they are in the habit of going. They are also disposed to go out for domestic service. They are allied to the Zulus, speaking the same language. Zulus will not work underground; they do it, but they do not like it, and the Swazis have the same disinclination to that class of work, although they work there sometimes. The population is small, and by the time local farmers, Barberton, the coal mines, and the railway works are all supplied, I think there will be very few left to go far afield to the mines on the Rand. Swaziland is a part which I should regard as a useful source of supply for the Transvaal, but not to any very large extent for the Witwatersrand.

1,777. Can you give us an estimate as to the numbers which might be got from there? Have you any idea as to the number for the Witwatersrand?—There are 1,079 Swazis working here now. If at any time there were as many as 5,000 Swazis working here it would, in my opinion, be a very good number; that is, working at the same time at any work on the Rand. I should think that would be as many as you would be likely to get here. I have not any figure as to the population of Swaziland at present. I expect to have close figures very shortly, but it is less than 100,000.

1,778. What is the native population of the Orange River Colony?—It was given at the Bloemfontein Conference as 140,000.

1,779. Do you think our agricultural interest can look for any appreciable supply from the Orange River Colony?—Not worth writing down.

1,780. Do they turn out from there to work, freely?—In the Orange River Colony, with the exception of two parts, practically the whole of the native population is situated on farms. There are two places, Thaba 'Nchu and Witzies Hoek, where natives are collected, all the rest are distributed on the various farms, and according to their law only five families can be engaged on any one farm. I think there are scarcely any private locations as before described, where large numbers are collected together for the sake of rents. It is conspicuous for the absence of them. The incidence of the native population on the farms is very useful, and there is no supply to be drawn from them. At Thaba 'Nchu, one of the locations I have referred to, there are none to be drawn from and at Witzies Hoek in the north there are so few as to be scarcely worth reckoning. From the locations they sometimes go to the towns to work; a few may come to Johannesburg, but I think very few. The Orange River Colony as a source of labour supply is in my opinion not worth calculation so far as the Transvaal is concerned.

1,781. In connection with native labour supply generally, can you give us any all-round figure which native administrators have been in the habit of taking to arrive at the number likely to go out to work, as compared with such gross population?—I reply to that question, that you may take any native population you like, and divide it by 5 to reduce it to adult males. That is the first thing to do. Then you have to make other deductions in order to exclude the old men, the boys, the sick and wounded, those who must remain behind for attention to tribal or kraal affairs where there are tribes or kraals or family affairs where there are families. You must make further allowance for those drawn away by Europeans living adjacent to them, for they have the first call. In order to arrive at the number of able-bodied men, I mean physically capable of going away to a distance from their homes for work, you must divide the number by 10. That is to say, you divide by 5 to get the men, and by 10 to get those which are fit and can be spared to go away to work. As illustrating this, if there were 1,000 souls in any area of the Transvaal, say, if you asked me what proportion of that 1,000 is fit to go away for work, I should reply 100 only.

17133

1,782. Would that number be working continuously?—That number could be available for work; that number could be away at one and the same time, if it were required that they should be away; that proportion could be spared and would be physically fit for work.

1,782A. Those are all the questions I wish to ask you. Would you wish to supplement what you have said by tendering further information?—I may, perhaps, say, with further reference to the figure of 100 which I have just given you, that they could be away during any part of the year, but as the natives do not, as a rule, work for more than six months at a time, that 100 would not be away for the whole year; if 100 were fit to go away to work, 50 would go for six months, and 50 for the other six months. Very few work for a year. Your available population must be divided by two, that is, into six months periods.

1,783. Does your answer as to the 100 out of the 1,000 apply to any part of South Africa?—I think it might be taken generally of any part of South Africa.

1,783A. Is there nothing further you would like to say to supplement the statements you have already made?—With reference to what you have just asked me, it might be apropos to say that in following up the question of available men, I made enquiries about Germany, and I found that in Germany the male population was 27 millions, and the war strength of men between the ages of 19 and 40 was 2,550,000 fit to serve in the army, that is to say, picked men. The division by 10 is thus confirmed from Germany. I do not think there is anything else I can say; no doubt the questions which may be put to me will bring out any further information the Commission may desire to have.

1,784. Mr. GOCH: I should like to make clearer in my own mind the figures supplied having reference to the death-rate. If you will turn to page 6 (v. p. 111) of the statements you have furnished us with, I think you will find that the total number employed in the labour districts is 116,913. Turning to page 12 (v. p. 117), the statement shewing the wastage, we have 1,907 deaths for the half-year. We have, therefore, for the labour districts a total death rate of approximately 1½ per cent. for the six months, got by taking 1,907 on 116,913; that would give us 3½ per cent. per annum, on the total number employed, or equal to 35 per 1,000 per annum. Now we come to the special case of the Portuguese in connection with whom you have given special reasons for the high death rate. If you turn to page 10 (v. p. 115), we find that out of a total number of Portuguese employed of 49,470, 2,186 died from 1st November to the 30th June, that is, for eight months. That is equal to 4½ per cent. for two-thirds of a year, which in turn is equal to 6½ per cent. per annum, or 65 per 1,000 per annum. Would that be the correct way to look at the question?—One very important feature is this, that you have to calculate what the wastage is passing through the Department. Should not the wastage throughout the period be taken into account in calculating the death-rate?—I take it that if this were done the high death-rate shewn by these figures would be considerably lowered. If you base your calculations of death-rate only on the total number here to-day, it seems to me you arrive at a wrong result. I think if the wastage were put at 35 per 1,000, we should find that the death-rate had been over-estimated by a good deal. Take the general population as 116,913 and add wastage in the period we have under review as 35,000, I am inclined to think the death-rate might come out at below 30 per 1,000. That may not be so serious when compared with some European towns, especially considering that a good deal of sickness occurs amongst women and children, especially among children, which does not apply to us here, so that it would seem that the death-rate here is not altogether abnormal. It may be abnormal when compared with other South African towns, but in some European towns I believe the rate ranges from 17 to as high as 32 per 1,000, and Sir Godfrey says it is abnormal compared with the

F 4

rest of the world. I think you will find the rate is 32 per 1,000 in some cases where no epidemic has occurred.

1,785. The CHAIRMAN: I might suggest that the witness might go into this matter and put in at a later stage another statement clearing up the point raised by Mr. Goch?—Yes, I shall be glad to do so.

1,786. Mr. GOCH: I think it might be well to do so. I should like to establish a doubt as to the very high rate which appears on the face of the memoranda. I was anxious to have the point cleared up. It is not clear to me whether the population of the town of Pretoria is included in some of the figures furnished. I find a total on page 3 (v. p. 103) of 49,131 as the people employed in the towns, may I ask if that figure includes the town of Pretoria?—No.

1,787. To get at the total, then, we will have to add Pretoria?—Yes.

1,788. What would that be?—Although the town of Pretoria is not included, the district of Pretoria is included on page 2 (v. p. 107) under the heading of "Central, 3,380," that would include the Premier Mine, etc., but excludes the town of Pretoria. The figure for Pretoria town could be ascertained. I am informed we have it in the office. It has come in since these statements were drawn up.

1,789. Turning to the blue print (v. pp. 113-119) under the heading of "Adult males," the number remaining at home is given as 24,477; column (h) shews 39,503 not now at work; column (f) shews 18,412 unable to work: that comes to 82,362. On page 6 (v. p. 111) of your statements the total number employed in the labour districts coming from the Transvaal is 21,466; adding this to the 82,362, it gives over 103,000?—The 21,466 natives now in the labour districts are included almost entirely in this return. I will make it clearer. The four items I refer to—"Number who must remain at home," "Available not now at work," "Unable to work," and "Total employed in the Transvaal," bring us to a total of 103,828, and there appears to be 34,011 working elsewhere than on the mines or in labour districts. What I want to get your opinion on is this: Whether we may assume that these are working on farms?—There are a variety of industries and works now going on in the Transvaal which, as far as labour is concerned, are very absorbing. There is a tremendous amount of capital now being spent in the country, and all this capital requires labour. The army is absorbing a number of natives; also the police force, repatriation and public works. Many houses in the country which had been destroyed are being rebuilt; mines are being opened up—gold, coal, and diamond mines; all of these industries are absorbing large numbers of natives, and to say that most of it is going to the farms would be incorrect. No doubt a number are going to the farms. At present there is a most unusual demand for labour from sources which have grown up since the war; previously most of the spare labour went into the mines, but now there is so much public and private capital in course of expenditure that it must be calling for an enormous amount of native labour.

1,790. The point I wish to establish, sir, is in connection with the statement in column "E," under adult males, in which you give the total as 55,477 now at work. We have accounted for 21,466, on p. 6 (v. p. 111) of memoranda, but there remain 34,011 working elsewhere. You say a great number are being absorbed in the various new developments, and it leaves only a small amount available for farm labour?—Out of the 55,477, there would not be a large amount of farm labour, certainly. Farm labour is supplied rather from those who are situated on the farms. You may take it that the balance would probably be absorbed by the railways and towns, and a very small proportion would be available for the farms.

1,791. We may take it, then, that of the 34,011, the balance are employed on railways and in towns

so that farmers would probably have a small proportion of them?—Yes, the railways, towns and industries are absorbing most of them.

1,792. Then the farmers depend for their labour on those "Remaining at home," and those "Not now at work," a total amounting to 63,950?—Of those who must remain at home, a great number go out to work at short distances. Therefore, although they may be returned as amongst those remaining at home, still, as I have said, a great number of them go out to work at short distances.

1,793. A fair proportion of them would be available for farm work?—Yes.

1,794. The total number given as "Now at Work" is 55,477. Taking the basis which you have laid down as being correct, that is, on one-tenth of the population, which is estimated at 620,000, this would appear to bear out your idea that only one-tenth of the population can be depended upon to work beyond their own districts?—I would ask the Commission to kindly remember that I am rather handicapped in connection with this time to look at this blue print (v. pp. 113-119), which was compiled specially for this Commission, so that, therefore, I am practically at as great a disadvantage as yourselves.

1,795. At the same time, it would appear that the figures arrived at are well borne out, being in the neighbourhood of 60,000, and fall in with your theory that only one-tenth of the population can be depended upon for work?—These returns have been supplied to me by five different men, and I did not know what they were going to say: the division by 10 is my own, but it is to a very large extent borne out. The information as given seems to force us to the conclusion that, so far as the Transvaal is concerned, all the available men have been out at work for some period.

1,796. Mr. EVANS: In your opinion are there as many Portuguese natives in the Transvaal now as before the war?—In the absence of any statistics, my impression is that there are as many in the country now as there were before the war, though not all on the Witwatersrand. There are a large number in domestic service, a considerable number on the railways, and a variety of other works in the Transvaal, whereas formerly they used to go straight to the rand.

1,797. Are there fewer or more natives working now than before the war?—During the past year there has been more labour in circulation than there was before the war. They may not work for such long periods, but there has been more labour in circulation, to the 30th June.

1,798. Now supposing the conditions on the mines were made as perfect as they could be made from the point of health, how many more natives do you think you could get? Would there be an appreciable quantity?—I do not think you would notice the difference in six months. What I do think is that the knowledge that these conditions existed would only filter back slowly to the natives in their kraals. It takes a long time to teach them. The reason is that the native is a man who imbibes opinions and facts very slowly, and if he was told there was a better condition of things existing to-day, he would laugh at it, and not believe. It is only when members of his family come back and tell him of it that there is any chance of his believing it at all.

1,799. But even supposing the best impression is carried to them on account of the improvement of the health conditions, do you think there would be very many more offering their services?—I certainly think that it would affect the supply.

1,800. Can you give us an expression of opinion as to the best possible increase in the number of workers among the native population: what is the best we can get here for the Rand?—The Cape says they cannot send you many, Natal says they are all employed, and, as far as the Transvaal is concerned, I do not think you can get any more at one time than you are getting now. The Portuguese element is uncertain. Nobody knows how many

there are. There is a "modus vivendi" with the territory of Mozambique, and all within that area are probably available to come here. From Portuguese territories, north and east, we have apparently received but few heretofore, and it is doubtful whether we may be able to get any large supply from there:

1,801. Do you think that the large proportion of natives from the hotter parts of these Portuguese territories can stand the climate here?—I am not at all a believer in the theory that the Africans cannot stand the climate here. There have been statements in the papers here about the Central African natives who come from so much warmer climates: not being able to do well here—not being able to stand the climate—but I dissent from that view altogether. There were about 380 Central African natives came down here a short time ago, when the weather was very cold. They were, physically, fine men as a rule, well set up, and I was very favourably impressed. The moment they arrived they were found to be scorbutic. We had them subjected to a medical examination. The doctors said they had a tinge of scurvy on them already, and in a short time many of them were laid up. On inquiry, however, I found that it was not the change in conditions, but the sudden epidemic of influenza, which had affected pretty near the whole of Johannesburg. I think that thus a wrong impression has been given. The conditions certainly are different temporarily, but when people go into the regions of the Esquimaux, they put on suitable clothing, and eat suitable food, and I cannot see that the same doctrine cannot apply to the native.

1,802. You referred this morning to the Bloemfontein Conference, and you said that it was conspicuous by the absence of facts and figures. Were there present at that Conference some of the best informed and most experienced men on native affairs in South Africa?—Yes.

1,803. Was the conclusion of the Conference the unanimous opinion of these men?—Yes, they lacked what they all deplored, a specific statement as to facts and figures to guide them.

1,804. Mr. PHILIP: Sir Godfrey, you mention in your diagram (v. pp. 118-119) in column "R" that 69,427 men of the Transvaal have gone out of their district to work?—Yes, passes were issued.

1,805. It is more than half the adult population. Did they go out for twelve months?—No, not continuously.

1,806. They would only have gone for about six months?—Those who are unable to work should be taken into consideration.

1,807. About the 24,447 set down as "Remaining at home," what is the reason for their remaining?—As I said this morning, it is 17 per cent. Where there is a considerable settlement, a certain number of men must remain behind to plough, and hoe the ground up, put their seed in, and tend to its cultivation; a certain number must attend to cattle. They have tribal ties of various descriptions, and 17 out of every 100 is not a large proportion, although 24,000 looks large.

1,808. Can you give us the number of natives squatting on private farms?—That is a missing link upon which information is being collected. I can scarcely venture an opinion to-day.

1,809. I have been told that on one farm at Pietersburg, the owner is drawing £600 from natives squatting?—I quite believe you.

1,810. Can you give us any idea of the number of men in the employ of the railway? I have heard that it is about 18,000?—I have tried to ascertain, but the railways are unable to give us the information.

1,811. I notice that Sir Percy Girouard stated in the Council the other day that there were 14,000. I have since heard it is 18,000. You cannot corroborate?—I have no means of checking railway returns.

1,812. According to column "L" there are 34,481 living in Government locations. Is there room for the natives on Crown lands?—So far as agriculture is concerned, the locations are crowded.

1,813. Can you give us any idea of the extent of these locations?—That I cannot give you, as they are not surveyed, but, if you will look at the map, you will see that they are extensive.

1,814. You were a good many years in Basutoland. We have had the population given us as 262,000. Was that about correct?—Yes, and it is rapidly increasing.

1,815. One witness who was before us mentioned that there were a large number of passes issued for labourers, and a large number of visiting passes. I think the labouring passes were 37,000 and the visiting passes 57,000. Would these represent native boys going out to labour?—The number of visiting passes issued would partly represent those going out with the idea of accepting labour on farms and in towns, etc. They visit two or three days, and if they find agreeable masters they stop there.

1,816. A large number of Basutos are employed in the north of the Cape Colony?—Yes, and a very large number for farms in the Orange River Colony.

1,817. Do you think there is any possibility of our getting an increased supply of labour from Basutoland?—As things are going now, no; not with the railway so close to the border and the high rate of pay.

1,818. Mr. TANTON: You gave us just now as a working figure to arrive at the available labour a proportion of 1 in 10. If you will look at the statistics (v. pp. 118-119) you kindly furnished us with, you will find in column "H" that in the eastern division, which includes Lebombo and Sabi, the number who are classed as "available, not now at work," is 9 per cent. In the northern division—Spelonken—the percentage rises to 41 per cent. Passing down to the central division, the percentage rises to 73 per cent. Obviously thus your figure of 1 in 10 must be regarded as a very general estimate seeing these variations in different districts?—Taking the central division, 73 per cent., it is quite possible that the greater part of them had been already at work.

1,819. What makes you think this?—I have not the slightest doubt in my own mind that the greater part of this 11,000 had already been at work. I think that would account for the high percentage, and the same would apply to the northern division where the percentage is 41. With regard to the eastern division, it is most likely the natives are working now. We ourselves have assisted in getting them for the railway for this very division.

1,820. But, taking under the head of Central District, Pretoria, adult males, 260, "now at work," and 5,240, "not now at work," the labour supply must be subject to extraordinary fluctuation if your explanation can be accepted?—I admit there is something in our contention, and I shall make it my business to inquire into this matter further, so as to ascertain the facts.

1,821. Do you think that the more the native gets into contact with urban centres, the less he works?—No. He wears clothes and has a reputation to keep up.

1,822. I think that these figures show that there is considerable fluctuation in the labour supply. Some witnesses have stated that the native only works when he wants anything. Would you accept that as a general principle?—Well, I should say my opinion of the African native, whom I have met in the north, west, east, and south, is that he is a child of pleasure. I do not think any native works because he considers it an honour to work. The native's requirements are very easily satisfied, and he works, most of the time, so that he may gratify his wants.

1,823. So his wants are the source of industry. Let us deal with his wants. I suppose he needs food?—Yes.

1,824. Is that want often felt? Are there variations in the demand for and supply of food?—I mean

in your experience?—There are at times in certain seasons—and I believe this is one of them—where the native experiences very great want indeed, and would be starved to death were it not that European storekeepers import grain to keep them alive. At the present time, grain is being supplied to the native territories of South Africa, i.e., Zululand, Basutoland, Bechuanaland and in the Transvaal. I know for a fact that traders are putting in stocks in some parts of the Transvaal to meet the demand. These stocks are coming from Southern Africa.

1,825. What is the effect of that generally upon the native—the demand for food? How do they purchase the grain?—Well, we have been living in rather peculiar times. There was a very useful standard wage formed in the country, which has now been doubled or trebled. Most of the natives have been out of work, and most of them have a little money stored by, but they have no banks. The native used to bank by buying cattle. The natives never buried their money or stowed it on the roofs of houses; they bought cattle. They cannot buy cattle now because there are no cattle to buy. They are afraid to hide it away, so they do not work very long. They have not in the absence of cattle the same object in getting money, and, if we could induce them to put it in banks and get the interest on it, we would get more labour.

1,826. Am I to understand that the native is a capitalist in a small way with hidden money?—No, he is afraid to do that.

1,827. Where does he get the money to buy his grain?—During the past two years he has been working at a very high rate of wage and he has got more money than he ever had before, owing to his working for the Military. From that store they can buy grain. If these natives come to me and say they are hard up for food, and that they cannot get food, I may have to get the food for them, but they will have to work for it.

1,828. I think your answer refers to an exceptional period, and shews that owing to exceptional circumstances the natives have money now. Supposing there had been no war?—If there had been a demand for labour, the supply would have been very much greater than at any other time.

1,829. The scarcity of food would tend to drive them into the labour market?—Yes, and if there had been no labour, a great many of them would have had to starve. They would have had no means to live on.

1,830. What age is a native when he first experiences the need for money?—There, again, it depends so much upon the environment. You were speaking just now of the urban natives. The urban natives have got an idea that it is a nice thing to be wearing nice clothes. The law of this country, and also that of the Free State, provides that no native shall go without clothes, and that is one of their cravings, the craving for clothes, and such like. In the back country kraals, they want cattle rather than clothes.

1,831. At what age does he want a wife?—Well, I suppose the greater number of men marry when they are between 20 and 25, except in Zululand, under the old system, where they had to qualify as warriors before being allowed to marry.

1,832. Is there any general custom as to when the native goes out to seek the money for his dowry?—No, but he begins very early.

1,833. At what age?—At 18 years of age. Like all societies, different natives have different customs in this matter.

1,833a. Is that the average age?—I say 17 or 18 years of age. That is when they begin to talk about it. It is then the native begins to come out to work. When he is young he goes to work near by his kraal, and, later, he goes further afield.

1,834. And when he returns, about what age is he when he marries?—I suppose you might take the middle age, that between 18 and 25.

1,835. So that he finds himself under the necessity to provide money for his "lobola," for the dowry at some time between the ages of 18 and 25?—Yes.

1,836. You have given us two of his principal wants; are there no others?—That, of course, depends upon the place he is living in. There is the question of shelter and so on. But it all depends upon what his fancies are, and what his tastes become. There are those in this country who believe that to keep the natives down to the lowest level is the best, because he is an animal, and will work as an animal. That view, I think, is a false one. What we have got to do is to consider what will induce the native to work; to create in him a certain number of wants, and according to the standard of the native's wants, so will his efforts be to gratify them, and, if he wants to wear decent clothes, and decent boots, and his wife wants to wear decent clothes, and have a looking-glass, and a chest of drawers, and a decent house overhead, and if the children—taking example from them—want also to be clothed, then it means that every man who has ideas of that standard, together with his wife and children, has got to work harder to maintain that standard.

1,837. The average native lives in a hut?—Many of the locations are near the towns. There are houses in them. In Basutoland huts are giving place to houses very largely.

1,838. Take the hut tax in Basutoland. The valuation of the huts is a very small amount, is it not?—They are not valued at all. The tax is practically so much per head of the adult men, and so much per wife, after one.

1,839. What would you put as the value of huts?—The houses I am speaking of would not cost under £20.

1,840. What about the ordinary hut?—I should think it would cost about £7, wattle daub and thatch.

1,841. The native pays no rent, I suppose?—It depends where he is.

1,842. I am speaking now of the natives outside the farms, and outside the European areas—in Swaziland and Basutoland?—He pays nothing except his tax.

1,843. Take clothing now; what are his average requirements in that part of the country?—Well, the man has got his two or three blankets. If he is rich, and up to the standard I previously quoted, he has got a suit of clothes, pair of boots, and a hat, and these are more or less replenished every year if they are at all shabby.

1,844. Let us get at the native away from the town. You see them in the back districts, or on the roads of the Transvaal, and as a rule they are poorly dressed?—You are speaking of the Transvaal. Basutoland is 100 years ahead of the others. One cannot make a comparison.

1,845. What are the requirements there; are they all dressed?—Every man has got a suit of clothes, and does not go about visiting in a blanket—probably not one man in the country is without a suit of clothes.

1,846. How often does he wear it?—When there is a particular occasion on which he can shew it off.

1,847. Otherwise, he keeps it in a trunk?—He keeps it in a little box which costs him about 10s. 6d. This is another want; more boxes more work.

1,848. Does his means of locomotion cost him anything?—In Basutoland, they crave very much for waggons. In 1901, there were 1,600 waggons in the country. Every householder has got from two to three horses.

1,849. Does he get these animals out of the country, or does he breed them?—They have been bred mostly in the country.

1,850. What other wants have they got? Is there any considerable demand for groceries?—They drink tea and coffee, and are very fond of sugar, jam, etc.

1,851. You are speaking of the Basutos?—Yes, and these people will do the same. The Basutos are elevated, and they will buy these luxuries, and the more we can induce them to buy luxuries, the more they will have to work to pay for them.

THIS VOLUME IS TIGHTLY BOUND

1,852. You are not referring to the Swazis and the Zulus?—I do not think the Swazis have got to jam yet.

1,853. What about means of defence; is there much expenditure on guns in Basutoland?—While the Basutos have certainly laid in a good many guns, which they bought from the Boers, the Boers at the same time complained to their Government of their being armed. When the Snider guns were done away with, and the Martinis came in the Boers worked the Sniders off on the Basutos; similarly when the Matusers came in, they worked off the Martinis on to them.

1,854. So that the demand for weapons of defence is satisfied at present?—Well, they have got a fair number of guns in the country.

1,855. The Cape Government tried to disarm the native?—Yes, but I do not know what this has to do with the labour question.

1,856. I want to get at the native's requirements. The native needs money, I take it, to buy guns, and that money he gets from his labour. Well, going through the list of his wants, we have had food, and one or two other items; we have had European manufactures and guns. You say there is no great demand for this last article at present?—In the Cape, the Transvaal, and the Orange River Colonies, the holding of guns is prohibited by law, and it is not a sale that may be carried on.

1,857. Are there any other wants about which you can tell the Commission that tend to force the native into the labour market?—Well, for instance, if elementary schools are set up, the children do not like to go to school unless the little girls have shoes and petticoats, and the little boys wear clothes. Then the father has to work for these requisites.

1,858. The education of the natives is furnished in most cases free by mission stations and the clothes are a consequence of it?—Yes, it is one of the things which furnishes an additional cause for labour.

1,859. Are there any other wants that you can think of?—Well, I am thinking of the natives of this country in particular. I cannot think that in this country there will be any great wants for some years to come, unless we succeed in cultivating such wants by gradual elevation.

1,860. Take the question of food, what is the area of Basutoland?—10,000 square miles.

1,861. What is the population?—About 290,000.

1,862. What is the acreage per head?—It is quite unsurveyed, and a great part of the country is mountainous, which cannot be calculated. I can tell you one thing, and that is, there is practically no more land to cultivate.

1,863. The acreage per head is considerable?—Yes, but you have to remember that a very large proportion is pasture land, and some of it is too steep for anything.

1,864. It is used for pasture, and serves to support the native's cattle, which also supply him with the means of getting food?—Yes, in a way, but they do not care to part with cattle. They have many sheep and produce a lot of wool which brings in money.

1,865. Is there any likelihood in the future of the Basutos being compelled to seek land elsewhere, owing to the pressing demand for land in their territory?—No, I hope that they will not be compelled to seek land elsewhere for this reason. The time has now passed when it is possible for any chief in Basutoland—according to the tribal system—to give out any more "gardens," as they are called. All the gardens now fit for cultivation are appropriated. The younger generation have not the advantages of the older generation. They cannot when they come of age go up to the chief, or the headman, and ask for a plot of ground, because they are going to be married. The only lands for cultivation now are those which descend from father to son. The present generation of boys have had to go out and work, and, if they go to other territories, it is

for the purpose of getting work and then returning. They like their own domicile and always go back to it.

1,866. The present condition as regards the land question is that there is no necessity for the Basutos to leave the country permanently; they go back?—Yes, they have plenty of room for building their houses on, but they cannot get new land for cultivation.

1,867. It is one of the most populated areas in the country and produces largely?—Yes. There is no country that produces anything like the cereals it does; every man is a farmer, and all arable land is under cultivation.

1,868. It supplies all the actual food requirements of the natives?—I think it is, taken all round, the great granary of South Africa. Speaking from memory again, after a good season perhaps a quarter of a million bags of mealies are harvested, and perhaps 120,000 bags of wheat; and a great quantity of wool is exported.

1,869. Could you furnish the Commission with statistics bearing on this point, taking Basutoland, for instance?—Yes. I could tell you what the output has been for some years of mealies and wheat.

1,870. What is the ordinary trading system by which this grain passes out of the country. Is it done by traders?—There are numbers of traders all over the country, and the natives grow their grain, reap and clean it. Then they put it in a skin bag, and put it across an ox, and take it to the shop, and bargain with it. The native is a curious man, and likes to have the money in his hand. They weigh this grain by the "skol," and when each "skol" is marked off the native then puts the money in his pocket and goes out and smokes his pipe and then goes back to the store and spends the money. He takes grain for mealie meal, and he usually buys clothing, boots, socks, shawls, looking-glasses, saddles, ploughs, and many other things.

1,871. Could you tell us what the average consumption per head is of European goods?—I am afraid I could not. The Customs duties for last year were £33,000, or 15 per cent. on the gross value. £220,000 would be about the value of the imports.

1,872. Even supposing it is more; the population is 290,000?—Yes.

1,873. So that the average consumption per head is less than £1 per annum?—Yes, but of the total population, children purchased little, and a good many imports are free, being Colonial goods and non-dutiable.

1,874. That is in what is probably the most progressive native territory in South Africa?—Yes.

1,875. Do these conditions you have been telling us about exist in Swaziland, or Zululand?—No, the climate is warmer in Swaziland, and they have not reached that stage yet. They have no tastes of the same sort as the Basutos have.

1,876. I suppose the consumption of European goods is very small in such territories as that?—In Swaziland there are very few traders, and the stores are few and very miserable ones. In Basutoland you will see very good stores set up, with £10,000 stocks.

1,877. It is probable that the information which is being furnished to this Commission may lead to legislation. Take such a district as Swaziland, where, I think, the acreage per head is something like 160 acres. Do you think that the limitation of that area per man is desirable in the interests of the native himself, and as tending to induce him to work?—I think these matters want regulation, but much depends upon soil, water and other circumstances.

1,878. The acreage, we will say, is 20 acres per head in Basutoland, and in Swaziland, 160. Would you maintain that disparity?—I think it would be undesirable to allow natives to occupy country with a great deal more land than they require.

1,879. And you would be in favour of limiting the area of land held in certain districts where it is exceptionally large?—Yes. I think the land ought

to be made more use of. There is a great demand for it. I would not turn the native adrift or harass him. He has got to be cared for, but I would not give him much land to foster idleness; otherwise in good seasons he is content to live on his crops and do nothing.

1,880. The cutting down of the land area would tend to limit the production of grain, would it not?—It would in the case of Basutoland, where there is a limited area, but not in the case of Swaziland, where they have a large area. Swaziland is riddled with concessions, and is a difficult subject to discuss.

1,881. There is no early prospect of increasing the labour supply by curtailing the food supply of the natives, is there—I mean, making such a change by law?—You mean by taking away from him the land that he has got to cultivate?

1,882. Or by putting him upon a smaller area?—Yes, in some cases by more equal distribution.

1,883. There is no prospect of such an early change for the country?—I think it would be very difficult to deprive natives of what has been granted to them by previous Governments. I do not think the other South African Governments would entertain the proposal for a moment.

1,884. It has been very generally stated that one of the causes of the native's indolence is the practice of polygamy. Is that your experience?—No, not nowadays. Formerly it obtained, no doubt. A man found it easier to get wives. He got the wives, and he did not do much work; they did it. That day has passed. At the Conference at Bloemfontein, men of experience met, and they said the amount and effect of polygamy was greatly exaggerated. In these papers I have put before you, you will see the number of polygamists is 11 per cent. of the male population only. I was very much struck with these figures myself. I could scarcely believe it. The influence of polygamy with the natives in South Africa is a vanishing quantity. It will disappear.

1,885. The effect, I take it, of the possession of two or three wives is to limit the native's energies. He does not work so hard?—Well, then, again, you have to consider what these wives require of him. If they require clothing from him, he has to provide it by his labour, because there are very few cattle left now. They cannot buy cattle, because there are very few cattle to buy. I daresay if he found his wives were expensive, he would send them out to work, or he would send his children out to work, and it is for that reason we are going to see a decrease in the percentage of polygamists.

1,886. Then you would not interfere with this question of polygamy?—I would not touch it. We should not interfere because it would give them a common cause of grievance, which should be avoided.

1,887. I believe it is strongly supported by the women themselves?—They like it.

1,888. Now take rent. We may take the hut tax as a sort of Government house rent?—It used to be called hut tax, it is now a tax upon the native and his wives.

1,889. You have told us it is £2 per head, and £2 per wife for more than one?—Yes.

1,890. Has that a considerable influence upon the native in forcing him into the market?—I think the effect of it has been scarcely felt. The ink is scarcely dry on the receipts we have been writing in connection with it—the first systematic Government collection, which has realised something like £300,000. There is very little more to be done but to get in some arrears. It is a big undertaking, and I am more than satisfied with what has been done.

1,891. In your opinion it is one of the causes compelling the native to work?—Unquestionably, it is one of the things that causes the output from his pocket. If he has no cattle, wool or grain to sell, he has to produce that £2 somehow, and if he has two wives he has to produce £4. Money does not grow. It has been proved this year that

they have got a lot of money. In future years every man who pays his tax has got to work for it. I should say it will entail their actually working for it in most cases.

1,892. Do you not think that in some cases it would rather stimulate their agricultural energies and make them produce more?—It would stimulate greater agricultural energies where they have got land, but the land at the disposal of the native is not very extensive. They cannot increase their output very much, I think.

1,893. So that to increase the taxation is to increase the grain output of the natives?—It must have that effect naturally.

1,894. Mr. WHITESIDE: Sir Godfrey, you spoke of the danger of the natives working in the mines, and said that the chiefs did not care for boys coming here, and, further, that the pay on paper was higher. Would you kindly tell us what you mean by "the pay on paper"?—I was speaking of the time prior to the war, and the chiefs to whom I spoke at that time were Basutoland chiefs. I should tell you that many of the mining companies and corporations in Johannesburg before the war had been in the habit for years of sending letters and agents down to me so that I would help them to get labour, and in the course of my duties it was necessary for me to ask them what the rate of pay was. It was stated as being so much per month. Subsequently, I found that given to me on paper was never verified—deductions were made from the boys' pay. The first deduction I allude to is the cost of getting them up to the mines and of touting. In olden times, it nearly always came off a boy's first, second, or third month's pay. If the boy came to work for six months, he sometimes lost two months' wages by deductions.

1,895. That has had a considerable effect upon the supply?—Yes, before the war, but now I should say deductions are not allowed.

1,896. Do you consider the action of the Chamber of Mines in reducing the rate of wages has had a bad effect upon the supply?—I think it is just possible that at the beginning of the war, when everything was in a chaotic state, that reports getting back to these centres where large supplies came from, may have influenced them, because, at that moment very large wages were being paid by everybody else. It was natural the natives would say, "Everybody else is offering me this amount, and the mines whom I used to work for are offering less, and, therefore, I won't go." Therefore, it might have induced many to stay away who would have come to the mines. Subsequently, I do not think any number of natives would have worked on the mines, if they could have got the same amount of money near their own homes at over-ground work.

1,897. Do you think if the squatting system was prevented that the supply for the mines and agriculture would be increased to any extent?—What do you mean by squatting?

1,898. On farms generally; over and above the number allowed by law?—Yes, I think if the squatting law was put into operation properly, and no more were allowed on farms than are actually required, if it did not make a considerable difference, it would make a difference in the supply of labour to the farms. The redistribution would be such that many farms that have no labour would be supplied.

1,899. In column "J" of this blue print, you tell us that there are 78,000 on the farms. Is the whole of that 78,000 actually at work?—That is one of the points that I was asked to satisfy the previous questioner on in detail. Some of those people are on those private locations on farms concerning which you have just asked me. In private locations they are squatting there and paying rents, and as such would not be workers, unless they required to work for food. They pay a rent to the farmer for squatting on the farm; they pay a tax to the Government, and have to live. If they are short of food, and have no money to pay their tax or rent, they have to go out and work, but the farmers who have those squatters do all they can to prevent them going out.

1,900. Mr. QUINN: When you came here, Sir Godfrey, what was the state of things you found on the compounds along the reef? How were the conditions and the food of the boys?—Well, I must say that when I first arrived here it was in the middle of the war, and the conditions were very bad. I ought to say that it was quite beyond the power of those here running compounds to get the materials to run them with, decently. There was no railway traffic available to them, but I think they were doing all they possibly could with the conditions obtaining.

1,901. Have you any knowledge of the conditions at these same compounds before the war when they could get all they wanted?—If you ask me if I saw them with my own eyes, I saw four or five before the war, and they were very bad.

1,902. What you saw were very bad?—They were certainly bad. Of course that was some years ago.

1,903. Did it ever come within your knowledge when you were in command in Basutoland; did complaints come to your ears about those compounds?—I frequently heard from the chiefs in authority that the men died, and they asked the reason, and appealed to me not to let them go, because they said they were going away to die; but on the other hand, I saw hundreds of boys who came back and in many cases they spoke very nicely of some of the particular mines they used to go to. That is another side of the question. The boys in many cases suffered a great deal on the road, and no doubt many of them did die.

1,904. You took steps to make suggestions to the mining people to get these things altered?—I have done so very fully and frequently.

1,905. I understand in many cases at all events, they readily fell in with your views?—Most readily, my suggestions have been cordially carried, and I have never experienced opposition in getting changes for the better made.

1,906. So immediately improvements began to take place?—Yes.

1,907. What, in your opinion, still remains to be done in the majority of those compounds to make them what you think, with your vast experience of native requirements, they ought to be?—I think the first thing is to stop at once the means of communication of disease, that is by having clean and good floors. The second thing I am convinced of is the necessity of having a useful and suitable variety of food, with vegetables mixed with it.

1,908. Vegetables are being given in large quantities in some of the mines, are they not?—Yes, it is being done, and I doubt not that in the course of a few months everyone of the suggestions we are now making will be in actual operation. Then in regard to the medical treatment of natives when they are ill. A great deal is being done to improve matters, though it is hardly to be expected that one medical man only on each mine can look after so many in a short visit.

1,909. He pays an occasional visit?—Yes.

1,910. Do you think that is sufficient, that the medical practitioner, who has other work to do in town, should go there for an hour or two a day, even if he goes there every day. Is that, in your opinion, sufficient?—In the abstract, I think it would be quite impossible for one man to treat and to fully attend to the treatment of a large body of natives like that. What they are going to do, if they are not doing it already, is to have some trained hospital attendants, who can take the orders of the medical men, and I think, then, the medical men can do it.

1,911. Is it within your knowledge that on many mines the hospital accommodation is lamentably deficient?—On some mines it is still deficient.

1,912. On others it is being rapidly improved?—Yes, it has been bad in some cases; and in some cases it is extremely good to-day.

1,913. Now, in regard to sleeping accommodation in these compounds, take the amount of space allowed, is it within your knowledge that most of the

places to-day are still very deficient, and therefore calculated to spread disease amongst the natives?—There can be no question that if you do not give a fair amount of cubic space to a human being that that human being must breathe poison. I believe in some cases at the present time there is not enough cubic space. At the same time, if you gave considerable space to the native, he is a queer creature, and he will prefer to go and herd with others. If you gave him a room as big as we are in, and also offered him a hut outside, probably he would go to the hut and pack together with others. Yet I realise the necessity of cubic space for health.

1,914. You spoke this morning of some Commission or Board of Enquiry, composed of medical men, who handed in, subsequently, a report making many valuable suggestions?—Yes.

1,915. Is it possible for this Commission to have that report handed in?—The report does not really belong to me. It was in conjunction with the Chamber of Mines that I called for the report and the whole thing was done in partnership with them. I have not the faintest doubt but that they will allow the report to be put in.

1,916. Do you know who was the Chairman of that Medical Commission?—Dr. Irvine.

1,917. Now coming to this historical Conference at Bloemfontein, you said this morning the Conference was conspicuous for the absence of facts and figures. Is it not strange, Sir, from your point of view, that a Conference sitting and dealing with a matter which is of vital importance to everybody in this country should pass a resolution without having any facts and figures that were reliable?—The information that was at the disposal of those men who passed that resolution was, I believe, as approximately correct as figures could have made it. What I wanted to draw attention to this morning was the fact that there was no tabulated statement on record which the public had access to. I believe the resolution that was passed by those men at Bloemfontein was what, in their opinion, were the facts of the case, and possibly those opinions were correct. I am afraid you misunderstood what I meant. What I meant was that none of the States had got records of those facts and figures. I admit that the gentlemen concerned were competent to express an opinion.

1,918. Will you give us next, Sir Godfrey, the number of natives employed on public works in South Africa, say 20 years ago—that is, within your experience. Those employed all over South Africa—in the mines, railways, and other big public works?—20 or 30 years ago there was not a mine worthy of the name except Kimberley; there were but few public works.

1,919. Do you think that if I were to say that there were not 20,000 natives employed in public works 20 years ago, I should be within the margin?—What do you mean?

1,920. Mr. QUINN: I mean on the railways, on the building of reservoirs, and on the mines?—There were no railways 20 years ago.

1,921. Kimberley was in existence, of course?—Yes.

1,922. Kimberley was open in 1874?—In 1870, I think.

1,923. Can you give an estimate of the number of natives employed on mines and railways and in various ways to-day throughout South Africa?—I am afraid, without reference to records and inquiries, it would be asking a little too much for me to give you that.

1,924. Take all the mines, railways, public works, military and other things, would it be sufficient to put it down at a quarter of a million?—It might be a quarter of a million or more. There are 130,000 in the labour district of the Witwatersrand.

1,925. Might we take 200,000 as a certain figure—taking the mines of South Africa, the dock works, the railways, the Army in occupation, and the Police?—Oh, yes, a great deal more.

1,926. I would be correct in saying 200,000?—Yes.

1,927. There has been an enormous increase in the amount of labour available for the past 20 years?—Yes.

1,928. I understood you to say this morning that if the boys worked, after they acquired what little things they required or wanted for which they went to work, they then stopped working?—Yes.

1,929. And that the larger wages paid, the more the volume of labour was interfered with?—Yes.

1,930. How do you reconcile that with the fact that for 20 years the increase has been at least ten times what it was previously?—The population has increased. There has been a greater demand. The general habits of the natives have been revolutionized in 30 years. In those times he wanted nothing more than his skin to cover him, now he spends £5 or £10 on other things. The native cannot depend upon agriculture so much as he used to, as the land does not increase with population.

1,931. Is it not a reasonable assumption then that we can count on a similar increase of labour available as the days go by?—No, you have got the fact that the general demand is enormously greater than it was and is an increasing quantity.

1,932. Leave the demand out?—You cannot.

1,933. We will leave that meantime then. Is there an agreement in existence, or an understanding between your Department and the Portuguese Government with regard to recruiters?—There is no agreement at all. I am governed by the "modus vivendi." There is a general understanding between us, because we have a great deal to do with each other in one way and another. I would not like to say that we disagree. There is an understanding that we should work together with the common object of facilitating the supply of labour.

1,934. Is it sufficient for a recruiter to take from you a certificate of character for the Portuguese to allow him to recruit in their territory?—The Portuguese Government approached my Department when the licences were issued. They said, we will not issue licences to any person in the Transvaal to recruit in Portuguese territory unless he is accredited properly with a licence. That is to say, they would support the laws of this country. They said they would not act "ultra vires" so as to encourage people from the Transvaal, who perhaps were bad characters and who had been refused licences, to go down there and recruit in their territory against their laws and ours too. They wished the spirit of the law in both territories to be observed.

1,935. Now evidence has been given that the Native Labour Association will not recruit boys for three months; they insist upon at least six months' service. If that is so, do you think it would adversely affect the supply? May it not be possible that boys would come for three months who would not come for a longer period?—I think it is quite possible, as in the case of the Basutos, who will never tie themselves to a six months' contract. The number that would be affected by that would not be large. The natives from the Transvaal and the Portuguese territory really supply the great bulk of the labourers.

1,936. It would affect the Basutos in a measure?—In a small measure. If the mine has all the expense of getting them up here, it is scarcely fair to expect them to take on boys for three months.

1,937. It is a question of expense?—Yes.

1,938. By once getting them here and endeavouring to create their wants and all these things that you spoke of—coats, hats, etc.—do you not see even the additional expense in the three months' contract would bring them back for three months?—I certainly would get every boy here for three months that was economically sent.

1,938A. It would not pay a mining company to for three months?—I certainly would encourage employment for three months, if that was economically practicable. It would not pay a mining company to spend a lot of money in getting a boy for three months.

1,939. Do you not think there would be a chance of those boys coming back again for the sake of the shops?—As a matter of fact the natives who come here and work in Johannesburg see more in the shops in their own territories than they see in the shops in Johannesburg. Goods are cheaper in Basutoland; for instance, you can get a suit of clothes for £1 there, and here it is £2.

1,940. What is your experience, Sir Godfrey, of the length of time the boys remain in employment in the town? Is it a fact that the length of time is very much greater than that extended to mining people?—I think it is, but they are never bound to a period; it is generally from month to month. As long as the boy is fed and he is getting his regular pay, it is an attractive sort of life, and if you send his pay back home for him, he will probably remain. I do think the Zulus and Natal natives stay very largely for a year, whereas in the mines they do not stay for more than six months.

1,941. Mr. DANIELS: With regard to this diagram (v. pp. 118-119), Sir Godfrey, in column "E" attention has been drawn to the Central Division here. In the Pretoria District those now at work number 260. I think that it was admitted that none of the Pretoria towns or districts are included in this at all?—The Pretoria town statistics are not in this at all.

1,942. Therefore the 5,240 stated here as "not now at work" is not correct. If you had 2,000 or 3,000 men working in Pretoria that would reduce this item "Men in Pretoria?"—The men working in Pretoria would be men who come from Zoutpansberg. They might not have come from the Pretoria District at all.

1,943. Do you not think 260 being the total number drawn from the Pretoria District must be incorrect?—No. I think, very likely, from the area outside the town of Pretoria that 260 is not the whole of the Pretoria District; because Haman's Kraal is included in the Pretoria District. Haman's Kraal is quite close to Pretoria. It has been divided only. I think Pretoria would be the wrong designation for that. I will have some explanation for that by the time I come before the Commission again.

1,944. The CHAIRMAN: Sir Godfrey, the Commission is very much obliged to you for the information you have given to it. It is understood that when you return we will probably want to call you again?—Certainly, I shall be very pleased to come.

The Commission adjourned until 10.30 a.m. on Tuesday, the 4th of August, 1903.

## SEVENTH DAY.

Tuesday, 4th August, 1903.

THE COMMISSION SAT AT 10.30 A.M.

Mr. MELLO BREYNER, recalled.

(Mr. Breyner gave his evidence in French, which was translated to the Commission by an interpreter.)

The CHAIRMAN: The Commission will resume the cross-examination of Mr. Mello Breyner. We left off, I think, with Mr. Whiteside.

1,945. Mr. WHITESIDE: Mr. Breyner, in the first paragraph of this statement of yours, headed "Statistics," is not the value of your estimates destroyed by the fact that you state that these statistics, although official, may be less than the truth, and then you go on to give the reasons?—Yes, I understand that. You want to know whether those estimates are true?

1,946. Yes. Do you adhere to this statement and say it is true, or is it simply an estimate of your own?—These are official statistics, but they are a little bit off.

1,947. I must press the point, Mr. Breyner. You state that these figures may be less than the truth, and then you go on and give the reasons for that, consequently it destroys the whole value of the figures given on this paper?—These are official figures, but I cannot say they are true at present, although they might have been true at the time the statistics were taken. Well, I adhere to these statistics. These statistics, I say, are about five or six years old, but the figures may be a little high now.

1,948. They are five or six years old?—Yes.

1,949. Have you represented the Native Labour Association since it was formed?—Yes.

1,950. You have told us, Mr. Breyner, that time and money must be spent to obtain labour from the Northern territory, but that labour can be had. My question is, can you tell us if that labour can be had in any considerable quantity?—Well, labour can be got there at present in the Northern territory, but not so largely as in the South.

1,951. Can you give us any rough estimate of what you think it would be possible to get from those districts?—Well, statistics have been given by persons as to how many workmen they had for some years as follows: From Quilimane, 432; from Mozambique in 1902, 508; in 1903, 428; and from Beira, 33. The total during those two years is 1,401.

1,952. You give us, Mr. Breyner, a considerable number of figures on this printed statement which are altogether estimates of your own. Now, my question is a plain one. I want to know if you can give us another estimate of what might be the quantity of labour we might get from this particular district. I do not want to know what we have already had?—These are the figures from 1903, or at least they are the figures of labour available up to the present date.

1,953. I want to know what you, Mr. Breyner, would estimate the available labour supply from this particular district at present. I do not want to know what we have already got.—Do you wish to know up to the end of the year how much labour can be got there? I give the statistics per month of what has been got there.

1,954. I do not want to know what we have had; we have got that. You have given us a lot of estimates on this sheet. I want you to go a little bit further and give us an estimate of the total quantity of labour available which we can

get from that territory?—Well, I say in a few years labour can be got there; 60,000 natives can be got there in about five or six years.

1,955. You told us, Mr. Breyner, that there were some 80,000 to 90,000 natives available for the mines from the Southern territory. I want to know how you arrive at those figures?—Well, I say it is because before the war in that Southern territory they used to deliver about 80,000 workmen.

1,956. I would like to ask you, Mr. Breyner, does the W.N.L.A. enjoy any privileges which the old Rand Native Labour Association did not enjoy?—I do not think so.

1,957. Do you think that the W.N.L.A. is a monopoly?—No, it is not.

1,958. Can you tell us what it cost the Witwatersrand Native Labour Association to land boys in Johannesburg from the territories which you, Mr. Breyner, recruit from?—It depends on the distance of the district from where the labour is recruited. The greater the distance and the larger the district would certainly make it dearer.

1,959. Is the present process more expensive than in pre-war days?—It is cheaper, much cheaper.

1,960. You give us, Mr. Breyner, some figures on this statement shewing the total of 22,000 odd sent forward up to July 14th of this year. My question is, how many recruiters and runners, etc., were necessary to obtain this result?—11 have been employed.

1,961. Can you tell us how many runners were employed by these recruiters?—Two for each recruiter.

1,962. In the first statement you tell us that some 80,000 natives were sent to the Rand under the old system of recruiting. You also express admiration for the present system of recruiting under the Witwatersrand Native Labour Association. How is it we have not got better results under the system which you admire so much?—Well, 80,000 have arrived for many years. Since the industry commenced here, they have continued to arrive. Since the war only a short period has elapsed and the results were larger before the war than now.

1,963. I suppose you consider those results that you have given us, Mr. Breyner, are satisfactory?—Well, I say it is for you to judge whether they are satisfactory or not.

1,964. I am asking you as a representative in charge of the recruiting down there. Do you think those totals can be increased or improved upon?—I worked well to get this result out, but I believe that this result can be improved upon still.

1,965. Mr. QUINN: Take the top of this statement of yours, Mr. Breyner, "Summary of Mr. Mello Breyner's Statistics." The first statement here is (v. p. 38) "The official statistics give us a number of 363,030 adults from 15 to 50 years old in the district directly administered by the Government, that is Lourenco Marques, Gaza-land, Inhambane, Mozambique, and the Crown lands of the district of Quilimane?"—Yes.

1,966. Is it not true that a very large number of natives do not pay any hut tax at all; is it not true that they do not pay in money, but pay it by labour?—They pay it with money.

1,967. Is there not a large number who do work and do not pay money for the hut tax; they work

out their hut tax by labour and do not pay hut tax at all?—Well, there may be some, but then there are those who pay with produce or with labour, but generally it is with labour.

1,968. A great majority do that. But tell us if you can, about how many pay by labour or by produce. Is it 20,000, perhaps?—I cannot estimate how many will pay in labour. First of all, they must pay in labour and then, if they have no money, they pay in produce. If they fail in this, they have to work for it.

1,969. Would it be correct to say that there is a large number who do so?—No, it is not a large number.

1,970. Have you any idea how many, roughly speaking; is it 5,000, or 10,000 or 20,000?—It may be 5 or 6 per cent.

1,971. That would be, roughly, about 20,000 according to what I have been informed. Now, at the bottom of that statement (v. p. 38), you say: "But we know that there are considerable districts where very little is received in taxes from that source owing generally to the great distances at which the authorities are situated." Have you any idea how many escape paying taxes altogether? Is it 20,000 or 10,000? "There are districts where very little is received." I want to find out what numbers there are that escape payment?—There is a very small number, but I cannot estimate it.

1,972. Would it be a fair estimate to say in these districts that I have referred to in this first paragraph in your statement, that, in addition to 363,036 who pay taxes, there are, including these boys who work out the tax, and boys who do not work at all—would it be fair to say that the male population may be put down at 400,000 roughly?—Yes, roughly speaking.

1,973. Take the next paragraph. There are no reliable official statistics with regard to these Northern territories under Company Government. The next paragraph says: "The Administration of the other part of the province belongs to three Companies—Mozambique, Nyassa and the Zambesi Companies." Now, there are no official figures that can be relied upon for that?—I have no official figures.

1,974. Can you tell us from your own information or knowledge whether it is true or not that the adult male population of these three Northern provinces is not likely to be much greater than the Southern ones for which you have got official figures?—It may be equal or it may be less.

1,975. Or more?—Or more.

1,976. Is it a fact that many of the villages of the Southern provinces are like big towns, they are so populous?—In the district from Inhambane there are very large villages.

1,977. Do you know of any island on the Zambesi, for instance, where there are a very large number of natives?—Yes, the population is very thick there.

1,978. Can you give us any idea of the population; where you have seen them there and know them to be very, very thick?—I have passed many villages. I saw the population and they were very populous, but I cannot give any figures. We may safely take it that it would be a safe estimate to say, that on the road South—in the valley of the Portuguese territories north and south—there are 800,000 adults.

1,979. So we can work from that basis?—Yes.

1,980. Take the second paragraph of your statement, headed "Emigration." In the second paragraph you say (v. p. 38): "Taking into account the natural disposition of the natives to indolence, we cannot count more than one-third of them as being available, that is roughly speaking, 250,000." Do you think that one-third of 800,000? Would you like to modify that estimate—two-thirds being too lazy to work? Do you not think that that is far too many to wipe off as being too lazy to work?—Do you mean the whole population of the land?

1,981. Yes.—Only one-third is available for work. This is only an estimate.

1,982. Suppose we write off that—or say that every other man refused to work—and suppose we say that out of 800,000, 400,000 would be available. Would that be a fair estimate?—Yes, that would be a very good estimate.

1,983. May we take 300,000 out of the 800,000. Could we reasonably hope out of 800,000 to have 300,000 who would work and who would be available?—I do not say it is not impossible to get 300,000, but still I estimate it at a quarter of a million.

1,984. Well, read on, you say (v. pp. 38-9): "From this figure we must deduct from 80,000 to 100,000, required for the internal needs of the Province of Public Works, for the Municipal service of the town, for agriculture and mines, for the service of the ports, for the needs of the coastal service, for military service, for various industries, and for domestic service." Do you not think that 80,000, the lower figure, is a very high estimate? Would you not like to modify it?—Yes, perhaps it might be that it would be less than 80,000.

1,985. In the printed statement furnished to us and headed, "East Coast census of native population," we get a summary of natives employed in Delagoa Bay. Look at that for a moment. Now the summary of natives employed locally; we get for forwarding, landing and shipping companies, commercial houses, public works and municipality, harbour works and railway, builders and contractors, brickfields and stone quarries, and domestic service, a total of 7,463. Now, if so few are required at Delagoa Bay with all these services, how can 80,000 be required for similar public works and similar services elsewhere?—Well, for the interior they require many boys and also for agricultural purposes.

1,986. In any case the 80,000 is a very high estimate?—Well, it is a rather large population.

1,987. Then take the heading "Note" in your statement (v. p. 39), "Projects are on foot for constructing three lines of railway in Portuguese East Africa, namely, the lines to Swaziland, Quilimane, Ruo and Pemba to Nyassa. These lines are likely to be built in the more or less near future." Will you tell us a little nearer what you mean by "The more or less near future?" Take the Swaziland Railway, how far is that advanced?—I cannot give a specific time for the near future, but I think the railway in Swaziland will be constructed before the others.

1,988. Surveying is going on for the Swaziland line?—They are at present surveying it.

1,989. What is the distance of that Swaziland line?—From 40 to 50 kilometres.

1,990. That is about 27 English miles, is it not?—Yes.

1,991. I think the other day you said 20,000 natives would be required for that line. Do you not think that that number will be too many now? Have you ever heard of such a thing?—It depends upon the rapidity of the construction. If they want to construct it very soon they will have to employ more. But if they are going on slowly, then they can employ 10,000 or 15,000.

1,992. I want to refer to that 20,000. Do you not suggest that the necessity of that 20,000 boys for that 25 miles of railway is far fetched?—I cannot say whether it is too large a number or not.

1,993. It is a guess of yours?—Yes.

1,994. Are the Portuguese Government accustomed, in carrying out their railway works, to do them very rapidly?—I think when they require the line very soon, then they will construct it more quickly.

1,995. You have said in your opinion they will first make the Swaziland line. Do you not think they will do that first, before they go on with another railway line that is mentioned in this statement of yours?—I cannot say.

1,996. Has anything been done except talking about it with regard to all the lines except the Swaziland line? May it not be some years before they start them?—Yes, they are surveying a lot of other lines.

1,997. Do you not think that 60,000, the estimated number of natives required for railway construction, is a very high one indeed? It is the highest one you have given yet.—As I said before, it is a question of whether they carry on the construction rapidly or slowly and this is only an estimate, which might be smaller or larger.

1,998. Do the boys who work on such works as railways not tend to become peculiarly lazy and a drink-loving lot? Are they not boys who are not likely to leave home?—All the blacks are lazy and all the blacks like drink.

1,999. There are some more so than others. There are classes of boys in Portuguese territory who work fairly well. Those who come here work well, but there are other classes who only work a week and then they want to be lazy for a week. Is that not so?—Well, I think amongst the blacks there are some better and some worse.

2,000. Is it not a fact that on the railways and on the Public Works in these Portuguese Provinces the natives employed are a distinct class from those who come up to the mines—a lazier class?—They are the same.

2,001. Then out of the 550,000 that were set aside out of the 800,000 which you believe to be the number of male adults, is it possible for the whole of that 550,000 adults to be continually lazy and do no work?—I do not think so. They are all lazy. I have come across some very nice people, but they are very rare.

2,002. You said that out of 800,000 natives, which you say are there, the male adults which we can count on only as likely to work, are 250,000. Is it not likely, and probable, that out of that other number—over half a million—these needs for railways, public works, and all these other things that you have talked about, may be supplied?—It may be, but I do not know.

2,003. It is possible?—Yes, but I am not certain.

2,004. Is it a reasonable thing to expect that out of the remaining half-million these requirements for railways and other works can be met?—It is possible.

2,005. Will you tell us on what basis you are paid? Are you paid a salary and commission, or salary only; or a commission only?—I get a commission.

2,006. Is it a commission per head of boys recruited, or what?—Yes.

2,007. Do you pay a commission also to those recruiters who work under you?—Yes.

2,008. And you have got 11 white recruiters?—Yes.

2,009. Now, what is the proportion of the total amount of commission that you receive and that you pay these 11 recruiters?—The Association pays my assistants or recruiters a certain sum of money, and I get a certain sum of money.

2,010. You are paid by commission and no salary?—No.

2,011. Are the recruiters paid by commission?—Yes.

2,012. And no salary?—There are some recruiters who get a certain sum of money for a certain number of boys.

2,013. You are at the head of the recruiting down there; you are the chief man?—No, I am only the representative of the Labour Association with the Portuguese Government. I am not the recruiter, there is another man there.

2,014. Are you in charge of the recruiting down there; all these men working in Portuguese territory, are they responsible to you?—There is a manager there; I have only to do with the Government.

2,015. You are not in charge there?—No, I am not directly in charge of the recruiters.

2,016. These other recruiters are not responsible to you directly?—No, they are not responsible to me, nor am I responsible for them.

2,017. What is the name of the gentleman to whom they are responsible?—Until the end of last month there has been a gentleman by the name of Pickard there. At present there is someone else whose name I do not know.

2,018. What do you do? You say you do not recruit; you do not manage the other men who do recruit. Are you with the Portuguese Government and do the diplomatic work?—Yes.

2,019. You make things smooth?—Yes.

2,020. Can you tell us how many recruiters there were in those provinces before the war?—In the old Rand Labour Association there were 11 before the war.

2,021. Do you know how many free recruiters there were before the war?—The Association employed 11, and there have been 28 outside of that Association.

2,022. Was that since the war that there have been 11 white men recruiting, as against 39 before the war?—Yes, that is so.

2,023. Do you get a salary as well as a commission?—I get no salary.

2,024. But I think you do get a salary?—I only get a commission.

2,025. Does your partner get a salary as well as a commission?—He is only paid by commission; he does not get a salary.

2,026. Had you anything to do with obtaining labour for the mines before the war?—Yes, before the war I worked on my own account for the Native Labour Association.

2,027. For the Association that was in existence then?—Yes.

2,028. Were you successful then?—Yes, I have been successful.

2,029. Was there as much money made out of it by you then as you make now?—It is nearly the same.

2,030. How were you paid then, by a commission or salary, or both?—I was always paid by a commission.

2,031. Were you consulted by the present Native Labour Association; was your opinion asked before the wages were reduced—that is, while the war was on? Under the new arrangement were you asked what you thought about it?—They consulted me as to how to pay the boys, and as to their distribution in the country.

2,032. They did not consult you about the amount they were to pay the boys?—Yes, they asked me that.

2,033. And did you agree; was that your suggestion, or did you say that it was someone else's suggestion, that wages should be cut down from the old price?—I have not been of the opinion that wages should be reduced. I maintain that wages should be the same as before.

2,034. Did you tell them so at the time you were consulted?—Yes, I conversed about it, and this has been my opinion.

2,035. With regard to the two years that have gone by and during which you have been trying to get natives; has not that convinced you that your own judgment was right about the reduction in wages?—Yes, I am more convinced than ever about it.

2,036. Why, what has the two years taught you; I mean from 1900, when we started working the mines, until now?—It is since they reduced the wages that the boys come less to the mines.

2,037. Do the natives in the parts with which you are acquainted—or, rather, has the increase of wages which took place in February last, had time to get fully known all over the country?—Certainly it will have a good effect there.

2,038. First of all the natives got to know that the wages were reduced, and in February last the wages were put back to what they used to be. Has sufficient time elapsed since February to let that be generally known?—In the Southern Provinces, yes, they know it already.

2,039. Can you suggest to us, then, what in your opinion, would be a good thing to do to increase the numbers coming in?—You want to continue the present system.

2,040. Can you suggest anything else? Is there any other way of improving the present system, or altering it? Is there anything you can suggest to keep the present system and do something else?—The present system can be improved: but it must be studied and worked.

2,041. What would you do to improve it? Supposing you had a free hand to do what you liked, what would you do?—I would first start it and then I would suggest something to improve it.

2,042. Supposing we increased the recruiters' wages and the commission, would that have any effect?—It might, but it is not necessary. They are working now quite well.

2,043. And you do not think they would work any better if they got more money?—They might do so, but while they are working quite well now, it is not necessary.

2,044. When we get permission to go into those two Northern territories, do you think that recruiters will go up there for the money they are getting now?—Yes.

2,045. They could be got to go?—Yes.

2,046. Some time ago one or two recruiters had their heads cut off up there. Do you know anything about that?—Yes, I heard of that.

2,047. Can you tell us why they were decapitated?—That is a question of native politics.

2,048. There is a reason for it?—As I said, it is in regard to native politics.

2,049. Is it within your knowledge that the reason why those men were killed was that they had been informing that slavery was being carried on up there and the natives knew it?—I have nothing to do with this; it is a local question, and a question among the chiefs.

2,050. Mr. TAINTON: Take that list of figures you gave us. Mr. Breyner, "The East Coast Census of Native Population." Whose census is that?—It is from the Government Office.

2,051. In your statement the other day you say the total number of adults from 15 to 50 years of age is 363,036. If you add up the men on this census I have mentioned, you get a total number of 402,000?—Yes.

2,052. How is it that the other day the official census was 363,036—that is, a difference of 40,000? How do you explain that?—It may be that there is a mistake in the addition.

2,053. Does not this census perhaps include all the males over 15 years of age? I am simply suggesting this, of course?—No, I do not think so.

2,054. Which of these two figures must we take as correct?—There may be a mistake in the addition. But I find on adding the figures up that they come out all right. Those figures, 402,000, they are official and, therefore, they are correct.

2,055. Then the figure in your statement the other day is incorrect?—I do not know.

2,056. In the same table the word "minor" is used—that is young lads. What is the age at which they count as adults? What does this word "minor" mean? What is the age of a minor?—A lad 15 years old is a minor.

2,057. Look at the figures under the heading of "Inhambane District": Adults, masculine sex, 127,720; minors, 46,498. Does that include all the males in that district?—Yes.

2,058. You say that the minors in Inhambane are about a quarter of the whole male population?—Yes.

2,059. Is it true that only a quarter of the males in that district are below the age of 15 years?—Yes, that 46,000 represents boys under 15 years of age.

2,060. Only a quarter of the males in that district are below 15 years of age. It is 46,000 out of 144,000; that is the total carried out?—I believe that from the whole population the boys under 15 years would be a fourth.

2,061. Does that proportion hold true for the whole of that census?—Yes.

2,062. In all other censuses taken that I know of, one-half of the male population is below 15 years of age. How do you explain the difference?—These figures are not mine; they are official.

2,063. You made a distinction the other day in the two kinds of land there; there was private land and Government land. How much of the Mozambique District is Government land?—The whole Province of Mozambique.

2,064. What do you mean by the Province of Mozambique? Does it include the whole of Portuguese East Africa?—Well, shortly, all the Portuguese possessions of that part are what I call Mozambique.

2,065. Including the north of the Zambesi also?—Yes.

2,066. Now what is the district of Mozambique? What are the boundaries? How far does it go?—From a small river on the north of the Zambesi, which I have forgotten, and it goes to the Lurio.

2,067. How much of that Mozambique District is Government land; the whole district?—Well, there are other proprietors. Besides the Government, there are some private proprietors.

2,068. How much land is owned by the Mozambique Company?—From the River Sabi to the Zambesi.

2,069. From latitude 22 south to the Zambesi; you have said that the territory from latitude south marked on the map by a red line is owned by the Mozambique Company?—It commences from the River Sabi; it is much more north of that red line. Up to the Zambesi it is Mozambique Company's territory.

2,070. What proportion of that territory is held under the Government?—The whole of this district belongs to the Mozambique Company except in the northern district; a small portion of which belongs to the Government.

2,071. Where is that?—North of the River Mazoe, just south of latitude 16.

2,072. If I understand you correctly, you have pointed out the territory belonging to the Zambesi Company; is that right?—Yes.

2,073. Then north of the Zambesi, near the mouth, there is a territory also belonging to the Zambesi Company—above Quilimane?—On the north there is another Company.

2,074. It is marked here "Compagnia Zambesia," is that correct?—Yes.

2,075. North of the Zambesi Company there is a large territory which by agreement is held by the Nyassa Company, is it not?—To the north of Mozambique there is a territory which is under the Nyassa Company.

2,076. So that all the territory north of latitude 22 is in the hands of private companies?—Not all, the district of Mozambique is under the Government.

2,077. Where is that district of Mozambique, that is what I want to get at?—It commences at the River Mazimbwa, and extends to the Bay Lurio, which is a little north of latitude 14.

2,078. How far west does it extend? Is it a coast province, that is, does it run along the coast?—Yes, it is a coast province.

2,079. How far does it go inland and how wide is it?—It goes through to the lake of Nyassa.

2,080. What territory is held by the Nyassa Company then?—The Company of Nyassa holds from the Bay of Lurio to the German East African frontier.

2,081. Are you allowed to recruit in the territory of these Companies?—At present I am not allowed, but I have asked for permission to do so. This has nearly been arranged with the Zambesi Company.

2,082. Will you tell us what this Prazo system is; what does it mean?—Simply white contractors pay the taxes to the Government. They pay over to the Government a certain sum of money for the right to levy taxes in a certain district.

305

2,083. What is the price paid? Supposing the taxes amount to nominally £100,000, what proportion of that amount is usually paid by the contractor to the Government?—They pay a certain rent.

2,084. How is that collected?—The collection is made on the basis of the taxes which are paid.

2,085. Is that system in force only in the provinces that the Government control, or is it also in force in the provinces administered by private companies?—It is only in the district of Quilimane and in the possessions of the Zambesi Company where this custom prevails. The district of Quilimane is under the Government and the other belongs to the Zambesi Company.

2,086. Has this system not been introduced into the district of Inhambane?—No, only in the Zambesi Company's territory.

2,087. Have they any intention of introducing it there?—I do not know; it has been spoken about.

2,088. It is mentioned in the report of the British Consul for 1900 as being introduced into Inhambane; is that incorrect?—Well, there have been repeatedly remarks about it, but nothing has been positively done.

2,089. Now I will call your attention to an extract from a Lisbon newspaper and handed in by Mr. Perry. In the second paragraph it says: "Everyone knows that Portuguese East Africa is "not very densely populated, and that, particularly "in the Zambesi, there exists a chronic labour crisis"?—I have read this article and am of opinion that the person who wrote it has little or no knowledge of Portuguese East Africa, and of the habits and customs of the blacks.

2,090. That is where they have this Prazo system?—On the contrary, there is plenty of labour in that part. The Prazo system is prevalent in the district of Quilimane and in the territory of the Zambesi Company.

2,091. What rights does the contractor get for his lease?—The contractor has got the whole administration in his hands.

2,092. Does he decide all disputes and law cases?—He has judicial and administrative powers.

2,093. Has he got the right to raise a police force?—He has got sepoy.

2,094. He has complete control over the natives under his lease?—Very nearly complete.

2,095. Then he would object to any recruiting going on, or to anyone trying to take away his boys?—At present I do not think he would make any objection.

2,096. I would refer you to this article again, "It is known that the "raid on" the natives "in order to induce them to go to the mines has "taken such enormous proportions; and that the "recruiters are working so freely, that complaints "are already beginning to be heard from the establishments in the Zambesi and in the Inhambane "district." Is that statement correct?—Perhaps the next sentence will explain: "In the so-called "Leases" (prazos), the hut tax is at present "farmed out to various people who undertake to "pay in cash the proportionate amount of this tax, "and there people now find the number of their "natives diminishing considerably, with a corresponding reduction in their own income." The meaning of that statement is that the recruiters are working in this district, and that they are taking the natives from their leases. Is that so?—Well, there have been no complaints, and I do not understand why they should not be recruited there.

2,097. What I want to get at is that the necessities of the leaseholders are against recruiting?—That is a thing that can be arranged with the Prazos.

2,098. How far have their negotiations gone with the Zambesi Company?—They are waiting only a final settlement with the Directors of the Company.

2,099. That is, the recruiters will be able to take natives from these private leases?—Yes, certainly.

2,100. The natives are not allowed to leave these leases without the owners' consent, are they?—They cannot.

2,101. The British Consul, in the report which I have just referred to, objects to the introduction of the Prazo system into the Inhambane, on the ground that it interferes with the liberty of the native. Does it do that?—What I know is this. This system places a certain number of natives under the control of the contractor.

2,102. The men are not allowed to leave that ground without his consent. Has the contractor the right to send them out to work?—He can send them to work, but he has not the right to force them.

2,103. Then when Mr. Selous says that in his experience these natives are practically slaves, he is incorrect?—Quite the reverse; it is not true.

2,104. Their master is their judge?—In simple questions he is their judge.

2,105. How would he make his profit suppose the recruiters were allowed to go into his ground? Where would his profit come in? If he sends the boys away to the Rand, how does he make his profit? Does he make a charge per head?—Well, they are working here and have to send the taxes on to him, and if a recruiter wants to get a man he must come to some arrangement with the proprietor.

2,106. What is the usual amount paid per boy in the Portuguese territory?—It depends upon the district from which they come. The tax is about four shillings.

2,107. Government tax?—Yes.

2,108. What amount does the Labour Association pay the Government per head, when the boys are sent out?—Thirteen shillings per head.

2,109. What amount does the Government charge the boys when they go back?—I am not certain, but I think ten shillings.

2,110. What is the amount of the hut tax charged to the boys?—It depends on the district. About the Zambesi, I think, about four shillings, and in the south about eight shillings.

2,111. So, roughly, including hut tax, the Government makes about thirty shillings per boy?—When the boy is away he does not pay tax.

2,112. I am just asking the question. The Government makes about thirty shillings per head out of this immigration to the Rand and back again. This money has a considerable influence on the Government revenue, has it not?—Whether it has a great influence on the revenue or not, I am not aware.

2,113. Are you aware that the Province of Inhambane is the only one in which the revenue exceeds the expenditure?—Yes, I am aware of this.

2,114. And is the statement of the British Consul, in his report for 1900, correct, that the value of the goods imported in 1899 was £101,000, and in 1900 it fell to £50,000, i.e., 50 per cent.; are you aware of that?—No, I am not aware of that.

2,115. Do you think that probably this reduction is owing to the war? Is that a fair deduction?—Yes, I think so.

2,116. So that unless a great many of the boys went from Portuguese territory to the Rand, it is probable that the revenue of that Province would be very much smaller, is that so?—The Government loses when the boys leave, but when they come back they bring money.

2,117. What age do the boys go out to work?—About 15 or 16 years.

2,118. What is their average stay on the Rand? How long do they work before they come back again?—On an average, two years.

2,119. Then when a boy comes back he is about 17 or 18? How long does he remain at home?—It depends how long he keeps his money. If he spends it quickly, then he returns sooner.

2,120. How long does any boy stay at home after he has come back from the Rand?—Sometimes six months, sometimes a year, or sometimes a year-and-a-half, and sometimes two years.

2,121. You told the Commission that you expected to get one-third of the whole adult population out to work, so that if a boy goes out to work

every two years, in six years the whole population has been out to work?—Only one-third is available, but the whole of that third does not come up here.

2,122. One-third every two years makes the whole population come out in six years. If you have 100,000, and you make 33,000, or one third, come out every two years, in six years you have the whole of that labour.

The Commission adjourned for luncheon until 2.30 p.m.

2,123. Mr. TAINTON: You said that one-third of the available population could be sent out, showing that the whole of the population came out once in six years. Will you please explain that?—Part of the third comes here, and part stays there.

2,124. How much is coming here?—Since the war to the present time 38,000 for 1902; in 1903, to July 14th, 22,240 arrived.

2,125. That is not answering my question. Take now these figures of natives under the Government as 363,000; you said in your evidence, given on the third day (v. pp. 38 et segg), that one-third of that would make 120,000. Is this right?—Yes.

2,126. You said that two out of every five boys are wanted for work down in Portuguese territory—two-fifths?—That is the biggest proportion.

2,127. That leaves 75,000 as the available supply from Government Provinces. You said, I think, in your evidence that you could get 80,000 a year out of those Government Provinces. Is that right?—Yes, and this is also the highest estimate.

2,128. You say the native works for two years. You get 80,000 one year, and 80,000 the next year. That is 160,000 boys you get for two years?—Naturally, it will be so if part of them do not return, but, in fact, part of them do return.

2,129. Do not you mean that for a period of two years' service you recruit 40,000 boys a year?—It is about right; we have got here 40,000 boys the first year, and 20,000 boys the second year. That makes 60,000 boys here now from the East Coast. At the end of May there were here in the Transvaal 62,700 boys.

2,130. I believe the figures of the mines are about 63,000, so that nearly all the boys here are Portuguese boys, if those figures are correct?—My figures are at the end of May; may be now these figures of the mines are correct.

2,131. You adhere to your statement that you can get about 80,000 boys every year out of Government Provinces?—Yes, I adhere to this statement.

2,132. What are the chief tribes inhabiting Portuguese East Africa south of the Zambesi? Can you give the names of the chief tribes?—Some.

2,133. Will you give them?—South of Mozambique Company's territory there is a tribe called Mandua; it is a very numerous tribe. North of the District Inhambane there is a tribe called Macuaqua.

2,134. Where does that tribe live?—To the north of the District Inhambane.

2,135. How far does the Mandua tribe extend?—The Manduas occupy a very large district.

2,136. Do they live in the territory of the Mozambique Company?—No, some of them emigrate there, but they don't live there.

2,137. You say the natives there are very indolent and lazy?—Generally, it is so.

2,138. Do you find any great difference amongst the tribes? Is one tribe more inclined to work than another?—Yes, I find some tribes are more inclined to work.

2,139. Can you mention the names of the industrious tribes?—The Basutos and Tongas are more suitable for work here in the Transvaal; also the Shangaans of Gazaland.

2,140. Will you explain why the tribes outside of Mozambique territory are more industrious than those inside?—I do not say so. The Manduas are an industrious tribe, and they live in the territory of the Mozambique Company.

2,141. How do you explain that 33 per cent. of the boys south of parallel 22 come out to work voluntarily, and none of those north of parallel 22 come out to work?—The natives south of latitude 22 have been accustomed for several years to come to work here, and in the northern district recruiting only commenced there during the last year.

2,142. Why do not the boys come out from the northern territory?—Because it is a new thing there, and it is only in the last year that operations have been made north.

2,143. Then it is the recruiting that makes the difference?—The tribes of the south are already accustomed to come here, and it is no new thing to them; and those tribes of the north have no knowledge of the Transvaal.

2,144. Is it the recruiting that makes the difference?—It has existed a long time in the south, and they are accustomed to come here.

2,145. But you have lazy boys south of latitude 22, and lazy boys north of latitude 22. Why do they come from the south and not from the north? Is it the opening up of the country by recruiters that makes the difference?—The lazy boys of the south already know the Transvaal, and the lazy boys of the north do not understand.

2,146. Are the boys south of latitude 22 more industrious than those north?—Those boys north know nothing of the country.

2,147. If you get permission from the Mozambique Company to recruit there, what will you do to open up the country in the Mozambique Company's territory?—At present I have no permission, but should I have it, I will send recruiting agents.

2,148. Will those recruiting agents go to the officials of the district?—They have to go to the officials before they can be granted a licence, and then he (the port official) indicates places in the district where he (the recruiting agent) may operate. Of course, the recruiting agent has the choice of places.

2,149. Do the native chiefs assist the recruiting agents?—Yes, he (the native chief) gives assistance because he has control of them (the recruiting agents), and he also performs police duties.

2,150. Are the chiefs paid anything?—The Government pays them.

2,151. Gives them a salary?—A salary.

2,152. Does that salary depend upon the number of boys they send out?—No; it is a fixed salary.

2,153. When do you expect your negotiations with private companies will be successful, so that you can recruit on their ground?—In the Zambesi Company's territory, I think I have permission to recruit. With regard to other companies, I do not know, but think they will come to some arrangement.

2,154. How much do they pay the Mozambique Company for each boy sent out?—Till now that point has not been treated, but I believe they will pay the company the same amount as paid to Government.

2,155. That is 23s. per head coming and going?—Yes, that will make it.

2,156. Do you know anything about the population of the country owned by the Mozambique Company? Can you give figures?—I have asked the Company for figures, but have not yet obtained them. In any case I can say the population is rare, except in the south, which is more thickly populated, and also in the north about the Zambesi River, in the district of Sena.

2,157. The Mozambique Company has the control of 60,000 square miles of territory?—I do not know the figure, but it is a very large territory.

2,158. Would it be fair to expect 100,000 boys or more from that territory?—Certainly not.

2,159. How many?—I think I should be doing very well if I was able to obtain 10,000.

2,160. That gives a population of about 60,000 people for the whole territory of 60,000 square miles?—I said just now that the territory of Mozambique is less populated.

2,161. That would make the population for that large country one per square mile?—Yes.

2,162. I call your attention to the accounts of the Mozambique Company for 1898. The hut tax received there, according to these statements is £10,878. That would go to show that the population is not very large. Is that correct?—The population is not large.

2,163. The Company made a loss in 1900 of £16,000?—That may be because there are some parts where hut-tax cannot all be collected.

2,164. So that it would pay the Company to sell the boys, or let the boys go, and make 23s. per head out of them?—It is my opinion that it would be profitable to the Company, and I have proposed to the Company that it would be more profitable for them, to send the boys to work and get their 23s. per head.

2,165. You said that you expected that the population of the country held by private companies was about 400,000; that is, the adult population that could come to work?—It is very hard to arrive at figures, but I believe these figures are nearly correct.

2,166. You only get 10,000 boys out of Mozambique. That makes the adult population of Mozambique territory 30,000. One in three?—Yes, I think there must be 30,000 male adults.

2,167. Are there 370,000 adults in the other provinces?—Do you mean in all the rest of the—

2,168. We are talking about land held by private companies. We have finished with Government ground. You have set down the estimated population at 400,000; out of that there are 30,000 in Mozambique territory. That leaves 370,000 for ground held by private companies?—From this 370,000 must be subtracted the population of the other districts of Mozambique.

2,169. But you have already included that in your census return; you must leave this out. I want to get at your figures for the whole of the population of the land held by private companies. You put it at 400,000; 30,000 must be deducted for Mozambique territory, leaving 370,000 for the rest of the ground held by private companies. Is this correct?—(Witness did not answer this question.)

2,170. Looking at the map, you will see the Mozambique Company own about one-third of the total ground held by private companies?—It is even larger than one-third.

2,171. You get according to your statement only 10,000 boys out of one-third of territory, which, according to you has 400,000 boys?—Will you kindly explain this, or put the question in another way?

2,172. You give us on private lands a population of 400,000 male adults. On territory which according to you is more than one-third of that total, you have, according to you, an adult population of 30,000, leaving a balance of 370,000 for the remaining two-thirds?

2,173. You say you estimate that there are 400,000 in the territories north of latitude 22, including the district of Mozambique. Are you not counting the Mozambique 160,000 twice over?—This must be subtracted, and then we arrive at the right figures.

2,174. We got these figures from you this morning, 402,000, which includes the district of Mozambique. I understood from your evidence-in-chief that there were 400,000 males there?—In the district of Mozambique there are 160,000; this must be subtracted from the 400,000, and the remainder will be the right figure.

2,175. Well, that leaves 240,000, and the official figures for territory held by Government are given as 363,000, so that the total is 603,000?—363,000 are the figures for the territories of the south.

2,176. But if you refer to your statement, you will find that you include the district of Mozambique in the 363,000?—The 363,000 are included in the districts of Lourenco Marques, Inhambane, and Mozambique.

2,177. Mr. PHILIP: Mr. Breyner, you stated that before the war you had 80,000 boys from

Portuguese territory. How long did it take to get those 80,000 boys here?—Now or at that time?

2,178. At that time?—It took me several years—practically since Johannesburg was started.

2,179. Can you tell us how many you had in 1895?—I have not got the figures for that year.

2,180. And in 1896?—From March, 1897, until March, 1898, the natives arriving here numbered 14,510.

2,181. How many in 1899?—From April, 1898, until January, 1899, the total was 15,538.

2,182. And from January, 1899, until 5th October?—11,970.

2,183. So that you sent up in these three years 42,000 boys. So that nearly 40,000 boys must have been on the fields before 1897, and must have remained here?—These are the figures of the Rand Native Labour Association; but there have been some other boys in connection with that Association. During the period that the Association brought 42,000 boys, other agencies brought in 6,400.

2,184. Well, there would have been 32,000 boys on the fields from 1897 until the time of the war. Do you mean to say that if you subtract from the 80,000 the number of boys who arrived during that period, there will be a margin of 32,000, who must have been here since 1897?—Yes.

2,185. And during the years before the war we only recruited about 15,000 a year from Portuguese territory?—That figure is a little too much.

2,186. Since the war you have recruited in six and-a-half or seven months 22,300?—Yes.

2,187. And you did all you possibly could, Mr. Breyner, to get all the boys you could?—I do my best to get the greatest number.

2,188. And if all agents were allowed to recruit free down there, then, Mr. Breyner, they would be able to send up more boys?—I do not think that they would be able to bring up more boys, because from 1897 until the war commenced there were only 48,000 arrived.

2,189. What was the average recruiting per month before the war?—I have here a tabulated statement shewing the number recruited each month; it is as follows:—

1898.—					
April	...	...	...	...	1,126
May	...	...	...	...	802
June	...	...	...	...	1,545
July	...	...	...	...	1,368
August	...	...	...	...	1,949
September	...	...	...	...	2,453
October	...	...	...	...	2,114
1898.—					
November	...	...	...	...	2,103
December	...	...	...	...	2,078
1899.—					
January	...	...	...	...	2,041
February	...	...	...	...	1,162
March	...	...	...	...	2,230
April	...	...	...	...	1,477
May	...	...	...	...	1,036
June	...	...	...	...	948
August	...	...	...	...	999
September	...	...	...	...	871
October	...	...	...	...	231

2,190. Now for this year, for the six months, you have recruited 8,203, so that your average for these two years is about 1,500, and for the last year about 1,200 per month?—The average for the last seven months is about 4,700.

2,191. Naturally it is to your interest that we should continue to get our labour from the Portuguese territory?—Naturally.

2,192. You derive the whole of your income from the labour which you secure for us?—Partly, but I have other business.

2,193. You mentioned in reference to the population up there—I think it was in answer to a question by Mr. Quinn. Mr. Quinn asked if some of them did not pay by produce and labour. Would those men who paid by produce and labour be included in the official census which you have here?—Yes, they are included.

2,194. Then in reference to the men employed, in the statement that you gave us of those employed at Lourenco Marques, I notice you did not include those who were engaged in military or police duty. Are there not a number engaged in police duty?—No, they are not included.

2,195. Have you any idea how many are employed by the military or on police duty?—In Lourenco Marques?

2,196. Yes?—I estimate that there are from 350 to 400 black police and soldiers.

2,197. In reference to the railway lines that are being constructed, is the country very difficult over which these lines are to be constructed?—Some parts are plain and some parts are mountains.

2,198. Will there be a great deal of work in excavation and bridge work?—I think that in Swaziland there are high mountains, and there will be a lot of work there.

2,199. In your original statement (r. p. 39), you said it would take from five to seven years to work up another current of emigration from the Northern Provinces?—Yes, that is so.

2,200. Do you confirm that statement?—Yes, I confirm it.

2,201. Mr. EVANS: Have you any idea how many Portuguese natives there are in the Transvaal, apart from those employed by the mines?—63,000 blacks left here for Lourenco Marques, and there are 13,760 remaining here. From the end of the war until the end of last May, 54,454 arrived here. This makes 68,214. Till the end of May, 11,513 went away. Thus there remains now 56,701 at the end of May last.

2,202. How many of that number were on the mines?—At that date 45,935 were on the mines. There is a difference of 10,767, who follow occupations other than mining.

2,203. Now in your opinion are there practically as many Portuguese natives here now as there were in 1899?—I think to the figure 56,701 must be added those who arrived last month and the month before. Taking the two months into account, the total Portuguese here now are equal to the number that were here before the war.

2,204. Referring to the possibility of getting 60,000 natives for the Rand from the Northern territory in so many years; how many do you think we can get in 1904?—That is a most difficult thing to say.

2,205. Well, it ought not to be more difficult than this 60,000. Cannot you give me an estimate how many we can get in 1904? It ought to be as easy to make that estimate as the other one.—For a large period it is much easier to estimate than it is for a small period. It may be that next year it will be four times as many.

2,206. This 60,000 then is mere guesswork?—While from the South there is a current existing, it is more easy to collect; in the north it is very difficult.

2,207. Now do I understand that because you get a certain number from the Southern territory, you reckon on also getting a certain number from the Northern territory?—It is merely an opinion.

2,208. So that the figures as regards the Northern territory are purely guesswork?—Yes.

2,209. Now as far as the Southern territory is concerned, do you adhere to the estimates as they appear in the documents you put in?—I adhere to these figures, although they are a little low, and I think that the population is bigger than the figures show.

2,210. And are you still of opinion that only one-third of the adult males can be induced to work?—It is merely an opinion. It may be one-third or it may be one-fifth.

2,211. Are you also of opinion that the 80,000 natives required for internal needs must be deducted from the third and not from the two-thirds?—I reckon that the one-third adults is the working part and certainly the 80,000 must be taken off.

2,212. I understand you to say that they are a very idle people, and that only one-third work?—Yes.

2,213. And that all the local needs and our needs must come out of that one-third?—Everything must come out of that third. I have been collecting some statistics and I shall be pleased to hand in to the Commission a copy of these figures if they have not already got them.

2,214. Mr. QUINN: This morning you gave me to understand that 363,036 between the ages of 15 and 50 was the number of those who paid hut tax to the Government. My point is this, that number is the number who pay hut tax?—Those people pay hut tax.

2,215. Then you said to Mr. Philip, in addition to this, that probably there would be another 5 per cent., who did not pay hut tax. You said they paid it in produce or by work—or the difference in labour. About 5 per cent. probably paid in produce in addition to this?—I give here simply the labour available; of that number there may be included those who are not able to pay taxes in cash.

2,216. Does this figure, 363,036, mean only those who paid directly by money or by tax?—Here, I have included the natives who have paid taxes; it does not matter whether they pay in cash or labour.

2,217. This includes all whether they pay in cash, in labour, or in produce?—Yes.

2,218. With regard to a few months before the war, the recruiting got much less; it got less and less until October, 1899. There was a feeling of uneasiness amongst the boys and they began to stop coming after the war broke out?—Yes, in the last month preceding the war the natives knew about the war coming on.

2,219. Mr. WHITESIDE: You have stated, Mr. Breyner, that only during last year was recruiting started in the Northern territory. Has there been sufficient time to fairly judge the results?—It would require two or three years to judge about this matter. It is necessary to wait until these natives who are already here return to their homes and spread the news.

2,220. Therefore, it is quite impossible to say that we cannot get sufficient labour there at the present time. There has not been a sufficient interval to judge of the result?—Certainly not. We cannot say for certain or make a correct calculation of the number of boys that can be got.

2,221. The CHAIRMAN: Has it come to your notice that recruiters who are not now employed by the Association have spread reports, or used their influence with the chiefs to prevent natives now coming forward?—There are no such recruiting agents who are not employed by the Association.

2,222. I understood you to say that the Association employs 11 recruiters and that previous to the war 39 persons were recruiting?—Yes.

2,223. Have none of these 28 any influence with the chiefs to prevent natives coming to work?—Before the war there were 11 recruiters and 28 outside of that. Now some of those 28 may be there in those territories which we spoke of, but I do not think that they have any influence there.

2,224. Will you tell us what amount of money the Portuguese Government gets for each native who comes to work in the Transvaal?—About 13s.

2,225. And how much when the same native returns?—Well, I think, but I am not sure—that on his returning the Government gets 10s.

2,226. And is there a hut tax to be paid by the native in addition?—Well, in addition to the 23s. he has to pay 10s.; 9s. or 10s.

2,227. Is that a hut tax or a poll tax?—It is for a house.

2,228. Then is there any poll tax or head tax in addition to that?—No.

2,229. The CHAIRMAN: Mr. Breyner, we recognise that it has been very difficult for you to give your evidence, first through a Portuguese interpreter and then through a French interpreter. The Commission is very much obliged to you for coming twice from Delagoa Bay to give evidence before it?—I thank you very much for your courtesy, sir.

Mr. DAVID FORBES, Jun., called, sworn and examined.

2,230. The CHAIRMAN: Mr. Forbes, you live in Swaziland?—Yes.

2,231. Have you lived there for many years?—I lived there continually before the war for about six years, but I have been in the country since I was about 14 years of age. I am about 40 years of age now.

2,232. You have known the country intimately for 20 odd years?—Yes.

2,233. You are living there now?—Yes.

2,234. Are you employed by the Witwatersrand Native Labour Association?—I undertake the organization of the labour supply from Swaziland.

2,235. Have you done that recently?—I undertook it about two months ago.

2,236. Is there any official census of the population?—I believe there is. It was taken in the Transvaal. They have compiled one now. The Swazis are trying to compile one now. There was one before the war, but I do not know the figures.

2,237. Have you before you this memorandum headed "Evidence-in-chief of Mr. David Forbes, jun.?"—Yes.

2,238. Do you wish to hand this in as your evidence-in-chief?—Yes.

2,239. Mr. Forbes' statement was then handed in to the Commission, and reads as follows:—

#### SWAZIS IN SWAZILAND.

The approximate number of able-bodied men in Swaziland is about 15,000, between the ages of 18 and 45. They have no inclination to work outside of their own country. I believe they would work readily in their own country at £1 per month on surface work and £2 per month underground. The number that worked in the Witwatersrand mines before the war was less than 2,000. There are now on the Rand about 400. The reason given by the Swazis themselves for this is the great mortality amongst them when on the Rand. To my knowledge one of the principal chiefs named Umlaba lost three out of four of his sons working on the mines shortly before the war, and when this was spread among the Swazis it had a very bad effect. The Swazis have a saying now that they would sooner go poor men in their own country than die at the Rand with money in their hands. The Swazis, as a whole, will not work on the mines at the present time. They still have to live down the old impression they have formed, and the only way to do that is to employ them on railway and other surface work to give them confidence. The method of recruiting in Swaziland adopted is to teach the Swazi Queen and all the principal chiefs that it is to their advantage that all able-bodied men should turn out to work, not only for the gain they receive in wages, but also because the native tribe that supplies the largest percentage of working men to the State can expect the greatest consideration at the hands of the Government. The Swazi Queen and chiefs in turn bring their influence to bear on the people and encourage them to turn out. I am quite convinced that the Swazi Queen and principal chiefs are quite alive to the fact that their future welfare depends to a great extent on their usefulness to the State and will do all in their power to enable us to recruit every available native. In connection with the turning out of natives to work, the Queen of Swaziland and chiefs have no power; the most they can do is to use their influence. All the Swazis with whom I have spoken (and my recruiters report the same to me) with a view to getting them to come out to work, ask if they come out to work, will they be let off with £2 per annum hut tax, and when I say "No," they say "What is the good of going out to work if you are taxed the same as those who stay at home?" I have always refrained from saying that if they work they will be able to pay the tax, as the native mind is very suspicious and would immediately interpret it the other way, that the more they work, the more they would be taxed. The hut tax has been fixed at £2 per hut, but if it were arranged that every native who could show a certificate that he had

worked for an employer for six months of the year would be exempted from 50 per cent. of his taxes, it would have a better effect in turning out the natives than raising the wages £1 per month. The natives of South Africa are by circumstances and inclination all small farmers, very bad ones, no doubt, but that is their natural calling, and every native who comes to the mines or to any labour market comes for the purpose of enabling him to earn the capital necessary to start on his own; when he has earned the amount necessary, nothing will induce him to stay any longer on the mine. Natives have no ambition to make money for its own worth or for the power it gives, their greatest ambition is to earn just enough to enable them to live in their own country without the necessity of working for another for the rest of their life. To earn that amount at the present rate of mine wages most natives will do it in six years, and certainly all in 10 years, giving an average of eight years. The facts as they present themselves to my mind are as follows:—Natives turn out to work from the ages of, say, from 18 to 45. Taking this as a fair estimate, and that the average native retires from work after working eight years, this means that to keep up the supply you will require three-and-a-half times the number employed, to draw from to keep up the full complement. If it takes the whole of the natives available between the ages of 18 and 45 to make the full complement, I leave it to the Commission what the effect will be on the labour market in 10 years when this supply has retired from service.

2,240. The CHAIRMAN: You give the able-bodied men in Swaziland at 15,000 between the ages of 18 and 45?—Yes.

2,241. How do you arrive at that?—You see, about 10 or 12 years ago, a Swazi King died and they had an official burial, and at an official burial like that all the able-bodied men are supposed to turn out and be present. Well, I estimated that there might be about 10,000 present, and with the knowledge I had of the natives and those who remained at the kraal, I think that that was about two-thirds of the able-bodied men. The other one-third remained at their kraals; they could not all go away. At a state ceremony all those that can go out are supposed to go out, and I think that about two-thirds came out. There were two columns half a mile long, and there were about 10 men in each row. They were walking six feet apart, and I concluded that there were about 10,000 present. Since then there have been a great many natives who have gone out into the Transvaal and a good many have trekked into the Portuguese territory also.

2,242. When will those official estimates based on the hut tax be ready?—I should think they would be ready in a short time, but they will not be anything like complete. The natives are not ordered to pay the tax, they are paying it voluntarily. A lot of them will not pay it, because there is starvation in the country. It will not be anything like complete.

2,243. How do you get your figure 2,000 working on the mines before the war?—This was a canvass of the mines taken by the Labour Association.

2,244. Do you know in what year it was taken?—It was taken recently.

2,245. Before the war there were less than 2,000 working on the mines?—This was probably the number of the Swazis on the mines before the war.

2,246. You do not know how these figures were arrived at?—No, I cannot say.

2,247. You say that the Swazis at present have an objection to coming to work on the mines?—Yes, I have tried my best to get them to come and work on the mines during the last two months and I could not get a single one to turn out.

2,248. What reason do they give for not turning out?—They say that there was quite a large mortality amongst them when they were on the Rand before the war. They say there is too much sickness on the Rand and that too many of them die. That is the reason they gave me when I spoke to them.

2,249. Have the Swazi Queen and the principal chiefs any real influence with the men that come

out to work?—They have a slight influence, but not much. Not since our Administration has been in the country and not since the Commission has been sent into the country.

2,250. Had they any material influence over them previously?—Of course before that she (the Queen) was the Government authority in the country, and could order them to do anything.

2,251. Was her influence ever exercised before the war towards turning them out to work?—I do not think so.

2,252. What do you mean by stating that the Swazi Queen and principal chiefs are alive to the fact that their future welfare depends to a great extent on their usefulness to the State?—I was down in Swaziland about two months before I was asked to organize the labour supply. When I went there, she had all the chiefs talking about the hut tax, and they said that they wanted to protest against the hut tax. Owing to my being there, they concluded that I might have some influence, and asked me to see what I could do in the way of getting a reduction of the tax. I spoke to one or two of the principal citizens here, and they said that they did not see why they should trouble about the matter, as the Swazis did not turn out to work and they were of no use to them. Also that the natives should be taxed so as to make them turn out for work. When I was asked to undertake the organization in Swaziland, I asked the Queen to call up all the principal chiefs, as I wanted to make a communication to them. I pointed out to them that I had spoken to the people here and one or two of them said they would not take any interest in it because the Swazis were of no use, and I pointed out to them that, if they became a useful people to the State, they could then expect the people to take an interest in them, and naturally the Government would take an interest in them. I believe the Queen quite recognised that. I also pointed out in connection with that that those who were always in contact with her treated her best, and that she should naturally treat them best, and that we in connection with the white Government would do the same. I also said that if they proved a useful people to the State, then they would get equal privileges.

2,253. Do a large number of Swazis turn out to the other districts?—There are quite a number in the Ermelo district working on the roads and also at Barberton.

2,254. Do they prefer going to Barberton to coming here?—Yes, it has not got the same bad name as the Rand has.

2,255. You have no idea how many turn out or leave Swaziland for elsewhere in any particular year?—This year, I believe, quite a lot have turned out to work in the Transvaal, but you can get the correct number from the Commissioner of Swaziland, because he issues passes to them.

2,256. Mr. QUINN: You said there were two columns half a mile long, and there were ten men in each row. They were walking six feet apart, and you concluded that there were about 10,000 present. This, to us at all events, is a novel way of arriving at the approximate number of able-bodied men. How many miles long was this procession?—There were two bodies of them, and each body was about half a mile long.

2,257. And how many boys were there in each row?—About 12.

2,258. And how far apart were they, about six feet?—Yes.

2,259. Have you ever observed large bodies of men marching in processions that length marching six feet apart? Your method of calculating was a very rough one?—Yes, we were simply judging the number of men. They were walking six feet apart, and there were about 12 men in a row, and there were two columns of them half a mile in length.

2,260. Taking your basis, there may have been a good many more than 10,000. Two columns half a mile long; ten men in each row; walking six feet apart; about 10,000 present. That is a very rough guess. You might have made it another 2,000 or 3,000 easily?—Yes.

2,261. People usually walk about 18 inches apart when marching?—Not with shields and assegais.

2,262. Now, was there free recruiting, Mr. Forbes, before the war?—I believe it has always been free to anyone.

2,263. Do you know how many recruiters were engaged in Swaziland before the war?—I could not say.

2,264. How many are engaged in Swaziland now?—There are three recruiters.

2,265. You are the chief of them?—Yes.

2,266. With regard to these men who are working with you now; were they working in Swaziland before the war?—No.

2,267. They are quite new to the work?—Yes, but they are people who have been used to Swaziland for 15 years.

2,268. They are new to recruiting work?—Yes.

2,269. So it is an entirely new supply?—Yes.

2,270. —Now, how are you remunerated for your work? Is it by salary, or by commission, or both?—Well, I get part salary, and part commission.

2,271. —And the others?—They have a salary.

2,272. They get no commission?—No.

2,273. What are the salaries of the others?—One gets £50, with expenses, and the other gets £38, with expenses.

2,274. I understand from what you say, both in your statement handed in and in answer to the Chairman, that the boys have strong objections to coming here?—Yes.

2,275. On account of the treatment they receive? Not the treatment. They say it is the health of the place; it is the mortality of the place that I refer to.

2,276. Are you aware that this is a very healthy place?—Yes.

2,277. How can there be an exceptionally heavy mortality?—The Swazis are not used to working down a mine, and they get heated, and when they come up they do not take proper precautions to cover themselves, and consequently get pneumonia.

2,278. Do you think that the conditions which obtained in the mines, in the compounds before the war—the want of proper care for the sick—had anything to do with the mortality?—I have had no experience of that.

2,279. It is a fair assumption to make?—Yes.

2,280. They do not die half so quickly at Barberton?—No.

2,281. Why should there be a difference in the two places?—Barberton is a hotter climate and more suited to them.

2,282. You make a statement here—at the bottom of the second page (v. pp. 152-3) of your statement—"When they have earned sufficient money nothing will induce them to stay any longer on the mines. Natives have no ambition to make money for its own worth, or for the power it gives. His greatest ambition is to earn just enough to enable him to live in his own country without the necessity of working for another for the rest of his life." That is an opinion?—Yes.

2,283. Am I to understand from that, Mr. Forbes, that it is your opinion that after working in the mines that is the frame of mind the native is in? He does not get any wants like other people. When once he has tasted the value of money, and experienced luxuries, these do not appeal to him; he is content to go back again to his kraal and only go out again to earn money when he is forced to do it?—Yes.

2,284. When natives get possession of blankets, looking-glasses, and other things, the desire for these things grows, and then ceases. Are not new wants created in these Swazis? Is there not a steady progress with them?—Not to any great extent. The Swazi has more wants, but not to the extent that it would force him to come to the mines. He will not acquire the habit of creating wants which will make him come up and work in the mines here.

2,285. Is it not a fact all over the world, no matter what the state of civilisation is, that these wants grow on people?—Yes.

2,286. I understand from you that the Swazis are an exception to that. Their wants do not grow, and they simply work as long as they are forced to?—As far as my experience goes, not only the Swazis, but none of the natives, are too ambitious to make money.

2,287. You say you consulted some of the principal citizens about the possibilities of obtaining labour in Swaziland?—Yes.

2,288. Were there mining people amongst these people you consulted?—Yes.

2,289. And they said it was no use bothering about the Swazis?—They said it was no use; they would not trouble to try and get a reduction of the tax because the Swazis would not turn out to work and were, therefore, of no use to them.

2,290. Mr. WHITESIDE: Have you any knowledge of natives other than the Swazis?—Yes, I know a good bit about the Zulus, and I have been through the Portuguese territory a good number of years.

2,291. Do you think you can speak with the same degree of authority in regard to these other natives as you can with the Swazis?—Not quite.

2,292. Do you think that 5,000 might be obtained for railways and public works generally?—I think so.

2,293. Therefore if the Swazis are averse to working in the mines, if they were recruited solely for railways and public works, it would relieve the strain on the supply for mines and farms?—Certainly.

2,294. What is the natural disposition of the Swazi? Is he lazy and disinclined to work?—Yes, he is disinclined to work; he will walk about for miles and will not work.

2,295. Do you think that they would engage for public works?—They are very timid at the present time. When I went down there, I said it was impossible to get them for the mines. I have been down there two months, and I have only been able to secure 40 boys up to the present. I do not think I should be able to get them to come out unless they are influenced by the Queen and the chiefs. I do not think any private recruiting, without the influence of the Queen and chiefs, will have the effect of bringing the Swazis out. If they are influenced by the Queen—and her influence has weight with them—then they might come out.

2,296. What reply did Mr. Perry give you when you made these representations to him?—He said that I was at liberty to recruit them for surface work and for railways.

2,297. You started to organise the recruiting business in Swaziland during the last two months. Do you consider that that is sufficient time to estimate what the probable results will be?—No.

2,298. You said in answer to Mr. Quinn that there was starvation in the country, and consequently an inability to pay hut tax. Should that not tend to influence the supply?—No, it is rather against it, because the native—the Swazi especially—will not come away and leave his wife and family to starve. They will not leave them there.

2,299. What is the Swazi system as regards marriage? Do they practice polygamy?—Yes.

2,300. What are the terms you are offering to Swazi boys to work on the mines?—£3 per month.

2,301. Have you any objections to telling us who these leading citizens were to whom you spoke?—I would rather not.

2,302. I suppose they were the same people who remarked that the Swazis were not worth troubling about?—That was the reply I got. I really thought myself that the Swazis were not in a position to pay £2 a hut. Immediately after the war, they

had not had an opportunity to earn money, and I thought it was rather a severe tax, and spoke to one or two people here and in Pretoria about it. They said the Swazis did not turn out to work, and that they were of no use to them, and that the natives should be taxed to make them turn out for work. They said they would not take any interest in the matter, as the native should be taxed and made to work.

2,303. You say the natives prefer Barberton?—Yes.

2,304. Have you any difficulty in getting them to work at Barberton?—I tried principally to get them to come up here. They go themselves to Barberton.

2,305. The mines in the Barberton district, or I understand the majority of them, are members of the Witwatersrand Native Labour Association. Therefore, if you are employed by the Native Labour Association, is it not to your advantage to send these boys along, because I understand that boys can now contract for any mines they wish? Therefore there should be no difficulty in recruiting boys for the Barberton district?—There should be less difficulty than recruiting them for here, but even there they will not go to a mine unless on their own account.

2,306. But so far as your interests are concerned, it does not matter where they go to, so long as you recruit boys for the Native Labour Association?—Yes.

2,307. There are a number of mines, members of the Barberton branch of your Association. How is it you find there is a weakness in the Barberton district? Why do you not get boys for that district?—My principal idea is to get them used to coming up here to work on the Rand, so that they may live down this bad impression that has got abroad in the mines here. There would be no difficulty in getting them to go to Barberton. I tried to influence them to come up here and live down this bad impression.

2,308. That is a waste of effort so long as you have got customers in Barberton. You are serving your employers equally well by getting boys for Barberton?—Yes.

2,309. Mr. TAIN'TON: Is it correct that the Queen of Swaziland is in the pay of the Native Labour Association?—Well, she is in one way. I explained to the Queen that it was necessary to teach the Swazis that it was to their interest to come up here to work for the white men, and the more they turned out the more it would be of interest to the country and themselves, and I asked the Queen to teach these people this, and I said that the Labour Association would allow her £30 a month for teaching her people this. I did not put it to her that she was actually a recruiter, but pointed out that she had to teach her people to come up here and that it would be to her interest to do so.

2,310. Did she accept that?—Yes.

2,311. Then she is using her influence?—Yes.

2,312. How many boys have you sent out to the mines so far?—Thirty-nine.

2,313. What percentage do you think is due to the Queen's influence?—Well, I do not think any of them.

2,314. You said just now that a good many went out to work. What number do you estimate went out, speaking roughly?—Speaking roughly, I have nothing to go on, but the accurate number could be got from the Pass Office in Swaziland. I should think about 3,000.

2,315. Is that more than the average?—Yes.

2,316. Have you any explanation for the number being more than the average?—You see, they have got this tax to meet and that has got a lot to do with it.

2,317. What tax?—The tax of £2 for a hut.

2,318. When was that imposed?—It was imposed before the war, but they started collecting it about two months ago.

2,319. This number, 3,000, has it come out within the last two months?—No, since the end of the war.

2,320. What specially influenced the people to come out in larger numbers than usual?—You see, they have not been working for some time and some of those that can get away without deserting their wives and families come out to get work to buy food with, and others come out to get money to meet their taxes. They have not been working since the war, and a lot of them have small supplies.

2,321. Then the question of food supply is affecting the labour supply of Swaziland at the moment?—Yes.

2,322. Were you there in 1897 and 1898? Do you remember the country about that time?—Yes.

2,323. What was the effect of the rinderpest on the country? Did it destroy the cattle?—Yes.

2,324. Did it lead to distress amongst the natives?—Not actually to distress, but it took a lot of the property away.

2,325. There was also a scarcity of grain at the time?—I am not quite sure. There was one year just after the rinderpest which was a very bad season.

2,326. What year was that?—I think it would be about nine years ago—eight or nine years ago.

2,327. The rinderpest was in 1897, was it not?—I cannot remember.

2,328. Has the loss of the natives' cattle affected the price of the women—the dowry?—Yes.

2,329. To what extent?—To a great extent. In fact now there is very little paid for the women at all; they take them on credit, etc.

2,330. What was the price before?—It was from five head of cattle to about fifteen head.

2,331. What was the money value of those cattle?—It was up to about £30.

2,332. Was the necessity to provide £30 or £40 one of the causes that drove the men out to work before the war?—Yes.

2,333. It does not operate now to the same extent?—Well, I think it will, because they pay in money now, or, rather, those who have the money do so.

2,334. How much do they pay?—I think from £20 to £30; I could not say for certain.

2,335. Has there been a decrease in the amount paid for the woman on the average?—I think so.

2,336. And to what extent has it affected the labour supply?—I do not know whether it would affect it to that extent or not. Probably it would.

2,337. Has there been any increase in the number of trader's stores in Swaziland during the past few years?—There are not so many as there used to be.

2,338. Is the turnover of those stores large?—In some of them it is pretty large.

2,339. Do they supply the Swazi requirements with European goods?—Yes.

2,340. Well, then, would you say that the demand for European goods amongst the Swazis is less than it was before?—I do not think that the demand is less. There is no transport in the country at the present time, because this tick fever has killed the ox transport which used to deliver the goods. The goods are too expensive now; and the natives are not buying as much now as they did.

2,341. I would like you to explain this sentence. In the last paragraph of the second page of your statement, "The natives of South Africa are by circumstances and inclination all small farmers, very bad ones no doubt, but that is their natural calling." Have you anything to offer in explanation of that?—That has been my experience all

through. I have noticed that before the whites came into the country, all the natives live on the country and grow all their stock and grain. In fact the same conditions obtain now in all the purely native country.

2,342. The same conditions obtain in other native countries?—Yes. In native countries now such as Swaziland and Gazaland, which are not under the direction of white Government.

2,343. Do I understand that the wages they earn are used in improving their agricultural position?—Yes.

2,344. Mr. PERROW: You said you had been employed by the Native Labour Association for two months?—Yes.

2,345. And you sent to the mines less than 40 in two months?—Yes.

2,346. And you said that you are offering boys £3 per month to come and work on the mines?—Yes.

2,347. Mr. PHILIP: The Swazis are a nation of warriors, are they not?—Yes.

2,348. And they despise men who work?—I think, really, they are too lazy to work, they do not work.

2,349. And the Barberton mines; are they wanting labour at present?—I really do not know.

2,350. Mr. EVANS: You said that 5,000 boys might be recruited for the Railway, is that in addition to the Swazis now working?—Yes. I think that the Swazis ought to contribute, if they all turn out to work, about, 8,000.

2,351. There are 3,000 now working, I think?—I think so.

2,352. Do you expect, yourself, to get as many as 5,000?—No.

2,353. What is the best that you can do?—I think if I can do 3,000 or 4,000 it is as much as I can manage; that is only those coming back again. During 12 months we ought to supply about 8,000 Swazis for work.

2,354. And could you go on keeping 8,000 Swazis out?—I do not think so; I should think about 6,000.

2,355. That is the best that Swaziland can do?—Yes.

2,356. Before you took up the work for the Association, did you know about an arrangement that existed between the Association and the Barberton mines?—Yes, the Barberton mines had Swaziland to recruit in. Barberton was handed over to the Association for recruiting.

2,357. Is that the reason why the Association themselves were not recruiting in Swaziland?—The Barberton Branch was given Swaziland to recruit from, and Johannesburg did not recruit there—it was handed over solely to the Barberton Branch. Recently the Johannesburg Branch arranged to recruit there also, but Barberton is still free to go on with their own recruiting. Mr. Perry made this arrangement.

2,358. There was an agreement?—Yes.

2,359. Do you know whether there was an undertaking on the part of the mines at Barberton not to recruit in Portuguese territories?—I do not know. Until recently there was an arrangement that they were not to recruit in Swaziland. Mr. Perry then got permission to recruit in Swaziland, but the Barberton Branch still recruited there.

2,360. It is your opinion that the higher the wage paid to the Kaffir the less he works?—Yes.

2,361. That is, if he comes out to earn £10 and succeeds in earning it in six months, he will only work for that six months, but if it takes him 10 months to earn it, he will work for that 10 months. The higher the wage the less the Kaffir works?—Up to a certain degree. You want to have the wages sufficiently attractive here to bring them out, or sufficiently attractive to get them to leave their country.

2,362. Would you put the present wages down as reasonably attractive to Swazis?—The present wages are just what they ought to be.

2,363. How does the farmer come out on that?—He comes out badly.

2,364. Is it a fair thing for the mines to raise the wages and take the labour from the farms?—That cuts both ways. The farms are no good without the mines, and the mines are no good without the farms.

2,365. The CHAIRMAN: For what period have the Swazis been engaged to work; is it three, four, six or twelve months?—This year I had the greatest difficulty to get them for four months.

2,366. What wage would you offer them for railway work?—£2 10s. 0d. per month.

The CHAIRMAN: The Commission is very much obliged to you, Mr. Forbes, for your evidence.

The Commission adjourned at 5.0 p.m. until 10.30 a.m. Wednesday, the 5th August, 1903.

## EIGHTH DAY.

Wednesday, 5th August, 1903.

THE COMMISSION SAT AT 10.30 A.M.

Mr. FRITZ WIRTH, called, sworn, and examined:—

2,367. The CHAIRMAN: You are Mr. Fritz Wirth?—Yes.

2,368. You are engaged in business, I understand, in Lourenco Marques?—Yes, sir.

2,369. You are in partnership with Mr. Breyner, whose evidence we had yesterday?—Yes.

2,370. And you are carrying on a general business there?—Yes.

2,371. You handed in a statement which is headed, "Evidence of Mr. Fritz Wirth." Have you that statement before you?—Yes.

2,372. Is it your wish to hand that statement in to the Commission as your evidence-in-chief?—Yes, sir, and I am willing to give any evidence on that statement. I endorse Mr. Breyner's written statement.

2,373. Do you wish to say, in addition to your statement, that you agree with Mr. Breyner's evidence-in-chief?—Yes.

2,374. Mr. Fritz Wirths evidence-in-chief was then handed in to the Commission, and read as follows:—

In submitting my Report, I beg to state that I have resided in East Africa since 1884, and have practically been in connection with recruiting ever since the construction of the Lourenco-Marques-Transvaal Railway, which was commenced in 1886. During the construction of the Portuguese section I devoted a good deal of my time to recruiting for the sub-contractors. In 1889, when the Z.A.S.M. started their operations across the Incomati River, I supplied them with 3,000 East Coast natives, and have ever since given close attention to the supply of native labour, resulting in securing for the Witwatersrand Chamber of Mines the first licence issued by the Portuguese Government permitting official recruiting. This licence was secured in the name of Mr. William Grant, whom I represented on the East Coast until the Rand Native Labour Association was formed, when I entered their employ as the East Coast representative, until the outbreak of the Transvaal Crisis.

On the reorganisation of the present Native Labour Association, I am pleased to state that we (Breyner and Wirth) have again been entrusted with the internal working of the East Coast, and can thus state that I have represented the Department formed for the purpose of recruiting labour

on the East Coast under the auspices of the Chamber of Mines ever since its formation in 1897 until date.

### METHODS OF RECRUITING.

This was first established by Provincial Notice No. 129 A., dated 23rd April, 1896, which was afterwards substituted by Provincial Decree 109, dated 18th November, 1897, and since by the *modus vivendi*, dated 18th December, 1901.

Under Provincial Notice No. 129, A, it was necessary to secure a passport, together with a special permit by the Public Prosecutor, for each native recruited. This could be secured by anybody desirous of recruiting natives against a fee of 6,000 reis per head. Under this notice, between its date of issue, 23rd April, 1896, and March, 1897, the total number of natives thus contracted amounted to 1,348.

### PROVINCIAL DECREE NO. 119.

By this decree only those holding a special licence were permitted to recruit labour in the Province of Mozambique. The cost of this licence was £100, and a further deposit of £100. The necessary payments for each native recruited consisted of 7s. 6d. passport fee at Ressano Garcia, 2s. 6d. registration fee at the Curator's Office, on the arrival of the recruit at Johannesburg, 10s. repatriation pass, and a further 10s. on the native changing his employment or re-engaging on the mine. Under this Decree during the period March 1897 till October 5th, 1899, 48,422 natives had been recruited (see Statistics page A). Out of the aforementioned number of 48,422, and during the period stated, 42,018 natives were contracted by the Rand Native Labour Association (see Statistics page B) leaving a balance of 6,404 recruited by independent recruiters. The present method of recruiting under the *modus vivendi* dated 18th December, 1901, is practically the same as practised by the Provincial Decree No. 109, which actually forms part of the present legislation, permitting emigration, with the exception of a reduction in emoluments foreseen by the said decree. During the existence of the *modus vivendi* the W.N.L.A. recruited south of latitude 22, from February, 1902, to December, 1902, 38,517 natives, and from January, 1903, to 14th July, 1903, 22,314 as well as from north of latitude 22 during the period from July, 1902, to the 14th July, 1903, 1,787 natives, vide Statistics, pages C, D and E. I may mention that prior to the war the total number recruited north of latitude 22 was 184 from Mozambique, and 247 from Quilimane.

## RESUME.—TOTAL OF NATIVES OFFICIALLY RECRUITED.

Independently, south of latitude 22, from April, 1896, to March, 1897 ...	1,348
Rand N.L. Asso., south of latitude 22, from March, 1897, to 5th Oct., 1899 ...	42,018
Rand N.L. Asso., north of latitude 22, from March, 1897, to 5th Oct., 1899 ...	434
Independently, south of latitude 22, from March, 1897, to 5th Oct., 1899 ...	6,404
W.N.L.A., south of latitude 22, from Feb., 1902, to Dec., 1902 ...	38,517
W.N.L.A., south of latitude 22, from Jan., 1903, to 14th July, 1903 ...	22,314
W.N.L.A., north of latitude 22, from July, 1902, to July 14, 1903 ...	1,787

This number includes 386 from British Central Africa.

## COMPETITIVE TOUTING.

By the aforementioned, you will note that the touting in the past did not achieve the desired results. Taking into consideration that during the period of April, 1896, to March, 1897, when practically free recruiting was permitted, only 1,348 natives were officially contracted, whereas the Rand Native Labour Association contracted for the period from March, 1897, to March, 1898, 14,510 natives, or during the period March, 1897, to the 5th October, 1899, a total of 42,452, from the Province of Mozambique, with a staff of 11 recruiters, against an output by 28 independent recruiters, during the same period, of 6,404. You can only consider the touting system as an absolute failure, or arrive at the conclusion that the greater part of the natives had been smuggled. It is, therefore, not to be wondered at if the Portuguese Government prefer looking forward to a central organisation. In fact, the enormous difference in results as set forth, and the constant complaints arriving from the interior, caused through the recruiters working against one another, resulted in the Government issuing a decree, even prior to the war, by which the Chamber of Mines was recognised as the only competent body permitted to recruit labour within the Province of Mozambique, through the mediation of their East Coast representative (who was to be a Portuguese subject), for which position Mr. F. de Mello Breyner was chosen. This decree was not put into force through the outbreak of the crisis, and was afterwards cancelled, the situation having completely altered through the return of almost all the East Coast natives on the commencement of hostilities. Notwithstanding, as far as I am able to vouch, the Government would not have tolerated the methods of recruiting formerly adopted; in fact, it resolved to take the recruiting entirely into its own hands, in view of which the Native Intendencia was formed. Besides, the effect on the natives caused by competitive recruiting was a very bad one, resulting in large numbers going miles out of their usual route to avoid being molested, which accounts for the fairly large numbers formerly recruited at Komatipoort and Hectorspruit, because there is nothing in the world that the natives detest so much as to see themselves being traded with, which it practically amounted to, for they, personally, had no choice whatsoever of the mine they wished to work at, or by whom they would like to be contracted, finding themselves ultimately in the hands

of the highest bidder. The only results achieved by the touting system in the past were irresponsible promises to the recruits and a forcing up of the capitation fees paid to runners, from which no corresponding result was obtained, for instead of increasing the output, its only result was to decrease the area of operations, as competition will not permit the exploration of new resources. The money presently spent in opening up districts which may result in turning out profitably would be spent in the increase of runners' fees, which increase, I am afraid, in view of the natural disposition to indolence, would not have the desired effect. I am certainly of opinion that should it ever happen that the touting system be reverted to again, the Portuguese Government would not tolerate its being dealt with as heretofore. It would, without doubt, result in each recruiter being restricted to a certain commando (those first, choose first), when you would realise that a number of the districts presently explored would be left unworked, and a decrease in the output set in at once.

I need not refer to other matters, as they have been dealt with by Mr. Breyner.

2,375. The CHAIRMAN: It appears that you have been in East Africa since 1884?—Yes.

2,376. And you have been engaged, or you have had to do with recruiting operations in connection with natives since then?—Yes, practically since then.

2,377. Or rather, as you say, since 1886?—Yes.

2,378. You recruited for certain railway contractors in the construction of the Transvaal railway?—Yes.

2,379. You state here that you were recruiting for the Chamber of Mines. When did you begin to do that—was it in 1889?—When Mr. William Grant went down to Delagoa Bay I secured the first licence issued by the Portuguese Government; I secured it for the Chamber of Mines.

2,380. Was that in 1889?—It was in 1897.

2,381. Now, previous to that, was an official licence necessary to recruit labour in Portuguese East Africa?—No, sir.

2,382. When did you become agent for the Rand Native Labour Association, that is the original Association?—When they first started operations.

2,383. Do you know what year that was?—It was the same year that Mr. William Grant went down.

2,384. You continued to act then for the Native Labour Association until the outbreak of the war?—Yes.

2,385. Then after the British occupation you became agent for the new Association?—Yes.

2,386. And you still continue to act for them?—Yes.

2,387. Do you know why the Portuguese authorities introduced this method of licensing recruiters?—Because they were not satisfied with the recruiting as it was carried on previously. They had not the proper control over the recruiters. During the period that no licences were required the output throughout the whole year only amounted to 1,348.

2,388. What year was that?—It was from the 23rd of April, 1896, to March, 1897.

2,389. You do not mean to say that only 1,348 natives left their territory during that time?—Those were the only ones that were contracted for.

2,390. So that they paid the interior tax?—Yes.

2,391. Then was it for revenue purposes that they introduced this licensing of recruiters?—It was practically to stop the smuggling of boys.

2,392. Under Provisional Decree No. 119 only those holding special licences are allowed to recruit. Have you any idea how many licences were issued each month?—I have not got it, but could let the Commission have it. I know the number of licences issued throughout the whole period.

2,393. How many were granted throughout the whole period?—28 to outside recruiters and 11 to the Rand Native Labour Association.

2,394. Did the Portuguese authorities put any restrictions on the men when they were granting these licences?—No, no restrictions. The document necessary to obtain a licence was a recommendation by two mining industries of the Transvaal and the approval of the late Transvaal Government.

2,395. These Conditions had to be complied with before the licences were granted?—Yes.

2,396. How many licences are issued now for recruiting?—Eleven.

2,397. Are they all granted to representatives or agents of the Witwatersrand Native Labour Association?—Yes.

2,398. If railway contractors were to combine and were desirous of importing natives from Portuguese East Africa, is there anything against their getting a licence?—The special licence is by the *modus vivendi*. There is an agreement between the two Governments. Down at Delagoa Bay they do not approve of or issue any licences without the approval of the Transvaal Government.

2,399. Is there anything in the *modus vivendi* to prevent any combination of persons, if they had the approval of the Transvaal Government and wanted to get labour, getting the approval of the Portuguese Government?—Not that I know of. The Portuguese Government have the liberty to grant licences or not. I daresay that if one of the 28 former recruiters were to ask for a licence down there probably it would not be granted to them, seeing they got only 6,000 men before the war.

2,400. On page 3 of your statement you mention that prior to the war the total number recruited north of latitude 22 was 184 from Mozambique and 247 from Quillimane. Were any special steps taken to get these boys, or did they come on their own accord?—The Native Labour Association had a licence.

2,401. And they were recruited by them?—Yes.

2,402. Do you wish to say anything further, Mr. Wirth, before the Commissioners cross-examine you?—No, sir; I am prepared to be examined on my statement.

2,403. Mr. GOCH: With regard to recruiters, when they were allowed to tout freely they worried the lives out of the camps apparently—according to your statement?—It had the effect that while this was going on a greater part of the natives crossed the borders to avoid the recruiters, and not only that, but as soon as they commenced the numbers of runners ran up immensely and the recruiting area was reduced considerably.

2,404. Their method seems to have been to capture these men on the road?—They were all stationed at the main turns and the drifts where the natives used to cross.

2,405. And then they captured them?—The one that bid most, got them.

2,406. How did they bid to the runners employed by them? You say that the one that bid most got them. How did they bid, in what form?—These natives are collected by the native runners. Although the runner, for instance, would be working for you, and you promised him a certain amount to engage labour, if I came across him and offered him more money I would get your boys.

2,407. You offered the runners so much more per head, not so much increased wages for the Kaffir?—No.

2,408. Have these Kaffirs anything to say in the matter—are they simply captured?—They find themselves disposed of by the runner to the party bidding most.

2,409. These touters are simply highway runners and you may look at it as simply a point of business. They capture a man on the road for an employer, and if others come along and bid higher they take this man away?—The native is not to blame; it was not really explained to him who he was really contracted for. Whatever white man he was delivered to he went to.

2,410. He was a sort of passage man?—Yes.

2,411. And these fellows made the money out of him?—Yes.

2,412. And with all that effort they only managed to get 1,348 men in 13 months?—That was when no licence was necessary; during that period it was practically free to anybody; it was merely necessary to take out passports for the boys recruited.

2,413. All their efforts from March, 1897, until 5th October, 1899, amounted to 6,404 men?—These were the numbers of the official contract obtained by 28 recruiters outside of the Rand Native Labour Association.

2,414. On official data this 6,404 that they recruited from March, 1897, until 5th October, 1899, is the most recent effort of these independent touts that you know of?—Yes, sir.

2,415. Is this an official figure?—Yes.

2,416. They registered the boys?—Yes, they registered the boys.

2,417. If there were any more, then it was done in a way to defraud the Portuguese Government of their dues?—Yes.

2,418. They are a lawless lot, these touts?—For practically every boy they took across the border it meant 13s. in their pockets. The mines did not care to stir recruiters to smuggle boys across the border, but gave 13s. for each native.

2,419. Mr. EVANS: Do you generally agree with Mr. Breyner in his judgment as to the actual number of boys obtainable from the Portuguese territory?—Yes, I consider his figures as to the population are based on the minimum.

2,420. Yes, but he expresses certain opinions on these figures. Do you agree with those opinions? He was examined very closely on all the figures that he gave and gave his opinion on those figures?—Well, as to the figures given for the internal needs, I should say they are put down as rather high.

2,421. What do you put the internal needs down at?—They may probably employ at certain times the number given by Mr. Breyner, but not during any length of time, or any large period. And with regard to the railways to be constructed, Mr. Breyner gives 60,000 labourers as those that would be required. It depends upon whether these three railways would be supplied at one time.

2,422. I take it that you agree with him as to his estimate of the actual number on the Rand in 1899, which is estimated at 80,000?—Yes.

2,423. You also agree with the view he expresses as to the length of time taken to recruit up to that figure. He stated that it had taken from the commencement of the Rand?—Yes, I said from the commencement of the Rand.

2,424. Can you tell us anything about recruiting in Portuguese territory for Rhodesia?—I do not believe there is anything going on south of latitude 22. I believe they are getting some of their boys from the Mozambique territory, but without the permission of the Company.

2,425. Now will you take that map on the table?—Yes.

2,426. You see latitude 22 there, and you see a red line slightly to the south; is that the boundary of the Mozambique Company's territory?—Yes.

2,427. Do we understand that practically all the boys that have been recruited for the Rand with the exception of the few you mentioned here have been recruited south of that red line?—Yes.

2,428. That has been the main recruiting ground?—Yes.

2,429. And from the whole of the northern portion you have got, excluding British Central Africa, about 1,300?—Yes.

2,430. That is all that you have got from the whole of the North?—Yes.

2,431. Now you give here in Annex "E" of your statement a summary of natives recruited north of latitude 22 for this year. This is up to the 14th of July. Now can you give us an idea what the recruiting of these natives has cost; can you tell us what the expense has been?—As far as I am aware, I believe something like £15,000 or £16,000 has been spent.

2,432. And the result is less than 1,500 natives?—Yes.

2,433. In that £15,000 or £16,000 do you count the cost of the British Central African Mission?—No.

2,434. Can you tell us what the average number recruited was within the first six months of this year, as compared with the past average per month obtained prior to the war?—You mean the first six months?

2,435. The first six months of this year. Have you got figures shewing the average monthly number recruited for the first six months of this year?—21,000.

2,436. Is that the average per month?—It is 21,000 for six months.

2,437. That would make 3,700 per month, roughly speaking. That is the average per month?—Yes.

2,438. Then what was the best monthly average before the war? I believe you find 1898 was the best year?—Yes.

2,439. What is the average there?—For nine months it is 15,538 boys.

2,440. Which makes 1,700 per month?—Yes.

2,441. So you are doing on the average 3,700 a month now, as compared with the best period before the war, 1,700 per month. Is that the position?—Yes.

2,442. Now coming back to that Rhodesian recruiting. Is it illegal for the Rhodesian mines to recruit in the northern portion?—The Rhodesian mines are practically getting the whole of their supply from Tete, on the Upper Zambesi, and from certain portions of the Mozambique Company's territory, but it is not with the permission of the Company.

2,443. They are smuggling?—Yes.

2,444. Are any steps being taken to stop this smuggling?—I really do not know.

2,445. You do not know what is being done there?—No. I do not believe really that there are men touting there. I believe that the boys cross on their own accord, with the exception of Tete; I believe there are some boys being recruited there.

2,446. Now, the Associations get authority before the end of this year to recruit in the whole of that northern territory, how many natives do you think we will be able to recruit in 1904? I mean for the whole of the territory north of latitude 22?—That is a difficult answer for me to give. It depends upon what the Zambesi Company will do. The Company on the Lower Zambesi has 190,340 available men, not including the Upper Zambesi.

2,447. Have those men ever been sent away from their homes to work before?—Well, a portion of the boys from the Upper Zambesi emigrate to Rhodesia.

2,448. What do you mean by a portion of the boys—would it mean about 6,000?—It is calculated that Rhodesia has about 6,000 East Coast boys.

2,449. All told?—Yes.

2,450. So that is not a very good number?—No.

2,451. And it is practically the same climate as where they come from; the change of climate is slight?—I do not know.

2,452. What do you know personally about this northern territory? What is your personal experience? Have you travelled in it?—I have been up the Northern Province.

2,453. Where have you been, at Mozambique, which is on the East Coast?—Yes.

2,454. Where else have you been? That is all you personally know of that northern territory?—Yes.

2,455. What is your view about the pay we are giving the natives now? The boys returning from the Rand to Delagoa Bay at present are very well satisfied, are they not?—Yes.

2,456. They are satisfied?—Yes; in fact some of the boys only come down to Delagoa Bay on the spree and do not even go to their homes, but return to the Rand again. That is because they cannot get any liquor up here.

2,457. Does that form a large percentage?—I should say about 1 per cent.

2,458. That is a great advantage for you, I should think; it saves recruiting and you get the same amount for it?—Yes.

2,459. Mr. Breyner told us that in his opinion there were as many Portuguese natives in the Transvaal now as there were before the war, but that a great many of them were in domestic service and employed by the railway, etc. Do you agree with that?—At the outbreak of the crisis 65,000 boys returned to Delagoa Bay and 13,761 remained on the Rand—East Coast natives. Since then and up to May, 54,454 have come up, making

a total of 68,215; 11,513 have returned to Delagoa Bay, leaving a total of 56,702, whereas on the mines up to the end of May, 45,935 were employed, making a difference of 10,867 natives which the mines have lost. They are in town somewhere.

2,460. Mr. PHILIP: From March, 1897, to October 5th, 1899, there were 48,000 boys recruited, of which the free recruiters only recruited some 6,400, so that you have virtually recruited seven times as many during that time as the free recruiters?—Yes, the 11 recruiters of the Rand Native Labour Association.

2,461. From February, 1902, to December, 1902, you recruited 38,517 boys?—Yes, sir.

2,462. That was during the period that the wages were low—that was at the low rate of wages?—Yes.

2,463. And that was more than the total that had been recruited in any one previous year?—Yes.

2,464. So that it is not so much a matter of wages with the remainder?—This total of 38,517; it is officially known that only about one-third of that figure are old boys who have been on the Rand before. Two-thirds are new boys who have never been on the Rand.

2,465. Did these new boys come out under the reduced wages?—Yes. They practically did not realize it when we told them down there they were getting 30s.; they laughed at it.

2,466. We have been told by some witnesses that the more wages you pay a Kaffir, the shorter time he will work?—That depends upon the distance he is from his home. If near his home he works less than if he were further away.

2,467. As soon as he has sufficient wages he returns home?—Not necessarily, with our East Coast boys; when the war broke out these 65,000 boys I am alluding to were returned by us to their homes. Well, some had been here for 8 and 10 years.

2,468. Take the census in your statement, you have it compared with that of free recruiters. All the talk we have heard of independent recruiters doing better than the Association has done at the present time is all nonsense?—Yes, absolutely.

2,469. You mention here that owing to the methods of recruiting the Government formed the Native Intendencia?—It is the Native Labour Department.

2,470. Mr. TAINTON: Could you tell us, Mr. Wirth, what the Government charges are at present upon the boys leaving the country?—3s.

2,471. That is leaving the country?—Yes.

2,472. And upon their going back?—10s. It depends upon the number of years the boy has been upon the Rand. The Government is permitted to charge him 10s. per year.

2,473. Do you agree with Mr. Breyner's statement that the average time of service for boys on the Rand is two years? We shall get it from mine managers and others.—Prior to the war you may take two years as a general average. Of late a good many boys have left the mines.

2,474. Since the war?—Yes, I do not know as regards this year.

2,475. At any rate the Government gets an average of 10s. per boy returning?—Yes.

2,476. And what about the hut tax?—They get 2,500 reis each, which is more or less between 8s. and 10s.

2,477. Do you confirm Mr. Breyner's figure that you think 80,000 boys can be recruited in the Government Provinces?—Which Government Provinces?

2,478. Those mentioned by him in his statement—Lourenco Marques, Gazaland, Inhambane, Mozambique and the Crown Lands of the District of Quilimane?—Certainly, they were on the Rand and now you have got them back.

2,479. You think an equal number could be obtained from the lands of the private companies?—You are alluding to the Zambesi, the Nyassa and most of the land owned by private companies?

2,480. That is his (Mr. Breyner's) statement, and I thought you were familiar with it?—Do you mean could the same quantity of boys be recruited?

2,481. Yes. Mr. Breyner bases his figures on the population in the Northern Province, which is known to be very much larger than the population south of latitude 22. If you take 80,000 and say the boys are engaged for two years that means you have 160,000 on the Rand before they begin to go back?—I maintain nothing of the kind. If the present system is carried out you will probably have an average of 110,000 boys on the Rand and that will be your standing number.

2,482. Of course I am merely drawing certain conclusions from the figures which have been given us. You have taken an average of two years' service, well, take 80,000 boys a year, which means 160,000 boys on the Rand. Now you say the total number we could keep here would be 110,000?—In a certain length of time.

2,483. We must modify your figures on the basis of a two years' contract, and 110,000 makes only 55,000 boys recruited per year?—Prior to the war you have had 80,000 boys on the Rand—you get that as a standing number. Under the new resources you will probably get 20,000 more boys south of latitude 22 and from 20,000 to 22,000 boys will be going to and fro.

2,484. Then we will not have more than 110,000 boys from south of latitude 22. Supposing that the private companies give you leave to operate in their territories, according to Mr. Breyner's estimate you will be able to double that figure, making a total of 220,000 on the Rand?—In what number of years?

2,485. I am putting your figures to you, that is all. You have modified them already very considerably?—Do you mean whether we can get boys from the north? It all depends what the Chartered Companies are able to do. The Prazos on the Lower Zambesi have 190,347 available men.

2,486. Look at Mr. Breyner's evidence on page 38. At the bottom of the second column you will find his estimate from the whole of the Portuguese territory is 150,000 boys per year?—Yes, he practically puts down the Northern District at 40,000 but only for the near future.

2,487. But if you deduct 80,000 from 150,000, that leaves 70,000 for the northern district. 150,000 on a two years' contract would mean 300,000 boys on the Rand?—No, 150,000 boys available will be your standing number, as you had 80,000 on the Rand before.

2,488. Then with 150,000 boys here on a two years' contract you must reduce your annual number to 75,000—half the number. I am merely showing you the difference in your figures?—But it would take you a certain time until you got your number back.

2,489. We will have to consider these figures then as subject to considerable modification?—I believe the figures given, as to the number of boys available, are really a minimum, but it is a question of time when those boys can be recruited.

2,490. Mr. Breyner states that there are 150,000 boys available for emigration into the Transvaal out of the one-third of the total male population. On a two years' contract that will give you 300,000 boys?—I do not quite understand the question.

2,491. If you send 150,000 boys in one year and they stay two years, that makes 300,000 on a yearly average?—Mr. Breyner says there are 150,000 boys available.

2,492. Well then, we come back to 75,000 as the yearly number sent out?—Not naturally so.

2,493. I see that free recruiters in the period of two-and-a-half years from March, 1897, to October, 1899, sent out a total of 6,404 boys?—Yes.

2,494. That is an average of 2,560 a year?—Practically.

2,495. You are now sending out an average of 40,000 a year?—Yes.

2,496. Is this emigration of the boys from the Portuguese territory quite voluntary? Is there no influence which is used to compel them to go out?—None whatsoever.

2,497. Then under free recruiting the boys came out at the rate of 2,500 per year, and under Government recruiting the number has increased to 40,000?—I do not say that free recruiting only amounted to 2,000 a year. 2,000 have only been officially recruited. All the other boys have crossed the frontier; you will practically get your figures from the boys on the mines.

2,498. Then this figure is really valueless as to the return from free recruiting?—It simply points out to you the official figures.

2,499. Would you say that a very large number of boys left the country and that there is no record of their contracts in this interval?—Yes, a big number of boys used to come from Komatipoort and Hectorspruit.

2,500. What number; have you any estimate?—I am not prepared to say.

2,501. Can you give us an idea of the increase due to the Government's interest in this matter? Since the Government has taken an interest in the matter, what is the improvement owing to this Government recruiting? I take it that the whole of your statement goes to show that there was a very small output of natives from your territory before this official arrangement with the Labour Association, and you give certain figures in support of it?—No; with an organised system, more boys can be put out than with the old system, without a proper organisation.

2,502. What is your estimate of the increase due to this organised system?—Well, under the present system you are getting 2,000 more boys per month than formerly.

2,503. But compared with the recruiters' figures of 2,560 a year in 1898, you are now getting out a very much larger average. The official figures you give us here give for the period from March, 1897, to October, 1899, 6,404 boys, that is an average of 2,560 a year. Now you are getting 40,000. I want you to explain the cause which has led to that great increase?—You are leaving out the Rand Native Labour Association, which recruited during the same period. While those 28 independent recruiters got 6,000 boys, during the same period the Rand Native Labour Association got 42,481.

2,504. Well, go to the head of your statement (v. p. 159), and you get there only 1,348 as the result of free recruiting in 1896, can you explain the cause which led to this great increase?—Before that the boys were smuggled, and naturally smuggled, because you had them on the Rand.

2,505. So that the official figures give absolutely no information with regard to the number of boys obtained under free recruiting?—Not necessarily so. If you take what the Rand Native Labour Association has put out, together with the free recruiting, and you add them together, you will find the present system has put out 2,000 more boys per month.

2,506. Mr. WHITESIDE: Mr. Wirth, Mr. Breyner states that we can get 60,000 boys from the northern territory. I understand you do not know much about the northern territory, but from the knowledge you have, do you think that is a reasonable estimate?—Well, according to the figures of the population of the northern district, there is no reason why that estimate should not be taken, considering the number of the population.

2,507. Would you consider that the minimum number?—Mr. Breyner made a remark in his statement, which was left out of his evidence. He has put a foot-note to it which is not in print. This foot-note is as follows: "I beg to remark that the statement which I have made, and which was translated, is entirely omitted, viz., that the figures as to the compilation of the number of boys available for the mines should be taken as the minimum,

whereas the figures as to the boys required for the internal wants of the province should be taken as a maximum. In fact, the chances are that the latter figures will never be reached by the Public Works in contemplation."

2,508. The CHAIRMAN: What is that you are reading, Mr. Wirth?—Mr. Breyner said it was omitted from his evidence. He stated that the chances were that the boys required in the province would never reach that number at one particular time.

2,509. Mr. WHITESIDE: Can you give us any idea how long it would take to get these boys from the northern part?—I am not prepared to say.

2,510. Are you acquainted with British Central Africa?—No, sir.

2,511. In answer to a previous member of the Commission, you say we get an average of 3,700 per month?—Yes, sir, that is, from the southern portion of the Portuguese territory; from the south of latitude 22.

2,512. Do you think within the near future these figures might be appreciably increased?—No.

2,513. Or I might put the question in another form: What do you consider the maximum output for the mines south of latitude 22?—I stated before, with the present system you should probably get 20,000 more than you have had before.

2,514. You tell us that boys from Tete cross to the Rhodesian mines?—Yes.

2,515. Do they go freely?—Yes.

2,516. Do you think you could get any appreciable number of natives for the Transvaal if recruiting were started in that district?—It is a fact that the Zambesi district is the most thickly populated; otherwise, the *prazo* system would not have been in force there. It is the most thickly populated portion of the country.

2,517. Then, I may take your answer as being in the affirmative; that boys could be obtained from that district?—Yes.

2,518. You have told us that the East Coast boys come out freely. I take it that we may consider mine work popular amongst the boys. It is probably the only work they seek for?—Yes.

2,519. The CHAIRMAN: That is, boys from the interior.

2,520. Mr. WHITESIDE: What is your opinion of the reduction of wages which took place to 30s. per month?—I believe it is the general opinion that it was a big mistake.

2,521. Is this your own opinion, and was your opinion asked as to the advisability of reducing wages?—The subject was mentioned.

2,522. What was your reply?—That I thought it insignificant; that the effect would not be felt by the natives, because, as I said, they would not believe they were getting 30s. The effect would only be felt after six months or so—after the boys had returned.

2,523. Consequently, we are now feeling the result of that reduction to 30s. per month. At the present moment it is known, I believe, in the country that the wages have been increased. It is having the effect of bringing greater numbers out?—I should say the output for this year is considerably better than last year and the first year.

2,524. Have you any knowledge, Mr. Worth, of boys being ill-treated when returning home after service on the Rand?—I refer to the period before the war?—I do not quite understand what you mean by being ill-treated.

2,525. Being robbed of their money, and so on?—On their way back?

2,526. Yes—I daresay instances of the sort have happened, but they are not general.

2,527. Mr. QUINN: Mr. Wirth, we want to go back to these figures of Mr. Breyner's. It may look like repetition, and in a measure it is. I wish to say these figures are so important that you will understand me—that I want to emphasise a point

already made. Now, can you tell us when these figures quoted in Mr. Breyner's summary were compiled? The quotation I refer to is this: "Official statistics give us a number 363,036 adults from 15 to 50 years old in the district directly administered by the Government, that is, Lourenco Marques, Gazaland, Inhambane, Mozambique, and the Crown Lands of the district of Quilimane." These figures, given by Mr. Breyner, are based on the hut tax collection of the last five years—the average for five years?—Yes.

2,528. I think you were present yesterday when I asked the same question of Mr. Breyner with regard to the boys who do not pay taxes in money?—That was not properly put to him.

2,529. I think you will understand me perfectly. Is it correct to say that there are a large number of natives, in addition to this 363,036, in the districts under consideration, who do not pay taxes in money, but pay in produce or labour instead?—No, the figures are as stated, 363,036.

2,530. These figures, then, represent the number of natives who pay the Government hut-tax either in money, labour, or produce?—Yes; but there would probably be a lot of boys who do not pay at all, as the districts are very large.

2,531. Cannot you tell by other authorities what the proportion is who do not pay?—The proportion who pay in labour and produce is so great that in the opinion of those likely to know there are a large number who do not pay until they are obliged.

2,532. What proportion would you think?—These figures are only based on the hut-tax collection. The Government cannot possibly have any means of keeping an account of the number who do not pay, the territory being so large, and often the boys shift from one place to another.

2,533. Would it be 5 per cent.?—I cannot say. You could reckon on 5 per cent.

2,534. Let us say 5 per cent. on 400,000; it is a little item worth considering in the compilation?—Certainly. Mr. Breyner took 800,000, which we agreed to as a fair number for the provinces south and north of latitude 22.

2,535. Of that 800,000 he took 550,000 as a proportion which he considered not available, leaving 250,000 out of the 800,000, which we might probably count on. I want your opinion about that 550,000. Do you not think that is a very big reduction to set on one side as being not available for work?—No, I believe you cannot reckon more than a quarter of these. If you take the districts already explored, there are 363,000 available, and as you only had 80,000 on the Rand, that is about a quarter.

2,536. And do you think that will be made up? I doubt it, because emigration from south of latitude 22 has been going on since the days of Kimberley.

2,537. Then, in your opinion, this estimate is approximately correct?—Yes.

2,538. Now, you speak of having recruited labour necessary for the building of the railway line in 1889. Do you know the length of that line in English miles?—What number of natives were employed on that line?—I personally recruited 3,000.

2,539. Were these 3,000 the whole of the native labour employed on the line?—No, sir.

2,540. How many more?—I do not know the number of natives employed by the N.Z.A.S.M., but I believe I could get the figures.

2,541. Regarding these 60,000 natives, which it was clearly stated on Thursday would possibly be required for railway building, do you think they will be wanted for the railways mentioned. The chances are that you would not require that number?—There is no prospect of these three railways going on at one time. I should think 20,000, instead of 60,000 natives would be plenty.

2,542. You are referring to the Swaziland Railway now?—But you must take into consideration where the railway is being built. If it is built in the native territory, it would require more, and if at a distance it would take a lesser number. Being near to his home, a boy does not usually work longer than four to six weeks, when his place is filled by others. The class of boys who perhaps work a month, and drink, or loaf their time away, is not the class who come up here. For railway work near their homes, you would probably get these boys you have been putting on one side.

2,543. Mr. Breyner considers that from 80,000 to 100,000 workers would be required for internal public works?—I dare say at times they would be employed, but not for any length of time. If you take the Zambesi, there are employed between 30,000 and 40,000 men on the *prazo* system.

2,544. Do I understand you correctly to say that they would probably get 110,000 as a permanent labour supply for these fields from Portuguese territory?—Yes, I maintain that if the present system is not muddled it could be done.

2,545. And in addition to the 110,000 which would be a permanent number fixed here, we might reasonably hope to get another 60,000 from the Northern Provinces north of latitude 22?—I would not like to say 60,000.

2,546. These are Mr. Breyner's figures?—Probably, but Mr. Breyner stated in his evidence that these figures are based on the same proportion of the northern to the southern provinces. This is what he said: "I calculate that with the establishment and maintenance of an organisation to facilitate recruiting, it would take at least from five to seven years before the northern provinces are in a position to furnish to the Rand a complement of 60,000 to 80,000 labourers, which, on the above calculation they may be able ultimately to supply."

2,547. Do you agree with him in this?—Yes.

2,548. So that, roughly, within the near future, we might count?—There is no saying what the Chartered Companies may do, and what the Zambesi Company can do. I am of opinion that in the Zambesi Company's territory you might get 20,000 boys in two years. I think that is all you can reckon on. I do not think they will give you more.

2,549. Can you tell us what is the rate of increase in the population down there?—No.

2,550. Are there no official figures on the subject?—I am not in a position to answer that question.

2,551. But it would be a factor in our future requirements of very considerable importance, would it not?—Certainly it would.

2,552. Mr. WHITESIDE: Will you turn to page 33 of Mr. Breyner's evidence? He gives there the total male population of workers as between 700,000 and 800,000. Do you agree with that estimate? Is that roughly correct?—Mr. Breyner, in his evidence, I believe, estimates the population north of latitude 22 to be at least equal to that of south latitude, but, as he states, they are low figures.

2,553. You said just now, in answer to Mr. Quinn, that you expected a total of 110,000 labourers to be kept permanently on the Rand, from the Southern Provinces, and expected a further total, not less than 60,000 from the Northern Provinces?—As regards the 60,000 from the Northern Provinces the estimate is merely based on the population which ought to be able to supply that number, but I cannot say whether it will or not. It will take a great number of years.

2,554. Your estimate in answer to Mr. Quinn was 60,000 and 80,000?—Yes.

2,555. That makes the total number of workers 170,000 only kept permanently on the Rand, putting the two figures together?—I am just giving the collection.

2,556. Putting the two together, it would mean 170,000?—But you do not take into consideration the length of time. We shall not get that number for the next two years.

2,557. I am not taking the question of time. We want to get the proportion of the figures of the natives of Portuguese East Africa?—It may take five or six years.

2,558. You have told us that 110,000 are available from the south, and 80,000 from the north?—I will not say 80,000, say 60,000.

2,559. That is 140,000 from Portuguese East Africa?—Yes.

2,560. For internal works, Mr. Breyner's estimate was 80,000 to 100,000, and there is a total of 220,000 natives from Portuguese East Africa permanently at work?—Well, say 70,000 are not at work or even 60,000, which you expect from the north.

2,561. You misunderstand me. I mean that you will have a total of about 270,000 boys at work from Portuguese East Africa. That is approximately about one-third of the available population between 15 and 30 years of age. 33 per cent. of the adult population of Portuguese East Africa can be got to work—that is your estimate?—Well, you have these facts to go upon. There were 80,000 boys on the Rand, and the population is 365,000; it is not one-third, but about one-quarter.

2,562. I think you told the Commission that the natives left in very large numbers when the pay was 30s. per month?—You mean emigrated to the Transvaal?

2,563. Yes?—Practically the same number as this year, or this year is a little better. When the pay was 30s. a month they would not believe it until they arrived here.

2,564. I think you told the Commission that they believe now that there is a bigger wage coming? How did they hear of it?—It was reported to them.

2,565. By whom?—By the runners we have in the provinces. There are 11 white men and about 1,500 black men employed.

2,566. Did many return when the pay was only 30s. per month?—Yes. From February, 1902, to December, 1902, 6,267 natives returned.

2,567. Does not that shew that the boys do not work as long when they get £3 per month as when they were getting 30s. per month? That is to say they stopped longer on the Rand when they got 30s. than they do now when they get £3?—Not necessarily so.

2,568. You cannot take these 6,267 into consideration because you had 13,761 boys on the Rand during the whole period of the war, and probably these 6,000 I am alluding to were boys that had remained on the Rand and since returned?—The boys who were working and getting the sum of £3 went back and told the boys at home who could not believe they were only paying 30s. per month on the Rand.

2,569. I do not quite follow you. Is it your opinion that the boys stopped longer when the pay was 30s. than when it was £3?—The boys only contract for a year, and on the completion of their term they are at liberty to return home.

2,570. Mr. FORBES: I think you gave the number of boys available for work from south of latitude 22 as 110,000?—Yes, sir.

2,571. How many of these boys do you consider would be at work here at any one time?—The 110,000 available would not be here at any one time. I am taking it in round figures, because prior to the war, when free recruiting was permitted, the Rand Native Labour Association could not as conveniently exploit the districts as it can do under the present system. Under the former system, you had a standing number on the Rand of 80,000, and I maintain that you will have 110,000 under the present system, 20,000 of whom would be going to and fro.

2,572. If 110,000 is the available number, then they would all require to be here at the same time to keep up that number?—Yes.

2,573. Mr. PHILIP: With the exception of Mozambique, you know nothing of the population of the territory known as the Zambesi?—Except from the statistics of the Government.

2,574. But you know nothing personally about it?—No.

2,575. Mr. EVANS: What do you estimate is the average number you would be able to recruit in the future from north of latitude 22?—It entirely depends on the Chartered Companies whether they give us permission.

2,576. Then what would you estimate the number obtainable from the southern territory?—The present average would keep up until 90,000 boys were on the Rand, and then it would drop considerably, perhaps to 2,000 per month.

2,577. What would you represent the average monthly wastage to be; that is, the number that would return, die, go off to domestic service, and so forth?—I cannot say.

2,578. Can you give us a rough idea?—I am only able to give the number of boys who return to Lourenco Marques.

2,579. What would you think from your experience was the average monthly wastage; that is what I want to get at?—I have no figures, but there were 12,167 returned to Delagoa Bay this year from January up to the 14th July.

2,580. That makes 2,000 per month?—Yes. 12,167 returned, and 22,314 were recruited for the same period.

2,581. That is a net increase for six months of 10,000?—Yes.

2,582. So that the rate at which the number of Portuguese boys working on the mines here increases, in your opinion, would be about 10,000 for six months. Is that right?—It depends on circumstances, Mr. Evans.

2,583. Yes, but I have asked you for an estimate of what the number would be?—You can take that as correct.

2,584. Now, how many Portuguese natives are now working here on the mines alone, do you know?—At the end of May, there were 45,935.

2,585. Would it be near the mark to say 48,000 or 49,000?—Up to the end of July, Mr. Evans?

2,586. Up to the present time?—45,935 were on the mines at the end of May.

2,587. Did that allow for wastages, and are you sure of those figures?—Yes. In June you received from the East Coast, south of latitude 22, 4,540; in July, 4,200.

2,588. The wastages—what are those?—For these two months? I have only got June. A big number returned in June. It was very large indeed, and amounted to 3,022.

2,589. Then you have another month?—But you cannot take it in comparison. Up to the 15th July, 855 boys returned.

2,590. That leaves 49,000 after allowing for those who have left and gone to work in town, died, and so forth. So that something between 48,000 and 49,000 is the number?—Yes, sir.

2,591. You say that the maximum number we can possibly get from the present area that you are allowed to recruit in is 110,000, and how long would it take us to get them at the rate you are working? It would take us three years, I suppose—that is, if your figures of 1,700 per month are right?—Yes, but I doubt if you will have the standing number until some time about the end of 1905.

2,592. Do you think we shall get it in 1905?—I think so.

2,593. Do you think you will be able to maintain the number at the rate you are now sending up?—No, sir.

2,594. Then how do you make out we shall get 110,000 by 1905?—Well, Mr. Evans, as I said before, it depends on circumstances.

2,595. But, under normal conditions, are you likely to increase the number of Portuguese boys on the mines by more than 1,700 a month? For the months of April, May, and June you have maintained a gross average of 4,000?—Yes, but the returns have also been high; so that, when you have deducted the wastages, the net increase has not been great. I am giving it to you for the last four months.

2,596. How many Portuguese boys have left the mines and taken up work in the town?—From the beginning of the operations of the W.N.L.A. the mines have lost 10,767. The loss would not start until 12 months after the commencement.

2,597. Do you think you will be able to do more than 1,700 a month?—No, I do not.

2,598. But you stick to that figure as the maximum. You mentioned just now that it would be possible to get 20,000 boys in two years from the Zambesi Company's territory. On what do you base that estimate?—They are in a position to do so.

2,599. How, and why?—Because on the Prazos in the Lower Zambesi you have a native working population; I think there are 119,347.

2,600. Where do you get your figures from?—The official statistics of the Government.

2,601. How are those made out?—The number of men available in these Prazos are only given for the Lower and not the Upper Zambesi.

2,602. Do the Prazo holders know exactly how many are in their Prazos?—The Prazo holder collects poll-tax from each boy, and the poll-tax for the year 1893 amounted to 89,027,223 reis.

2,603. The CHAIRMAN: Can you give us that in pounds sterling?—I do not know exactly what it is.

2,604. Mr. EVANS: What reason have you for believing that these 20,000 will really come out?—Because on the Upper Zambesi, Mr. Evans, that there is a great surplus of population is a known fact. I also know from information supplied by a Director of the Zambesi Company. It has a big surplus labour population—that is, the Upper Zambesi. It is very difficult to get men from the Upper Zambesi to the Coast, because it is so expensive.

2,605. What I want to get at is what have you to base this estimate on, apart from population statistics? Perhaps that is true, but whether the men will come out or not is another question. Have you anything else besides these population statistics?—The opinion of the Director of the Zambesi Company, who thinks he can supply us with 20,000 natives in 18 months.

2,606. Has this Company agreed to that?—It was his opinion.

2,607. Have natives from that country ever gone anywhere to work?—Boys from Tete go to Rhodesia from the Upper Zambesi.

2,608. That is the only instance you have got. You do not know whether they will be willing to work or not?—The emigration from the North, of course, is very different to the emigration from the South. The North does not do what the South does. In the North the boys have considered themselves slaves, and they only realize that they are not when they come out.

The witness proceeded to read a list of figures.

2,609. The CHAIRMAN: From what are you quoting, Mr. Wirth?—This is the Annual Report of the Governor-General of Mozambique.

2,610. Can you hand that into the Commission?—Yes, sir; I can have a copy made for you, or will hand you this.

2,611. The document, which was in Portuguese, was handed to the Commission. Translated into English, it reads as follows:—

## TRANSLATION.

## PRODUCTS AND CULTIVATION.

The products at present exported from the Crown "Prazos" (farms) are as follows:—  
Copra—Monkey Nuts—"Sesamum"—Rubber—Wax—Ivory—and a few Skins.

The other products which are not yet produced in sufficient quantity to be exported, being consumed in the country, are as follows:—

Rice—Mealies—Kaffir Corn—"Meocire"—and different kinds of beans.

\*

"PRAZOS" (FARMS) ANGUASE AND ANDONE.—On account of the Inspector General's Department having only started regular operations in the second half of last year in the "prazos," which are under the direct management of the State, cultivate only rice, monkey nuts, and "sesamum," these promising good results.

"PRAZOS" BOROR AND TIRRE.—Satisfactory results have been obtained from 500 rubber plants, some of which have obtained the height of 3 metres.

"PRAZO" MASSINGIRE.—Satisfactory results obtained with Ceylon coffee.

"PRAZO" CARUNGO.—Coffee and rubber have given bad results, due to damaged seeds having been used.

"PRAZO" MADAL.—On this farm the cultivation of Cape vines and of rubber is going to be tried.

"PRAZO" NAMEDURO.—The experiments with coffee from Ilo, Inhambana, Arabia and Siberia have given no results, the seeds having not germinated due to being very dry.

No results have been obtained from the white nettle or from indigo, on account of having been planted too late.

The culture of tea is about to be tried.

## CROWN "PRAZOS" (FARMS) WITH THEIR LESSEES, RENTERS AND ADMINISTRATORS.

Groups to which they belong.	Name of "Prazo."	Names.	No. of armed Sepoys allowed to the Lessee.	Approximate number of Colonists contributing.

(a) These two "prazos" have been administered by the State since April, 1888. They are hoarded with the village of Quelimane, and in them reside the hundreds of natives which come to work daily for the public departments and for private employers.

(b) The cancellation of this lease has been proposed on account of non-payment of rent.

(c) Ditto.

N.B.—The Sepoys are supplied with arms and ammunition by the Lessee at his own expense.

COMPARATIVE MAP OF THE REVENUE OF THE "PRAZOS" (FARMS) DURING THE YEARS 1880—1886—1893.

Name of "Prazos."	Comparative Revenue (in Reis).

<b>Total ... ..</b>	<b>27,689,000</b>	<b>35,787,045</b>	<b>98,827,223</b>

(a) The revenue was unknown until the year 1888, when it was 75,000 reis. The present lessee has not yet taken charge of the "prazo," on account of alteration of arrangements with regard to same.

(b) The revenue was unknown until the year 1888, when it was 20,020 reis. The new contract has not yet been signed.

(c) Since December, 1890 (date on which the Company took possession of the "prazo"), the rents have not been paid.

\* "Prazos" whose names are prefixed with an asterisk, were leased prior to the decree of November 18th, 1890; all the others are let under the new regulations. The former are subject to the fiscal control of the Inspector-General who sees that the lessee carries out the terms of his contract and complies with the laws that were in force at the time when that contract was made. They are also under the provisions of Article 9 of the decree of November 18th, 1890, but with this exception, that the lessee cannot exercise the powers of a Government agent unless specially authorised to do so. They have not, so far, been classified in groups, but as soon as the existing leases expire they will be labelled "Group A" and re-let by public auction.

CIRCUMSCRIPTIONS (AREAS UNDER ONE AUTHORITY) WITHIN WHICH THE "PRAZOS" (FARMS) ARE GROUPED AND WHOSE AUTHORITY THEY ARE UNDER.

Circumscriptions.	Head Office.	Prazos.
1st. Inspector-General ... ..	Quelimane (Department of the Inspector-General).	Andone (a)—Anguese (a)—Carungo—Cheringone—Inhassunge—Luabo—Madal—Mahindo—Melambe—Pepino—Quelimane do Sal—Tangalane and Timbue.
2nd. Sub-Inspector Costa ... ..	Maquival (on bank of River Namacurra).	Buror—Licungo—Macuse—Marral—Nameduro and Tirre.
3rd. Sub-Inspector Napoles ... ..	Mutorhra (on left bank of River Zambezi).	Goma—Guengue—Maganja below Chire—Maganja beyond Chire and Massingire.

(a) The prazos Anguese and Andone, which are under the direct administration of the State, are included as part of the 1st circumscription and the head office of the administration of these prazos is at Coalane (on the road from Quelimane to Maquival).

2,612. The CHAIRMAN: Do you know, Mr. Wirth, whether any recruiters of the pre-war days, who are not now employed by the Association, have been using influence with the Chiefs, or in other ways, to prevent boys coming to the Transvaal?—They may have tried to do so in the commencement, but the boys are very well satisfied with the present method of recruiting, because they are looked after. They have receiving stations throughout the country where the boys can seek shelter and get food. As regards that report, I do not think that it is of any importance; in fact, there are none of the old recruiters down there—at least

not in the Interior. I doubt very much if the Government would permit them to go into the Interior.

2,613. You do not think their influence is now a factor in influencing the boys?—Not in the least. There are about half-a-dozen of them at Komati-poort.

The CHAIRMAN: The Commission is very much obliged to you for your evidence, Mr. Wirth.

The Commission adjourned at 12.30 p.m. until 10.30 a.m. Thursday, the 6th of August, 1903.

## NINTH DAY.

Thursday, 6th August, 1903.

THE COMMISSION SAT AT 10.30 A.M.

SIR PERCY FITZPATRICK, called, sworn and examined.

2,614. The CHAIRMAN: You are Sir Percy Fitzpatrick?—Yes.

2,615. You have been connected with the Chamber of Mines for a number of years?—Yes.

2,616. You were President last year, were you not?—Yes.

2,617. You are also on the Board of Management of the Witwatersrand Native Labour Association?—Yes.

2,618. You have prepared a statement giving your views on the matter which the Commission is enquiring into?—Yes, I have prepared a statement hurriedly and in which I endeavoured to conform to the Terms of Reference, but I do not really know whether I have done so or not. It is not a complete statement, and probably goes somewhat beyond what is required in some points, but I did my best in the time available.

2,619. Will you now hand that statement in as your evidence-in-chief?—Yes; but there are several alterations. I have referred throughout the statement to the year 1898 (as being the industry's best year), but what I meant was the maximum of the industry in August, 1899, when we had 6,000 stamps at work. The maximum dividends were paid in 1898, and I had the year 1898 in my mind in that connection. But the industry was at its best in August of 1899. I meant the maximum of the industry for the year 1899. Where I refer to the Rand Mines, I mean the Rand Mines, Ltd., and its subsidiaries. I will make these few corrections afterwards, and before the statement is published. I think the members of the Commission will understand what I mean.

2,620. Sir Percy Fitzpatrick's statement was then handed in to the Commission and reads as follows:—

To the Chairman of the Labour Commission,  
Johannesburg.

Sir,—I shall endeavour to comply with the request to submit a statement, but, as the summons to give evidence was wholly unexpected, and as I leave for Europe this week, it is only with the utmost difficulty that I can find time to note down anything. I trust, therefore, that the Commission will realize that these brief and imperfect notes are submitted under difficult circumstances and merely for the purpose of consulting the convenience of members. The shortage of native labour was felt intermittently before the war. It might indeed be said that there was a constant shortage. It was not

such as to cripple the industry, but it did certainly retard bigger developments. I do not think the shortage was ever regarded as likely to be permanent, and there was a confident and general belief that there was an ample supply in Africa and that it was only a question of organization and better facilities in order to secure it. The same confident belief existed in many minds for some time after the war, and certainly prompted me to persist in unremitting and searching tests of the African supply and to insist upon the fullest evidence being forthcoming before accepting the importation of coloured labour as inevitable. Two developments have occurred since the war which have made the position clearer. First, our experience has shown us that the available labour supply is nothing like what we thought it was; secondly, the demands on that supply have increased beyond all expectations. From every part of Africa we have the same complaint. In Cape Colony the shortage has for some time been the cause of agitation; witness the appeals for importation of cheap Italian labour and later meetings under Mr. Merriman, of the Fruit Growers' Association, for any cheap labour; see also the testimony of Colonel Stanford at the Bloemfontein Conference. In Basutoland we have proved and the C.S.A.R. have proved that there is no surplus worth mentioning for the mines. I have personal experience which shews at present there is none available even for the farms in the neighbourhood. Zululand is closed to recruiting by the Natal Government for the reason that it does not yield enough for their own needs. Rhodesia has for years been complaining of shortage and appealing for indentured Indians. Portuguese East Coast has been the salvation of the Rand. But all the evidence goes to show that we cannot expect very much more from that quarter. Further north, in the East, Centre and West of Africa, we appear to have little to hope for. Up to the time of Mr. Chamberlain's visit I firmly believed that other parts of Africa could supply us with the labour that we required. His authoritative statement regarding the position of the Central African Provinces was the first cause of doubt. Our own experience has corroborated what he said. The testimony of the recognised authorities upon the native question at the Bloemfontein Conference, men entirely free from any interest except the sense of duty, was evidence which cannot be ignored, more especially as this evidence accorded entirely with our own experience. We were, and are, face to face with certain facts which to my mind cannot be explained away. It had always been my hope that the native labour supply of Africa would suffice to carry us over the "dead-centre" up to the time when cheaper living and better conditions would enable the use of white

labour to gradually and generally extend, and eventually to a very great extent replace coloured labour. It is clear to me now that the native labour of Africa will not suffice for this purpose of carrying us over the period which must intervene before the general conditions of this country will enable the free and more or less general use of white labour. Such a period must necessarily cover a great number of years. It is without doubt in every way regrettable that the native labour supply of Africa is not sufficient for this purpose, for the question would be simpler, the labour more easily obtained and managed, and possibly cheaper than any other, and the money paid in wages would have remained in the country; also the use of local labour would have had the great advantage of solving two questions, viz., the native question as well as the labour question. But it seems to me certain that the supply is not sufficient, and we have to consider the other alternative. The Native Labour Association was formed in 1900. I need not recapitulate what other witnesses have said on this subject. In 1899 the Boer Government by Proclamation reduced the native wages to 8d. per day or 20s. per month and enforced this wage up to the time of the British occupation. This was the condition of affairs when the mine-owners were called upon to restart the industry. At the meetings held in Cape Town it was decided that the wages were too low and they were raised to 30s., with, I think, a provision for 35s. in certain cases. That was regarded as the standard and even at that time the possibility of introducing piecework and so increasing wages by payment on results was discussed. Towards the end of 1902 piecework was introduced and under this system it was possible for any native who was willing and able to work to earn upwards of 40s. In my judgment this was an adequate wage, and, taken in conjunction with the housing, extra clothing, feeding, etc., which are provided by the mines, it can only be regarded as an ample wage. I do not approve of the later increases in wages, and stated so at the Chamber of Mines' annual meeting in February last, because it seemed to me that they would not achieve the object in view, and that we should be purchasing or attempting to purchase a temporary advantage by a permanent burden at the expense of the mines and of the whole community. There is much conflict of opinion as to what actually was the effect produced by the different rates of wage, varying from 30s. to 45s., and it is to say the least of it very much open to doubt whether the popular impression is at all near the mark. There is, however, no doubt about the last rise in wages from 45s. to 60s. It entirely failed in its object. Such extravagant rates not only failed to bring about the desired result, but actually defeated it by enabling the native to satisfy his ambition in the shortest space of time. It is no permanent solution of the question that the mines should have outbid the other industries of the country or draw out immediately for a few months an additional number of natives, who would otherwise and in the ordinary course work for a longer period or periods at some future time. It profits nothing to rob either our neighbours or the future. If we are of opinion that we cannot considerably increase the present labour supply, we must also recognise that the mining industry has no sacred right or preferent claim over the rest of Africa, and it must take its chance equally with all other employers. The proposal lately made to exclude the railway construction from competition was made on the grounds of public interest and on the assumption that the scarcity of labour was a passing difficulty, not on the grounds that the mining industry should permanently have a preferent right. If we are to accept the condition of shortage as permanent we have to recast our programme and our estimates for the whole of Africa, and it is well to see what this means in the Transvaal alone. The complement allotted for the present gold mines is 145,000 natives. It is stated that this complement is unnecessarily high. It is not economically high, but in my judgment the work can be done with a smaller number of natives, but at a proportionate sacrifice of profit. Nor, in view of other facts which are available, is this point of very great importance. The following points will show the danger of drawing hasty conclusions. On

the Rand Mines, Limited, group, the average of natives employed is about 10 per stamp; it might, therefore, be concluded that as there are about 60,000 natives on the mines, there should be no difficulty in running 6,000 stamps and so get back to the position of the industry in 1898. The answers to this are that in the first place there is no power which would compel non-milling companies to forego their right to employ native labour for the benefit of the milling companies. The suggestion is impracticable and iniquitous, and would involve shareholders and companies in ruin. The mines, as employers, have the same freedom and rights regarding the employment of labour as individuals have; they voluntarily pool the supply in order to divide it without ruinous competition upon an equitable basis. But even if it were possible to coerce non-milling companies to surrender their rights, and so allot natives for the purposes of output, an average of 10 per stamp would not produce the output. The Rand Mines, Limited, group, represent a highly selected portion of the Witwatersrand, yet even in that group there are companies requiring twice this average of natives per stamp. Moreover, the average of 10 per stamp is not maintained by choice, but under stress of necessity, and at a considerable sacrifice of economic advantages. It is quite impossible for less fortunate companies, or for the average of the Rand, to make the sacrifice which the Rand Mines, Limited, companies are able to do. The position of the industry in August, 1899, is, however, not the goal. The aim of the Commission is, I understand, to determine whether the supply of labour be sufficient, not merely for to-day, but for a reasonable time to come. It would have been sufficient for the time being to get back to the position of August, 1899, without looking for further trouble, but for the fact that the evidence seems conclusive that we shall only regain that position with great difficulty, and that there is the most slender of prospects of improving upon that position. The general position of this country to-day is not to be justified on the basis of the industry's position in August, 1899. It is only warranted on the assumption that the reasonable expectations of further development will be realised. In 1899 there were about 6,000 stamps at work. The engineers who prepared the Water Scheme estimated for 16,000 stamps. It is known that there are properties awaiting development for which the skilled labour, the machinery, and the money can easily be found, and in connection with which some £50,000,000 sterling will be spent by way of working capital as labour becomes available. The commitments of this country and the dependants upon this industry are more heavy and more numerous than they were in 1899. The whole superstructure upreared upon the industry is vastly greater than it was in 1899. Unless the base is broadened the structure must topple. It would be ridiculous to suggest that we must provide now for the development which may take place years hence, but it would be equally ridiculous to ignore developments which are necessary to justify the actual position to-day. A certain development of the main industry beyond the position of 1899 must take place, or we must adopt the logical alternative of revising the whole position of the country. In the latter case the towns' populations, Pretoria and Johannesburg, are to a great extent superfluous. The Municipal projects are not justified; the Municipal loans can offer no adequate security; the Water Scheme for the Rand will not be needed; the railways and public works lately approved of must be abandoned.

Cheap labour (which for some time to come really means coloured labour) has been the basis of South African calculation. It fixes the limit of development, and determines the pace. We must either supplement the present supply or stagnate till conditions change so much that white labour will become the cheap labour. I do not believe that anybody will be content or even able to submit to the latter course. Shareholders can wait for dividends, but men cannot wait for bread.

WITNESS: On page 3 of my statement (v. p. 178) I referred to the clothing of the natives. I do not mean to imply that we clothe the natives entirely,

but there are certain allowances made in the way of overcoats and blankets which form extras.

2,621. The CHAIRMAN: Is there anything else in regard to corrections of that kind in your statement?—Yes, on page 4 I also referred to the complement of 145,000 natives. That is for the working gold mines only; I have not included the complement for the other mines.

2,622. You mean you have excluded the coal mines?—Yes, they are employing 10,000 natives now, and of course if the gold mines get their full complement, the complement of the coal mines would have to increase proportionately, and probably run to 20,000. That would really make up a complement of 165,000, or thereabouts.

2,623. Are there any other corrections you wish to draw our attention to?—I do not think that I have mentioned what the Rand Mines' group requirements are.

2,624. We will come to that later?—Yes, well, I can make an explanation there too.

2,625. The first head of our enquiry is that of the requirements of the agricultural, mining and other industries of the Transvaal. You say in your statement that you have some farming experience?—Yes, it is not an extensive experience, but all I needed, because it corroborates all we have found out upon the mines. I have a farm down near Harismith, and, as bearing upon the available supply in the Orange River Colony and Basutoland, I may mention that I have sent three times into Basutoland to try and get 50 boys. I have got all the best introductions for the white men that went there, and I believe every assistance, and I have failed to obtain a single boy. I have been trying, also, on the spot to get them constantly for the past six months, and have succeeded in getting none except a few farm boys who have lived on neighbouring farms and have come to live on mine, or boys who lived on my farm before and who have returned.

2,626. Have you any idea what is the average number of natives the ordinary farm requires in this country?—No, I could not say that; it depends entirely upon their operations. I wanted to get about 50 for special work—for dam-making, tree-planting, etc. That was an exceptional number, but I find that in order to have 12 months' supply you have to have families resident there. You have to allow them to cultivate for themselves a certain area, which, of course, the proprietors determine entirely, both as to location and the area, and then you get the alternate weeks' work from the able-bodied males of the family.

2,627. You have stated the requirements of the gold mines on the Witwatersrand to be 145,000?—I have said it is the complement allotted to the mines by the engineers.

2,628. Can you give us any information with regard to that figure, either the total figure or the particular group which you have mentioned? How was it arrived at?—Well, it was arrived at by a committee of the engineers of all the different groups, I have got a memorandum here on the subject. I will read it. The complement originally fixed was 141,250, and that has been increased by new requirements—new companies, I believe—up to 145,000. It was arranged as originally arrived at by the consulting engineers on the basis of the needs of the gold companies of 1899 and did not include the needs of many floated companies with subscribed working capital not then actually working, like the Paarl Central, the Langlaagte Royal, the Buffelsdoorn and many others which were not considered likely to be started at once. The figure was arrived at by calculating on the basis of the work done by the number of boys employed during the period of January to May, 1899, and the number of boys that it would take to keep the full mills erected running 365 days in the year; full time. As on an average the mills only run about 330 to 340 days a year, in practice there would be something less than 145,000 required. But, as against that deduction, if you were to add the complements of those companies which were not included, the figure 145,000 would be quite low. That is to say, these

companies would make up more than the reduction due to the fewer milling days. Take what is called the Eckstein group. The full complement on the 365 days' basis is 21,033. If you reduce that by taking a 330 milling days' basis, that reduction would be more than compensated for by the increase in stamps on even three of the companies—the Bonanza, the Robinson and the Ferreira—so that complement would not be reduced, but it would actually be increased if we were to revise the calculation to-day. I may add that we have only received 9,217 out of the complement of 21,033 allotted to this group.

2,629. When was that statement prepared, may I ask?—Do you mean the complement?

2,630. The CHAIRMAN: Yes. You say if it were revised to-day, there would be an increase?—Yes; I should think this statement was prepared 18 months ago. It would certainly be increased to-day.

2,631. It was prepared some time ago at any rate?—Yes. It was the complement upon which we began to distribute natives after the war, so I should think it must be quite 18 months ago. Then we have an increase of work in half-a-dozen separate companies of that group which would involve an increase of the complement. Some companies which have started development work, such as the Robinson Central Deep (which actually started before the war), will, as they progress, of necessity increase their requirements of labour; so will others, too, so that our experience points to this, that a complement calculated to-day upon the same basis as it was calculated before would be higher than 145,000; it would be considerably higher than 145,000 natives for the Witwatersrand. Over and above that, we have, of course, companies like the Turf Mines, the City Deep, the Wolhuter Deep, the Klip Deep, the South Knights, the South Nourse, Deep, and may be many others which were floated some time ago and provided with ample funds, and they are only waiting for natives in order to start. If we started these companies I named, they would employ another 4,000 natives to begin with, say, within three months of starting, and more and more as development proceeded. Of course, you get a number of other companies which are not in as advanced a position as those and they are not being dealt with at all, simply for the reason that there is no immediate prospect of finding the labour. Even an actually floated company like the South Rand—there is absolutely nothing to prevent that company being dealt with now, except the want of labour—and the same remark applies to a great many properties extending from, say Langlaagte to the Knights, that I know of.

2,632. Is there anything you wish to say on the question of further requirements?—I mention something bearing on that in my statement.

2,633. The amount of capital which is to be expended, about £50,000,000, is not that covered by the remark you have just made?—No, I say in my statement: "It is known that there are properties awaiting development for which money can be easily found and in connection with which some £50,000,000 will be spent, as labour becomes available." That is by way of working capital. Of course that £50,000,000 is a guess. I could not myself verify more than, say, between thirty and forty millions. But then I do not know other people's business.

2,634. Have you finished under that heading?—Yes.

2,635. Well, now, take the third sub-heading of the requirements, "Used for other Industries"?—I can give you something else on that. I gave you only what is called the Eckstein group; that does not include the Rand Mines, Ltd., group. The Rand Mines' group are at present working with just a fraction under 10 natives per stamp—to be exact, 9.94. In the middle of 1899 they were working with 15.9 per stamp, say 16 then, as against 10 to-day, and they were then short of natives. We do not regard this as a sound basis—this proportion of 10 natives to a stamp. I have mentioned in my statement that the Rand Mines' group cannot be

taken as representing the average of the fields, for one thing, because I may say we had opportunities of selecting before the others did, and they were exceptionally well selected properties, and it would be quite impossible for the average of the Rand to work on the same lines as we can work. We are doing this under a severe pressure of necessity and at a very great sacrifice of economic consideration. For example, in almost every mine we have had to either abandon, or very greatly modify, the sorting, and we are running larger stopes for working rock drills, which we would not work if we could get hand drilling done, and of course that means we are sacrificing profits. That can be done when you are committed to a certain course; it is better than shutting down. It must be done for the same reason that companies which are actually started will not only work for a small profit, but they will work for no profit and even continue to work at a small loss for a long time—as experience shows all over the world—rather than abandon the thing altogether. Now we are not anywhere near the position of working at a loss, but there are companies which I could quote—and I have an intimate knowledge of them too—which would be working at a loss if they had to work on this basis, and that is the reason they have not been started. There is one company even in the Rand Mines' group which is included in that average of 10 natives per stamp, which, taken by itself, averages 18.45 natives per stamp and would be very glad to get more, and has had to make an enormous sacrifice of profit to work on the basis of 18 natives per stamp. I have nothing else to add there.

2,636. Take the third sub-heading, "Requirements of other Industries." I think you were on the Railway Commission, were you not?—Yes.

2,637. Did any information come before your notice as to the labour requirements of the railways?—Yes, a great deal. I could repeat simply what was said at the Inter-Colonial Council and something that has occurred since. The requirements were at least 40,000 natives for the new construction lines, if they were to be done by native labour, and I think more than that to complete the railways within three years.

2,638. Those are the railways to cost £5,000,000?—The railways would cost over that if you include the lines built by private enterprise, like the Fourteen Streams line and the Lobatsi. They were to be built by private enterprise subject to certain terms under which the Government could expropriate, but they were not included in the vote of £5,000,000. I should say the amount to be spent was about £7,500,000 on railways.

2,639. And that expenditure would require, if the work was to be done in three years, 40,000 natives?—You see we got several estimates. I fancy to do it in three years it would require 60,000 natives, but I am quite safe on the 40,000 point of view; they said 40,000 for the five millions voted, and then, having increased the railway vote 50 per cent., I assume that the labour requirements would bring it up to 60,000. There is another point about the railways. We had a meeting the day before yesterday with Lord Milner and the Lieutenant-Governor and the Commissioner of Railways, because the Railway Department have come to a standstill. They are 3,000 boys short of their maintenance requirements—that has nothing at all to do with the construction—and they complain that they cannot get these boys and the condition of the lines after the war and the neglect during that period is such that there will be a very great danger to life and a very great loss in traffic. In fact, they state that they must have labour. The Portuguese Government have undertaken to supply from Portuguese East Africa 1,000 boys a month, and we know from experience that this would simply mean commandeering the boys already recruited by the Native Labour Association—that is what is was in the past and what it would be again—and, even if it were not so, it would mean commandeering from the kraals,

and the effect of that is to so scare the natives that if 1,000 were taken under those conditions, you might say 1,500 or 2,000 would be lost to the place, because they would simply clear. Well, it also came up that if these 3,000 natives were not produced for the railway between 300 and 400 white men would have to be dismissed from the Railway Department, and Lord Milner insisted, and of course we quite agreed, and there can be no two opinions about it, that this is no time in which to send men out of their billets to go and look for other work if it can be avoided, so we accepted the position. We are saddled with supplying those 3,000 natives, but at present they do not demand from us more than 1,000 per month. Now that is a liability undertaken by the Native Labour Association within the last 48 hours. And the Railway Department themselves have been attempting to recruit for two or three months. They have an organisation to recruit for themselves in British South Africa, and we asked them why they wanted to go to Portuguese East Africa, where they know every boy is willing to work underground and where they know they are in direct competition with the mines, and they told us that their attempts at recruiting had been a complete failure. They have recruited in the Northern Transvaal for several months, and they have a very insignificant number. I could not say exactly what it is, but it is quite insignificant. And they have recruited in Zululand with the consent of the Natal Government, but they are limited to 6,000 all told. They have not got the 6,000 and the Natal Government have complained within the last week that the competition is too severe and they themselves are not getting the labour from Zululand. Everybody knows that the Zulus do not work underground in the mines. There are a certain number who come here voluntarily to do surface work, garden work, stable boys, house boys, but nothing more. With reference to Zululand I might mention, too, that apart from what our railways will require for construction, if we build the Wilge River line it means the Natal Government have got to double their line or build an alternative route. Now, where are they going to get the labour from? They state that they cannot get enough for themselves now, before they contemplate that second route. Sir Percy Girouard told me the day before yesterday that they were complaining about this competition in Zululand. Now there you have got, I believe, 600,000 natives.

2,640. You mean in Zululand and Natal?—No, 800,000 in the two places.

2,641. 750,000, I think?—Well, you have got over half-a-million in Zululand, and our railways are limited to 6,000 all told. They cannot get them and the Natal people and the Government are complaining of the competition already. It does not look promising for the further requirements.

2,642. Now, the next main heading of your statement is the available supply. You state that before the war there was a shortage for the mines?—Yes, there was a shortage. It was acute at times and at other times it was not.

2,643. When the Chamber of Mines' witnesses come before us, they will give us figures about that?—Yes. I think I remember only one period when we felt happy because there promised to be a surplus of labour, but I do not think that it lasted more than a month or two, otherwise we were always casting around for a way to increase the supply. But I do not want to suggest that it was as acute as we feel it now. It was never anything like this.

2,644. I understand that you are acquainted with the steps that were taken during the war in Cape Town to form the Witwatersrand Native Labour Association?—Yes, a good deal.

2,645. You have been connected with it since then—1900?—Yes, I was very ill at the time and did not attend regularly, but I had a great deal to do with the formation of the Native Labour Association. Of course, there may be things which

other members will remember, and which I did not know about at all, owing to illness and absence, but I have a pretty clear idea of what happened while I was there.

2,646. It was at that time when the much discussed question of the rate of wages to be paid was settled?—Yes, that is the time when we arranged the question of wages. We did not decrease them.

2,647. What do you mean by that?—We never lowered the wages.

2,648. You surely lowered the wages, did you not, as against the wages before the war?—Yes, certainly, but not as against the wages then being paid. Wages were then 20s. a month—8d. per shift. This rate was fixed by proclamation by the Boer Government in October, 1899, and the natives worked at that rate up to the time of the British occupation, and after that under the British military authorities. That lasted for a year, and towards the end of 1900 we were told that the military authorities did not favour, and did not consider it necessary, to make any change, but we thought in Cape Town—and I remember discussing it very frequently with Mr. Strange—that we could not expect the natives to continue satisfied on the 20s. wage. It was understood that there were a very considerable number of natives here, some working on the mines, and a great many taken over by the military. Well, we fixed the minimum wage at 30s., and the maximum at 35s., and even then discussed the piece-work system which would enable a boy, on payment by results, to earn upwards of 40s., probably a good deal more; but the piece-work system was not actually introduced for a very considerable time after that—two years, I think.

2,649. The Chamber of Mines raised the rate of wages to 45s. at some subsequent period?—Yes, I think about the middle of January this year, but they introduced the piece-work system, if my memory serves me well, about October or September of last year.

2,650. Were you in favour of that increase?—No.

2,651. You were opposed to it?—Yes. I think I was the only member of the Chamber of Mines who was opposed to it. I wanted to stick to the piece-work system. Perhaps one other member agreed with me.

2,652. There was a subsequent increase to 60s. You were opposed to that?—Yes. I opposed the 45s. increase for this reason. There was a tremendous demand in and about the town for labour. We made every appeal we could to private employers, householders, the military, the Municipality, and to the contractors and builders, and asked these employers to be reasonable and patient, reminding them that there were only a certain number of boys and they were competing on the spot, one against the other, for those already here, and it did not add a single boy to the number. We urged that we must all wait a little bit until a better supply came in, and in the meantime divide up what we had and try and make it go round; but they would not do that. Then we made up our minds that the only thing before us was to go ahead as fast as we could bringing in boys and fill up the town, and, as soon as the requirements of the individual and contractor were met, we would begin to get the benefit of our organisation, and possibly find a flow of voluntary boys, the surplus of the town, coming on to the mines. You see the contractors were then paying as much as £6 per month. They were giving them 30s. a week. Well, the mines could not possibly compete with that, and we watched the numbers pretty closely and reckoned that about the end of December of that year, according to the increase which was apparent for each month, and on our judgment of the requirements of the place, the town would be about full up; and that was what actually occurred. At the end of December, I think, for the first time—I am speaking from memory—there were from 1,000 to 1,500 with

passes to look for work, and I strongly opposed that increase of wages, and I am just as convinced to-day that it was wrong; that we ought to have stuck to the piece-work, at any rate to have tested it for another month or two to see the result of the overflow. However, it was not a very big increase, and it is not that increase that I think so unwise, but the later increase to 60s. This last increase was, I think, simply due to the pressure from outside, and the belief amongst mining people that they had to do something—to give some convincing proof—that they were trying their utmost to draw the available natives out of Africa. Personally I should not have done that. I think the right course before making any such increase would have been to take every possible pains and steps to explain to the public what our position was, and then simply ask them to come in and consider with us whether we ought to spring another 15s. a month on the 50,000 boys we had, on the off-chance of getting a few thousands more. We were promised 20,000 to 25,000 natives out of Basutoland if we would raise the wages to £3 per month. We raised the wages 15s. a month (i.e., up to £3), and I do not think that I exaggerate when I say we got nothing for it. I do not believe that we are getting any more than we were before. The reply from the Agency, a very powerful Agency in Basutoland—the most powerful that you could get—was this, "To boil it all down, there are three employers for every native available;" that is the exact expression, and that agrees entirely with my own experience on the Basuto border. I was willing to pay 50s. a month for boys to do farm work and a £1 premium for every boy delivered who would work four months, and I did not get one. About the increase in wages, I might mention another thing. Before we raised the wages the first time this year, we were told that the boys would not work for those wages, but the stream from the East Coast has gone on steadily and the curious thing is that the East Coast boys used not to be recruited upon any definite rate. Previously the rate of wages was never mentioned at all; natives were simply recruited for labour at current rates, and they never got a wage ticket until they came in contact with our people upon the Transvaal border. They came to work and never asked what the rate of wages was, so one would suppose that they came up to the Transvaal, under, shall I say, misapprehension; that is to say, they thought they were going to get the same rate of wage as they got before the war, and found when they got here that they were only getting 35s. Well, you would expect a reaction, when those boys began to go back home again at the end of last year. We were all warned that as soon as they got back they would spread the news amongst their friends and that we would never get another native. But what is the result? The supply has been increasing ever since. There is no evidence that either decrease or increase of wages had any influence on the East Coast. It is only from the East Coast that we have got any labour worth mentioning. It has given us about 90 per cent. of our supply. The natives who were nearer the spot—in British territory—and who know all about the increase in wages still do not come forward. You cannot say they stayed away because of the low wages, for now, when wages are higher than ever, they still do not come to the mines.

2,653. Do you wish the Commission to understand that in your opinion the rate of wages does not materially affect the supply of natives?—Within reasonable limits, yes. I do not think £1 a month would be enough, that is why I objected to it myself, but I think round about the 40s. level is the right wage—a very adequate wage—and that the increase to 60s. was not only unnecessary and useless, but it is mischievous. I have had very nearly 20 years' experience of working with the natives, and my own experience of the ordinary native labourer is that the quicker they can earn the money—the bigger the sum you give them—the sooner they go. If they get £3 a month, they may spend a little bit more than if they got £2 a month, but they will certainly work a shorter period. What the native has in mind is a certain

sum to go home with, and he will go away sooner and stay away longer if he can get that sum in a shorter period.

2,654. Mr. QUINN: If it will be agreeable to you, Sir Percy, I will take your statement, and ask the questions I wish to ask in the order there. We got the statement rather late to ask questions, but we will do the best we can.—Certainly.

2,655. Would it be right to say that the Witwatersrand Native Labour Association is really managed by the Chamber of Mines, or is it managed separately?—It has entirely different functions, but, for its particular duties, it is practically the same body. The personnel is the same.

2,656. On the second paragraph of the first page of your statement you state: "The shortage of native labour was felt intermittently before the war. It might, indeed, be said that there was a constant shortage." I understand you have qualified that somewhat since; that there were times when you had enough boys?—I said that there was one time. I can only remember once when we began to feel happy about it, and felt that we were going to get our turn.

2,657. In 1897, in your evidence before the Industrial Commission, in reply to a question asked by Mr. Brakhan, you said you had enough?—It is quite possible.

2,658. Then there was another question as regards coloured labour which was to the effect, "I understand you to say that there is no want of black labour at the present moment." And the reply was, "Not at present." So I think it is fair to take it that in 1897 we had enough labour for the mines?—You must take it just exactly as I said it. I said, "At the present moment." I cannot remember to-day the conditions at various periods. I abide by the evidence that I gave.

2,659. You speak in this statement also of yours of the unremitting and searching tests of the African supply. Are those unremitting and searching tests going on still, and is there no slackening?—Oh, yes! None whatever.

2,660. Can you tell us how often before in the industry has an attempt been made to reduce the rate of wages?—I think it was done twice.

2,661. What were the results?—As well as I remember, it was done perfectly easily. Or do you mean, Was there an economy?

2,662. No, did you not have to go back to the old rate of pay?—No; we did not raise it, but it became gradually raised—as well as I recollect—by competition among ourselves, for the want of this very organization, the Native Labour Association.

2,663. Would I not be correct in saying that when an attempt was made to reduce it, you had to go back to the old rate?—No, in fact it was always thrown in our teeth when we protested against raising the wages, that we could easily reduce them again, as we had twice before successfully reduced the rate of wages and no ill-effects had followed. You must understand this, that the necessity for the reduction in the rate of wages arose from the fact that there was competition among ourselves and that little by little one employer bid against another until finally the average became too high and the whole industry took it in hand and tried again to make a fresh start. That is my recollection of it, and that was what prompted us to form the Native Labour Association. You see we could not pool the supply, so we pooled the demand. The employers agreed to divide the supply among themselves, that is, what they could get. There was no monopoly of the supply. When I said the Native Labour Association and the Chamber of Mines were practically the same, you understand, of course, that they have got different duties. The Association has nothing to do with the rate of wages, for instance.

2,664. I am anxious to show if I can that when there was a sufficiency of boys here on two occasions at least, there has been an attempt to cut down

wages with the result that there has been a shortage?—No, it did not appear to affect the supply at all.

2,665. In answer to Mr. Hugo, page 47, of this Industrial Report, you are reported to state, "As regards the black labour an arrangement was come to last week whereby it was agreed to reduce the wage by 30 per cent." This is a statement put down to you here. You proposed at that time to reduce it by 30 per cent.?—Yes; and you have just quoted my evidence that there was an ample supply after this.

2,666. In the third paragraph of the first page of your statement, you say, "Firstly, our experience has shown us that the available labour supply is nothing like what we thought it was; secondly, the demands on that supply have increased beyond all expectations." That you have already explained?—Partly.

2,667. Would you like to add to that anything further than what you have given to the Chairman?—Well, I have explained in the statement than what was really a very great shock to me was to find that this supposed enormous reservoir in Central South Africa was not available.

2,668. What proof have you of that?—The proof of our experience. I suppose I estimated it rather loosely and took it for granted in just the same way as others, including the late Mr. Rhodes, did, and perhaps I was influenced by Mr. Rhodes' assumption that there was an enormous supply up there. I several times discussed with him the possibility of pushing on this Cape to Cairo railway with the object of opening up the labour supply. I thought it would help the development of the north, of course, to have that railway, but that it would also greatly help us to have the labour supply. I also discussed other things like making an arrangement with the Portuguese companies on the East coast by paying them a round sum per annum—the sum suggested was £100,000 per year—if we could get the labour supply. I was confident, and he was confident, too, that the natives existed there and would be available. One of the first blows to that theory was Mr. Grogan's book, wherein he explained that the labour was not available really; and then Mr. Chamberlain, coming straight from the Central Provinces, stated repeatedly and positively the same thing, that they were complaining there of a shortage, and that there was really no prospect of getting this labour. Whether it is there or not, one thing appears to be certain, that we were not going to get it. A year ago no one here knew that, but it is clear to us to-day.

2,669. I admit the force of all that, but there is a good deal of the opinion about this statement of yours after all?—I understood that you asked for my opinion. I did not volunteer it. Well, this is my opinion based on all the evidence that I can get.

2,670. I have a great respect for your opinion, Sir, but three months ago your views were opposed to what they are to-day, and I am trying to find out good reasons for this change?—That is exactly what I am giving you—the evidence as it became available, the facts as I got them.

2,671. When I find a gentleman like you coming right round from one end of the stick to the other, so to speak, I want to know the reason of it?—You are not quite right there; but no matter. I have told you two of the reasons, but I will go over it again. I started with and clung to the belief that we had an unlimited supply in Central Africa if we chose to extend our organization and incur the extra expense; other people of great experience shared the same belief. I have told you that later on I got the experience of men like Mr. Grogan, who have been there and know the real truth. Then the next thing, Mr. Chamberlain's statement, which represented the evidence of Central Africa and the views of the Imperial Government. Then, coming to South Africa here, I was very largely influenced by the statements of the gentlemen at the Bloemfontein Conference. At the time that the Bloemfontein Conference

took place, of course I knew nothing. I did not know that the labour supply was going to be considered. Afterwards I heard the opinions given by Mr. Moor, Sir Godfrey Lagden and Colonel Stanford.

2,672. Sir Godfrey Lagden said here that he was struck by the absence of facts and figures when he arrived at that Bloemfontein Conference. I think you yourself, Sir, or someone else in the Legislative Assembly, have since called for them?—Yes. I wanted them to check the opinions expressed, but I also tested their opinions by our own experience. I mean, for instance, Mr. Moor's opinion agreed with our own experience and the experience of the collieries in Natal, who are employing Indians, because they cannot get natives; and the experience of the docks in Natal, where they have raised the wages to, I think, 4s. or 3s. 6d.; and the experience of farmers in Natal; and the refusal to allow us to recruit in Zululand; and the failure of the C.S.A.R. to get natives there. Without corroborative evidence, I should not have attached the same importance to the "ipse dixit" of Mr. Moor. I do not even know Mr. Moor. And so of the others too! But after all they are the highest authorities on the subject in the country, and our experience since then supports their view. I cannot see how one can resist it all.

2,673. With regard to the railways, you are still of the same opinion that you were some time ago, that it would be wise to make an effort to use white labour on the railways, instead of the natives?—Oh, certainly. Of course there is a limit to which you can do it. We tried white labour, and our statistics show that it was a failure, but we are still using a much bigger proportion of white labour than before the war. It should be tried on the railways, but to what extent it can be done I do not know. It must be either a sound principle or a legitimate sacrifice.

2,674. The main argument you use is, What is to become of these people afterwards?—I would not advocate employing 40,000 unskilled whites who would be turned loose at the end of three years on this community.

2,675. Is it fair to say they would be turned loose? Would there not be more development where this labour could be utilised?—We have not enough money to pay for the present development, as we are doing some by private enterprise, and I do not know how we can expect more unless we get more native labour.

2,676. What we have got to-day is surely no criterion of what we can yet. I understood you to say that we can easily get £50,000,000 for development, and surely this would enable us to pay a little more possibly for white labour if we use it?—You have got the cart before the horse. The £50,000,000 depends upon the native labour supply. That money will be spent on the development of the mines. Unless we get cheap labour the mines cannot be developed, and the 50 millions will not be forthcoming, and we will not need these railways. Of course if we had the native labour supply to justify the expenditure of the £50,000,000 it follows that we would also have it available for railways.

2,677. My point was this, if you could free an immense amount of native labour now being used by the railway people and put it on to the mines—if you were successful in getting more native labour—you would be able to get that £50,000,000 spent in the country for railway lines and other public works?—I did not refer to railways and public works. I referred to 50 millions for the mining industry. You say the "immense amount of labour employed by the railways?"

2,678. Yes?—Do you know what they have now?

2,679. I know what you said some time ago.—I quoted their figures some time ago as 18,500. I asked Sir Percy Girouard the other day, and he said that they had got about 18,000 all told, 15,000 on maintenance and 3,000 on construction. So far they had failed to get the 10,000 for construction

which were agreed to under a compromise with the mines. They have got 3,000 of them. They have now 18,000 all told in the two Colonies. So that if you took every boy off the railways to-day and put them on to the mines, it would bring the supply up to less than 80,000 out of the 145,000 immediately required.

2,680. Now I understand that you cannot extend the use of white labour on the mines beyond what it is now—I mean the Rand Mines?—Certainly not.

2,681. In this speech you made on the 25th March, I understand you stated that the cost of production of a sovereign's worth of gold was 11s. 10d. in 1899, and in 1902 it was 13s. 8d. Is that a fair margin of profit? It is a profit of about 43 per cent. on the production of the pound's worth of gold and should allow of the further use of white labour on the mines?—Is that the Rand Mines, Ltd.?

2,682. Yes, I am speaking of the Rand Mines, Ltd. If I could get a sovereign for what has cost me 13s. 8d. I should be well satisfied?—That is only working costs. There are millions of invested capital to be taken into account, actual cash subscribed and spent.

2,683. I am taking capital into account?—Oh, no. Nothing of the sort. You have only taken working costs and allowed no return whatever on the millions of cash spent in working capital—apart from the value and cost of the claims.

2,684. What would be the interest on the capital required in the production of a sovereign's worth of gold?—That varies in different companies. No one could answer a question like that.

2,685. What I want to get at is what amount would, with the interest on the capital included, be required to produce a sovereign's worth of gold?—That does not appear. Interest on capital is never charged in working costs. When we say working costs, we mean working costs!

2,686. If it does not appear in the 13s. 8d., what does it mean?—It means that that is the working cost of winning £1 worth of gold. I cannot tell you the total capital of a dozen companies offhand, and the interest to be allowed on it. You do not even quote a rate. I will work it all out for you if you tell me what you want.

2,687. Perhaps the Chamber of Mines could do so?—I think I see what you are after; you had much better take it on averages—say the average of the best companies in the best year. You can take it this way. In 1898 there were 40 companies which paid dividends. The capitalised value of these 40 companies was, I think, 70 millions, and the dividends paid amounted to under five millions. The amount invested in cash as working capital was nearly 40 millions. Therefore, the profit paid on the capital as it stood at that period was about 7½ per cent., not 46 per cent., as you said just now.

2,688. Very interesting, but it will not help me much because so many of these companies are so very much over-capitalised.—But even if that were true it has no bearing upon the 40 millions of cash invested. Leave out all questions of capital and only take the cash spent. Leave out the value of the claims even for the present.

2,689. There is one mine which is over-capitalised beyond all decency. If you add the dividend to the capital the picture is not a proper one at all?—Of course, naturally, and like every other critic you take an extraordinary case. They are the attractive ones. You talk of a company being over-capitalised. Now, why not take the results of the 40 companies I have quoted in the last complete year of working, 1898. It is an average based on the best that the industry has ever done. Would it not be better for the purpose of criticism to keep these figures in mind? They ought to suit your purpose, surely. But, if you prefer it and will tell me what you want, I can get you the figures as they apply to the Rand Mines group.

2,690. I prefer to deal with the figures of the Rand Mines separately. I want to know what a pound's

worth of gold really costs to produce, and I want to know what interest the Rand Mines pay?—You have just quoted from my last annual address the cost of £1 worth of gold. I really do not understand your questions about interest.

2,691. What dividend did they pay?—The Rand Mines Corporation? I am afraid you do not understand the position at all. The Rand Mines, Ltd., is a proprietary company. It is not a working company at all. It has never turned out a single ounce of gold. So the question has nothing to do with the Rand Mines, Ltd. The Rand Mines, Ltd., is the manager of and shareholder in certain subsidiary companies. These produce the gold. It is their results that you want to get. The capitals and the conditions of these companies vary, but their business is the same. They are not trying to produce a sovereign's worth of gold at the cost of a sovereign. Their business is to produce it at as low a cost as possible.

2,692. I want to deal with the Rand Mines Company. I see by the report that they made a profit of £337,000. Well, then, £337,000 would presumably be the estimated proportion which the subsidiary companies paid to their shareholders. Then it was paying a fair average—the shareholders received so much and the mine managers received so much?—I cannot follow you at all. I have told you that the Rand Mines, Ltd., is simply a shareholder in the other companies and draws its share of dividends according to its shareholding. Let me give you an example. I am a shareholder in the Geldenhuis Deep and so is the Rand Mines, Ltd., but unfortunately they draw a larger profit than I do because they own more shares.

2,693. This is a misfortune. Are the costs of mining higher here than in America? You remember Mr. Hall's evidence before the Industrial Commission, in which he pointed out the very great advantages the mines in this part of the world have in comparison with the mines of America. He speaks of fuel being cheaper, of the conditions of work in the mines being better, and he quotes a lot to show how much better it ought to be to work here than in America. He goes on to say that in addition to these advantages you have cheap native labour and many other things which appear to show up the comparison of mining in the two countries to the detriment of mining in America. Is that so, and is it a fact that these mines should be worked cheaper than the mines of America, for the reasons given?—I have had no practical experience with America, but I know we have had the best brains of America here, including Mr. Hall's, to teach us, and if they ought to work cheaper here than in America—and they don't do so—it is not easy to see what stops them.

2,694. The point is that they use only white labour there, and yet they go ahead?—They are equally free to use it here.

2,695. Yes, but they can use it there with all the disadvantages that here you do not have to suffer under. How is it that it will not pay under the same conditions here?—Did you not enumerate amongst the advantages here the use of Kaffir labour?

2,696. Well, it is an advantage we have over America. And you suggest that it would improve things if we were to forego that advantage? How is it we cannot use a greater amount of white labour here, and when the native labour fails, have to get labour from somewhere else?—I cannot tell you, Mr. Quinn, because I have never been in America. We have managers here who have worked with white labour all their lives, and there is no reason why they should not use it here. There is absolutely nothing to prevent us using white labour here; there are no restrictions. So far as we are concerned, that is, speaking for the employers—the mineowners and directors of companies—as a matter of business anything which would reduce the cost of the work would be considered an improvement. Of course, the only reason why white labour is not used as you suggest is the cost of it.

2,697. They are free to do that if they think they can make the thing pay?—Absolutely free.

2,698. It is said that there are other reasons and that the mine-owners will not allow it?—It is absolutely untrue. I need not go further than to point out the efforts we made in the past year to employ white men.

2,699. Now, touching on the question of native population for a moment, I think you will admit that there is no reliable data obtainable?—Yes, I do not go very much on the figures given.

2,700. You admit that all sorts of guesswork figures are given?—Yes. Both ways.

2,701. I believe you know that before the war many efforts were made to form an estimate of the Boer population, but it was found out afterwards, and the discovery was one which some of us had reason to remember, they were greatly in excess of the estimate provided before the war. Now, if we could not arrive at an estimate of the Dutch population, we may be equally far out in all these opinions in regard to the native population?—Quite so. I agree with you; you mean that the statistics are not a guide. The real thing in both cases is the number who turn out.

2,702. I do not mean that; I mean that there are no statistics of the kind in the Transvaal. But the authorities have elected to go by an expert or his opinion. You refer to the shortage of natives in Zululand. Would it not be more correct to say that they refuse to work; that the numbers are there, but they will not come out and work?—It is quite possible, Mr. Quinn.

2,703. With that huge number of natives and so few at work, would it not be right to say that there are a number of natives who refuse to work?—It is my opinion that they will not work. It is so with certain tribes and in certain parts, and so I consider statistics of population to be most misleading. In justice to the people of Natal, we must bear this in mind that they state that their natives do really work, probably on their own places. It is not so much a question of want of numbers in Natal, as want of will, that is, amongst the Zulus. Rhodesia is greatly in need of labour, and has been so for a long time. Natal imports it largely; Cape Colony wants cheaper imported labour; and some of us have come to the conclusion that we want it here.

2,704. What is to be the result of it if all these Colonies are to be free to import large numbers of coloured labourers from various parts of the world? What is to be the result to this country in 10 years? Rhodesia already wants to import labour; Natal is already doing it; Cape Colony is crying out for it; and now the Transvaal wants it?—Of course, I think the policy of importing Asiatics and turning them loose to trade and compete with the white man, as they do in Natal, would be a disastrous policy.

2,705. But there they were supposed to come out under strict indentures?—Under strict indentures for a certain time of service, and then they were free Indians. I do not suppose that there will be many people who will submit to that here; at least I hope not.

2,706. It is interesting to me to know what chance the poor white man will have by and by. You will have every Colony—

2,707. The CHAIRMAN: Is not this trespassing beyond our province?

2,708. Mr. QUINN: Oh, we often get a little beyond it, Mr. Chairman.

Sir PERCY FITZPATRICK: I do not wish to proceed beyond the line of reference, but if anything of this nature comes up, I am quite prepared to deal with it.

2,709. The CHAIRMAN: I think we had better stick to the industries of Central or Southern Africa.

2,710. Mr. QUINN: Before this decision was taken to raise the wages for the first time, I understood you to say, Sir Percy, that you raised the wages when you came back, to 30s.?—I said that

our action in Cape Town in 1900 was in the way of raising, and not reducing, the wages, but I do not want to emphasise that point. The responsibility of fixing the rate of wage rests with us, of course.

2,711. It was a reduction on the wages prior to the war?—Undoubtedly.

2,712. Was the opinion of experts taken on the question, that of Mr. Mello Breyner and Mr. Wirth—were they asked as to the reduction of wages on an empty market; were they consulted?—I do not know. Our opinions as to who are experts might differ. We discussed this question when we made the previous reduction, and had the opinion of those who were considered to be experts in the matter, so I am pretty sure that we discussed it with competent advisers on this occasion too.

2,713. Mr. Mello Breyner was asked his opinion on the matter, and he said he had given his advice against. Mr. Wirth said the same.—Well, you see, in every business there are divergent interests represented. Now, if a man has only to find natives to make a profit out of mines, he will not be likely to take any risk in the way of reducing wages. It would not matter to him how high the rate of wages was. At that time, I think, these gentlemen had been managing the East Coast supply, and had a sort of concession for it. Of course they would not risk damaging their business. It would naturally appear good business to them, as it would appear to me if I were in the same position, to let the mines pay any rate of wages as long as they profited. I do not want to disparage their view, but it was a different view from ours. We had to consider not only the numbers that we could get, but also the costs.

2,714. All I want to know is if they were asked?—I could not say.

2,715. With regard to this number, on page 4 of your statement, where you say the complement allotted for the present mines is 145,000 natives, do I understand you to mean that that estimate was made from the numbers of boys working from January to May, 1899? I think you stated that?—January to May, 1899, is right, but the estimate is not on the numbers alone, but on the work done too.

2,716. Do you think it is likely that anyone will accept as reasonable a statement of figures based on a period eighteen months ago when mining companies had to take 15 boys per stamp as against 10 now. Is it a fair basis, or calculation, for that period? Why was not the calculation based on the efficiency now under the changed conditions shewn by these figures? Instead of shewing us 145,000 as being the number required, it shews an enormous number less?—I do not quite know how they could get at a basis unless they took the actual results. You see they have taken the actual working results. It is not guesswork or estimating.

2,717. In the pre-war days were not a large number unable to work through the effects of drink? Was it not about 30 per cent.?—If I remember rightly, it is in my evidence. It was not that there were constantly 30 per cent. My experience shewed that it was at times about 30 per cent. on Mondays or Tuesdays on certain mines, but I could not tell what the average loss was.

2,718. The Rand Mines are managed now with 10 boys per stamp, so if they had 150,000 boys on the mines before the war, they could do the work easy now with 100,000?—You mean the whole industry?

2,719. No, I am talking of the Rand Mines. We have not the figures of the industry before us. In the meantime, we have the facts that before the war the Rand Mines required 15 boys per stamp, and now they are managed with 10 boys per stamp. Why, then, was this, a calculation of the immediate requirements numbering 145,000, based on the pre-war standard of efficiency, as against the present one?—The reason was that the engineers had no prophetic instinct. They made this calculation 18 months ago, and did not then know what was going to happen to-day.

2,270. It did not require any of their prophetic instinct to give us the statement this morning based on conditions that existed four years ago?—Have they given you such a statement?

2,721. I understand they have?—I have not seen one nor heard of one.

2,722. This question of the 145,000 natives is a very important point, and I must understand it. It is calculated on the standard of efficiency before the war, and it is, admittedly, far below what it is to-day?—The efficiency of the natives you mean?

2,723. You are using 10 boys to-day where you were using 15 before the war. Why was not the statement of the immediate requirements based on the efficiency of the present time instead of 1899?—For one reason, because it would be wholly incorrect. Take the requirements of the Rand Mines' group. They are as the engineers recommend. They are actually 2,000 more than they were estimated to be 18 months ago. If you want the estimate revised up to date, you could increase the figures given by 2,000.

2,724. Am I right in saying you manage with 10 boys where you originally had 15?—No; what do you mean by managing with 10 boys per stamp? We are not managing profitably, but going behind in our development and contributing nothing towards the expansion on which the whole future of this place is based. Leaving all that out, we are going on, sir, from day to day with 10 boys per stamp where formerly we were able to do our business much more profitably, and to do it all, or nearly all, with 16 boys per stamp.

2,725. Let us for a moment leave profit out of the question—if that is possible—and suppose the same kind of work is being done to-day, and the same kind of development as was done on the Rand Mines before the war, the subsidy we are getting is being used to keep the stamps continually running. How many boys do we require for the Rand Mines, that is leaving out the question of profit?—I could not contemplate such a condition. It is a commercial undertaking, and if I were to discuss such a thing I should expect to be out of the Chairmanship of the Rand Mines to-morrow. I really cannot tell you, Mr. Quinn—I cannot possibly work out how many natives and what reduction would bring us down to the level of working at no profit at all.

2,726. 145,000 boys is the number required now. Then you state that these figures are based on the work done by the natives before the war from January to the middle of the year 1899?—Yes.

2,727. It is admitted by everybody to have been a time when the efficiency was far below what it is to-day. I will content myself with that for the present?—145,000 is quite a wrong figure to put in; I do not think, moreover, that this great efficiency is admitted by everybody. The other day, for instance, the manager of one of the biggest concerns here, after receiving a number of fresh natives who had come down from the Upper East Coast, said: "For Heaven's sake, give us chimpanzees or something that will learn!" He could not teach them anything—not even how to hold a pick, or that it would be cold again at night, so they sold their overcoats when the sun warmed them. He was helpless for a considerable time. We have also more piccanins now than we used to have. We do not get the same class as before, but it is quite possible that the general efficiency, owing to the stopping of the drink, is greater.

2,728. All these questions only prove that we ought to have had a proper estimate put in with this evidence. There is no getting at what one wants. Statements are made in this evidence of yours which are not supported by figures?—What figures do you want? It is the estimate of the engineers of the Rand that 145,000 was the number required, and this was worked out by the whole of the engineers sitting in conference on the basis of actual results.

2,729. Eighteen months ago?—Yes. This is the basis of our labour distribution on which we have worked for 18 months, and on which we continue to distribute our labour.

2,730. Based on figures of efficiency four years ago?—Based on the latest and fullest records of work available.

2,731. Do you think that is a reasonable statement to put in of a calculation made four years ago?—I am not putting it in as a statement, and do not understand what you are complaining about. You ask for the figures on which we base our labour distribution, I gave them to you. They have been our guide for 18 months and are so still. If you do not like them you can form your own judgment.

2,732. Unfortunately, I cannot.—Well, you eliminated the question of profit from gold mining just now, and having done that it becomes a simple matter to tell us what we ought to do with our labour.

2,733. Taking your other opinion about the number of natives which would be required for the coal mines you consider that at present about 10,000 are employed on the coal mines?—Yes, I believe that is about the figure. If we were to have the full number of boys employed, we would, probably, require another 10,000.

2,734. That is a pure guess?—Yes, a mere guess. I do not attach any importance to it. If you double the native labour employed on the gold mines, and so double their work, you would probably have to double the natives who supply the coal for the gold mines; but you can make whatever allowance you like on that.

2,735. Suppose we had 145,000 boys on the mines to-day, could you give them all work?—Yes, and as many more.

2,736. Can you find water for all the men to-day?—Yes, certainly. There is nothing—absolutely nothing—in the water supply to prevent a much larger number of boys being employed than you have mentioned.

2,737. Mr. WHITESIDE: Sir Percy, you tell us on page 2 of your statement that Rhodesia has been for years complaining of shortage, and appealing for indentured Indians. We have had a witness who told us that boys are coming freely from Tete without any recruiting?—It is quite possible. How many are there coming?

2,738. I have not got the exact figures, but I understand that country is very thickly populated, and they are coming in considerable numbers. Another witness informed us that we could get all the labour we wanted.—I am not a witness on Rhodesia, but I can quote you the statement of the Chamber of Mines and representative men there which are all to the opposite effect. A little time ago when we were negotiating with regard to this native labour supply and Rhodesian people wanted to get from us a certain proportion of natives to supplement their supply, it was very necessary from their point of view to show that they were not being well treated by us, and were not deriving any benefit from our source of supply—in fact that what labour they had came from their own sources. Nevertheless under cross-examination it came out that of the 12,000 natives in the employment of the mines only 3,000 came from Rhodesia and 9,000 from our territories. That does not look like being able to get all they wanted there.

2,739. You go on in the next sentence to say that you cannot expect very much more from the East Coast. Now, that, in my opinion, is directly in contradiction of the evidence we have been receiving before the Commission. Practically every witness who has given evidence before this Commission says that there are plenty of labourers available?—Before you pass that point I may say that as far as I am concerned I cannot vouch for the evidence of other witnesses; but tell me this, if the labour is available, why is it not forthcoming?

2,740. The evidence goes to show that there has not been sufficient time to get the labour?—I have

not read the evidence, as I have not had time, and I do not know who are the witnesses you refer to. Were they gentlemen of experience on the East Coast?

2,741. Yes, Mr. Breyner and Mr. Wirth.—You do surprise me. Why, these very gentlemen used to be the agents for the supply of labour. If it was so plentiful, why did they not get it out before?

2,742. I understand it is available; so far as the northern territory is concerned, they consider that it will take time and money, but the labour can be had.—The money is not wanting; we have not stinted anything of that sort. There are plenty of funds available for any reasonable expenses in connection with these matters, and we have certainly given time to it. The complaint against us has been the length of time spent without getting much to show for it. Moreover, these gentlemen have been at it themselves many years—years before the war.

2,743. Further down you tell us that we are face to face with certain facts which to your mind cannot be explained away. Is there anything further in connection with that you would like to tell us?—I believe you had the statement of Colonel Stanford?

2,744. Not yet.—I understood that it had been made public. You have had the evidence of Sir Godfrey Lagden. We are face to face with this fact, that the recognised experts—that is the official heads of the Native Labour Department in the four Colonies, state that there is not sufficient native labour available. That is their deliberate opinion. Many of the facts which support that opinion have been published or given in evidence here. I have already given you many others—several times over. I have shown how we have fared in Basutoland, and what the C.S.A.R. have experienced there, also in Natal, Zululand, Rhodesia, Transvaal—shortage and failure everywhere. You have the Cape Town Docks, where from Colonel Stanford's statement they cannot obtain sufficient native labour although they offer 4s. 6d. per day. You have the Western Province Fruit Growers' Association, Cape Colony, appealing for imported cheap labour, as both native labour and the proposed Italian substitute have failed. You have heard of a meeting under the presidency of Mr. Merriman of these Cape farmers—Bondsmen—at which it was resolved that cheap labour of some kind must be provided. It was pointed out that this would cover Chinese, and the reply which was accepted by the meeting as satisfactory was that although the resolution covered any kind of labour the selection would rest with the Secretary of the Agricultural Department, who was a very good man.

2,745. We have had evidence to show that there are something like 80,000 available from Portuguese territory, and that it is possible to get 60,000 from the northern territory, making a total of, say, 140,000; and, as far as I can gather, the requirements of the mines are about 145,000?—Do I understand you to say that these are available in addition to those we have, or are our present lot included in the 140,000 that you quote?

2,746. That estimate includes all.—And we have got, roughly, 49,000 at present from the East Coast, so that there are about 100,000 available who are not coming out.

2,747. Something like that, according to the evidence we have been receiving from witnesses from that territory?—Well, they may exist, I cannot prove a negative, but if they are available, why do they not come out. As I submitted to Mr. Quinn, it is not merely a question of population, it is a question of willingness to come out, and in view of our extraordinary efforts and our failure to get them out, I cannot see how anyone can say there are 100,000 there willing and able to come out.

2,748. Right throughout your statement you state in different places that the supply is not sufficient, and you say on page 5 that the aim of the

Commission is to determine whether the supply of labour is sufficient, not merely for to-day, but for a reasonable time to come. When you say it is not sufficient, do you not think you are pre-judging the position?—I understood the whole object of calling me as a witness was that I should give my evidence and opinion on this point. I am here for the very purpose of saying whether there is or is not sufficient labour. You believe me or you do not. I give you my convictions, but, whilst I think it unnecessary to go into the question of what the requirements may be many years hence, I also feel that we must take cognizance of some probable and immediate expansion. The position of the industry in the past is not our ultimate goal. This was my point, Mr. Chairman, that it is not sufficient to show that we may get enough labour to do the work which we did in 1899 and shut our eyes to everything else. Restoration to that position as a finality will not suffice to carry this country on as it should and must go. That is why I asked what the Commission aims at.

2,749. I take it, Sir, that this is not the proper time to express our opinion; we take the evidence and give our opinion later. Will you tell us in what month the Native Labour Association was formed?—Some time in the latter half of the year 1900.

2,750. Were you present at the preliminary meeting?—It was on the 25th October, 1900, that the rate of wages was fixed, and the Association was formed probably some time before that. I told the Chairman what took place. I was absent repeatedly through illness. If there were preliminary meetings prior to August I cannot have been present, as I was not in the country, but I took a strong part in the formation of the Association. As far as my recollection serves me, I was there—perhaps not at the preliminary meeting, but certainly at the formation meetings of it.

2,751. At any meeting at which you were present was any estimate formed as to the probable saving which would result as before the pre-war days?—I cannot tell, but I am perfectly certain that there would not have been any question of the reduction of wages without reckoning what the result would be. You asked me about the formation of the Native Labour Association; that has nothing to do with the rate of wages.

2,752. Do you know, Sir, if the question was gone into as to what would be the resultant saving in the doing away with the rock drills?—I want to clear up the former question. The Chamber of Mines and the Native Labour Association are two different bodies, having different functions (as I have already fully explained), although the personnel is pretty much the same. The rate of wages is fixed by the Chamber of Mines. It would be a meeting of the Chamber you refer to, and not the W.N.L.A. at all. I cannot tell you if the question of the resultant saving in the doing away with rock drills was considered at that meeting. In fact, I was ill in Johannesburg on that date, October, 1900, so could not have been present at that meeting in Cape Town. But I may point out that the reduction in native wages does not seem to bear upon doing away with rock drills.

The Commission adjourned for luncheon at 1 p.m. until 2.30 p.m.

The Commission resumed at 2.30 p.m.

The CHAIRMAN: We will proceed to cross-examine the witness.

2,753. Mr. TAINTON: Like my colleagues, Sir Percy, I am somewhat at a disadvantage in not having had time to go through your statement. I propose to put a few general questions, leaving the details for later witnesses. What was the rate of wages before the war, on the mines?—Immediately before the war?

2,754. Within a year or two.—I cannot tell you exactly. There was a schedule of rates for many different classes.

2,755. Approximately, is the rate higher now than it was before the war?—Yes.

2,756. Have these high wages had no appreciable influence on the supply?—The last increase in the wages has had no influence on the supply so far as I can make out—nothing we can trace.

2,757. Suppose you raised the wages considerably, would that tend to make mining more popular?—I suppose it would in a way. If you raised wages considerably, I have no doubt you would deprive a number of other industries and employers of their complement, and you would also, perhaps, draw out a certain number of boys for a short period who would not otherwise come out, until say next year or the year after.

2,758. In your opinion the effect of high wages is to attract a large number of boys to the mines from other industries?—In theory it certainly would be so. In practice I may say with reference to the last increase of wages from 45s. to 60s. this has not attracted more labour, because other industries and local employers pay just as much as we pay. If we increased it still further, I have no doubt we should draw away boys from them provided they did not again increase their rates.

2,759. What is the usual rate of wage in agricultural employment; is it not much lower than on the mines?—Very much lower. As far as my experience goes the rate of 30s. is considered a very high rate to pay farm boys in the Orange River Colony, and farmers have told me that with this wage farming could not be made to pay.

2,760. Do you mean that the rate of 30s. per month for agricultural labourers must be taken to a certain extent as the profitable limit? Can farmers pay much higher wages than that?—I am told not, but I have not had much experience of farming.

2,761. You refer to the shortage of labour; has that shortage been constant on the mines in your experience?—Broadly speaking, I should say yes. As I told Mr. Quinn this morning, there was only one period when we felt satisfied. But we did not consider the outlook as serious for the future, as we all believed that there was practically an unlimited supply in Africa and that we only needed proper organization. There were several attempts of considerable importance made in past years, but the first real organisation was the Witwatersrand Native Labour Association.

2,762. Was the shortage acutely felt before the war?—Yes, at times, but I would not say it was always acutely felt. I put it this way: we were not stopped or set back, actually, but since 1894 at least the expansion of the industry had been limited because of the limited supply of labour throughout the country. I have no doubt had labour been abundant we should have made very much greater strides.

2,763. And what efforts have been made to overcome this labour difficulty? When did you start the first organisation to cope with this difficulty?—I forget the dates of the other attempts, but the first really effective organisation was the one we started in Cape Town in 1900.

2,764. But you had a Labour Department of the Chamber of Mines as far back as 1893?—Oh, yes. We were always at it in the Chamber. The question was always with us. The Native Labour Association was the development of what went before.

2,765. Was that development due to the failure of the mining or free recruiting agencies?—It was due to the fact that the boys did not come forward from any source in sufficient numbers, and also due to the evils of the touting system, and the desertions, and the very heavy premiums which resulted from competition between the mines themselves. We were forced to co-operate to increase and fairly divide the supply.

2,766. Then the present position of the industry has not been the result of a sudden difficulty with regard to the labour question?—No. Of course it is much more acute now than it ever was before,

but I do not think it is unfair to say that our operations have been for years limited by the amount of labour we could get.

2,767. There has been a good deal of talk to the effect that the efforts of the leaders of the mining industry are not genuine. Can you give us one or two reasons combatting that view?—I can give this answer (although it should be unnecessary, as it must be obvious to everybody), that we have nothing to gain by not getting all the labour we possibly can, but everything to lose; and that we must be fools if we do not get whatever we can. It is most contrary to our interests. Can it be believed by any sane person that we are so utterly stupid as to neglect what we can get and urgently require merely for the chance of something else that we are by no means sure of, a something that we do not know to be any better than what we have on the spot? So far from not taking what we can get my own feeling is that we have made sacrifices to increase the supply which were out of all proportion to the possible results, and this more particularly in regard to the increase in wages. It is simply a question of quantity, so why on earth should we refuse any?

2,768. Is it not a fact that the majority of the boys taken on by the mines from the Labour Association are employed in the producing mines?—The majority are employed in the producing mines.

2,769. The groups controlling these mines have taken the boys and put them on the producing mines to the detriment of the non-producing mines?—That is certainly so. In order to achieve that they have practically suspended the vital and fundamental condition of the Native Labour Association, which is that everyone shall be treated alike, and for the last two years there has been a provision overriding all others, viz., that the complement of the producing mines shall be maintained.

2,770. Then you have been making the position really better than it would otherwise have been?—We have been making sacrifices to increase the output.

2,771. Have you had any complaints from shareholders in the non-producing mines as to this particular policy?—Yes, some bitter complaints; so much so that we have had one or two companies who have seceded from their groups on this account—that it was unfair to shareholders. Of course it is pretty well known that there is very considerable difficulty in maintaining this policy. We all recognise that each one is entitled to its rights, regardless of whether it produces or does not produce. It is indisputable. We cannot compel them, but we induced them on public grounds to forego their rights. They did it for a long time, but some of them refused to do it any longer.

2,772. Is it a wise policy thus to create a fictitious prosperity?—No, it is not. In fact, by the light of after events you may call it a shortsighted policy, but we adopted it in the belief that the supply of labour would be adequate and that we would speedily get back to our former position. Of course it is apparent now that the policy was not economically wise or justifiable, but we could scarcely foresee that.

2,773. Dealing now with the question of demand, these figures of yours, 140,000 or 150,000. Is that the estimate of the mining industry as to its immediate requirements?—When the engineers met 18 months ago they defined the basis, and on that basis the estimate of 140,000 would be a good deal short of present requirements. In Eekstein's group, for instance, it would have to be increased by 2,700 and in the Rand Mines' group by 2,000.

2,774. Do you know what estimates they took into consideration? Did they deal only with companies actually existing or did they take possible contingencies into consideration?—They did not take any account of contingencies. In fact there were many even of the existing companies which they did not include for the reason that they were not expected to start work immediately. I cannot give all the names from memory.

2,775. Perhaps we can get these details later?—I mentioned this morning that the Paarl Central and other companies like them were not taken into consideration at all simply because they were not likely to start at once. If we wanted to make a big complement it would be very easy to extend the list. That complement was for business purposes, not for advertisement.

2,776. Assuming that a marked reduction in costs occurred, have you ever attempted to estimate the possible consequences on the labour market with regard to the development of the mines?—No. I have never attempted it for the whole of the Rand. I could give you individual cases, such as the Crown Reef, as an example of how the reduction in the cost of working might carry with it a very great extension of the demand in the labour market. On that mine we have lately started to work the main reef, hitherto untouched, and it is distinctly payable. If that continues, and other mines do likewise, just look what it means. It means doubling the tonnage in the Crown Mine.

2,777. Assuming that the main reef could be profitably worked, what effect would that have on the mining industry?—I do not know to what extent there would be a payable output, that depends on the gold contents; as to the effect on the mining industry it is very difficult to answer that question because there is not only the main reef to be considered; there are operations on other reefs which are limited by the present rate of working cost. I cannot estimate the effect on the output, but if we could get the average cost down to 15s. I should think, judging by the companies I know, it would probably more than double the tonnage worked, which would mean about doubling the employment of white and black labour and the circulation of money too.

2,778. So that reduction in working cost would carry with it a great extension of the labour market?—Undoubtedly.

2,779. Is it true that the main reef series have been extended lately both on the East and West Rand?—I am told so. I should add on that point that a reduction in the cost of working might carry with it a very great extension of work quite outside the area of the present producing companies.

2,780. You are acquainted, are you not, with the recent results obtained on the East and West Rand?—I know of the discoveries on the eastern and western ends of the Rand and the other reefs to the south, but I cannot speak from personal knowledge of them, and I have never included these things in my calculations because this side of Modderfontein and this side of Randfontein there is such an extent of reef which has never been touched up to the present and which we believe to be highly payable, that it is unnecessary to look beyond this for the present.

2,781. It would be fair in attempting to arrive at the solution of this great problem to assume that a great extension will take place in the mining industry?—Yes.

2,782. How far would that affect the deep level properties? Can you give us any idea of the number of men required to work them properly; can you give us a rough estimate?—I do not know that you can get a better basis than the engineers' estimate on the water scheme which is to supply 16,000 stamps. That estimate was made before the war and before they anticipated any shortage of labour.

2,783. What district did that estimate include, what mining district? Have you any reason to suppose that estimate is unduly low? I ask the question because I have heard different estimates?—The estimate was for the Witwatersrand area proper as then understood. It would be greater to-day, I suppose. Now if you took only 10 boys per stamp that would be 160,000 boys required, but I consider 10 boys per stamp to be unduly low. My reason for saying it is unduly low is that it has been tried on only one highly selected group of mines and even these mines have experienced a great loss of working profit as a result of that

experiment, so that the average mine certainly could not stand it. Now I take it that in the deep level companies the average working capital would be a million or thereabouts. I do not think that would be too much, and you must be able to see a fairly decent margin of possible profit in order to pay off that million or it will not be subscribed. I said this morning, in reply to Mr. Quinn, that the best this industry has done has been £5,000,000 in dividends, and that the actual sum spent on capital account was 40 millions by the companies that paid those dividends, so that it is only 12½ per cent. return on the money subscribed, leaving out the claim values altogether.

2,784. How do you connect this with the efficiency of the boys?—The experience is that the reduction of the boys to 10 per stamp has greatly reduced the profit as compared with the 16 boys per stamp. We would prefer a sound economical basis of 15 or 17 boys per stamp.

2,785. Can you give us, in rough figures, the number of boys required per stamp?—It depends upon what you mean by require. Under circumstances of necessity the Rand Mines' group—

2,786. Mr. TAINTON: I would like you to leave out exceptional conditions.

WITNESS: I was going to give you an illustration of what we are doing to-day under pressure of existing circumstances, not of what we would prefer to do, or ought to do.

2,787. Assuming for the moment that figure, 15 boys per stamp, is reasonable, then according to this estimate, based on the water requirements of the mines, we shall require in time 250,000 labourers?—240,000 on the basis of 15 boys per stamp.

2,788. The estimate of the engineers, then, referred only to one industry, the gold industry, and did not touch iron, coal and others?—The estimate of the engineers of 145,000 only referred to the requirement of a portion of one industry. We think that estimate correct for our business, but, if you assume for the moment that it is too high and take off even 30 per cent., we are still 40,000 short of even that reduced total. The shortage is so great and so clear that it is waste of time to argue whether the estimate could or should be a few thousand more or less.

2,789. You are aware that other mining industries are conducted in other parts of the country with a fair amount of success?—Oh, yes.

2,790. It is true, is it not, that the Transvaal is a country of great mineral wealth?—Oh, yes, of known great mineral wealth.

2,791. Do you know that it has any other particular resources?—Yes, iron, coal of great value, also copper and silver, for what they are worth.

2,792. Is it reasonable to expect that, given favourable conditions, a very considerable expansion of the mining industries of the country will result?—Yes, certainly.

2,793. There is, therefore, no finality about the figures which have been mentioned from time to time as to the number of labourers likely to be required?—I should not like to suggest finality. One cannot pretend to define the future.

2,794. Suppose we take one of these estimates, say 200,000 labourers, is it not true that the employment of 200,000 would immediately create a demand for more labour?—Of course it would mean the immediate employment of a proportionate number of whites. But, if I understand you rightly, you refer to coloured labour. Yes, because by increasing the product of the industry you would get more capital free for investment in further development, and this would naturally need more labour.

2,795. Let me put it this way. Supposing a Commission had sat on the labour requirements of the United States, say, a century ago. Would it have been reasonable at that time to have fixed the labour demands of America at, say, 100,000 or 200,000 men? Have you any reason for expecting a great expansion in South Africa?—Yes, I have plenty of reason, but I do not want to reckon it in

this connection, because I have not seen the way clear yet to the half-way house to that position. We need not look too far into the future. We cannot map it all out on the basis of to-day.

2,796. The only point I wanted to make clear was, that the estimates which have been made are based almost entirely on the immediate requirements of a single industry, and that these requirements are very imperfectly known. Is that not so?—Yes, that is quite right.

2,797. You have left out of account any demand that may result from the ordinary development or extension of the country's industries as the population increases; what would you estimate that at?—I am not able to say, but I deliberately left it out because it looks like faking a big case.

2,798. The point I want to arrive at is this, that that phase of expansion is inevitable?—Absolutely inevitable.

2,799. You stop at the point of the requirements of a single industry?—It is not even all its present requirements. The figure of 145,000 natives is clearly defined in the statement as the engineers' estimate of the immediate requirements of certain mines whose names and totals are separately given. I do not care in the least whether it is considered to be right or not, and, as I said, for the purpose of discussion I am quite willing to reduce it by 30 per cent. That would bring it down to 100,000. Well, we are now 40,000 short of that, and we are still short by 30,000 to 40,000 of the pre-war total of natives, and, mind you, when we get to that position, that is not finality. I take the position in August, 1899, because it is the best position the industry ever attained, and I say that even if we restored the industry to that position we could not stop there. It would not suffice to carry the burden that is now laid on it and justify what is projected.

2,800. There is a tendency in public estimates to stop at a certain fixed standard supply. Do you agree with that view?—There is no fixed limit that we could say will meet the demand, because the demands will extend. We shall have to meet them by developments in many directions.

2,801. Referring to page 2 of your statement, you say, "It has always been my hope that the native labour supply of Africa would suffice to carry us over the dead centre on to the time when cheaper living and better conditions would enable the use of white labour to gradually and generally extend and eventually to a very great extent replace coloured labour." Upon what do you base your preference for African labour?—One reason why I prefer it is that we would solve simultaneously both the native and the labour questions if we had them (the natives) steadily at work. Other reasons are that we know it and understand it; it is near at hand; we have the organisation for it; the wages are spent in this country.

2,802. Do you think that African labour is more efficient than any other unskilled labour?—No, of course not.

2,803. It is cheaper than you can get any other labour for?—I have no experience of other unskilled labour, except white. It is cheaper than white, but whether it is cheaper than other coloured labour or any other kind of labour I cannot personally say. But the information given to me is that compared with them—but I have no personal knowledge.

2,804. Then you have not examined this particular question, that is the cost of African labour as compared with other labour?—You mean as to whether it would be economically an advantage to substitute other coloured labour for this black labour?

2,805. Yes?—No, I have not considered it in that light.

2,805A. Have you any reason to suppose that the African is better physically than any other labourer?—At present he is pretty poor.

2,806. Is he more intelligent?—I am afraid he is backward there.

2,807. Is he particularly moral?—I think they are a moral lot in their kraals.

2,808. Have you any knowledge of their gambling habits in the compounds?—I have seen them gambling, etc., but I do not know how they compare with others.

2,809. Then your preference for African labour is rather a matter of sentiment. You have not gone into the business side of the question?—I have not considered whether it would be more profitable to get Asiatic labour in substitution for African. We know the African labour. We know it is cheaper than any other sort of unskilled labour that we have experience of. We have proved it good enough for the purpose. It is manageable. It is near at hand. The only question is to get enough of it.

2,810. If you could get cheaper labour outside you would not continue your preference for African labour. I want to get at whether it is a matter of business or of sentiment?—As a matter of business it is possible that it would be better business to import coloured labour, but I do not know it, and I do not see how anyone else can know it until he makes the experiment. There are all sorts of points to be considered; the amount of wages required, the cost of getting them, the cost of feeding and housing, the amount of work they will do, and the questions as to their management.

2,811. Are you aware, as has been stated by some witnesses, that a proportion of the natives introduced into this country remain here and settle here?—I know that in a few cases boys have worked for eight or nine years, and some of the Zulu boys working in the town have practically settled here, but they do not do so in any considerable proportion.

2,812. Assuming that the evidence is correct, do you think it would be desirable to increase the number of natives in this country; to increase the disproportion between the native and the white?—It is a very big question. It would greatly depend on how you placed them. If you mean placing them in a big location, I should say of course not. In any case I should personally greatly prefer not to increase the native population of this country. I should prefer to use unskilled coloured labour of the country to carry us over the dead centre. There is such an enormous amount of development to be done here that I do not think that all the coloured labour we are likely to get will check the expansion of white labour or will check the extension of mechanical processes and appliances provided you do not introduce coloured labour to displace the white man. In fact it is just this development stage that I called the dead centre. We want a lift over that.

2,813. Supposing it is found by this Commission that labour can be found in Central Africa, is it fair to assume that we should have to introduce natives to the extent of 200,000 or 300,000 a year to maintain the required complement? We are dealing now with this Central African labour. We want to get the number we should have to bring into the country annually?—It all depends on the term of work. If they only work six months you want double the number that you would if they worked twelve months. At two years it would mean a replenishment of half the total each year, but whatever numbers we may get my own feelings is that the pressure will come in the future just the same as to-day to do with as little coloured labour as possible. There is such an enormous quantity of lower-grade ore and there are so many extensions that there will always be a great incentive to make the most of all kinds of labour.

2,814. The point I want to get at is this, it is probable that there will be a great expansion in the demand for labour. If that demand is not satisfied from Central Africa, does it not involve the introduction of a large number of natives into South Africa? What would you assume that the immigration would amount to yearly?—Take our present position. We have 60,000 natives here and the wastage, that is the number going away as time-expired labourers, is about 8,000 per month according to the three or four months' returns. Therefore the boys seem to average 12 months' service, and whatever your complement is one-twelfth will

leave every month. That is, roughly, the figure from the present statistics. There is the point you arrive at. If you had a quarter of a million complement you would have to recruit a quarter of a million every year to maintain this. The stock and the turnover, so to say, are the same on the present term of work.

2,815. How long do you think this mineral industry will last?—A long time after you are buried.

2,815A. I want to get at the results which are likely to follow the introduction of coloured labour from Central Africa. From your replies, I take it that the numbers introduced would run into millions over a series of years?—I cannot see so far into the future as that. We may develop the use of white labour and machinery further, and I hope we will, and we may be able to make these natives go further in the future. I believe we will, but it will take time, and this is what I am coming to. I cannot say what we will require in ten or twenty years because it is certain that there will be a steady and natural process of development or improvement, and even in five years' time we might bring down our economical basis from fifteen to eight boys per stamp. The question as to the further future is too speculative for me. Conditions change too much and too quickly to say what will happen years hence.

2,816. Leaving out possible improvements in methods of working, the proposal to introduce natives means the introduction of a very large number of natives into this country?—Yes.

2,817. I want to refer to another point. Can you give us any suggestion as to how we can meet this labour supply; what about taxation?—I have made all the suggestions that have occurred to me to the Native Labour Association. We have thought of nothing else for the last eighteen months. We have put all our brains together, and have done all that we know of to increase the supply.

2,818. What is your view of the effect of taxation?—I know of various taxation proposals, but do not think there will be an appreciable result from taxation. I think a good result would follow from compelling the native to pay rent for the ground he uses as the white man has to do to-day.

2,819. What about the native reserves?—That is a big question. It involves determining the future of the natives; the title, tenure, extent and uses of land.

2,820. That means we can only attack this question of labour supply indirectly?—Indirectly and in a number of years. No one in his senses would suggest tackling the native reserves in a hasty and arbitrary manner.

2,821. You have no suggestions to offer likely to meet the supply in the near future?—No; I cannot offer any suggestion you could call a practical suggestion. The native question has to be faced and dealt with some day, but it should not be dealt with singly as a labour question. You will get no one to take it up merely to supply us with labour. The suggestion to force labour out by taxation or breaking up the reserves is not even a practical one. You know the Chartered Company would not be permitted to do it even if they wanted to; moreover they have not enough labour for themselves. The Portuguese have had their fill of Kaffir wars, and are not likely to risk any more for our sake. Natal has had the Zulu war and the Cape their native troubles. Do you expect them to court more by hasty and ill-considered action?—I do not see why anyone should take on Kaffir troubles for the benefit of the mines.

2,822. Do you agree with the suggestion of the Bloemfontein Conference that there should be locations near towns?—Personally I do not at all. I take it on the lowest we want 100,000 labourers here. They are not going to live here permanently without their families; that would mean a population of perhaps three-quarters of a million. Where are we going to put them, and how are we going to manage them?

2,823. I think you made the experiment of employing white labour on the mines?—Yes.

2,824. Was it successful to any extent?—No, it was not successful, if you mean the white unskilled labour that we took on to do the work ordinarily done by the blacks. It was not successful at all.

2,825. Did you arrive at any decision as to the relative efficiency between black and white?—Yes, it was all published. It is quite clear in this particular unskilled class of work the white cannot compete with the black. The wages of the whites cost us 9s. per day (5s. pay and 4s. keep), but of course we would have to include the cost of housing if we attempted a permanent system.

2,826. What would be the cost of housing—say of housing a small family?—We have not attempted to deal with men with families. It was an experiment made to find employment for a great number of irregulars who were discharged in Johannesburg and who might have been forced to live on their savings during the time they were looking for work.

2,827. But if we substituted the alternative white labour here, presumably you would have to arrange for the introduction of the families of these white men?—Finally, of course, this would take place.

2,828. Can you give us any rough estimate of the cost of housing per head? Supposing a family of five, would it run into £500?—Not working men, oh, no. I should not think that. You are talking about the amount if he were attempting to live on 10s. a day and find himself.

2,829. No, I am taking actual conditions?—We paid them 5s. per day and we found them.

2,830. I am not speaking of this particular experiment. What would be the cost of housing a man and his family?—It would be very difficult for me to say. I think you had better ask one of the engineers; they could tell you better than I.

2,831. It is an important point if you introduce the white man. The cost of housing them would run into a very large amount, would it not? I want to get at the probable cost?—That depends on the number introduced.

2,832. I want to get at the number and cost of the houses which would be required to accommodate this white population, if we had, say, 200,000 white miners?—Well, if they only cost £100 a piece it would amount to 20 million pounds.

2,833. Rents are very high in Johannesburg at present, are they not?—Yes.

2,834. Why is that?—You must ask the "Housing Commission."

2,835. Is it owing to the demand being greater than the supply?—Certainly.

2,836. Therefore we have more white people in the town than we can accommodate?—Yes.

2,837. If you introduce a very large working population it is likely to considerably increase that demand?—Of course. It would be impossible to introduce them at present, quite impossible. That is my objection to the point Mr. Quinn raised this morning about the employment of 40,000 white men on the railways, and the question of discharging them at the end of three years. I consider that they would ruin the white men of this place. There is no possibility of absorbing 40,000 suddenly floated in. What have we got, only 15,000 now.

2,838. If those difficulties exist together with high rents, it is not likely you can reduce the cost of living for white men within a reasonable period?—No, that is the trouble, we have to obtain the boys and develop the country before the white labour will be able to expand, as I hope it will eventually expand. It has got to be gradual, of course.

2,840. Then your answer is, that on the ground of cost and other considerations, it is impossible at present to introduce white labour?—In substitution for the unskilled coloured it is quite impossible. We have tried it on a big enough scale. You will find that the records of our own mines show that

the maximum of white to black was reached some four months ago; it has been going back; they cannot stand it.

2,841. Mr. PERROW: You stated that before the war you were employing 16 boys per stamp?—15.9.

2,842. Can you tell me the number of rock-drills you had at that time?—I cannot do that.

2,843. Were you working more mines at that time than you are at present?—Oh, yes.

2,844. I see to-day that you are employing 10 natives to the stamp?—On the Rand Mines' group.

2,845. Do you know the number of rock-drills you are using to-day?—I know the proportion is very much greater.

2,846. Than what it was before?—Yes.

2,847. You have got several places in these mines to-day you are not working at all; small reefs?—Yes.

2,848. If you tried to keep your stamps going, what number of boys would it take with them all running; the rock-drills and things of that sort?—I would have to work that out. I should think that the basis of the 15 or 16 boys per stamp or thereabouts is the right one.

2,849. Are you determined to decrease the rock-drills according to the number of boys you have on this sheet—145,000—to keep your mills going? Would you decrease the rock drilling in proportion as you get in natives?—No, certainly we should not, because we do not see any prospect of getting enough boys. We have only got 40 per cent. of our complement of boys, or less than that, and we have not got two-thirds of your stamps "dropping" yet, and, until we get all the stamps going we cannot consider the question of increasing hand drilling to any great extent in substitution for machine drilling.

2,850. You would much rather have the skilled native doing hand drilling than do the work with machine drills, would you not? They do it much better?—Oh, much better.

2,851. If you were working the stopes by the boys hand drilling what percentage would you save in waste to be sorted out. You have to sort a deal more when you use machine drills?—Oh, yes, unfortunately it is hitting us both ways without the use of the machines; owing to the shortage of boys, we have had to stop the sorting too.

2,852. Do you not think that you have sufficient rock-drills now?—You mean from the economic point of view?

2,853. Yes, and for the health of the miners?—Yes.

2,854. I should say your estimate, 145,000 boys here, is very low instead of very high?—The number of boys is low. Of course if we were to go into the question of substituting hand drilling for machine drilling all along the number would have to be increased.

2,855. The question of white unskilled labour has been mentioned by Mr. Quinn and another Commissioner. I suppose you would much rather have sufficient unskilled native labour and skilled white labour than you would have part white unskilled labour with part native, and part white skilled labour?—Oh, yes, from a business point of view, that is sound.

2,856. Mr. FORBES: You mentioned this morning, Sir Percy, that you have not got nearly the number of hands that you had before the war?—No, nothing like the number.

2,857. Surely a great proportion of the old hands have been coming back?—Oh, yes, a great many of the old hands from Portuguese East Africa came back, but we have got a very small supply from British territory.

2,858. Have you any idea what the average number is?—As to the average, I could not answer that question. We have no average, but we have had experience of exceptional boys remaining practically the whole time for years and years; we have also had experience of

others who used to work for a good spell and get their money out and go back home in three or six months. Others again have gone away and have not come back at all. I have no statistics that I know of which would enable us to give you the average number who return.

2,859. Mr. PHILIP: With regard to this number of 145,000 boys required by the mines, I notice that there are a number of mines not included?—Yes, I explained before that the 145,000 were for mines ready to start 18 months ago. There are many more which would start now if they could get boys. For instance, there is the City Deep group of five mines. They require 650 in order to start preliminary work, and within a few months would want a great many more.

2,860. About how many would they require?—I should think about three times that number. I cannot say right off. There are many others more advanced, like the Village Deep. Their requirements vary according to the stage and scale of work and the number of stamps.

2,861. Say for 200 stamps?—They would want over 3,000.

2,862. There are a good many more mines in the same way; for example, the Jupiter is put down at 250, but with its stamps going will want 10 times as many, so that really 145,000 is a very small estimate of what will be required?—Yes.

2,863. When you double your supply of native labour here what will be the result on white labour; how many more will you have to employ?—I imagine that we will about double the white labour too. The first big increase of boys ought not to bring a proportionate increase in white labour, because we are working on a false basis now and at a great sacrifice of profit, and we really ought to get more natives and reduce the proportion of whites to blacks in order to get on a sound economic basis, but I do not think that an increase of, say, 30,000 would very much disturb the present proportion between blacks and whites.

2,864. If you double the present number of boys you double the white labour?—I believe it will be so.

2,865. Mr. Whiteside called your attention to the evidence of Messrs. Breyner and Wirth. Mr. Breyner stated that he hoped to be able to get 60,000 boys from the Northern Portuguese territory. Mr. Wirth stated he might be able to get 110,000 from Southern Portuguese territory within a certain time. But when he was cross-questioned on it, it came out that at present we were getting a net increase of 1,700 boys per month, and he said they could not expect to keep up the present rate of recruiting, and finally it came to this, that in order to increase it up to 110,000 boys, if it was going on as at present, it would require three years to do it. That was his evidence. Now are Messrs. Breyner and Wirth interested in maintaining the Portuguese supply?—Of course.

2,866. What is your opinion of their estimates of what they can get?—I think they take the same view as I might if I was in their place. It is in their interest that we should look only to them for supplies.

2,867. Do you think they will be able to carry out what they estimate?—Personally I do not believe it. If they could do it, why did they not do it before. The reward is attractive enough, goodness knows.

2,868. Do you think if the Squatting Law was enforced that we would have an increase of labour from the Transvaal itself?—You mean the law not allowing more than five families on a farm?

2,869. Mr. PHILIP: Yes?—No, I do not think so. The farmers would benefit, not the mines.

2,870. The question was asked with reference to the percentage of boys who could not work before the war owing to drink. Have the mines kept any record of the boys incapable of work owing to drink? Could we get it from any of the mines, or from the Chamber of Mines?—I think you could,

but I think you will have to get the companies to look up their own records. Our experience was that individual companies might have, say, 30 per cent. to 50 per cent. incapacitated on Monday, 15 per cent. on Tuesday, and 5 per cent. on Wednesday—something like that. This experience would occur at different times and in different localities, not all the companies all at the same time. Thus you have to strike an average for the whole of the week to see how many were absent and then you have to strike an average for the whole industry. One cannot give such an estimate off-hand.

2,871. Sir Godfrey Lagden said at the Bloemfontein Conference he was surprised that there was a total absence of statistics. In your opinion were the men present at that Conference sufficiently competent to judge the questions before them without having tabulated statements?—They were sufficiently competent to speak for Rhodesia and the four Colonies, and in my opinion competent to speak broadly on the whole question. I do not think it matters in the least if they were out a few thousands; the difference that we have got to make up is far too big to worry about a few thousands.

2,872. They were as well qualified as anyone from the various Colonies to give an opinion?—I should think they were the best qualified men in South Africa. They have all the information that is available.

2,873. You have stated that Portuguese East Africa was the supplier of South Africa?—Yes.

2,874. Is it your opinion that the mining industry should be dependent upon the goodwill of a foreign Government?—I think it is a very unsatisfactory position that the success of the mining industry should be dependent upon the goodwill of a foreign Government. That was proved at the time of the *modus vivendi*. I think they got special terms by using this as a lever.

2,875. Mr. DONALDSON: In your statement, page 6, you say, "The whole superstructure reared upon the industry is vastly greater than it was in 1898." Will you please tell us what you mean by superstructure?—I mean that this industry is the basis of the prosperity of South Africa, and particularly of the Transvaal. I think the developments and the demands and the projects, legitimate projects—which are now before this country are enormously greater than they were in 1899. This is due, in part, to the security which is felt, there being no longer a political uncertainty, but it also is due to the faith that we have—which I confidently share—that this industry, the country's mainstay, will prosper and greatly expand. Even in 1899 we had all undertaken obligations and formed projects which were dependent upon the success of the industry, and which were calculated on the continued steady expansion of the industry. Well, since then we have had a vast increase in the projects, commitments, and legitimate anticipations. That is the superstructure. You will see the whole thing round about you; in the towns an increase in the population of Pretoria and Johannesburg. You see the Municipal undertakings in each place. You see £7,500,000 to be spent on railways, £5,000,000 out of loan, and £2,500,000 by private enterprise. You see big public works projected and authorised all through the country, the Johannesburg Municipal Loan Works, four millions; Rand water supply three millions; and of course there is the £30,000,000 War Debt, which we have got to consider and mean to pay. That is what I mean by superstructure. It is the legitimate expectations of this country founded upon this industry—not upon the industry as it was in 1899—but a general steady and very great increase in that industry, probably to 16,000 stamps capacity instead of 6,000. That estimate is not made to-day by me, but by the engineers of the Rand, and was put forward before the war; and that is why I say the position of August, 1899—which is the highest point reached by this Rand mining industry—is not the goal and cannot possibly justify the expectations formed of this country to-day. You have to extend the base or the whole thing will topple over.

2,876. What you call the superstructure means other work and development outside what you described as the industry?—Yes.

2,877. You mean the other progress of the country outside that?—Yes. The whole programme of this country, not the Transvaal alone, but of all South Africa. I do not think, for instance, it is the slightest good the Natal Government talking of doubling their line if we do not improve on the previous best of the industry. I do not see what would justify increased public works in this Colony, and why the Cape Colony worries about increasing their railways if we are going to remain where we were in 1899. You had better stop everything, the railways, the harbour works, and dissolve the Water Board if you are not aiming at doing better than you ever did before. It is inconsistent and foolish to talk of progress and at the same time remove the great factor of progress, that is the expansion of the industry.

2,878. Mr. GOOH: In this superstructure you have just been describing, I would like, perhaps with your assistance, to make a somewhat clear view of the position in comparison with that of 1899. I believe the value of town property, then, taken in Johannesburg, was £14,500,000 in round figures?—Yes.

2,879. It is now £38,000,000. As regards Johannesburg it is that, I suppose, which represents the enormous increase in the superstructure?—Yes.

2,880. The net expenditure in Johannesburg for 1899, or 1898—which is near enough—was £420,000. It is now on the basis of £700,000 in round figures, plus £3,000,000 which they are immediately spending in public works and probably £2,000,000 more which they will want almost immediately afterwards. The expenditure of the State in 1898 was in the neighbourhood of £1,000,000. Now, including the charge on goods carried by the railways, it is estimated at £7,000,000. We had a Public Debt—a State Debt—which was, if we include the cost of railways, somewhere near £14,000,000 in 1899. We have now £35,000,000 borrowed; £30,000,000 to come next year, and a £3,000,000 Municipal Loan to add to that. In round figures £70,000,000 is the Public Debt that we are face to face with?—And Water Board, two or three millions.

2,881. We have not taken that into account yet?—That is correct.

2,882. Then, Sir, is it correct that in 1899 our trade was on the basis of £10,000,000 sterling imports per annum?—That I do not remember.

2,883. Well, it was that. You know that last year it was £20,000,000?—Yes.

2,884. I think these increases show the gigantic proportions to which this superstructure has attained?—Yes.

2,885. Am I correct in stating that the production of gold now is on the basis of something like £12,000,000 sterling per annum?—Yes, that is about it.

2,886. What was it in 1899?—It was at the rate of close on £20,000,000.

2,887. How far back do you go to get back to £12,000,000 a year? What year was it; somewhere in the '90's, I think, it had reached that figure?—I cannot remember, but I should think it would be in 1896; it is easily verified.

2,888. Take 1896, we are to-day therefore in no better position than we were in 1896?—We are thrown back to that. "No better" does not properly describe it, because we have to pay out more. Our ordinary position is no better than it was then.

2,889. Viewing the position in that way, in your remark in your principal evidence to the effect that the general position in this country to-day is not to be justified on the basis of the Industrial position of 1899, is it not overstated?—Yes.

2,890. You are justified in making that statement in view of these facts?—We are in nothing like the position that we were in August, 1899, that is the highest pinnacle of the Rand Industry, and even if we were so it would not justify the undertakings and demands and the projects of this country.

2,891. Well, if we accept the position of shortage in labour as permanent, then, as you say, we have to recast our programme for South Africa altogether?—Yes.

2,892. Do you think we will have an opportunity to recast it; will we not come to a smash right away?—Whatever anyone might individually prefer, in my opinion, what is said about going through a period of extreme trial in order to secure some other solution is beside the point. Shareholders may wait for dividends but the people cannot wait for bread, and that is why I recommended at the Inter-Colonial Council that they should not take any natives for the railways, but should import coloured labour for the purpose, because I believe that if the smash comes, people in desperation will seek relief where they can get it, they will open the floodgates of India without any restriction whatever rather than starve.

2,893. Mr. QUINN: You assented a moment ago to certain suggestions of Mr. Goch's. He pointed out to you the enormous difference between the assessment value of this town now and what it was immediately before the war?—Yes.

2,894. But he did not put it to you that the area of that assessment was just twice as big to-day as it was before the war. Now, instead of a three mile radius on which our assessment was made, it is a six-mile radius?—I implied the suggestion that the town had extended.

2,895. The point put to you was the enormous increase in the assessment and valuation in this place, and you were not told that the area was just twice as big?—I know that quite well, but do not think you need attach so much importance to the assessment area being increased, because the town has been extended. It is the same town that is assessed.

2,896. Excuse me, it is not. It is twice as large. What I want to draw attention to is this: I want to show how easily this superstructure may be put up and how easily it may be knocked down. Take that one question alone, the valuation is now £38,000,000, as against £14,000,000. The enormous difference is not brought about altogether now, but only in a very small part by the increase in the value in property; it is merely that bigger area which was there before that has been taken in. Will you assent to that?—No; certainly not in that form, because I know that there has been an immense appreciation in values, and I know that the big area has been taken in largely for the reason that the town is bigger. However, I do not think it matters much. The point is this: You assess a certain town; it is going to pay rates. The rates are going to be paid on £40,000,000 instead of on £15,000,000. The practical point is they will have to be paid and they will come from the mining industry—it comes indirectly out of the mining industry through the public.

2,897. And at the back of the mining industry it is the public, and they have got to pay?—Certainly that is true of the investing public, but it cannot be the public of this country, because they did not put the 40 millions of capital into the mines.

2,898. But it is the public somewhere. The public of this country have also subscribed an immediate want, so again, in answer to Mr. Forbes, you said to go on getting natives from Portuguese East Africa brought about the unsatisfactory state of things that we were dependent upon a foreign country?—It was not a desirable state of things for the industry to be wholly dependent upon the goodwill of any one foreign country, and that was shown by the *modus vivendi*.

2,899. You will take care that it is not perverted?—I should be very much opposed to our getting all our supply from only one source at any time.

2,900. What, in your opinion, will be the effect of displacing a very large amount of native labour here, taking it for granted that you eventually import labour. Will not the effect of that imported labour be to displace the present labour to a very large extent?—It would greatly depend upon how much you imported.

2,901. If you imported some of this labour, you would go on importing it?—I suppose if you could get it you would go on until your deficiency was made up.

2,902. That would mean the native population here would be displaced from its natural field of labour?—I do not agree with that at all. It is a question of deficiency and not of displacement.

2,903. In answer to another question, I understood you to say that if you could get cheap coloured labour to-day it would probably increase the amount of white labour required?—Yes.

2,904. May it not have the other effect?—Supposing we imported coloured labour, is there no fear that coloured labour would displace not only Kaffir labour, but white labour also?—I am speaking on the assumption that your coloured labour is to do the unskilled work that is being done by the natives now.

2,905. Could you keep it at that? Supposing you could import 100,000 Chinamen?—Yes, I believe so; in any case you would prove that as you went. You could not get 100,000 in a bunch. It is a practical impossibility.

2,906. Would the effect of that importation, once you have succeeded in it, not, in your opinion, have a tendency to shut out a large amount of white labour in addition to the Kaffir labour? If you grant the assumption that these men who are imported as coloured labour will be confined by law to do the same work as the Kaffir does; now, my opinion is that they will not shut out either white or black?—On the present position, you see we are 100,000 short of immediate requirements of unskilled coloured labour, so the equivalent of 100,000 in something has got to be found before anybody is displaced at all, and, in the meantime, there must naturally be a great addition to white labour. If we could get 100,000 natives they would not displace any of the 60,000 that are here.

2,907. The CHAIRMAN: On the question of the increase of wages, you said you had great objections to the increase from 45s. to 60s?—Yes.

2,908. Would not the effect of that be to help you to retain the labour you then had?—No, absolutely no. In my experience it failed, and so did another supplementary inducement. We offered them a bonus of £3 a head to sign on for another 12 months. I believe a lot of the managers went around amongst the natives with the £3 in one hand to represent the increased wages, and £3 in the other hand to represent the bonus, and I do not think it influenced 10 per cent. of the boys. In my experience only half a dozen in one place and 10 in another signed on. It did not appear to deter them from going home at all.

2,909. Would it not be fair to say, had you not increased the wages to 60s., a large number of those boys would have taken service elsewhere, where

they could get the 60s.?—It might have done that. I can only speak of the places where we actually tested it. I cannot say whether in others they were influenced by that or any other reason, and remained on in other cases. They might have been so, but who can tell.

2,910. Have you anything you wish to add before closing your evidence?—Just a word on the broad question of the extension of the field from which we draw our supplies. The limits of this African supply were not foreseen by any of us, certainly not by me. Perhaps they ought to have been foreseen, but I really believed, with everyone else, that there was practically an unlimited supply north of the Zambesi, and that there were considerable supplies south of it. Now we find ourselves face to face in this department with the problem which we have already dealt with in most others. We began the industry with the bullock waggon for transport, and we have got so far now that we have got four main lines of railway from the coast. We began with firewood and Brakpan coal as our fuel, and now we lay the whole country under tribute to supply our fuel. We began with the running spruets as the sources of our water supply, and now have a network of immense dams and have started a scheme that will cost two or three millions to bring an adequate supply from outside. In skilled labour and in brains and in capital we have tapped the whole world, and it is only in the crude labour that we have not extended our original field at all. We believed the supply was sufficient; but there has been great and unforeseen competition from many other sources, and we have come up against the fact that it is not sufficient. So far as I am concerned, I go under to the facts. I am sorry to be unable to maintain the theories that I hoped would prove right a year ago, but if the facts do not agree with the theories, so much the worse for the theories.

2,911. Mr. PERRROW: Did you offer that £3 to the boys for 12 months or for six months?—I think it was for 12 months—30s. for six months and £3 for a year.

2,912. You had 5 per cent. who remained?—In some cases none, in some 5 per cent., or perhaps 10 per cent., but I am not quite sure. I remember the instance of the ridiculous failures; we went up full of hope and out of 50 or 60 boys, perhaps five changed their minds and stayed, and the others went on their way home. May I explain a reference to the railway requirements? We were told at the Railway Construction Conference that the lines then authorised would require 40,000 natives to build them in three years. We have added 50 per cent. since then to our programme, so that theoretically those lines will now take 60,000 to complete in three years.

2,913. The CHAIRMAN: You mean by that, including the various railways to be built out of the five millions voted?—The railways paid for by the £5,000,000 loan would take 40,000 natives and the lines authorised by private enterprise another 20,000, that would be 60,000 in all constantly employed for the railway construction for a period of three years.

2,914. Sir Henry Fitzpatrick, the Commission is very much obliged to you for the evidence you have given to it.

The Commission adjourned at 4.30 p.m. until 10.30 a.m. on Friday, the 7th August, 1903.

## TENTH DAY.

Friday, 7th August, 1903.

THE COMMISSION SAT AT 10.30 A.M.

Mr. HUGO BRENTANO, called, sworn and examined.

(Mr. Brentano gave his evidence in French, which was translated to the Commission by an interpreter.)

2,915. The CHAIRMAN: I understand, Mr. Brentano, that it is your wish to give your evidence in French?—Yes, sir.

The interpreter, Colonel R. A. Bettington, refused to be sworn, and the Commission waived the point.

2,916. You are Mr. Hugo Brentano?—Yes.

2,917. What is your nationality, Mr. Brentano?—French.

2,918. Have you before you a statement headed "Evidence of Mr. Hugo Brentano"?—Yes.

2,919. Is it your wish to hand that in as your evidence-in-chief?—Yes, I hand it in to the Commission.

2,920. Mr. Hugo Brentano's statement was then handed in to the Commission, and reads as follows:—

I am acquainted with the districts on the Somali Coast and Abyssinia. I have been engaged in horse-breeding in Somaliland and Abyssinia, and cattle farming in Madagascar. I placed myself in communication with the W.N.L.A. with reference to a proposal to supply the mines with African boys. The boys I proposed to supply were Somalis and Abyssinians, of the ages of 18 to 40. Many of these boys had worked on the railways from Djibuti to Abyssinia, and some have had experience on the railway in Madagascar, where they were working for some time and then repatriated. Some of the boys have been used to stevedore work, and some to coaling, and other arduous labour. They are physically sound, able-bodied and wiry, and most energetic workers. They have not worked underground, but I am certain that they will do so. I offered the W.N.L.A. 20,000 of these men, delivery to be given and taken at ports in the Red Sea. I was advised that I should go to Johannesburg to treat about my offer, as I was informed that the W.N.L.A. desired to see me on the subject. I came to Johannesburg and had interviews with Mr. Perry and others. I offered the following:—

To supply 20,000 boys as above within twelve months—delivery at ports in the Red Sea. I was to feed the boys until delivery was given.

Contracts with each boy to be signed for three years at a wage of thirty shillings (30s.) per month, to be regularly paid to the boys, together with food and housing and medical treatment if required.

Contracts to be attested before Consuls or Local Authorities, and to be thoroughly legal.

I was to receive £5 per boy on delivery. When I cabled that so many boys were ready to be embarked, that cable should be confirmed by the Consul or other proper authority, so that the complement of boys would be ready for each steamer advised. Mr. Perry asked me for a guarantee. I asked him what guarantee would he suggest. He said what was wanted was the following:—

For the first 5,000 boys I was to be paid £3 per head, the W.N.L.A. retaining 40s. per head until completion of 20,000.

For the second 5,000 boys I was to be paid £3 10s. each on delivery, the Association retaining 30s. per head.

For the third 5,000 boys I was to be paid £4 per head, the Association retaining 10s. per head.

On the completion of my contract, viz., delivery of 20,000 boys, the amount of £25,000 retained to be paid over to me.

I said I would think the matter over, and I accepted after doing so. He then said that this (although it had been suggested by him) he considered was not a guarantee, and asked for a deposit or a banker's or substantial firm's guarantee for £5,000. I refused to provide this, and said I was willing to abide by the suggested guarantee.

Thinking that the imposition of a further guarantee by deposit of £5,000 pointed to a want of serious consideration of my offer, I sought advice from friends who were interested in the labour supply being increased.

Through one of them, I offered to deliver 1,000 boys at a port in the Red Sea, the whole of the money for them, viz., £5,000, being retained by the Association to form the guarantee asked. This was refused. But the following offer was indirectly suggested to me:—

I should contract to deliver 20,000 within a year at Aden—not less than 1,000 at a time.

For the first 5,000 I was to receive £2 per head on delivery at Aden, and a further £2 per head as soon as 5,000 had been received, making £4 per head in all.

For the fifth to the twentieth thousand, I was to be paid £4 per head on delivery.

When the 20,000 was completed, I was to be paid the balance, viz., £1 per head, on all delivered.

In addition to this, a guarantee was required either from a bank or some substantial firm up to £5,000, that at least 5,000 would be delivered within a year. To this I answered as follows:

To the Secretary, W.N.L.A.

Johannesburg,  
30th July, 1903.

Sir,—With reference to my previous letters regarding the supply of labour, I now beg to submit the following proposition:—

1. That I undertake to deliver 20,000 boys at a port in the Red Sea within one year of date of signing agreement.
2. For the first 5,000 your Association pay me £1 per head as delivered, and a further £3 per head as soon as 5,000 are delivered.

For the remaining 15,000 your Association pay me £4 per head as delivered, and, on the whole number being delivered, you pay me the remaining £1 on £20,000.

I regret I am unable to provide any further security in the matter.

I have, &c.,  
H. S. BRENTANO.

This last offer of mine placed me at a disadvantage, and should supply a complete guarantee that what I undertake to do I shall carry out.

To this offer I have had no reply yet.

I am willing, if my terms are accepted, to sign the agreement, and to immediately communicate with my people to get the boys together for early shipment.

I have based my offer of 20,000 boys upon my recruiting only in British territory.

If it were permitted me by the W.N.L.A. to recruit where I liked in the parts I am acquainted with, I could get a very much larger number.

The boys I would deliver are Mohommedans, but, where they have come in contact with other natives, such as Madagascar boys, they have worked well in harmony, and no trouble could be anticipated on this head.

They are not a trading people; they are used to work when they can get it; in their own country they get very trifling wages.

The country is overcrowded, and many go to seek agricultural work in Abyssinia, where the country is high and very cold in winter.

Their food is mealies and Kaffir corn.

2,921. You have had some correspondence—some negotiations—with the W.N.L.A. with regard to supplying labour from the Somali Coast?—Yes.

2,922. How long have you lived on the Somali Coast?—I left in February, and before that was there for six months, and previous to that was moving about Somaliland and in Madagascar.

2,923. Your period of residence there has been six months?—I first went there four years ago, and since that time have been going backwards and forwards, sometimes to Somaliland and sometimes to Madagascar.

2,924. What business have you been carrying on there?—Salt mines.

2,925. Do these mines employ any large number of labourers?—They employ in all about 600 men.

2,926. Have you been engaged in the emigration of labourers from that country to any other country?—No.

2,927. These 600 labourers you refer to as having been engaged on the salt mines—was the mining underground?—No, there is no underground mining there at all. The salt mines are on the sea level.

2,928. Is there any emigration of labourers from that country to others for working purposes? Have any been sent to Madagascar in any large numbers?—70,000 were sent to Madagascar for the construction of the railway system.

2,929. When was that?—About 18 months ago.

2,930. What was the period of their service, their engagement?—A year.

2,931. Do you know the rate of pay?—One franc, 25 centimes, per day. Roughly speaking, one shilling.

2,932. Have these labourers returned?—Yes.

2,933. Is there any exportation of labourers to any other country?—Not that I know of.

2,934. What was their natural occupation in their own country?—The employment seems to be pretty general. They go in for agriculture and work as porters, and work on the harbour works discharging ships, on the canals, and practically do everything.

2,935. Mr. EVANS: How long have you been cattle farming in Madagascar?—For one year.

2,936. How long have you been in Madagascar?—About a year and a half; I was horse-breeding in Abyssinia.

2,937. When were you breeding horses in Abyssinia?—Off and on for years the whole business has been carried on.

2,938. What part of Abyssinia were you in?—From Djibuti to Harrar.

2,939. Where was this horse-breeding carried on?—Where I have said.

2,940. But what is the particular spot?—On the border of Djibuti.

2,941. When did you first go to Djibuti?—Four years ago.

2,942. How long have you been there?—My answer is the same as I gave just now. I have been backwards and forwards there on several occasions.

2,943. Have you lived there for three months at a time?—Yes.

2,944. When was that?—The first time I went I stayed four months.

2,945. Where did you spend those four months?—All over the country.

2,946. Where did you land on arrival there?—At Djibuti.

2,947. Where did you go to from there?—To Addisababa.

2,948. Have you been there since?—Not at Djibuti.

2,949. Do I understand the horse-breeding took place at Djibuti?—We were farming at that place, but we got horses all over the country.

2,950. You bred horses?—Yes, we did horse-breeding. We bred as many horses as we could, but at the same time we bought more horses outside at the coast when we were not able to rear sufficient.

2,951. Did your horse-breeding take place at Djibuti?—No, in Abyssinia.

2,952. How far is it from the borders of Abyssinia to Djibuti?—66 kilometres.

2,953. How far is your farm from Djibuti?—The farm is an extensive one, and is on the border of Djibuti.

2,954. Does the farm extend 60 kilometres?—No.

2,955. Now, how long were you there looking after this farm?—My partner has been there and has not left the place for six years. He goes backwards and forwards.

2,956. What is the name of your partner?—M. Germain.

2,957. What other occupation has he besides looking after this farm?—My partner?

2,958. Yes?—Only the salt works.

2,959. I should like the name of the firm. How does he spell it?—Germain and Co.

2,960. Are there any other partners?—There is another partner, Mr. Germain's brother at Madagascar.

2,961. What is the extent of this farm; how many square miles, or acres, does it cover?—3,782 hectares.

2,962. Now, what are these men you are referring to?—They manage the salt works.

2,963. But you mentioned mining also?—No, only salt.

2,964. How long has this saline been worked?—Six years.

2,965. What is the output?—It is a private matter.

2,966. Yes, but I think I am entitled to test your statements. You have made a certain statement as to the number of labourers you employ.

2,967. The CHAIRMAN: The witness says he employs 600 labourers.

2,968. Mr. EVANS: I should like to know whether the output justifies 600 labourers being employed?—I object to the question.

2,969. The CHAIRMAN: I am afraid I cannot press it.

2,970. Mr. EVANS: I also do not wish to press it.

2,971. Do you export any salt?—We have practically a monopoly to supply Abyssinia, and this we practically do.

2,972. Do you produce more salt than they do at Zaila?—I do not know the production there.

2,973. How long have these 600 men been working?—They have been employed off and on for six years. They have changed about, sometimes they work for a year, sometimes more, and sometimes less.

2,974. Are they working now?—Yes.

2,975. Do they work all through the summer?—Naturally they work in the summer as well as the winter.

2,976. Do the 600 men work all the time?—That depends upon the requirements.

2,977. Can you tell us, roughly, what is the average number you employ throughout the year?—About 600 men and boys pass through our hands every year.

2,978. Yes, but you might only employ 400 for a month. I want to know the average number you employ throughout the year.—There is great difficulty in getting at it accurately, because sometimes we have more and sometimes less at work, but there are at least 350 or 400 boys at work all the year round.

2,979. Now, what kind of mining do these people really do?—I do not know; we have not done any mining at all. You know what a saline is?

2,980. The CHAIRMAN: I understand witness to refer to salt and lime works.

2,981. Mr. EVANS: Will you describe exactly what class of work these men do?—Agriculture.

2,982. No; I am asking about saline workers, and I want to know exactly what class of work they do?—Their main work is filling sacks. You know it is a process of evaporation, and these men fill sacks and work the petrol motors besides.

2,983. I am speaking still of these saline men. (To the interpreter:) Will you explain that to the witness?—Interpreter: The witness does not know what you are driving at, Mr. Evans. He mentions that he has employed on the farm and salt works a mean 300 or 400 men, and you are asking him what sort of work they do in connection with this salt business.

2,984. That is what I want to know.—You asked the class of work they do, and I replied for him that they are chiefly employed filling up the bags, etc.

2,985. Can you tell me roughly how many are employed filling the bags?—About forty.

2,986. How many are there employed on the salt pan?—Only about 50 altogether.

2,987. You state in your evidence-in-chief: "Many of these boys work on the railway from Djibuti to Abyssinia." Has the construction been finished?—Yes, the train has been running since January.

2,988. How long were they engaged in the construction?—It was commenced four years ago, and has been interrupted many times owing to the difficulties with King Menelik.

2,989. Had they any difficulties with their workmen?—No.

2,990. Have you had anything to do with the construction of this railway?—No, I have had nothing to do with it.

2,991. Are you aware that an attempt was made to get Coolies for the construction works there?—I never heard anything about it.

2,992. Now, where are these men who were taken from Somaliland to Madagascar? Are they still there?—Yes, they have been there ever since. They have been employed discharging cargo.

2,993. Are the Somalis employed in anything besides discharging cargo?—Yes, they employ them in the construction of the railways in Madagascar.

2,994. How many?—I believe they had between 6,000 and 7,000.

2,995. How many did they employ in railway construction?—The majority were so employed.

2,996. And why did they repatriate them?—Because the railway was finished—no, the railway was not finished—but the railway work was interrupted. The railway will not be recommenced for 18 months.

2,997. And are they going to employ Somalis when they recommence work?—I cannot say.

2,998. Can you explain why the French did not take Somalis to Reunion instead of Chinese as they are doing?—I cannot tell.

2,999. Are you aware the French are importing Chinese to Reunion?—I am not aware of it. I have not been there myself, and do not know what goes on there.

3,000. Are you aware that the emigration of labourers from French Somaliland would only be allowed with the consent of the French authorities?—Yes, I know that.

3,001. Do you also know that companies or agencies for Colonies or countries which are not French are bound to find security of 40,000 francs?—Is that for a certain number?—For an indefinite number?

3,002. Yes?—If the French Government have to deal with companies of good standing, the moment they have signed the contract, which includes repatriation of the boys, they are allowed to go without any deposit or guarantee.

3,003. When boys are taken to a foreign country?—I am talking of foreign countries. In French Colonies there is only one form to go through.

3,004. Does it apply to all their Colonies?—I am speaking of foreign countries.

3,005. You said there was only one formality. Does that refer to the other Colonies?—It is only to foreign countries.

3,006. Are you quite sure of that?—I am. So long as the Governor of the Colony is satisfied of the bona-fides of the company or corporation, it is all right.

3,007. And, supposing we wanted to bring these people here from Madagascar, could we do so without authority and putting up a guarantee?—It is prohibited.

3,008. There is no general condition as regards Madagascar?—Each Colony has to recruit and repatriate the natives, and is under the law of the Governor of such Colony. Each Governor has practically arbitrary power. The general laws of the Colony come from Paris, but the local affairs are run by proclamation of the Government.

3,009. Is there anything in the general law requiring security of 40,000 francs?—I do not know, but one thing is certain, that so far as Somaliland goes there is no clause of that kind.

3,010. We will go on with this statement. You say there: "They are physically sound, able-bodied, and wiry, and most energetic workers. They have not worked underground, but I am certain that they will do so." How do you acquire that certainty?—We explain most carefully to these people and their chiefs, in their own language, the work they will have to do, saying to them that they will have to go underground, and so forth, and they fully understand that, and those objecting to that would not be engaged.

3,011. What language has this explanation been made in?—In their own language.

3,012. What is their own language?—It is an Arabic patois.

3,013. You state here that you offered the W.N.L.A. 20,000 of these men, delivery to be taken and given in a port on the Red Sea?—I was advised to come to Johannesburg to treat about the matter, because I was informed the W.N.L.A. desired to see me on the subject.

3,014. I want to know who informed you that the W.N.L.A. desired to see you?—It came through second-hand. I had no official information from the W.N.L.A. that they wanted to see me, but through a friend of mine.

3,015. Have you copies of this correspondence with the W.N.L.A.? Have you the first letter you sent to them?—Yes.

3,016. Would you mind reading it?—No.

Witness then read the letter as follows:—

"12th June, 1903.

"Chairman of the Witwatersrand Native Labour Association.

"Sir,—I beg to submit for the consideration of the Association the following proposal for the supply of native labour, viz., for the consideration hereinafter named, I undertake to procure a minimum of 20,000 boys for work on the mines, or otherwise as desired, the term of whose service shall be three years reckoned from the date of engagement, and whose wages shall be one pound and ten shillings (30s.) per month each, with food, housing, and medical attendance when necessary. At the termination of the period of engagement, the boys to be returned to port of embarkation at the expense of the Association. All the boys to be either British subjects, or subjects of a State over which Great Britain exercises a Protectorate, and to be of full age and able-bodied. I engage to have these boys at a sea port or sea ports within 11 (eleven) calendar months from the date on which an agreement in writing is entered into between us, the name of such port or ports to be disclosed to you on the signing of such agreement. The consideration to be paid by your Association to me shall be the sum of £5 sterling per boy; to be paid to me at the port or ports of embarkation of the boys

by the Consul, or other representative of the British Government at such port or ports. On my notifying you that the boys are ready for embarkation, you shall, within 10 days, take delivery of them at the port or ports, whereupon I shall become entitled to receive the consideration in the previous section mentioned, and shall not be responsible for any further costs in connection with them. Kindly favour me with a reply hereto at your earliest convenience.

"Yours faithfully,  
H. S. BRENTANO."

"Please reply c/o Donaldson and Sievwright, 4 and 5, African Banking Corporation Chambers."

3,017. What reply did you get?—The reply was as follows:—

"June 19th, 1903.

"H. S. Brentano, Esq.,  
c/o Messrs. Donaldson and Sievwright,  
African Banking Corporation Chambers,  
Johannesburg.

"Sir,—With reference to your letter of the 12th of June, offering to procure a minimum of 20,000 boys for working on the mines, I have the honour to enquire whether these boys would be natives of Africa or not. Assuming that they are, are you prepared to quote a price at which you would undertake to bear all expenses of recruiting, shipment, and feeding until delivered, say, at Delagoa Bay? If your answer to this is in the negative, will you state what guarantee you are in a position to give that you will supply at least 20,000 natives within 12 months? It is evidently impossible for the Association to go to great expense in making shipping and other arrangements, unless it has substantial security that the labourers will be forthcoming.

"I am, sir, yours faithfully,  
T. G. WILLIAMS,  
Acting Secretary."

3,018. What reply did you send to this letter?—The following:—

"Johannesburg,  
June 22, 1903.

"Secretary, W.N.L.A.,  
Johannesburg.

"Sir,—I am in receipt of your letter of the 19th inst., and in reply to the first query therein, I beg to state that all the boys supplied by me will be natives of Africa. I regret that I am not in a position to undertake the delivery of the boys at Delagoa Bay, but as a guarantee that I will recruit, and have 20,000 able-bodied boys at the coast within 12 months of the date of any agreement we may enter into, I am prepared to allow you to retain in hand the following sums: viz., £2 per head for the first 5,000 boys, 30s. per head for the next 5,000, 20s. per head for the following 5,000, until such time as the whole of the 20,000 are delivered in terms of my letter of the 12th instant, such sum only to be claimable by me in the event of my fulfilling my agreement. I trust this will meet with your views."

3,019. And the next letter—did you get a reply?—Yes; I got a reply as follows:—I will read it.

"June 24th, 1903.

"H. S. Brentano, Esq.,  
c/o Messrs. Donaldson and Sievwright,  
4 & 5, African Bank. Corp. Chambers,  
Johannesburg.

"Sir,—In reply to your letter of the 22nd inst., I am directed to say no guarantee is offered by your proposal that we should retain in hand part of the commission proposed to be paid for the first 5,000 boys. The guarantee required is against this Association incurring loss by going to considerable expense in providing shipping and by your then being unable to supply any considerable number of workmen. For instance, what is required is a guarantee, say, of £5,000 that you would supply, say, 10,000 workmen within six months. In the event of your failing to do so, the guarantor to be liable for all expenses incurred by the Association in providing shipping, etc.

"I am, sir, yours faithfully,  
T. G. WILLIAMS,  
Acting Secretary."

3,020. What did you say in answer to this?—The reply was as follows:—

"Johannesburg,  
June 25th, 1903.

"Secretary, Witwatersrand Native  
Labour Association.

"Sir,—I am in receipt of yours of 24th inst. It was not my intention that any expense whatever should be incurred by your Association without value, and I am agreeable, in order to satisfy you on this point, that no steps shall be taken by you in the matter of shipment of the boys until such time as you receive a cable from the British Consul or representative at the port, that the boys are at the Coast, awaiting shipment, and I will pay the cost of feeding the boys for 10 days after the despatch of such cable. Such a cable will not be sent unless a full shipload is ready. It, therefore, follows that your expense would only start when the boys are actually at the Coast, but on my failing to procure same the whole cost of recruiting, etc., would be my loss and not yours. Being a stranger here, I am not in a position to arrange a monetary guarantee, and think the proposal, as made, costing me, as it will, a large sum of money, should be sufficient guarantee of my ability to perform my obligation. As I am desirous of leaving shortly, I shall be glad of an early reply.

"Yours faithfully,  
H. S. BRENTANO."

3,021. What did they reply to that?—It was as follows:—

"June 26th, 1903.

"H. S. Brentano, Esq.,  
c/o Donaldson and Sievwright,  
Johannesburg.

"Dear Sir,—I am in receipt of your letter of the 25th inst. Your proposal would afford us no security against heavy loss in case you failed to keep your engagements. We regret, therefore, we cannot entertain it in the absence of a responsible guarantee.

"I am, dear sir, yours faithfully,  
T. G. WILLIAMS,  
Acting Secretary."

3,022. Is that the end of this—how does the correspondence go now? I do not want you to give names, but I should like to know what happened after this?—So far as the W.N.L.A. goes?

3,023. All I want you to do is to give me the further negotiations. The last letter you read was 26th of June, in which the Association said your proposal would offer no security?—I have part of a private letter in which the Association made me an indirect offer.

3,024. Have you any objection to reading the whole of that letter excepting the first paragraph and the name at the end?—I will do so.

3,025. Mr. QUINN: I would suggest that we do not press the matter. But I should like some reason why the whole of that letter is not to be read. If we have not a chance of knowing the whole contents, then I submit it must not be read at all, or we must have good reasons why only a part of it is read.

3,026. Mr. EVANS: I have no objections to the letter being read, but I do not think it is right to bring private names out. I do not mind Mr. Quinn or any member of the Commission seeing the letter.

3,027. Mr. QUINN: I do not want to see the letter; I only want to know the reason why it is to be partly read.

3,028. The CHAIRMAN: Is this letter from the Native Labour Association and what is the date?—July 13th, 1903.

3,029. The witness then quoted from the private letter as follows:—"The form of guarantee which I propose to ask from Mr. Brentano would be some thing like this: You will remember his original offer was to guarantee a minimum of 20,000 within 11 calendar months. He should contract to deliver 20,000 at Aden, not less than 1,000 at a time, as it probably would not be worth while chartering a ship for less. For the first 5,000 we pay 40s.

"per head on delivery at Aden and a further 40s. per head as soon as 5,000 have been received, making £4 per head in all. From the fifth of the twentieth thousand we pay £4 per head for delivery. When the 20,000 are completed we pay the balance remaining, viz., £1 per head on all delivered. In addition to this we should require a guarantee from a bank or some substantial firm, up to, say, £5,000 that at least 5,000 would be delivered within a year. This is to guard against the chance, which, as I told you, I regarded as a probability that Brentano would deliver one or two thousand boys whom he might be able to pick up in Aden or the Coast towns and who would be useless for mining work, and would then fail to supply more. In this case we should have spent considerable sum of money on shipping only to bring here a couple of thousand men of a type absolutely useless to us. If he can really tap a genuine source of labour, it is a different thing. But in that case, he will have no difficulty in supplying 5,000 within a year."

3,030. Mr. EVANS: What reply did you make to that?—The reply was dated July 13th and was as follows:—"With reference to your previous letter regarding the supply of labour—

3,031. I do not require that to be read. Taking the first letter, would it be fair to describe that letter as a request for a free option to sell to the Association, somewhere in the Red Sea, on giving 10 days' notice, any number of boys up to 20,000 at a price of £5 per head?—Which letter do you refer to?

3,032. The Association quotes it as the 12th of June; there is no date on it?—There is a letter from the W.L.N.A. dated 30th of June.

3,033. Would it be fair to describe that letter of the 11th of June as a request by Mr. Brentano for a free option to sell to the Association somewhere in the Red Sea, on giving 10 days' notice, any number of boys up to 20,000, at a price of £5 per head?—

3,034. Mr. QUINN: Can we ask whether that description is—

3,035. Mr. EVANS: I am asking Mr. Brentano if that is a fair description of the contents of that letter?—I do not quite understand you.

3,036. The CHAIRMAN: Will you repeat the question to the witness in French?

3,037. Mr. EVANS: What I want to know is, did you ask the Association for a free option to sell to them in the Red Sea on giving 10 days' notice and at £5 per head?

3,038. INTERPRETER: Where does the free option come in?

3,039. The CHAIRMAN: Will you kindly put the question?—Yes, sir, but I must understand the question before I can put it.

3,040. The INTERPRETER then put the question to the witness again, who replied as follows: I will give you the general lines of the thing.

3,041. Mr. EVANS: In your other letter do you repeat the same request, and that payment by the Association should be by instalments?—Mr. Perry asked me to write a letter according to the terms and conditions indicated by him, if I were agreeable to accept them.

3,042. Has not Mr. Perry adhered throughout to the conditions contained in the letter of the 19th of June from the W.N.L.A., where he says: "It is evidently impossible for the Association to go to great expense in making shipping and other arrangements unless it has substantial security that the labourers will be forthcoming." My question was, has not Mr. Perry adhered to that point throughout?—Mr. Perry himself suggested that this payment by a scale would be sufficient guarantee, and asked me to put this down in writing, and I did so, and the moment I agreed to this scale of payment Mr. Perry immediately increases his terms and asks for a cash guarantee, so practically Mr. Perry did not insist upon that guarantee being assured.

3,043. Has not the Association, either through Mr. Perry or in any other way insisted on this guarantee from the commencement?—No. When Mr. Perry asked me for that guarantee there was no question of the £5,000.

3,044. Was that in writing?—The whole thing was a conversation carried on between Mr. Perry and myself. There was nothing actually in writing. Mr. Perry said: "Give me that in writing and say 'you accept these terms,'" and so soon as my letter was written the terms were increased. In regard to Mr. Perry's first question there was absolutely nothing in writing about that.

3,045. In the letters has the Association insisted on the guarantee?—Yes, after the first conversation we had they were insisted upon.

3,046. Was this first conversation before or after 19th June? Was that the time payment by instalment was suggested?—Yes, on the 11th June a conversation took place between myself and Mr. Perry.

3,047. But is it not rather curious that in the letter of the Association on the 19th June no mention of the matter is made, and the first mention is made in your reply?—Yes, but I explained that it was the result of the conversation with Mr. Perry, and it was at his request that I made the offer.

3,048. We will leave that. Without a substantial guarantee I should like to know how the Association could prevent you delivering to them for £1 boys collected in the coast towns of the Red Sea at an expense of 2s. 6d. each?—I want to know who told you I was going to recruit at Aden.

3,049. I did not use the expression "Aden," I said "coast towns."—It is impossible for a man to pick up boys in ports like that. You have got to make these arrangements with their chief and with them. I consider my offer, to make all the guarantees necessary, and to take all risks myself, fair enough, and the Association takes no risk at all. Until I delivered 5,000 boys I should only receive 20s. per head and the cost of recruiting would exceed that sum very largely, and if I did not stick to the terms of my contract I should lose a great sum of money. The costs of recruiting are very heavy, of which I will give the following explanation:—I should have to make large presents to the heads of the tribes and the chiefs, and affairs of this kind require a very large organisation. I should have to pay commission in different places and pay people to feed the boys from the day of their engagement till the day they were shipped. And as I should never deliver less than 1,000 at a time, and it is evident I could not engage them all in one day, I should be obliged to feed them for some time. There would be other expenses which I cannot mention in detail, but they will amount to a very fair sum. All these costs I should have undertaken free of cost to the Association if I had organised this business. Besides, there would be my travelling and living expenses, and I have told the Association that I would be prepared to transport the boys to Aden at my own expense. It must be evident from this that my expenses would be so heavy that they would exceed greatly the one pound (£1) per head which I would receive for the first 5,000 boys. I suppose these preliminary expenses would amount to £3 per head at least. I would only thus get back my money after the delivery of the first 5,000 boys—that is my preliminary expenses. From this it must be clear that I would stand to lose a large sum of money if I failed to fulfil the terms of my contract. I would, therefore, lose practically £10,000 on the first 5,000 boys. On the question of figures, I receive £1 a head and I spend £3, and if I did not fulfil my contract I should lose £1 per head. Therefore it is evident that I am risking quite a large sum in every £10,000. And it is evident then that if I was not absolutely certain of what I am doing, I should not have made this last offer because I stand to lose so much. I want the Commission to distinctly understand that I have not come to make a haphazard proposal. It is a position which has been thought out, studied and prepared. So far forward is the business that the date on which the

contract ought to be signed would enable me to cable to my agents, and the matter would be in hand even before I arrived in the country. I think it would be impossible to leave what I have undertaken there. What I wish to say, too, is that I have already been put to expense in coming here—my expenses for the last two months here—and my time is too valuable to waste it here for nothing. For all these reasons, I think, it would be evident, therefore, that my offer to the Association carries no risks so far as they are concerned, and from which they will only be able to get a great benefit, and I alone accept all the risks of this offer, and from my point of view the guarantees that I offer are amply sufficient.

3,050. I understand you to say that you will be £10,000 out of pocket on the first 5,000 boys?—Yes.

3,051. If you have that money why do you object to give the guarantee of £5,000 that the Association asks for?—It is because I am absolutely certain that I will be able to carry out the contract.

3,052. But what guarantee has the Association against the shipping risks? Supposing you inform the Association that you have collected 1,000 boys and they send a ship there, and afterwards it turns out that the 1,000 boys do not go, what guarantee have they against the risk—the expense of that ship?—Each time I cable that I have got a lot of boys at any port, that cable will be confirmed by the Consular authorities of the place.

3,053. Supposing the boys declined to come. Supposing they declined to go on board?—There would be no difficulty about that on the part of the boys who have voluntarily engaged. They engage before the Consul and before the chiefs.

3,054. Supposing there was a difficulty, the loss would be to the Association?—Nobody would lose. It is really of no service, because there is absolutely no need of the Association to engage chartered ships. We have got a five-monthly service coming down there to these different ports, and you can send them down in regular groups—even though they do refuse to go on board.

3,055. From what ports do you propose to ship the boys?—From Quilimane and Berbera.

3,056. But what guarantee have we that the boys shipped at Aden are not collected in Aden?—You have several guarantees. The first is this, that the contract will be made before the Consul at Aden or Quilimane. They will not land at all. They will be simply shipped direct.

3,057. And what ports do you propose to ship them from?—Djibuti.

3,058. What companies?—The Havraise Peninsulaire Company—the French Company there.

3,059. How often do they call at Djibuti?—Every month.

3,060. Where do they go to?—They generally go to Bashanga. It is a Company which picks up things there.

3,061. I see in your first letter you say all the boys are British subjects, or subjects of States over which Great Britain exercises a protectorate. What subjects are they—subjects from what countries or colonies?—They are taken on the English coast of Somaliland.

3,062. Do you say that the Association desired British subjects?—Their desire is that they should be British subjects.

3,063. Did the Association decide that before you made the very first offer to them on the 12th June?—Well, from the beginning—from the commencement—the Association said it was their wish that these boys should be recruited in British territory.

3,064. I am asking you was that wish expressed before you wrote the first offer to the Association?—I said from the commencement.

3,065. Was it before?—It must have been before.

3,066. Are you sure that it was before?—Yes, it was before.

3,067. You refer in your letter of the 25th June to the following: you say that no steps should be

taken by you—that is by the Association—in the matter of shipment of the boys until such times as they received a cable from the British Consul. What British Consul is that? The British Consul where?—The Commissioner.

3,068. The Commissioner of Somaliland?—It should be the Commissioner.

3,069. Where would that be, at Berbera?—Yes.

3,070. Do I understand that these are Somalis—these people whom you are bringing here?—Yes.

3,071. Now, I want to give you an opportunity of explaining this. Are you aware that in 1900 and 1901 two batches of Somalis, numbering over 600 were recruited on the Red Sea coast for the Rhodesian mines?—Yes.

3,072. And that 453 of those 600 deserted, either on their way to Rhodesia, or soon after their arrival there?—Yes, I know, 453.

3,073. And that 18 had to be sent back from Beira as worthless vagrants. And that 24 had to be returned owing to their inability to stand the climate, and that 42 died, and that only about 60 out of the 600 completed their term of service. Have you heard of that experiment?—I heard of an experiment which took place in 1900 and 1901. The reasons for returning these men are not stated.

3,074. Can you give us your reasons for returning them?—What I heard was that a certain number of boys from the Somali Coast to Rhodesia were engaged, and these boys were engaged to work coal on the ships. When they arrived at Aden they were put on another ship, and sent off to the Rhodesian mines without having been told anything about it. When those boys arrived, they were put to work at over-ground work, and they said nothing, but shortly after that they tried to send them down below. This they absolutely refused—and then they had to be engaged for that sort of work as they had only been engaged there to go and load coal into the bunkers of the ships. They had been engaged to coal the ships and not to work in the mines, and that is why they demanded to be repatriated. They said actually the boys there could not show very excellent results, as they had not been actually engaged to work either in South Africa or in the mines.

3,075. Where have you got that information from?—The recruiting agents of the boys at Somaliland and the boys at Beira. The agent recruited boys to coal ships at periods, and he was given a commission.

3,076. When did you get this information; since your arrival here?—Before.

3,077. You were acquainted with this experiment before you arrived here?—Yes.

3,078. Now, what do you know about the conditions of recruiting in British Somaliland?—I would like the question elucidated.

3,079. Are there any conditions; it is permissible to recruit in Somaliland?—Under a few conditions.

3,080. What are the conditions?—In the contract that is to be made with the companies for employing these boys, it must be distinctly stated that the boys should be paid regularly, and their annual salaries guaranteed. And they mention also in the contract that the boys should be repatriated after their term of service is ended.

3,081. Is that all?—Yes.

3,082. Would you, as a recruiter, be under any obligations in recruiting in Somaliland?—What obligations would a recruiter in British Somaliland have to undertake?—I have told you.

3,083. Those are all?—Yes.

3,084. Do you know that on November 19th, 1900, the Commissioner of the Somaliland Protectorate, issued regulations with regard to recruiting of natives in British Somaliland?—The regulations which you mention were communicated to me this year.

3,085. Have you a copy of them?—No.

3,086. Are you aware that clause 2 provides that no person shall be allowed to recruit or enter into any contract or agreement with any native of the Protectorate to leave the Protectorate without the previous sanction of the Consul-General? Are you aware of that?—You mean without the permission of the Commissioner?

3,087. Yes?—I have permission already.

3,088. What did you pay for that permission?—I paid nothing. I have an understanding with the Commissioner.

3,089. Is there another clause in these regulations which requires a recruiter before he gets a permit to furnish a security of fifty rupees for every native he recruits?—Not that I know of. I have never seen the regulations, and I have never seen anything of the kind.

3,090. Do you also know that in the regulations there is a fee of ten rupees charged for a period of engagement exceeding two years—payable to the Government?—I think the information must be wrong, because it is my belief the term is three years, and that is why I made that period three years. I believe that you are in error in your statement that two years is the limit. Three years is the limit, and that is why I made that limit in my offer so as to avoid having to pay the excess there.

3,091. Two years is the limit?—I say you are wrong. According to the regulations which I read, it is three years.

3,092. Do you know of the security of fifty rupees for each native?—The Commissioner told me that there was no security to be given for a three years' contract.

3,093. Then you would have nothing to pay to the Government if you recruited boys in British Somaliland?—No, on the condition that they were repatriated at the end of their term.

3,094. Then, if that is so, how many boys do you really think you could get from Somaliland?—I say 20,000, but if I was allowed to recruit where I chose, I could get 50,000 in two years.

3,095. Then what have you to say to the following telegram from the Commissioner of Somaliland, dated the 28th of last month?—"Referring to your telegram, No. 3512, all available Somaliland labour is at present required for local works in connection with military operations, and even for this purpose sufficient supplies are not procurable. In any case, I consider that Somalis are not suitable labourers in South Africa." What have you to say to that?—I state that I am in a position to know the condition of the country as well, if not better, than the Commissioner. The Commissioner is exaggerating in his remarks. 4,000 to 5,000 boys have been engaged now as porters or carriers, and, furthermore, I know about that cable too. What the Commissioner states about the Somali boys not being of any use to the mines, I am of a better opinion than the Commissioner possibly, because I employ the boys myself. I traverse the Commissioner's statements entirely.

At this stage of the sitting, the Commission decided to take the evidence of Colonel Harding, C.M.G., who was anxious to get away. The Commission agreed to take his written statement without examining him upon it.

COL. COLIN HARDING, C.M.G., called, sworn and examined.

3,096. The CHAIRMAN: You are Colonel Harding, I understand?—Yes.

3,097. You are Commandant of the Barotse Native Police?—Yes.

3,098. You have a statement before you which is headed "Statement by Colonel Harding, C.M.G., Commandant of the Barotse Native Police?—Yes.

3,099. Is it your wish to hand that statement in to the Commission as your evidence-in-chief?—Yes.

3,100. Colonel Harding's statement was then handed in to the Commission and read as follows:—

I have been in Rhodesia since March, 1894, and during that time I have held a Commission in the Imperial Forces of this country since 1896. I was a Native Commissioner in Mashonaland in conjunction with my police duties in 1896, whilst in 1899 and 1901, I was Acting Administrator in North-Western Rhodesia, as well as Commandant of the Police Force in that country. My duties in North-West Rhodesia have necessitated my continual travelling through the whole of that country, and quite recently I have carried out a protracted patrol through the Mashukulumbwe Country and other portions of North-Western Rhodesia, from there I travelled to Barotse and proper, and, in fact, only left the capital of that country Lealui, and the residence of the King Lewanika a fortnight ago.

The remarks which I am about to make with reference to the supply of labour by the natives in North-Western Rhodesia, are made to the best of my belief, and based on facts which have come personally to my notice, through my numerous journeys through that country, and are made quite unbiassed and independent of the Administration of either North-Eastern Rhodesia or that of the Administrator of Southern Rhodesia.

In speaking of the natives of North-Western Rhodesia, though there are numerous tribes all owing allegiance to the Barotse King, I shall, to avoid confusion, divide them into three distinct tribes, viz., the Mashukulumbwe, Batoko, and Barotse. The Mashukulumbwe, if you refer to the map of North-Western Rhodesia, live on each side of the Kafue River, and together with smaller tribes living in the same radius, form a considerable tribe of fine stalwart men. No census of this tribe has yet been taken, and it is impossible to make an even approximate estimate of their numbers. The Mashukulumbwe, at the present time, live in their kraals, they have cattle, and their time is mainly spent in hunting. They have had little contact with white men, and until the last three years it has been hardly safe for white traders to visit their country. Though never hostile, they would on occasion either blackmail or possibly rob or isolate a trader, and to-day it is with the greatest difficulty that they can be taught to carry loads, even for Government officials on patrol, and have absolutely no idea of the responsibility of a contract, and though engaged to work for a month or to carry loads for a distance of a hundred miles, would see no harm in leaving their employer before the expiration of their contract, or leave the loads which they had engaged to carry, half way on their journey, and the enraged owner in a hopeless condition. Until quite recently the majority of the Mashukulumbwe men wore no clothes whatsoever, and even now invariably you meet a considerable number of this tribe in the state of nudity. Few have crossed the Zambesi in quest of work, and it will be some considerable time before they will be reliable workmen in their own country. The Northern Copper Company have employed more Mashukulumbwe than any other people; they are still extremely short of labour, and at the time of my visit to their headquarters in April last, bitterly complained of the scarcity of labour, and the ignorance and rawness and unreliability of the Mashukulumbwe who had been engaged to work in the Copper Mines, or on the surface, as the case may be. I have no doubt that in the course of a few years this tribe will get more accustomed to the white man in the ways of civilisation, and will gladly work, but even when this happy state of affairs has arrived, the Copper Company should require all the available labour in that district, and not only that, they will have to go further afield to obtain the necessary labour to carry out the huge developments which are contemplated in those districts.

The Batoko tribe live directly north of the Victoria Falls, and extend on the north bank of the Zambesi to the junction of the Kafue and Zambesi Rivers. A part of this tribe is often

confused with the Zambesi natives, though, of course, the Zambesi natives live generally east of the confluence of the Zambesi and Kafue Rivers. The Batoko tribe have, for some years, in considerable numbers immigrated to Southern Rhodesia, the Transvaal, and Kimberley. I was through the Batoko District a few months ago, and was struck by the limited number of available men who were seen during my journey through that district, having often great difficulty in obtaining sufficient carriers to transport my loads from one village to another. There is no development of any extensive character in the Batoko country, but a considerable number of natives are required to work at the Government camps, and also are used as carriers by the different prospecting parties which are now engaged in that district. No doubt, in course of time, here, as in the Mashukulumbwe country, there will be more available native labour, but with the ordinary development of the country, more labour will be required for immediate use, and it is useless to look for any extensive exodus of labour from this place either for the Rand or South Rhodesia.

The Barotse are a far more numerous tribe than either the Batoko or the Mashukulumbwe. A considerable number of the Barotse have already proceeded to work at different centres south of the Zambesi, and I have repeatedly met them at Bulawayo, and also at Johannesburg, Kimberley, and other places, where, I believe, they have proved diligent and intelligent workmen. King Lewanika does not encourage the emigration of his people to such distant places as Johannesburg or Kimberley, and, due to that fact, there are several Barotse working in those centres, who go under different names. The same remark applies to the Marotse who work at Bulawayo. Recently a considerable number of the Barotse natives have obtained work on the construction of the railway between the Falls and Bulawayo, a class of work which they much prefer to underground employment. Others are employed at the Wankie Coal Mine, and here, when speaking to the manager the other day, he informed me that the work at the mine was practically at a standstill through the scarcity of native labour. A large number of the Barotse are continually employed on the river, where, in their small dug-out boats, they take the majority of transport from the Falls to Lealui, both for the missionaries, who have a Colony at that place, and for the traders, who ply an energetic trade with the natives living in the Barotse Valley, buying cattle, etc. The Barotse Valley is the most thickly populated district for its size in the whole of North-West Rhodesia, but whilst the people in the valley prove excellent oarsmen, they are of little value for mining work, due to the fact that they live in a tropical climate, and feel the cold at places such as Johannesburg and Kimberley, more than the natives who live further east. Already Lewanika has been approached by the organisers of the railway between Bengwala and Tanganyika to supply labour for that railway, and I am told by Lewanika that when that proposed line comes into his territory, he will use every endeavour to provide the necessary labour.

Immediately north of Lealui, between the Ke-bompo and Zambesi Rivers, the country is not thickly inhabited. This is due to the fact that for a considerable number of years slave trading has thrived unchecked in that district, and during my visit to that district two years ago I was particularly struck with the number of old deserted kraals which had been raided by Behain slave traders and the inhabitants, regardless of sex, taken to the West Coast.

The Tanganyika Company, who have considerable property close to the Belgian border, E.N.E. of Lealui, require all the available labour which is to be found in the head waters of the Kafue and Lunga Rivers. The Tanganyika Company are continually applying to Lewanika and the Government for necessary labour to carry on the development of their copper mines and from the Barotse tribe and the others living immediately in the Barotse country, I can hold out no hope

that labourers in any considerable number will need to seek work south of the Zambesi River, provided the industries north are prepared to give a fair wage and guarantee good treatment. I have referred to the fact that Lewanika does not favour his people going so far south to obtain work; the reason of this is because a large number never return to his country, and consequently his power as a chief is diminished.

On the other hand, Lewanika does not oppose or take any forcible steps to stop his people seeking work wherever they may feel inclined. Lewanika was asked some time ago to tell his people to work at a certain mine, but he replied that the money would talk and the treatment they received, meaning, of course, that natives would seek labour where they received best pay and treatment, and he was powerless to stop them or to insist on their going to that place or this.

By the few remarks which I have made I have clearly shown, or at least it was my intention to show, that from North-Western Rhodesia it is useless to expect a great exodus of labour either for the Rand or elsewhere. A great portion of the country in North-Western Rhodesia is, practically speaking, unexplored, and it will be some considerable time before the natives will voluntarily leave their homes to seek work. By such time as the natives are sufficiently civilized to seek work, there should be, if the expectations of mining experts prove correct, sufficient work for all male adults in the country without their seeking employment elsewhere. In North-Western Rhodesia there are considerable tracts of country particularly adapted to agriculture, and at the present time there are considerable requirements for grain and other local produce. At the time of writing the price of grain at the Victoria Falls is in excess of the price at Bulawayo, and, to earn money (whether it is for the sake of purchasing clothing or to pay any tax that is imposed by the Government), the natives are more inclined, in some instances, to stay at home and superintend the planting, clearing and enlarging of their respective gardens than taking a precarious journey to Southern Rhodesia or elsewhere.

At all events it is my opinion that in Southern Rhodesia it has yet to be proved that gold mining is the be-all and end-all of the resources of that country, and it is just as desirable for a native to remain at his kraal and provide by extensive husbandry sufficient food for the extensive requirements which follow the settlement of a white population in his country as it is for him to go further afield and seek such employment as necessitates his paying for the requirements of his daily wants and his obligation to the Government in the shape of hut tax.

No Government will for a moment tolerate forced labour, and by that I presume the meaning of the words "forced labour" is that no native will be forced to work against his will, and that, on the other hand, no native will be forced to obtain his work in any particular province or country in South Africa. A native's labour is his capital, and he is allowed to take it to the best market, but I consider it is the duty of the Administration in any province to see that natives are made acquainted with a true state of the facts relative to the country where they are employed, whether they go alone, or leave in charge or under the direction of a labour agent. Often natives from one province are induced to seek work in another country under false pretences, and by that I mean that the true facts of the case relative to the value of a sovereign are not made known to them. For instance, the current wage in North-East Rhodesia is from 5s. to 10s. per month, and they are told that in the Transvaal they can obtain £2 or even more per month, but they are not informed that whereas in North-East Rhodesia they can buy a fowl for half a yard of calico, in the Transvaal or Southern Rhodesia such a bird would cost half-a-crown; or whereas in their own country they can obtain fish for next to nothing, further south they are unprocurable.

I feel sure that natives would come in more readily to work if there was some provision made for them on the main roads or foot-paths by which they travel, and this applies particularly to Rhodesia. Often natives seeking work have to travel days without food, and I am informed that when they arrive at their destination they are in such a condition that they are unfit for work for a fortnight.

Again, natives who have completed their contract in a satisfactory manner should be assisted on the return journey to their homes as much as possible. Stores or rest houses would accomplish this, for though we presume that a native, after completing his work, has, or should have, if he is careful, a considerable amount of money, it is absolutely useless unless there are places where he can purchase the necessities of life as he proceeds to his home.

With reference to the management of natives on mines, or, in fact, when engaged in any work, we find invariably that where one property or one master is constantly complaining about the scarcity of labour, another employer living in the same district has sufficient and more than he really requires. This points to the fact that on some properties the natives receive better treatment and are better cared for than on others. I am of opinion that in some cases the treatment of natives, when in employment, can be improved, and improved not by any outlay of money or extensive expenditure, but by studying the habits and customs of the different tribes where the native migrates from and by enabling them, both in food and accommodation, to live on their compounds as much as possible in the same way as they would at home, in every case allowing them more food than they would usually get at their kraals, as the work which they undertake at the mines is considerably harder than their ordinary vocations in their own country. I have been informed that at the majority of the Rand mines the food given to the native employees is beyond criticism as regards quality and even quantity, but this is not the case everywhere, and even where food is given which both in quality and quantity is satisfactory, it is not the food which the native has been brought up on and accustomed to. It is very hard for a native who has constantly lived on manja (manioc) to be fed entirely on mealies. The fact of keeping tribes as much as possible separate and of giving them, when possible, comfortable huts with wood fires instead of huge corrugated barns with hot water pipes would have a good effect.

As you are aware, the popularity of a mine or any other work, mainly depends upon the white men who are in charge of the natives employed. The compound overseer or manager should be a kind of father, ready to hear any complaints and personally make himself acquainted with the men under his charge. I have repeatedly heard, from boys returning from work, complaints against foremen who are in charge of them underground; men who have no knowledge of any Kaffir language and little of English give an order which is not understood, consequently there are aggravating and silly mistakes on the part of the native in carrying out such an order. Such white men have no dignity and are not consistent; often at times too familiar and at others too severe. One native going to his home with complaints and generally dissatisfied, will do more harm in the way of discouraging natives from seeking work than 50 who return to their kraals satisfied will do good. Too much care cannot be taken in all work to avoid accidents. Recently, on my way to Bulawayo, I met more than one native who was returning to his home seriously maimed and who complained to me that they were unable to walk and could obtain no food to see them to their homes. These cases, I believe, occur more often in the case of natives working for small sub-contractors than when employed in any responsible Company; nevertheless they are liable to cause a lot of harm and are injurious to the employment of voluntary labour. The injury is indirectly felt by other Companies who realize that it is to their advantage to treat their employees with consideration and fairness.

17133

By the remarks which I have made, I do not mean or intend to dictate, but I simply throw out suggestions and repeat facts as they are represented to me by the natives themselves, when, in a legitimate way, I have, recognising the necessity of all natives doing their share of work, advised them to go in search of same. Though every Government or Administration recognises, and is always willing to act in an impartial way, for the exodus of natives from its province to seek labour, it must be borne in mind that the charm of governing natives is gone as soon as they in any numbers leave. They leave their country to seek employment as ignorant and tiresome children, but return offensive and often rebellious men, who disregard the word of their own chiefs and ignore the word of the authorized authority of their own country, having learnt during the period of their employment all the vices of civilization without its redeeming influences.

3,101. The CHAIRMAN: Colonel Harding, the Commission is very much obliged to you for preparing such a full and complete statement, and, considering that you have been kept in Johannesburg for a day or two beyond the time that we proposed to hear you, we are very much indebted to you for coming and tendering your statement. Is there anything you wish to add to that statement?—No, sir.

The Chairman again thanked Colonel Harding, who thereupon withdrew.

Mr. HUGO BRENTANO'S cross-examination was then continued.

3,102. Mr. QUINN: Can you give the Commission any estimate of the cost per head of bringing these natives from the ports, and delivering them to the mines here?—The average price would be £3.

3,103. You mean shipping and everything?—Do you mean the cost from port to port?

3,104. After you have handed them over to the steamships, what is it going to cost the mining people to bring them from that point right on to this point?—I reckon £3 over and above their food.

3,105. Shipping, railage, and everything?—I do not know the cost of the railway transit. That which I have given you is from the port of departure to Delagoa Bay.

3,106. And food in addition to that?—Yes.

3,107. Would it be safe to take them from one port to the other for £4 per head, food included?—It would not cost so much as £4, food included, from the port of departure to Delagoa Bay. Mealies are very, very cheap.

3,108. Do you think that any considerable proportion of these boys would remain longer than the three years?—I calculate that an average of 20 per cent. would re-engage.

3,109. And now is it correct to say—with regard to the question of the class of work they have been accustomed to—that they have been accustomed to working in boats and steamships, and stokeholes, and work of that class?—They are exclusively employed at discharging boats and at that kind of work.

3,110. How does the climate they have been accustomed to compare with what you know of the climate here?—It is unquestionable that the climate of Somaliland is hotter than this, but the country is barren and the natives are in the habit of going inland to Amhara, in Abyssinia, which is a high country similar to the Transvaal and where there is frost and snow in the winter.

3,111. These boys come from an Arab stock which is an exceedingly sturdy one, and they can stand the climate of Madagascar which is also cold?—Yes.

3,112. With regard to the recruiting, is that a reasonable estimate of yours that it will cost you £3 to get your boys ready for shipment?—For the first 1,000, I do not think it will be done under £3 per head.

K

3,113. By accepting the £1 you would stand to have a very big loss on the first lot?—I say, as a matter of fact, it would only be after I had recruited 5,000 boys that I would be able to get back my own, because I would be a loser on the first 1,000. I get £1 on the first lot, and it costs me £3.

3,114. Coming to your dealings with the Witwatersrand Native Labour Association. Judging from the correspondence I have listened to, and the statements you made, I gathered your Association has been a little bit shifty in its transactions over this matter, and in its dealings with you?—I was rather surprised at the change of front of the Association, which was shown in the different correspondence.

3,115. Do you think in your dealings with the Witwatersrand Native Labour Association, if you had been, or were in a position to put down £5,000, they on their part would have been willing to go on?—I think so, because, according to my information they have agreed upon the principle of the thing, so there is no great squabbling over the principle of this guarantee.

3,116. Now you have listened to a good many questions from Mr. Evans this morning, and you have been asked questions which seem to point to the unsuitability of many of these natives?—I recollect the argument.

3,117. Were any of these arguments and these statements brought before in your dealings with the Witwatersrand Native Labour Association. Have they ever been brought to your notice until this morning?—The Association made the same statements as Mr. Evans did.

3,118. So that you knew all about them before you came up?—Yes.

3,119. When did they make those statements—at the beginning, or did they come on afterwards?—The very first day.

3,120. Now, coming back to numbers. You undertook to supply 20,000 in one year?—Yes.

3,121. On a three years' engagement; and I think I heard you say something about the possibility of a great many more than 20,000 being obtainable?—If the Association will not bind me to recruit in the British Protectorate of Somaliland, I will undertake to obtain a minimum of 50,000 men in two years.

3,122. Now, would it be possible for you to reduce the price in the event of a larger number being taken?—If I was sure of the undertaking to recruit 50,000 men in two years, I would look into the matter of the reduction in price and consider it.

3,123. In the event of an arrangement being given to you at once—say, in a week or two—how many boys could you send in the first lot?—The first arrivals would take place within a month of the signing of the contract.

3,124. Mr. TAINTON: How long have you been in Somaliland?—Off and on for four years.

3,125. Were you the first man to start recruiting there?—I have not recruited myself.

3,126. Has there been any person in Somaliland recruiting natives and sending them out of the country previous to your beginning to do so?—I have not recruited there myself, but men were recruiting there for Madagascar as far back as 1898.

3,127. You have never recruited there before?—Not for export.

3,128. You have no experience of the business personally?—I know the boys, I know the regulations, and I know exactly what to do.

3,129. Have you any personal knowledge of this Madagascar recruiting?—From what point of view?

3,130. Have you any personal knowledge of the number of boys sent out, or do you know anything about it?—I have already mentioned the fact that boys were sent to Madagascar for the construction of railways and other things, and I, myself, am not recruiting.

3,131. But you know that merely as a fact, just as I or any other person might know it?—With this difference, that I have been to Madagascar, and seen the boys working on the railways.

3,132. You had nothing to do with the actual work of sending them there or recruiting them?—No.

3,133. You have no personal knowledge of the results—how many were sent on, and how many were sent back, or anything of that sort?—No, I cannot give you the exact figures, but I have seen the boys working there, and they have not had a very heavy—

3,134. Can you tell us how many were sent out to Madagascar?—About 6,000 or 7,000.

3,135. Who gave you those figures?—I got those figures from friends of mine in Madagascar, who were charged with the work of recruiting.

3,136. Were the natives sent from French Somaliland?—They recruited them between French and British Somaliland.

3,137. You wish now to recruit in British Somaliland?—Yes, simply because the Association has been appointed.

3,138. Have you been actually in the country of British Somaliland for four years?—I know the country.

3,139. Have you been in British Somaliland for four years?—I never said so.

3,140. How long have you been there?—I have already answered that question, and I have said that I have been there off and on during the last four years; going backwards and forwards, but my partner has been there for over six years.

3,141. Are there any mines in British Somaliland?—No.

3,142. The natives are not accustomed to mining?—There are some only who have done prospecting in Abyssinia.

3,143. Are they intelligent and educated people?—They are not educated; they do not go to school. They are as intelligent as any black race can be.

3,144. It would be difficult to explain to them what a mine was?—They are not quite capable of understanding, but after you have explained a thing to them, they are quite capable of understanding.

3,145. They are accustomed to heavy work?—Coaling, which is fairly heavy work.

3,146. Can you get 20,000 boys accustomed to coaling, at a Somali port? You make a statement that those boys are accustomed to arduous labour—accustomed to coaling work; is there any port in Somaliland where there are 20,000 coaling boys employed?—No.

3,147. Where do you propose to get the 20,000?—In Somaliland.

3,148. Inland?—On the coast chiefly. I have not gone very far into the Eastern area.

3,149. It is a Protectorate; and there are native chiefs there?—Yes.

3,150. You propose to get the boys from the chiefs?—I am always obliged to refer to the chiefs.

3,151. I think you said you made them large presents as part of your expense?—That is part of the expense.

3,152. Is the authority of the chiefs very strong; is it unimpaired; have they full control over the boys?—They have sufficient control—a certain authority.

3,153. And do the chiefs send these boys out?—I have had interviews with several of the chiefs there, and I know the number of boys that I can get from these chiefs.

3,154. You have no very great experience of Somaliland, but you propose to go in and deal with these chiefs for a certain number of boys by giving these chiefs presents. Is that your scheme—I have

already stated that my partner has been there for six years. He knows the people and the country, and speaks the language and all the dialects well, and he would undertake the work. As to the question of presents, it is the usage of the country there. The presents are part of the expense, but that is not the actual means of recruiting.

3,155. Then all the evidence which I understood you have given us here this morning is second-hand, and is obtained from your partner?—I have picked up a great deal of it myself, and a great deal of it my partner knows, and, furthermore, we cannot all come here to give evidence.

3,156. Your partner is the man living in Somaliland, from whom you have derived a great deal of the information you have given us this morning?—Yes.

3,157. You, yourself, have no direct means of obtaining information from certain chiefs as to the number of boys procurable from these chiefs, by giving them certain presents?—Giving presents is merely a formal matter. You have to go and make your contracts with the chiefs, but the question of presents is not for actually obtaining the boys.

3,158. The boys come voluntarily without these presents?—It is the chiefs who get these presents.

3,159. These chiefs exercise a good deal of arbitrary power over the boys. I want to get at the influence exercised by the chiefs?—It is their good will.

3,160. You have never had any personal negotiations with the chiefs for boys in Somaliland?—Yes, my partner knows all the chiefs. I myself have visited a certain number:

3,161. I want to know whether you, yourself, have had any dealings with any of the chiefs in Somaliland with respect to the recruiting of boys. Have you ever had any experience?—I say that my partner knows them all intimately, and that I, myself, have visited a certain number of these chiefs, and conferred with them on these matters.

3,162. Have you ever obtained boys from these chiefs?—I have never really sent any boys away. We have been to see whether we could obtain boys through them and in what number.

3,163. You have not, therefore, entered into any arrangements in connection with your scheme in Somaliland previous to your coming here to submit this scheme. You do not know from your own experience whether it is a practical scheme or whether it will be successful?—I visited these chiefs there, and from what I gathered—and everything else—I based my statement that I could obtain 20,000 boys.

3,164. The CHAIRMAN: Mr. Brentano, the Commission is very much obliged to you for the evidence you have given it to-day, and we regret that you have had to wait for so many days before we could call you.

The Commission adjourned at 1.15 p.m. until 10.30 a.m. on Tuesday, the 11th August, 1903.

## ELEVENTH DAY.

*Tuesday, 11th August, 1903.*

THE COMMISSION SAT AT 10.30 A.M.

Mr. DOUGLAS H. FRASER, called, sworn and examined.

3,166. The CHAIRMAN: Mr. Fraser, are you a resident of Bloemfontein or of Basutoland?—Weponer, I call my present place of residence.

3,167. You have been in that part of the country for many years, I understand?—For 27 years on and off.

3,168. Are you still carrying on business in Basutoland?—Yes, practically all over Basutoland.

3,169. Have you a statement before you headed "Evidence of Mr. Douglas H. Fraser, Bloemfontein"?—Yes.

3,170. Do you wish to hand that statement in to the Commission as your evidence-in-chief?—Yes.

3,171. Mr. Fraser's statement was then handed in to the Commission, and read as follows:—

(1 and 2). I am best acquainted with Basutoland and Baralong territory and the Orange River Colony, having been a resident in the latter place 27 years, and am still living there.

(3). In my opinion the Basutos are the hardest and the most industrious of any of the South African tribes.

(A). They are a pastoral and agricultural race essentially, and any extraneous labour they undertake seems with the fixed intention of increasing their flocks, herds, and lands. The bulk of the money earned is spent in cattle, sheep, goats, horses, and ploughing material. They have supplied Kimberley with labour since the opening of the mines, also Jagersfontein, the Orange Free State, and Basutoland has been the granary of that part of South Africa when imported produce was unknown, and the Boers ploughed and sowed but little.

(B). Their usual food is mealies, kaffir corn, and beer, which in the form of "letting" is both food and drink; also pumpkins, peas and potatoes, but they are living more on wheaten bread than formerly. They rarely kill animals for food, but meat is a great attraction.

(C). The few employed in their own country are paid from 15s. to 40s. per month and food. The number of skilled labourers is so small, as not to be worthy of mention.

(D). They are somewhat small in stature but hardy and wiry and good horsemen. Pulmonary complaints seem to be on the increase, owing perhaps to the use of European clothing, and work in towns and mines.

(E). The Basutos never went freely to the Transvaal mines even before the war. They objected in Kimberley to underground working at first, but having got used to these mines and Jagersfontein, they have become regular workers there. They have gone also to Cape Town and Port Elizabeth, and to any railways which may be built, and very largely as grooms, house-boys, and the many forms of employment which towns offer. They are intelligent enough to know where pay is best and the condition of labour pleasantest and least exacting; they accordingly go there. No native in South Africa goes to work without some definite object, or unless it be to supply some definite want. On the opening of the Kimberley Fields, they were offered and freely supplied with guns as an attraction to induce them to work there and in Cape Town. Labour was then as scarce as now. Civilization and schooling create wants, but unfit them for such work as in the Transvaal mines. Educated natives will rarely take such work. There is only one industrial school in Basutoland, and that is a small one, but there are numbers of mission schools. 1

am unable to give any statistics as to the numbers which have left to work. These will, no doubt, be furnished by the Basutoland Government. They will serve to prove that although not going to the Transvaal mines, they are going freely elsewhere. In addition to supplying labour, Basutoland exports to the O.R.C., Transvaal and the Cape Colony, large quantities of wheat, kaffir corn and mealies. The amount of labour in connection with the production of these quantities of grain is very considerable. They have to give their chiefs a certain amount of labour. There are many complaints from those who went to the Transvaal mines before the war as to the quality of food, bad housing, scurvy, sickness and mortality, indifferent treatment at the hands of ignorant overseers who do not understand their language or ways, six months' contract, no settled rate of pay. Since the war few complaints are heard, especially now wages are fixed definitely at £2 10s. and £3 and other conditions certainly ameliorated, nor do I hear of any complaints or refusal to go underground; but the principal deterrent to-day preventing Basutos from going now freely to the Transvaal is the length of contract. They do not care to leave for six months; they must plough and sow and the chiefs do not encourage them leaving for so long a time. I have suggested to the Witwatersrand Native Labour Association the importance of altering their contract to three months, and feel sure the result would be satisfactory. A general complaint, too, is the length of the month, which the natives say has often five Sundays. I think there is still room for improvement in food. Hundreds of tons of musty and damaged grain come to the Transvaal and are quite unfit for horse food or mules, and what becomes of it?—Sufficient care is not given to provide sweet and fresh meal. A large quantity supplied to the mines is quite unfit for food.

**MORTALITY.**—I consider the rate too high. One chief has in the past month prohibited recruiting owing to some of his men dying. There is a greater demand for labour in Basutoland than there has ever been before, and in one camp I have noted labour agents for as many as ten different companies and organisations at one time. Some of these are the following:—The Witwatersrand Native Labour Association, the Jagersfontein Mines, De Beers Mines, Indwe Coal Mines (Cape Colony), Lace Diamond Mines, Koffyfontein Mines, Robinson Diamond Mines, Vereeniging Coal Mines (and others in that neighbourhood), Military and Remounts, Railway Maintenance and Railway Construction, Bloemfontein and Johannesburg Municipalities, and, in addition, prospecting and construction all over the country in every village absorbs a very large number, and many from the mountains on the east of Basutoland go to work in Natal. These employers of native labour are all paying on a parity with rates offered by the Transvaal mines, which are the furthest off and offer the least attraction. No native can be expected to go to the Transvaal on a six months' contract when he can get the same price without any contract, near his home. I consider the number now out at work a fair average, and a greater number will probably not leave. For any special work, such as railway construction near their homes, numbers would go out who otherwise would not go to the mines or further afield. There are always numbers who will go and squat with the Boers in preference to any other labour. They take their stock with them which multiply as they will not in Basutoland; they plough and sow and seldom get any monetary wage. Older men go to this work, and the Dutch being short of cattle are glad to have any family of natives who will bring their cattle and plough and sow. The country is densely populated for South Africa, and every available land ploughed. I am of opinion that polygamy is on the decrease, the natives finding that they have at times to support their families instead of their family supporting them, as was the case when the lands were plentiful and crops good. The fact that the climate is a rigorous one, and the country becoming yearly more populated and the lands less productive, makes it more of a necessity that the population should go to work.

AS TO THE BAROLONG TRIBE, remnants of which occupy the territory known as the Moroka in the neighbourhood of Thaba 'Nchu, these are practically Bechuanas, and in physique an inferior race; they very rarely go to the mines, but engage in country and town work in the Orange River Colony, and live on farms or in town reserves. Before the war they were broken up as a tribe and are now much more scattered. They were essentially a pastoral people and disliked any hard manual labour for which they seem not well fitted. As wagon boys, drivers, grooms, shepherds, shop and house boys, and town servants, they are spread over the Orange River Colony. A labour agent informs me that he has not in the past four months been able to secure a single boy from the Thaba 'Nchu district for the mines. They find more congenial employment in their own Colony, and no wages or alteration of conditions would produce labour from this district or others in the Orange River Colony which cannot be taken as a factor in the supply of labour to the mines.

3,172. The CHAIRMAN: Have you any connection with the Witwatersrand Native Labour Association?—Yes, I am recruiting for them in Basutoland now.

3,173. Have you been recruiting for them for any length of time?—Since the 1st of May; I took on the work of recruiting for the whole of Basutoland, but never before that time.

3,174. Have you recruited labour for anyone else previous to that?—No, never.

3,175. Do you know what is the population of Basutoland?—I know what it is by hearsay. I have heard it put down at so much, but I have had absolutely no chance of checking it in any way.

3,176. Have you any knowledge of the number of Basutos who leave their country to work elsewhere, outside of their borders?—Any statistics that I might mention would only be from hearsay. It is useless my giving the Commission any figures the accuracy for which I cannot vouch. You will probably get them from the Commissioner of Basutoland. I would rather give evidence on such points of which I am absolutely sure than give figures from hearsay.

3,177. Can you tell us if there is any large number engaged in labour of any kind in their own country?—In Basutoland itself there are very few natives at work in the employ of white people. Perhaps 1,000 would cover the whole lot. They are working at their own occupations—agricultural labour and so on.

3,178. From your knowledge of the country and of the natives, did any large number come to work in the Transvaal mines previous to the war?—The Transvaal mines were never popular with them. They never came here very much, but in taking on this work from the Witwatersrand Native Labour Association, after the war, I was tempted by the promised rise in wages and by the shortage of crops, and my opinion was, when I took on this agency, that we should be able to send at least 1,000 boys per month to these fields instead of which we have been sending up till now, I think, under 300 per month.

3,179. What is your explanation of the falling off in your expectations?—I think the first reason is that there are about ten employers for every native who wants to leave to work.

3,180. You did not allow for that in your estimate?—I was not aware of it. I was not aware that the demand for labour would be so great. One reason they are giving for their not coming is the six months' contract.

3,181. Do other employers recruit them without that condition?—None of them ask for a six months' contract. They can at the very doors of Basutoland get £3 per month and stay for only one month if they like, or stay on as it suits their purpose, and it is that sort of competition which upset my calculations when I took on the work for the Association.

3,182. Is that high rate of pay, the sixty shillings rate of pay, close to their own borders likely to continue?—I should think it will continue for years. I should think it would continue for two or three years at least, because there are railways to be constructed and there is so much to be done.

3,183. Is this 60s. per month paid mainly by railway contractors?—Not mainly by railway contractors but by municipalities and mines. I should not like to say that many other employers are paying the same rate.

3,184. What are the Orange River Colony farmers paying for Basutos?—The Boer is not a large employer of native labour unless as squatters. The natives will work for very little money, or no money at all, along their own border if they can get room for their stock and so on. In the smaller villages where there is considerable work to do, the natives are getting £2 per month. A farmer pays some of his natives 10s. per month and gives them land to plough and sow on and room to run their cattle. Sometimes he pays them nothing at all, but he has the option of calling them out for daily labour by paying them so much a day.

3,185. You say in page 3 of your statement that there were numerous complaints before the war as to the treatment of those who went to the Transvaal mines?—Yes.

3,186. Then you go on to say: "Since the war few complaints are heard." Do you think the treatment the natives receive here has or will materially influence the numbers coming to work? I think it would materially increase the numbers coming to work if it were not for the large demand from other quarters. I do not see how you can expect a large number of Basutos to come here under present conditions, and, the large demand for labour elsewhere. I think the statistics that the Basutoland Government will show you will prove that they are going out to work in large numbers in proportion to their population, but they are not coming here.

3,187. Will you look at page 4 in the last paragraph. You say: "I consider the number now out of work a fair average." Is that not a misprint?—Yes, it is a misprint. It should be: "I consider the number now out at work a fair average."

3,188. You said, Mr Fraser, that the failure of the crops, you thought, would influence a large number to come out to work. Has that influenced numbers largely to come out to work?—I think it has influenced them to a great extent. Large numbers have gone to work.

3,189. Previous witnesses have told us that the failure of the crops has not influenced the numbers going out so much as we would think, but it is because the natives do not care to leave their families without food. In other words, the natives prefer to stay and starve with their families. Do you think that applies to the Basutos?—If a native can get work within two or three hours of his home, he can go to work for a month or two, and then go back and feed his family. In making arrangements with the Witwatersrand Native Labour Association a proviso was made that we should advance them monies, to be deducted from their wages, before they left their homes.

3,189A. Have you been offering that?—Yes, we have been doing it. Whenever a native wanted an advance of one or two months' wages before he left he could get the money, which would, therefore, enable him to leave his family. I think the want of food is a factor in inducing natives to go to work.

3,190. Mr. QUINN: On page 3 of your statement, Mr. Fraser, in the third paragraph, you say: "I have suggested to the Witwatersrand Native Labour Association the importance of altering their contract to three months, and feel sure the result will be satisfactory." When did you make that suggestion?—I think it was 14 days ago.

3,191. Has anything been done in the matter so far?—I have a reply to that letter, which has missed me in coming up, and I have only seen a copy of it this morning. They ask for further suggestions from me as to what I think should be done

with regard to such an alteration. As I say, I only saw a copy of that letter this morning and I have not been able to answer it as yet. I might add while on this question that my suggestion would be that we should recruit in some other way; that we should engage them for two months, with a month's notice, which would practically be three months; that the recruiter should reduce his commission very considerably, and that the native should pay his fare up to the Rand out of his first month's salary, i.e., at the end of three months he would be released. The cost to the mines would be considerably less, and it would be very much more satisfactory to the native, I think, if they would make that alteration. I cannot make any other suggestion as to the methods of recruiting among the Basutos.

3,192. You say again, following on that paragraph: "A general complaint, too, is the length of the month, which the natives say has often five Sundays." Have you suggested to the mines that they should alter that?—Yes, I have suggested that verbally. Their answer is that it is impossible; that a native has to be paid by the working day.

3,193. I suppose you made it clear to them that your reason for recommending it was that you thought it would improve the supply which you state here?—Yes, but I am of opinion that all these are matters of treatment which are necessary in dealing with South African natives, and I do not think that such an alteration would improve the immediate supply in face of the enormous demand there is from other quarters. If you pay them for their Sundays, if you reduce their contracts to three months, I am not of opinion that it will, under the present circumstances, increase the supply of Basutos to the mines very largely.

3,194. What do you mean, then, by stating that if their contract was altered to three months, you feel sure the result would be satisfactory. What result would you get?—The result would be satisfactory with regard to recruiting. It would remove their main object of complaint to-day, and my idea was that I was not only recruiting for to-day, but for the future, and it is to some extent an advertisement for these mines. These natives have never been contented to come here and afterwards they may come.

3,195. That is what you mean by being more satisfactory?—Yes.

3,196. It is within your knowledge, of course, that all other large employers of labour who understand natives make the method of paying them as simple as possible. The native mind is very suspicious, and they should do it on the simplest possible plan, the one most easily understood by the native. That is what you advocate?—Quite so.

3,197. And here they are not doing it?—No, I do not think the present way of paying them is a good way.

3,198. Then, following on that paragraph, you say: "I think there is still room for improvement in food. Hundreds of tons of musty and damaged grain come to the Transvaal, and are quite unfit for horse food or mules, and what becomes of it? Sufficient care is not given to provide sweet and fresh meal. A large quantity supplied to the mines is quite unfit for food." Can you prove that?—No, I cannot prove it to-day, but I am well aware of it; I am well aware that that has been the case in the past.

3,199. In the immediate past?—Shortly subsequent to the war.

3,200. You are aware that there was a great deal of scurvy and ill-health on the mines immediately after the war through these very actions; was that within your knowledge?—Yes, that is within my knowledge, and it is an absolute fact. These are the reasons in my mind for the sickness to which you refer.

3,201. Of course you agree that also would help to advertise the mines to their disadvantage as a labour market?—The sickness on the mines?

3,202. This treatment and the food they got and the sickness they got because of it?—That certainly is disadvantageous to the mines.

3,203. Mr. WHITESIDE: Mr. Fraser, can you suggest anything which might be done to make labour on the mines more attractive?—I have no more suggestions to make beyond those alterations in the term of contract, and in the mode of payment, and the granting of facilities to the boys to get back home at a cheaper rate at the end of their term. At the present moment a Basuto engages himself for six months, but under your mode of payment he only gets paid for five. He works six months for five months' wages. It costs him 25s. 6d. when he goes back home, without taking into consideration the boy's food, etc., before he gets to the rail head. I consider that excessive. I have not lately heard, and I have been in close touch with the boys, much complaint about food or other treatment which I mentioned to Mr. Quinn we heard of before the war, and just after the war, but these two matters which I have mentioned want attending to.

3,204. Mr. TAINTON: You say on page 2 of your statement, Mr. Fraser, in the third paragraph, that "No native in South Africa goes to work without some definite object, or unless it be to supply some definite want." I would like you from your knowledge of the native to give us a few of the main causes which we may call compelling causes, that is to say, causes influencing him in his location which would drive him out to work. Can you tell us what they are? Leave the Rand alone for the moment.—The causes to drive him out to work are his wants.

3,205. And you mention, I think, food as one?—According to his status and according to his civilisation such are his wants.

3,206. Well, we shall put down food. What is another want?—Cattle, sheep, horses, and living things.

3,207. What else?—And you might say wives, but that is rather taken up by the question of cattle. Then there is clothing. Of course, as I say, it depends on the man's station in life and how civilised he is and what his wants are. A great many of them cannot do without clothing; the more raw the natives the less clothing they want.

3,208. Well, clothing is really a part of his needs. Is it not, for manufactured European goods?—Yes.

3,209. Can you tell us whether there has been any great increase in the demand for European goods during the last 27 years?—There has been an enormous increase.

3,210. Sir Godfrey Lagden told us that the Customs duties up to the last year amounted to something like £30,000 a year. This, at 15 per cent., gave a consumption of goods of less than a pound per head per year?—How do you mean by less than £1 per head per year?

3,211. The value of the whole of the goods imported into Basutoland was less than £260,000, which number, 260,000, is the population of Basutoland. Would that figure be confirmed by your experience?—Such statistics are matters which I have no chance of checking.

3,212. Then, if we take that figure as correct, when you say "enormous," you mean relatively to the demand which existed some time ago?—Yes, relatively to the demand which existed some time ago, and to the demand which exists from other South African tribes in other parts of the country.

3,213. Are the Basutos more advanced, and is their demand for European goods more extensive than that of other South African tribes?—Yes, that is what I wish to say.

3,214. Therefore, their need for money is greater?—Yes.

3,215. Is it owing then to this cause that more Basutos will come out to work; a larger number of adults will come up to work from Basutoland than from most other native tribes?—I consider for those reasons you have named there ought to be a

larger number come up than other native tribes, but they do very much more work at home than other native tribes do, which is a factor that does not seem to be considered by people generally.

3,216. What I want to get at is this. We shall probably have reliable labour statistics from Basutoland, and I think it is probably the only district where we shall be able to get such statistics. Do you think that the number going out from Basutoland is greater than it is from other native districts? Is the proportion larger, or as large, or smaller?—I should think it is larger than the proportion which goes out from any other native tribe in South Africa, but I have no statistics or data which I can give you or on which I can go.

3,217. You have given us two or three of the causes for their going out to work, do you know of any others?—Causes for going out to work?

3,218. Yes, the need for money: practically it amounts to that, does not it?—Yes.

3,219. Is there any other great need of theirs?—Well, no. I should think what I have given you is quite enough—the need for absolute existence. They are obliged to go out and work, and I think the country is getting less and less productive as time goes on, and more and more thickly populated, and I take it that in years to come they will go out to work more than they do or have done in the past.

3,220. You say on page 1, "The bulk of the money earned is spent on cattle, sheep, goats, horses, and ploughing material." Do you think there has been a great increase in the wealth of the Basutos with respect to these items? Are they richer now than before?—That can only be accurately answered by statistics.

3,221. What is your impression? You should be able to judge from your own experience?—It is a very difficult question to answer, because they acquired an enormous number of cattle in the war; but, again, they lost very heavily through rinderpest and other sickness. However, I should think their status is much what it was before the war, and they are no wealthier.

3,222. But if their earnings are devoted to these objects, the tendency is to increase their agricultural and pastoral wealth?—Exactly.

3,223. Would that increase their independence in this way, that they would be able to live upon the product of these things—their cattle, sheep, goats, horses, and ploughing their lands?—They always have ploughed and sowed grain largely for sale, and they do so still, and the surplus grain they always sell.

3,224. Is the use of agricultural implements increasing amongst them—ploughs and things of that sort?—I do not think it is increasing. I think that every man has a plough, or if he has not, he has got to buy one. They do not plough with picks and that kind of thing.

3,225. Do not the women do the cultivation of the land in Basutoland—digging with the hoe, that is?—The women and the men both hoe.

3,226. But the point I want to get at is this, are ploughs substituting the hoe in the fields?—They use the hoe for one purpose and the plough for another.

3,227. My information perhaps goes further back than yours. Not long ago they used to use the hoe for cultivating, but now you say they use the plough. Is that it?—They never used the hoe much, but they used the pick for cultivating on places which are inaccessible to the plough. They use the hoe for weeding, and the plough for ploughing.

3,228. Then the cultivator in Basutoland is the man, not the woman?—I call the cultivator the person that ploughs and sows.

3,229. That is the man in Basutoland?—Yes.

3,230. And not the woman?—No, the woman's part of the work is to hoe and weed.

3,231. In Basutoland, then, the men are not so dependent upon the labour of their wives, which is

a very general belief, you know?—I do not say that they are not dependent upon their wives, but I say their wives do a large amount of the field work; they do not do everything. They do not do the ploughing, but they do the hoeing and weeding and some the threshing.

3,232. Is the agricultural output larger in consequence of the use of the plough?—Oh, it has increased enormously.

3,233. You say at the bottom of page 2, "Basutoland exports to the Orange River Colony, the Transvaal, and the Cape Colony, large quantities of wheat, Kaffir corn and mealies?"—Yes.

3,234. Does that mean that the production of Basutoland is more than sufficient for the food wants of the people?—They export very large quantities.

3,235. This surplus grain product, is it made use of in supplying these wants that you speak of, the purchase of clothing and everything?—Yes. It is their means of livelihood. That is why I say that in a good grain season, when they have plenty of food, they do not wish to work to the same extent as they would in a bad season.

3,236. Then, would it be fair to say, taking your experience of Basutoland, that the Basuto native is becoming more of a farmer as time goes on, and is dependent less upon outside labour for his means of livelihood?—No, that might give a false impression. He never will be anything else but a farmer if the conditions of climate and crops allow. But when those conditions fail, when the population increases and the lands get poorer, he must go out and work as he does now. There is an enormous difference in the production of lands during the last 25 years. Lands are not producing what they were. It takes much more work to produce the same amount of grain, and the population consuming that grain is always on the increase.

3,237. Well, now, leaving that out of the question for the moment, and coming back to one sentence you used. You say that if seasons are favourable, he never will be anything else but a farmer. Assuming that we had a succession of ordinary favourable seasons, what effect would that have upon the labour supply of Basutoland?—It is not within my memory that we get a succession of favourable seasons in this country.

3,238. But just assume it. Leave out for a moment the actual facts.—Then, I think, probably the same number would go out as has been going out in the past, which is not very large.

3,239. Then I understand you to say that a favourable season would not affect the numbers going out. Is that what you mean?—No, and there are many other things which have to be taken into consideration. If you have a very favourable season everywhere, all over the country, it at once affects the price of grain, which goes down to *nil*—it has in the past gone down to 4s. or 5s. or 3s. a bag—then they cannot get the same amount of money by selling their grain as before, and out they come to work. They have their wants which they must supply by labour, if they cannot supply them from their grain.

3,240. This food factor is of great importance. If I understand your answer, in seasons of scarcity they come out to supply their wants, and in seasons of prosperity they come out to supply their wants because the grain value is low?—Yes.

3,241. Well, now, let us leave the Basuto at home and leave the compelling causes acting on him there to come to the Rand. Do you think that the method of recruiting has much influence upon the man at his kraal? At the bottom of page 3 of your statement you say: "There is a greater demand for labour in Basutoland than there has ever been before, and, in one camp, I have noted labour agents for as many as 10 different companies and organisations at one time." Do you think that the method of recruiting has much influence on the boy—that is to say that it would induce him to come out when he does not want to come out?—I think the natives are much shrewder judges of the labour market than anyone imagines, and that if they do

not want to go to work, no agent on earth will induce them to do so. My opinion is that the only thing which can be done is to bring before them fairly and plainly the conditions on which they have to come and my complaint of the system of recruiting before the war is that this was never done. They could not rely on the statements which were given them nor as to the conditions of things where they were going to work.

3,242. Well, if no agent can induce a man to come out, if he does not want to come out, what, in your opinion, is the effect of recruiting methods on the labour supply? What is the extent of their influence?—There must be someone as a go-between—that is between the employer and the native.

3,243. Yes, but what I mean is this, does one method of recruiting as compared with another method, increase the labour supply?—Well, I say not. I think not. I think the native will weigh the advantages of the places for which they are recruiting and go to whichever place offers the best advantage.

3,244. Take another of these attractive influences, such as high wages. Has that much influence?—Certainly.

3,245. Does that bring a man out to work when he has no particular desire to do so, or does it merely influence him in favour of a particular industry?—I think a high rate of wage would get a larger supply of natives to come out.

3,246. Has it much effect in diverting labour from one industry to another?—You mean by that that the higher the rate of pay, the more boys come out.

3,247. Has it much effect in attracting labourers from one particular occupation to another?—Oh, certainly. The native is a very fine judge of where he gets best paid and best done by, and he goes there.

3,248. If you told a native who was not particularly anxious to go to work that the rate of mortality in one particular field had gone down, would that induce him to come out?—It is not a thing I should tell a native.

3,249. You think it is best left alone?—Yes, I think so.

3,250. Arising out of that answer, has the high rate of mortality on the Rand had a deterrent effect on the labour supply, preventing the natives coming here?—I believe it has had an effect on the labour supply. It is only within the last few weeks that one chief stopped recruiting because he heard that some of his boys were dying, but on the other hand I find that boys returning from the fields now do not mind their underground work, and do not mind the wet shafts or anything if they can only get well paid.

3,251. Mr. FORBES: You said, Mr. Fraser, that the Basutos find employment nearer home than this, and are equally well paid?—Yes.

3,252. Do you think under those circumstances there is any chance of any considerable number coming here, notwithstanding any inducement which may be offered them in the shape of better food and so on?—I think that whatever alterations are made, either in terms or conditions, you must not expect a large influx from the country into the mines as long as the demands on labour in Basutoland are as large as they are.

3,253. Mr. DONALDSON: You have a very intimate knowledge of Basutoland?—Yes.

3,254. And I think you said that when you started for the Association, the time was specially favourable, more favourable than you had ever known it for getting natives from there?—Yes, more favourable than I remembered. I considered it so.

3,255. You consider it was a specially favourable time?—Yes, or I should not have taken on the work.

3,256. I gather that you got less than a third of what you expected and that you were consequently disappointed?—That is so.

3,257. Then have you come definitely to the conclusion that the Transvaal need not expect a larger number of Basutos than are coming now?—Those are my ideas—those are my confirmed ideas.

3,258. That the number that comes from Basutoland at present will not be increased?—No.

3,259. Mr. GOCH: The supply will not be increased even though all these alterations are made in their favour which you have enumerated. You have mentioned several things that might be an improvement?—It will not be increased even though these alterations are made in their favour, so long as the outside demand is as large as it is.

3,260. The CHAIRMAN: Mr. Fraser, the Commission is very much obliged to you for coming before it and giving your evidence.

Mr. DAVID ERSKINE, called, sworn and examined.

3,261. The CHAIRMAN: You are Mr. David Erskine?—Yes, Sir.

3,262. You have before you, Mr. Erskine, a memorandum headed "Evidence of Mr. D. Erskine, Pietersburg." Is it your wish to hand that in as your evidence-in-chief?—Yes, Sir.

3,263. Mr. D. Erskine's statement was then handed in to the Commission:—I started operations as District Manager for the Northern Transvaal in August, 1901, with a few recruiters, gradually increasing same up to 24, which I have at present, paid as follows:—Six drawing a salary of £10 per month, also on commission; two on salary of £25 with a commission, and 15 on commission only; during which time I have organised and opened stations all over the principal recruiting parts of the district, as well as placing depôts for natives en route, including sleeping accommodation and feeding for same. All my recruiters are reliable men and mostly have been selected by me. They are well acquainted with the country, understand the methods of the natives, speak the native languages, also Dutch, which is very essential in these parts. The majority of them were recruiting before the war. Up to December, 1902, my recruiters were all on salaries; since then I have some on salaries and commission and others on commission only, which practically means free recruiting carried on at present under licensed men. During the first five months ended December 31st, 1901, the total of 5,274 was recruited and sent down for the mines. During the following year ending December 31st, 1902, 11,278 natives were recruited for the mines, out of which 955 were taken by the military. During this time there was great opposition, the military commandeering natives very freely. From January to 30th June, 1903, I recruited and sent down for the mines the total of 5,955. I estimate, roughly, that an average of over 2,000 natives leave the Northern districts per month for work. Out of this number our Association recruit and send down about half, the balance being collected by the Native Commissioners for public works and recruited by other agents representing Jagersfontein, Kimberley and various diamond and coal mines; also the C.S.A.R. If the above were not in competition with the Association, I estimate an average of 1,500 to 2,000 per month would be our output from this district. The Basutos in the Northern Transvaal are more or less in favour of mine work. There is a certain tribe called "Maquambis," which are a race between Shangaans and Tongas, who originally came from the Portuguese territory with one Albasini, who was then a chief among them. The majority of this tribe prefer working on the surface, and their preference is for store work, etc., in Pretoria principally. I estimate, roughly, the population of the Northern Transvaal to be 300,000. I take it that out of this number three-fifths are females and two-fifths males. Out of this I should say that 45,000 are men available for work from the age of 18 to 40 years. My calculations are principally based on opinions of old men resident in this district and of persons who have worked and been connected with the Native Affairs Department of the late Government. I believe a census has been taken by the

present Native Commissioners while hut tax collecting, but I do not think their statistics are completed yet. Of this number, perhaps half go out to work for an average of six months a year. Comparing the present system of recruiting to the old, I consider the present one is a much better method and has many more advantages in its favour. Under the old Government no recruiting licences were issued, thereby enabling every person to recruit labour, which was detrimental to recruiting in general, inasmuch as natives were recruited under false pretences and had all sorts of promises made to them which were never fulfilled, thereby causing distrust and discontent among them. This was a common practice on the part of agents or touts who were selling the natives collected, and at the same time, to suit their own purposes, were promising the natives much higher wages than were being paid by the mines. The chiefs in my district have expressed to me that they prefer the present system to the old. They are fully aware that the recruiters are genuine and reliable men, and that should any misunderstanding arise, it will be thrashed out and settled by me at once. Under the old system this could not be done, as in various cases the agent or tout who had made these rash promises could not be found, and on appealing to the Government they could get no satisfaction on the grounds that the persons could not be traced. In cases where the natives eventually came into contact with the agent who had made them false promises, they managed to get out of the difficulty by putting all the blame on the mine in which these natives had been working, hence the reason of certain mines having bad names among the natives. The chiefs also know that natives engaged by agents representing the Association will be treated according to the terms of engagement, and not hawked about and sold indiscriminately as before the war. The chiefs in my district have expressed to me their appreciation of the treatment the natives have received who have been sent down to the mines during the last twelve months. The attitude of the chiefs, as will be seen by the above, is entirely in favour of the Association, and they consider same a sound and good institution. I am of opinion that in later years the power of the chiefs is slowly diminishing. Regarding future recruiting, I am of opinion that owing to the increase of wages and the good treatment received by the natives at the mines, which is becoming generally known throughout the district, a gradual increase in numbers can be expected.

3,264. Were you engaged in recruiting native labour previous to the war?—Yes, Sir.

3,265. On your own account or for some Association?—For the Rand Mines.

3,266. You mean the Rand Mines, Limited?—Yes, Sir.

3,267. How long were you engaged in it?—I was with them for about two years.

3,268. In what districts were you recruiting for them?—The East Coast principally.

3,269. Previous to working for the Rand Mines were you in the native labour business at all?—Yes, Sir.

3,270. On your own account?—No, on account of companies. I was compound manager and labour manager for the Simmer and Jack.

3,271. For any length of time?—Yes, for a little over five years.

3,272. How did you recruit the natives for them, Mr. Erskine, by "free labour touts," or did you send out your own paid employees?—I had my own labour touts.

3,273. Men to whom you paid a salary?—No, a commission.

3,274. Did you recruit for the Simmer and Jack in different parts of the country?—Yes.

3,275. The East Coast?—Yes.

3,276. In the Northern Transvaal?—Yes, but we touched the Transvaal very little and confined ourselves mostly to the East Coast, Basutoland, Pondoland, and Cape Colony.

3,277. In your statement you say you are now employing 24 recruiters. You are referring to white men, I take it?—Yes.

3,278. That figure is exclusive of native runners?—Yes.

3,279. Do you employ many native runners?—Yes.

3,280. Could you give us the number?—No.

3,281. Approximately?—About 400 to 500.

3,282. Since you started working with the W.N.L.A. you have recruited, I see, on an average about 1,000 natives per month?—Yes.

3,283. Do you see any prospect of that number being increased from the Northern Transvaal?—Yes, I do.

3,284. What cause will bring about the improvement?—The improvement will be caused by the increase of wages, and the great improvement which has taken place in the compounds in food and clothing, and things like that. The natives are also just beginning to realise that the wages have been raised. The natives take time and will not believe the white man until he sees his brothers returning home, and then he has a conversation with them, and that is one of the reasons I think that will cause the supply of labour to be increased.

3,285. You speak of the population of the Northern Transvaal as being 300,000; on what do you base that estimate?—That is my own opinion and the opinion of old residents and officials who have held positions under the late Government—Native Commissioners and others of that class.

3,286. For what period do the Northern Transvaal natives usually engage to work?—Six months.

3,287. Do they in any large numbers re-engage for a further period?—No, Sir.

3,288. You say that the chiefs in your districts have expressed their preference for the present system of recruiting?—Yes.

3,289. Is that a general expression of opinion from the chiefs?—It is.

3,290. You cannot give any estimate as to the increase in the monthly number of boys you are likely to get for the reasons you have given?—No, I am afraid I cannot.

3,291. Do you find from the Associations mentioned—railways and others—a considerable amount of competition for natives in that district?—Yes.

3,292. And do the natives prefer railway to mine work?—No, not as a rule.

3,293. Mr. DONALDSON: You say, Mr. Erskine, you think there may be an increase in the number of boys you could secure?—Yes.

3,294. Do you anticipate a large increase?—Not very large.

3,295. What would it amount to? Your returns at present you put down at 1,000 per month?—Yes.

3,296. What is the limit of your reasonable hopes?—My reasonable hopes would be to increase it to about 1,500.

3,297. You think it could be increased to 1,500?—Yes.

3,298. And that is the utmost you could reasonably look forward to?—It is rather a hard thing to say, you know.

3,299. You would have an increase approximately of 500 per month?—Yes.

3,300. And they would stay here for six months?—That is what they contract for.

3,301. Then from your neighbourhood the greatest increase you can reasonably hope for would be an increase of 3,000 labourers on the Rand at one time?—Yes.

3,302. Do you consider that this increase of 3,000 from that part of the country can be looked upon as certain or assured?—You could hardly consider it certain. You can never rely upon natives.

3,303. You think there is a reasonable prospect?—A very reasonable prospect indeed.

3,304. Mr. EVANS: In counting the increased supply, have you taken into account the requirements of the mines and industries nearer the Northern Transvaal than the Rand, such as developments in the Murchison Range and the developments of copper properties up there?—Yes.

3,305. Have you taken that into account?—Yes, I have taken that into account for this reason, the natives never like working near their own homes, but always prefer to go away.

3,306. What natives are employed there now?—Whereabouts?

3,307. In the Northern Transvaal, in the mines?—Very few. There is hardly a mine working there.

3,308. Do you think in the event of the Murchison Range developments and the development of certain mines it would interfere with your supply?—It all depends on the amount of the labour required. I could not say whether they might require five boys or a thousand.

3,309. Where could they get them?—From the Portuguese or the other border.

3,310. Can you tell us anything about the Northern Transvaal natives going to Rhodesia? Is there any recruiting in the Northern Transvaal for Rhodesia?—Not now. They did have a few runners come from Rhodesia six or seven months ago.

3,311. What is the position now?—The natives will not go there at all, and are coming back from there now.

3,312. Is there anything to prevent them going?—Not that I know of.

3,313. They are free to go?—Yes.

3,314. You say here, on page 2, that you estimate that 45,000 men will be available between the ages of 18 and 40. How do you arrive at that figure?—Simply by taking the population at 300,000, of which three-fifths are females and two-fifths males.

3,315. That would make 120,000 males?—Yes.

3,316. But out of 120,000 do you think 45,000 would be between 18 and 40 years of age?—This is a rough estimate; we have no figures to go on.

3,317. But do you not think it is a high figure?—I think it is rather low.

3,318. You know a white population between these ages never reaches 20 per cent. It is based purely on population?—Yes.

3,319. You said you were recruiting before the war for the Rand Mines. Had you anything to do with the recruiting of a batch of 300 at Quilimane for the Rand Mines?—I do not know anything about that.

3,320. Some for the Crown Deep?—These were recruited for the Witwatersrand Native Labour Association.

3,321. Do you know anything about the northern portion of the Portuguese territory?—No.

3,322. Mr. FORBES: Can you give us any idea of the average number of years the native goes to work before he returns to his kraal?—It all depends upon the natives. You take the East Coast native and compare him with the Zulu, and the result is different. I should say an average of about eight or ten years.

3,323. For the East Coast?—Taking the whole.

3,324. Mr. TAINTON: Were you acquainted with the northern districts before the war?—Yes.

3,325. Was the output of natives then as compared with now greater or less?—I could not say for certain, but I should think about the same; may be, a slight difference.

3,326. Is that merely your opinion, or is it based on figures?—Merely an opinion; you cannot get any figures at all.

3,327. That would show that the improved methods which you refer to in your statement have had no appreciable effect upon the labour supply?—Well, we cannot tell whether we are doing better than under

the old methods, but the output for the Association has been upwards of 1,000 per month, and under the old methods it was never more than 700.

3,328. Do I understand you to say that the output before the war was approximately the same as now?—On the mines in general, not a record by any particular company, but by the different agents.

3,329. Then does your reply mean that the organisation of the mines now is more complete, that is, that the mines are taking the labourers from other industries?—It is getting more, but I should not like to say it was taking labourers from others.

3,330. You see you make a statement and refer in some detail to the important fact that the methods of recruiting have improved, and I wanted to get at your estimate of the increase due to these improved methods. You tell us now that before the war the labour supply was practically the same as now, and this would show that these improvements have had no appreciable effect?—You really want to know whether the present system is better than the old?

3,331. No, I want to know its effect on the output of labour?—I do not quite understand that question.

3,332. I do not know that I can put it more plainly. The output before the war was the same as it is now?—Yes, about the same.

3,333. Is it not, then, a fair inference that your improved methods have had no effect?—No.

3,334. Is it not?—No.

3,335. Will you explain?—Yes, it is because if you take the natives coming at the present time for the old Association and the new, you will find out we are a little over, and you must bear in mind that before the war more than half of these natives who came to the Rand were forced labour sent out by the Native Commissioner, and that is what we do not do at present. Therefore it proves that this present method is better, because all the natives coming out are willing natives.

3,336. In what way was the labour forced?—You could go to the Native Commissioner and say you wanted a certain number of boys, and were willing to pay so much per head for them—

3,337. To pay the Native Commissioner?—Yes, and he would simply go to certain chiefs and say I want so many boys from you, and so many from you, and you simply paid for them and did nothing.

3,338. Did the boys turn out on the authority of the chief?—Yes, and the Native Commissioner.

3,339. Were you fully acquainted with these facts before the war?—Yes.

3,340. Did you hold a responsible position in the labour organisation of the Rand at that time?—Yes.

3,341. Is there any measure of compulsion employed now. How far do you use the chiefs?—The chiefs were used to this extent: We placed each man with a chief—a sort of recruiter, all about in that district, and he has to carry out the directions given him, engaging natives and giving bonuses to the chiefs, that is, if the chiefs assist him or do not hinder him.

3,342. Then the chief's influence is used. Is the power of the chief diminishing?—Yes.

3,343. I see you say in your statement that the power of the chief is diminishing?—Yes.

3,344. The effect of this particular factor as influencing the labour supply is not likely to last?—I did not say the chiefs had great power over the natives, I said very little power.

3,345. You say, on page 4, paragraph 3, "I am of opinion that in later years the power of the chiefs is slowly diminishing"?—Yes.

3,346. Is that correct?—Yes, it is diminishing.

3,347. Then the question that I put just now, that the influence of the chiefs upon the labour supply is likely to be less in the future than in the past, must be answered in the affirmative?—Yes.

3,348. And this factor of compulsion which was true of the Northern Transvaal before the war, was

it also true of the East Coast natives, particularly in Portuguese territory?—It is true; the officials on the East Coast force the labour out.

3,349. I asked whether this factor of compulsion existed on the East Coast as well as in the Northern Transvaal?—No.

3,350. Then Portuguese methods were better than Boer methods?—In that way, yes.

3,351. Have you a close acquaintance with the Portuguese system of recruiting?—I used to.

3,352. Were the recruiters there accompanied by an official?—No, not in my time.

3,353. Did they turn out voluntarily—freely?—The natives.

3,354. Yes?—They did.

3,355. What inducement did you offer them to come out?—When I went there the inducement was good terms. At that time I had a good name amongst the companies, which goes a long way with the East Coast natives.

3,356. The CHAIRMAN: Does the witness mean a good name amongst the natives or the companies?—The companies which I worked for. The companies naturally take the name of the man who is working for them.

3,357. Mr. TAINTON: Was everybody as successful as you in the way of recruiting?—Yes, I should say they were; some failed, of course.

3,358. How far does the personal factor influence the labour supply?—It is a hard question to answer: I could not say.

3,359. I asked the question because your answer gives the impression that it is of considerable importance. I wanted you to amplify that answer and state whether that is so or not?—Well, you see, when the native knows you to have a good name and you have treated them well, it is all right. I always found I could get natives on the East Coast.

3,360. What is your average per month?—It is a long time since I was there; I could not say. Do you mean for the Simmer and Jack or the Rand Mines?

3,361.—I mean your work as a whole; what was your average?—Before the war?

3,362. Yes?—About 800.

3,363. Referring to the Northern Transvaal, is there much increase in the demand from the farmers for labour since the war?—Not as yet.

3,364. Is there a diminished demand?—I could not say for certain.

3,365. Are agricultural operations being carried on extensively in the Northern Transvaal to-day?—Not that I can see.

3,366. Are you in a position to compare present agricultural wants with those obtaining before the war?—Not quite.

3,367. Do you know anything about that?—I could not say; I only know what I saw coming through.

3,368. Taking our figures for 1902 and the first six months of 1903, the output per month was approximately the same?—Yes.

3,369. How do you justify your belief that the output will improve—that the supply of labour will improve?—For the months coming?

3,370. Yes? It is not shown by these figures?—No, it is not. The reason is that the news of these high wages which have been raised has not yet been properly circulated amongst the natives. They all know about it, but they are going to take their own time to discuss it and wait for their brothers to return. If a place has a good name the native will go there. Previous to the war the Rand had a good name and the natives all came here, and even when I recruited there at 30s. I did very well because the natives had been here before and received good wages and would not believe they got 30s. until they came down and saw the fact for themselves.

3,371. If £3 is paid on the Rand, what effect has that upon the rate of wages in the outside districts?—I should say very good.

3,372. It puts the rate up?—Yes.

3,373. So that employers there are compelled to increase the rate there in order to counteract the effect of these high wages on the Rand?—I would not quite say that. I have employed niggers in the country myself.

3,374. Mr. WHITESIDE: What recruiting districts have you had the most experience in?—The East Coast, I should say.

3,375. Do you think you could obtain better results there if you had been sent by the W.N.L.A. than what you are obtaining at the present time?—I am unable to answer that; I do not know.

3,376. Still you believe the present factor has a great deal to do with the matter. The natives know you, and, therefore, if you had been sent there you would have done a great deal better?—On my own account.

3,377. Yes. There is a possibility that you could have done better if you had been allowed to choose your own district?—I cannot say. It is rather hard to praise yourself, you know.

3,378. I am still taking you at your own statement. "A man that has a good name will do better, etc." And you have told us that you have a good name amongst these boys, and it is quite logical to expect you would have better results from in the Transvaal?—It is a hard question to answer, because I have not been there since the war.

3,379. In answer to the Chairman, you stated the rise in wages has just become known. Could you frame any estimate as to how long it is going to take before an effective supply is obtained?—I always reckon the native takes a long time. I should say from eight to ten months from the date of the wages being raised.

3,380. I see. Consequently we have not yet reached high-water mark as the fact is not well known that the wages have been raised?—It is well known, but the natives will take time to consider it.

3,381. Did the 30s. rate have a bad effect on the supply?—Yes, we are still feeling the effect to-day.

3,382. You have also stated that the natives prefer going out. Is it not reasonable to assume that your estimate of 2,000 per month might be reasonably increased?—I should not say so.

3,383. You think this is as large a number as we might reasonably look for?—Yes.

3,384. Can you offer any suggestion as to what might be one to make the mines more attractive?—No, I do not think I can.

3,385. Mr. QUINN: What date were you sent to the Northern Transvaal?—About August, 1901.

3,386. Did you report soon afterwards that the 30s. wage was not sufficient? Did you report to the W.N.L.A.?—Not soon afterwards.

3,387. Did you report at all; any time?—Yes.

3,388. When did you report that?—After returning from a period of six months spent amongst the natives.

3,389. What date would that be, roughly?—I could not say.

3,390. There was no material increase for a long time after you reported that you could not hope to get a good supply at that price. The old rate they did not return to till February this year?—Yes.

3,391. Is M. S. Erskine, who has been in the Colony, your brother?—Yes.

3,392. Now can you tell us what proportion of boys, if any, from the Northern Transvaal, remain here for a longer period than six months?—I could not say for certain, but it is very few.

3,393. Any appreciable number?—No. A few did remain after the first six months because they were getting such small wages.

3,394. Why were you sent to Northern Transvaal, seeing, from your evidence, I understand, you were more accustomed to the East Coast?—I could not say.

3,395. Had you had much experience in the Northern Transvaal?—Not much.

3,396. But a great deal on the East Coast?—Yes.

3,397. So that any good reputation that your treatment of the natives may in the ordinary course of things bring you has not yet been felt in the Northern Transvaal where you are now?—I think it has been felt by now.

3,398. It has?—Yes.

3,399. Would it be right in your opinion to say that the Northern Transvaal was the most disturbed part of the country during the war and so far as the natives were concerned?—Yes, I should say it was.

3,400. In your opinion the food given to the natives and the conditions on the mines generally before the war were bad?—Yes, in comparison with the present.

3,401. And for some time after that it continued the same or worse, and many died from scurvy and other diseases?—There were reports to that effect, but I could not say; I was not down there.

3,402. The CHAIRMAN: Mr. Erskine, the Commission is very much obliged to you for the evidence you have given.

The Commission adjourned at mid-day for luncheon, till 2.30 p.m.

Mr. J. P. GOODWIN, called, sworn, and examined.

3,403. The CHAIRMAN: You are Mr. J. P. Goodwin?—Yes.

3,404. You are the District Agent of the Witwatersrand Native Labour Association in Mozambique?—Yes.

3,405. Have you before you a statement of evidence headed "Statement of Evidence of J. P. Goodwin, District Agent W.N.L.A., Ltd., Mozambique?"—Yes.

3,406. Do you wish to hand that in to the Commission as your evidence-in-chief?—Yes.

3,407. Mr. J. P. Goodwin's statement was then handed in to the Commission and read as follows:—

That portion of Portuguese East Africa which is governed by the Portuguese Government, and is known as Mozambique district, lies between lat. 13 and lat. 18, and is bounded on the north and west by the Lurio River, on the south-east and east by the Indian Ocean, and on the south and south-west by a straight line running from the mouth of Kizunga River, to the source of the Lurio, passing to the south of the "Peaks of Namuli" range of mountains. On the north of the Lurio River is Portuguese Nyassaland, and to the west is British Central Africa, the southern boundary adjoining the Zambesi Company's territory. The greatest distance from the east to the west is approximately 300 miles, and from the north to south in a straight line about 230 miles.

The natives of the country are Makuas, but along the coast they have become mixed with Indians and Arabs, and most of the chiefs are "Monhes," a name given to Indians by the Portuguese. These coast tribes are in a more advanced state of civilisation than the real Makuas, and have adopted the religious customs and observances of the Mahomedans; they are accustomed to white men and to work, but are very lazy and independent, and do not make very reliable servants or workers. The raw Makua is quite unaccustomed to white men, and to working, except at his kraal, the only exception I know of being in the district of "Erata," where several natives have left their kraals and come to work in Mozambique, a number of them having settled permanently on the island.

The native population is absolutely unknown, and it is impossible to bring forward any reliable figures. Taking into consideration that the furthest military post in the interior is 40 to 50 miles from the coast, and that beyond that point white men or Indians are not to be met with, it is easily seen what a large tract of country is unexplored, and how impossible it is to form an opinion of the population of the interior. I put forward the population of the tribes with whom we are in touch as 50,000 to 100,000, but hope it will be understood that these figures are only computed from the supposed number of men the various chiefs have under them.

The Makuas are not a wealthy tribe, and it is rarely one hears of or sees cattle in their possession; goats they have but not in large numbers, and in some places even fowls are scarce.

The men are (comparatively speaking) good workers in their gardens and assist the women in agricultural operations, and amongst the few tribes who bring their grain to the coast to trade, only men act as carriers. Owing to their custom of living from hand to mouth they suffer from famine, if they have a season of bad crops, and last February the people of "Cabula-mum" were living on the seeds of grass. There are no large villages of 50 huts or more together as in Inhambane, and generally each man builds his one, two or three huts some distance away from his neighbour; if subjects of an important or powerful chief, the men build huts more or less in the open surrounded by their mealie gardens, but the people of a weaker chief build in secluded spots in the thick bush.

Tribal fights and stealing of women are of frequent occurrence.

Recruiting for the mines by the W.N.L.A. began in June, 1902, and these are the numbers of boys each month who have arrived on the mines from there:—

July, 1902	...	...	...	...	180
Aug. "	...	...	...	...	26
Sept. "	...	...	...	...	48
Oct. "	...	...	...	...	162
Nov. "	...	...	...	...	30
Dec. "	...	...	...	...	58
Jan., 1903	...	...	...	...	108
Feb. "	...	...	...	...	57
Mar. "	...	...	...	...	71
Apr. "	...	...	...	...	59
May "	...	...	...	...	3
June "	...	...	...	...	88
July "	...	...	...	...	62
					952

The total for the 14 months being 952, or a monthly average of 68 boys.

It is very difficult and discouraging work, recruiting in a new unexplored country and among such suspicious, incredulous natives as the Makuas.

At the commencement of recruiting operations, chiefs were visited and by the aid of presents were persuaded to send one or two of their relations to go and visit the Rand and return to their kraals with a report of all they had seen. In some cases a number of boys were sent to accompany the chief's representatives and to stay and work on the mines. When the chief's relations returned from the Transvaal with clothes and presents, and with good reports on the place, the effect in many cases on the mass of natives was quite opposite to that which we expected and desired. Instead of believing the returned men, the natives thought that they had sold the boys who accompanied them, and bought their clothes, etc., with the proceeds of the sale. Nothing less than the return of the actual workers would satisfy the majority of the natives, and a returned labourer is only of use in his own particular district; anywhere else he is disbelieved.

At the beginning of March this year we began building camps in the country, as apparently the natives would be a long time in believing in our bona fides, if we continued working without any

settled camps, and also to do away with the expenses of carriers. The advantage of living in the country amongst the natives is very great, because all the boys become acquainted with the recruiters, and know that they are there permanently, and that their brothers will come back to the recruiter's camp. Every chief in the districts where our camps are, expresses satisfaction at the fact of our men living there.

All the boys who have returned up to the present have been well satisfied with their treatment on the mines, and have been instrumental in obtaining new recruits. The long period of service (12 months) has prevented us from sending out more boys this year, because the natives refuse to come out before their brothers from the mines return; and yet a shorter term of service would be inadvisable, because it takes the Makuas a few months to become accustomed to the climate and the work, and undoubtedly their treatment becomes easier, as they pick up a knowledge of kitchen kaffir language and mining work, so they will feel more satisfied at the end of 12 months than at the end of three.

I consider that we might expect a monthly output of from 100 to 150 boys during the next five months, and for the year 1904 from 200 to 250 per month. These are maximum figures.

I find that owing to the cold winter in the Transvaal, and the great difference between this climate and the climate of Mozambique, a large percentage of the boys have suffered from pneumonia and chest complaints and a number have died on the mines. This may have a bad effect on recruiting when the companions of these sick and deceased boys return, and it is possible that instead of the output increasing it might decrease. The figures quoted above are based on the supposition that the boys continue to return to their kraals satisfied with their life and treatment on the mines.

3,408. The CHAIRMAN: Where are your headquarters?—Mozambique.

3,409. Will you describe to the Commission the western boundary of the district which you work? You mention in your statement that what "is known as the Mozambique district lies between lat. 13 and lat. 18, and is bounded on the north and west by the Lurio River, on the south-east and east by the Indian Ocean, and on the south and south-west by a straight line running from the mouth of the Kizunga River to the source of the Lurio, passing to the south of the "Peaks of Namuli" range of mountains." Does the western boundary go right up to the latter?—Yes.

3,410. How long have you been agent for the Association?—Since January. I got up there on January 16th.

3,411. Had you resided in that district formerly?—No.

3,412. Had you resided in Portuguese East Africa formerly?—Yes. I was 12 months in Gazaland and Inhambane in 1902.

3,413. Were you working for the Association?—Yes.

3,414. Do you know the native languages?—Yes. I know Shangani, Matabele and Zulu. I know sufficient of these languages, but I am not a fluent speaker.

3,415. Previous to working for the W.N.L.A. were you living in Portuguese East Africa?—No. I was in Rhodesia.

3,416. You state the native population of the country is unknown?—Yes, it is.

3,417. Have the Portuguese no reliable figures?—No, not at all. I saw the figures that they had, but some of the chiefs that we already know were not included in their list. Their list only accounts for the tribes along the coast. Some of the chiefs that our men already know are not included in the Portuguese statistics.

3,418. You say in your statement, "Stealing of women is of frequent occurrence?"—Yes.

3,419. Do you mean to say that the country is very unsettled?—Very unsettled, in fact it is almost dangerous to travel through.

3,420. Have you been westward any distance from Mozambique?—I have been to our Ituculo camp 60 miles from the coast. The furthest point any of our men have been is 100 miles from the coast about two days' further on than the military post of Ituculo.

3,421. Do you find the boys willing, in any numbers, to come to work?—Well, it is all strange to them. They were not very willing at first. They come more from curiosity than anything else.

3,422. Have any number of boys been in the habit of coming from that district to work in the south at all?—No, except in the district of Erate, just south of the Lurio River, 20 miles from the coast. A number of them have settled permanently on the island.

3,423. How many will that refer to, hundreds or thousands?—No, it will not be 50 or 60 on the island altogether.

3,424. Then you state here that the natives inland will only believe the men who return from the Rand, and "When the chief's relations returned from the Transvaal with clothes and presents and with good reports of the place, the effect on the mass of the natives was quite opposite to that which we expected and desired. Instead of believing the returned men, the natives thought that they had sold the boys that accompanied them, and bought their clothes, etc., with the proceeds of the sale." You find them very suspicious?—There was a native who went north with seven other boys and the seven other boys stayed to work on the mines, and this native came back to his kraal alone, and when he got back he could hardly move away from his kraal because the other natives said he had sold the boys who went with him in Lourenco Marques. He was afraid the boys' friends would kill him.

3,425. Then is there slavery in this country now?—Yes.

3,426. Do they enslave members of their tribe, or of other tribes?—Yes. I was up between Mozambique and the district of Erate, and when we were passing through, two women came to us and said that their little boys had been taken away and sold to a chief called Comala.

3,427. You mean the natives will enslave their fellows?—Yes, and they are always selling each other's women. If a Makua wants a wife, he gets his gun and the first man that comes along with a woman he shoots the man and takes the woman.

3,428. The number you succeeded in recruiting since you went there is 952?—Yes.

3,429. Have many of these boys returned yet?—Yes, some of them have returned; I should say between 60 and 100 have returned.

3,430. As more return do not you think the number willing to come out to work will increase? Yes, to a certain extent, but most of the boys collected in 1902 were boys from the coast and Mozambique, and there was a gang of 62 that arrived in Mozambique while I was there, most of them belonging to Mozambique territory, and after they went away we sent about 50 Mozambique boys also, but we nearly cleared the town. There are very few of the real Makuas that have returned yet.

3,431. Do you want the Commission to understand that the bulk of the natives you have sent are from the coast, or near the coast?—Yes.

3,432. Is there not a large population at the coast to draw from?—Yes.

3,433. You say in your statement that during the next five months, you expect to be able to send from 100 to 150 boys per month?—Yes.

3,434. And in 1904 from 200 to 250 per month?—Yes.

3,435. Are you relying on these figures from natives in the immediate neighbourhood of Mozambique, or from the interior as well?—From the interior as well.

3,436. You say in the last paragraph of your statement, "I find that owing to the cold winter in the Transvaal and the great difference between this climate and the climate of Mozambique, a large percentage of the boys have suffered from pneumonia and chest complaints and a number have died on the mines?—Yes.

3,437. Where did you get this information from?—I have been visiting the compounds, and I found that there had been a lot of sickness amongst the Mozambique boys.

3,438. Have you conversed with a number of boys that you have sent up here?—Yes.

3,439. Have they expressed themselves satisfied with the conditions?—Those who have been here for only two or three months are rather dissatisfied, but those who have worked for seven, eight, or 12 months are all more or less satisfied. The majority of them are satisfied, and all those who have returned to Mozambique have all been satisfied.

3,440. What complaints have the natives who have been here for two months to make?—Some say the white men knocked them about; others do not like the food; others say their brothers have died and a lot of them complain of sickness.

3,441. What food are they accustomed to in their own country?—The real Makuas are accustomed to mealies, Kaffir corn, and rice. The Coast boys eat rice and the Makuas want rice as well when they get down to the Coast. They eat the same food as the Shangani.

3,442. You mean mealies and kaffir corn?—Yes.

3,443. Mr. GOCH: How many years do you think it will take you to accustom them to come here in anything like a large number?—I suppose each year they will gradually increase.

3,444. I suppose we should get at least a thousand a month. Do you think we could ever reach that number?—It would be a long time.

3,445. How long do you think?—Well, I think that if you get 600 as an increase every year you will be doing fairly well. Of course, there are certain times when you cannot get any boys at all from there, that is during the harvest time and the ploughing season. Some months you can get very, very few.

3,446. Only about 50 a month is all that you may hope for?—Yes.

3,447. Will not that steadily increase with time?—Yes, I say about 600 in every year. It might increase, however. The natives in the interior are practically savage, and we do not know how they will take to the work.

3,448. It will be a matter of 10 years before you can get up to anything like a satisfactory material output?—Yes.

3,449. How many men have you there?—Nine other white men beside myself.

3,450. Do you know what the monthly cost of the men recruiting there is?—I know it is a considerable figure.

3,451. If you want to be successful in the course of ten years, you will need all of those men?—Yes. The men have got two kinds of work, which is to recruit and open up the new districts; so that the men are not only recruiting, but opening up several other parts of the country.

3,452. Mr. DONALDSON: You say you have nine other men (white) recruiting up there?—Yes.

3,453. Have you had them long, or are you gradually increasing your staff? Did you start in there with your present staff?—There were nine men when I went up there in January.

3,454. You sent more boys before January than you did afterwards?—That was caused through a lot of the boys being collected from the Coast tribes and only a few from the interior. They were persuaded to come up by their friends, and after the

boys came up the chiefs were impatient about the return of their friends who had gone out, and until they returned they would not let anyone come out.

3,455. Take the returns from January up to the present time, do they not work out an average of not more than six boys for a recruiter per month?—Yes.

3,456. Mr. EVANS: You say that you anticipate 200 to 250 per month for the year 1904?—Yes.

3,457. On what do you base that estimate?—I base that more or less upon the number I expect to get from each district. I am only estimating from all the different districts.

3,458. You have no reason for that, you are only guessing at it?—Yes.

3,459. Now, later on, you say that the death rate here may have a bad effect upon recruiting?—Yes, it may. Some of the boys are very dissatisfied because some of their brothers have died.

3,460. Do you know what the death rate is among the Mozambique boys?—As a rule it is higher than the death rate of the East Coast boys.

3,461. You think that it may have a bad effect?—Yes.

3,462. Mr. TAINTON: We have had it in evidence that the average term of service on the Rand of the East Coast boys is about two years?—Yes. The average term of service is about two years for the Shangaans and Inhambanes.

3,463. We have also had it from other witnesses that the approximate number of natives likely to turn out to work in Portuguese East Africa is one-third of the male population between 15 and 50 years of age. Does that estimate agree with your observations?—Well, that varies with the different tribes; some tribes are more or less civilized, and some tribes have different natures to others. The Machuas are the worst tribe that have come under my notice yet, they are very vicious and not accustomed to white people at all, and it takes a long while to persuade them to come out at all or believe a word you say. I think that would be too high a percentage for the Machuas.

3,464. What proportion of the population belongs to that tribe—taking the whole population?—The population is unknown because no one has ever visited them yet.

3,465. Take the total native population of the whole country—what proportion are Machuas?—It is impossible to say.

3,466. Can you give it roughly?—No.

3,467. This estimate of the one-third of the male population as available applies only to a fringe on the coast line?—I do not think that it would apply even to that, it may apply to the Shangaan and the Inhambanes, but these boys of the coast are not fond of work.

3,468. Then what district does that estimate of one-third of the male population apply to?—I should think that that applies to the ordinary Kaffir who has been coming to the mines for several years—like Gazaland, Inhambane or the Northern Transvaal.

3,469. No, leave the Transvaal out. It applies to the district about Lourenco Marques?—Yes, but it does not, in my opinion, apply to the Mozambique district.

3,470. Have you any knowledge of Portuguese East Africa outside of the district of Lourenco Marques?—I have travelled all over Gazaland and Inhambane.

3,471. Do you know the country about the Zambesi?—No, I have never been up so high as the Zambesi overland.

3,472. Where are you stationed?—At Mozambique.

3,473. At the Capital?—Yes.

3,474. North of the Zambesi?—Yes.

3,475. How long have you been there?—Since the 16th of January.

3,476. How many natives have been sent out from that district?—952.

3,477. Why have you not been able to send more?—Because they would not come, because it is a new country. To show you the difficulties you have to work under up there, I went to a chief called Comala, and Mr. Nourse told me that I should get a lot of boys. Well, I went to this chief's kraal, and we stayed there for five days, and he was sending runners out to call all his people together. One of his sons had been to Johannesburg and knew the place, and the chief promised that if we stayed there until he got all his boys called together he would supply us with some boys to go to work. The other recruiter left a day before I left with one of the sons of the chief, and the latter had only two boys to give us after we had waited five days for them, and he was sending all over the country for them. I left the following day with only one boy; we brought this boy down and picked up six more on the road, and we had about nine boys after waiting five days for them. The chiefs promise you that they will get any amount of boys.

3,478. But they do not carry out their promises?—No.

3,479. And if they do not carry out their promises you do not get the boys?—Not in the beginning. Now these other boys have come up to the mines, and it is only upon their return inland that we can get any other boys. The chiefs have no influence to send any boys out, but they have influence to stop them if they want to. If we were not friendly towards them we could not get mealies, or food, or anything, and we might probably be stopped by force in that country.

3,480. Do you mean by the Portuguese officials?—No, they have no authority whatever in the interior.

3,481. What do you mean by the interior?—I mean the interior of the country, say 50 miles from the coast west.

3,482. Does Portuguese authority stop 50 miles from the coast up there?—There is a commandant of the military post at the Lurio River and one of the chiefs went and complained to him that another chief was selling his women and wanted the commandant to give him some redress, and all the commandant did was to tell him he was to go and retaliate on the other chief. The commandant had not sufficient men to assist him. He had only got 20 native soldiers, a sergeant, and himself.

3,483. I think in 1900 there was a native chief outside of Mozambique who was at war with the Portuguese, was there not?—Yes, I think there was a sort of war with the chief called Marrave.

3,484. How far was that from Mozambique?—It is about 60 miles south south-west of Mozambique.

3,485. Mozambique is the Capital of Portuguese East Africa, is it not?—Yes.

3,486. Can you give us any estimate of the number of men you are likely to obtain in that district?—I have given the numbers here in my evidence.

3,487. In what period of time?—In my statement I said I think if we get 600 extra every year we are doing well.

3,488. Do you look to the Portuguese authorities to help you in this matter?—Not in the way of recruiting at all—not directly or indirectly.

3,489. Why not?—Because they have not got any influence with the boys.

3,490. Are we to understand that before the Portuguese Government can assist the native labour market it is necessary for the Portuguese Government to establish its authority over those native districts?—In which way do you mean the Portuguese Government to assist?

3,491. Before you can get any assistance from the Portuguese Government to send out boys, I take it from your replies it will be necessary for them to subdue these people?—No, not at all, that was not my meaning.

3,492. What is your meaning?—I mean that the country is not explored and is uncontrollable—that the Kaffirs are the real masters of the country, and of the interior.

3,493. Before the Portuguese Government can assist you, it must establish its authority over these people?—If we continue working, it is very probable that we shall civilize the country before they do.

3,494. Then having regard to the estimate made by the Portuguese officials as to the number of boys they can obtain in that territory, are you sure of your fact that Portuguese authority is not established there?—I am confident of it.

3,495. Is the district of Mozambique directly under the control of the Government?—Yes.

3,496. Have you any acquaintance with the districts which are held by the "Prazo" holders?—No.

3,497. You say in the second page of your statement, "Owing to their custom of living from hand to mouth, they suffer from famine?"—Yes.

3,498. Is that a frequent occurrence?—Well, lately I think the crops have been rather good. It was only in the one district I have mentioned.

3,499. Is that one of the factors which influences the natives to come out—the food supply?—I should consider so.

3,500. Is there any demand for manufactured goods amongst the natives there?—All the goods that are used amongst the natives there are cotton goods from India. All the trade is done by the Indian people.

3,501. Why then do they come out to the Rand?—Well, in the first place, it is their curiosity and their wanting to earn money or obtain clothes like they see the white men wearing.

3,502. Does that motive remain as a permanent motive?—Yes, I should say so.

3,503. Do they stay here a long time when they once come?—Some of them who have been here 12 months desire to stay another 12 months in preference to going back home.

3,504. Can you give us any reason for, or explanation of that preference?—I consider that they have a nicer time here than at their own kraals; they have better food and better clothing, and once they get accustomed to the work the majority seem to like it.

3,505. Is drink one of the attractions?—Not on the mines, because they do not get as much here as at home.

3,506. Did they not get a good deal of drink before the war?—Before the war the Mozambique boys never came here.

3,507. Do you find that they gamble a good deal?—Yes, the coast tribes do.

3,508. Mr. WHITESIDE: Mr. Goodwin, you said in your statement that "All the boys who have returned up to the present have been well satisfied with their treatment on the mines and have been instrumental in obtaining new recruits." Do you think that sufficient time has elapsed to get good effects from that?—In the districts where the boys have returned—yes. The majority of the boys that have returned belong to Mozambique.

3,509. A good many have returned so far?—No.

3,510. They have not returned in sufficient numbers to affect the supply?—No.

3,511. You give us as the minimum 200 to 250 per month. Is that minimum confined to this year?—No, it is for next year.

3,512. Then as time goes on we may expect the numbers to rapidly increase?—I should think gradually, not rapidly, because it will take some time for us to become acquainted with chiefs in the interior; it takes three or four months to become acquainted with one new chief. For every new chief, it will take practically six months for us to become acquainted with him.

3,513. Still you have an increasing stream of returning boys carrying the news of the new Eldorado to these natives; it must of necessity increase the sphere of your recruiting somewhat?—The news brought by the boys would only be useful in their own district. The tribes further in would not believe anything these returning boys say to them.

3,514. For all you know the number of the Machua tribe may be something enormous?—Yes.

3,515. The present cost of recruiting boys up in your district is rather high?—Yes.

3,516. You have stated that these boys prefer long service on the mines. They stay here for a considerable time?—Some of them have preferred to stay on instead of returning to their homes.

3,517. Should not this fact tend to make them cheaper in the long run, so far as the cost of recruiting goes?—At the same time that might have a bad effect on the boys in the country. The non-returning might make the others suspicious that they have died, or been killed, or something like that.

3,518. So for the present it would be better if those boys were to go home, say, after six months' service?—If they belonged to the interior the Mozambique is advertised sufficiently there. If any boys have finished their 12 months' service, it would be better for them to go back home.

3,519. And be recruited over again?—Yes.

3,520. Mr. QUINN: How long have you been in the country?—Since January 16th of this year.

3,521. Had you been there before?—No.

3,522. How long have you been in South Africa?—From 1890 to 1891 I was in the Transvaal, and I was five years in Rhodesia.

3,523. What part of the Transvaal were you in?—On the mines on the Rand.

3,524. Where were you in Rhodesia?—On the different mines there.

3,525. You have been about seven months in this district on which you are giving evidence?—Yes.

3,526. That is all the experience of recruiting that you have had?—I first entered the Association in November, 1901.

3,527. Where were you between 1901 and January of this year?—In Inhambane and Gazaland.

3,528. You have been in Portuguese East Africa for 18 months?—Yes.

3,529. You do not know the language properly?—I understand the language.

3,530. Can you talk to the Machuas?—I know sufficient to make myself understood. For instance, if I wanted a drink or to find myself a house I could make myself understood.

3,531. Do you not find it a disadvantage in not being able to converse with these boys?—I have very good police boys.

3,532. You have an interpreter?—Yes.

3,533. But it is much better to speak the language yourself?—Yes.

3,534. Now with regard to all these figures you have given us—except where you have reliable statistics—these ideas of yours with regard to the possible increase are just your opinions?—Yes.

3,535. Without taking into consideration the possible changes and conditions?—That is based on the opinion that things continue as they are and the boys return satisfied.

3,536. The CHAIRMAN: Mr. Goodwin, the Commission is very much obliged to you for your evidence.

Mr. WILHELM HOLTERHOFF, called, sworn, and examined.

3,537. The CHAIRMAN: You have before you, Mr. Holterhoff, a statement headed, "Evidence of Mr. W. Holterhoff." Do you wish to hand this in as your evidence-in-chief?—Yes, but I would like, with your kind permission, to make two or three alterations. On page 1, six lines from the top, where I have mentioned "One hundred and fifty other free recruiters," this should be "fifteen other recruiters."

3,538. You are talking about Hectorspruit and Komatiport?—Yes.

3,539. You say there were fifteen free recruiters working in 1897. Do I understand you to mean at Hectorspruit and Komatiport?—Yes; there were more started, and got paid off at the end of a month or two.

3,540. But you never had more than fifteen free recruiters at one time?—No.

3,541. You say these free recruiters used to supply direct to the mines from 3,000 to 4,000 boys per month?—Unfortunately, my books were lost during the war, but I take these figures from the books of the N.Z.A.S.M.

3,542. And so it is on these figures you base your knowledge, and they are supported by your own figures?—Yes.

3,543. So that on your statement, your own best month contributed 900 to 950 boys. What would about the average be?—About 650 to 700.

3,544. Mr. Holterhoff's statement was then handed to the Commission, and reads as follows:

I am a farmer and timber dealer, residing about five miles from Hectorspruit, on the Delagoa Bay Railway. I have lived there since 1894, and am well acquainted with Gazaland and its inhabitants.

In 1896 and 1897 I was recruiting for the mines; at this time there were about 15 other free recruiters. Between us all, we used to supply direct to the mines, from 3,000 to 4,000 boys per month. This was from May, 1896, until some period in 1897. My own best month contributed 900 to 950 boys. During this period free recruiting was allowed, the Rand Labour Association being also in existence—the free recruiters were getting much better results than the R.L.A.

In 1897, what was known as "Grant's Concession" came into existence, and this interfered with free recruiting in Gazaland. This was not a real concession, but had the effect of doing away with free recruiting as it had formerly existed. The result of the Concession was that boys preferred to go to Lydenburg and Pilgrim's Rest. A large number went there at this period, the labour supply there being very ample; previously, boys could hardly be induced to go there.

At the same time, the free recruiters were able to supply about 1,000 boys per month to the Witwatersrand mines, as many natives would not be recruited for the then Association, but preferred to get through the country on to the border, where we intercepted them and recruited them. For about six months this went on, but when the R.L.A., who were exploiting "Grant's Concession," found we continued to have such good results, they approached the Portuguese Government, and it was then arranged that Kafirs could not leave the country of their own free will. When boys were found approaching the border for the purpose of seeking work through the free recruiters, or on their own account, they were arrested by the police on the Portuguese border and either compelled to go home, after work in the forts, or coerced into being recruited for the R.L.A. This exists to-day, and is the cause of a great loss to the W.N.L.A. in the number of boys given as recruited, but who are lost after the recruiting has occurred. I know of cases where boys were recruited against their will for the W.N.L.A., and on the road jumped out of the train to rejoin old employers. In other cases, boys have purposely recruited with the W.N.L.A. in order to get across the border for the purpose of escaping and rejoining employment they had before.

The boys look on the W.N.L.A. as a "forcing" institution, a sort of machine worked with the assistance of the Portuguese Government to compel them to choose only one kind of employment outside their own country. The result is that only those who must work will be recruited. If the boys were allowed to come into the Transvaal by their old routes and footpaths, without the restrictions and military inspection with which they associate the W.N.L.A., thousands more would be available. Even at the present time, many boys would escape the Portuguese espionage or the recruiters of the W.N.L.A., and would present themselves in the Transvaal in search of various kinds of labour, but for the fact that the Transvaal game reserve, through which the principal footpath from Matukanyana runs, is rigidly closed to the egress of natives. The 895 recruited at Komati Poort, as mentioned in the W.N.L.A.'s report for 1903, are boys who have come to Komati Poort, escaping the vigilance of the authorities on both sides.

If the Portuguese Government would allow the boys to leave at their own free will, and return at their own free will, with roads free for the boys to travel on, I consider that 6,000 boys per month could be recruited by free recruiters. If arrangements could be made with the Portuguese Government, capitalising the amounts drawn from the W.N.L.A. and from the natives themselves, so that the emigration of boys would not be interfered with by the Portuguese Government, and the immigration not controlled by the W.N.L.A., then the supply from Gazaland alone would be very large indeed. The native mind does not grasp kindly the officialdom surrounding the recruiting by joint forces of the W.N.L.A. and Portuguese Government authority, and so long as this continues, the large number available will not be tapped.

It has been said by a witness at this Commission that free recruiters have been the cause of disturbances amongst the natives. There is one case on record, but the parties who caused the mischief were residents in Portuguese territory. There was also a case of misbehaviour on the part of a recruiter, and he was an employee of the R.L.A. at the time.

As a matter of fact, the free recruiters studied the boys' ways and made it attractive for them to seek work. Understanding the boys thoroughly, they escaped the unfavourable opinions which the boys form of those who are recruiting to-day under red-tape arrangements. If the free recruiter is in any way given a bad name to-day, it is a legacy left by those who in the past desired to bring the Native Labour organisation into the concession machine which it has now come to be considered. It cannot be denied that free recruiters sent up, even after the concession was granted, a very large number of boys. If, as stated by a former witness, those boys were smuggled, then the 895 boys recruited in 1903, at Komati Poort, by the W.N.L.A., were also smuggled, for they got to that place by the same methods. In Komati Poort district there are very few boys, and those who live there find home employment.

The number of boys independently recruited, as given by a former witness, was (1896-1899), 6,404. This is, I consider, a most ridiculous statement. If the Commission can obtain the figures from the old Netherlands Railway, of tickets issued to natives, it will find that in the best month during 1896, about 6,000 boys were sent away from Hectorspruit and Komati Poort alone. The books of the R.L.A., I think, will shew that they rarely sent away themselves more than 1,500 per month at that time. I hold that free recruiting is a method of getting large supplies, provided the Transvaal Government pays a yearly sum to the Portuguese Government to do away with all restrictions upon the boys coming and going, as they will. I further hold that any restrictive monopoly, such as the W.N.L.A., or any other institution so conceived, is, in the matter of Kafir labour particularly, a hindrance to a free and full supply, rather than a help. I consider that if the Transvaal Government will only give permission to recruit to persons with knowledge of the

country and the natives, and whose stability and good behaviour is guaranteed, Gazaland alone will supply, in my opinion, 120,000 to 150,000 boys at the rate of 6,000 per month, on twelve months' contract.

3,545. Do any other recruiters do business there?—Yes, sometimes.

3,546. Do you know of any?—Yes, Theodore Williams.

3,547. Has he done any previous business with you?—I cannot say, sir; but with the free recruiting we were sending more natives than the Rand Labour Association.

3,548. How do you know that?—I know by the numbers that we were sending away. Our boys did not come to the Rand, but some of them went into the employment of the N.Z.A.S.M., some went to Springs, and some to Balmoral.

3,549. About 600 boys went to Koffyfontein, who were recruited by the free recruiters?—Yes.

3,550. You say that the boys desert from the recruiters to the W.N.L.A. Do you know if in any large numbers?—I have seen the number given as over 1,000. Many natives would escape the Portuguese espionage, or the recruiters of the W.N.L.A., and would come to the Transvaal in search of various kinds of employment, but for the fact that the Transvaal game reserve, through which the principal footpath from Matukanyana runs, is strictly closed to the egress of natives. This game reserve is on one side of the Crocodile River, and no game there are allowed to be interfered with.

3,551. This restriction prevents a certain number of boys coming through to engage in work. On page 3 you say that if free recruiting was re-established you consider that 6,000 boys a month could be recruited. Are you confident as to these figures?—Yes, and if arrangements could be made with the Portuguese Government capitalising the amounts drawn from the W.N.L.A.; and from the natives themselves, so that emigration would not be interfered with by the Portuguese Government, and the immigration not controlled by the W.N.L.A., then the supply from Gazaland alone would be very large indeed.

3,552. You say that the free recruiters studied the boys' ways and made it attractive for them to seek work. Are not the W.N.L.A. doing that, too?—I cannot say. I have not been in that country myself.

3,553. In the last paragraph of your statement you say that, in your opinion 120,000 to 150,000 boys, at the rate of 6,000 per month, can be recruited from Gazaland alone?—Yes.

3,554. Mr. QUINN: Have you ever as a recruiter offered your services to the W.N.L.A.?—Yes.

3,555. When?—When I returned from home about September last year.

3,556. Did you write to them?—Yes.

3,557. Have you a copy of the letter?—No, I got an answer back to communicate with the Barberton Branch. They told me they were not going to employ any more men.

3,558. What did you do when they told you that?—I understood that the men had to work for wages, and as I had a business of my own, I could not afford to give all my time to it. I could not afford to work for wages.

3,559. Have you not a copy of the letter which was sent to you in reply?—No, that is the only communication I received from the Barberton Branch.

3,560. In communicating with the Native Labour Association, did you give them any account of your past experience or success as a recruiter?—I do not know exactly. I wrote a letter, but I have not kept the copy of it. I think it was after my return to this country.

3,561. Kaffirs are prevented now from leaving Portuguese territory, unless with the permission of the Portuguese Government?—Yes.

3,562. Is it within your knowledge that a considerable number emigrate from Portuguese territory and do not get here?—I cannot say exactly the number, but these boys come out of Portuguese territory.

3,563. You say, on the second page of your statement, that when boys were found approaching the border for the purpose of seeking work through the free recruiters, or on their own account, they were arrested by the police on the Portuguese border, and either compelled to go home, after work in the forts, or coerced into being recruited for the R.L.A. This exists to-day, and is the cause of a great loss to the W.N.L.A. in the number of boys given as recruited, but who are lost after the recruiting has occurred. Are you speaking from personal knowledge or merely from hearsay when you make that statement?—I am speaking from my own knowledge.

3,564. You say, "I know of cases where boys were recruited against their will for the W.N.L.A., and on the road jumped out of the train to rejoin their old employers," is that from hearsay?—I know it is in my statement; I have a copy of it here.

3,565. The result is that if this system were adopted, there would be more labour available, is that your opinion?—Yes, the Kaffir usually gets very suspicious, and when we want to recruit him, it is then that such a question presents itself. He is of such a suspicious temperament.

3,566. And therefore you consider that 6,000 boys per month could be recruited by free recruiters?—Yes.

3,567. What do you mean by saying, as a matter of fact the free recruiters studied the boys' ways, and made it attractive for them to seek work. What do you mean by making it attractive?—Well, shewing them the advantages they would have.

3,568. You say that the numbers independently recruited as given by a former witness, between 1896 and 1899, as 6,404, is a most ridiculous statement, and you say if the Commission can obtain the figures from the old Netherlands Railway of tickets issued to natives, it will find that in the best month during 1896, about 6,000 were sent away from Hectorspruit and Komati Poort alone. In the last note you say, "That I consider that if the Transvaal Government will only give permission to recruit to persons with knowledge of the country and the natives, and whose stability and good behaviour are guaranteed, Gazaland alone will supply, in my opinion, 120,000 to 150,000 boys, at the rate of 6,000 per month, on a twelve months' contract." What is your opinion of the present recruiters of the W.N.L.A.?—My opinion is that the men employed by the Association are very good indeed; some of them were employed as recruiters before the war.

3,569. Do they make less money now than they used to?—I do not know what they are getting. I have not been in the Portuguese territory since I came back from Europe.

3,570. What amount per head did you get for your boys?—We were getting about 27s. 6d. per head before the "Grant Concession" came into force. After the Concession we got about from 30s. to 45s., which is almost double the previous premium pay.

3,571. Mr. WHITESIDE: I think I may take it that you do not approve of the methods of the Native Labour Association?—No.

3,572. You do not think they are getting the results they ought to get?—No.

3,573. Can you suggest any method of getting this class of labour. On the last page of your statement, you state that free recruiting is a method of getting large supplies, provided the Transvaal Government pays a yearly sum to the Portuguese Government to do away with all restrictions upon the boys coming and going. Do you mean that we would get these results if we went back to free recruiting?—Yes.

3,574. So that you consider your estimate could be attained under free recruiting?—Yes. There was

under the old system no force or compulsion used, but the boys were free to join whatever mine they liked.

3,575. Mr. FORBES: These boys you refer to as 900 and 950—where did you get them from?—From Gazaland.

3,576. Then you were not in the habit of recruiting at Hectorspruit?—No, we intercepted them on the road. That is to say, some of them, and others went to the bigger chiefs in the country.

3,577. Mr. EVANS: How long have you been in South Africa?—Since 1893.

3,578. And how long have you been at Hectorspruit?—Since 1894.

3,579. What is the name of your farm?—It is called Government Farm No. 91.

3,580. How far is that from Komati Poort?—Twenty-five miles.

3,581. And what were you doing before the war?—In 1896 and 1897 I was recruiting for the mines.

3,582. What mines were you recruiting for?—I was recruiting for the Simmer and Jack, and Primrose Mines, and also the Robinson Mines.

3,583. Were you then recruiting for two parties?—Not at the same time; generally for one.

3,584. When did you exchange your boys then?—I exchanged them with some other boys who were there at the same time.

3,585. And this was done at Hectorspruit?—I have no record. The recruiting ground was Gazaland, but exchanges for mines were not made there.

3,586. Were you licensed by the Portuguese Government?—No, it did not require any licence at that time, that is from 1896 to 1897. After the Portuguese Government licensed recruiters I used to intercept the boys as they came across the border, and charge the mines 30s. per head for them.

3,587. Did you go on recruiting after the period when a licence was required?—Yes.

3,588. Well, how did you manage it?—We intercepted the boys as they came across the border.

3,589. Would it be fair to say that you were smuggling these boys?—The boys were coming across the border to work, and the recruiters intercepted them on this side of the border.

3,590. Do you think that was good business?—Certainly.

3,591. Have you tried to get a licence in the Portuguese territory?—It was useless to try. Everybody knew that we would not get it on a recruiter's application.

3,592. You say that a certain number of boys could be recruited in Gazaland?—Yes.

3,593. I ask you, were these boys recruited in Gazaland before the "Grant's Concession" came into existence, or afterwards?—We intercepted them as they came over the border. In any case they would not have come to the mines.

3,594. You say here that the free recruiters were getting better results than the Rand Native Labour Association. Why was this?—They got better results all the time, even after the Concession was given.

3,595. Up to what period?—I cannot say exactly.

3,596. Would it be in 1896, 1897, or 1898?—I think it was in 1897.

3,597. No, do you know what the monthly increase on the Rand was in 1897?—No.

3,598. Would you be surprised to hear that it was less than 450 per month in the year 1897?—In 1897 we had a good number of boys from Komati Poort.

3,599. Do you consider that 1896 was a good year?—Yes.

3,600. What was the net increase in 1896?—In the beginning of 1896 there were hardly any boys on the Rand.

3,601. Taking that into consideration, what do you consider was the net increase?—I have no idea.

3,602. Do you think it was double the number in 1897?—I have no idea.

3,603. You have no records? Do you know if there are any records?—I have got no records.

3,604. Do you know a Mr. Dyer? Do you know if he has got any books?—He did not do any recruiting himself.

3,605. Do you think he has got books?—I think so. He did not recruit any himself.

3,606. Now what is there in the methods of the W.N.L.A. that you object to?—What I object to first is that the Kaffirs are bound to go to one company, and not to mines that they choose; second, that they have to go 150 miles sometimes to reach the port of entry.

3,607. Do you know whether those persons who recruited at that time were duly licensed by the Portuguese authorities?—I do not know.

3,608. Now, really, are your objections to the methods of the Association or to the action of the Portuguese Government?—To both of them. The Portuguese Government is to blame for the action of the soldiers in detaining boys, and forwarding them to the W.N.L.A.

3,609. Do you think that the Portuguese authorities would allow boys to come across?—I do not know.

3,610. You are not acquainted with the Portuguese authorities?—No, I am not acquainted with the Portuguese authorities at all.

3,611. Were you licensed there?—No.

3,612. Mr. DONALDSON: Where were your headquarters?—At Hectorspruit.

3,613. Did you carry on any other business there?—Yes, I have a store, but my principal business was not forwarding boys who have been forwarded by others, as you state.

3,614. Mr. GOCH: You state that your experience of recruiting is brief, and that your successful months have only been a few?—Yes, but I continued to recruit "smuggled" boys right up to the beginning of the war. The boys in Gazaland refuse to come out under present conditions. The boys who were intercepted come to the well-known footpaths and get food. I know the W.N.L.A. agents gave the boys food, but the boys liked to go to the recruiters of their own free will.

3,615. Of course, I suppose, you would have the same conditions continued for your success. It would not do for you to have to wrest them from the Portuguese Government at all, would it?—Yes.

3,616. You still think you could recruit 120,000 out of Gazaland—you would get the permission of the Portuguese Government?—I base my opinion on the condition of things before the war. I understand from what I see of the boys that have been lately recruited for the Native Labour Association that most of them came from the far district—from the Zambesi—and I reckon that in the nearer part of Gazaland they refuse to come out under the present conditions.

3,617. You said that the free recruiters were more successful than the officers of the Native Labour Association?—Yes.

3,618. And that they (the Association) only recruited 25 per cent. of the boys?—I say 25 per cent. at the present time. The free recruiters who work would get 75 per cent. of the labour and the Native Labour Association would get 25 per cent.

3,619. And the free recruiters would be in the position to fix the price at which they could get them?—The price would be fixed by the Association.

3,620. The great thing seems to be to intercept the boys?—These boys did go to these footpaths knowing that our recruiters were there and would feed them.

3,621. They actually came to your men—came and "sorted" you out?—Yes, more to get the food.

3,622. That would be the course you would try again?—When recruiting, if we could not remain on the border and we found they did not come, then we would have to go into the country for them.

3,623. The recruiters of the W.N.L.A. give them food?—I know they do. The boys will not recruit under them on account of the restrictions; they think they are forced and must go to them.

3,624. They prefer to be caught up on the road?—They like to go of their own free will. Sometimes the Kaffirs intermarry down there on the border with the Shangaans and with the Swazis. The Shangaan, when he want to see his family, cannot even get out of the country.

3,625. He does not come at all then; he does not see his family?—Yes, when he comes down to Delagoa Bay. When a lot of them want to get over the border then they are made prisoners—and they want to get out of the country.

3,626. The OHAIRMAN: The Commission is very much obliged to you, Mr. Holterhoff, for the evidence you have given to it.

Mr. LIONEL COHEN, F.R.G.S., called, sworn and examined.

3,627. The OHAIRMAN: You are Mr. Lionel Cohen?—Yes.

3,628. Have you before you your statement headed "Evidence of Mr. Lionel Cohen, F.R.G.S.?"—Yes.

3,629. Do you wish to hand that statement in to the Commission as your evidence-in-chief?—Yes.

3,630. Mr. Cohen's statement was then handed in to the Commission, and reads as follows:—

(1). I have been resident in this country since 1891 and am conversant with its labour conditions. During the past 12 years I have travelled extensively in Mashonaland, Matabeleland, the Northern Transvaal, and from 1896 to 1902 I resided in Portuguese East Africa (Gazaland). Before the war I established a labour agency in Gazaland, and acted as recruiter for the Consolidated Gold Fields, and had depôts in Lourenco Marques, Gaza and Inhambane. I have a special acquaintance with the Portuguese African native conditions, and with the permission of the Commission I will confine my evidence to this branch of the subject.

(2). The native of Lourenco Marques is naturally indolent and averse to leaving the town in search of work. The majority of them are employed at the docks, in the Customs and railway service, stevedoring, lightering, etc. Large numbers are engaged in house-work, and as a rule they prefer to stay in the town, where they earn from 1s. 9d. to 3s. per day. These boys cannot be relied upon for continuous work; they have a habit of taking holidays as they choose. It is very difficult to give actual statistics, but from the latest figures available I gather that there are 110,000 natives in the district of Lourenco Marques, including the hinterland of Maputa, Catembe, Magnde and Sabi. Of these, only a very small proportion could by any chance be counted as "possible" for the Rand. Turning to Gaza, whence a very large number of boys, both Mashagans and Machopies, emigrate to the Rand, the total number available is 60,000. The characteristic of the Mashagan Kaffir is that he considers it *infra dig*, to do any hard manual labour, such as tilling the soil. His wives are compelled to do this work, and he lives in idleness. In the districts of Bileni and Machopie the natives can get from 6s. upwards for a bag of mealies, in cash, and from 10s. to 12s. in barter, and as they grow on the average from 15 to 20 bags per annum, with no exertion on the part of the male native, to whom marriage is very much a matter of convenience, his comfort is assured, and he is able to indulge his natural instincts towards indolence and remains with his own family in his own country instead of coming to the Rand, where the earning of a living has its attendant disadvantages. In any reference to Gazaland, it must not be forgotten that, so recently as

1898, the country was absolutely virgin as far as regular trading is concerned. I was the first trader who began to buy rubber and mealies in Gaza in that year (1898), but to-day there is a large trade done by, I should say, about 1,000 Arab buyers, besides a large number of Portuguese. I should like to emphasise this point—that it is only since 1898 that the native has begun to cultivate for profit; previously, he simply grew what he personally required, but in the last five years he has gathered the knowledge that he can maintain himself (by his wives' labour) on the produce of his land, and this is telling more and more against his coming outside his own country to work. Under the old régime, in the pre-war days, the native who left Gazaland for the Rand was not on a holiday jaunt, or in search of novelty. He came with the fixed idea of labouring steadily until he should have earned sufficient money to purchase a wife, for he had no other resources, such as tillage, to fall back upon, as he has now. To-day, with the development of his resources, there is no such inducement for him to travel. He grows mealies, Kaffir beans (for which there is a great demand), and pea-nuts. He is a large poultry raiser, with a paying market for eggs and fowls close at hand in the various trading stations, and his piccinins can and do collect large quantities of rubber, for which about 2s. 6d. per kilo is paid by the trader. His women folk collect wax and gum-arabic, which is sold at a profit. In fact, the whole conditions have so utterly changed him in the past few years that the aim and object of the native is now to remain on his own land instead of migrating elsewhere. With his larger knowledge of commercialism, he is cute enough to see where his comfort lies, and I am of opinion that no inducement in the shape of pay would bring him to the mines, a kind of labour quite opposed to his ideas of existence.

Again, in recent years, the moral code of the native has become very lax. Where at one time he had no prospect of marrying until he had at least the equivalent of £30 to £40, to-day he can secure a wife by paying, say, £1 to the girl's father, and, to use the commercial term, discharging the balance by instalments. Frequently, after the first payment, nothing more is paid until after the birth of the first child. A native whose children are all girls has a still more powerful reason for staying at home, because he knows that in a comparatively few years he will profit by their transfer to husbands. A few years ago, also, there existed a semi-military code, much like the Zulu and Matabele, but not so strict, under which no young man was entitled to marry except he had attained to full manhood. To-day we find lads of 15 and 16 have already taken wives. For many years the native idea of affluence was summed up in the two words "diamond" and "gold"—the pseudonyms for Kimberley and Johannesburg. But within the last three years the native has learned that he can, with infinitely less exertion, pick up more money at the ports—Beira, Lourenco Marques, and Natal—where he has short hours and a climate more suited to his physical likings. He shivers to-day at the idea of the cold morning in the compound and he talks with his fellows about the "m-lungu 'tgate"—the witchcraft of the white man—which has led to the death of many of his brothers on the mines, and the hardships of work in the deep levels, a new terror of recent years, from which others of his tribe return, prematurely aged, often with incipient paralysis and the wreck of their former selves. The hut tax the native pays now is 10s. per annum in gold, or 3,000 reis, or he can give 15 days' labour in a *commando-militar*, i.e., working on construction in a military camp, in lieu of payment. In hard times the Portuguese will take the equivalent of this tribute in kind—mealies, rubber or poultry. Before the war thousands of boys had not been home for years, the diamond mines of Kimberley and the gold mines of the Rand offering attractions too powerful to resist, more especially the Rand, where there was an unlimited supply of liquor and good money to be earned, all of which the boy spent on luxuries, without a thought of the morrow. Since 1899, however, when the bulk of the natives went home by *force majeure*, they have come to know

what home and its comforts mean, as I have already indicated. To the Machopie and Inhambane Kaffir, who can be classed with the Mashangan, these remarks also apply, but with even more force. They are an immoral race, with marriage so easily attained that there is no necessity for the prior earning of money. They have lately begun to trade by selling the sheep they rear, which formerly were all kept for their own consumption. They are experts in beer-brewing, and utilize mealies, pineapples (which grow wild in millions), mandioca root and native fruits, for the distillation of a spirit stronger than proof whiskey. This spirit is traded among themselves and also with the Indians, payment being rendered either in cash or kind. Each year large expeditions are organized, and great bodies of natives go to the hunting grounds in the vast plains lying inland, where game is plentiful, and also palm trees, from which last the hunting parties distil the same kind of spirit. Many natives remain on these grounds throughout the year, leading a nomadic life. In former times the chiefs did not allow these wanderings; to-day their authority is weakened—they are mere figure-heads and their words carry no weight. The approximate number of natives in the Machopie and Inhambane districts is 140,000. In both Gaza and Inhambane various local industries have been started within the last three years which give employment to a great number of natives, who can earn on the spot sufficient money for their immediate wants. With regard to Mozambique and the Zambesi districts, my knowledge is less precise, but I know that the natives there are not keen on coming to the Rand. They have primitive ideas of the value of money, and manual labour is a thing to be shirked. The number of able-bodied men is, roughly, 170,000. Summarising, the mines will have a formidable rival in the Portuguese Government, which will employ large numbers of natives in the many schemes in contemplation—the docks at Lourenco Marques, the railway from Matolla to Swaziland and the proposed railway from Inhambane to Lourenco Marques, besides the many local industries which are springing up. Taking, as a round number, 480,000 able-bodied men as living in Portuguese East Africa under the absolute authority of the Portuguese Government, I estimate that not more than one-quarter of this total may be reckoned as available for outside labour. Owing to the causes I have indicated, there is no likelihood of this number being increased as time goes on; the probabilities are all in the contrary direction. As to food, the native is treated more liberally in the compound than in his own kraal, and the accommodation, in the majority of cases, is better here than that to which he is accustomed. Another reason operating against a large supply of labour from Mozambique and Inhambane is the dread of cold. No native can ever be persuaded to take precautions against the effects of cold and damp on the mines; he accepts pneumonia as an incident and no warnings will keep him clear of his superstitions.

3,631. The CHAIRMAN: You resided from 1896 to 1902 in Portuguese East Africa?—Yes.

3,632. You were engaged recruiting labour in Gazaland previous to the war?—Exactly.

3,633. Is your East Coast experience confined to Gazaland?—Gazaland, Lourenco Marques, and Inhambane—the three districts.

3,634. Did you do a large business in recruiting previous to the war?—Not very much, about 300 a month.

3,635. Where did you recruit these boys?—In Gazaland, Lourenco Marques and Inhambane.

3,636. Had you sub-agents to do the work?—Yes, I also employed a sub-agent.

3,637. Were they your paid servants?—Yes.

3,638. Then the opinions you express in this statement of yours are based on that experience which you now refer to?—Yes.

3,639. You give it as an opinion here that the natives in Portuguese East Africa are indolent?—Undoubtedly.

3,640. And formerly the only means of getting money was by their visiting the diamond fields and gold fields?—Yes.

3,641. You say now there is a considerable market for their produce?—Yes.

3,642. And that by disposing of that produce in these towns they get the money for their requirements?—Yes.

3,643. You seem to think that we need not hope for any large increase of natives from these territories?—Taking, as a round number, 480,000 able-bodied men as living in Portuguese East Africa, under the absolute authority of the Portuguese Government, I estimate that not more than one-quarter of this total may be reckoned as available for outside labour. I reckon you cannot get a large increase to the number of 120,000, as I mentioned it in my statement.

3,644. On what page of your statement?—On the last page.

3,645. The last statement on the last page, summarising it?—What paragraph are you referring to?—I have not my own copy here.

3,646. The CHAIRMAN: The Secretary will turn it up for you. In the last paragraph you speak of 480,000 able-bodied men as living in Portuguese East Africa under the absolute authority of the Portuguese Government, and only one-quarter available, that is 120,000. By outside labour do you mean that available for leaving these territories to work elsewhere?—Yes, Sir.

3,647. How long do you suppose it would take before you would be able to recruit that number for work here?—It is very difficult to say. You see I have not been down there for the last two years, but if free recruiting were allowed I would say the number the W.N.L.A. are getting out would be materially increased.

3,648. You cannot put a figure on the number per month?—I am afraid not, Sir.

3,649. Do you think under a system of free recruiting a larger number of boys would be got out?—Undoubtedly, Sir.

3,650. What are the objections to the methods of recruiting detailed here in regard to the W.N.L.A.?—In the first instance, the W.N.L.A. have certainly lost the confidence of the niggers. The natives have put it down to the W.N.L.A. that they were responsible for the reduction of wages. Then again the natives were told that they could earn £3 per month, and when they came up to the Rand and found that on the best work they could not earn that, putting down two holes. The majority certainly objected to do that.

3,651. Then it is not to the men employed by the W.N.L.A. that the antipathy is taken?—I do not think so.

3,652. Is it within your knowledge that the men employed are largely the same men who engaged as free recruiters before the war?—The majority of them are.

3,653. You say that another reason against a large supply from Mozambique and Inhambane is the cold. Do you think the natives give much consideration to that?—I think so. Latterly when this exodus took place from the Rand, the boys had been here for years and years. They were attracted by the drink. Some of these Inhambane boys have been here for years. Lots of these boys never went back home at all, and latterly, since the deep levels have been started, they come back paralysed. You see them coming home, their relatives carrying them in those "Machila." Naturally it goes round country that they are paralysed and it detracts from a large supply coming in.

3,654. What is this paralysis due to?—It is due to water in the mines.

3,655. Drinking water?—No, the water they are practically standing in while on shift.

3,656. You are referring to shaft-sinking?—No, sir, to the hammer boys in the deep levels. They are always in deep water.

3,657. Have you had some experience of these mines?—Very little, sir.

3,658. You have not seen boys working in the deep levels standing in deep water all the time?—No, sir.

3,659. Mr. QUINN: This very interesting paper of yours tells us that the native of Lourenco Marques is naturally indolent and averse to leaving the town in search of work. The majority are in the docks, Customs, railway service, and so on. Have you any idea how many natives are employed in this way in Lourenco Marques?—I could not say accurately; off-hand, I should say 10,000.

3,660. So it is hardly correct to say the majority are so engaged. Afterwards you told us the number was 10,000 there?—That is an error, sir. I meant to say the majority who do work are re-engaged.

3,661. Coming to this soul-stirring description, the returning boy, on page 3: "He shivers to-day at the idea of the cold mornings in the compound and he talks with his fellows about the 'm'lungu'—'tgate'—the witchcraft of the white man which has led to the death of many of his brothers on the mines, and the hardships of work in the deep levels, a new terror of recent years from which others of his tribe return, prematurely aged, often with incipient paralysis, and the wreck of their former selves." Do you know for a fact that the work in the deep levels is, generally speaking, any different to the work in the ordinary mines?—Undoubtedly.

3,662. In what respect?—With the deep levels everything is damp and the native suffers from severe rheumatism, and eventually contracts paralysis.

3,663. You have been told that?—From the natives I have seen returning to Gazaland and the way they have worked.

3,664. Mr. WHITESIDE: You think we should go back to the free recruiting system?—Yes, sir.

3,665. Have you formed any opinion as to the number of boys per month we may get for the mines if we went back to free recruiting from the districts you are acquainted with?—No, sir, I have not.

3,666. Thank you, Mr. Cohen, I have nothing further.

3,667. Mr. TAINTON: You speak of paralysis of the boys returning from the Rand as if it were a common thing. Is any large portion of the natives so affected?—A very large proportion.

3,668. Will you give us any rough figures?—It is difficult to give any rough figures. I mean where I had my camp I used to see gangs and gangs of boys pass. Probably 6 per cent. (perhaps this is rather a large estimate) of the boys returning were either suffering from rheumatism or paralysis.

3,669. Where were you stationed then?—In Gazaland, on the main road to Inhambane. The boys used to disembark at Chai Chai, and go through the Shangaan and Machopie country to Inhambane.

3,670. What year was that?—This was from 1896 up to April, 1902.

3,671. Did you find the boys on returning before the war were affected by the same complaint?—Lots of them were.

3,672. I was not there after the war; I left there in April, 1902.

3,673. Then this refers to conditions previous to the war. Do they attribute this disease or complaint to other causes than dampness in the mines?—The native never attributes it to dampness. He says it is the white man's witchcraft.

3,674. Which may mean his liquor?—I hardly think so, sir.

3,675. Was it special to this particular period or was it going on before?—Well, I think it was during the last two or three years.

3,676. During the last two or three years, then, it has become common?—Yes, sir.

3,677. You say that in your opinion there are 480,000 able-bodied men living in Portuguese East

Africa under the absolute authority of the Portuguese Government; that is on page 5. What do you mean by absolute authority?—Well, there are numbers that are in the interior, in the district of Namarraes, in Mozambique, and these do not recognise the Portuguese authority at all. The Portuguese have had two or three campaigns, but have never subdued them. It is impossible to say how many there are, but these 480,000 are the absolute number under the control of the Portuguese Government.

3,678. What proportion of the country is under the control of the Portuguese Government?—Gaza and Inhambane and portions of Mozambique.

3,679. What proportion of Portuguese East Africa; give us the rough figures?—I am not sufficiently conversant with the Mozambique to give you that figure.

3,680. You can estimate the population in the district and yet you do not know this?—I supplied those figures from statistics given me by Dr. Pinto Coelho, the late Administrator of Native Affairs. These figures were supplied to me upon making enquiries, and they took three months' work to complete.

3,681. Where does Dr. Coelho reside?—In Lourenco Marques.

3,682. Have you these statistics with you?—I have not these with me, but they are given in my statement, as he gave them to me.

3,683. But you have taken them from official figures?—He was the Native Commissioner. That is the census of the natives that resided in Lourenco Marques, Gazaland, and Mozambique who actually paid hut taxes, or were under the entire control of the Portuguese authorities.

3,684. We have had other official figures, and they differ considerably from those you have given us?—Possibly so, because the figures from the district of Mozambique are very problematical, but those of Lourenco Marques, Gazaland and Inhambane are correct.

3,685. Do these figures refer to these last three districts—Inhambane, Gazaland, and Lourenco Marques?—They refer to Mozambique as well, Sir.

3,686. Then, it appears from these estimates, as given to us, there are considerable differences in Portuguese official figures?—Possibly, sir.

3,687. You have no knowledge of the methods of recruiting adopted, have you?—Yes, sir.

3,688. How far does the Portuguese Government assist these recruiters?—In every possible way, sir.

3,689. Will you explain that answer?—Well, for instance, the Government, when it is decided to recruit, send out their official interpreter. He is practically a little Governor in Gazaland and he is called the nabob of the natives. He informs the natives that recruiting is allowed and the boys can come to Johannesburg, and he explains everything to them, and their action is quite free on their part.

3,690. Who is this gentleman who has such tremendous influence in Portuguese East Africa?—What is this influence based upon?—He has been official interpreter for the Government since 1895.

3,691. It is just personal influence?—Yes.

3,692. You say that of this number you estimate that one-fourth is available?—Yes.

3,693. What do you mean by available?—Well, some remain at home, some will go to Delagoa Bay to work. I gather from observation that this is the number. These figures of the number from Mozambique are very problematical because the country is not opened up at all and the native there is not very civilized and knows nothing of mining labour; the others, however, are born traders, go from Gazaland to Inhambane, and you will find them opening Kaffir stores and dealing in rubber, and never engaging in manual labour.

3,694. You have not yet explained clearly what you mean by available. Does that mean that one-fourth of the male population is at work in any one

year?—I reckon, sir, that with free recruiting you would get that one-fourth of 480,000.

3,695. We have been told that the average period of contract of service of these boys is two years or longer?—I do not think so, sir. In regard to the Inhambane boy, this is true, but with regard to the Shangaan his period would be six months, on account of the crops. I may explain that the Shangaan is a superior tribe, an offshoot of the Zulu, and reckons it *infra dig* to work.

3,696. Then no large proportion of the Shangaans turn out, is that it?—Oh, yes, sir, they turn out because their main need is cattle and as many wives as they can get, and they live in the lap of luxury.

3,697. When does he obtain the object of his ambition, wives?—It is hard to say, sir; some heads of kraals have 10 or 12 wives.

3,698. At what age does he obtain them?—Before the war in the Magigone there was a kind of semi-military system in force and the native until he got to maturity would not think of taking a wife. Today this is altered and boys of 14 or 15 come back and get wives for which they pay a few pounds down and the rest when they can.

3,699. You say the adult male population. What ages do you reckon in that?—From 15 to 45—15 to 40 we will say.

3,700. Are you aware that the supply from Portuguese East Africa is now larger than it was at any other time?—Yes, sir, the recruiting per month is larger.

3,701. How do you reconcile this fact with the general tenour of your statement to the effect that the native now on the coast works less than he did before?—Because before the war there were, approximately, up there 90,000 natives, and these have not come back to the Rand yet, and those who were here before naturally will do so eventually.

3,702. The general tenour of your statement may be summarised by saying that in your opinion the supply will tend to decrease?—Undoubtedly.

3,703. If you take the number of natives at work on the Rand before the war as 80,000?—Witness: There were more than 80,000.

3,704. Well, 90,000 then?—Yes.

3,705. According to your statement just now you expected to get 120,000, therefore there will be an increase, not a decrease?—There certainly will be an increase, but that increase will come from Mozambique, and I reckon we may get about 17,000 natives.

3,706. Then you look forward to this increase from the opening up of new districts, and not from recruiting in the older districts?—Yes, sir, to a great extent.

3,707. Have you any knowledge of the time required to extend these operations?—Well, from my experience of natives, I should say it will take years and years.

3,708. That is rather vague? Can you give us any time?—I am sure I cannot say.

3,709. And this estimate on page 5, of 120,000 being one-quarter of 480,000 is not the supply we may expect immediately, but one which may be reached after years and years?—Well, I think if they recruit for a year the supply would get up to what it was before the war. I think 20,000 may possibly be recruited at Mozambique and in the district of the Zambesi.

3,710. Were you ever interested in free recruiting?—Yes, I was recruiting in opposition to the old W.N.L.A. before the war.

4,492. I suppose there was the ordinary antagonism which exists between two of a trade between you?—Undoubtedly.

3,712. Mr. PERROW: You mentioned about the levels and the Deep Deep?—The Deep Deep is the term the natives apply to them—to the whole of the deep levels.

3,713. And you mentioned that the boys complained about it being too wet?—Yes.

3,714. Do you know the mines? Have you been down in any of these deep level mines yourself?—No.

3,715. Are you not aware that they are the same as outcrops when the boys get to work?—No. In the deep levels, I understand, the boys are always in two or three feet of water.

3,716. You did not mention the shaft now. There are only about 15 or 20 boys in the shaft per shift, and the others must be in drives and stopes?—Undoubtedly.

3,717. Do you know that in the deep level mines on the Rand they have sent down water from the surface for drilling, and the ventilation in the deep level mines is better than that of the outcrop companies?—I am not aware of that.

3,718. Mr. EVANS: Do you consider that the Association are employing the best recruiters that can be got?—Yes, sir, to a certain extent.

3,719. Supposing you had to form an Association like that, would you do it very different to what they are doing. Would you employ different men from what they are employing?—A few. I may say I agree with the methods the Association are adopting now. The Association has been practically reorganised on different lines and on a different basis altogether from what it was when it was initiated.

3,720. Then where does this advantage of free recruiting come in?—Certain agents might have been employed who have a personal influence on the natives, and then, again, a stranger might come in, and the antipathy of the native would be shown towards him. The native knows as well as we do what the W.N.L.A. is, and they would say you belong to the W.N.L.A. camp, and pass the border surreptitiously.

3,721. And who are the men they are not employing that they might employ?—There is Holgate.

3,722. Who is he?—A recruiter in the old days. Also Dyer in Komati poort.

3,723. Was he recruiting before the war?—Yes.

3,724. Had he a licence from the Portuguese?—Not from the Portuguese; from the Transvaal Government.

3,725. Mr. WHITESIDE: Is it right to ask the witness for these names?

3,726. The CHAIRMAN: The witness need not reply to them if he wishes.

3,727. Mr. EVANS: Is Mr. Dyer recruiting now?—Yes.

3,728. Where?—In Komati poort.

3,729. Where does he recruit?—Round about the Portuguese border.

3,730. What is he recruiting, Portuguese boys?—It is difficult to say. All I know is that he is getting boys.

3,731. Is he getting them in large numbers?—Not small numbers, because the W.N.L.A. have dozens of native runners and special men to watch him, and have also asked the Portuguese authorities to put on special patrols to prevent the boys crossing the border and getting recruited.

3,732. What are these boys, are they Portuguese boys?—Some are Portuguese and some are Shangaans who originally belonged to Transvaal territory.

3,733. Is there a large number settled in Transvaal territory?—It is difficult to say off-hand. There is a fair number.

3,734. Has he a licence to recruit in Portuguese territory?—I understand that the Portuguese Government does not issue licences unless a recommendation is given by Sir Godfrey Lagden, which he absolutely refuses to give. Nobody can collect boys in Portuguese East Africa; it is practically a monopoly which the Witwatersrand Native Labour Association have got.

3,735. Why does the Portuguese Government refuse permission to recruit?—They say "Go to the Governor-General," and he says "Give me a recommendation from Sir Godfrey Lagden."

3,736. Have you tried to get a licence?—Yes, I have tried for some of our companies to get a licence for a recruiter, and was told exactly as I have just now stated.

3,737. You were refused?—Yes, refused.

3,738. Did the Association ever offer to employ you?—In the first instance they offered to employ me. At first they did not offer to employ me, and afterwards when they did I refused.

3,739. Did not Mr. George Goodwin have negotiations with you—Major Goodwin?—Yes, he practically pumped me dry and got maps and data and everything else and then threw me over.

3,740. Did he not offer you employment at all?—Eventually, yes.

3,741. Eventually, what do you mean?—That was when I was up in Johannesburg and did not require the Association.

3,742. Did you not say to Major Goodwin that you would be prepared to act as recruiter for the Association?—Yes, in fact I understood from Major Goodwin that I would be one of the recruiters.

3,743. Do you know the reason why you were not employed?—It is very difficult to say what was the reason.

3,744. Do you know whether the British Consul had anything to do with it?—I asked Captain Crowe, and he said it was a pity I listened to the rumours about the town.

3,745. And the Captain denied it?—Yes, and said it was absolutely untrue.

3,746. But Major Goodwin promised to employ you?—He gave what I might call a tentative proposal.

3,747. Did not Major Goodwin say definitely that he could not employ you because Captain Crowe refused to recommend your name for a licence to recruit in Portuguese territory?—I do not recollect.

3,748. The CHAIRMAN: Mr. Cohen, the Commission is very much obliged to you for the evidence you have given.

The Commission adjourned at 5 p.m. till 10.30 a.m. on Wednesday.

## TWELFTH DAY.

Wednesday, 12th August, 1903.

### THE COMMISSION MET AT 10.30 A.M.

Mr. FREDERICK INGLE, called, sworn, and examined.

3,749. The CHAIRMAN: Have you before you, Mr. Ingle, a statement headed "Evidence of Mr. Frederick Ingle?"—Yes.

3,750. Is it your wish to hand that in to the Commission as your evidence-in-chief?—I have only a statement I submitted to the Commission as regards the heads of evidence that I wish to give. I have not had time to make up a statement of the details, but shall be pleased, if desired by the Commission, to put it in at any time.

3,751. We will call this your statement, Mr. Ingle, and take it as your evidence-in-chief, that is the formality we usually follow.

3,752. Mr. Ingle's statement was then handed in to the Commission, and reads as follows:— I have had 33 years' practical experience of mining, and have been connected with native labour since 1869. In 1869-70 the ordinary miner at the diamond fields rarely had more than two or three natives, and very many had none. By the end of 1870, a good many of those natives who had been at work in 1869, had reached their homes with the good things, in the shape of brass and copper wire, etc., that had resulted from their immense adventure, and straggling parties of twos and threes began to come from all directions, all being readily engaged by the miners, and beginning to bargain for their wages before engaging themselves. About this time it became necessary to go to the Pass Office and take out a shilling pass for each native, but it was only to be done once, not each month, and I do not remember that it was necessary to get any pass for their leaving. The wage was now generally from two to three pounds, and their purchases began to get more varied, but no money was taken away except as curiosities. Those who wanted natives badly now began to go out along the roads to intercept them, and engage them before they could reach the camp; this led to the beginning of the labour tout, who was a veritable God-send to the poor starving natives, who, had it not been for the assistance they received from

the tout, would in many cases have died on the journey. What I wish to testify to the Honourable Commission is, among others, the following facts:—(1.) That in 1869 the country had no mining labour. (2.) That the supply we now have, is the growth, approximately, of thirty years. (3.) That when the demand for labour first came into existence, the requirements of the labourer were confined to wire, tinder-box, knife, and hatchet. (4.) That in the thirty years it has grown to clothing, jewellery, variety of food, money, and recognised luxuries of civilisation. (5.) The requirements of the early days once satisfied, required the minimum of renewal. (6.) The growing requirements call for constant renewal and therefore tend to constant labour. (7.) The labour in 1870 was all spasmodic. (8.) The labour to-day is: 20 per cent. permanent, 30 per cent. from one to three years, 50 per cent. spasmodic, the first 50 per cent. growing *pari passu* with the diminution of the second, and that very rapidly. It is frequently stated that the industry has never had enough labour, which is a statement I believe could be disproved to your satisfaction, though it must be granted that it is the case to-day. (9.) That, as is the case with all cheap commodities, native labour has been and is being used wastefully. As an exemplification of this, I quote the case of the Nourse Deep Mine, which before the war required 1,600 natives, and would, if they had offered, used 200 more, whereas under stress of necessity, they are able to do the work with 900, and, I am informed by one in authority, require no more. (10.) That every effort used to increase our native labour supply is equally an effort to increase their civilisation, and that we owe this effort to every section of the country under British protection. (11.) That what is now our best labour, *i.e.* Shangaan and Inhambane, was, when first introduced to Kimberley, no more able to stand the changed life or to work well than are now the interior natives. Of a party of eight Shangaans who in 1871 started for Kimberley, three died on the road to it, and one immediately after arrival, the remaining four served me for four months, being only able to do

effective work during the last month. (12.) That the demand for native labour could be greatly reduced on the mines by the establishment of a department to exploit the new ideas for labour-saving appliances that are now being lost through want of encouragement, and means to put them to practical test. It is a noteworthy fact that two-thirds of the native labour is employed underground. First, the ore has to be moved from the headgear to the sorting-house, thence to the crushers, thence to the mill or waste-dump, thence to the cyanide or slimes tanks, thence to the tailings dump; whereas, underground the ore has only to be moved from the stopes to the shaft. That the native labour supply in this district could be greatly increased by legislation, preferably by the establishment of a Federated Council for Native Administration, subject only to the veto of the High Commissioner for South Africa.

3,753. The CHAIRMAN: You have had experience on native labour since 1869?—Yes, on the diamond fields.

3,754. Anywhere else?—I have been on the Vaal River, at Priel and all along the river camps.

3,755. Besides Griqualand West, where have you been engaged with natives?—At Jagersfontein, and on the Rand.

3,756. Have you ever employed any large number of natives yourself?—Up to the year 1900, in a subordinate position, I have had up to 1,500.

3,757. You make a statement, Mr. Ingle, that there was no mining labour in the country in 1869?—Yes.

3,758. There is a very considerable supply now, of course?—Yes.

3,759. The principal matter the Commission has to consider is this question of the labour supply. Do you think we may look for any large increase in the territories from where we are now drawing our labour supply?—Not so much from numbers as from continuity of service. It makes a great difference whether 50 per cent. of the labour supply should be spasmodic, that is, from one to three months' duration, and whether it is continuous, that is to say, 12 months in the year. The development of native labour is towards continuity.

3,760. Do you think that development towards continuity, as you call it, is common to all the tribes you are acquainted with?—Yes.

3,761. In your statement you speak of 20 per cent. of the present supply being permanent?—Yes.

3,762. What do you mean by that?—That boys come down here possibly intending to work for a definite object, but get entangled with the habits of the community, and their desires disable them from accumulating money, and they go on from year to year still with the desire in their minds, but unable to effect the saving which would carry it into execution.

3,763. Do you mean the desire to return to their homes?—Yes.

3,764. How do you arrive at your estimate of 20 per cent. being permanently employed here?—It is an estimate based upon my knowledge of boys with whom I have been at work, and so far as I can recall in each case where I have been in control, and where I have had boys on my own labouring, there has been that percentage of labour which have remained continuously at work.

3,765. Never returning to their kraals at all?—No. In several instances they have approached me in their endeavour to get the amount they require, and they have asked me to retain their pay, so that they may not be able to spend it. I have retained their pay, and when it has accumulated to £15, £20, or £30, I have paid them that amount, and asked, "Where are you going?" "I am going home!" In half the instances after the absence of a month they have returned and said they had spent their money and were still unable to go home. Then they would work again, or I have found them at work on neighbouring mines.

3,766. Then your statement that 30 per cent. work from one to three years, is that also an estimate?—It is also an estimate based on a long experience. We are now in what I would like to term a transition stage, that is from this spasmodic to regular labour, and this stage is being passed through very rapidly.

3,767. In the last page of your statement, Mr. Ingle, you suggest that sufficient attention is not given to exploit new ideas for labour-saving appliances?—Yes.

3,768. You talk of the establishment of a department to exploit these ideas. Do you mean a Government department?—Preferably a Chamber of Mines department.

3,769. Are you not aware that the mining people encourage all appliances of this kind?—No. I am aware, and have experienced that the mining people, through their agents, the consulting engineers, depress very considerably the ideas that are floating about, and afford no opportunity for the ventilation of these ideas.

3,770. Have you yourself made proposals to them in connection with new ideas of this kind?—Yes.

3,771. Did they not inquire into them at all?—No, they said to me, "We are not a philanthropic body." They said it to me through the manager of the mine. "We are here to make money; if you have any idea that you think will reduce the cost of working or facilitate working, put that idea into practical effect, and then come to me. Do not come to me and ask me to develop your ideas. It does not pay. We want a definite problem put before us, and we want it practically demonstrated that it is a money-saving apparatus, and then only shall we have time to devote to it." I wrote to Mr. Sydney Jennings, whom I consider to be a representative man in the matter of engineering, and I said to him in the letter, I have a matter that has been in my mind for a long period, and I should be glad if you would afford me an opportunity to submit this to you. I represented to him that I was aware his time was valuable, and I would endeavour, if he could give me half an hour at any time, to fit my wants in with his, and would meet him if possible. I received no acknowledgement of that letter, and concluded that it had been treated with the customary contempt that is given to subordinates who venture at any time to suggest to their superiors methods which might be adopted as an improvement to those which exist.

3,772. Do you wish to suggest, then, that what you call the indifference of the mining people for labour-saving appliances extends not only to those which are in the ideal stage, but when they come to the practical stage?—Well, Mr. Chairman, I do not suggest that it is the mining people generally who repress these ideas, but I suggest that the mining people have nominated officials whom they trust, and whom they consider to have sufficient ability to guard their interests, and I say that it is these people that repress any new ideas coming from their subordinates.

3,773. My question was not exactly that. It was whether this suppression, as you call it, on the part of some of the engineers, I think you said—(Yes)—whether that extends to the labour-saving appliances once they have been proved?—No, sir.

3,774. What do you mean in your last paragraph, when you say that "The native labour supply in this district could be greatly increased by legislation, preferably by the establishment of a federated council for native administration, subject only to the veto of the High Commissioner of South Africa"? What legislation do you suggest to increase the native labour supply?—We have native labour distributed over the whole country. We have hitherto had no definite policy on the part of the Government that was unanimous, if I may use the term, to the whole of the natives. The Cape Colony has one, the Free State has another, Natal has another, and the Transvaal another, all differing, and I submit that it would be beneficial if the whole of the native question were under the administration of one Government or party.

3,775. You mean a common native policy for South Africa?—Yes.

3,776. But on what lines? To induce a larger number to come out to work, for after all, that is the practical question?—The great deterrent to natives coming to work is the want of opportunity to reach it immediately when the desire arises. Natives, like white people, have their moments of dissatisfaction and discontent. If immediately that period arises facilities existed for them to find labour, they, to a much greater extent than now, would seek it. I had in my mind when I referred to the federated council a hope of the time coming when this South Africa would be federated. Then I think no better result of that factor could take place than a uniform administration of the natives of the country.

3,777. That was not quite my question. What practical legislation do you suggest? We will assume the federated policy is applied to the native:—I would suggest first that the native has free railway travelling to any centre of employment, and that he should be made to pay for that benefit when he returns by paying double fares. One of the greatest difficulties in recruiting labour is the binding of the labourer to any definite mine for which he is engaged. If the labourers in the interior could get here without binding themselves to anybody, and had the option of taking up employment anywhere, and of any kind that they chose, we should have a vastly greater number of labourers than we have to-day.

3,778. Yes, in addition to free railway travelling to the centre of employment, what other legislation would you suggest?—I would suggest that each native tribe—each head man—had with him a British Commissioner, who should be empowered to state definitely the improving works that had to be done in the country controlled by that chief.

3,779. The public works?—Yes, in the shape of roads and reservoirs.

3,780. You said improving works?—That is so, these are improving works. I would make it a responsibility on that chief to have these works effected, always with the proviso that if he showed to the Commissioner's satisfaction that the labour did not exist in his district to execute that work, that he should be then relieved from execution. That would result in, at any rate, the native who had no occupation being given an opportunity of choice as to whether he would work for the love of his chief on the development of his own country, or whether he would seek work where he could get paid for it. I contend that is a right on the part of the administration to work for the progress of every section of its country. That progress can only be attained by improving that country, and if a large number of natives, or any number of natives locate themselves on any area the administration would be in its rights to demand that that area should be improved.

3,781. Have you any other suggestions?—No, sir.

3,782. Mr. EVANS: You refer to the Nourse Deep; was that the time when George Goodwin was general manager?—That time covered the period when Captain McDonald, George Goodwin, and E. P. Cazalet were in office one after the other.

3,783. Do you consider George Goodwin used natives wastefully?—Yes.

3,784. What period are you referring to exactly; can you tell me?—1898 to 1899.

3,785. Do you know how much development was accomplished in the year ending, say, July, 1898?—I could not give the footage, but the normal development was being carried on to the best of my knowledge.

3,786. Do you think that 198,000 tons would be a mistake? Would that be near the mark?—Yes, I think it might be near the mark.

3,787. Do you know how much development is being done now?—No, I have no knowledge of the mines since the war.

3,788. Do you think it would be incorrect to say that 66,000 tons per annum is being developed now?—No, I am not prepared to say it is incorrect.

3,789. Do you know what percentage of surface dump was being milled before the war?—The surface dump was practically not very great. We had on that surface dump, so far as I remember, about one tram-line connected with it, and two mules, and about 20 men employed off and on.

3,790. Do you know what surface dump was used?—That was down at the shaft, near the Heriot.

3,791. Do you know what surface dump they have been milling recently?—No.

3,792. Have you any idea where they are stoping now?—No.

3,793. You do not know whether they are working the easiest stopes in the mine?—I only know that they were making a profit of £6,200 last month. I only know that from the published report.

3,794. Do you know what the grade was before the war?—To the best of my recollection it was about 11 dwts.; I am not sure, though.

3,795. Have you any idea what it is now?—No.

3,796. Would you think it wrong to say that there is a reduction of 2½ dwts?—I should not think so.

3,797. Would you think it was wrong to say that the reduction is entirely due to the necessity of milling what is nearest at hand without paying particular regard to grade?—I should not be prepared to admit that for the simple reason that in three or four visits I have made I found no stuff was being taken from that dump down the shaft near the Heriot, and I am inclined to think from the occasional visits I make, the whole of the quartz is coming from the mine.

3,798. Then how would you account for the reduction of 2½ or 2½ dwts. in the grade?—That reduction may result from it being policy to use what they consider a limited labour supply, on coming into convenient stopes, and to working with rock drills in preference to working with stopedrilling boys.

3,799. And how would you explain the tremendous reduction in the development?—I have no explanation to offer in regard to that tremendous reduction, if there is such a one.

3,800. From 198,000 tons per annum, which was the basis in 1899, it has been reduced to 66,000 tons, the present basis. How do you account for that reduction?—I account for that by reason of them being, as they consider, short of native labour, but I contend that the whole of the development work may be done with nearly the same expenditure with white labour. I wish to confirm, from my experience of mining, that when it comes to sinking shafts, raising winzes, drifting, or any work where the drill automatic can be applied, there speed is a compensation against cost; speed is greatly gained by the use of pure white labour. It is in my mind the wastefulness that has been engendered by the so-called cheapness of native labour that has resulted in every miner in this country feeling that he cannot work unless he is attended by one or two boys to assist him. In any other country, the footage in sinking and in development generally would be effected with white labour, and it could be equally effected here, and at as low a cost.

3,801. Yes, but that does not account for this enormous difference in development. Do you put it down simply to incompetent management?—No, I put it down to a misapprehension—to a manager not being pressed to develop the mine. I contend that to-day there is just as much white labour offering for the mining work as there ever has been, and I contend that the difference in the cost between development by white labour alone and development by white labour assisted by natives is an immaterial one, which should not affect this industry one iota.

3,802. You are making a statement here and quoting the Nourse Deep in proof of it. I am giving you the figures?—No, you give me as a question

whether the lack of development is not a deterrent to the interest of the mine, and I tell you that the development is a matter altogether independent of native labour and that the development should proceed equally expeditiously to-day without the native labour as it did in 1899.

3,083. Why do you quote the Nourse Deep if it does not prove your case?—It does prove my case. The Nourse Deep is only losing in the matter of development. You say that the Nourse Deep developed 198,000 tons per annum against 66,000 to-day. I wish to submit to this Commission that this drawback is a created one. That it is not one that is dependent upon the shortage of native labour. I take it that five miners out of six will assert that when it comes to the difference between the cost of native and white labour in the matter of sinking shafts, raising winzes, drifting, and general development, white labour is equally as cheap as native labour, and, therefore, I submit to this Commission that any attempt on the part of the mining companies to say that they are unable to develop their mines owing to the scarcity of native labour is a mistaken opinion, that the development could be effected equally as cheaply with whites as with natives, and therefore that the non-developing of the mines is not a result of the shortage of native labour, but a result of the preference of the mine managers not to develop until they do get it.

3,804. That is, you say, that the non-development of the Nourse Deep is a created one, because they would not use white labour?—Yes.

3,805. Mr. PERROW: Mr. Ingle, I see by your evidence that you are a practical miner?—Yes, sir, I am a certificated mine manager.

3,806. You have been mining 33 years, I think?—Yes.

3,807. Have you worked much on the mines on the Rand?—Yes.

3,808. On what mines?—I managed the Cornucopia and the Teutonia, and I tributed on the Black Reef. I have been at statistical work on the Nourse Deep, and I was clerk of the works at the Jumpers.

3,809. Are you not talking about managing the mines? I am speaking about mines. I ask, what mines you have worked on on the Rand? I am speaking now as a practical miner.—Yes, sir, on the Black Reef, which we tributed. I, as one of the partners, took control of the mining pure and simple. I have contracted to sink shafts.

3,810. Have you ever done any rock-drill work?—No.

3,811. Have you ever done any stoping or sinking with natives?—Yes.

3,812. Have you ever done any stoping or sinking with white unskilled labour?—No; but I have with skilled labour.

3,813. So you could not say that you ought to get the same price for sinking with white unskilled labour as with the natives. Which would be the cheapest for you if you were going to take work on the mines?—I would not touch either of them. Why should I quote skilled labour as available for that special purpose?

3,814. I think you said just now that the work could be done with white unskilled labour?—No, I said that development work could be done with white labour as cheaply as it could be done with native labour, given always the additional speed obtained by the use of white labour.

3,815. But you have never tried it yourself. You have never worked these things yourself. You have never done the contract part of this work?—Yes, I have.

3,816. You have done it with native labour but not with white labour?—With both.

3,817. Would you come out all right and at the same price with white labour?—If I had capital at my back I should take first consideration in the development of speed. White labour must be employed to supervise the drilling. When you have finished your drilling and exploded your holes,

everything is at a standstill until you clear your face again. To clear that face it is preferable in my opinion to put on unskilled white labour, because that unskilled labour clears away the debris that is created by the last shot, and does it in half the time, thereby giving your skilled labour the opportunity to get to the face quicker than they would do if they had native labour to clear it away.

3,818. You think that the white unskilled labour would clear away these places in half the time that the same number of natives could do it?—I would not like to define it as half the time; I know they will do it more speedily, and speed being an object, the extra cost of that labour would be returned in the speed attained.

3,819. Mr. TAINTON: When did you leave the diamond fields?—First, in 1874, I left Kimberley, going down to Jagersfontein, and I left the latter place in 1883.

3,820. There was a large white population on the fields when you were there, was there not?—Are you referring to Kimberley or to the River?

3,821. I am speaking of the Diggings as a whole. In the '70's, when we first landed, there was nothing but white labour.

3,822. I ask if there was a large white population there?—Yes.

3,823. Do you know its number?—No.

3,824. Was it larger that it is now?—I am speaking of the Diggings as a whole at that time?—What time?

3,825. In the '70's, when you were there. Was the white population not larger than it is now?—Yes.

3,826. Was it much larger?—I should say so—yes.

3,827. You say in your first paragraph that "The ordinary miner at the diamond fields rarely had more than two or three natives?"—Yes.

3,828. Taking that larger white population—the larger demand—do you think that the demand for native labour now is in excess of what it was at that time?—Yes.

3,829. Upon what do you base that opinion?—The spread of the industry—the same number of boys that are required at Kimberley.

3,830. I am speaking of the diamonds fields; taking the white population at that time and the native population employed by the whites, do you think that there is a larger number of native workers now employed in the diamond diggings than there was in the '70's?—In 1874 I should think the native labour supply had reached what it is in Kimberley. I take the native supply of Kimberley to-day to be 10,000 approximately, and so far as my recollection goes, there would have been in 1874 quite 10,000 natives at Kimberley.

3,831. The natives in the vicinity of the fields came out as freely then as they do now, without special inducements?—Yes, about that time the gun-running was being done, and that supply of guns resulted in an influx of native labour, which satisfied the demands at that time.

3,832. In what way did the gun-running influence the labour supply?—The gun-running brought to bear the pressure of the chief, who made his people go and obtain guns, and it was this gun business that gave us our first relief. Up to that time the boys who came to Kimberley were in a fearfully emaciated condition, dying along the road in large numbers, and having to be fed up for some considerable time before we could get work from them, and the demand was so great by the miners that only a portion of them could be satisfied. That would be in 1872. Then the guns were introduced, and within six months of that the industry was being inundated with labour—all wanting to get their guns, and as soon as they got them, they went back, and it took them at that time to get a gun, which was being sold at £7 10s. 0d., about four or five months before they could get the guns and powder-horn and the et ceteras they required to get back.

3,833. With the satisfaction of that demand for guns, did the supply fall off?—Immediately the gun traffic was stopped by the British Government, there was a falling off, but it was not acute. So far as my recollection goes, personally I felt no inconvenience from it, nor did I hear complaints from those who were around me working.

3,834. Your statement goes to shew that you think the labour supply will increase considerably, owing to the demand of the natives for European goods?—Yes.

3,835. That is the general contour of your statement?—Yes, sir.

3,836. You have had considerable experience in your 30 years. Can you give us any information which will shew to what extent that demand has grown in that period?—Yes. When the first boys came from the interior to Kimberley, we were paying 10s. per month. They would work possibly three months and would then purchase brass, copper or iron wire, a knife, a hatchet, and would consider themselves equipped. If, in addition to that, they could steal all the old files or tools that you had left about, they would return content with that. They spent none of the money then in the shops as is being spent to-day, to augment the food given them. The growing requirements of the natives from that time to this has been in the direction which calls for continuous supply. The native comes here and you supply him with mealie meal and meat. But he is not content with that, he must come and buy his loaf of bread with a little sugar, his cup of soup, and, occasionally, a cigar now and then, also tobacco and sundry ornaments to wear, all of which are calling for constant renewal. The boys wore in the early days things which would last a native a lifetime, but nowadays when he comes down to the mines he cannot save his money. It is with the greatest difficulty that the boys now in the compounds are able to get together that amount of money for which they have a definite object. The tendency to-day amongst the boys is to spend as often as they can get it. It will be a company of boys from a particular kraal who will have the occupation of one room. It has become an established practice amongst them that, alternately, as the money comes, each one shall buy a sheep or shall buy an ox head, or shall buy something which will be a treat for the company that are there, and it is getting now beyond that one feast that they had at the beginning, what to them is, a continual feast, because there is a continuous wrangle amongst them as to whose turn it is now to supply either the luxuries of coffee, sugar, or bread, or soup, or any of the dainties which they can get on the mine, and it is the continuous demand that requires continuous supply, that has to be looked to as the greatest factor for the increase of our labour.

3,837. You base your observations upon the requirements of the native worker. Have you any data shewing the demand for goods per head for the native population of South Africa?—No, I have no data for that; I have only the data of personal experience in the difficulty they are finding in saving their money.

3,838. You are basing your observations upon the native worker as you see him in the compounds?—Yes.

3,839. You have no experience as to whether the demand for European manufactures is extending amongst the tribes?—Only so far as casual reading has brought to my notice that the imports of British clothing is increasing very, very rapidly, that is, to-day. So far as I can remember, it is quite 100 per cent. in excess of what it was in 1894.

3,840. Now, coming back to the native in the compound as you know him. From what you told us just now, it appears that a considerable proportion of his wages is expended in supplying such luxuries as meat, coffee, and things of that kind?—Yes.

3,841. Is a large proportion of their wages expended in obtaining additional food, luxuries?—

Well, it would be a matter of estimate as to what I would consider a large proportion, and what you would consider a large proportion. I should consider a large proportion, if it could be shown that a native expended 10s. of his wages in the month for the buying of luxuries and food.

3,842. Has it come under your observation that this expenditure that you speak of on the mines is largely confined to the East Coast boys, and does not obtain with the other tribes?—No, the East Coast boys are developing wonderfully in the matter of daily requirements. The East Coast boys in the early days had absolutely no daily requirements. I have known men to work for months on the mealie meal diet without going to the expense of buying one feed of meat. Nowadays the East Coast boys are spending much more in addition to their food than they ever did before, as also are other boys.

3,843. Well, according to your statement, it has taken 30 years to create quite a moderate demand amongst the natives for these things. Would you advise South Africa to wait for its native labour supply until it created a larger demand?—No, I would certainly advise that the powers that be should give much greater attention to the possibilities of reducing the necessity for native labour together with increasing the supply and to offer every facility to encourage the consumption of commodities by them.

3,844. Then you do not look to the native population of the country for the settlement of this difficulty?—Yes, absolutely I do.

3,845. Within what period of time do you think that we can expect our labour demands to be satisfied by the native population?—If that demand were to be controlled by what I call reasonable precautions; to secure a minimum of it this summer will give us native labour to carry on this industry of the country and the mining section of the community to full effectiveness.

3,846. What additional agencies would you employ to effect that object—that is, to increase the native labour supply; we will leave white labour out for the moment?—I certainly would not go on in the erratic manner in which the labour people have hitherto gone. I take it that the labour has been repressed always when just at the flow; instead of the mining people taking the flow and supporting it, they have repressed it. For instance, if you will remember, in 1897 the summer season supplied us with more labour than we wanted. Now, what was the result of that additional supply? The result was a meeting of the Chamber of Mines, and you will find it recorded in the Chamber of Mines' Report for 1897 that we are informed that labour is now in excess of the demand, and we think this is a fitting opportunity to reduce the pay. Now this was just at the end of summer. The whole great influence of the summer had been brought to bear, and instead of encouragement being given for the continuance of that influx, what was done; a 30 per cent. reduction in the wages was agreed to by the manager of the powers that were then in existence. This 30 per cent. reduction came just at the end of a good season and at the beginning of a bad one. Because, I think it is notorious that the winter is the bad season for supplying, and that bad season was welcomed by the mining people by a reduction of 30 per cent. in the wages of the natives. Now, I contend and submit to this Commission that I could offer no greater evidence of the fatuous policy, which I will call it, of the mining magnates in their treatment of this native labour question. It will be, according to the reports of 1897, remembered that this was a second decrease in pay; that it is reported that "it is desirable to make a further decrease in pay." Now I ask anyone with a knowledge of the native and a knowledge that he may have gained in paying the native, whether these drastic reductions at the wrong periods are not sufficient to dam the supply to anybody.

3,847. Have you any knowledge of the position of the native labour supply in 1898 and 1899?—In

1898 and 1899 there was that chronic want of native labour that exists in this country from the time that I ever knew it. Whether the labour supply was good or bad, I never knew the time when there was not a want of labour, and, as far as my recollection goes, to 1898 and 1899, the industry was fairly supplied, having thoroughly recovered from the set-back that took place in 1895.

3,848. Well, if the industry was fairly supplied in 1898 and 1899, what was the effect of the reduction of wages in 1897?—The effect in that year was that the Native Labour Association had to bestir itself considerably and increase its organisation in various districts to recover that which was lost in 1897 and 1898.

3,849. But if the labour supply did not fall off in 1898, how do you explain your argument as to the bad effect of the wages reduction in 1897?—It was in the winter of 1897 that the shortage fell, and as an immediate response—you will find it reported in the Chamber of Mines' Report—there was an immediate set-back in the supply of labour, and that is what actually took place. I know from personal experience that very many boys left where I was concerned immediately on that reduction.

3,850. The point is this. The low scale of wages introduced in 1897 was continued through 1898 and 1899. The native supply remained full and sufficient in 1898 and 1899. I do not see the connection in your argument between the reduction in wages and the supply?—But the connection comes in my affirmation that the supply did immediately fall off in response to this reduction of wages. That it was increased by expenditure in another direction; that expenditure taking the form of recruiting agents in every other part of the country. Countries were tapped which had not been tapped before.

3,851. You do not know the native in his home or at the kraal?—No.

3,852. You attach great importance to such details as methods of recruiting?—I attach great importance to facilities being afforded so that you do away with recruiting to a great extent. I attach great importance to a native being able to reach a labour centre whenever he feels inclined to come, independent of recruiting.

3,853. You think that proximity to an urban or an industrial centre increases the average of the natives' industry?—By proximity, if you will take that to mean facility to reach, it is in one respect a degree of proximity, because 1,000 miles off, if the facilities to reach it are as great there, it is as near as a place 200 miles off without any facilities.

3,854. Facilities mean communication with the labour centre?—Yes.

3,855. I ask you whether you think the labour supply is better in those districts where the natives are in close proximity to the industrial centres?—No, I do not think so. The natives have a natural antipathy to work when they are near their homes. If facilities are afforded to carry them 1,000 miles from their homes, they will put in a long period of work to justify their journey.

3,856. You mean that the natives prefer to go 1,000 miles rather than work in the immediate neighbourhood of their homes?—Yes, that is my meaning.

3,857. You said just now that in the course of your experience in this country there has been a chronic want of native labour?—Yes.

3,858. What is your explanation of that shortness of supply?—Well, the industry has gone ahead of the spontaneous supply.

3,859. Do you limit yourself to the mining industry; take the whole market?—I do not know anything about the whole market. I only know about mining, and as regards mining, I think the supply has been one that could be a matter of surprise to anyone knowing the native as I first knew him. No one in 1870 would have dreamt of the day coming when there would be 200,000 natives in the labour market.

3,860. Then the supply of native labour has increased very greatly in your experience?—Yes.

3,861. But it has never been sufficient to make that supply abundant?—No, sir; and I would like to say why. I take it that the demand for native labour is somewhat like the demand for fresh air. It is easily got, and yet we do know that there are thousands and thousands of people who are robbing themselves of that which could be easily got by anyone taking due care to get what they do want. I say it is a parallel case with native labour. Native labour is easily supplied. It is a want that has been developed to such an extent that no man, woman, or child, can do anything in this country without having a native labourer tacked on to them. Now, I say, that this want—so-called—is a spurious one, and I say that it has been the curse of this country that the want has been so easily supplied. I think that meets your question, Mr. Tainton.

3,862. Well, if I understand your argument, it amounts to this: That the native labour supply has increased enormously, but that the industrial expansion of the country has also increased in a greater ratio, and that the supply of native labour has been short of that industrial expansion, because the employers have wasted it?—Yes.

3,863. Further, you say that it is the habit of the white people of this country to employ native labour and not to work themselves?—Yes.

3,864. There you are touching a social question. You said something about white labour, Mr. Ingle. So far as I can understand your replies to the other members of the Commission, your proposal is to employ white labour upon development in the mines?—Yes.

3,865. Would you also employ white labour generally through the mines, or only on development?—It will be present to the minds of the whole Commission that there is a tremendous amount of tailings to be removed on this Rand—the work having been completed. Now, I know of no part of mining that offers such freedom for automatic management under white control as the removal of the tailings from the tanks to the dump. It will be within the knowledge of some of the members of the Commission, at least, that at the present time there are no automatic appliances, so far as I am aware, but that each mine has an average of about 40 natives working on the removal, either in the way of contract, or in the way of their own employees. Now, if you will recall the construction of these tanks, you will, I think, agree with me—and I am quite sure that any American will agree with me—that there is no difficulty whatever in arranging for the automatic carrying of the tailings from the tanks to the dumps, and it is saving the industry from 4,000 to 5,000 natives who are now employed in the removal of the tailings.

3,866. Then your answer is that your remarks are not intended to be read as referring only to the use of white labour on development work, but that you think that the use of white labour can be extended in other departments?—Yes.

3,867. Could you give us any rough figures showing what proportion of white labour you would use in relation to black?—It is a very difficult thing to give a rough figure if I have not also the figures that are going to be produced by the willingness of the mining magnates to spend their money in the machinery to do away with the natives. If you will give me the data as to how much facility the mining magnates are going to afford—

3,868. It seems to me that you ought to be quite independent of what the mining magnates may do. What, in your opinion, should be the proportion between white labour and black labour on the mines? Leave out such contingencies as what mining magnates may or may not do?—How can I possibly give an estimate of how the facilities are going to be supplied.

3,869. If you cannot get this figure, I must stop. I want to get your ideas as to how far you would employ white labour?—I have said that I would employ white labour wholly on development. I would introduce labour-saving appliances to do away with all such work as that of moving tailings by

hand, and I take it that when we have had as a statistical fact that in other countries, five men are able to run a stamp—when we admit that already, we are using two men per stamp, we leave three men per stamp to be provided for by native labour, and I think that if we double that quantity we should have a very much less demand for native labour than we have to-day. Instead of those three men per stamp being required, if we replace them by natives—we know as a fact that it takes 15 natives to replace them. Our supply of labour per stamp is two white men and fifteen natives, as against the foreign demand of five white men per stamp.

3,870. Where do you get that figure of five white men per stamp?—I get that figure from statistics; in 1900 and 1901. The Australian statistics give for Mount Morgan the number of men, 2,126, and the number of stamps, 484. Those figures you will get in pages 22 and 31 of the Australian Statistics. The East Murchison is given as 856 men, and ran 170 stamps, that you get in the same statistics. The North Coolgardie is given at 1,753 men, with whom they ran 563 stamps. Our returns from 72 companies give, 70,000 natives, 3,060 whites for running 4,600 stamps.

3,871. Have you any knowledge of the cost of living, and items of that kind out in Western Australia?—No.

3,872. Do you know what grade of ore it pays to work there?—The grade is rather higher than we have here—in some instances.

3,873. Do you look for any immediate reduction in the cost of white living in this country in the near future?—Yes.

3,874. In what particular item do you think the expense can be reduced?—In rents, in food, in clothing, and in everything.

3,875. Are you aware that rents are very high throughout the country at present?—Yes.

3,876. Does that not shew that the number of white people in the country is already greater than there is house accommodation for?—Yes.

3,877. Are you aware that a great amount of money is being put into building?—Yes.

3,878. Have you any idea of the amount of capital that is required to house 100,000 white men, plus their families?—No.

3,879. Would you consider £100 per head as a fair estimate?—I should think that that would be a low estimate, say £100 per family head. £100 per head of population would be excessive.

3,880. Do you think that you could get a decent cottage built in this country, taking the price of land and the price of labour, for less than £100 per head? Could you build a decent house for less than £500, taking a family of five?—Yes.

3,881. Suppose you introduce the 100,000 whites, they would be followed by a very large number of other people who would supply their wants?—I hope so.

3,882. What was the number of white miners on the Rand before the war?—Taking those actually employed on the mines, I should think it would have been about 10,000.

3,883. What was, approximately, the total white population?—60,000.

3,884. Including Boers and everyone?—I should think rather more, say 70,000.

3,885. Including the Boers—the whole country?—I have no idea.

3,886. Would 200,000 have been a fair estimate?—I do not know.

3,887. If we take the figure of 200,000 as approximately correct, it would go to show that there were 20 other whites to one white miner?—Yes.

3,888. You think that that proportion is likely to remain more or less true if you introduce more white miners?—Yes.

3,889. Mr. WHITESIDE: Mr. Ingle, will you kindly look at paragraph 11 of your statement. It has reference to the Shangaans and the Inhambanes, when they were first introduced into Kimberley. What I wish to ask is, do you think we have a parallel in the present experiment of introducing labour from Central Africa?—Yes, that was my reason for making this remark.

3,890. I should like to have your opinion of the present Native Labour Association and its methods?—My opinion is that the intention of the present institution is good, but that the execution is very bad; that the same amount of money expended in a different way would have had incalculably larger results.

3,891. Then I think we may take it that you are convinced in your opinion that there are ample supplies of native labour to be had for the different requirements?—Yes, but not for exorbitant requirements. For requirements that could be made by due consideration of the powers that be.

3,892. Do you think there will be anything in the idea of constructing light railways in the thickly populated native districts so that you could give them the facilities you speak of to come to the labour market?—I think it would be an admirable policy.

3,893. In answer to Mr. Tainton, you told us that the grade of ore in Australia is somewhat higher than here?—Yes.

3,894. Is it not a fact that the ore lodes are not so regular there as the reefs that we have here?—Nothing approaching it.

3,895. Secondly, if they are running stamps at five white men per stamp, they must be running their reefs economically?—Yes.

3,896. If the same policy of economical management was adopted here they would be able to get infinitely better results than they do; infinitely better results than in Australia owing to the more regular reef formation here?—Yes, that is so.

3,897. You say in your statement that you have had 33 years' practical experience in mining and have been connected with native labour since 1869. In 1869 and 1870 the ordinary miner at the diamond fields had rarely more than two or three natives and very many of them had none?—Yes.

3,898. Mr. EVANS: Do you think there is much possibility of increasing the number of natives from present sources?—It makes a great difference whether the supply is spasmodic or continuous.

3,899. How do you arrive at your estimation of 20 per cent. of native labour as permanent?—It is based on my experience of native labour. It is only an estimate.

3,900. When you suggest a department to exploit labour-saving ideas, what do you mean?—I mean a department of the Chamber of Mines. I think the mining companies exercise a great deal of repression in regard to new ideas. My own experience is that they refuse to help the inventor unless the invention is submitted in a working form. I have written to Mr. Sidney Jennings submitting a labour-saving idea, and my letter has not been acknowledged. I take it that this was an instance of the customary contempt meted out to subordinates who venture to suggest that the best methods are not being adopted.

3,901. Do you mean to suggest that the mining companies and their engineers are indifferent to labour-saving appliances, when they are submitted in a practicable form?—No, I do not suggest that. My object in suggesting a federated council is to secure a common native policy in the different States of South Africa.

3,902. Mr. WHITESIDE: Do you think that the plea of the mining companies that they could not develop their mines owing to the want of native labour is based on a misapprehension?—I think so.

3,903. Do you believe that the general developing work could be carried out by white labour at an immaterial difference in cost?—Yes. The neces-

sary white labour is available, but in the past an idea has got abroad that a white man could not work unless one or two boys stood round to assist him.

3,904. Mr. TAINTON: How do you suppose that in 1897, at the end of the summer, there was a supply of native labour exceeding the demand of the mines?—That is so, this can be found recorded in the proceedings of the Chamber of Mines and the mine-owners took advantage of the situation to bring about a reduction of 30 per cent. in the wages.

3,905. This was a second reduction?—Yes, and it was made at the beginning of a good season and the beginning of a bad one. There could be no better illustration of the fatuous policy of the mining magnates than the drastic reductions at the wrong moment, which were calculated to damp down the best labour supply. I think that during the coming summer there will be an increase in the labour supply sufficient for the general effectiveness of the mining industry.

3,906. Do you attach great importance to facilities being given for natives to come to the mines free of travelling expenses at the moment they feel the inclination?—Yes, it is the curse of this country that nobody can do anything without native assistants. The demand for native labour was to a great extent a spurious demand.

3,907. And you attribute the shortage of labour for industrial purposes to this fact?—Yes.

3,908. What in your opinion should be the proportion of white to black labour?—How can I possibly give an estimate unless I know what facilities have to be given for the employment of white labour? I would employ whites only on development and would introduce labour-saving machinery to do away with all such work as the moving of tailings by hand. In other countries mines were worked with 5 white men per stamp; here, two white men and 15 blacks were required.

3,909. Where do you get your figures of five men per stamp?—From the Australian statistics, but I do not know the cost of living in Western Australia, nor am I acquainted with the grade of ore it paid to work there.

3,910. Are you of opinion that it was higher than here?—I believe it was rather higher than here.

3,911. Mr. WHITESIDE: Do you think it would be an admirable policy to build light railways into thickly populated districts in order to give facilities to natives to get to work?—Yes.

3,912. Mr. QUINN: I understand that experiments on the Wolluter Mine have borne out the truth of your opinion as to the value of white labour in shaft sinking?—Yes, I believe there are plenty of natives to do all the work required.

3,913. Mr. GOCH: Do you think that white men could work for much less than £25 a month under altered conditions?—Yes. In Australia five men were employed per stamp. According to the present method of employing whites and blacks, the cost per stamp was £96 ss. 0d. per month. Five white men at £25 per month would mean £225 per month per stamp.

3,914. Then taking 6,000 stamps as the basis of working for the Rand, you want us to increase the cost of working our mines by £2,070,000 per year—that is your theory of it?—You have me at a disadvantage. I have not had time to manipulate the figures.

3,915. It is not a question of manipulation—I am simply working out your own figures. Your theory of the proper method of working the mines is to spend £2,070,000 per year more for our labour?—You say so. I have not worked it out.

3,916. Mr. DONALDSON: Have you come before this Commission to give expert evidence on native labour?—Yes.

3,917. Do you state that the demand at present is in excess of the supply?—Yes, but the demand is a fictitious one.

3,918. Do you know the native in his own country?—No.

3,919. Do you speak any kaffir language?—Not properly.

3,920. In your statement you say you think a federated council for native administration would tend to increase the supply. Do you suggest that the Portuguese Colonies should be represented in the suggested federated council?—No.

3,921. Are you aware that three-fourths of the supply of natives for the mines come from Portuguese East Africa?—Yes.

3,922. Are you aware that three-fourths of the natives at work here come from districts where there are no railways?—Yes, but that is no reason why railways should not be built.

3,923. Mr. EVANS: With all your experience, how is it that you are not a mine manager now?—That is a very pertinent question. One reason is because I will not approach the powers that be in the same way as others do who become managers. My work in the Teutonia, which I worked at 14s. a ton in the initial stages, entitles me to command of the best mine on the Rand.

3,924. Do you not think it is a remarkable thing that the owners have not approached you to secure your services?—I do not say that they have not approached me tentatively, but I am content to lose the advantages that I might gain by being more tactful.

3,925. Do you not think that you are too much of a theorist and too little of a practical man?—My work proved that I am a practical man. Facts and results are the best proof.

3,926. Mr. PERROW: Do you know of tickets being put in daily shewing the amount of work done underground by the boys?—There were no such tickets. All the record kept was of the number of hours each boy worked. There was competition underground between blacks and whites to see who would do the most work.

3,927. I am not saying anything about the number of hours. I am asking you if you know that the overseer puts in a ticket for every boy shewing exactly how much and what work he has done during the day?—No. For years I have been specially engaged, that is, from 1896 to September 1899, in checking these tickets, and the amount of work has never been mentioned, but simply that it was a whole or half a day, and the particular department to which it should be charged.

3,928. Then how long is it since you had any dealings with a mine?—Before the war.

3,929. Do you think the practice was in force years before the war?—Well, we have been improving our methods. There were no tickets 20 years ago.

3,930. I am not talking of 20 years ago. Do you know that these tickets have been put in for years on the majority of the mines on the Rand?—No, I do not know.

3,931. Well, I tell you so, and that it is done in the majority of the mines to-day. Perhaps you do not know everything about mining on the Rand?—No, I wish I did. I have two friends from Rhodesia who could give valuable evidence, but who are afraid to do so on account of what would happen to them if they did. They have told me that in Rhodesia at the mines they were connected with "the labour was tumbling over itself to get employment." I know that there is a feeling amongst men who are in a position to afford the most valuable information that if they spoke out what they mean their reception on the mines afterwards would be the reverse of what they desired, for their employment is their bread and butter.

3,932. Mr. TAINTON: Mr. Chairman, seeing that a suggestion of coercion has been made, I think this should not be allowed to pass by without notice. We are a public body, and I would suggest that we should not leave this matter at this point.

I propose, therefore, that we should discuss it "in camera" with Mr. Ingle, after our public meeting.

3,933. The CHAIRMAN: Have you any objection to discussing it in private, Mr. Ingle?—I have no objection.

This course was agreed upon, and the Commission adjourned until 2.30 p.m.

The Commission resumed at 2.30 p.m.

Mr. COURTNEY ACUTT, called, sworn, and examined.

3,934. The CHAIRMAN: Have you before you, Mr. Acutt, a memorandum headed, "Evidence of Mr. Courtney Acutt"?—Yes.

3,935. Is it your wish to hand that in as your evidence-in-chief?—Yes.

3,936. Mr. Acutt's statement was then handed in to the Commission, and reads as follows:—*District*: I am acquainted with the native tribes of Natal and Cape Colony. *Length of Time*: In the case of the former, for thirty years during my residence there, and in the case of the latter, for fifteen years, during which time I have employed the natives from Cape Colony in my various contract works. *Work*: With regard to the Natal natives of Zulu descent, these appear to prefer domestic work to any other, and in the case of Cape Colony natives, principally any description of navvy work. *Food*: At the kraal, sour milk, pumpkins, potatoes, yams, mealies, and Kaffir corn. *Pay*: Formerly, from 20s. to 40s. per month; but latterly, from 40s. to 60s. per month. *Physique*: Good. *Ailments*: In former years no special ailments, but in later years development of chest troubles. *Special Conditions affecting the Labour Supply*: In the first place a native prefers the condition which exist at his kraal, which is practically one of idleness (in addition to the fact of his family being there), and it takes some considerable time for him to make up his mind to leave it. He has no value of time, and does as little work as possible, and that, only when compelled by circumstances. It naturally follows that he prefers to work nearer home, if he can obtain the same rate of pay. The inducements for labour in the Transvaal should therefore be: (a) Higher rates of pay than he can obtain nearer at hand; (b) a system by which travelling may be rendered easier, and with a little more degree of comfort, from his location to his destination; (c) means of payment for such; (d) the knowledge of just treatment by employers; (e) proper tout system and employment of men sufficiently acquainted with the native's character and habits for recruiting purposes; (f) proper selection of compound managers; (g) some regard for tribes in distributing the boys at the compounds. The deterrents are:—(a) being without means of leaving; (b) reduction of wages; (c) irritable treatment; (d) deduction of any description from wages; (e) non-existence of task work or piece work. With regard to approximate numbers, I am not in a position to furnish figures, but I am satisfied that although there may be sufficient numbers of natives in the country, if they would all work, yet in view of the enormous requirements, not only for mining, but for agriculture, domestic and public works of every description, the demand will always far exceed the supply. As far as Natal is concerned, the Transvaal can only rely upon those natives who come of their own accord, in view of the fact that touting is prohibited there. (A Bill introduced by the Natal Ministry, to amend the Touts Act, has been rejected by the Legislative Assembly.) Even with certain improvements, which may tend to increase the present supply by a few thousand boys, I am convinced from my knowledge of the natives and their habits, that the requirements can never be obtained in South Africa as long as it is possible for them to subsist without work.

3,937. How long have you been in South Africa, Mr. Acutt?—Forty-five years.

3,938. Have you worked with natives the greater part of that time?—Yes, all that time.

3,939. You say you are acquainted with the native tribes of Natal and Cape Colony?—Yes, of Natal, during my residence of 30 years, and of the natives only in their work. I do not know anything of their home habits or anything of that kind.

3,940. You know the object of this Commission is firstly to ascertain the requirements of the mining and agriculture and other industries of the Transvaal?—Yes.

3,941. Are you able to give any reliable information as to the requirements of these industries here?—No.

3,942. You know there is a considerable demand for native labour?—Yes.

3,943. You have employed natives on the Rand previous to the war?—Yes.

3,944. As a contractor?—Yes.

3,945. What is the largest number you have ever employed at any one time?—I should think about from 1,500 to 2,000.

3,946. Where did you recruit them, Mr. Acutt?—Chiefly from the Cape Colony.

3,947. Did you recruit them?—I said so.

3,948. Did you send out agents?—I had agents at different parts of Cape Colony.

3,949. Do you know the total native population of Natal?—No, but according to the latest figures the population of Natal and Zululand is put down at 750,000.

3,950. You know that recruiting for this Colony is not permitted in Natal or Zululand at present?—Yes.

3,951. Previous to the war, when recruiting was allowed, did any large number of Natal and Zululand natives come to these fields?—Not for mine work to any great extent.

3,952. Did they come for agricultural work?—They came here as house servants, stable boys, trolley drivers, etc. There were a good many men who called themselves Zulus, that is, men from the Zulu border, and the same on the Pondo border. These men called themselves Zulus, but the Zulu proper does not come here to work—not for mine work, or to work for contractors.

3,953. By the Zulu proper do you include the Natal native as well?—Some of the Natal natives. There is a portion running south of Durban down to Pondoland; these men came up in fairly large numbers.

3,954. For mine work?—Yes, and all other kinds of work.

3,955. If the recruiting restrictions were removed in Natal and Zululand, do you not think we might depend upon getting a supply of natives from there for any purpose?—I do not think it is possible you will increase them. At the present moment there is a famine there and the boys are providing for their families, but in the ordinary way very few could be got to work, especially at planting times. It is an exceptional time now on account of the famine.

3,956. Is it within your knowledge that there is a greater demand for labour in Natal than a supply?—Absolutely.

3,957. Before you came to the Transvaal were you a large employer of natives in Natal?—Yes, but only as waggon drivers, leaders, and for chopping down timber, or anything of that kind, but not in large numbers.

3,958. At any time during your residence in Natal were you an employer of large numbers?—No.

3,959. You make a statement, Mr. Acutt, that the native only goes to work when compelled by circumstances. So far as you are aware, does the Natal native work for any great length of time when he comes here?—As a rule, from ten to twelve months.

3,960. When do such natives return to work again after finishing their service?—They used to go back as soon as they had spent their money, which was usually spent in cattle. But the circumstances have altered lately, since the rinderpest, and there has not been the same outlet for their money.

3,961. Do you know if the rate of pay now given to the natives in Natal is approximate to the same as is given here?—I think it is a little less; it varies from 40s. to 50s. there.

3,962. You say you are satisfied that, although there may be sufficient natives in the country to supply the demands for labour if they would work, you do not consider from their habits that we can get a sufficient number?—It has never been my experience for 40 years, sir. We have never been able to depend upon them.

3,963. You mean by that there has been a constant shortage for the whole period?—Yes.

3,964. And has there ever been a time when the labour supply was ample for the requirements?—For any industry like sugar or coffee, where you would require to reap it at a certain time, it has never been my experience in Natal that you could get sufficient. For railway work, or anything of that kind, where the few months would not matter—where you would, perhaps, have 12 months to complete your contract—you would not be troubled with a busy or slack season. Do you understand what I mean, Mr. Chairman? We could not depend upon labour for any industry like sugar, wattle bark, or anything of that kind. No man would plant with the prospect of having to reap with Kaffir labour—nobody does.

3,965. Do you mean to say that Natal having gone abroad for labour, it was not because there was not sufficient labour, or as much as was required, but because they could not depend upon it in certain seasons?—You never could depend upon it, all sorts of things would happen to alter it. A big crop would alter it. If they had a big mealie or Kaffir corn crop they would not need to work, and, if you had a big crop they could not work for you as they would be busy with their own.

3,966. Have you any suggestions to make as to how a large number of natives could be got to work—a larger number?—In every direction by certain inducements. For instance, on the Swazi border at the present time, there is a famine. A certain number may be got from there who would leave the native families provided for, and so enable them to get away, but in that district it would not mean a very large number. The same thing would apply in Pondoland, where they are in large numbers.

3,967. Mr. TAINTON: You said just now, Mr. Acutt, that all sorts of conditions would alter the labour supply, tending to make it unreliable. Could you specify those conditions? You mentioned one, a big crop; are there others?—That would be the chief one.

3,968. In your opinion, then, is the food factor the principal one affecting the labour supply?—Well, it is—What was your question?

3,969. I asked if in your opinion the supply of food is the chief factor affecting the labour supply?—Yes, during the good season the natives do not turn out in the same numbers as they do in the bad ones. But the medium one is the best one. To-day we have a famine, and there are lots of men who do not like to leave their camps because they could not leave their families provided for, therefore they stop at home.

3,970. I understand, then, that when the want of food goes so far as to threaten starvation, the native remains at his kraal, but if it does not go so far as that, the want of food makes him go in search of work?—Yes. The native goes to work chiefly for money to acquire wives with.

3,971. At what age is that necessity for money to buy wives first felt as a general rule?—The fathers send their boys off, and they supply the old gentlemen with wives first.

3,972. He takes their money?—Yes.

3,973. At what age do they generally go out?—Near the towns from 10 to 15 years of age.

3,974. When do they first begin to set aside money to buy wives for themselves?—They never do that for themselves as long as the father is alive. They rear the father's family and supply him with wives, and they come in when the sisters get married, and from the old man's stock.

3,975. They get the necessary cattle from the father of the family?—From the sale of the sisters, yes.

3,976. How far has the destruction of the cattle by rinderpest affected that custom?—A good deal. It caused a check, because from the start there were no cattle at all. The country was practically denuded of cattle, and during that interval their morals got a little more lax, as it was perfectly impossible to secure wives with the purchase of cattle. Then they began, the lower class of the natives, to sell their daughters for money. Now, again, the cattle are becoming more plentiful, and the Zulus are getting back to their old custom, and are demanding cattle.

3,977. What amount of money was generally demanded for a wife?—It started at about £30. To-day it is up to £100, I think, reckoning ten head of cattle at £10 each.

3,978. Then would you say the demand for this money is one of the principal factors driving the natives into the labour market?—Yes. A man has to go off for money to supply his wants and money for his hut tax.

3,979. Yes, I will come to that presently. How long have you been amongst natives?—Forty-five years.

3,980. Do you speak their language?—Yes.

3,981. Are you thoroughly acquainted with their customs?—Yes.

3,982. You say, under the heading of "Special conditions affecting the labour supply," in the first paragraph, "a native prefers the condition which exists at his kraal, which is practically one of idleness." Will you explain to the Commission how he is able to maintain himself in this condition of idleness?—Well, he has to pay 14s. per hut on Crown land, and it would be a big kraal which would have ten huts, and a kraal of ten huts would have at least 20 males.

3,983. Adult males?—No, not adult males. We will say ten able to go out to work.

3,984. How do they maintain themselves in this condition of idleness. How are they able to keep it up; a white man cannot do it?—A good fertile hen will meet the case pretty nearly.

3,985. Do you mean that the produce of a single hen will supply them with all the money they require?—A hen per hut is quite sufficient, and perhaps more than sufficient.

3,986. Then the demand for money is very small?—Very small; until they want to purchase clothes or cattle, it is nothing at all.

3,987. How do they get their food?—The women work.

3,988. On the native lands?—Yes.

3,989. Is there plenty of land available in Natal for the native wants?—Oh, yes.

3,990. Is there any chance of that being exhausted at any time owing to the increase of population curtailing the land facilities—is there any chance in the near future of the locations becoming too full?—It will be a long time before it comes to the two acres and a cow.

3,991. You spoke of the unreliability of native labour affecting the position of the employer. How far has that unreliability been a factor in bringing Natal to the decision to import foreign labour?—There never was. From my earliest recollection a planter has had to sacrifice his entire crop because he could not get native labour to take it off—almost his entire crop. That is one of the earliest experiences that I can remember, and labour was

173

all around on the hills and everywhere. And although it was close by, the natives could not be induced to work.

3,992. Then the population was large and was sufficient for the demands of the employers?—No, it was not.

3,993. I mean supposing that the natives had worked?—Fifty times, yes. In those days there were very few industries.

3,994. Is that condition true to-day that there are large numbers of natives whom the planters cannot induce to work?—Yes.

3,995. Would you say that if the natives in the country could be induced to work the labour question as we know it now would be settled?—If they could be induced to work.

3,996. Yes, if they did a fair share of work, would that settle the labour question here?—I do not think it would, taking into account the development in the very near future.

3,997. Leave that out and take the demand as it is to-day?—I do not know that there is any more practical reply than I have never known enough labour.

3,998. I take it from your answer just now that in Natal there are large numbers of natives but they cannot be induced to work?—Yes.

3,999. Suppose you could induce the native to work, do you think that would settle the difficulty?—You mean to work all the year round?

4,000. Yes, do you think that would settle the question?—Well, if the native worked as the white man works, it would be purely a calculation whether there were enough men in the country to do the work required.

4,001. Do you think there are men enough?—I have not those figures.

4,002. Are there men enough in Natal for her labour requirements?—I think they have more than enough, but I do not think they cast about enough. My opinion is there would be plenty for Natal's requirements to be got on the Pondo and Swazi borders where the famine is pretty severe.

4,003. By Natal's requirements, do you mean for agriculture and railway making?—Yes, you might say for railways, but certainly not for agriculture.

4,004. If you went to the native at his kraal and he was in fairly comfortable circumstances with a good food supply and a little money, and he did not know you; if you had no personal influence with him, and you went and asked him to come out and work for you, promising him meat once a day with vegetables, do you think he would come?—No, I think he would look upon me as a fool if I offered him all these things.

4,005. You do not think that an improvement in the food supply on the Rand mines will have the effect of inducing labour to come out to work?—You do not want to pamper the Kaffir; you must not if he is feeding on mealie meal and meat once a week, give him all mealie meal, but certainly he is better for pumpkins or something of that kind which is a nice little addition and will keep him in better health than feeding him only on porridge. But none of these things will affect the supply unless they are in the hands of men who understand them. They would rather go on bare porridge with men who understand them than work in the compounds with men who do not understand them and get all these things.

4,006. Well, if instead of going yourself to these natives, you sent an agent, do you think he would be more successful than you would be?—That is purely a tout's business, and a tout, I take it, is a man—at least not actually a tout, but an agent or recruiter—would be a man well known in the district. For instance, a man who has had a store and the natives with him for a long time. He might induce a lot of men in the neighbourhood where he was known to come out. I do not think I could go to Natal to-day and get half a dozen men quickly. I had two or three men in Natal during the war.

17133

4,007. You say if you went to the neighbourhood where you were known to-day, you do not think you would have much success?—My experience in Natal during the war, where I went in for a little wattle bark, having bought the plantation, I could not get native labour enough to do the work in spite of the fact that I was personally known and used all the powers I could.

4,008. Was your reputation amongst them a good one?—Very good.

4,009. Then do you think the method of recruiting, provided it is fairly efficient, has much influence upon inducing the native to come out to work?—Yes, it has a great deal. There are lots of men that are ready and anxious to work, but the Kaffir is such a peculiar animal that the railway fare would weigh on his mind.

4,010. You do not quite understand my question. It is this, if you compare one method of recruiting with another, do you think that it makes much difference whether you recruit in one way or another provided each is fairly efficient. Do you think that if you have two men competing one against the other it makes much difference to the native?—Whether you have a man that knows them or not?

4,011. Suppose they both know them. I want to get at your opinion as to the difference between the free and the paid recruiter?—By a paid recruiter you mean a man who works on a salary?

4,012. Yes, or as an agent of an organisation; does it make much difference to the labour supply?—Only the man who is getting much more remuneration would work harder.

4,013. Suppose they both work on commission?—What is the difference?

4,014. That is what I want you to tell me?—If you make it equal, where can there be any difference.

4,015. I want to know if there is any difference in the results provided both methods are fairly efficient?—I do not see how you divide the two if you make the thing equal. The man who is working for himself, getting 40s. per head, is only interested in getting the greatest number.

4,016. The question, I may explain, arises from this fact: We have heard much about the methods of a particular organisation. I want to get at the influence which this particular labour organisation has on the whole problem of the labour supply?—You mean to say this: that if the native knew that one man was the agent of the Native Labour Association and the other man a free man which would have the best chance; is that it? The Kaffir would be more inclined to go to the free agent.

4,017. Why is that?—Because they have an objection to be put in the pound, as they call it.

4,018. You think the system of the Native Labour Organisation of bringing them up here in batches and putting them in the pound has a deterrent effect?—Very great, to the Zulu mind.

4,019. Do you think that particular difficulty affects the labour supply of the mines to any extent?—From the district I am speaking of—that is Natal and Zululand—it does not affect the supply because I think there are as many here as there ever has been.

4,020. Have you any suggestion to make by which that particular obstacle could be removed or improved?—Well, there is one thing, to do away with the time—the indenture so to speak—so many months' indenture.

4,021. You mean the six months' indenture?—Yes.

4,022. Do you think the indenture for a shorter period would assist the matter?—I do. I think the Kaffir would like it that way.

4,023. He would come for a shorter period when he would not come for a long one?—Yes. As he describes it, he is put in the pound.

4,024. Suppose a native was desirous of coming out to work and he did not care to go to the

M

mines, would he stay at home or is he likely to seek work elsewhere?—Do you mean to say the Natal Kaffir, and would he seek work in Natal?

4,025. Or elsewhere at some other occupation?—You mean any work—office work, etc.

4,026. Yes?—He would seek that elsewhere.

4,027. Then, in your opinion, it is small matters, such as period of service and details like the one you mention, "putting in the pound," which affect the labour supply as a whole and make mining unpopular as compared with other occupations?—Yes, it makes mining unpopular. The natives do not like discipline and these other little things like that matter of being bound for so many months.

4,028. Then these things tend to make mining unpopular?—You see there are so very few of these men go to the mines.

4,029. I am speaking generally?—You are speaking of Johannesburg.

4,030. Yes?—It makes Johannesburg unpopular.

4,031. So you say that, speaking broadly, Johannesburg is not a popular field as a labour market for the native?—It was very popular. It was quite usual during the war for the men to say, "Oh well then we are going back to Johannesburg." Well, I was interested then in getting labour and was paying as high as £3 to try and get this particular wattle before the trees ceased to strip. I said to the natives, why do you want to get to Johannesburg when you can get £3 here? They said, oh, we like Johannesburg; it is fashionable.

4,032. Is it no longer fashionable?—To-day it is not fashionable.

4,033. Can you give any reason explaining why it has fallen out of fashion?—Well, the news of the rise in wages has not got back to them in all the districts.

4,034. You would take the lower wage as one of the influences which has made Johannesburg unpopular?—Naturally, when they could get £2 10s. 0d. down there and only 30s. here.

4,035. Is there any other factor?—And little things like what I say, such as being put into the compound. This has nearly all been removed now, but it has not got known amongst them. I do not think that if the men came back to-day they would mind it; only it has not got abroad amongst them.

4,036. At the bottom of the first page of your statement you say, "The inducements for labour in the Transvaal should therefore be"—then you enumerate a number of points which influence the labour supply. Do you think that the various points mentioned in that list have, as a whole, much influence on the supply?—Yes, a good deal; of course, they are little things.

4,037. Would they induce natives to come out if they were not particularly desirous of coming out?—Well, it would reduce it. They are paying here higher rates of pay than they are paying at home. I do not see why they should pay all these rates if they can get the same as at home. Then the system of travelling might be improved. A man might be staying at a kraal and have an inclination to come out and he might have been watching a lot of little chickens grow up until they were able to pay his fare, whereas if a man went round and was prepared to pay that native's fare he would come out, but you have to have a man of that kind before the boy will come.

4,038. What kind of a man?—A man that would get a boy ready to come. Then again, there is a matter I wanted to bring forward as a suggestion and that is the matter of travelling up. It may not be thought much of, but it affects the traveller very much. A man gets into an open truck with 50 others, say with no lavatory accommodation, or anything, and under the old Government it was one of the practical jokes to allow the men time to spread over the field and then blow the whistle and see them run. In consequence of this, in getting

a batch of men up from the Cape Colony it would be found that there were three or four short; when the whistle blew three or four of them would be left; of course this was a very cruel thing. The native was left there without his kit or anything, and sometimes in the Free State they would be left like this. Well, they tell me the conditions are worse to-day.

4,039. Do you mean in this particular respect?—I mean a want of consideration in these little ways. In travelling over the Free State you can imagine what they would give for a drink of water and when they arrive at a railway station they are not told that they can get off for a drink of water; they stay in the train thinking the train is going off immediately, then they ask if they can get out in ones and twos, and when they are all out, then the whistle goes. There are most important things to tell the people along the line, because I am perfectly certain it is done with ill-will. You see, men who have to have four or five days on a train, it is pretty hard with them that they cannot get this little office.

4,040. You made use of the expression just now that before these factors came into play you must have the native ready to come?—Yes.

4,041. From your replies to earlier questions, I understood that it is your experience that you cannot get the native to work if he is fairly comfortable at home; if there is no impelling cause at that end?—The impelling cause would be to get more cattle. He has no requirements whatever at home, absolutely none. One suit of clothes will last him for years and years, because he never puts them on.

4,042. But I want to get at the relative importance of the various factors. These things that you mention in your list just referred to, are they to be regarded as minor causes affecting the labour supply, or would you put them down in the category of major causes?—Looking at it from the native mind, it is a very important thing. It is not a very big undertaking for him to come from his kraal to the Rand; he would come all the sooner would he not. It is a natural consequence, but how much longer he would stop at his kraal under the other circumstances, or under these I could not tell you. If a Kaffir has made up his mind you can put him in a train for a whole week without water or anything else and he will come. I am mentioning these things because I feel sure it involves no trouble or expense to tell the people at the different stations; I think we must show these gangs of boys consideration. A goods train hangs up for 20 minutes or half an hour at a siding, and it is very easy to tell these men that there is an interval of 20 minutes or so. I think it is a very important thing. However, a man does not mind having his railway fare deducted out of his wages, but what he does not like is the lot of pin-pricking. I believe the thing. I believe what did affect the labour to a great extent was the deduction of pay on the different works; for instance, a man will have a ticket at the end of the month; there is one shilling deducted because he "dashed" a truck, 1s. 3d. because he tipped it, 1s. 4d. because he shovelled earth into it, and he has no idea of what he is going to get at the end of the month, and when he does get it, it is £1 17s. 4d., and then the compound manager has done him down. He cannot understand what he is getting paid like that for. Then there is this again, if a man knows who he is coming up to.

4,043. But presumably most of these things do not exist in Natal, that is to say, the majority of the employers there are prepared to treat the native well?—Yes.

4,044. Did these factors have much influence in inducing the native to come out to work?—No, I do not think they did; not very much.

4,045. These things did not bring him out to work down there?—No.

4,046. It has been necessary to introduce other labour in order to meet your industrial requirements?—Yes, it always has.

- 4,047. Do you think that there is any prospect of a change in that condition of affairs in the immediate future?—I do not. Do you mean to say in the native mind.
- 4,048. In the native's attitude towards work?—The Kaffir will not work until he is obliged to do so.
- 4,049. What would be the compelling causes?—If he had to pay rent, for instance, for the house—if he had to pay £5 a month for a house, he would have to earn it. He pays absolutely nothing now, and gets all the right of land for grazing and cultivation, and why should he not work. A man has practically retired when he has got a couple of head of cattle. We all like to retire when we have got enough.
- 4,050. Would you strike at this labour question by hitting the land—reducing the area?—That comes to the most difficult problem of the whole lot—as to how it is to be done. You see it is only six or seven years since the railway got into Johannesburg and up to that time farmers ran transport for a living. They did not cultivate their farms except a little. They would keep three or four kraals on their farms to supply them with the labour that was necessary. After the land transport was all finished, and they began to settle down to work, they began to find that "Mr. Kaffir" was not any good at all. A man is not going to plant 500 bushels of mealies in Natal and rely upon the Kaffirs to take it off.
- 4,051. Mr. PHILIP: I do not think Mr. Tainton has gone sufficiently exhaustively into this evidence of yours. You state that during your forty-five years' knowledge of Natal you have never been able to get sufficient labour there?—No.
- 4,052. That is after an experience of forty-five years?—Yes.
- 4,053. What necessitated the importation of Coolies into Natal?—My earliest experience was in connection with a crop of cane that had to be cut down, and it could not be reaped because there was no Kaffir labour.
- 4,054. Can you tell us when the first importation took place?—About 44 years ago.
- 4,055. Do you know how many were imported to start with, or about how many?—Up to 1885 you want to know how many Coolies were employed by farmers north of Maritzburg?—I cannot tell you.
- 4,056. Do you know how many there are at present?—A very large number, I believe.
- 4,057. I believe before 1885 there were no Coolies employed by farmers north of Maritzburg?—I do not think there were.
- 4,058. Why is it during recent years that nearly all the farmers of the Colony have been requisitioning for more coolie labour?—On account of the railway connection, and there being a market there, which never existed before.
- 4,059. If there was native labour in Natal they would not need to import Coolies would they?—The Kaffir is not reliable.
- 4,060. Is it not a fact that farmers in Natal have removed large numbers of Zulus from their farms because they could not rely upon them, and they have applied for Coolies?—In almost every case.
- 4,061. What condition was the sugar industry in before the importation of Coolies?—It was only in its infancy then. We used to consider a big crop 200 tons then.
- 4,062. You could not get your cane in?—No.
- 4,063. Is it not a fact when railways were built in Natal and farmers gave up transport riding and returned to legitimate farming they had to import Coolies to do the work?—They imported Coolies to do the work of the Zulus.
- 4,064. And in Natal a large number of men are employed as house boys. Are they not kitchen and house-boys?—Yes.
- 4,065. Do you think it would affect the labour supply at all if we, for all house-work, insisted that Kaffir women shall be employed, and not Kaffir men?—I do not know.
- 4,066. Could not the women be got to work as house servants?—No.
- 4,067. The men would not allow it?—It would be such a break-up of old custom. No respectable woman ever leaves her kraal.
- 4,068. You think it is a good thing for the whites and Zulus that these boys should be employed as servants?—They make very good servants.
- 4,069. Mr. EVANS: We have been informed by a missionary from Natal that if there were a sufficient number of places to hold religious services and night schools on the mines the supply of natives from Natal would materially increase. What is your opinion on that point?—A few years ago I should have laughed at it altogether, but there is more in it than most people think. I do not think that people would come from beyond the Tugela to school here, although I have been perfectly astonished to see during the last two years how these men do like it. After they have had a long day's work they will go for hours and hours spelling over a few syllables.
- 4,070. Is there something in it?—Yes.
- 4,071. Do you consider that the estimates and figures in the Natal Blue Book are trustworthy? Are they the best evidence that we can get?—Well, it is the only evidence you can get.
- 4,072. In your opinion, are figures as to native population any test of the labour available?—No, I do not think so.
- 4,073. We have been given here large figures as to the native population in certain territories in South Africa. Would you consider that a guide as to the number of workmen that we are likely to get out of that population?—No, I should not be guided by that—by the fact that we have not got enough—where there are so many hundreds of thousands there. Whether they are there and of any use, if we cannot get them—and we cannot get them under the existing law—the only thing that we can go upon is that we are in the country, and we have not got enough labour.
- 4,074. The only test is the result?—Yes.
- 4,075. Not estimates as to population?—No. I do not see any use of that at all.
- 4,076. Do you consider that the wages affect the labour supply? Do you consider that the high wages have a tendency to diminish the supply?—That is a point now. At present the wages are high; then men will be induced to come in larger numbers; the place will fill up more.
- 4,077. But will they work for as long a period?—When the Kaffir is once away from home it is not quite so much a question of the money he is getting as whether his heart tells him that he wants to go home.
- 4,078. We had some witnesses here who told us that the Kaffir comes to make a certain sum of money, and if he can make it in six months he will go home, but if it takes him twelve months to make it, he will stay. What do you think of that?—I do not think it affects him at all. They have got arrangements now for the remitting of money. In Natal and Cape Colony when a man has earned £5 or £10 he can remit it, but if he parts with that money at the agency, when he returns for it he has lost all the figures or account of it, and if that money is not in his purse it is gone.
- 4,079. Do you think that what he earns affects his possible return afterwards. When he has gone back to his kraal?—If he is in a position to spend the whole of that money at once in cattle he is a poor man again as regards money.
- 4,080. And he will come back?—He will come back as soon as there is any need for money.
- 4,081. How many years do you think a Kaffir works in a lifetime?—Well, I know one fellow who was a boy when I was a boy. He is an old man now, and his sons have been to work and have gone home again from their work. He has two or three generations, I should think, now. I should think a

Kaffir is fairly old at 40—they age much quicker. I should think that at forty-five they ought to stop working. But those men do not come out unless they can help it. They have got a couple of wives and they remain at home.

4,082. They do not come out unless they are obliged to?—No, those men look upon themselves as retired.

4,083. Between what ages would you call a Kaffir a likely labourer for the Rand?—A Kaffir, of course, is quite capable of working right up to 50 or 55 years of age.

4,084. I mean as likely to come here?—You will not get many over 40 years of age.

4,085. What do you put the ages of the men down at who are working here—roughly?—Oh, I should think from 20 to 33 years of age.

4,086. You think that the bulk of them are between those two figures?—Of course I am taking the labourers; you very seldom see an old man, and very seldom see a very young man amongst them.

4,087. Now I understand that it was owing to the unreliability and insufficiency of Kaffir labour that the people of Natal imported Coolies?—Yes, we could do nothing.

4,088. Mr. TAINTON: You state at the bottom of the first page of your statement, when referring to the natives, "It naturally follows that he prefers to work nearer home if he can obtain the same rate of pay." We had a statement from one witness to the effect that the native preferred to work a considerable distance from his home. Do you agree with that statement?—Well, he would get that idea from the old ideas. Somehow or another it was fashionable amongst them for men to like to come to Johannesburg. I asked one fellow about it; I said why do you want to go there when you can get the same amount at home. He said we like to go there. I should not take that to mean that they preferred to go further away from home.

4,089. You adhere to this statement as correct, "That he prefers to work nearer home?"—Oh, yes, if he can get the same amount of money.

4,090. The CHAIRMAN: Mr. Acutt, the Commission is very much obliged to you for the evidence you have given. It is quite a relief to get a witness who is not devoid of humour.

Mr. M. S. ERSKINE, called, sworn and examined.

4,091. The CHAIRMAN: You are Mr. M. S. Erskine?—Yes.

4,092. Have you before you a statement headed, "Mr. M. S. Erskine's Report for Labour Commission?"—Yes, sir.

4,093. Will you hand that in to the Commission as your evidence-in-chief?—Yes.

4,094. Mr. Erskine's report was then handed in to the Commission and reads as follows:—I am South African born. At the age of 18 I was Clerk and Native Interpreter to the Magistrate of Maritzburg, Natal, and so employed for a period of 12 months. In 1887 I proceeded to the Rand; for 12 months I was Compound Manager and Native Timekeeper on the old Du Preez G.M. Company, employing over 500 natives. After this I was on the construction of the railway line between Elandsfontein and Vereeniging. I had to recruit the necessary labour for this work, employing 2,000 natives, and was on this construction for six months. I was then appointed assistant to Mr. Metcalf, manager of Forbes Reef, Swaziland, and on this property I was in charge of all the natives, and recruited all its labour from Delagoa Bay and Swaziland. In 1892 I returned to the Rand, and worked the cyanide contract on the New Primrose Company for six months, after which I was offered the management of this compound, as the Company had great difficulty in obtaining labour, and, when obtained, in keeping the natives. After three years I increased the number of natives working on the Primrose from 900 to

3,500. These natives I recruited from the East Coast, Natal, Cape Colony, Swaziland and the Northern Transvaal. The Barnato group then gave me the management of the Rand Native Labour Association. I have worked for the W.N.L.A., Ltd., since it was first organised. In November I proceeded to Delagoa Bay to start recruiting operations. However, everything was so unsettled that after a short time the Association decided to recall me and all the men who accompanied me. In April, 1901, I proceeded to Johannesburg, and thence to Pietersburg. In the following August I started recruiting in the Northern Transvaal and in three months I despatched 3,500 natives to the Rand. I attribute this success to the natives disbelieving the statement that wages were reduced to 30s. per month, as they felt certain that now the Rand was in the hands of the English they could earn even higher wages than when the country was governed by the Dutch. In December, 1901, my brother, David Erskine, was appointed District Manager of the Northern Transvaal, and took over all my agencies. I was then despatched to look round the Cape Colony. I went through East Griqualand, East Pondoland and the Transkei, calling on the Magistrates and holding meetings to explain that the mines were now ready to employ labourers. In March, 1902, I started recruiting throughout the Cape Colony; after three months I had failed to induce any of the Colonial natives to engage at the 30s. per month wage. Wherever I held meetings the Magistrates gave me all the assistance in their power, but told me that I would never recruit successfully at the exceedingly low rate of pay. At these meetings the chiefs and headmen told me plainly that they would use all their influence to persuade their men not to engage for the mines unless the pay was raised to the wage existing before the war. I then went to Mafeking and Bechuanaland. In both these places I was unsuccessful, the natives making the same complaints as in the Cape Colony. The Association decided to try the Western Transvaal. I proceeded to Krugersdorp and drove through Rustenburg, Pelandsburg and Zeerust up to the Nabes Kraal, which is situated near the Crocodile River. En route I interviewed the chiefs at all the big stads, and, without exception, they all expressed the greatest surprise at the low rate of pay, saying they were certain that I would never persuade the men to work on the Rand for such a paltry wage. They also stated that their men had worked on the mines since the Rand first started, and had always earned big wages, that in spite of the dangerous work in the mines they had always worked underground, and that a good number of them had been incapacitated for life through chest and lung complaints caught whilst at work in the mines. The chiefs said they would not advise their men to go out at the low rate of wages. In my opinion the chief reason of the poor supply of native labour from the Cape Colony when first started was owing to natives only receiving 30s. per month under a six months' contract. Another grievance the natives had, was not being allowed to return to their old mines. I am now speaking when I first started recruiting in the Cape Colony. These grievances are now at an end, the wages being raised to the rate ruling before the war, and a native can select his mine at the time of engaging. This he could not do before, as only certain mines could employ them, owing to military restrictions. The natives who are engaged under the new conditions are still, most of them, on the Rand, and the natives are awaiting the return of these boys to their kraals to satisfy themselves that we pay the wages we promise, and that boys receive good treatment. There is a vast difference in the present method of recruiting as compared with the old. Before the war, the boys were mainly got through lying and cheating, as everyone and anyone could recruit and used to sell their boys to the highest bidder; also each mine was allowed to tout in those days. The old system of contracting boys was all a fraud, as the man who recruited the natives was never to be found when wanted, and by the time the boys arrived on the Rand they had often changed hands three or four times. Under the present system we compel every recruiter to tell the truth. He also has his boys

contracted before the Magistrate for a period of six months at the minimum wage. This signing on before a Magistrate the natives detest. Before the war no time was mentioned and the maximum wage always promised. In the old days, on the arrival of a gang of boys in Johannesburg, no passports were required, consequently large gangs of natives went where they liked. Thus the mine who had originally paid the expenses for the boys would often lose them, although they held the natives' district passes, as they could never be traced. The great objection natives have now to working under the present Pass Law is, they find they cannot roam about as they like, but have to complete their contract on the mine to which they have been allotted. There is no doubt that it will take a considerable time for the natives to get used to the new laws now in force in the Transvaal. I feel sure that the Association and its present method of working is the only successful way of recruiting labour for the mines, and now that the wages are the same as prior to the war the natives will find out that the best and cheapest way of getting to the Rand is through the agents of the W.N.L.A. My method of recruiting is: I appoint a white recruiter in each district; he employs from 20 to 30 native recruiters or touts, who travel from kraal to kraal making it generally known that all natives who wish to proceed to Johannesburg can do so, that their boss (mentioning the agent's name and where he is to be found) will pay all railway fares to the Rand and give rations free to any and all natives desirous of working on the mines. The white agent goes round the district about every three months arranging big meetings with the chiefs and headmen, also all who care to attend. At these meetings the question of wages, treatment, etc., is thoroughly gone into, and the agents answer all questions. Should a question be asked he cannot answer, he immediately communicates with headquarters, and I go into the case personally. All the white recruiters and natives employed in this way are paid a salary or commission. Every batch of natives is contracted before the Magistrate or J.P. The batch is then sent to the District Manager's office, where terms, etc., are again discussed before the natives are finally despatched to the Rand. The attitude of the chiefs all depends on who pays the highest. They never do much in the recruiting line. They are nearly all in the pay of the Colonial Government, and will not move a finger to turn the boys out unless ordered to do so by the R.M. The chiefs are always ready to accept a wage and make all sorts of promises, but nothing ever comes of them. They have absolutely no power over their men and never will have; if they are objectionable in any pronounced way, the men send a deputation to the R.M. who always overrules the chief's decision in favour of the tribe. The population of the East Cape Colony is, roughly, 1,075,000 persons. From October, 1902, to March, 1903, 44,717 natives left their kraals to obtain labour. Of this number, 9,377 went to the Transvaal, the remainder went to Natal (6,318), Kimberley and the different docks and harbour works in the Cape Colony (28,117), O.R.C. 842. Native labour has always been very scarce since the Rand first started. The longer the gold fields and other fields of employment are open the richer the native becomes, and the less he will work. Supposing in six months I recruited 3,500 natives from the Cape Colony for work on the mines, each native returns home with an average of £15. This amount enables him to remain idle for 15 to 18 months, and the supply of labour from the districts where these men were recruited will be affected accordingly for the time being. The pay and the conditions in general on the mines have greatly improved during the last six months, but these facts have not had time to be practically illustrated to the natives at their kraals. When they are I feel confident that the labour supply from the Cape Colony will be increased. The liquor restrictions on the Rand have to a certain extent affected the supply for the worse, but all the chiefs I have spoken to on this subject are greatly pleased, as they state when a native takes to drink he forgets his family and all home ties. Of course, this is another reason why natives stay a shorter time on the Rand as they are able to save money more

quickly. In the native territories of Eastern Cape Colony, Pondoland, East Griqualand, and the Transkei, the total population is roughly 839,000 natives; of this number about 104,875 natives are able-bodied men. The total population of the East Cape Colony where I am recruiting is about 1,076,600; of this number about 134,500 are able-bodied men. The natives of the Cape Colony are great agriculturalists, and are very fond of their homes. For this reason we can never count on the bulk of the population as being available for labour outside the Cape Colony, or indeed anywhere except on their farms. I find that on the whole the natives are not averse to working in the mines, but have a great preference for surface work. At one time I had 32 white recruiters working for me besides over 600 native runners. I have always given every man an opportunity to recruit natives for us if he could show at all that he had any chance of obtaining labour.

4,095. You have been connected with natives and native labour since 1886, Mr. Erskine?—Yes.

4,096. Do you know the native languages?—Yes.

4,097. You recruited a large number of natives for the construction of the Elandsfontein and Vereeniging Railway Line?—Yes.

4,098. After that you recruited natives for the Forbes Reef Company in Swaziland?—Yes.

4,099. You then became manager of the Primrose Compound and recruited natives for that compound?—Yes.

4,100. You brought their supply up from 900 to 3,500?—Yes, about that.

4,101. How long did it take you to do that, do you remember?—I know I was six years, and at the end I had 3,500 boys. It took me all that time. We went up gradually; we did not get them all at once.

4,102. Did you work for the Rand Native Labour Association before the war?—Yes.

4,103. After you left the Primrose Company?—Yes.

4,104. Did you work for it for any length of time?—I think it was for about three years.

4,105. You state that you worked for the W.N.L.A.—the new Association—since it was organised?—Yes.

4,106. And that you went to Delagoa Bay in November to work for them?—Yes.

4,107. What year was that in?—In November, 1900, I think.

4,108. You were not successful at that time?—We could do nothing. We were stopped.

4,109. Owing to the unsettled state of affairs?—Yes.

4,110. Then you have been working for them ever since?—Yes.

4,111. First in the Pietersburg District, and latterly, in the Cape Colony?—Yes.

4,112. You found at first that the low rate of pay—30s. per month—which was offered, was a great hindrance in recruiting?—Yes.

4,113. When was that rate of pay increased, do you remember?—It was about December, 1902.

4,114. December of last year?—Somewhere about the end of last year.

4,115. The raising of the rate, then, in your opinion, enabled you to recruit more easily?—Yes.

4,116. From your evidence it would appear that you entertain no doubt at all about the superiority of the Association's methods of recruiting as against free recruiting?—That is so.

4,117. Certain witnesses have told us that under a system of free recruiting a much larger number of boys would be got to work on the mines. You do not hold with that view?—No.

4,118. Has the Association been improving its methods since it first started?—Yes.

4,119. You appear to have a very large number of recruiters and runners in your employ, or under

you. You say here, "At one time I had 32 white recruiters working for me besides over 600 native runners." Have you as many now?—Yes, they are all there, but are not active now because there are no boys coming out.

4,120. You do not appear to think that the chiefs have much influence in inducing the boys to come out?—No.

4,121. Had they more influence before the war?—Not down in the Cape Colony. They are just the same in the Cape Colony now as they were. Their power has not increased or diminished.

4,122. Are we right in understanding from your evidence that if urged by the Resident Magistrates they can exercise some influence in turning the natives out to work?—Yes.

4,123. Do the Resident Magistrates exercise that authority?—They do not order the chiefs to turn them out, but they ask the chiefs to help us.

4,124. An authority of that kind has not much effect on the chiefs?—No.

4,125. Are you of opinion that the richer the native is the less he will work?—Yes.

4,126. Do you think that the rate of pay influences the native in the period he remains at work?—Yes.

4,127. It has been said here by some witnesses that the higher the rate of pay the shorter period the native will work. Is that your opinion?—It all depends.

4,128. On what?—On the amount of money he wishes to earn before he retires.

4,129. Do you mean by that he comes to work having a definite amount of money in view?—Yes.

4,130. And when he has got that amount he returns?—Yes.

4,131. Do you think that the fact of the wages now being higher is pretty well known amongst the natives?—It is not as well known as we could wish it. It is well enough known, but the proofs are not there.

4,132. What proof do they require?—They require the proof of the boys now earning the advanced rate to return home and show their earnings.

4,133. When a large number of boys have returned, do you think that will increase the output?—Yes.

4,134. To a material extent?—I could not say. It will increase it any way. I cannot give any numbers.

4,135. Mr. GOCH: You are working in the Eastern parts of the Cape now, are you not?—Yes.

4,136. I notice that out of a number of natives, 44,717 left there to obtain work, of which only 9,377 came to the Transvaal?—Yes.

4,137. Have you any hope of increasing that number to the Transvaal?—Yes, I have every hope.

4,138. How many do you think you can get up here?—I say I should average between 1,500 or 1,600 a month.

4,139. How long did it take you to recruit the 9,377? Did you recruit them?—No, those are the figures given.

4,140. Were you responsible for any of them?—Yes.

4,141. How many?—I have not got the figures for some of the months. For instance, in March, 1903, there were 2,299 natives left the Colony for the Transvaal, of which I sent 841.

4,142. You sent out how many?—841; and in December, 1902, there were 1,468 boys left for the Transvaal, of which 791 were recruited by me. In January, 1903, 2,227 left the Colony for the Transvaal, and 922 were recruited by me. Take February, 1903, 2,245 boys left the Colony, and 1,239 were recruited by the Association.

4,143. Then you think that you will be able to reach 1,500 at least?—Yes.

4,144. How long could you maintain the output of 1,500 from there? You say you think you can get 1,500 per month?—For six months.

4,145. And then?—I should say down to about half.

4,146. Are there any special favourable features now?—Yes, they come out more in the warm weather than they do in the cold.

4,147. When the winter comes on you will probably drop down one half?—Yes.

4,148. Would that be a normal state of things—800 in the winter and 1,500 in the summer?—Yes, that is provided the wages remain the same. If there is any alteration there would be a difference in the output at once.

4,149. According to this you would have 800 a month for six months, that is, about 13,000 or 14,000 per year as the most that you could put through?—Yes, under the present circumstances. There is no hope of being able to send more out.

4,150. You say in one part of your statement the population is 1,075,000, and in another part you say it is 839,000; are these two different districts?—One covers the whole lot.

4,151. The larger number covers the whole lot?—Yes.

4,152. Sir Godfrey Lagden, in his evidence, stated that he thought about 10 per cent. of the total population would be available for work; is that not your experience; for the whole of South Africa? You speak of a million people here, roughly, therefore, on that basis, there should be 100,000 men available for work. Do you think that is about right?—I think so.

4,153. So that you could only recruit about 14,000 per year for us?—Yes.

4,154. The rest, of course, are in great demand in other parts of the country?—Yes. If 44,000 came out in six months, if you double that you get your 10 per cent.

4,155. Well, then, out of all the eastern district that is the limit we can hope for?—Yes.

4,156. Mr. DONALDSON: You at one time were recruiting on your own account, that is to say, outside of the Association?—No, sir.

4,157. I think you say that you recruited labour for the railways?—I was on a monthly salary then.

4,158. Would not that, as compared with the methods now in vogue, come under the heading of free recruiting?—They talk now about agents of the Association as one class of men and others that may work outside as free recruiters.

4,159. You have practically done both classes of work?—Yes.

4,160. Is it your opinion that the methods of the Association attain the best results now?—Yes.

4,161. Mr. EVANS: Where do you get the figures you quote here from?—From the Magistrates and from the Blue-books.

4,162. What Blue-books?—One Blue-book that has just come out. It got to the Engobo Magistrate about August 3rd.

4,163. And are you quoting from that Blue-book?—Yes.

4,164. Do you consider that a trustworthy source?—I think it is about as near as you will get.

4,165. Who would you consider the best informed witness we could get about native affairs in Cape Colony?—I really could not say; there are so many.

4,166. Can you mention any names of men who are thoroughly well informed on native affairs there?—I do not think I am at liberty to mention any names.

4,167. Mr. PHILIP: There is a little discrepancy in your figures here. On page 5 you say the population of East Cape Colony is roughly 1,075,000 persons. Does that include whites?—No.

- 4,168. Well, then, on page 6 you say, "In the native territories of Eastern Cape Colony, Pondoland, East Griqualand and the Transkei the total population is roughly 839,000 natives?"—Yes.
- 4,169. How do you come to get these two sets of figures?—The latter are just from Pondoland, East Griqualand and the Transkei.
- 4,170. And the Eastern parts of Cape Colony?—Yes, because there are others that make up for it.
- 4,171. You have got the whole of the Eastern part of Cape Colony on page 5 of your statement at 1,875,000 persons. Then on page 6 you have got the population for Eastern Cape Colony, Pondoland, East Griqualand and Transkei at 839,000. Now just below that on page 6, you say, "The total population of the East Cape Colony, where I am recruiting is about 1,076,600." That is more than either of the other figures?—Yes.
- 4,172. Now what is the part of the Cape Colony where you are recruiting?—In the Eastern parts, Transkei, East Griqualand and Pondoland.
- 4,173. Are you recruiting in Queenstown, East London and Kingwilliamstown?—Yes.
- 4,174. Can you tell us how many natives you have recruited out of East London?—I could if I had the figures.
- 4,175. Have you recruited any there and in Kingwilliamstown and Queenstown?—Yes.
- 4,176. Can you tell me how you recruit the natives when they can come down to the East London works and Port Elizabeth harbour works and get 4s. 6d. per day?—That is simple enough. Natives come to East London and Port Elizabeth; on arrival they find there is no work, the Harbour Board not requiring any labour for the time being. The natives are penniless and have to engage for other centres, who will pay their expenses.
- 4,177. Well, you state that from October, 1902, to March, 1903, the total recruiting in the Eastern part of Cape Colony was 44,717 natives?—Yes.
- 4,178. That is, those natives left their kraals for labour?—Yes.
- 4,179. Then this number, 9,377, went to the Transvaal?—Yes.
- 4,180. And 6,381 went to Kimberley?—Yes.
- 4,181. And the different docks and harbour works in the Cape Colony got 23,117. And the O.R.C., 842?—Yes.
- 4,182. Well, now, can you give us any idea out of that 9,000 how many came from the Cape Colony, leaving the Transkei, Pondoland and East Griqualand out. That is, the districts of East London, Kingwilliamstown, Aliwal and Queenstown?—If I refer to my books in Queenstown I can tell you.
- 4,183. Then, again, you give us the figures that you have recruited yourself. The figures for December to March. Can you tell me how many you recruited in April?—594.
- 4,184. And how many in May, 1903?—447.
- 4,185. And how many in June?—332.
- 4,186. And how many in July?—I have not got them, but I should say it is about 190.
- 4,187. So that your recruiting with the exception of December last, which was 791—or rather that is the smallest number that you recruited. In February you recruited 1,239 and you have fallen down from 1,239 in February to 332 in June?—Yes.
- 4,188. Now how can you tell us in the face of that that you expect to increase your number to 2,000 when your number has really decreased to a quarter of what you recruited in February?—Did I say 2,000?
- 4,189. You said you hoped to be able to recruit on an average 1,500 to 1,600 per month. You say that for the next six months you will be able to recruit from 1,500 to 1,600?—Yes.
- 4,190. Will you say that the boys down there have not got to know of the difference in wages—
- when it was reduced to 30s. You said that it had not had time to spread and in the same way the increase has not had time to spread?—Oh, no.
- 4,191. I think you say in your statement that you have recruited a certain number of natives: "In the following August I started recruiting in the Northern Transvaal and in three months I despatched 3,500 natives to the Rand?"—Yes, that is up in the North.
- 4,192. You say you recruited them at 30s. a month, and they would not believe that the wages had been reduced?—Yes.
- 4,193. There are a great many natives in all these districts you speak of and all these districts are full of mission schools?—Yes.
- 4,194. There are a great number down there who can read and write?—Yes.
- 4,195. And do you mean to tell me that the natives who come here do not write down and tell their friends that the wages have been increased?—Yes.
- 4,196. Now during the months of December, January and February, you recruited a large number of natives before the wages had been raised, that was at the old 30s. rate, was it not? The wages were not raised here until February. In December, January and February you recruited a very large number at the old rate of 30s.?—No.
- 4,197. What did you recruit them at?—50s.
- 4,198. When did you recruit at 50s.?—In August to November.
- 4,199. The wages were not raised here then?—With the exception of the railway.
- 4,200. Then you did not recruit for the mines but for the railways?—The bulk of them were recruited at 50s. for the railways.
- 4,201. When the mines were only paying 30s.?—Yes.
- 4,202. And now that the mines have raised their rates to 60s., your results are one-fourth of what they were before the wages were raised?—Yes.
- 4,203. So that you are gradually going back although the wages have been raised?—Yes, because the boys will not come out in the cold weather; because it is a bad time of the year. And another thing, a boy can only get £3; if he goes underground he will not protect himself and the trouble is that he wants to be left to himself.
- 4,204. Now the whole of the Transkei, East London, Kingwilliamstown and Queenstown are all good agricultural districts, are they not?—Yes.
- 4,205. Every Kaffir there grows a fair amount of stuff, and it is the best cultivated part of the country outside of Basutoland, is it not?—Yes.
- 4,206. And in addition to the grain they grow for themselves, they sell a great quantity down there, do they not?—Yes.
- 4,207. So that the natives are fairly well-to-do both in grain and cattle?—No.
- 4,208. Now take this particular year, the natives have not had such good crops to sell. Compared with other parts of South Africa, the crops have been better down in the Transkei than elsewhere?—I do not know.
- 4,209. At any rate those natives derive a great income from the grain they grow?—Yes.
- 4,210. So that they have no necessity to come up to work?—Except they want something. If they sell the grain they come out to work for other things. Then again they might not get enough money for their grain.
- 4,211. Mr. FORBES: Is your experience a boy would work from 10 to 12 years in his life?—Yes.
- 4,212. Then they are not fond of work?—No.
- 4,213. Mr. TAINTON: On the first page of your statement you state that after a few years you increased the number of natives working on the Primrose Mine from 900 to 3,500. Do you attribute that increase to your personal influence?—No.

4,214. Are you aware why the East Coast natives came to work in larger numbers than the boys from British South Africa?—I am not aware.

4,215. Mr. QUINN: Are you aware that there have been faults in the compounds, such as filth, bad construction and bad cooking?—Yes.

4,216. Can you say whether these faults have been removed?—I cannot say.

4,217. They were very badly constructed compounds?—Yes.

4,218. What is your opinion of the present compound manager?—I have still faults to find with certain compound managers, and this will not tend to encourage the increase of native labour.

4,219. You say on the first page of your statement that you increased the number of natives

working on the Primrose from 900 to 3,500; how many stamps had the Primrose when you left?—160.

4,220. How many stamps were there when you went there?—100.

4,221. Mr. EVANS: If the conditions in the compounds were made perfect, would that make any difference in the number of natives who would come to the mines to work?—I cannot give figures.

4,222. Can you give an estimate?—No.

4,223. Have you no figures in your mind?—No.

4,224. The CHAIRMAN: Mr. Erskine, the Commission is very much obliged to you for your evidence.

At this stage the Commission adjourned until 10.30 a.m. on Thursday, 13th August, 1903.

### THIRTEENTH DAY.

*Thursday, 13th August, 1903.*

THE COMMISSION SAT AT 10.30 A.M.

The Commission sat in Committee from 10.30 a.m. till 11.10 a.m.

On resuming,

4,225. The CHAIRMAN: Before we call the first witness I am glad to be able to say that as a result of a conference with Mr. Ingle yesterday he has been able to produce one of the two witnesses from Rhodesia to whom he referred in his concluding statement yesterday, and there is a probability that we shall be able to get the evidence of the other witness from Rhodesia to whom he referred. Then with regard to the somewhat vague statement which Mr. Ingle made to the effect that certain local witnesses might be got who could give valuable evidence to the Commission, but who had a fear that if they did so their employment might be imperilled, Mr. Ingle cannot at the moment give us the names of the persons he had in his mind when he spoke, but we are hoping that he will be able to supply us with the names of some such witnesses, and we shall then endeavour, either by hearing their evidence "in camera" or by making other arrangements, to see that any such witnesses will be fully protected if they come forward to give evidence before us. I should like to say generally that the Commission is only too anxious to hear evidence from every person who can tell us anything that will be of value in assisting us to arrive at a sound conclusion on the matters referred to us. I would like again to repeat what I said when the Commission first sat—that we have advertised the sittings of this Commission in the widest possible manner. We have written every person whose name has been suggested to us as likely to give any available evidence, and nothing is wanting on our part to make the enquiry as full and complete as possible.

Mr. JOHN H. STUART, called, sworn and examined.

4,226. The CHAIRMAN: Mr. Stuart, have you before you a statement headed "Statement of evidence of Mr. John H. Stuart?" Is it your wish to hand that in as your evidence-in-chief?—No, sir. I have very little to say in this matter. My evidence, as far as I am concerned, is a mere nothing. All I can say myself is where I was employed there was sufficient labour for all requirements during the time I was there. I was only six months in the country. In a conversation I had with my friend, Mr. Ingle, on the subject of native

labour, I said that on the two mines on which I worked there was sufficient labour for all requirements. Outside of that I do not know anything about Rhodesia; I was only six months there altogether. The boys were coming backwards and forwards looking for work, but they could not get it.

4,227. What mines did you work on?—The Beatrice and the Lone Star; the work was done principally by contract, and the contractor had no difficulty so far as the work was concerned.

4,228. Do you know how many boys he employed?—about 65 altogether.

4,229. Do you know how many were employed on the Lone Star altogether?—I should say between 150 and 200 would be the average.

4,230. Between 150 and 200. How long were you there?—Only three months.

4,231. Was that recently?—Yes, I came down about three weeks ago, and the Beatrice when I left had shut down.

4,232. How long did you work on the Beatrice Mine?—Three months, and then it shut down. They were going to shut down before I went there. It was not for the want of boys that it shut down. It was considered that transport was the great object there. It was very difficult to get firewood there because there was no transport in the country.

4,233. Transport was the difficulty?—Yes, beyond that I do not know anything about the shutting down of these mines.

4,234. Do you know how many natives were employed on the Beatrice?—About 300. Most of them were married and settled down and had their families there.

4,235. A good many of them were?—Yes, and all seemed very contented.

4,236. Is the mine situated in a native district?—That I could not say, sir, but it is 36 miles from Salisbury.

4,237. And there was no scarcity of labour there?—Not on the two I was working on; I know nothing about any of the others.

4,238. Mr. DONALDSON: Did Mr. Ingle misunderstand or was it your impression that boys were falling over each other to get employment in Rhodesia?—Not so far as falling over each other,

but there were sufficient boys coming in to these two mines looking for work, but there were enough on the mines without them.

4,239. In your knowledge were any natives ever refused employment on this mine?—They were going and coming all the time. When the boys on the mine got paid off there were others coming in to take these places and the boys paid off would clear away. It was very seldom the boys in the district would work for more than a month. They would go when they were paid and other boys would come in from the district around. There were a good many from the Zambesi and the Portuguese territory. The boys from the district very seldom worked for more than a month before they left.

4,240. Were there any other mines in the neighbourhood of Salisbury?—Only the two I know of.

4,241. The Salisbury district is a very considerable one, is it not?—Yes, it is a good large district; I saw very little of it.

4,242. And were these two mines the only large employers of labour in the district?—They were the only two I know of in the district.

4,243. Then from your knowledge of the labour in that district, do you think it likely there would be a large number of natives leaving that district to go elsewhere for work?—That I could not say; there may be.

4,244. You can offer no opinion?—No. When I was leaving the country and when I went in I travelled with an agent—I should say you would call him a recruiting agent. He was bringing in 300 boys for the Wankie district. He brought them from Portuguese territory.

4,245. Was that to supply the requirements of the Salisbury district?—I should say they were.

4,246. Then from what you say the Salisbury district does not supply itself with boys, and has to get them from outside?—I could not answer to that.

4,247. But you saw a labour agent bringing in to that district 300 boys from elsewhere?—No, sir, he was not bringing them into Salisbury.

4,248. Where was he taking them to?—To the Wankie Coalfields, about 60 or 70 miles from Bulawayo. He was bringing them from the Portuguese territory and taking them north of Bulawayo.

4,249. Did you do any contract work there?—No, sir.

4,250. Have you in your mining experience in Africa ever undertaken any mining contracts?—I have done no mining here. Mill work is what I follow up; that is my work.

4,251. You understand underground work?—Yes, perfectly, in connection with mining.

4,252. If you undertook a contract to do underground mining either here or in Rhodesia would you have as your employees white or black labour or mixed?—That would all depend. If I could do the work as cheaply with white labour I should certainly prefer it to black; if I could do the work as cheaply by mixing it I should do it.

4,253. But you understood labour in this country, I presume, having lived here four years?—I know a little about it, but not much.

4,254. Are you able to state now whether you would employ white men only or a mixture?—Certainly not.

4,255. Mr. QUINN: You have had a fairly large experience in Australia and New Zealand?—Yes, I have been many years mining in that country. I belong to Australia.

4,256. If you could have obtained a mine to work on tribute in Rhodesia, would you have had any difficulty in getting native labour to work it?—In Australia.

4,257. No, Rhodesia?—I think I could have got sufficient labour in Rhodesia if I had taken a mine on tribute. I would have taken the Beatrice if I could have got it and would not have had any difficulty in getting labour.

4,258. In your opinion sinking and driving can be done, all things considered, as cheaply with white as with coloured labour?—I think it could because a white man is so much more practical; more particularly a contract work.

4,259. Can you give us any idea, Mr. Stuart, of the relative amount of labour here as compared with Australia?—No, I cannot go into that, but I should think from what I know of the mines and what I have had under me in Australia that somewhere between four and five men per stamp would be about the number. But the mines there are much smaller than here, and the mills, too, are much smaller.

4,260. Have you observed the way in which the native labour is used in this country?—No.

4,261. You are not prepared to say that in your opinion there is too much wasted?—No, I am prepared to say nothing like that.

4,262. You are leaving for Australia to-day, I understand?—Yes, I am leaving this evening.

4,263. Would you have come over to give evidence if you had not been leaving?—I came to substantiate what Mr. Ingle suggested, that there is sufficient labour on those two mines I have been on. I have not come as a witness. I should not have volunteered to give evidence. I should prefer that my name should not be published.

4,264. You would not have volunteered to give evidence?—No, because I have no evidence to give.

4,265. But you seem to be very nervous, Mr. Stuart—no, I will not put it that way—unwilling to have your name associated with it; you have just suggested that your name should not be mentioned or put in?—My evidence is so small that I consider it amounts to nothing, sir, and I would not care to have my name put in at all.

4,266. If you do not care to answer the question I am going to put to you, just tell me so. You are not bound to answer it in any way. Is there any feeling in your mind that, being a workman and appearing here it might damage your prospects if you give evidence which might be against certain interests?—If my evidence was considered to be against that mine, I suppose I would not get work if I looked for it.

4,267. And that is at the bottom of this feeling of yours that you do not want to have anything more to do with it than you can help?—Just so.

4,268. Mr. WHITESIDE: Mr. Stuart, have you read a copy of this statement you have before you?—This is a copy that was taken down yesterday, but it is not quite my meaning if you can understand me, because as I said before I consider my evidence is a mere nothing. It was simply to substantiate my friend, Mr. Ingle, over a remark I made to him during a conversation between us.

4,269. Who took it down, Mr. Stuart?—It was a gentleman who took it down; I never saw him before.

4,270. Are there any portions of that statement you would like to have taken out?

The CHAIRMAN: He refuses to put it in as his evidence-in-chief.

4,271. Mr. WHITESIDE: Exactly so, but I consider there are certain portions of this statement which are most valuable, and I suggest that we have it corrected and put in.

The CHAIRMAN: I suggest that you ask him if this is his view, and so on, and so on.

4,272. Mr. WHITESIDE: There is one statement, "The latter mine is worked by contract, and, as in the case of the Beatrice Mine, there is not the least difficulty in obtaining a full supply of labour?"—I have not made that assertion. I simply stated that there were sufficient boys on all these mines on which I was employed, for all requirements, that is, while I was there. Beyond that I know nothing about the state of the country as regards labour or anything like that.

4,273. Then is this portion correct, "It is a matter of common knowledge that there is not

"a scarcity of labour in Rhodesia, despite the fact that it is the desire of some people to close down the mines on the pretext that such is the case?"—I did not say that at all. That portion is hearsay evidence and ought to have been put down as such. It is not put down as I stated. So far as the district was concerned, I have heard it talked of in the camp, and it was said that it was not the want of labour that caused the mines to close down, but rather the want of transport.

4,274. I did not mean to suggest, Mr. Stuart, that it is your own knowledge, but it is common talk amongst those you have associated with that this is the cause?—Yes, and that is so far as hearsay evidence goes. I place no reliance on that because you often hear a lot of talk in the camp which you have to take very little notice of.

4,275. Then there is another paragraph—the next one—

The CHAIRMAN: Would it not better to ask him if this is the case.

4,276. Mr. WHITESIDE: Have you spoken to miners and contractors regarding the labour supply?—Not to my knowledge.

4,277. Have you spoken to a contractor?—Yes, to the contractor on the Lone Star; I have had a conversation with him and he told me that he was quite able to get all the boys he required. Beyond that I have not had any conversation with any other as regards boys.

4,278. I understand you to mean they stated they would not experience any difficulty in getting labour if they wanted it?—That I could not say. According to a conversation I had with this agent, he said the mines in that district could get plenty of boys if they required them, but the boys would not go below Bulawayo to the Rand.

4,279. Thank you, Mr. Stuart, I have nothing further to ask.

4,280. Mr. TAINTON: You are from Australia, Mr. Stuart?—Yes, sir, that is where I came from.

4,281. What part?—From Sydney.

4,282. Were you ever working in West Australia?—I was; I had two years in West Australia.

4,283. Do they work the mines there with white labour?—All white labour, sir.

4,284. What do the white men receive there per week?—When I was there the wage was £4 to £5 per week. That was in a part of West Australia.

4,285. What year was that?—I could not say; it was about the year West Australia opened; I do not know what year that was.

4,286. Why did you leave it?—To come over here.

4,287. Do you mind telling us your reason for leaving it?—When I left it I was paying 2s. 6d. a gallon for water, and I left and went to Sydney and met some friends, who happened to be coming here, and I said, "Well, here goes for Africa," but I was very sorry afterwards that I came, because, had I gone back to West Australia, I should have made a great deal more money. Knowing the country so well, I could have made a great deal of money in it.

4,288. It was after you left that the boom took place?—Yes, it was.

4,289. The working costs were very high on the mines, were they not?—Everything was very high and very expensive.

4,290. Could you give us a rough idea of what it cost per ton to—?—No, I could not, not at that time, because there were no pressure mills on the field when I left. The boom had not set in. It was principally alluvial. If a man found a reef, unless he could dolly it out to about an ounce or two to the ton, he would not trouble about it.

4,291. Yes, but can you give us a rough idea of what it cost per ton to work?—I cannot say; there were no mills on the field then; they came later on.

4,292. Why do you say the average number of white men employed per stamp is five. Where is that?—I did not say it was quite five, I said from four to five. That is in the other portion such as Queensland and New South Wales. In these countries I have run mills for several years; I have been mining there for years. Not in West Australia, because West Australia is a much more expensive place to mine than either New South Wales or Queensland.

4,293. What are the white wages in other parts of Australia?—From 35s. to £2 2s. a week. If you are a miner that can go into a face you get £2 2s. a week, and the 35s. men shift the dirt. The miner, in taking a face, is not supposed to shift dirt.

4,294. Mr. TAINTON: Now, coming to Africa, and these boys in Rhodesia, were they Portuguese boys and Zambesi boys?—Some of them.

4,295. Do you know what districts these boys come from?—No, sir, I could not say. It was merely when travelling by train that I just had a slight conversation with this agent who was bringing them.

4,296. I am speaking of the boys in the compounds?—I was speaking on the labour of the country and so forth, and I got into a conversation with this agent.

4,297. Do you know that these Portuguese boys and Zambesi boys do not come from Southern Rhodesia at all?—No, I do not know more than what I have stated.

4,298. So you are not aware that these Portuguese and Zambesi boys were introduced from outside of Rhodesia to work on the mines?—No.

4,299. Mr. PIERROW: I think you told us, Mr. Stuart, that you worked six months in Rhodesia?—Yes, three months at different times.

4,300. For two different mines?—Yes.

4,301. Three months in each mine?—Yes.

4,302. You have never worked in any of the other mines not in Rhodesia?—No.

4,303. Do you thoroughly understand mining?—Yes.

4,304. You had plenty of boys on the two properties in Rhodesia?—Yes, sir, while I was there.

4,305. I think you said just now that you had been employed in mining in Australia for a great number of years?—I followed mining for a great many years.

4,306. With regard to the men required per stamp, I think you said it takes something like four or five men per stamp?—Yes.

4,307. Can you give me the size of the reef of the mine that you have been employed in in Australia?—As far as Australia is concerned, some of them are very large reefs, about three feet thick, others again are larger and others again are smaller, some six inches and seven inches and something like that. If you have a three-foot reef or anything approaching that, I hardly think it would take four men per stamp because we do not crush as much over there as you do here. If you crush three tons per stamp it is very good.

4,308. Well, you mentioned about the three-foot, six-inch reef, and you also mentioned about the nine-inch reef?—Yes.

4,309. Would you not have to carry a place three-feet wide just the same? Which way can you get through a nine-inch reef? What way could you work a nine-inch place?—Well, you will have to take out one roller or the other.

4,310. Would that waste rock go to the mill?—No. In the mining in Australia they do not send any waste to the mill as far as they can help. That is picked out daily and sent into the heaps again.

4,311. You will have to drill your holes?—Yes.

4,312. Which way would you start the small rock that comes from the waste rock?—They usually take it either on the foot wall or the hanging wall,

whichever you can get a safe pick at. You work that and leave the rest stand perhaps for twenty feet, so that you get your reef fairly clean.

4,313. You could not go forth twenty feet in a nine inch place, then come back and shoot that down?—How is that?

4,314. Have you ever worked in a nine-inch place?—I say I work alongside of the nine-inch reef and leave my reef stand. I cut out a channel alongside of the reef and leave the reef stand. I come back and take the reef. I do not shut the reef down at the same time as I make room to get at it.

4,315. Would the nine-inch reef that you send to the mill and the 3-feet 6-inch reef, with four or five men, keep one stamp going?—Four or five men would not keep one stamp going with a nine-inch reef. It would depend whether the ground is here or not.

4,316. We will leave the nine-inch reef out. It will take five men per stamp to keep going a 3-feet 6-inch reef?—Yes.

4,317. And that stamp will only crush three tons to-day?—I do not see that. I have crushed more and I have crushed three tons. It depends upon how you are working. If you are running the mill for the public they will not allow you to put through any more than three tons. If you do so they state that you are losing the gold.

4,318. Have you ever been down a mine here?—Yes.

4,319. What mine?—The Jumpers.

4,320. You are acquainted with the size of the reefs here, I suppose?—I am not acquainted with them all over the Rand.

4,321. You are acquainted with the tonnage that has been crushed per day with a stamp in this country?—Yes.

4,322. What is the tonnage?—It depends upon what your stamp is.

4,323. Take the majority of the stamps that are working to-day; take 90 per cent. of them?—From 4½ to 5 tons.

4,324. There is a difference in the tonnage?—Yes.

4,325. When you say five men can keep one stamp going, and it is only crushing three tons per day, it would take more men to keep the stamp going that is crushing four or five tons?—I mean to say that in crushing three tons a stamp, if you are crushing for the public they will not allow you to crush anything like so hard. If I was running a mill in Australia and attempted to put through the stuff the same as you do here, they would run me off the field. They would say I was rushing my stuff through the mill and losing the gold. I would have to study the public interest, and not my own.

4,326. We had it from the witness yesterday that five men would keep a stamp going?—Of course that depends on the size of the reef or who you are crushing for. If it is a company you are crushing for you can put through more. As a usual thing in Australia it is about from three to three and a half tons. I have known in New Zealand where they only put one and a half tons through, and that was considered good crushing, but that was dry crushing. Now, the same man that put through the one and a half tons dry crushing at that time there can now put through something like four tons. That is at the Waihi Mine. They have turned it now into a wet crushing machine, previous to that it was dry.

4,327. You cannot put as much through a dry crushing as a wet one, so if you had a stamp that would crush four and a half tons, it would take more than five white men to keep that stamp going?—That would depend upon the size of the reef.

4,328. Take a 3ft. 6in. reef?—It depends upon what reef white men will break.

4,329. You have spoken about the number of men it would take to keep a stamp going?—I think from four to five men per stamp in Australia. I have not gone into that question very particularly.

4,330. It will take four or five men to send three tons of rock to the mills?—I did not say that. I did not say it will only crush three tons. I do not say that for a moment because there are many things attached to that. There is, for instance, the number of holes that you are crushing for the square inch, that you are screening, and there are lots of other little things that you can bring in in the working of a mill. It is according to the quantity of stuff you are putting through. If you are putting through a thousand holes to the inch you cannot put through as much stuff as to the hundred.

4,331. You have mentioned that between four or five men can keep one stamp going?—I think that is about the average; I think that that would be about what it would take.

4,332. Now, can you tell us the tonnage, on an average, that your stamps would crush in Australia?—That is per stamp?

4,333. Yes, per stamp. Take the average of your mines in Australia per stamp?—That practically brings it to the same thing, how many tons to a stamp.

4,334. You have got an average—according to the mine—to keep a stamp going; you should have an average of what your stamp will crush?—During my time in Australia—in running that public mill in Australia—we were crushing for the public. Anything like from 55 up to 75 tons for five stamps is considered a fair thing in running for the public. In fact, they would not allow you to put any more through.

4,335. And it would take four or five men to do that work?—That I cannot exactly say, because that is outside mining altogether. This is public stone I am speaking of crushing, it is not the mines.

4,336. Mr. PHILIP: What is the weight of the stamps that you use in Australia?—They are much lighter than here. The heaviest stamp is 800 lbs. and from six up to eight.

4,337. They would average about seven?—I dare say about seven. They discount the heavy stamp altogether, because there is too much wear and tear on it.

4,338. Mr. Ingle made a statement yesterday that he had two friends who had just come down from Rhodesia, and who had been at work on the mines there, and they affirmed most distinctly that the labour there is tumbling over itself in application for work. Did you make that statement to Mr. Ingle?—Not in exactly those words. In the first place I have not worked in any of the mines. I was working in the mills, and I simply said in a conversation with Mr. Ingle, which was private, that the two mines I worked on had sufficient labour on those mines for the work that was going on. There were boys coming and going looking for work, but they were not employed.

4,339. Mr. Ingle says you affirmed most distinctly that they were tumbling over each other?—No, there is a slight misunderstanding.

4,340. And he goes on to say there has never been a shortage; and that labour was so plentiful as to be scandalously wasted. Do you state that?—As far as "scandalously wasted" is concerned, I did not go into that at all, because I have nothing at all to say as regards that. Labour may be wasted, but at the same time I am not going to say whether it was or was not, because I think it is going back on the managers.

4,341. Mr. EVANS: During the time you were in Rhodesia, were underground boys plentiful?—Well, the whole of the mines were working, and there were sufficient boys on the mines to do all the work.

4,342. Do you know what tribe of natives work underground?—No, I saw nothing underground at all in Rhodesia.

4,343. Do you know whether the natives of Rhodesia themselves work underground?—The natives of the district would rather load.

4,344. But do they work underground?—Yes.

4,345. Do you know what tribe they belong to?—This contractor I spoke of has got boys working underground. The best boys that come there as far as mining is concerned are either the Portuguese or the Zambesi boys. With regard to the boys of the district, you have to drive them a lot to get them to do much work. The best boys that come in there are the Portuguese boys and the Zambesi boys; they are considered the best.

4,346. I think you said just now that you met a contractor, or two contractors, with a batch of 300 boys?—I considered he was an agent of some sort. He was in charge of those boys at any rate. He had something like 300 and was bringing them in by train for some of the mines on the other side of Bulawayo. They came up from Portuguese Territory, but from what part of Portuguese Territory or anything connected with them I do not know.

4,347. Do you know where he was going to?—No.

4,348. Did you mention the Wankie District?—I do not know to what mine he was taking them.

4,349. Have you any idea what distance he was taking these boys? What is the distance from the Portuguese territory to the Wankie Mines?—It is something like 300 miles from Salisbury to Bulawayo, and I do not quite know the distance from Bulawayo to the Wankie District. I think it is something like one hundred miles. I have no idea for certain of the distance from Salisbury down into the Portuguese Territory.

4,350. Do you think that it would be an exaggeration to say that they were taking these boys 700 miles?—Yes, I should say so.

4,351. Was it more than 500 miles?—I know nothing about the country—only from Salisbury to Bulawayo. That is the only distance I have been along that line.

4,352. Were they taking them right across the whole of Rhodesia from east to west?—That I cannot say. I do not know the geography of the country myself.

4,353. If you like you can look at the map?—It would be of no service to me. From the conversation I had, he was bringing them out from the Portuguese territory and taking them to some mine towards the Wankie District, and in our conversation when speaking of boys, I asked him whether he was taking them to the Rand mines, and he said, "No, I am taking them to the Wankie coal mines, because they do not care about the Rand, and do not care about leaving their district."

4,354. But if boys are plentiful in Rhodesia, why should this contractor incur the great expense of bringing these Portuguese boys such a long distance?—That I could not say, and another thing I cannot say whether boys are plentiful in Rhodesia or not. I will speak of the two mines I, myself, was employed at. I know nothing about Rhodesia outside of these two mines. I do not know whether labour is plentiful or scarce. I only know from hearsay, which I do not consider anything at all.

4,355. Do you agree with this statement, "The reason the boys of Rhodesia will not come to the Rand is that they complain that the distance is too far away from their homes"?—I do not know anything about that. I only know what the agent spoke of in coming to the Rand. He said boys would not come to the Rand because it was too far from their homes.

4,356. The CHAIRMAN: Mr. Stuart, the Commission is very much obliged to you for the information you have given to it.

Mr. H. L. McGARRY, called, sworn, and examined.

4,357. The CHAIRMAN: You are Mr. H. L. McGarry?—Yes.

4,358. Have you before you a statement headed "Statement of Mr. H. L. McGarry's evidence"?—Yes.

4,359. Do you wish to hand that statement in to the Commission as your evidence-in-chief?—Yes.

4,360. Mr. McGarry's statement was then handed in to the Commission:—

I am at present a recruiter in Gaza for the W.N.L.A., Limited. I have been nearly 13 years in Portuguese East Africa, and during that period have been connected with labour for about nine years, supplying same from the districts of Lourenco Marques, Gaza, and Inhambane. At first I was Manager of the Chamber of Mines Native Labour Department at Komatipoort, under Mr. William Grant, after which I was connected with the old Rand Native Labour Association since its formation, and have been with the present Association since they started operations on the East Coast.

The present system of recruiting is as follows:—The districts are divided into four sections, each section being in charge of a chief recruiter. These sections are again divided into six sub-sections, which are each in charge of a recruiter, who is under the control of the chief recruiter, this making ten recruiters altogether. Further, I may mention that each recruiter has a certain number of receiving stations in his area, and also a staff of about 200 native collectors. So that there are about 1,000 to 1,500 runners that are constantly employed in the country amongst the natives, persuading them to proceed to the Rand. In addition to the ten recruiters, there are two others who are at present exploring the country between the most northern point of our operation and Latitude 22, with a view of opening up that area. There is also an independent recruiter who is operating in Maputaland from a point called Namahassh. When a runner collects a few boys, he proceeds with them to the nearest receiving station, where the boys are fed and duly forwarded to one of the main camps. There are also Portuguese conductors employed in the country, whose duty it is to conduct batches of natives to Ressano Garcia and see that they are well treated and looked after *en route*. The recruiters are themselves constantly travelling about their respective areas, interviewing chiefs, indunas, headmen, etc., and explaining to them the advantages of the Rand; and, in fact, using every means in their power to persuade the natives to come to Johannesburg. I am well acquainted with the districts mentioned, and thoroughly understand the methods that were employed previous to the war, when free recruiting was carried on. In my opinion, I do not think, should free recruiting be resorted to, it would in any way improve the present supply. The present system is no doubt far superior and more systematic than that of free recruiting. Under the present system the country is being gradually opened up, whereas under the old system no recruiter considered it worth his while to open up sparsely-populated areas, and consequently all the recruiters rush to the most populous portions of the districts. Further, the natives were promised absurd wages on the Rand, and in many cases changed hands two or three times before arriving at their destination. Consequently, instead of free recruiting improving the supply, it had a tendency to decrease it, as the natives were under the impression that they were being sold to the highest bidder. The above refers to the districts south of Latitude 22. I am quite unacquainted with the country north of that latitude, and consequently cannot give any information regarding it.

4,361. The CHAIRMAN: You are recruiting in Gazaland for the Witwatersrand Labour Association?—Yes.

4,362. You were employed by the Native Labour Department, and then by the Rand Native Labour Association before the war?—Yes.

4,363. So that you have a good many years' experience in supplying labour?—About nine years altogether.

4,364. You give a description here of your method of dividing out the country?—Yes.

4,365. You say here the districts are divided into four sections. Are you referring to Gazaland or to the sub-divisions?—The three districts, Lourenco Marques, Gazaland and Inhambane.

- 4,366. Each district is divided into four sections?—The three districts are divided into four sections. Some are bigger, and some are smaller. There are four principal sections for the three districts.
- 4,367. You say there are ten recruiters altogether. Does that refer to Gazaland, or the three districts you have mentioned?—That refers to the three districts.
- 4,368. Do you think everything is being done by the Association to provide for the wants of the natives on the way to the rail head?—Yes, I think so.
- 4,369. You state that the Association's method of recruiting you think is superior to what is known as the free recruiting method?—Absolutely.
- 4,370. You have no doubt about that whatever?—I can assert it and re-assert it again.
- 4,371. Can you form any estimate as to the number of boys that you are likely to be able to recruit from Gazaland per month. Are you in a position to speak for the three districts?—Inhambane I cannot speak of, but the other two districts I can absolutely speak for with certainty.
- 4,372. Will you speak for Gazaland in the first instance? Can you form any idea as to the number of natives you are likely to recruit there per month?—I think about 2,000 per month.
- 4,373. Then what other district can you speak of?—The Lourenco Marques.
- 4,374. Have you any idea how many you can recruit from Lourenco Marques?—I should think about 500.
- 4,375. Can you say that in the future you can increase these figures?—No.
- 4,376. We have had witnesses from Lourenco Marques who spoke of being able to increase the supply of Portuguese natives living on the Rand to 110,000?—I should think there will be an accumulation of natives in the course of time. I should estimate 45,000 at the outside figure from those three districts that I have mentioned, namely, Lourenco Marques, Gazaland, and Inhambane, that is per year. Of course there will be a gradual accumulation and it will probably come up to 80,000 on the Rand.
- 4,377. Have you any idea how long it will take?—I could not say how long it will take, but of course they will accumulate here gradually the same as they did before the war. They were supposed to have accumulated 80,000 boys on the Rand before the war.
- 4,378. Do you think that number, 80,000, could be maintained?—Yes.
- 4,379. You think it could?—Yes.
- 4,380. Mr. DONALDSON: You think, Mr. McGarry, that the natives from Portuguese territory stay on the Rand as long as they used to?—No.
- 4,381. Can you give us any idea of the period they used to stay?—Well, I have known natives to stay on the Rand here for seven or eight years.
- 4,382. But what would you consider the average length of their stay?—Well, say about two years.
- 4,383. And what do you consider the average period of service under the present conditions?—As a rule they return at the end of their term of twelve months. Ninety per cent. I should think, return.
- 4,384. That is to say, if you send up what you expect to do, 2,000 boys from Gazaland now, those 2,000 boys return at the end of their work?—A big percentage do.
- 4,385. Where previously they used to stay on an average of two years?—Yes.
- 4,386. Mr. WHITESIDE: Mr. McGarry, on page 2 of your statement in the second paragraph from the bottom, you go on to say "under the present system the country is being gradually opened up." I would like to have your definition of "gradually." How long do you estimate it is going to take to open up these districts with which you are acquainted?—At present there are two recruiters exploring the country to the most northern point where we are operating, up to latitude 22, and, of course, there is no definite information that I can give you on that point at all, and until a report comes in no one can say what the districts will produce. We are only operating in certain portions of these districts and the northern districts have not been operated upon.
- 4,387. You are referring to parts you have no personal experience of?—I say it is gradually being opened up.
- 4,388. What is the present number that you are sending along from the districts in your charge—the districts under your control?—About 1,000 a month from the districts that I am working personally.
- 4,389. What would you consider the maximum number that can be obtained from the districts under your control?—45,000 a year.
- 4,390. Are you maintaining 1,000 a month at the present time?—Yes, I have been doing so for the last four months, say for May, June, July and August.
- 4,391. Are not these months the worst month for recruiting?—From March to July are about the best months according to my experience.
- 4,392. Therefore at the present time your returns are likely to be less?—Yes, in the near future—for the next two or three months—I think our returns will be less than for the past four months. That happens every year. There are certain favourable months for the natives to leave the country.
- 4,393. It is no criterion of a diminished supply, the fact that these three or four months show a diminished return?—No.
- 4,394. Are you experiencing any difficulty in recruiting at the present time?—None whatever. Do you mean as regards the Government?
- 4,395. I am speaking generally so as to give you an opportunity of stating if you have any difficulty?—The Government is giving us every assistance they can, and every effort is being made to produce the labour.
- 4,396. Are boys coming forward willingly or are they shewing any disinclination to come to the Rand?—Well, of course, they are recruited voluntarily, and they voluntarily come along, but I think the Rand has not got as good a name as it had.
- 4,397. You have to use persuasion to try to induce the boys to come along. They do not recruit themselves freely?—Oh, yes, of course many of the boys have left their homes on the way to the Rand and they are recruited by us. A big percentage are not taken from their homes, but are actually on the road to the Transvaal when we recruit them.
- 4,398. You said that the Rand has a bad name?—No, I did not say that.
- 4,399. You used words to that effect?—I said it has not got as good a name as it did have before the war.
- 4,400. Can you give us any reason why the Rand has lost its good name in any respect?—One reason is that there is no liquor sold here.
- 4,401. Are there any others?—No, I could not say there are. Of course I do not know the working of the mines or the compounds or anything of that kind, but the liquor is certainly a big factor in connection with the boys not coming forward.
- 4,402. Yes, but you tell us that the Rand has not got the same good name as it had in pre-war days?—Yes.
- 4,403. Surely there must be other questions besides that of the liquor, and I take it that you come in contact with a good many boys and you,

must get to hear what the particular objections are?—It is quite true, but the chief objection, as I say, is the want of liquor.

4,404. What are the minor objections if that is the chief one? If the absence of liquor is the chief objection, what are minor objections that the boys have?—Well, I do not know that there are any objections.

4,405. Well, I am afraid if you cannot tell us it is almost hopeless to get it from anybody else. Do they allege any complaints as against the system of managing the compounds?—No.

4,406. Do they allege anything about their food? No.

4,407. Do they allege anything about restrictions on the mines?—No.

4,408. And yet there are objections of some sort?—I must simply say that the Rand is not so popular as it was. I simply say as a general thing the natives are not inclined to come to the Rand as freely as they did. They certainly come up to work on the Rand, but they are not so satisfied as they were.

4,409. That is what I am trying to get at, the reasons for the dissatisfaction?—In a general way they are not so satisfied as they were.

4,410. Mr. QUINN: Do you think the question of wages had anything to do with their small amount of appreciation for the Rand before the war?—Do you mean at the start of operations?

4,411. Of course, until February last?—Not much.

4,412. You do not agree with the other witness on that?—No.

4,413. Did I understand you rightly when I understood you to say that you picked the natives up on the road coming to the Rand without your recruiting at all?—Very often they are on the road to seek work and are picked up by the runners.

4,414. On the way to the Transvaal?—Yes.

4,415. So that this comes in your return without your recruiting?—They come into the camp sometimes without any runners and offer themselves.

4,416. How are you paid, Mr. McGarry?—On results.

4,417. Do you get any salary apart from commission?—I am paid by results.

4,418. So that if free recruiting went on down there a lot of these boys that you send forward, and for which you get paid for on results, would be sent by someone else, and you would get less?—Exactly.

4,419. That would not interfere with your free recruiting?—By free recruiting the supply would not be increased, but it would be simply divided up.

4,420. And your income would be divided?—Yes. But I am not biased as regards that matter, because whatever system of recruiting was resorted to on the East Coast, I think, I am sufficiently well known there to be offered a position under any system of recruiting. What I may say is unbiassed.

4,421. It is a fact that if free recruiting went on down there, instead of sending as many boys as you have sent now, owing to competition you would only send a quarter, and your income would go down?—Not necessarily for this reason; the prices would go up and the number of boys sent out individually by me, of course, would be less, but I would have to get a bigger price to continue to get that smaller number.

4,422. You have no opposition at all to the recruiting done by this Association in this district?—Yes.

4,423. That is much more comfortable than having opposition?—Very much.

4,424. Now you state in the second paragraph of your statement, Mr. McGarry, "So that there are about 1,000 to 1,500 runners that are constantly employed in the country amongst the natives persuading them to proceed to the Rand." What is

the method of persuasion that you refer to here?—Inducing them by telling them that the wages have gone up on the Rand, and that living is better, and anything they can think of as regards persuasion.

4,425. Telling them the wages have gone up. That was necessary, I think?—Yes.

4,426. So they knew the wages had gone down?—Yes. But now I think the effect has been counteracted.

4,427. It had an effect?—Yes, a slight effect.

4,428. Now you find it necessary to tell them the wages have gone back again?—Yes, we tell them that in any case.

4,429. And the food was another inducement?—Yes.

4,430. So that the food in the compound was unsatisfactory before?—That I could not state. I have been told the system of compounds is better and the food is better, and of course we inform the natives accordingly.

4,431. Why was it necessary to inform the natives that the food is better?—To induce them to come out in larger numbers.

4,432. Is it not within your knowledge that there were very serious complaints about the food?—No, it is not.

4,433. Yet you considered it necessary to tell them that it was better?—Exactly. We were told to do so; that the conditions on the Rand were improved as regards the compounds and the food.

4,434. Do you know anything about the food before?—No.

4,435. Do you know anything about it now?—No, nothing.

4,436. You are told to say it is better, and you say it is better?—I do not suppose we would be told to say it is better if it were not better.

4,437. Now this number of 45,000, Mr. McGarry, is that just an estimate?—Yes.

4,438. It might be 55,000?—No.

4,439. It might be 35,000?—No. I say that from those three districts under any conditions of recruiting whatsoever, this will be the maximum that can be obtained.

4,440. How do you know that?—From practical experience.

4,441. What do you mean by practical experience? My experience in this country.

4,442. Have you counted the natives?—No, my estimate is simply from past results and these people going up to recruit between our most northerly point of operations and latitude 22, which will probably produce more boys.

4,443. It is an estimate pure and simple?—Absolutely.

4,444. Unsupported by any figures that you can produce?—From my experience in the country, nothing else.

4,445. Were you ever a free recruiter?—Yes.

4,446. For how long?—Well, off and on for a year or two at a time.

4,447. How many years of this nine years that you have been a recruiter were spent as a free recruiter?—I should say about three to four years.

4,448. And what were the results then to yourself first. Did you make more money than you do now?—Well, of course, that is rather an awkward question. Am I compelled to answer that question, Mr. Chairman?

4,449. The CHAIRMAN: You need not give figures at all.

WITNESS: As far as my experience goes my present position is as good as it ever was.

4,450. Mr. QUINN: Is it better?—No.

4,451. Is it worse?—No; I say it is just about what it was either from free recruiting or under the present system I am in about the same position financially as I would be under either.

- 4,452. What is the difference between the methods of the present Native Labour Association and the old Native Labour Association?—Well, the present Association, of course, is worked most systematically and the districts are all apportioned off, whilst, before, everybody rushed to the most populous parts, and the result was the sparsely-populated parts were never worked at all.
- 4,453. Now, you are satisfied that owing to the better system, districts are being gradually opened out that otherwise on account of the cost of doing it would not be opened out?—Exactly.
- 4,454. So with this better organisation, the present Native Labour Association in that respect will likely bear considerable fruit to-day, in that it opens out new sources of supply?—Yes.
- 4,455. It has cost you much more now to open out these sources, yet there is development going on, and the benefit will come back in the shape of more natives?—Yes.
- 4,456. What other way does it differ from the old system?—One is systematic and the other was not. It was simply haphazard, buying and selling or getting boys the best way you could; making them absurd promises and then re-selling them.
- 4,457. What do you mean by re-selling them?—I mean selling them to the highest bidder.
- 4,458. Will you explain that, please?—Boys, for instance, are collected and promised to be sent to a certain mine, then they are brought along to somebody who will buy them at a figure. This somebody again, before the boys arrive in Johannesburg, might re-sell these boys again, and that what they were promised originally does not take place.
- 4,459. The boys suffer?—Yes.
- 4,460. Were they compelled to go from one recruiter to another?—Yes, they were practically compelled; it was simply a bargain between two white men and the boy had to go.
- 4,461. Is there anything at all to-day in the shape of compulsion?—No, absolutely nothing.
- 4,462. They all come now of their own sweet will?—I do not mean to say there was compulsion before as regards recruiting in the first instance.
- 4,463. How do you get on with the Portuguese officials?—Very fairly.
- 4,464. Do they help you?—In every way.
- 4,465. Who makes that way smooth?—Where I am stationed we have the Governor of the district there.
- 4,466. Is he in the pay of the Native Labour Association?—My opinion is that he is not.
- 4,467. Does he get anything out of it at all?—Not that I know of.
- 4,468. Mr. WHITESIDE: Which was your most successful period as a recruiter, Mr. McGarry? Was it under the old system or under the present system?—Under the present system.
- 4,469. Is there any marked difference? Do you get a considerable number more boys under the present system than you did under the old system?—No, as I stated before, whatever the system is, the supply is not increased. It is simply divided, but personally I have done better under the present system than I did before as regards the quantity of boys that I have introduced into the country.
- 4,470. Is the number anything considerable, say 100 or 200 a month?—I certainly could not give you any figures.
- 4,471. The CHAIRMAN: You cannot?—No. Generally speaking, my supply is better than when I was acting independently.
- 4,472. Mr. WHITESIDE: In answer to a previous member of the Commission you stated that your financial position was very much similar to what it was before?—Yes.
- 4,473. Yet under the present system you are getting more boys than you got under free recruiting?—Exactly.
- 4,474. Then it follows as a natural consequence as you are paid by results now you ought to be better off financially under the present system than you were under the old system?—Oh, no, you see the price differed considerably so that you cannot very well make an estimate of that kind.
- 4,475. Well, the price differs, you say?—Yes.
- 4,476. Then are we to understand that the Native Labour Association pays you less per head than you obtained under the free recruiting system?—Well, naturally, because we have got the country to ourselves, while before the war we had competition. If we could deliver a boy to-day, say, at 10s., before the war we could not deliver that boy under 30s. or 40s.
- 4,477. Did the mines have to suffer for that competition?—Yes, you could always get from £5 to £6 for a boy on the Rand here before the war.
- 4,478. Your figures are different to other recruiters' figures?—Some are special; mine are personal.
- 4,479. Did you get this price yourself in pre-war days?—No, I was supplying to the Rand Native Labour Association.
- 4,480. What price did they give for boys, the Rand Native Labour Association?—Well, they got boys at 40s. in Ressano Garcia. Then, of course, there are Portuguese fees and one thing and another.
- 4,481. Then what is the present cost?—I would rather refer you to the office if you wish to know what we are receiving.
- 4,482. The CHAIRMAN: Do the chiefs assist you at all?—As a matter of fact, the chiefs have got no influence whatsoever.
- 4,483. In all your experience, taking the nine years from when you began this business, did the chiefs help you at all or have they had any influence?—None.
- 4,484. Not even then?—No, but of course in a general way they make things smooth for you, and of course we do everything we can for them, but really to get boys out through the chiefs you cannot do it. They have no influence whatsoever to turn the boys out.
- 4,485. Have the Portuguese authorities at any time of your experience brought pressure to bear on the natives in order to turn them out to work?—Do you mean for public works.
- 4,486. I mean for coming here?—No.
- 4,487. They have never done that?—No.
- 4,488. Do they bring pressure to bear on the natives who turn out to work for the Government?—They pay them to a certain extent.
- 4,489. Do they bring pressure to bear?—They call out any natives if they are required for an expedition or anything of that kind and they pay them.
- 4,490. What does calling out mean?—I say if they require 500 natives they will simply notify these natives and pay them what I consider is a very fair wage at present.
- 4,491. Is there compulsion on the chiefs to turn out the natives to do public works?—Certainly if the Government need the natives.
- 4,492. They simply requisition the chiefs to turn them out and they have to come?—Yes.
- 4,493. And the pay?—Yes.
- 4,494. Do you know what the pay is?—About 1s. a day, say 200 reis, which is 10d.
- 4,495. Are they fed?—Yes.
- 4,496. What district are you speaking of now where that practice obtains?—I am speaking of Gazaland and Lourenco Marques.
- 4,497. The CHAIRMAN: The Commission is obliged to you, Mr. McGarry, for the evidence you have given to it.
- Mr. E. G. McEWEN, called, sworn and examined.
- 4,498. The CHAIRMAN: You are Mr. McEwen?—Yes.

4,499. Have you before you a statement headed "Evidence of E. G. McEwen, Recruiter, Cape Colony"?—Yes.

4,500. Do you hand that in as your evidence-in-chief?—Yes.

4,501. Mr. McEwen's statement was then handed in to the Commission:—

I have been in South Africa 39 years, and was living on a farm in Natal 12 years. At the age of 17 I went to Basutoland, and continued farming until 1895. In 1896 I was compound manager at Scheerpoort Mine. In 1897 I was compound manager at Buffelsdoorn G.M. Co., Klerksdorp. At Both mines I was very successful. I increased the number of natives at Buffelsdoorn from 1,250 to 2,500 in two months. I speak the Zulu, Basuto, and Xosa languages fluently. I left Buffelsdoorn early in 1898, and was recruiting natives for the Langlaagte Deep, continuing to do so until the war started. In 1899 I got to Kimberley two days before it was besieged, and was appointed one of the managers of the Native Food Depots under the military during the war. After the siege I went to Queenstown, and was appointed Imperial Remount Agent to purchase horses in the Transkeian territories, which position I held until the end of the war. I know nearly all the Magistrates in the Transkei. I started recruiting natives for the W.N.L.A. in March, 1903. I did not start recruiting before March, as I knew it was useless to try and get natives from the Transkei at the wage offered, viz., 30s. per month. In March and April I held meetings in several districts. In June I again addressed large meetings of natives. I have all boys registered before a Magistrate or J.P. The great objection natives have to come to Johannesburg are: first, the term of contract, namely, six months; secondly, that they cannot obtain brandy; thirdly, the signing on before a Magistrate, as natives have an idea that they are as good as prisoners while the contract lasts. We have also to recruit at the minimum wage, which a native does not understand. They always say that if they sign on for 50s. per month, when they get to Johannesburg they will be made to work for that amount, and will not get more. I feel certain that when the natives now working at the mines have finished their term of six months, and go home and report that they are receiving the same wages as before the war, there will be an increase in the number of natives for Johannesburg. The population of Transkei, Pondoland, and East Griqualand is 839,000 natives, 8,600 Hottentots and Bastards, and that of the Cape Colony, 229,000 Fingoes, making a total of 1,076,600. Of this number 134,575 are able-bodied men. I think it is a great mistake to have too many white recruiters, as the natives are very suspicious. It would work very much better to have the work under one district agent. When there are 30 to 40 white recruiters, they are liable to tell the natives lies. It must not be taken that all labour available comes to Johannesburg, as the Cape Colony takes up very large numbers. Natives would rather work in Cape Colony as they get very much higher wages, viz., Capetown pays 4s. and 4s. 6d. per day, and natives are free to go when they like; Kimberley pays an average of £1 per week; Cape Railways £3 per month. The Jagersfontein Mines also take a lot of natives consequent upon the high wages paid. I think the average pay is £3 10s. per month and rations, etc.

4,502. The CHAIRMAN: Do you know Mr. Erskine?—Yes.

4,503. How long have you been recruiting for the W.N.L.A.?—Since March.

4,504. Of this year?—Yes, 1903.

4,505. Have you done some recruiting previous to the war?—Yes, for the Langlaagte Deep.

4,506. Have you done any recruiting for other companies or associations?—For the Buffelsdoorn Mining Company, when I was compound manager.

4,507. Were you successful in increasing the number of boys considerably?—Yes.

4,508. You did not start recruiting before March, because you thought the rate of pay was too small?—Yes.

4,509. You found the boys objected to a six months' contract?—Yes.

4,510. Another hindrance to recruiting, you say, is they cannot obtain liquor?—Yes.

4,511. Do you anticipate being able to get any considerable number of natives to come to the Rand?—I should say about 1,500 per month for six months in the year, and about 800 for the other six months.

4,512. Do you see any prospect of increasing that number materially?—I should not say so for the Rand, because there are many going to Cape Colony.

4,513. Mr. DONALDSON: Are you covering the same ground as Mr. Erskine?—Yes.

4,514. You are working there together?—Yes, I am recruiting and Mr. Erskine is the manager.

4,515. You are working there under the direction of Mr. Erskine, are you not?—Yes.

4,516. And I think you mentioned that you agree with this estimate of the number of boys that could be got from there. He said 1,500 a month for 12 months and 800 for six months?—I form my own estimate of the number of boys. I know the Transkei thoroughly.

4,517. Mr. WHITESIDE: Your estimate is 1,500 for 12 months and 800 for six months. Do you consider that would be the maximum we could get from the districts you are operating in?—Yes, while the railway works are going on in Cape Colony I do not think you will get any more.

4,518. Have you any idea how long this demand is going to last in Cape Colony?—No.

4,519. The CHAIRMAN: The Commission is very much obliged to you for your evidence, Mr. McEwen.

Mr. CHARLES GOODYEAR, called, sworn, and examined.

4,520. The CHAIRMAN: You are Mr. Charles Goodyear?—Yes.

4,521. Have you before you a statement headed "Evidence of Charles Goodyear, district manager W.N.L.A."?—Yes.

4,522. Is it your wish to hand that in as your evidence-in-chief?—Yes.

4,523. Mr. Goodyear's statement was then handed in to the Commission:—

I have had over twenty-four years' experience of the native districts of this country, nine months in Zululand, fifteen months in the Transkei, six months in Basutoland whilst in the Imperial and Colonial Forces, three years whilst in Public Works, and eighteen-and-a-half years in Mafeking. During this time I have always been in close touch with the chiefs and people of that district. From 1897 I have been connected with labour supply business, and at the time of the outbreak of war I was with the Rand Native Labour Association sending across large numbers of boys to the Rand mines from the west. My anticipation of resuming the collecting of boys after the war was disappointed, as the rate of wages was so reduced that the natives would not come, and moreover the W.N.L.A. had been organised to represent nearly all the different groups. The De Beers and other mines in the South were able to offer good wages and safe conducting by train even before the close of the war, and thus drew away a considerable number from the North of Bechuanaland and the Protectorate who had been accustomed for some years to go to the Rand. On April 1st, 1903, I took up the appointment of District Manager for the W.N.L.A. with Mafeking as my headquarters. My instructions were to work the Protectorate, Bechuanaland, Western Transvaal and Griqualand West in a thorough manner. One of the first things I did was to have the rest houses, which the General Managers had decided on, fixed at the various sites. Terms were arranged for the working of the Griqualand West district. With the assistance of the officials of all the districts, the chiefs and headmen were informed of the rise in wages decided on in the middle of April, and the position and working

of the Association was clearly stated to them. The increase in wages by the Rand Mines has not yet been properly realised by the mass of the natives and they have not yet been attracted back, as I am confident they will be when they get to know from the men now working at the Rand that the rates of 50s. and 60s. are really paid. Any success we have in recovering the few thousands they have got from the Mafeking district will, of course, necessitate the De Beers and the Griqualand West Mines falling back on their old sources of supply whatever they were. Recruiting was very slow until the rise in wages to 45s. came about in February, and really was not active until May, when the 60s. rate commenced to attract boys. There were other causes for shortage in numbers going out to work which ceased about the same time, such as the employment of large numbers by the Military Department, Repatriation Department, railway repairs and town buildings. A little later the decision of the Compensation Board relieved a large number who had been waiting. About 1,500 have come out since the rise of wages has been known. The chances of keeping up a fair supply are very hopeful, as the chiefs are supporting the efforts of the Association without reserve, and as they never supported the old recruiters before the war. They have, I think, perfect confidence in the statements made to them as to pay and general treatment of their people who go to work. The scarcity of food will probably compel some to work who would not otherwise hurry out. From my experience of the Bechuana tribe, I consider they go to work as freely as can be expected. A large percentage have gone to the mines even when they have had good crops. The price of grain in good seasons is not high, and the wants of the native and his family require money always and more than the grain produces. They were possessors of very large numbers of cattle before the rinderpest and every man is anxious to get money to buy stock to begin breeding again. The present wages, I am confident, draw back to the Rand a large number who are working elsewhere, and attract others whom the lower wage did not draw out. This remark applies to the Southern Protectorate, Bechuanaland and Western Transvaal. Early in June, 1903, Khama, the chief of the Northern Protectorate, threw his country open for the first time and actively supported the collecting of labour in his country, with the result that about 600 are already in the mines and on the railways and cantonments. This is a good beginning, and if the men are well served, the number who will come down on their return home will be probably three or four times greater. The completion of the railway to Lobatsi will very much assist to gather the whole of the Protectorate to the Rand, as the present six days' tramp and loss of time will be saved to the boys and really give them 12 days' more pay for each trip they go to work. The Association has done everything possible to meet the chiefs. Liberal advances have been made to provide food for families of men coming to work, and boys have had advances to buy boots, blankets, etc. Rest houses have been built every 22 miles, and ample food and fuel provided, so that the boys are now landed fit after their walk across from Mafeking. The Bechuana tribe is useful at any sort of work, and they are as healthy as any natives and have as good endurance. Civilization has had its effect on the people, and their actual wants now include good clothing and housing. They may be expected to be permanent workers in the South African population. The natives of Western Transvaal are very like those over the border, and with the now improved pay and treatment will go freely to work. A very large proportion of these boys go across to Krugersdorp, Potchefstroom and Klerksdorp by themselves to the mines and other work, so do not pass through my district agency. In Griqualand West, there is a great mixture of races and the whole population has been attracted there by the mines, diggings, and farms, around which they live and work. It is probable that many boys at present at work in Rhodesia will, when they come back to the Protectorate, join their friends going to the Rand mines. The

17133

official figures given to the Commission will show the possibilities of future supply from the Western Transvaal. For the Protectorate, Bechuanaland and Griqualand West, I submit the following estimate:—From hut tax returns it would appear that there are approximately 35,500, viz., 21,000 males in the Protectorate, 10,000 males in Bechuanaland, and 4,500 males in Griqualand West. Of this number I anticipate 19,000 might come to work during the coming year, viz., 4,000 from the Southern Protectorate, 4,000 from the Northern Protectorate, 7,000 from Bechuanaland, and 4,000 from Griqualand West. The following industries and services will draw on this number as under:—

De Beers, Griqualand West, O.R.C. Diamond Mines and River Diggings	6,000
Railways	1,000
Farms—Mafeking, 150; Vryburg, Taungs, 450; Griqualand, W., 250 = 3 men per farm; Total	2,550
Towns	1,000

10,550

Leaving 8,450 for work in the Rand mines. Of this number, never more than half would be at work at the same time, as six months is a maximum period of labour for them. This calculation does not take into account the construction of the railway to Lobatsi. If this is carried out, it might absorb one-third or more of the above supply. In conclusion, I may say that everything is being done that can be done to induce the natives in my district to come to the mines. Careful registers are kept at Mafeking and the chiefs can always trace any of their men if they want news of them. The chiefs are decidedly pleased that they are not now bothered with so many white rival touts, each praising his own group and probably disparaging others, and too often offering higher wages than the mines ever paid.

The Commission adjourned for luncheon at 12.40 p.m., till 2.30 p.m.

The Commission resumed at 2.30 p.m.

4,524. The CHAIRMAN: Mr. Goodyear, you have had a long experience of natives in South Africa?—I have, sir.

4,525. You were recruiting for the Rand Native Labour Association before the war?—No, I was recruiting for the Randfontein group immediately before the war. They were taking boys from me.

4,526. In your statement you say "At the time of the outbreak of the war, I was with the Rand Native Labour Association."—It was in 1896-7.

4,527. Previous to the war you were recruiting for the Randfontein group? Were you also in the Cape Colony?—Yes, Bechuanaland and the Protectorate.

4,528. Did you send many natives?—About 200 per month during the early months of 1889.

4,529. You resumed recruiting for the Native Labour Association after the war?—I took an appointment with them as district manager on the 1st April of this year.

4,530. Had you done any recruiting previous to that, before the war?—For about three months I was supplying boys to the Koffyfontein mines.

4,531. The diamond mine?—Yes. That was in the early part of 1903, in January and February.

4,532. Did you supply Koffyfontein with many natives?—About 100 in all.

4,533. Did they require more?—Yes, at that time they did, but I had some difficulty in getting boys, and I dropped it. I only continued the engagement for a month or six weeks.

4,534. You had some difficulty?—Yes, Koffyfontein is not a good mine.

4,535. What wages were you offering?—I really could not tell you.

4,536. You did not mention to the boys when you recruited them what was the wage?—They have been accustomed to go for several years, and they knew the terms. I think they are paid different rates of wages, some by the day and some on piece-work, but exactly what sum I could not say.

N

4,537. Have you got many natives since you started for the W.N.L.A. in April?—I commenced recruiting actively after the wages were raised to 50s. to 60s. Since then to the end of last month I have sent 1,463, that is from the 20th April to the end of July.

4,538. About how many did you send?—I do not think I could say the total, but I think about 500 per month for the last two months.

4,539. Do you anticipate being able to keep up that number?—I think so, and increase it somewhat.

4,540. Can you give the Commission any idea what you think you could work that number up to per month?—I am estimating from the Protectorate, which was not opened until I got Khama to do so, and since then I have had 600 boys from there. I anticipate when they go back and say the treatment is fair it will considerably increase the number.

4,541. You cannot form any idea as to the probable number there should be?—At the end of page 4 of my statement I said that deducting the requirements for other service, there would be about 8,000 odd, besides that, I have the Western Transvaal, Rustenberg, Lichtenburg, Marico, etc., to draw from.

4,542. Did I understand you to say you hoped to send 500 per month?—To keep the standing supply up to about 500, sir, unless there are any sudden changes. For instance, the Lobatsi Railway, if that went on, would take about 2,000—I mean to say the railway would find employment for 2,000 boys if under construction.

4,543. On page 5 you said that, allowing for local requirements, there would be 8,450 boys available for work on the Rand Mines.—And I think I ought to have added, "and other service and railways."

4,544. Then you go on to say that these boys would only stay for six months.—That is the period. You cannot estimate they would go on continuously.

4,545. That would leave 4,225. Yes, if you divide it exactly.

4,546. On the Rand from your district?—Yes, all the year round.

4,547. And if the Lobatsi Railway goes on, that might be reduced by one-third?—I say two-thirds would come here and one-third would find employment there.

4,548. Would sending these natives to the Rand increase the labour supply from this district, or would it be drawing the natives from other mines and other industries?—It would certainly draw them from other industries. At the present time, as I explained in my statement, we have been drawing them from other mines, that is before our wages were raised to 50s. and 60s. When the boys have returned home they will tell the others and a larger number will return to the Rand.

4,549. Do you find the Rand is more attractive than the mines in your own neighbourhood?—I think at different times the Rand is just as popular as any other. The best class of miners in our district have gone to De Beers for the last 10 or 15 years, but 90 per cent., however, always came to the Rand before, very freely.

4,550. In your opinion the low rate of wages which prevailed until February prevented them coming to the Rand?—Most certainly, sir. I should like to point out that I expect a probable increase over what was the condition before the war. This supply that I hope to get from Khama's Northern Protectorate—about 4,000 I think I said—These will be all extra boys brought into the field.

4,551. Do you wish us to understand that hitherto recruiting for the Rand has not been permitted in Khama's Northern Protectorate?—Except a few boys who leaked away, they have never gone away in big batches. Once only, I think, Khama gave the R.N.L.A. a big party of about 150. So many of them died that after that he closed the country against recruiting.

4,552. What has been the inducement to him to reopen his country?—I was able to go as the representative of the Association, which was thoroughly supported by the Resident Commissioner, the Assistant Commissioner, and the Missionary, who were convinced that the object of the Association was to look after the natives, and were pleased with the conditions and satisfied that the thing was being worked in a proper way, and they gave us their full support, and Khama was convinced with their arguments, and agreed to throw the country open. I may say that in that district he insisted that we should only have one representative, and we have a solitary recruiter there, and the chief does the whole of the recruiting himself, and sends messages to the men to come to him.

4,553. Then as far as Khama's Northern Protectorate is concerned, through you, the Association has a monopoly for recruiting there?—Yes.

4,554. Mr. DONALDSON: The increase you expect from the Western Districts is principally from Khama's country?—Yes, the increase in number that will be brought into the working fields generally will come from Khama's country.

4,555. At present, according to this statement, you send out 500 from Khama's country?—Yes.

4,556. Is it not a very optimistic estimate that you will get the number you hope to get—3,000?—I anticipate the number of working men—that is the number free to go out to different services—at that figure. You see I say that De Beers, the Griqualand and River Diggings and O.R.C. Diamond Mines will always want 6,000, and they will draw from that number, and also my figures for the railway too. The railways will have 1,000 and the farms so many, leaving 3,400 available for work, half of whom we may calculate will be out at one time only.

4,557. Are you providing for the requirements and the Western Transvaal in that estimate?—I anticipate not. De Beers, Koffyfontein, Jagersfontein, and the River Diggings are pretty well fixed in their demand.

4,558. Are there any gold mines in the neighbourhood of the Malmani Gold Fields?—I should not think they would ever want more than 200 boys, but I should hardly care to express a definite opinion.

4,559. Mr. EVANS: Of this figure, 8,450, would any of them come here for anything else besides mining?—Oh, yes, I think after the Rand Mines and other services here, they would come to the railways. At the present time I have sent all the boys to the railways that I could recruit. We are speaking in anticipation for the next 12 months—I mean available for the Rand—the railways and Johannesburg generally.

4,560. And what do you think that leaves for mining alone?—It is almost impossible for me to tell you what proportion, but I should say, judging from the number of boys who join now, that two-thirds of these would go to the mines, because our Lower Protectorate boys all join for mining, and the boys from Khama's country are a proportion only. I should think altogether two-thirds would willingly join for the mine, and the others for surface work, and if there were no railway service, they would join the mines to do surface work at 50s.

4,561. What would be the maximum under existing conditions you would expect to have here from your district mining?—I say about 5,000.

4,562. At the same time?—Yes, I anticipate that.

4,563. That is rather more than half of 8,450?—Yes, but I must point out that taking the whole of that, you have the Native Commissioner's figures, and Sir Godfrey Lagden's figures of the population and number of men available for the Western Transvaal. It was hardly worth while putting them in my report, because they are his figures, but you see there is a good number to be got from that site. The 5,000 I have not counted on, that is the 4,200 which is the half of 8,450,

but I am including all these in what I expect to get from the Western Transvaal, that is the extreme Western, where the stads are close together, and there are more coloured than white people.

4,564. Then 5,000 is your maximum figure?—Yes, of course I shall have to be responsible for these figures. I have no fair means of getting at them. I expect them to be realised unless something turns up like the Lobatsi Railway, and any peculiar circumstance which we cannot anticipate and see now.

4,565. Where would they come from really?—My area of recruiting begins at Kimberley and extends close up to the Tati and that is the whole length of the Protectorate—from Francistown to Kimberley. Most of the groups sent here are made up from shipments of twos, threes, fives and sixes from Francistown and Kimberley.

4,566. Mr. PHILIP: The De Beers Company have always got their main supply from your country for years past?—Perhaps about—I should say not much more than one-third really. They get boys from the lower tribes. The Kimberley mines have drawn upon Taungs and Batlapin tribes. That is within our sphere of recruiting. Then I should like to inform you that likewise a good number—500 or 600—boys have come from the far north, from Pietersburg and various parts of our country. They are the best; when they get to Kimberley they get well paid; they have been following Kimberley work for some many years that they give them good employment there.

4,567. If they now in Kimberley, owing to the raising of the wages here, found themselves short of boys, I suppose they would raise the wages as well and then they would have the pull on us?—Oh, yes, there is a possibility they will, but they could fall back on their own source of supply. They would have more Cape boys, more boys from Basutoland, and a great number more would be likely to go back again, and they have been able to get our boys so easily in having control of the railway that they come down to them at very little cost.

4,568. And the whole of the regular supply which you hope to give to Johannesburg per annum from all sources, that is from Bechuanaland and the Western Transvaal included, would be about 5,000 boys a year?—Yes.

4,569. Mr. TAINTON: You say, Mr. Goodyear, you have had 24 years' experience of the native districts?—Ever since I have been in the Colony I have been in the native districts the whole time.

4,570. May I ask in what capacity?—The first few months of my record here I was in the Frontier Light Horse, and had a lot to do in the Transvaal with the natives there and in the Transkei. I was Deputy Commissary, and had to visit all these tribes and came into contact with the Fingoes who were engaged in transport, and similarly in Basutoland for seven or eight months prior to the close of the war. I was visiting all the natives there and came into contact with all their chiefs and went about the country there a good bit.

4,571. What were you doing 18 years in Mafeking?—I came up with Sir Charles Warren and as commissariat officer with Col. Carrington in 1885, and have remained in the country ever since.

4,572. On page 5 you give the figure of 35,000 as the approximate number of males in the district under you? Is my reading correct?—It is correct, sir.

4,573. On page 5 you give the figure of 19,000 out to work?—Yes, I said 19,000, sir.

4,574. On what ground do you base that estimate?—Well, in the first place we have 21,000 males. The number of males I state there, I got from information I have had from the different departments as to the amount of hut tax they collect (there is no census or other returns to get information from), and from the Resident Commissioner's office, in the other case.

4,575. Upon what facts do you base that figure of 19,000 workers?—In the Southern Protectorate there are about 7,000 men altogether, and I am anticipating that out of that number there will be 4,000 working men, and I think that is a very fair estimate.

4,576. I want to get at your reasons for this estimate?—It is an acquaintance with the country and knowing the proportion that will come out.

4,577. You say "knowing the proportion"; how do you know it?—I know it by observation and through conversation with the chiefs and the store-keepers.

4,578. You say this proportion is approximately 55 per cent. of the total male population, which is a very high figure, and I want you to give good reasons for your estimate?—I claim for the people of that side that they are the best workers in the Colony. These people go out freely, and all go to work freely, and if you go through the stads you would wonder if it is worth while continually recruiting. You see so few about, and I am pretty confident that it is as near an estimate as anyone could make.

4,579. Do you mean that these 19,000 are out at work at one time?—I say that these 19,000 men are a proportion of the total who do work; who follow the work on the mines and earn money, either on the mines or on the railways.

4,580. My question was, are these 19,000 at work at one time?—You see, sir, I put down 10,000 for these various services. This is the number you are absolutely certain will be away. We have 8,000 away. That would mean that there would always be about 14,000 of them working.

4,581. About 14,000 would be the number always at work?—Always at work.

4,582. You say the average time of their engagement is six months?—I am speaking of the boys that come to the mines. The boys on the railways and the farms are mostly permanent, but the six months refer to boys who come to the mines and leave the country.

4,583. If you take the numbers you have put down on your list as working at the mines you will see it makes nearly 15,000. Would these 15,000 workers remain for six months?—No, a good proportion of them would work much longer. 10,000 would always be at work.

4,584. I am not talking of the 10,000. I am dealing with the 8,000 odd you set aside for the Rand and the 6,000 you set aside for De Beers. The total of the two figures is 15,000—make it 14,000 if you like. These 14,000, as I understand your statement, are working for six months in the year?—I should say a large proportion would work very much more. These boys always work—those who are working at the mines and river diggings. I have set down 4,500 for Griqualand West and the river diggings.

4,585. Why do you say then in your statement that six months is the maximum period of labour?—I had mining service in my mind at the moment.

4,586. I am taking the mining service. I ask you, why do you put in six months as the maximum period?—You must understand this, that the boys who come down to De Beers only work three months. Some boys work three months, some four months, and some longer, but I think six is about the average these men would put in. Bear in mind that on De Beers the average boy would only go down twice a year and that will give him six months' service.

4,587. Mr. PHILIP: What is the total number of boys we could expect to receive from your district?—I should say that the number would not exceed 5,000 boys yearly.

4,588. Mr. TAINTON: You have had a large experience in dealing with natives?—I have had over 24 years' experience of natives, and have been in contact with them during the whole of my stay in the country.

4,589. How do you base your estimate of the working population?—My estimate of the working population is based on hut tax returns, etc.

4,590. How then do you base your estimate of the number likely to come out?—My estimate of the number of those likely to come out is based on my knowledge of the country. I claim for these people that they are the best workers in the country.

4,591. This, therefore, accounts for the high average you have given us?—Yes, the average would be about 55 per cent. of workers out of the total male population.

4,592. What would be the number constantly at work?—About 14,000 would be the number always at work. On farms and railways, the boys work continuously.

4,593. On page 3, second paragraph, of your statement, you say that a large percentage have gone to the mines even when they have had good crops. The price of grain in good seasons is not high, and the wants of the native and his family require money always and more than the grain produces. Is it then your experience that the necessitous natives make the best workers?—It is a very difficult thing for me to reply to that question. They were possessed of very large numbers of cattle before the rinderpest, and every man is anxious to get money to buy stock to begin breeding again.

4,594. Mr. WHITESIDE: Mr. Goodyear, I think you said that the reduction of wages to 30s. had a bad effect in diverting the stream of labour from the Rand?—Yes, that is so. The full good effects of the restoration have not yet been felt. The natives will not believe in the advance until the boys go back with the money in their possession. There are a great many boys in Khama's country, and I am confident that we will be able to recruit them in increasing numbers. They are as well disposed to work as any other Bechuana natives.

4,595. Have you framed any estimate as to the maximum monthly number which may be obtained from this source?—In my statement, I have put down 4,000 as the number likely to go out to work.

4,596. Mr. EVANS: Is an increase of wages likely to cause an increase in the general labour supply?—No, in my opinion an increase in wages would not cause an increase in the labour supply generally—except in Khama's country—but it would divert the supply more to the mines.

4,597. The CHAIRMAN: Mr. Goodyear, the Commission is very much obliged to you for your evidence.

Mr. E. WILSON, called, sworn and examined.

4,598. The CHAIRMAN: You are Mr. E. Wilson?—Yes.

4,599. Have you before you, Mr. Wilson, a statement headed "Statement of E. Wilson, Esq.?"—Yes.

4,600. Do you wish to hand that in as your evidence-in-chief?—Yes.

4,601. Mr. Wilson's statement was then handed in to the Commission:—

I was in Central Africa, in the service of the British South Africa Company, for rather more than two years, viz., from July, 1898, to August, 1900. For eighteen months I was employed at Blantyre as Assistant Transport Officer, and afterwards as Acting Chief Transport Officer to the British South Africa Company and the African Transcontinental Telegraph Company. In this capacity, one of my duties was the supervision of the transport by native carriers across the Shire Highlands, from Chikwawa, on the navigable Lower Shire, through Blantyre to Matope or Mpimbi on the navigable Upper Shire. During those eighteen months, I had at all times from a hundred to three thousand Central African natives working under me. Probably from 10,000 to 15,000 of them passed through my hands during that time. I was subsequently for six months Sub-Native Commissioner, or, as it was then called, sub-collector, in

charge of the Nyala District of North-Eastern Rhodesia, on the Nyassa-Tanganyika Plateau. During that time, my station being on the Nyassa-Tangankika road, I acted as forwarding agent of the transport of the British South Africa Company and African Transcontinental Telegraph Company from Nyassa to Tanganyika. These two appointments between them brought me into contact with practically all the Central African tribes from the junction of the Shire and Zambesi Rivers to Tanganyika. I will deal with the principal tribes seriatim from south to north. The Sena tribe, on the Zambesi, do a certain amount of work on the sugar plantations, and as boatmen and steamer crews on the river. There is no probability of their being induced to come to the Transvaal as mine labourers in any quantity, and I do not think that they would be found efficient labourers if they did come. The Chikunda tribe is a mongrel tribe, occupying, roughly, the territory enclosed between the Shire, the Zambesi, and a line from Tete, on the Zambesi, to Chikwawa on the shire. They are very intelligent, but are not labourers. When they do any work, they are house boys, cooks, or boatmen. The Shire Highlands are occupied by the Yaos and Amanganja. The Yaos live in the northern part of the Shire Highlands, and in places on the shore of the southern half of Lake Nyassa. They are a race of fine physique, but do not work much, except as native police or native soldiers. They occasionally do transport work, but will not sign on for more than three, or at the most six, trips at a time from Blantyre to the Upper or Lower Shire. The Amanganja do practically no labour. They are intelligent, and some of them are employed as carpenters, masons, cabinet makers, and even as printers, telegraphists, and bookkeepers. When they do work, they work in that sort of capacity or as house-boys, cooks, etc. To the east of the Shire Highlands lie the Anguru and Alolo, and further to the east and south, down to the Coast, the Makua. The Anguru and Alolo may be taken together. They live almost entirely in Portuguese territory, and are tribes of poor physique and exceptionally low intelligence. The Makua live wholly in Portuguese territory. They are a tribe of good physique, often with some Arab blood, who work chiefly as police, soldiers, and captaos or "boss boys." They are an unlikely source of labour supply. In the Highlands to the west of the Shire, up to a point about a third way up Lake Nyassa, live the Angoni, who are of Zulu origin. They are of good physique, though not so much so as the Zulus, as they have degenerated by intermarriage with the inferior tribes, especially with the Achewa, who live between them and the Lake. They are the principal source of the labour supply of the Nyassaland Protectorate, both for working the coffee and other plantations and for transport. The Achewa are a puny and useless tribe. North of the Achewa, on the west coast of Lake Nyassa, live the Atonga, who come second to the Angoni in furnishing labour to the Nyassaland Protectorate. They have no connection with the Amatonga of Tongaland. They excel in stealing and lying, but are willing workers, and more than any other tribe have confidence in Europeans, and identify themselves with the interests of Europeans. At the north end of Lake Nyassa are the Wankondi, who are of wretched physique, and do no labour. North of them lies the Mambwe tribe, who have not so far taken much to work of any kind. Between the Wankondi and the Amambwe, the transport from Nyassa to Tanganyika is starved for want of carriers. The transport traffic there is generally acutely congested, and expeditions frequently find it advisable to recruit their carriers for this 220-mile journey further south, rather than to rely upon being able to secure their carriers locally. To the west and north of the Amambwe live the Awemba, by far the largest of the tribes of this part of Central Africa, their territory being bounded by Lakes Bangweolo, Mweru, and Tanganyika to the west and north, by the Nyassa-Tanganyika road to the east, and by a line from Bangweolo to the north end of Lake Nyassa to the south. They are of fine physique, but have hardly been weaned long enough from tribal wars to take to the life of a labourer. To

come to the various heads of Section III. of the Commission's circular:—(a) Usual Work. The rough work is the transport, on the head, of loads up to 60lbs. in weight, or the clearing and cleaning of coffee plantations. This is done by the Angoni and Atonga principally, and also to a lesser extent by the Anguru, Yaos, and Alolo. But, as a whole, the Central Africans are not labourers, and will never be an appreciable source of labour supply to the Transvaal. When they work, they prefer less arduous work calling for some intelligence. They are printers, telegraphists, pilots, bluejackets (on the gun-boats), cabinet makers, goldsmiths, soldiers, clerks, mechanics, masons, carpenters, etc. Central Africa is not "a white man's country," and the natives have been encouraged to fill positions which in South Africa they would be discouraged from filling, as being unfair competitors with Europeans. Furthermore, the labour supply has never been sufficient even for the local demand. The transport has called for more labour than it could get, and the planters have been lamentably short of labour, even when transport had a fairly good supply. The construction of a railway across the Shire Highlands will free a large number of natives now employed in transport, but they will readily be absorbed by the plantations, which, with rather more prosperity, will expand indefinitely. The construction of the railway and the better supply of labour will probably bring them that prosperity. (b) Usual Food. The staple food is mealie meal, made without the husks. A central African will absolutely refuse mealie meal with the husks, which he calls "cattle food." They only eat the husks when they eat the mealies in the form of pop-corn, which the Angoni largely do. The mealie meal is supplemented in different districts by bananas, rice and Manioc. Most tribes also eat meat to a considerable extent. (c) Usual Pay. The usual pay for unskilled labour is from 1s. 6d. to 3s. a month according to the district. This did not formerly include food, but competition has since caused the issue of rations as well in some parts, and may also have raised the wages by this time to some extent. (d) Physique, Aptitudes, and Special Ailments. The physique of the Angoni, Yaos, Atonga, Makua, and Awemba is good; that of the other tribes is indifferent or bad. The aptitudes are distinctly higher than those of South African natives, and do not lie at all in the direction of mere labour. I do not know of any special ailments of Central African as opposed to South African natives, except that elephantiasis is fairly common round the north end of Lake Nyassa. (e) Special Conditions Affecting Labour Supply to Transvaal. By far the most populous district of South Central Africa is that lying round Bangweolo and Mweru. The population there is also being largely increased by refugees from the Congo Free State. The only prospect, and that an uncertain one, of Central Africa supplying an appreciable quantity of labour to the Transvaal, is the tapping of this region by the completion of the Bulawayo-Tanganyika section of the Transcontinental Railway, which, I believe, is estimated to take five years. Branch lines to Fort Jameson and Bandawe would tap the Angoni and Atonga, so that the three most promising tribes, the Angoni, Atonga, and Awemba would be tapped. Elsewhere, the population is by no means dense, and, though a few hundred natives may be tempted down by curiosity and by a complete vagueness as to the real nature of the work they come to do, there is no prospect of anything but an insignificant supply of labour. (f) Approximate Numbers Available: Insignificant. (g) Local Enterprises and Number of Natives required for them: Coffee, rubber, and sugar are the principal crops. Fibre, tea, tobacco, and cocoa are also grown on a small scale. These branches of agriculture already require more labour than they can get, and the same is true of transport, the principal occupation of such natives as work. As there is a certain amount of gold in some districts, and as copper is very plentiful in the north, there is a possibility of Central Africa becoming, like South Africa, a mining country, in which case it would be even less likely to have labour to spare for South Africa. The local opposition to the export of labour is very strong. The missionaries

17133

oppose it because they do not consider the Rand a good school for natives, and the planters because they require all the available labour themselves, and also because they are afraid of intercourse between South and Central Africa raising the rate of wages in the latter to such an extent as to render their industries unprofitable. To prove that I have the courage of my conviction that Central Africa will not be a labour-field for South Africa, I may mention that I was offered by the Witwatersrand Native Labour Association a good post as their representative north of the Zambesi, and refused it largely because I felt that I could not make a success of the thing, though my previous experience would have put me in a particularly favourable position for doing so.

4,602. The CHAIRMAN: You have been in the service of the British South Africa Company in Central Africa from July, 1898, to August, 1900?—Yes, a little over.

4,603. When did you leave Central Africa?—In August, 1900.

4,604. Do you know the native language?—I know Chimanganja.

4,605. Is that language known to many of the tribes there?—Yes, it is known by most of them. It is the *lingua franca* of the country.

4,606. You occupied different appointments in that country?—Yes.

4,607. Appointments which brought you into close touch with the natives?—Yes.

4,608. You supervised the transport by native carriers across the Shire Highlands from Chikawa on the navigable Lower Shire through Blantyre to Matope or Mpimbi on the navigable Upper Shire?—Yes.

4,609. And during that period you had as many as 100 to 3,000 boys under your control?—Yes.

4,610. And you state that probably from 10,000 to 15,000 passed through your hands at that time?—Yes, that is the number I should estimate.

4,611. That means that each native worked for a short time only, does it not?—Yes.

4,612. For what length of time do they work?—That depends on the tribe. The average period worker by the native at one time is two months.

4,613. You tell us in your statement, "As a whole the Central Africans are not labourers, and will never be an appreciable source of labour supply to the Transvaal." Is that your well-considered opinion?—It is.

4,614. We have had a witness before us, Mr. Ross, who gave an estimate of the population, and of the number of natives who could leave that country to come and work elsewhere. Have you seen that statement?—Yes, I have seen it.

4,615. Do you disagree with that evidence?—Yes, absolutely.

4,616. Mr. QUINN: What have you been doing since August, 1900?—I have been in England, in the Orange River Colony, and the Transvaal.

4,617. Can you give us statistics of the population of the country?—No, it would be absolute guesswork on my part to give such figures.

4,618. There is a good deal of guesswork in this statement?—What do you consider to be guesswork in the statement?

4,619. Your idea that the Central Africans will never be labourers. But are there no statistics as to population?—I have not access here to any, and must decline to give an estimate of the population, as it would be purely guesswork on my part to do so.

4,620. What kind of work have these natives been accustomed to?—Transport is almost the only kind of work to which the Central African native is accustomed. They have done this for the Arabs for hundreds of years.

4,621. Is not all the native history entirely opposed to your opinion that they would never be of

N 3

service as labourers in the sense that we mean. Take the East Coast boys. At one time they were not labourers. Now they are the best labourers on the Rand. Do you think that these Central African labourers, that you have given us so much information about, are likely to remain for years in the same state that they are in to-day?—I think if they move from their present state it will be in the direction of being traders and skilled labourers. They are much more a trading people. They are more like the Nigerian natives.

4,622. What do you mean by traders?—Well, there is a very large volume of native trade in the country that used to be in the hands of the Arabs.

4,623. There must be someone to trade with?—It is not local trade, it is export trade. They have been carrying on the exportation of tusks of ivory, rubber, etc.

4,624. You speak of one tribe in your statement and you say "north of the Acheva on the west coast of Lake Nyassa live the Atonga who come second to the Angoni in furnishing labour to the Nyassaland Protectorate. They have no connection with the Amatonga of Tongaland. They excel in stealing and lying, but are willing workers and more than any other tribe, have confidence in Europeans and identify themselves with the interests of the Europeans." Did they excel in stealing and lying before they were identified with Europeans, or was that an accomplishment they learned from the white people? Is it their natural disposition I mean?—I should imagine so. The white people they have contact with, are principally missionaries, and I do not suppose the missionaries encourage them in stealing and lying.

4,625. There is an idea that some of these boys when they get taught develop these characteristics.

4,626. Mr. TAINTON: You were engaged chiefly in transport work in Central Africa?—Yes.

4,627. Did that occupation keep you on the main lines of route?—It kept me at Blantyre.

4,628. It kept you to the village at Blantyre?—Yes.

4,629. Did you ever go out with expeditions into the country?—Very little.

4,630. Upon what experience do you base your knowledge of Central African countries?—What do you mean by knowledge of the countries?

4,631. The knowledge you have given us here; upon what experience do you base it?—Because I have employed all these tribes under me. I have not talked about the country, I have talked about the natives there. I have employed the natives without travelling extensively through their country.

4,632. You have no personal knowledge of Central African native territories from travelling?—Well, I have lived in them two years; I have lived in the centre of them.

4,633. At Blantyre?—Yes. I was 18 months at Blantyre and again six months on the Tanganyika Plateau.

4,634. Were you ever in the Portuguese territory?—Only on the way up; on the way home by the Zambesi.

4,635. Were you ever living in the Zambesi Valley?—No, I was not.

4,636. Then you have no personal knowledge of the natives in their homes, of the tribal customs, of the population, or of their habits and ways?—I know a good bit less about the Blantyre district, although I was there for 18 months, than I do about the Tanganyika Plateau district. There I was Sub-Native Commissioner and I was travelling about that country very much more than I was when I was doing the transport work.

4,637. Is your experience then confined to the Tanganyika Plateau?—It is not absolutely so confined, because I have travelled out from Blantyre a

little in some directions to get a little shooting occasionally and got into the native villages, but I do not know the native villages down there well.

4,638. Could you give us from your own knowledge any estimate of the proportion of natives who remain at home and do not go out to work?—Well, I should think that in the Shire Highland district probably about 50 per cent of the natives capable of working do not go out to work, and in the Tanganyika Plateau district 90 per cent. or more. Because they do not work up there at all practically.

4,639. Are they obliged to pay hut tax?—There was no hut tax in North Eastern Rhodesia when I left there. The hut tax in the Nyassaland Protectorate was 3s. per hut, which was paid off by selling a few fowls. The hut tax was not high enough to be any inducement to work even in that country where there was a hut tax.

4,640. Do you think that a large proportion of the natives about Nyassaland go out to work?—I think in the Shire Highlands about half those who are capable of working go out. That is not in the Nyassa district; that is south of Lake Nyassa considerably.

4,641. Mr. PHILIP: Mr. Wilson, you have given us some very valuable evidence here. Do you think that we will be able to get any natives supplied from Central South Africa here?—I do not think that you will ever get an appreciable supply. I think you will do uncommonly well if you get 10,000 from there. You can take that as an outside figure.

4,642. Mr. DONALDSON: Can you give us any reason why these natives will not work? Is it because the conditions of life up there are so easy and simple for them that they have no need to work? Or is there some other reason?—It is a much less rigorous climate in the first place than further south. It is a tropical country, and inhabitants of tropical countries are never as good workers as the inhabitants of temperate countries.

4,643. You think it is to some extent climatical?—I think it is, and I think that most people recognise the fact that people in tropical countries are not the people that are going to do hard work.

4,644. The native can easily get all that he requires, can he not?—Oh, yes.

4,645. Then is there any reason why he should work?—There is none at all at present, except that he must work if he wants to buy things which cost more than he can get for the stock or crops he can raise.

4,646. That is the only reason that will induce him to work?—Yes. The native will want to buy fine clothes and all that sort of thing, and he may not make enough by selling fowls to do so and will do some work in order to get the money.

4,647. The CHAIRMAN: Mr. Wilson, the Commission is very much obliged to you for the statement you have put in and the evidence you have given.

Mr. HUGH L. HALL, called, sworn and examined.

4,648. The CHAIRMAN: You are Mr. Hugh L. Hall?—Yes.

4,649. You are a farmer in the Lydenburg district, I understand?—No, I am really in the Barberton district.

4,650. How long have you been farming in that district?—For a matter of 12 years in the Barberton district, and before that I was farming in the Lydenburg district. I was something like 12 years in the Barberton district and a few years before that I was in the Lydenburg district.

4,651. What is the area of your farm?—It is about 6,000 acres.

4,652. Are you an agricultural farmer or a stock farmer?—At Nelspruit I am an agricultural farmer. I have also a farm at Machadodorp where I used to raise stock.

4,653. Do you cultivate many acres? How many acres have you cultivated?—About 200.

4,654. How much native labour do you require to cultivate that number?—I have generally about twenty boys, and sometimes more. Well, you can take it that I have over twenty boys employed in the year right through. Possibly I hope an average of something like 25 boys.

4,655. You have 25 boys working all the year through?—Yes, about that.

4,656. What is the average acreage cultivated by farmers in your district?—It is hard to say; I am one of the biggest. The most of them are small; perhaps 100 acres; some are considerably less. Beyond me in the Barberton district there are several English farmers who get fairly heavy crops. The best around me cultivate perhaps from ten to twenty acres. They do not cultivate much.

4,657. What would be the average number of natives employed by the farmers in your district, taking the Boers and English farmers together?—I should think each farmer would want at least a dozen boys. I am speaking, of course, as if they wanted less than I wanted.

4,658. You think on an average the farmers in your district would each want a dozen boys right through the year?—Yes, and most likely more, because now they are going in for the cultivation of fruit and tobacco, which requires much more labour than formerly, when they cultivated mealies principally.

4,659. You have put twelve as a minimum?—Yes.

4,660. What is the average rate of pay per month?—I should say 30s. for an able-bodied native.

4,661. And in addition to that their food?—Yes.

4,662. Under the former Government I understand that on private ground the hut tax was 12s. 6d. per hut?—Yes.

4,663. And on Government ground 40s. per hut?—Yes.

4,664. The effect of that was to attract natives to private ground?—Yes. The Government wished the natives to be distributed on the occupied farms—farms that were occupied and worked. They encouraged the natives to settle.

4,665. By charging a lower hut tax?—Yes.

4,666. That method has now been altered?—Yes.

4,667. And the native tax is the same irrespective of his residing on Government ground or upon private ground?—Yes. Now the native pays 40s. per year, no matter whether the Government provides him with a farm and wood and everything else, or whether the private owner provides that; he still has to pay 40s. wherever he is.

4,668. What has been the effect of that alteration in the incidence of taxation as far as you are concerned?—Well, two-thirds of my natives have gone—quite two-thirds of them.

4,669. How many families had you living on your farm before the war?—I think it was fifteen.

4,670. How many have you now?—There are ten that I know have left, and there are one or two more that I know for a fact mean to leave me.

4,671. Are you satisfied as to their reasons for leaving?—They say, why should they stay on my farm where they have to pay me 20s. for living on my ground and work for me, and pay Government 40s. as well, when they can simply go to the Government ground, where they pay 40s. and work for nobody.

4,672. Have your neighbours had a similar experience?—Round in my neighbourhood there are no occupied farms. The Boers who own the ground around about me are high veld Boers, and they simply draw their natives to work on the high veld from these low country farms; and, secondly, their natives have not left so much as mine. I have been working my boys, and they have not called their boys out to work. In fact, the Boer himself does not understand the position. When he sends

for a Kaffir and the Kaffir refuses to come, he leaves him alone, whereas with me it has been different, when I have called them to come and work, they have had to come and work.

4,673. Yes, but there must be other farmers as neighbours within the district who have had natives before the war living on their farms?—Some of them have left their farms and gone on to Government ground.

4,674. Have you any suggestions to make as to how the farmers in your district can be supplied with labour?—I suggest as a means of enabling the farmers to get native labour you should revert to the old system by which natives living on occupied farms had to pay only a 12s. 6d. hut tax.

4,675. Mr. TAINTON: The Rand mining industry has started since you were a farmer in the Eastern Transvaal?—Yes.

4,676. What was the rate of wages on the farms before the mines started?—10s. was the outside pay.

4,677. Then the effect of the mining industry upon agricultural wages has been to raise them 200 per cent.?—Certainly.

4,678. What effect has that had upon the profits of the farmer?—Well, I cannot say it has had any effect upon the profits of the farmer since the mining industry started. He has a market for his produce which he did not have before.

4,679. You get higher prices now for your produce than you did before?—Certainly.

4,680. Could you give us a rough estimate of the amount of that increase in the price of produce?—Well, mealies I have known to be sold, before the mining industry started, at 5s. a bag. Now you can get from 15s. to £1.

4,681. Then, if you take mealies as the standard of value, the rise in the price of agricultural produce has been in a greater ratio than the rise in wages?—Yes, I daresay it has. The only thing is that we pay more than 30s. for some boys. I have boys on my farm to whom I pay £2.

4,682. I am speaking of the average?—30s.

4,683. So the effect of mining in creating a good market has been to put farmers in a better position?—Yes.

4,684. You have greater opportunities of making money now than you had before the mines started?—Not now. With the present law we have less, because we can make no money if we have no labour, and with the way things are going, we shall have no produce to sell at all. I look at it in this way, in twelve months' time we shall have none.

4,685. This rate of 30s. per month which you are paying natives, is that sufficient to keep them at work on the farms?—Well, speaking for myself, my contract with my boys living on my farm is this—

4,686. Take the case of loose boys. Is that rate of 30s. sufficient to keep them at work on the farm?—Boys who have not been accustomed to work underground for £3 a month, but who have been accustomed to work for a farmer for 30s., will certainly work for that amount.

4,687. What is the rate of pay for drill boys in the mines in the Barberton Division?—I think it is something between £2 and £3 per month. I think it is about £3 per month. Before the war good hammer boys got £3 per month. I am not sure, but I understand that that is about the wage for good hammer boys, and I believe the same was paid in Pilgrim's Rest for the best labour there.

4,688. Would you be surprised to hear that the price for hammer boys in the low country amounts to 35s. per month per boy?—It may be now; I should not be surprised at anything now, considering they reduced the wages to 30s. some time back.

4,689. Now, will you please explain how you work your natives and how you pay them?—My natives.

live on my farm with an understanding that they have to pay, of course, the Government tax. That they pay themselves. They pay me £1 a year for living on my farm; that is as a rent, and I pay them for working for me.

4,690. The CHAIRMAN: Is that £1 per hut?—Yes, per hut. A man and his wife occupy one hut.

4,691. Mr. TAINTON: Go on, Mr. Hall?—Well, they have to work for me whenever I require them, and I pay them according to their grade or the value of the boys. I will pay some of the big boys from £1 to £2; the best boys get as much as £2.

4,692. Some get £1 and some get £2 per month?—Yes, that is able-bodied boys. But they have to work for me when I require them, and they are not allowed to leave my farm and go and work for anybody else without my consent.

4,693. What number of months does a boy work for you per year?—Well, I reckon to get from four to six months' work out of him per year. If they wish to offer their services, they work longer, but that is the term I expect them to work.

4,694. You say you charge £1 per hut. Does that mean £1 per native family?—Well, if a man has two wives, he is supposed to pay £2, but I never enforce it; I have generally accepted the £1.

4,695. Then, in effect, you charged £1 per family and you had 25 families on your farm?—I do not think I said 25.

4,696. Twenty-five boys, I understood you to say?—There will be a man with two or three able-bodied boys, well those boys only pay me a matter of 10s.; umfaans pay nothing. A boy from 16 years downwards pays nothing.

4,697. Then if a man has one or two grown-up sons, you get £1 from the man and 10s. per head for his sons?—If the sons are grown up, yes.

4,698. What was your income from the natives living on the farm? What was your annual income?—I cannot say exactly. It would be something like £20 to £25 per year before the war.

4,699. Did you submit to them, when they came on your farm, that you should have the right of calling them out to work for you?—Certainly, that was thoroughly understood. No boy was allowed to come and stay on the farm without he came to me and got my terms, and I told him distinctly what I expected from him. Every boy understood that from me before he pitched his camp.

4,700. Do these natives cultivate any land on your farm?—Yes, a considerable amount.

4,701. Could you give us the area, roughly?—I suppose they would cultivate 60 or 70 acres; somewhere about that.

4,702. What do they do with the produce?—Sell it and eat it.

4,703. Have they much to sell?—In a good season they have a lot to sell.

4,704. For this privilege of living on your farm, and of cultivating your land, is your rate of wage which you pay them not lower than the average?—No, it is not. That is, for the average farmer; I am not talking about the mines. The mines, I expect, pay more than I pay. But my contract is that a native, when I pay him as much as he is worth, pays me for my ground and I pay him for his work, and he has got to work when I want him to do so.

4,705. Do you know the Boer Law known as the "Squatters' Law"?—Yes.

4,706. Was it under that law that these natives were brought on your farm?—They were not brought on my farm; they came of their own free will.

4,707. Why have they left?—Because they see no advantage in staying; they see no gain by working for me when they are really a loser every year of £1 7s. 6d. and they also have the

encumbrance of a master, whom, on Government ground, they are freed from. They do not work for anybody, if they choose, on Government ground.

4,708. Do you wish us to understand that this sum of £1 7s. 6d. per year—this difference in the Government tax—has been the cause of these people leaving your farm?—Well, it has no doubt been the principal reason, the principal cause. They also have the satisfaction, of course, of knowing that when they go on to Government ground, they are not interfered with; whereas, in the old Boer time, if they went on to Government ground they were liable to be caught and taken by the Native Commissioner and sent and distributed about the high veld. They are not afraid of that now, so they squat on Government ground again.

4,709. What do you mean by distributed by the Native Commissioner?—If the Native Commissioner collected any quantity of Kaffirs from the low country, he brought them on the high veld and distributed them amongst the farmers.

4,710. Under what law?—I think that is done under the "Plakkers Wet."

4,711. The one under which you maintain these families on your farm?—I do not say that I maintain them on my farm. They came voluntarily. They were never brought there. They came and asked permission to settle on my farm and the Government never told me I had to disperse them.

4,712. Do you know the main provision of the "Plakkers Wet"?—Yes.

4,713. What is it?—Five families to every farmer on a farm.

4,714. What effect did that law have upon the native tribes?—Well, it had this effect, that it gave the Native Commissioner the right to take the families living on farms in the low country along the Lebombo and these districts, and distribute them over the high veld.

4,715. Did the natives fall in with that policy?—No.

4,716. What did they do?—Heaps of them cleared over the Portuguese border. Those who were caught went to the high veld, some bolted back again, and some remained.

4,717. So that the effect of this attempt to obtain labour for the farmers was to drive the natives out of the Transvaal?—Yes, it drove a lot of them over the Lebombo.

4,718. If that policy had been continued, would it not have ended in the farmers losing their labour altogether?—No, I do not think so, because, as the natives get distributed over the high veld amongst the farmers, they gradually get accustomed to living amongst them and then they are not so keen on going back. At first they objected, but after a Kaffir had been with a Boer for a year or two, he seemed to have got accustomed to his surroundings and was satisfied to remain.

4,719. These men could not leave the farms without the consent of the farmer?—That is so.

4,720. Did not that give rise to abuses?—Well, lots of them bolted from the farms shortly after they were placed on the farms. Probably the desertion took place shortly after they had been put there, but after they had been there for 12 months or so they seemed to have been satisfied and remained on.

4,721. Are you acquainted with the circumstances of a case tried in the High Court, where the Chief Justice characterised an attempt to keep a native on a farm of this sort as practical slavery?—No; when was this?

4,722. This was about 1898. It was a well known case?—No, I am not acquainted with it.

4,723. Are the majority of the farmers, English and Dutch, in favour of this policy of breaking up the people and distributing them amongst the farms in order to settle this labour difficulty?—I should

say the farmers, as far as I know, are decidedly in favour of distributing the natives amongst the farmers. Every farmer that I have dropped across has been of that opinion.

4,724. Do you think that any evil would result from breaking up the communal system of the natives and destroying their tribal system?—No, I do not.

4,725. What, in your opinion, would tend to give the farmers labour?—When you give the farmer labour you also want to give the native justice, not to put him on a farm where he has got to work for nothing, and, when he has worked, let him be paid for his work.

4,726. Mr. DONALDSON: I understand that under the old system you were sure of a certain supply of labour to enable you to work a farm?—Yes.

4,727. Now that these natives, who lived on your farm, have left it, can you rely with any certainty on the supply of labourers for your farm?—No, none whatever; I have no certainty now.

4,728. Formerly you paid a matter of 30s. per month for your labourers who lived on your farms?—Yes, I did.

4,729. If you were to bring that labour from natives who lived on Government land in your neighbourhood, or from elsewhere, what rate of wages would you have to pay?—The same.

4,730. But can you get them?—No, not when I want them. I might get them by fits and starts. Possibly when my crops want reaping, I cannot get labour.

4,731. That is to say that under the old conditions you could be certain of reaping your crops?—Yes.

4,732. Under the present conditions you are not quite certain that you can sow them, or, if you do sow them, that you will be able to reap them?—That is so.

4,733. Mr. PERROW: I think you said you have 15 leaseholds on your farm?—Yes.

4,734. And some men that you have had working for you have had more than one wife?—As a rule the old men I seldom call out to work. A man who has got two or three wives is usually an old man, and I very seldom ask that man to work. The young men I take. I would go to the head man of the kraal and ask for one or two sons and I would expect him to send them. Some did this. Others would move off the farm.

4,735. With regard to the man who had two or three wives, you would only charge that man for one hut?—Yes, I could have charged him for two, but money seemed scarce, crops were bad, and there were the locusts and all sorts of things, and for the last couple of years I got no rents from my natives because the locusts were so bad. That was a year or two before the war.

4,736. Though you are so kind as you have been to the native to give up £1 per year, yet he leaves you?—You must not look for gratitude from a native.

4,737. Mr. QUINN: You say that one must not look for gratitude from a native?—Certainly.

4,738. Is it a reasonable thing to expect a native to be satisfied with, say, £2 a month when he can get £3?—He has got the benefit of living on my ground.

4,739. Well, give him all that in?—Besides, the work on the farm is very much more to his liking than it is on a mine.

4,740. And yet he leaves it?—If he can get £3 he leaves it in certain instances. Some boys who are accustomed to mine work and heavy drill work, do not mind it, but a strange native would prefer to work for 30s. on a farm than for £2 or £2 10s. on a mine.

4,741. Is not a native as much entitled as you or I to get the best return for his labour that he can?—I suppose he is.

4,742. Have you any claim on him to work for you?—I have a claim, yes.

4,743. Have you any claim to make a native work for you because you are a farmer?—I have no claim except on the boys living on my farm. They have to work for me when I want them.

4,744. You are complaining, I understand, because he leaves you?—He leaves me because he gets a better opportunity now. I do not blame the native for leaving me in the least; I blame the law-makers for making the laws which deprive us of our labour.

4,745. What is the law you object to?—I object to the rise in the Kaffir tax. Our natives have now to pay £2 instead of 12s. 6d., that is, those living on private property.

4,746. If you offered your boys £3 a month, would they stay?—Oh, I should think they would.

4,747. You have already told us, having got a good market for your produce now, you do not lose money by this extra wage?—And pay £3 a month?

4,748. What wage could you pay, consistent with a reasonable return?—I think that from 30s. to £2 is the most a farmer can pay to come out all right. You must bear in mind that a farmer is not successful every year. One year the locusts rob him of his crops, and another year there is no rain. He has, perhaps, two failures to one success.

4,749. Then you do not think that you can pay more than £2 a month profitably?—Certainly not.

4,750. I understand that in addition to your paying your natives 30s. a month, you allow them a certain amount of land to plough on?—As much land as they choose to plough on.

4,751. That is worth a considerable sum?—Yes.

4,752. Do you think it will make up the difference between the wages you are paying them and what they could get in the mines?—Yes.

4,753. And in addition there is their stock?—Yes.

4,754. The CHAIRMAN: Do you allow them to run stock?—Yes, in any number.

4,755. The Commission is very much obliged to you, Mr. Hall, for your evidence.

The Commission adjourned at 4.55 p.m. until 10.30 a.m. on Tuesday, 18th of August, 1903.

## FOURTEENTH DAY.

Tuesday, 18th August, 1903.

THE COMMISSION SAT AT 10.30 A.M.

Mr. BRINK: I feel it my duty, Mr. Chairman, to apologise to you and the other members of the Commission for not having been able to attend the sittings of this Commission sooner, but, unfortunately, circumstances prevented my doing so. I have read the evidence taken by this Commission very carefully, and with very great interest. I must admit that very likely I am not quite so well up to the work as the other members of the Commission, but I hope by the time we have to draw up our report, I shall be able to come to a decision.

The CHAIRMAN: I am sure the Commission is very pleased to see Mr. Brink has been able to come, although a little late.

Mr. H. C. SLOLEY, called, sworn, and examined.

4,756. The CHAIRMAN. You are Mr. H. C. Sloley, Resident Commissioner of Basutoland?—Yes.

4,757. Mr. Sloley, have you before you a memorandum headed "Memorandum by the Resident Commissioner of Basutoland"?—Yes.

4,758. Do you wish to hand that in as your evidence-in-chief?—I do.

4,759. Mr. Sloley's memorandum was then handed in to the Commission, and reads as follows:—

I am Resident Commissioner in Basutoland, and am fairly well acquainted with the Basuto, having been for 19 years in the service of the Imperial Government in Basutoland. The Basuto are composed of a number of other tribes or clans which were gathered under the rule of the Chief Moshesh. Although to-day these people all describe themselves as Basuto, there is no individual who, being more closely questioned, is unable to mention the particular clan to which he belongs. Thus included in the general term Basuto, are Makhoakhoa, Bahlokoa, Bataung, Baphuthi, Bakwena, Barolong, etc. These are a few of the principal clans allied to the Bechuana or Mountain tribes. There are also Zulus, Fingo, Tembus, and fragments of other tribes who are more akin to the Zulus and Xosa Kaffirs of the coast regions. These people preserve to a great extent their languages and own tribal customs, but from the industrial point of view, no distinction need be drawn between the component sections of the Basuto. The true Basuto are probably the most given to industrial pursuits, but the particular field of labour chosen is determined more by locality of residence than by any racial proclivities. These people are naturally herdsmen and agriculturists. Until the emigrant Boers crossed the Orange River in 1836, the Basuto had not come into contact with Europeans, and the idea of working for wages is quite foreign to their own system. Among themselves the native wishing his field to be ploughed, or weeded, or reaped, would invite his neighbours to help him, providing for them a little feast in the shape of a few pots of beer or some other food. I mention this by way of showing that cash payment for labour is a new thing among them, and as a reason for the exercise of patience in dealing with the question. It is not correct to assume that natives have by nature a double dose of the sin of slothfulness, but it is more reasonable to suppose that they have not yet acquired habits of daily, continuous industry for the support of life. Immediately upon the occupation of the late Orange Free State by the Boers, conditions began

rapidly to change. The first hired labourers among the Basuto were probably those who went to work for the Boer farmers on the border. Payment for such work was generally in kind, viz., a young beast for six months' farm work. The diamond mines at Kimberley and the construction of the railways in the Cape Colony induced many Basuto to leave their homes and work for wages, which, I am told, were generally invested in a gun of some sort, with which they were allowed to return to Basutoland. They appear to have taken kindly to this gradual process of change in the conditions, for they are not naturally an indolent people. The long, cold Basutoland winter has always forced them to make provision for themselves in the shape of well-built huts and warm clothing, and within the last half century, their list of wants has enormously increased. The following figures give some idea of what they actually purchase:—Dutiable goods imported into Basutoland—

1894	...	...	...	...	£68,674
1896	...	...	...	...	104,858
1897	...	...	...	...	135,560
1898	...	...	...	...	100,280
1899	...	...	...	...	93,683
1900	...	...	...	...	145,474
1901	...	...	...	...	230,680

These figures are the values of dutiable articles only, and give what are known as "English Cost Values." The purchase price to the Basuto was, of course, much more. The returns do not include the values of non-dutiable imports. The Basuto purchase also horses, cattle and sheep, waggons, saddlery, clothing, agricultural implements, groceries, patent medicines, oilman's stores, timber, roofing iron, and in fact, a list of their wants would be too lengthy. In seasons of scarcity they buy grain. During the past three years, they have paid in hut-tax £53,341, £60,755, and £62,000 respectively. I mention these facts to show that they have other uses for their money besides buying cattle to pay as dowry for wives. As I have said, their usual occupation when in Basutoland is agricultural work on their own lands, their neighbours', and their chiefs'. They begin young; a little boy begins herding goats at a very early age. A little later his father may send him to work with a Boer farmer for periods of six months at a time. When at home he takes part in herding the stock of the village, and in helping his father and mother in their field. A great deal of the work, of course, is not toilsome or continuous. The principal articles of diet are mealies and Kaffir corn, in the form of porridge and unleavened bread, and native beer or "leting." The consumption of wheat among them is increasing, and probably year by year their diet approaches steadily to a European standard, and includes more leavened bread, tea, coffee, sugar, and tinned food. Those who can afford it eat meat regularly; they appear to be very fond of fruit, and in the season eat quantities of half-ripe peaches, which they grow themselves. Thick milk, peas, potatoes, sugar cane, honey, fowls, pumpkins, melons, and rice are also eaten. The development of the Johannesburg Goldfields began to attract Basuto labourers for several years before the war. In 1893 to 1894 the following passes were issued:—

For labour	...	...	...	20,000
Other purposes	...	...	...	32,207
Total	...	...	...	52,207

The return does not show the number that went to Johannesburg; probably, not many.

In 1894 to 1895 passes were issued:—

For labour ... ..	25,384
Other purposes ... ..	37,495
Total ... ..	62,879

In 1895-1896:—

For labour ... ..	28,115
Other purposes ... ..	41,286
Total ... ..	69,401

In 1896-1897:—

For labour ... ..	11,778
Other purposes ... ..	19,521
Total ... ..	31,299

(The roads were closed this year on account of rinderpest).

In 1897-1898:—

For labour ... ..	30,274
Other purposes ... ..	45,516
Total ... ..	75,790

In 1898-1899:—

For work at—	
Johannesburg ... ..	5,971
Kimberley ... ..	1,096
Jagersfontein ... ..	4,494
Coal mines (Cape Colony)... ..	1,635
For farm and domestic service ... ..	24,175
Total labourers ... ..	37,371
For visiting ... ..	56,658
	94,024

In 1899-1900 (war year):—

To work at—	
Johannesburg ... ..	178
Kimberley ... ..	68
Jagersfontein ... ..	437
Coal mines (Cape Colony)... ..	37
For farm and domestic service ... ..	4,324
For visiting... ..	14,116
	19,160

(In addition to above, more than 3,000 were sent forward to work on Military Railways during Lord Roberts' advance.)

1900-1901 (war year):—

To work at—	
Kimberley, Jagersfontein, and coal mines... ..	585
Farm and domestic service ... ..	7,995
To work with the Army... ..	11,477
For other purposes... ..	23,815
	43,872

In 1901-1902:—

To work at—	
Kimberley, Jagersfontein, and Cape coal mines... ..	2,427
Farm and domestic service ... ..	3,920
Employed by Army... ..	6,847
For other purposes... ..	27,355
	42,549

In 1902-1903:—

To Transvaal ... ..	7,835
„ Kimberley Mines ... ..	2,533
„ Jagersfontein Mines ... ..	2,030
„ Cape coal mines ... ..	352
„ Natal Mines ... ..	1,164
„ Railways ... ..	6,054
„ Military ... ..	376
„ Farm and domestic service ... ..	34,042
„ Other purposes... ..	78,202
	132,538

Of those described as going to the Transvaal, I believe the majority went to Municipal employment. These returns are compiled from the counterfoils of passes issued. I am of

opinion that while it would be quite possible to improve upon the method of classifying the passes issued, the above figures indicate the tendencies of the Basuto as to the search of employment. It will be observed that the return for the year just past shows a great increase in the number of passes issued, and classifies more particularly the destination of the natives. This is, perhaps, to be accounted for by the fact that anticipating some enquiry on the subject, I had given instructions that more careful records were to be kept.

The census taken in 1891 showed 105,102 male natives and 113,042 females in Basutoland. An estimate of population in 1901 was a total of 262,561, of whom 125,819 were supposed to be males. I estimate the number of males between 18 and 35 as about 25,000 or 30,000, but in the absence of any definite vital statistics, it is difficult to give any but merely approximate figures. Of the 125,000 males, I estimate that 70,000 may be under 18. I estimate the number of young men available for labour on public works, mines, etc., at about 30,000, but do not consider this number would ever be available all at one time. The present demand is greater than the supply. At present about 1,800 male natives are employed in Basutoland in domestic service, public works, stores, etc., including about 300 in police and other branches of the Government service.

The Basuto working at Johannesburg remitted, during the year ending 30th June, 1903, the following sums to their homes through the Native Deposit Agency:—

	£	s.	d.
To Leribe ... ..	1,522	5	0
To Berea ... ..	342	6	0
To Maseru ... ..	560	1	0
To Mafeteng ... ..	255	0	0
To Mophales Hoek ... ..	21	0	0
To Quthing ... ..	58	10	0
	£2,759	12	0

The amount is not large, but the significance of the return is in the districts to which the money is sent. A very large proportion was sent to Leribe, the conclusion being that the northern districts, which are nearest to Johannesburg, send most labourers thither; the labourers from the south go to Kimberley, Jagersfontein, and the Cape coal mines.

The following labour agencies are registered as being at work in Basutoland:—

1. The Witwatersrand Native Labour Association, offering £2 10s. and £3 a month, with food and shelter, for a six months' contract.
2. Johannesburg Municipality, £2 10s. a month, with rations.
3. Driekopjes Mining Company, £2 10s. a month, with rations and tentage.
4. Erskine and Wayland, Germiston contractors, £3 a month, with rations and tentage.
5. Bloemfontein City Engineer, £2 10s. a month, with tentage.
6. De Beers, Kimberley, from 18s. to 25s. a week; three months' contract if boys refund railway fare.
7. Kaalvallei Diamond Mines, £3 10s. a month, with three months' contract.
8. Jagersfontein Diamond Mines, from 12s. a week upwards.
9. Bloemfontein Corporation, £4 a month, without food, but with shelter and fuel. (I believe this agent has got all the boys he wants for the present.)
10. Koffyfontein Mines, from 10s. to £1 a week (piece work), three months' contract.
11. Knights Gold Mine, offering £3 a month; six months' contract.
12. Contractor, C.S.A.R., 2s. a day.
13. Cape Government Railways (Carnarvon Line), £2 10s. a month, with a month's notice.

14. Vereeniging Estates, piece work. Drill boys, 1s. for 15 holes; 1s. 4d. for 20 holes. Loading, 8d. per five trucks.
15. New Jagersfontein Mining and Exploration Co., three months' contract, 12s. a week with rations.
16. Cornelia Coal Mine, contract three or six months, £2 a month (minimum), and all found.
17. New, Langley and Greig, contractors, Johannesburg, £3 per month, food, and quarters; four months' contract, 200 boys wanted.
18. West Rand Central Gold Mining Company, £2 10s. to £3, food and quarters; four or six months' contract.
19. Chief Engineer, Johannesburg, £3 per month, food and shelter; three months' contract, for railway construction work.

These agents are all working, in addition to the demand for native labourers among the Border farmers of the Orange River Colony. The farmers, being short of stock themselves, are able to offer the additional inducement of land for grazing and ploughing.

At the recent meeting of the Native Council, I brought the labour question forward, and asked why the Basuto did not go more freely to the Johannesburg Gold Fields. An intelligent member of the Council, speaking for the rest, gave six reasons which tended to deter the Basuto from coming to the mines. The following are briefly the reasons mentioned:—

1. The six months' contract, which is said to be too long. (This, I believe, does prevent many from engaging.)
2. The difficulty of returning in case of sickness and the difficulty of getting anyone to accompany the sick men on the road home. (I know that reports of this nature have reached Basutoland, and have prejudiced natives against the gold mines.)
3. Misrepresentations by agents. (This sometimes happens, but I do not attach too much importance to it, as we take steps to ascertain whether the boys know the terms of their engagements.)
4. They complained that they are "sold" to agents by their chiefs, and that it makes work outside the country unpopular. (I disapprove of chiefs being given payment for the number of boys they deliver—it leads to abuses.)
5. They complain that they cannot get passes to go unless they engage themselves to agents beforehand. (This is a mistake, and I informed them that every native who has paid his tax can get a pass to go wherever he wishes.)
6. They complained of the laws under which they have to pay for having their passes stamped in the O.R.C. and Transvaal. (I sympathise with them in this, and think it is a vexatious tax which tends to deter them from coming out.)

Other speakers also mentioned some lesser grievances. The six months' contract is, I believe, the great objection.

The fact is that it is more a question of demand exceeding supply than of any grievances, (I mean as far as Basutoland is concerned). There is only a limited quantity of labour available, and many employers competing for it, and the Basuto can get all the work they want much nearer home than Johannesburg. While the present demand exists close to our border for railway works, mines, agriculture, etc., I do not think there is any prospect of materially increasing the number of Basuto who come to Johannesburg. Being strongly interested in the welfare of these people, and anxious to see them bringing money into the country, I have always urged them to avail themselves of the opportunities of going out to work, though I am afraid neither their manners nor their morals are improved by going away from their homes to the labour centres.

I think the figures I have given show that the Basuto do go out to work in increasing numbers, but I admit that they do not appear to go to the gold mines. To attract a larger number to Johannesburg Mines, I suggest:—

1. The reduction of the contract period (if possible) from six to three months.
2. Some better provision for their comfort while travelling by railway.
3. The abolition of the charge of 1s. for stamping passes on reporting in the Orange River Colony.
4. Some arrangements by which a sick man could be sent home with a friend to look after him.

I shall be glad to give any further information, as far as I am able, but owing to pressure of official work, I have had to prepare this memorandum very hastily.

4,760. The CHAIRMAN: You have been 19 years in the service of the Imperial Government in Basutoland?—Yes.

4,761. In connection with native affairs all the time?—Yes.

4,762. Did you serve under Sir Godfrey Lagden there?—I did.

4,763. What position did you hold under him?—I was Government Secretary under him.

4,764. Your statement is so very full that there is very little that I want to ask you about it. Are you able to compare the industrial habits of Basuto with any other South African tribes?—No, I do not know much about other tribes.

4,765. Do you know that they are more industrious than other tribes of South Africa?—Yes; but not from personal knowledge, more from hearsay.

4,766. You take exception to the general statement, or the general idea as to slothfulness of the South African natives generally being applied to the Basuto?—Yes, I take exception to it because I think that the conditions they have been living under have not hitherto induced them to do very much labour. One must admit that the conditions are altering, and I think the Basuto are adapting themselves to the altered conditions.

4,767. You think they are not naturally indolent?—No, not naturally indolent.

4,768. You give the hut-tax collections for the last three years. What is the amount per hut?—£1.

4,769. Per annum?—Yes; and an additional £1 for each additional hut or wife.

4,770. You speak of natives going out in 1893 and 1894. I am referring to page 4 of your statement. You say, "In 1893 to 1894 the following passes were issued." Are you referring to a period of 12 months or to a period of two years?—From the 1st of July, 1893, to 30th of June, 1894.

4,771. A period of twelve months?—Yes, each a period of twelve months.

4,772. Now, you state they went out as follows:—"20,000 for labour and 32,207 for other purposes." Will you explain these two sub-divisions to the Commission?—Passes are issued on the ordinary pass form which is in use in Cape Colony, and a line in that form has to be filled in, I think, for the purpose of the journey, and the native interpreter who, as a rule, fills in the pass, put against it in those days either "seeking work," which was the usual expression for a labourer, or "other purposes," which would mean visiting; this would mean the natives would be visiting their friends in the Free State, or they might be attending a marriage feast, or something of that sort. In those days we did not classify them more accurately than that; they were shown as either "seeking work" or "other purposes."

4,773. And boys who are engaged in Basutoland to work elsewhere, would they be included under the first head, "For labour"?—Yes.

4,774. Is there a different classification made now?—Yes, the Commission will observe that in the last return, on page 6, during the years 1902 and 1903,

they are classified more particularly as to the destination. These particular classes of "labourers" and "travellers" are the classes. I asked for the returns to be sent to me from districts under these particular heads. I state a little further on that I think it would be possible to improve upon that method of classification. I think greater accuracy and more completeness might be obtained, and during this last year we have gone further in that direction than we have done before.

4,775. You mean that in addition to the classification you give for 1902-3 you hope in future to give a still more detailed classification?—Well, it could be done if necessary for labour industrial purposes. It would mean more work at the offices.

4,776. But take page 6 of your memorandum, 1902 and 1903, you could not hope to do anything better than you have done under "farm and domestic service," for instance, say 34,042. Do you suggest that you could give us a better sub-division of that figure?—No, not in that particular respect. I do not think that could be improved upon. I think if instructions were clearly issued to all offices at the commencement of the year, we might have a register so kept that one would be able to get more reliable figures than these. These depend very much upon what the native interpreters choose to enter upon the passes, and I think if more division was called for, one might have more reliable figures.

4,777. Do you wish to suggest with regard to "Other purposes, 78,802"—that a further sub-division might be made?—I do not think it is necessary. I would suggest, if a practical suggestion had to be made, that passes of different colours should be issued. It should be distinctly a labour pass, or a travelling pass. That would give at once two great divisions, and the labour passes might be further sub-divided in the register according to the destination of the labour.

4,778. What I want to get at is this. Will this labour defined here as having left the country "for other purposes" which you have stated to be for visiting purposes, do any large number of them take work while visiting?—A number of them do. In this particular year we are speaking of, I would like to explain the figures are very high, 132,583 took passes; that is an abnormal number. But in that particular year a great many refugees were in Basutoland, and, at the conclusion of peace they began to return to the Orange River Colony, and they are all included in this number. So that it is not a normal year.

4,779. Then would you also say the year 1901-2 was not a normal year?—Not a normal year, because of the war disturbing the conditions.

4,780. And could you give the Commission any approximate idea of the numbers that would leave the country for these different purposes in a normal year?—Well, a fairly normal year would be the year from 1898 to 1899, or from 1897 to 1898, before the war touches the matter.

4,781. Well, for one year, 1897-98, you give us a total of 75,790, and for 1898-1899 a total of 94,024. Would you take one figure between these two to be a normal year?—Yes, that I should think would be a normal average of the passes issued.

4,782. It has been stated here that the condition with regard to working on the mines that a boy must engage for six months has prevented quite a number coming to work on the mines. Have you heard that objection made by Basuto?—Oh, yes, that was the principal objection when I asked the question in connection with the Native Council. On page 9 of my memorandum I mentioned that I put the question to the Native Council, and they gave me six reasons, and the first reason was the six months' contract.

4,783. And the other reasons are enumerated in your statement?—Yes.

4,784. Mr. DONALDSON: I see on page 5 of your statement you had in 1897 and 1898 a total of 75,790 taking passes, and in 1898-99 you have 94,024. You have got them under two headings—for labour

so many, and for other purposes so many. I suppose those "other purposes" are private purposes. They come out of the country with passes to attend to their own affairs, not to go out to work in that way?—Yes; passes issued for any other purposes than labour—collecting debts, visiting, attending marriages, feasts, and one thing and another.

4,785. So that in these years which you consider normal years, you might say that there is an average of about 33,000 leave the country to labour?—Yes.

4,786. And I think you also state that they object to work for more than three or four months. What would the average period of their work be?—Well, that is rather hard to say. In the past we have had no system of registering their return. I am inclined to think that three or four months would be the average period.

4,787. That is to say in the normal year at one time the average of Basuto labourers working outside their country will not exceed from 10,000 to 12,000?—No; I think one can take it as higher than that, because the same man might go more than once.

4,788. But then, if he went more than once there would be another pass required?—Yes.

4,789. Would not that come back to the same thing. You get the number of labourers out of the country at one time, and divide this by three or four, if they would work for three or four months?—Exactly; of course it is a rough estimate. I have no means of ascertaining how long the average stay of the labourer is. For instance, on farms they probably stay longer than they would at the mines. They go to a farm and remain a season.

4,790. Do you think that the Transvaal may expect greatly increased supplies of labour from Basutoland in the near future?—No, I do not think so; not while the present competition for the labourers continues.

4,791. Mr. EVANS: On page 8 of your statement you have a list of labour agencies, and the 12th is the contractor for the Central South African Railways. Do you know who this contractor is?—There are two; there is Mr. Patterson, who is doing one section of the line, and I believe the other contractors are Wells and Driver, who have half the branch of the section.

4,792. Have they been recruiting for any length of time?—Not very long—since the extension from Thaba 'Nchu. I think Wells and Driver were really recruiting before the railway reached Thaba 'Nchu. They have not been recruiting more than a year. I could ascertain these things, but I have not had them before me.

4,793. Do you know where this construction has taken place?—Yes.

4,794. Where was that?—Wells and Driver are constructing the earthworks from Thaba 'Nchu half-way to a station called Modderpoort, and Patterson has the remaining section to Modderpoort.

4,795. Both in the Free State?—Both in the Orange River Colony.

4,796. I see on the other page you have the Chief Engineer, also of the railway, recruiting?—Yes.

4,797. Do you know who is recruiting for them?—A man named Sterley.

4,798. And do you know whether they are obtaining a large number of natives?—That particular agency, No. 19, was only down a few days before I left. It was the last one I put down.

4,799. Then you mention here the Knights Gold Mine; that is also on page 8. Is that mine on the Rand?—The agents are a firm called Hickling and Co., at Maseru.

4,800. Do you know who they are recruiting for?—It is registered in this form: "B. Denny, Contractor, Knights Gold Mine, Transvaal, for £3 per month for six months' contract."

4,801. You mention that the Central South African Railways pay 2s. per diem; would that be with

food and shelter in addition?—That is No. 12. Yes, with food and shelter in addition; but of course the shelter is very primitive.

4,802. That is equal to £3 a month quite close to Basutoland?—It is £3 for 30 working days.

4,803. With food and shelter, and quite close to the Basutoland border?—Yes, within ten miles of the border.

4,804. At the end you make certain suggestions. Now, would the application of your suggestions increase the number of Basuto working?—At Johannesburg?

4,805. Well, generally. Or, I will put it in another way. Would the adoption of your suggestions, so far as Johannesburg is concerned, simply mean diverting to the Rand labourers who are now working for other employers?—Yes, I think that would be the effect. It might also have a certain effect in increasing the general number working, but the principal effect would be in rendering the Johannesburg mines comparatively more attractive.

4,806. But do you not think that the effect of improved conditions here would be to compel other employers to improve their conditions in order to retain the boys—it would lead to a general rise in wages all round?—I have not suggested a rise in wages.

4,807. I am simply asking if the adoption of your recommendations would not really mean that?—It is rather hard to tell beforehand what the result of any measure would be, but I suppose it would mean that if it had, as I suppose it would, the effect of withdrawing labourers from local works, local contractors would have to take some steps to retain the services of these boys, and they would probably raise their wages, or offer some other inducement.

4,808. I take it there is not in Basutoland a source of supply which has not already been tapped? No, I do not know whether the mountain districts have been worked by agents very freely. I do not know whether it would make much difference to the numbers, but the agents have not visited the mountain districts; they confine their operations more to the camps and to the border districts.

4,809. Do you think that high wages would have the effect of reducing the number of months that the Basuto would work here or anywhere else?—Do you mean—

4,810. That is by earning a lot it would enable them to stay at home more than otherwise would be the case?—No, I do not think that; that would not occur to me. I should say that they would spend their money and then earn some more, that is my impression, not that they would save their money, or that they would live on their savings or anything of that sort.

4,811. I see. What do you consider the ages of the natives who come here to the Rand to work—between what ages would you put the bulk of them down at?—Of course very few of the native gangs have come under my eye, but those I met on the road or coming to the office, I should say 18 years was about the minimum. There was a number of young looking boys amongst them, but I should say 18 would be about the minimum.

4,812. And what would you put as the maximum—the age at which they practically cease coming out in large numbers?—I should say as a general rule 35 years or so.

4,813. Are you acquainted with the natives of any other part of Africa?—Not intimately. I have lived amongst others, but I do not know them as well as I know the Basuto.

4,814. You consider, I take it, that the Basuto is the most industrious of the native races?—I have always understood so, but it is not from personal observation, as I never had anything to do with the others from an industrial point of view. I am speaking of Colonial Kaffirs, Basas of the Umzimkulu or Pondos.

4,815. Do you consider that the climate has any effect on their industrious character?—I think it has; I think a cold climate has—

4,816. Is Basutoland about the most rigorous climate in South Africa?—I do not know. I do not think it is colder than the high veld here. It is certainly colder than all the coast regions and the Transkei.

4,817. Then I shall put it this way; than any territory occupied by natives?—I do not know these climates. I am inclined to think it is as cold as any of the high veld in Africa, and a great deal colder than any of the coast regions.

4,818. Thank you, Mr. Sloley.

4,819. Mr. PHILIP: You have given us the figure of the boys who have gone out to work and on a visit, for 1898 and 1899, as 94,000; on page 7?—I beg your pardon; on page 7?

4,820. On page 5 rather; you have got there 94,000 boys?—Yes.

4,821. On page 5 you state the total available labour is about 30,000?—On page 5.

4,822. Yes, in the second paragraph, "I estimate the number of young men available for labour on public works, mines, etc., at about 30,000"?—Yes.

4,823. Then according to these figures on page 5 it is evident that nearly all these 30,000 go out during one part of the year at any rate?—Yes.

4,824. And you do not think it is likely we will increase our labour supply from Basutoland while there is so much competition for the labour?—No. I think under exceptional circumstances you might increase your labour supply from Basutoland. For instance, if these other industries were suddenly closed down, the railway works and local mines at Jagersfontein and Cape Colony coal mines, and if, at the same time, you had a poor harvest in Basutoland, you would probably, while these conditions lasted, have a very material increase, but that is a think not likely to happen.

4,825. Mr. FORBES: You give here number of passes issued for visiting and other purposes?—Yes.

4,826. Is it not quite possible and very probable that one native may account for several of these passes?—Oh, yes; if he went over to get some brandy he would probably get a fresh pass each time.

4,827. And do females require passes in Basutoland?—As a matter of fact they do not.

4,828. Mr. BRINK: On page 3 you say, "their usual occupation when in Basutoland is agricultural work on their own lands, their neighbours, or their chiefs." I should like to ask whether the Basuto as agriculturalists are making the same rapid strides in progress as the white farmers in the Orange River Colony; whether or not on the same piece of ground they would be able to produce, say, more mealies, wheat or anything else?—On the same piece of land?

4,829. Yes. I will put it in a plainer way: whether the Basuto through being an agriculturalists are getting more wealthy and more independent?—No, I should say that is not the case. They have got very wealthy of late years; they have markets for their produce and such things, but until late years they did not. But at the same time their wants have increased proportionately, and I have no doubt that they have not only a great deal more money than they used to get, but they have a great deal more to do with it. That is my opinion of them.

4,830. Their wants increase in the same proportion as their wealth?—Oh, quite, I think.

4,831. Mr. TAINTON: You say on page 3 that the figures given there do not include certain articles which do not pay duty: can you tell us roughly what articles are free?—Of course, all South African produce is not included there. Colonial manufactures are not included there. I should have to have the tariff to refer to, but these two items occur to me as affecting the question. Colonial produce, South African produce, and Colonial manufactures.

4,832. Basutoland is a producing country and the quantity of Colonial produce coming in would not be much?—No. In bad years grain is imported, but it would not be much, as you say. Stock, horses and sheep and that sort of thing they purchase. All South African produce.

4,833. And Colonial manufactures?—All things like that, sir.

4,834. What would that cover?—A great deal of clothing. Suppose they bought clothing from a manufacturer in the Cape Colony, it would come in as a non-dutiable article.

4,835. I see. We may take it then that these figures give us fairly accurately the invoiced value of European goods imported into Basutoland?—No, the English Coast value. You would have to add to these figures, freight, insurance and one or two profits, I suppose, and transport up-country. I should think it would be almost doubled by the time they reached the hands of the Basuto consumers.

4,836. Yes, but these figures are included on the ordinary basis upon which the imports of the country are calculated. Take Cape Colony. The price of the goods imported into Cape Colony is the coast price, I think. This was the case in Basutoland also?—Which coast price; the price at this coast or the English coast?

4,837. The African Coast?—No, this is not the African cost. This is at the English cost; say it is a bale of blankets which include merely the manufacturer's charge, and I think under the Customs Convention packing may be included.

4,838. These then are the invoiced values?—I do not know how they make out their invoices, but they are all, I know, very far from the rental values to the Basutoland purchaser.

4,839. I did not want to know that?—I do not know how the invoices are made out. The figures are assessed by the Cape Customs officers in giving us our share of the duty, and he only takes the English coast value, and he must have a good deal of technical knowledge as to the English coast value.

4,840. On page 7 you say that an estimate of the population made in 1901 gave a total of 262,000 persons?—Yes.

4,841. Have you any figures or can you give us an estimate of what the present population is?—No. I have no means of doing so. I know there must have been a certain natural increase in two years, and I should think, as a set-off against that, there has been a certain exodus of people to the Orange River Colony after peace was declared.

4,842. There has been no extraordinary immigration into the country?—No.

4,843. If you leave out the figures of the value of goods imported during 1900—1899—1901—as being more or less abnormal figures, due to the war, do you consider the average for the preceding years is something less than £120,000 a year as the value of European goods imported? Do you agree with that?—Yes, if you take these years as abnormal years, but the returns are pretty constant. For instance the following year, 1902, the Customs fell very little short of the year 1901.

4,844. Yes, but I think we had better leave out the years of war and the year immediately following the war as likely to be affected by other causes?—Yes.

4,845. I should like you to take the preceding years. From your figures the average consumption per head of the population in Basutoland is about 9s. in value?—I have not worked it out. You are taking these figures.

4,846. I have taken an average of about £120,000 as the yearly value of European goods which comes out at an average of something less than 10s. per head of population?—I have not worked it out; I do not know. Are you taking these figures as English coast values?

4,847. Yes?—Those are not the figures of the price at which the goods sell. It is not the figure the Basuto pays for the things himself.

4,848. You have made that quite clear. Could you give us the figures of the value of agricultural produce exported yearly?—Yes, I have my annual reports for several years here.

4,849. Take 1898, say?—For the year ending 1898?

4,850. Yes, as being a year not affected by special factors, the year from 1897 to 1898?—Yes. Well, the exports for that year were calculated at £138,000.

4,851. Roughly, then, the value of the agricultural produce exported is equal in value to the value of the European goods imported on these figures?—I cannot admit that, because I think it is admitted that the figures do not give the imports from the time they cross the border.

4,852. I would ask you to leave that out. I think you have made quite clear what your meaning is?—Would it not be misleading to do that?

4,853. How is the value of agricultural produce calculated?—Well, it is calculated by calling upon traders to render quarterly returns of their exports of wheat, mealies, Kaffir corn, meal, mohair, cattle, horses and everything.

4,854. They quote, I suppose, the buying price, not their selling price?—That I do not know. I should think probably that it would be averaged by the district officer making up his district returns. If he saw any excessive prices in making up his district returns he would, I think, probably average them.

4,855. When did the Basuto first come into contact with the British, do you remember?—Well, they came into contact with Sir George Cathcart as far back as 1852, and I suppose they had relations with the British Resident at Bloemfontein before that, in 1848, 1849 and 1850.

4,856. I take it then they have been in contact with Europeans for 50 years?—Yes.

4,857. And in that period their consumption of European goods has risen to something less than 10s. per head; is that correct?—No, I cannot say that it is correct. Are you taking the figures I have given?

4,858. I am taking the figures you have given us?—At those figures, I suppose it is; I have not worked it out.

4,859. Are the Basuto popularly supposed to be the most progressive native tribe in South Africa?—Well, of course, I do not know what the popular supposition is.

4,860. What is your opinion?—Then again I do not know the other tribes; I believe the Fingos are a progressive tribe.

4,861. Well, may we take it that they are considerably above the average as regards progress?—I should think so, decidedly.

4,862. You see these figures are of considerable importance because they give us a standard by which we can arrive at the consumption of goods by natives throughout South Africa. If the Basuto are more progressive than other tribes your figures would go to show that that consumption is less than 10s. per head. Would you agree with that inference?—Oh, yes, if you take the figures as they stand here, it is so.

4,863. That is after fifty years' contact with Europeans?—So it seems; I believe history states that. I think, too, I ought to say while on the subject that they are making immense purchases outside the country which are not included here. The boys return from Johannesburg, and I have met them laden with blankets, saddlery, boots, etc., which they have bought at Johannesburg, Senegal, or Bloemfontein. I must say, on the whole, I do not follow the argument as to the 10s. per head after 50 years, but, of course, the figures as I have put them here remain correct as far as I am concerned.

4,864. Do the goods they bring in in that way pay duty?—Oh, yes.

4,865. The goods the natives bring in?—They do not pay duty to us. We lose all that, but they pay duty where they purchase them.

4,866. Could you give us the average character of these purchases; what do they roughly consist of?—Well, I should say clothing, boots and saddles principally.

4,867. I would like to take your figures as to the labour supply of Basutoland somewhat more in detail than was done by Lieut.-Col. Donaldson. I have taken out the average yearly number of the labourers leaving the country from 1893 to 1899, leaving out the year 1896-97 as being an abnormal year on account of rinderpest. Leaving out that year the average number of labourers who left the country in that period of six or seven years was a little less than 30,000 per year?—Yes.

4,868. Could you give any explanation of the increase in 1902-03 when the figures came up to 44,000, or considerably above the yearly average?—I can only assume that there are additional attractions and that recruiting has been pushed more systematically and vigorously, and, of course, under that line, "Farm and domestic service," a good many refugees are included under that heading also.

4,868A. You say a good many refugees?—I should rather say a good many Basuto went back to their Boer masters. You see at the time of the war they came over to our side and immediately peace was declared the Boers came back to seek their people and take them back on to their farms.

4,869. To some extent the 1902-03 figures represent the exodus after the war—natives returning?—I should say so, particularly with reference to those under the headings "Other Purposes" and "Farm and Domestic Service." Will you allow me to reconsider my answers. I do not know why I should say that about the "Farm and Domestic Service," because I see in other years even more went out; in 1897-98, 45,000 and in 1898-99, 24,000 went out, so I should say that the abnormal conditions following upon peace affected the last year, 1902-03 alone, that is to say, "Other Purposes," but hardly "Farm and Domestic Services."

4,870. Where do you get the figures mentioned just now of agricultural labourers?—In previous years. Well, every year they are included in "For Other Purposes."

4,871. Well, that does not include labourers, I am taking labour figures alone?—For labourers alone it was an abnormal year. In 1898-99, which was before the war, the figures were 24,000. I should say 44,000 was abnormal on account of the return of those boys to the farms.

4,872. Then we were told by Mr. Fraser, from Basutoland, that he considered the present year one peculiarly favourable for labour recruiters, one reason being the bad harvest. Would you agree with that view?—I do not think the harvest is quite as bad as was thought at one time. It is bad in certain places, but it is not a good harvest, and it might be said to be a favourable year because there is not an abundance of food in the country. The boys could not get their living by simply idling about drinking beer from kraal to kraal. It is not one of those years.

4,873. You said in reply to another Commissioner that the average period of service was from three to four months?—I estimated it at that, but I have no means of checking it. Of course, I daresay if you take farm service it would send the average up a good deal. I think the service for the mines and public works is probably three or four months.

4,874. We must reduce the figures to the standard of a year, and if you take four months as the working period it is necessary to divide that total of 30,000 labourers by three. We get then as the yearly average from Basutoland 10,000 labourers. That I think is correct?—You are taking this last year, 1902.

4,875. No, I am taking the six years already dealt with when the yearly average was normal and only 30,000 a year?—Yes.

4,876. If you reduce those figures to the standard of a year you get an average of 10,000?—Yes, if you take the average at three or four months. I have not calculated it.

4,877. Upon a basis of, say, 270,000 persons only one in 27 came out from Basutoland for outside service. Is that correct?—270,000?

4,878. Yes, 270,000. Divide that by 10,000 it gives 27 as the figure?—I did not give 270,000 as the figure.

4,879. Take 270,000 as the present population, allowing for natural increase, or take 260,000 if you like; that gives one in 26 of the total population which goes out to outside service?—I have not followed out your calculations, but should think the ratio was more like one in 26 out continuously.

4,880. I think you said that the Basuto are more industrious than other tribes?—Yes, I am under that impression.

4,881. We may take it then that the figure is rather above the South African native average. Do you agree to that?—I do not know. It is rather pinning me to a theory I am not prepared for. I say they are very industrious, but I do not say they are, compared with what has to be done. They do a great deal of work in the country, and should say they are very industrious at home apart from going out.

4,882. Leave the home work alone for the moment. I want to get at the labour output from Basutoland, which comes out, according to your figures, at one in 26. You said just now you considered them industrious, and I take it that that reply meant that they went out to work?—No, it did not mean that. It meant they were more industrious at home and out at work. I do not mean my reply to be that they went out to work more freely than other tribes, because I do not know how other tribes go out.

4,883. Do you wish to qualify the reply by saying that they do not go out to work as much as other tribes?—I do not follow that reply. I said, "My general impression is that they are more industrious."

4,884. You see, Mr. Sloley, this is a very important figure. We have very few labour statistics in South Africa and these from Basutoland are the most reliable we can obtain. I want to get at the average working population from that country. It comes out on these figures of 1 in 26, and I would like to know whether you think that is a fair inference from statistics supplied?—No; I should think if you are going to base general inference for the whole of South Africa on those figures, it would be well to be cautious, because I do not think those figures are absolutely accurate.

4,885. They are approximately so?—Approximately so, but I should say if you are going to take the figures in any particular district or territory, it ought to be more accurate than these are before you can base a theory for the whole of South Africa.

4,886. It is not a theory. The figures may vary one way or the other, that is what I understand you to say, but they are approximately a fair average figure for the Basuto?—Yes, but you see the calculation you are making and wish me to concur in is based upon a theory of pure guesswork that the period for service is from three to four months. I do not know that. I am only assuming that, because I hear so often that the Basuto do not wish to come to Johannesburg for more than three or four months. I do not object to the conclusions you may draw from my figures, but I do not wish to give my assent unless I have worked them out.

4,887. The figure, three to four months, we have had from a number of other witnesses. I think that part of your statement assumes that is the figure and that the Basuto do not care to go out to work unless it is for a short period; in fact, the six months' period is the first objection which

was made by that intelligent member of the Native Council referred to at the bottom of page 9?—Yes, the first and the great objection.

4,888. We were told by Sir Godfrey Lagden that the area of Basutoland was 10,000 square miles?—Yes.

4,889. Upon the population figures you have given us that brings out the acreage at 23 acres per head, including men, women and children. Is the country densely populated as compared with other sections of native South Africa?—Well, I think the population runs about 25 to the square mile. In Bechuanaland it runs at one decimal something to the square mile, so that it is more densely populated than that. I do not know the acreage of all these territories, so I could not say. The 10,000 square miles include the mountain district which is not suitable for agriculture.

4,890. Is it suitable for pasture?—Some of it is not suited for that even.

4,891. Basutoland is regarded, taking it as a whole, as one of the most fertile districts in South Africa?—Yes, I have always understood so by reason of its rainfall.

4,892. This average, then, of 23 acres per head of population, goes to shew that there is not likely to be any immediate pressure of the population upon its means of subsistence. Would you agree with that?—No, I think not the actual means of subsistence. You see they cultivate and plough a great deal more land than is actually required for subsistence. They cultivate it for the market.

4,893. That reply would go to shew that my inference is fair. They not only supply their own wants, but they are able to sell their surplus produce?—Yes.

4,894. Now take your statement as a whole, Mr. Sloley, is it fair to infer that it shews the Basuto as a tribe are developing rather as agriculturalists than as outside labourers?—You mean comparing such statistics as there are for the last ten years?

4,895. Comparing such statistics and statements as you have given us?—No, I am inclined to think that the limit of agricultural production has been reached and now the tendency will be rather in the direction of forcing them to live less and less on the land and go out and seek work.

4,896. Is there no room for improvement in agricultural methods amongst them?—Well, I am not an agriculturist. I should think there is not to a very great extent. They have learnt their lesson from the Boer farmers who know a great deal about it. They may plough deeper and by doing so would exhaust their ground sooner.

4,897. They do not use artificial manure?—No, they use the manure for fire, which is rather a pity, as it exhausts the soil.

4,898. Is the agricultural produce of Basutoland obtained from fields which have not been manured at all?—I do not know of any single field ever having been manured.

4,899. How is the output maintained? Is it due to the fertility of the soil?—You know they give fields a rest if they are worn out; they throw them out of cultivation.

4,900. They put fields out of cultivation?—A worn-out field is thrown out of cultivation.

4,901. Then there is surplus agricultural ground?—Yes, if you look at it that way, but the percentage is very small, put out like that. Most of the fields are ploughed year after year, and one does not hear of their being worn out.

4,902. Take your list in page 8 of labour agencies represented; have you any experience as to the measure of success obtained by those agencies? Are you able to compare their methods?—If you would not mind, before you ask that question, I have been asked to say that there is surplus ground. It is rather a serious thing to say, because I state there is not much surplus ground. I have consistently said in my annual report that

there is not any surplus ground. There are a few fields not cultivated, comparatively few, which are having a rest, but I do not think that you could call that surplus ground, and I should not like to bind myself to that statement because certain fields are given a rest occasionally for a period of years. I should not like to base a theory on that, that there was surplus ground, because any ordinary traveller would not see much surplus ground.

4,903. Have you any statistics bearing upon the relative proportion of agricultural and other land? Can you tell us how much is set aside for agriculture?—No, I have no statistics, only the impression one gets from travelling. Near the border, near the Caledon River, there is arable land, and there is very little grass; in the mountains there is very little cultivation comparatively.

4,904. In the mountains there is very little?—Comparatively, the mountains are principally grazing veld and on the plains you find fields.

4,905. To go back to the question put just now with reference to page 8, are you in a position to compare results obtained by various labour agencies; is one more successful than another?—No, I am not in a position, because the passes are not classified; they are simply marked Johannesburg or Transvaal.

4,906. Have you had any complaints from the Basuto or have you heard of any complaints as to the methods of any of these agencies—any one of them?—Any of these mentioned here?—Yes, I have.

4,907. Could you mention which has been complained about?—It was not a complaint which came officially before me for decision. The Paramount chief complained of the agent for the Johannesburg Municipality.

4,908. Yes, that is interesting?—I do not think it need be taken as an official complaint. I do not know if it was a well-founded complaint, but you asked me if there were complaints, and I give you it.

4,909. What was the complaint; to what effect?—He did not specify the complaint. I was with Lerothodi and talking to him when the labour question cropped up. It is rather an awkward thing to have to mention the name of a labour agent, as I do not know if the complaint had any foundation.

4,910. The CHAIRMAN: I would not mention the name.

4,911. Mr. TAINTON: What was the nature of the complaint? We do not want the name of the agent.—Well, he simply said so and so deceives people. I said I never heard of that and said if there is any deception, complaint should be made to proper quarters—to the Magistrate.

4,912. What I want to get at is this; my question is rather of a general character. There has been no objection from any section of the Basuto people against the methods employed by these various agents?—Yes, you will see in my statement at the Council meeting that was one of the objections this speaker took.

4,913. I am not referring to these agencies you mention, but has there been any objection by any considerable section of the people against the methods pursued by any of these individual agencies?—That was an objection against the agencies.

4,914. But excluding that one just mentioned?—If I refer you to page 10, the third complaint was misrepresentation by agents. I say I did not attach too much importance to it, as I do not think the agent in the country as a rule makes misrepresentations. I hear that the labourers are sometimes "jumped" on the road by other agents, who give glowing accounts and thereby deceive the boys. I have heard that said. The Basuto did not mention that, they simply said the agents deceived the people.

4,915. Have you heard any special complaints against the organisation of the Chamber of Mines?—You mean the Witwatersrand Native Labour Association, yes.

4,916. Have you heard any complaints against that officially?—From the Basuto?

4,917. Yes, from the Basuto?—No, one agent complains of another, but that is very often jealousy.

4,918. Mr. WHITESIDE: Mr. Sloley, do you come much in contact with boys returning from the Rand?—No.

4,919. Have you heard any opinions expressed as to what the reputation of the Rand is amongst the Basuto?—You are referring to what it is now?

4,920. Well, if you know of any complaints in any special period it would be well for us to have them?—I am speaking of a period of, say, six or seven years ago. I used to hear that they complained of the death-rate here—of coming up here and dying. I heard that what you might call the Christian section complained of the demoralisation of their sons, and I heard that they complained of harsh treatment and exactions in the way of monthly tax and flogging. I heard that they complained of being robbed on the road. Those are the complaints that I can just think of which refer to a period of six or seven years ago.

4,921. Are there any complaints of a similar nature nowadays?—You see on page 9 of my memorandum I give the main reasons. The second reason I give is the difficulty of a man returning in the case of sickness they do complain of that. If a man gets ill he is not allowed to return until he is so ill that he is not allowed to return alone, and then there is the difficulty of getting a man to travel with him, and he sometimes dies on the road. That is a complaint. I asked the speakers about complaints as to food. One of them said that the meal was sometimes not good and gave them pains in the stomach, but he said that was not a matter we make much of because when one goes out to work one does not expect to have as good food as you have at home. I think that was his expression.

4,922. So the Basuto are a very tolerant race with their treatment outside?—It struck me that when coming out to work they do not mind roughing it a bit as long as they get well paid.

4,923. Have you heard any complaints with regard to the compounds?—No.

4,924. You have also heard opinions regarding their management, I suppose?—No, I cannot recollect any complaints about their management.

4,925. Mr. QUINN: Mr. Sloley, I have only two or three questions to ask you. On page 3 of your statement you give us the figures under the heading of dutiable goods imported into Basutoland. From these figures it would appear the amount of money spent by the Basuto for this particular class of goods has increased in seven years from £68,674 to £230,680. It has nearly quadrupled in seven years. That is so, is it not?—It does appear so, but that year was an abnormal year.

4,926. I am taking seven years?—Of course, when I say it is abnormal, I think the figures are being maintained; I think the answer to your question, however, is yes.

4,927. The question pressed on you by Mr. Tainton is quite as important to this Commission as he said it was, and the suggestion made by him to you was that after 50 years of contact with white people Basuto spent 9s. per head—I want to show that that is very far from the mark, far out. Now in addition to these dutiable goods imported into Basutoland, in addition to the amount you have pointed out—the chances are by the time the natives get these goods they would be at least double the original invoiced price. There are the duties, the cost of bringing them into the country, to say nothing of the small matter of the various traders' profits which are all to be added to these figures before you can get anything like the amount the natives spend; that is so is it not?—Yes.

4,928. And if we double them or even only add 50 per cent., which is far below the mark, we get a very large amount of money, nearly £400,000 of dutiable goods?—Yes.

4,929. Then you go on to say they also spend considerably on goods that are non-dutiable imports, horses, cattle, sheep, waggons, and various other things?—Yes.

4,930. Now in addition to that, I understood you to say that you had noticed a very large number of natives who went out to work, and invariably—you do not say so, but I take it, it is so, and I put the question to you—returned with considerable purchases. They bring back all sorts of goods with them from the Free State or the Transvaal, or where they have been working; that is so, is it not?—That is so, and in that connection I might say that the speakers of this Council also gave as a grievance, or as a reason for not coming to work, the fact that they were intercepted by the Customs officer on the way down to Basutoland and charged duty on their things which they had purchased. I do not put it down as one of the six reasons, as I explained to them that it is now done away with under the new Convention. The fact of them mentioning that as a grievance quite confirms me that a considerable amount of their money is spent before they return home.

4,931. We know it. So that any attempt to suggest to you that they spent so many shillings per head per annum is quite out of the question. You would not answer that question in that way again, I take it, that probably 10s. per head represents the amount of money they spend after 50 years' contact with the white men, because on this an attempt is made to suggest to you to base some calculations of the amount of money spent by the different tribes in South Africa?—I do not wish to be connected with that theory. I made that clear, I think.

4,932. Quite so, I can understand your disinclination to be connected with that. Now in answer to another question, I think you were clear on the point. You were able to give in that case a definite answer to this effect, that the more they earn the more they spend. As you put it in your own language, "Their list of wants has increased enormously." That is so, is it not?—Yes.

4,933. As far as Basutoland goes, would that lead you to believe that having gained the few things for which they longed before they came to work, instead of their going back and resting satisfied, the Basuto, like other people, like white people, find their wants increase as they become more and more civilized. Would you care to put it in that way?—Yes, I think I would like to make it clear in my answer. I do not quite agree with the theory that the Basuto goes out to get a wife and buys a few cattle. He is continually earning money and spending it.

4,934. With regard to these comparisons which you were asked to make between the Basuto and other tribes in South Africa you, in every case, I think, made it clear that you do not pretend to speak with any authority about the other tribes at all?—No.

4,935. And when pressed you answered that way every time. You wished that to be clear. You speak with authority on the subjects you were asked to speak about, that is to say the Basuto?—Yes.

4,936. With regard to what you have said about the other tribes in South Africa, that is more or less hearsay?—Yes.

4,937. Now on page 9 of your statement, Mr. Sloley, you say "An intelligent member of the Council, speaking for the rest, gave six reasons which tended to deter the Basuto from coming to the mines." The first is the six months' contract, which is said to be too long. "This, I believe," you go on to say, "prevents many from engaging." Is it a fact that while they object to engage for more than three months for the mines that large numbers of them employed in other service in this part of the world—in the Transvaal—do remain a much longer period than three months—in stores, domestic service, etc. Can you tell us whether there are a large proportion of Basutos coming here engaging in service such as I have described and who stop here a very much longer

period?—I have no figures to go upon. I really cannot say. But I should certainly say those who come to work on farms stay considerably more than three or four months.

4,938. Take municipalities; we have them here in this municipality and they stay very much longer. Is that within your knowledge?—No.

4,939. Is it within your knowledge that the number of those coming to the Transvaal—I am told by the agents that there is rather a greater number went to the municipality than to the mines. Then any attempt made by you to base calculations on the number of Basutos working only three months might lead this Commission very far astray?—Yes, because an error in your premises might lead you very wide of the mark when you are dealing with hundreds of thousands.

4,940. Therefore, with regard to these calculations suggested to you, you really have not had time to do them justice, or give time to them for corrections?—No.

4,941. Mr. TAINTON: When does the Basutoland financial year end?—The 30th of June.

4,942. With regard to these figures you give on page 8 as to dutiable goods. Are they taken for the financial year ending June in each case?—No, they are taken for the financial year ending the 31st of March. Because the Cape Customs Departments which really keep the accounts with us, and credit us with the duty, are not able to prepare the June accounts by the 30th of June. March is the last month we get in that 12 months. They have quarterly accounts.

4,943. How then would you read it so as to be quite correct? Do you give them as from the 1st of January to December or would it be to the 31st of March?—The first year I am inclined to think did not run with our financial year at all. The first year in 1894 rather ran with the calendar year. Now, in the annual report, dated 1894 and 1895, that figure 68,674 was for the year ending the 31st December, 1894.

4,944. Is it for the whole year? Is that total for the whole year?—It is the total for the 12 months. It was framed by the Government Secretary of those days, who was not myself. The paragraph commences, "The dutiable goods imported into Basutoland for the year ending the 31st of December, 1894, amounted to a gross value of £68,674, being £29,326 less than 1893." He goes on to account for that by a temporary depression in trade which the whole country was suffering from.

4,945. Then the figure which Mr. Quinn took for 1894 was a year when abnormal causes were at work and when the imports were £29,000 less than in the previous year?—Yes.

4,946. Now, take your last figure, 1901. Did that year end on the 31st of March, 1901?—Oh, no.

4,947. That would end on the 31st of March, 1902?—That is for the year; that £230,680 is for the year ending March 31st, 1902.

4,948. That period then covered the war period?—Oh, yes.

4,949. Is it true that you had a large number of refugees—native and white—in Basutoland during that year?—Yes.

4,950. Do you think that that extra population accounts in a great measure for the increase in the dutiable goods imported?—To a certain extent.

4,951. Can you give any reason why the figures for 1897-1898 and 1899 are less than they are for 1896 and 1897?—I think that I might hand these reports in, for 1898.

The reports were handed into the Commission.

4,952. Take the figures for 1898 and 1899; the imports are less than for the previous years. Can you give any explanation for that?—£80,280 is less than the year before. I find in the report of that year £100,280—that is for the year ending 31st March, 1898—and the report on that year said

it was only to be expected that rinderpest, drought, and internal disturbances, would have this effect upon the trade.

4,953. I think you have made it clear from your evidence that the first figure for 1894 is small because of abnormal conditions, and your last figure for 1902 is large because of abnormal conditions, is that correct?—Yes, but the whole increase between 1900 and 1901 is not to be accounted for by that entirely, because in the next year—the year which I should have called here 1902, and which is really the year ending 31st of March, 1903—the Customs rates for that year are almost equal to this big year that we have.

4,954. What year is that?—This year of 1901, which is the abnormal year of £230,000.

4,955. What year?—That is the year, which in my memorandum I have called 1901. It is really the year from the 1st of April, 1901, to the 31st of March, 1902. You see these Customs accounts—we cannot square them with our financial year—we have to take them as the Cape Government sends them—that is the abnormal year. We should have expected a very much greater falling off in the following year than has been really taking place. As a matter of fact, the Customs returns for the next year ending 31st of March, 1903, I have not got the figures; the totals of the goods. I have the drafts for the money itself, and they are almost equal to the Customs for that year. That is to say, the Customs for this year 1901 amounted, I think, to £33,000, and for the following year it was £28,000, so it was keeping well up.

4,956. If you take the figures you have given us, excluding 1901 and 1902, the average annual value of imported dutiable goods is less than £120,000 a year, that is the figure I took; is it correct?—Yes, I suppose it is correct. I have not calculated it, however.

4,957. The CHAIRMAN: Mr. Sloley, the Commission is very much obliged to you for the evidence you have given.

Mr. H. W. INNES, called, sworn, and examined.

4,958. The CHAIRMAN: You are Mr. H. W. Innes?—Yes.

4,959. Have you before you, Mr. Innes, a statement headed "Statement of H. W. Innes,"?—Yes.

4,960. And a further statement which is headed "Supplementary Notes, H. W. Innes, Esq."?—Yes.

4,961. Do you hand these in as your evidence-in-chief?—Yes.

4,962. Mr. Innes' statement and supplementary notes were then handed into the Commission, and reads as follows:—

The district I am acquainted with is Nigeria, having lived there for a period of over two years (1898 to 1900). The natives employed in that territory are the Kroo boys of Liberia, a race of men who are prepared to do any kind of work. Amongst other callings, they are capable of doing mining work; mining operations having been carried on in the Gold Coast for generations. As regards climate, he is able to pretty well stand every kind; many of them journey to England on steamers, and I think a number of them have been tried in Rhodesia. I may here point out that they were not the success anticipated in Rhodesia, since, it is alleged, they did not receive proper treatment. The wages paid are 10s. per month, together with clothing, also housing. When employed at mining work, however, they are paid a higher price, but nothing like that paid locally. Their principal food is rice, and they are also very fond of mealies; furthermore, dried fish forms part of their diet, but it is not absolutely necessary to provide this food. As regards the number of boys available, I am not able to give even an approximate number, as the Kroo country is teeming with natives. I have not the least doubt that recruiting would be allowed in Liberia, if representations were made through official sources. Indeed, I think there would be no difficulty in obtaining an experimental number, say 500 boys. These, if properly treated, would, on

their return, give a good report of affairs on the Rand, and the result would be that there would be a general desire amongst other Kroo boys to proceed thither. The Kroo boys should be kept together. Of course, there are several tribes, but it is not by any means necessary to separate the different tribes. The natives of Sierra Leone and the Congo are paid in kind, such as cloth, etc.; it is only the Government that pays in cash. The natives, therefore, would be greatly pleased to receive money, and this fact alone would prove a great inducement for them to emigrate to the Rand. There are no special ailments; I only heard of two cases of pneumonia during my stay in the country. The climate of the Transvaal would, I am sure, suit the Kroo boy very well, and I feel confident that he would stand it better than the Indian.

1. District: Liberia and Nigeria N. and S.

2. Period: Two years.

3. Character of boys: Very good workers.

(a) Mining, sailors, stevedores, domestic—particularly as domestics.

(b) Rice, biscuits, animal food (once a week).

(c) 10s. per month to 20s., and food and clothing.

(d) Muscular, strong, and wiry, very quick and intelligent and docile. Owing to their adventurous spirit in travelling and working all along West Coast, they are not subject to the usual effects of extremes of heat and cold.

(e) Good treatment, or, rather, management, of first batch, would immediately have the effect of inducing further batches to volunteer for this work (and *vice-versa*, of course), because many of the boys keep up a correspondence with their homes and friends.

(f) 20,000 to 50,000 in Liberia, any number in Nigeria, if they are allowed to leave the State.

The points I desire to bring to the notice of your Commission are based, not so much upon actual experience of the different tribes referred to herein, but upon careful observation of local conditions. It may be now too late in the day to adopt any of the suggestions I wish to offer. The district I am particularly acquainted with is Nigeria. The period I lived on that coast was two years. The boys I came most in contact with were Kroo boys from Liberia. The character of that boy is, I believe, better in every way than any other native of Africa, particularly as a labourer. He will work as a miner, sailor, at stevedoring, or as a domestic. I do not think he would be very useful for agriculture. His usual food is rice and cabin biscuits daily, with animal food once weekly. His pay would run from 10s. to 20s. per month, food, and clothing. He would contract for 12 months, and would not receive any pay until the end of the contract. He is muscular and wiry, active, intelligent, and docile. Owing to their adventurous spirit in travelling up and down the coast they are not subject to any pulmonary affections, being accustomed to extremes of heat and cold. Still I would suggest that they be introduced to the Transvaal during the summer months, and, if possible, given surface work for a period of two or three months at first, so as to become thoroughly acclimatised. Good treatment or rather management of first batch, would very soon have the effect of inducing numbers of other boys to follow from Liberia, and the Kroo Boy corresponds with his home and friends. Of course, *per contra*, bad management would have the opposite effect. I would compute from information received from headmen and others that there are twenty to fifty thousand of these boys available in Liberia. In Nigeria again the country is densely populated, but I consider the boys from Nigeria, as being only useful for mining. As there are no mines or railways in these two countries I do not believe any serious obstacle would be experienced in securing large batches upon trial, always provided the recruiting agents were tactful, intelligent and observant of local customs and prejudices. No intelligent agent would handle West Coast boys like—

say, Basutos. For instance, the Kroo boy will not understand any deductions from his wage, for any purpose whatever; he would prefer being flogged than fined for any misdemeanour. I do not wish to imply by this, that they should be flogged or roughly handled in any way. In conclusion, I attribute the scarcity of labour here to several causes, but principally to the want of combination between the Government, the C.S.A.R., the Chamber of Mines, the merchants and the farmers. I do not mean on the question of non-uniformity of wages, though that also is a consideration, but that in recruiting native labour the W.N.L.A. (naturally perhaps) endeavours to obtain boys for mining purposes only. I believe the solution is simple, though it would take time. If the several interests mentioned above were to unite for the purpose of recruiting in every possible quarter, even Asia, for all classes of cheap labour, it surely would be possible to introduce a draft law in the Council, placing the regulation of importation under Government control and management. Coming now to the most important matter—the item of finance. Since the trade of Johannesburg depends upon the existence of the mines, the merchants and even farmers could hardly object to the payment by them of a quota of the initial expenses. Finally, I maintain that if boys were brought into the Transvaal and especially Johannesburg, as the centre of the Rand, even if they were unsuitable for the mines, they would take the place of those boys that are suitable for mine work, and compel the latter to gravitate to the mines or the farms. Thus, the Kroo boy, though suitable for and willing to do mining, might be utilised for shop work and domestic service, for which he is eminently suitable, releasing those now employed as servants, and the latter being able to do mine and farm work would naturally have to accept such. I am afraid my ideas and suggestions are expressed rather crudely, but I trust your Commission will understand.

4,963. The CHAIRMAN: You say you are acquainted with the district of Nigeria?—Yes.

4,964. Would that be the district marked on the map which I have before me the "Southern Nigeria District"?—Yes, that is the district.

4,965. How long have you been there?—Two years.

4,966. What were you doing there?—I was on a trading station.

4,967. On the coast or inland?—About 60 miles inland.

4,968. Have you ever travelled further inland than that?—No, not further.

4,969. Do you know the native language?—Yes, sir, a little.

4,970. You cannot give us any figures as to the population?—No.

4,971. Do such figures exist?—I should think they would, sir.

4,972. Do the natives of that country leave the country to work outside in any numbers?—Not from Nigeria.

4,973. Has any attempt been made to induce any of them to go elsewhere?—I do not think so.

4,974. In your statement you refer to some having been sent to Rhodesia?—Those were the Kroo boys of Liberia.

4,975. Do many of the natives work in their own country, Nigeria I am speaking of now?—Yes.

4,976. At what employment?—Principally in bringing produce from the market to the various stations.

4,977. There are no industries of any kind apart from agriculture carried on there, are there?—No.

4,978. You refer in your statement to the natives of Liberia?—Yes.

4,979. Have you been there?—I have not been on land there.

4,980. Have you come in contact with any of the natives of Liberia?—Yes.

- 4,981. On the coast of Nigeria?—Yes.
- 4,982. Are many of them employed at the coast towns?—Yes, a good many of them are employed at the coast towns; they do all the labouring work.
- 4,983. Do all the labouring work. Does that refer to hundreds or thousands?—Thousands, I should say.
- 4,984. At the coast towns?—Yes.
- 4,985. Do you know whether they leave the coast to work elsewhere in any numbers?—No, I do not know.
- 4,986. You do not know?—No.
- 4,987. You referred in your statement to the fact that you believed they could be induced to work elsewhere?—Yes, I think so.
- 4,988. Do you know anything about this Rhodesian experiment?—It is only from hearsay.
- 4,989. You know nothing of it yourself?—No.
- 4,990. Do you know anything of any experiment of inducing boys to leave that coast to work elsewhere.—Not to come to South Africa.
- 4,991. Well, to go anywhere to work?—They do the labouring work from Liberia right down to the Congo, and in the coast towns and the inland towns as well.
- 4,992. Mr. QUINN: What was the nature of the mining these natives did on the Gold Coast?—I do not know what the nature of the mining was. That was hearsay, too.
- 4,993. It was hearsay. You cannot speak of your own knowledge?—No, I have not been on the gold-fields.
- 4,994. Can you give us anything reliable regarding the numbers available?—20,000 to 50,000, I should say, but I cannot give the numbers definitely.
- 4,995. How do you arrive at this 20,000 to 50,000?—It is merely hearsay from the boys themselves.
- 4,996. You say you think there would be no difficulty in obtaining an experimental number, say 500?—I do not think there would be any difficulty.
- 4,997. Are you speaking now from knowledge or hearsay?—From knowledge.
- 4,998. Have you any knowledge of the character of the natives of South Africa?—A little. I have lived here three years.
- 4,999. Where have you been in the three years?—Two and a half in Cape Colony, and six months here.
- 5,000. Then from your three years' knowledge would you say the character of the natives you are speaking of would be better in every way than the other natives you are acquainted with in South Africa?—Yes, much better.
- 5,001. You say, "He would contract for twelve months, and would not receive any pay until the end of the contract. He is muscular and wiry, active, intelligent and docile." What would be the cost of bringing these natives here, assuming that you could get them from their own place to Johannesburg?—I could not say.
- 5,002. Have you any idea?—No idea.
- 5,003. Now, give us your opinion about the scarcity of labour. You say that is principally due to the want of combination between the Government, the C.S.A.R., the Chamber of Mines, and the merchants and farmers. What do you mean by "want of combination"?—I think if these various interests combine and get labour, whether it is black or yellow—
- 5,004. We could get yellow right enough, but this is outside our reference. We are talking of black labour. We should get a few other colours if we had got permission. Do you think if the Government, the C.S.A.R., the mines, and the merchants were to make up their minds, they could get labour?—Yes.
- 5,005. I think so, but there would not be any one else to find any fault with them. That is a nice suggestion you have made here: "Since the trade of Johannesburg depends upon the existence of the mines; the merchants and even farmers could hardly object to the payment by them of a quota of the initial expenses." What do you mean by that?—Bringing boys down.
- 5,006. Your yellow men?—Yes, or yellow men either.
- 5,007. It is an opinion of yours?—It is an opinion of my own.
- 5,008. You seem to have a doubt about the stability of the natives for the mines, because on page 3 of your statement, you say, "finally, I maintain that if boys were brought into the Transvaal, and especially Johannesburg, as the centre of the Rand, even if they are unsuitable for the mines"; why do you make that reservation. It is your opinion, I understand, that they would be suitable for the mines?—Yes, but if they were found unsuitable for the mines they could take the place of other boys that were suitable for the mines.
- 5,009. Mr. TAINTON: Does the whole of this statement, Mr. Innes, refer to the Kroo boys of Liberia?—Yes, I referred to Nigeria a little, but I do not think the boys would be anything else but miners.
- 5,010. You deal only with Kroo boys from Liberia; have you any knowledge of the numbers of these boys available?—No.
- 5,011. This estimate of yours on the second page: you say that you compute from information that there are from 20,000 to 50,000 boys available?—That is only taken from conversation with headmen and boys. I take it there would be twenty to fifty thousand available.
- 5,012. That is very vague. Is it 20,000 or 50,000?—You see I do not know the population of Liberia.
- 5,013. Are you acquainted with the Gold Coast?—With the natives, yes.
- 5,014. Have you ever been inland on the mines at Wassau?—No.
- 5,015. Do you know whether labour is scarce or plentiful there?—No.
- 5,016. Do you know what wages are paid to the miners there?—Not to the miners.
- 5,017. Do you know whether any of these Kroo boys go to the mines?—Yes, I believe they do; gold-mining on the Gold Coast.
- 5,018. Is that what you have been informed?—Yes.
- 5,019. Mr. FORBES: In page 2 of your notes here, you say: "In Nigeria again the country is densely populated, but I consider the boys from Nigeria as being only useful for mining." You consider the country is densely populated?—Yes, it is densely populated. I cannot get figures.
- 5,020. Well then, we have a telegram from the High Commissioner, Johannesburg, to the Secretary of State, London: "Chamber of Mines, anxious to send mission to West Africa, viz., Hinterland of Lagos and Nigeria, to ascertain if suitable labour can be obtained for mines. In order not to lose time, would you agree to mission of inquiry proceeding at once with the object (1) of obtaining information; (2) if information favourable, of bringing back experimental batch of, say, 1,000 labourers, on conditions to be determined by local authorities." This is dated May 12th of this year. Then this is the reply:—"From Secretary of State, London, to High Commissioner, Johannesburg, June 23. Referring to your telegram of May 12 No. 135, your telegram of April 27 to Sir R. Moor, conveying message from Jagden was repeated here, as Moor was on leave. I have referred matter to Moor, in whose judgment I have great confidence, and have informed him that I desire to assist Transvaal labour market by every means in my power. He has replied that in his opinion experiment if made would be entire failure,

unless backed by strongest Government personal influence and pressure, and in any event could not lead to establishment of labour market for South Africa. He pointed out that Southern Nigeria is scrupulously under-populated owing to recent slavery and internal disunion. Labour not half sufficient for needs of country, and no labour market exists. Interior tribes only just merging from a state of perpetual civil war and slave-raiding, and it would be regarded as recrudescence of slavery if Government brought pressure on labourers to leave country. Government has guaranteed effective support to house some of the best coast and inland tribes; and to hold out any inducement to natives to go to South Africa without sent by chief would amount to a breach of faith. Experiment would certainly cause much ill-feeling and would alienate friendly chiefs and tribes. In the face of this opinion I am reluctantly obliged to say I see no prospects of advantage in such an inquiry as it was proposed to institute in Southern Nigeria. After communication with Governbags I regret there is no hope of obtaining labour from that quarter." Now, in the face of this, do you still think there is labour to be got from Liberia. You said you were not far in the country?—I was not far in, but it seemed to be densely populated.

5,021. Mr. PHILIP: These Kroo boys are all natives of Liberia, are they not?—Yes.

5,022. That is a negro Republic?—Yes.

5,023. Do you know that the Governor of Liberia will not allow the recruiting of these boys?—For the Transvaal: I did not know that.

5,024. Do you know what wages these Kroo boys get on the coast?—Yes.

5,025. As stevedores and in other capacities they get 5s. per day?—As stevedores perhaps they do, but working on trading stations they get much less.

5,026. Are you not aware that the whole of the West Coast is short of labour?—I am not aware of it.

5,027. Do you know that the Government of the Congo attempted to get Kroo boys to build their railways and could not get them?—I did not know that either.

5,028. Mr. EVANS: Do I understand you recommend recruiting from Liberia only?—Yes.

5,029. No recruiting from any other part of the West Coast?—Not from any other part.

5,030. Now, during the two years you were there, where did you live?—Abonnena.

5,031. Where is that?—On the delta of the Niger.

5,032. How long did you live there?—Two years.

5,033. At this one place?—At this one place.

5,034. What other parts of the West Coast have you lived at?—I have been on the other parts of the Niger delta, Bonny, Buguma, and Bakena.

5,035. Those are all in Southern Nigeria?—Yes.

5,036. Have you lived in Liberia?—I have not lived in Liberia.

5,037. Have you stayed for any length of time there?—I have not stayed there at all.

5,038. What do you know of Liberia?—Only of the boys of Liberia.

5,039. What is the nearest point you have been to Liberia yourself?—Cavally.

5,040. Where is that?—That is in Liberia.

5,041. How long were you there?—About a day, on the steamer.

5,042. Did you go on shore?—No, I did not go on shore.

5,043. Somewhere in your statement I think you refer to the information you acquired from chiefs?—Yes, from headmen.

5,044. Where was this?—At Abonnena.

5,045. In Nigeria?—Yes.

5,046. Not in Liberia?—No.

5,047. Do you know anything about the Gold Coast Colony?—Very little.

5,048. Are you aware that they are short of labour there for the construction of the railway to Kumassi?—No.

5,049. You do not know anything about it?—I do not know anything about it.

5,050. Can you tell us anything further about this trial of Kroo boys in Rhodesia?—No, nothing further. I merely heard that there were 200 of them in Rhodesia, and that they were a failure.

5,051. They were a failure?—I think that was owing to the management of the boys.

5,052. When did you hear that?—About six month ago.

5,053. Would that be from the Kroo boys themselves?—No, it was in Johannesburg I heard that.

5,054. You say, "I have not the least doubt that recruiting would be allowed in Liberia." On what do you base that conclusion?—Upon a letter I saw in the papers on the Kroo boys.

5,055. When?—Some time ago.

5,056. Here?—Yes.

5,057. Do you know what the population of Liberia is?—No, I do not know.

5,058. Then you say that you are sure—you are confident—that the climate of the Transvaal would suit the Kroo boys. On what do you base that?—Because he is accustomed to heat and cold, travelling up and down the West Coast.

5,059. Did you not say just now that he only went from Liberia to the Congo? Does he go to any other part?—I believe he goes down as far as Cape Town, sometimes in warships.

5,060. Then you have it here that you estimate the total number that might be got from Liberia as 20,000 to 50,000; what is that based on?—You see that is from an opinion I have received from headmen of the station I was working on.

5,061. Headmen in Nigeria?—Yes; these are Kroo boys that do all the labouring work.

5,062. And would that be mere guesswork on their part?—I could not say.

5,063. The CHAIRMAN: Mr. Innes, the British Consul of the Congo State, makes this statement:

"I have received your letter of the 31st July, making enquiry as to the possibility of obtaining native labour from this part of South Africa for work in the Transvaal mines, and in reply I have to state that there is no prospect of the Congo State, or I might add of any part of West Africa, offering a field for the recruitment of natives for that object. Apart from the fact that the majority of Governments exercising authority in this part of Africa do not permit their native subjects to quit their territories except with an individual licence, which is but rarely granted, there is the fear of a scanty native population for carrying on the local work and for satisfying the vital needs of the local administration. In view, therefore, of the absolute impossibility of obtaining native labour from West Africa, I refrained from answering any of the questions you have appended to your letter, for they are in effect all answered by the very comprehensive negative that there is no labour at all on the Congo or elsewhere in West Africa for export to South Africa or any other quarter of the globe." How do you reconcile that with your general statement?—It is merely my opinion; it may be wrong or it may be right.

5,064. Thank you, Mr. Innes.

The Commission adjourned for luncheon at 12.55 p.m. till 2.30 p.m.

Mr. W. CLARK, called, sworn and examined.

5,065. The CHAIRMAN: Are you Mr. W. Clark?—Yes.

5,066. Mr. Clark, have you before you a statement headed "Evidence of Mr. W. Clark"?—Yes.

5,067. Do you wish to hand that in to the Commission as your evidence-in-chief?—Yes.

5,068. Mr. Clark's statement was then handed in to the Commission, and reads as follows:—

I have been acquainted with the East Coast native labour supply since 1889. During that year I secured a contract from the Portuguese authorities to construct a certain portion of the railway to Komatipoort. During the summer of 1889-90 I completed the small section of line from Ressaño Garcia to the Komati Bridge for the Netherlands Company. In April, 1890, Messrs. Van Hattum & Co., the contractors for the first 100 kilometres of the Eastern line, commenced operations. I was then working in partnership with Mr. Wirth, father of Mr. Fritz Wirth, and we undertook to supply Messrs. Van Hattum & Co. with 2,000 natives within three months, which undertaking we failed to carry out. From that time to about the end of 1892, I worked as a contractor on the Eastern line. Natives were plentiful during the whole period and were satisfied to work for from 25s. to 35s. per month. In 1893 I visited Tongaland to obtain natives for some work I was doing at Moodie's, near Barberton. I went to the Tonga chief, Ngwanas, and offered him a present of £100 and a horse, in return for the services of 100 natives, who were to work for six months at 40s. per month. The chief informed me that he liked having his natives near him, but if any wished to go of their own accord, they could do so. I returned to Barberton without any natives. In 1894, as a result of a conversation with Mr. Grant, Native Labour Commissioner for the Chamber of Mines, I proceeded to Inhambane in company with Mr. H. P. Gaze, at present Compound Manager of the Witwatersrand G.M. Company. At the time, the demand for native labour on the Rand slightly exceeded the supply. From time to time we had heard stories from Inhambane natives of the difficulty of getting away from their district to work in the Transvaal, and our intention was to enquire into those difficulties, and also get an idea of the amount of labour available. We foresaw the coming scarcity of native labour and knew that every year would increase the demand. On our arrival at Inhambane, the authorities refused to allow us to travel through the district. The Governor told us that he had been informed that we intended recruiting natives for the mines, that such recruiting was illegal, that Messrs. Rosa and Teixeira (two Portuguese subjects residing at Inhambane) had the sole right to send natives out of the district to work, and that we had better go back to Johannesburg. After waiting on him every day for a fortnight, and giving a guarantee that we would not recruit, we were allowed to go on our way. We were accompanied by sixty armed native police under a Portuguese officer in our journey through the district. We found the country very densely populated, but owing to the manner in which we were treated by our escort, we gave up the idea of making any stay. After entering Gazaland, we picked up several gangs of Nyembaans, who were on their way to the Transvaal. They told us that as they had no money to pay their passage by sea, they were compelled to go through the Shangaan country. Whenever we found a gang of Nyembaans, they were being compelled to work by the Shangaans in return for being allowed to travel through their country. In every instance, the gangs attached themselves to our party for protection. We arrived at Komatipoort on the 24th or 25th day from Inhambane. From there we continued our journey following the paths usually taken by natives at that time to Barberton, thence over the high veldt to Brakpan, arriving there on the 42nd day, having rested nine days on the road. From September, 1895, to September, 1898, I was Compound Manager at the City and Suburban G.M. Company. During the time I was there, the Company never had sufficient boys. Their complement was 3,000, and the most they ever had was 2,700 during a few months of, I think, 1897. Most of the time they were 800 to 1,000 short. The reduction of wages from 60s. to 45s. made no appreciable difference in the supply. We once received a gang of 200 Basutos in charge of a son of a petty chief, from Basutoland, under a six months' agreement. Mr. A. W. Baker had erected a school-room near the compound, which was in charge of a

teacher from Basutoland; but, in spite of that and the fact that we did all we could to please them, very few completed their engagement. For a month or two the school-room was crowded with natives, but after that very few attended from the compound. The length of time worked by the different natives was about as follows: East Coast natives, from 18 months to 2 years; Zulus, from 4 to 6 months; Northern Basutos, from 6 to 9 months; Pondos and Amaxosas, from 4 to 6 months; Bechuanas and British Basutos, from 4 to 6 months. The East Coast natives spent all their earnings on meat and drink. In September, 1898, I went to Beira for the Native Labour Association, and remained there until after the outbreak of the war. I failed to obtain labour there. During my stay, I visited the Sabi and walked through a portion of Northern Gazaland. I found that district not nearly so thickly populated as reported, and the natives disinclined to go out to work. For the past six months I have been living on a farm in the Middelburg district. There are 30 native families living on the farm, and under their agreement with the owner, one of each family has to work for three months in each year for rent. During the time the crops were being reaped, the natives were very slow in turning out, usually arriving to work at 11.30 a.m. and knocking off at 4.30 p.m., which they reckoned a day's work. About February or March this year, the natives were warned that the poll tax would be collected in a month's time. Within three days, 23 natives who live on the farm applied for passes to seek work. Everyone had returned within six weeks with sufficient to pay his taxes. With regard to increasing the supply to the mines, I do not think anything more can be done than is being done by the W.N.L.A. Irresponsible touting does more harm than good. The great object should be to enable the natives to reach the mines with as little trouble as possible. In the Transvaal, I think a considerable increase would result by remitting the poll tax of natives who had worked for, say, six months out of their district. Sir Percy Fitzpatrick, in his evidence before the Commission, stated that increased wages only resulted in natives going home sooner than they otherwise would do if they received less. In this he is not quite right. A large majority of the natives who come to the mines come for a certain period irrespective of what they earn. On the other hand, increased pay tends to lessen the supply, because natives who return home with large sums of money remain there longer than they would do if they went home with less.

5,069. The CHAIRMAN: You have had a long experience of recruiting natives and compound management, I understand?—Yes.

5,070. You began to recruit natives in 1889?—I went to work on the Delagoa Bay Railways in 1889.

5,071. In 1889 you began recruiting natives then, did you?—Yes.

5,072. And you have been in that business or managing compounds right up to the beginning of the war?—More or less the whole time.

5,073. Do you know the East Coast pretty well?—Fairly well.

5,074. You were some years—1895 to 1898—compound manager of the City and Suburban Mine?—Yes.

5,075. You never succeeded in keeping that compound full of natives?—No, sir.

5,076. You were engaged by the Native Labour Association before the war?—Yes, to go to Beira.

5,077. To Beira?—Yes.

5,078. You travelled through Northern Gazaland at that time?—Portion of it.

5,079. Have you travelled much in other parts of Portuguese East Africa?—I have travelled about the neighbourhood of Delagoa Bay and Tongaland, when I was under the impression that it was Por-

tuguese territory (it has since been annexed to Great Britain), and from Inhambane through the southern portion of Gazaland.

5,080. Are you acquainted with the method now adopted by the Witwatersrand Native Labour Association for securing labour?—Yes, I think I know the way they go about it.

5,081. And you are able to compare their methods with what is known as free recruiting?—Yes.

5,082. You have been a recruiter yourself?—Yes.

5,083. You give it as an opinion here that the Native Labour Association is doing its work well?—Yes, I think so.

5,084. And in your opinion their method of recruiting is preferable to that of free recruiting?—Yes, free recruiters always promise natives more than they can perform. Natives are promised all sorts of things which the recruiters are not able to carry out, as it is to their benefit to get as many natives as possible. It did not matter to them what became of the natives once they were handed over to a Company, and they consequently made promises which were not, in all cases, fulfilled, and the natives were not in all cases fairly recruited.

5,085. You have recently had some farming experience?—Yes.

5,086. In the Middleberg district?—Yes.

5,087. What is the size of the farm you are living on?—About 3,500 morgen.

5,088. You say that there were 30 native families living on that farm?—Yes, we had altogether, without counting old men, 55 able-bodied natives living on the farm. Of the 55 only three are away at work at present, and that has been about the average for the last six months.

5,089. How many away?—Three. Two youths are employed on the farm; they are working for rent.

5,090. Working in lieu of rent?—Yes, we have never been able to get sufficient natives. For the past six months I have been trying to get a boy to look after a couple of horses, but was not able to get one, in spite of the fact that the agreement made with the natives is that after putting in their three months in lieu of rent if any natives are wanted for the work on the farms, they must work for wages—single men, but not married men. In spite of that we cannot get them; they will not carry out their engagement at all. There are six of our neighbours immediately about us without a single native and they have not had one since the end of the war.

5,091. How do you account for that scarcity; or I would first ask, how do you account for the difficulty on the farm on which you are, where there are so many natives?—The natives are too well off, they have got the ground too cheaply, they are near a good market and get a good price for their produce, so that they have no need to work. I will give you an instance; one family, when called upon to produce a native to work in lieu of rent, produced a boy of probably ten years of age, worth 7s. 6d. per month, not more, or at the outside 10s. That youth worked three months, and for his labours the whole family lived on the farms and had as much ground as they liked to cultivate in return for the labour of a youth worth, say 30s.

5,092. For three months?—Yes. The same ground, if let to a white man, the owner would be wanting probably £20 to £25 a year for it. The ground is too cheap altogether.

5,093. You give an illustration in your statement as to the effect of levying a poll tax on these same natives, I understand?—Yes.

5,094. When the intimation was given that the tax was to be levied the immediate effect was that a large number went out to work?—Yes, I believe 23, either the day after they got the notice or within two days, 23 natives turned up at the house and wanted passes to look for work to get money

to pay the poll tax. Some returned within three weeks, and the last man turned up within six weeks with sufficient money to pay the tax.

5,095. The tax was £2 per head?—£2 per head.

5,096. Where did they find work with the farmers?—At the coal mines.

5,097. Had they no difficulty in being engaged for a month or two?—When I say coal mines I do not say they all went down to the mines, but they went and worked at coal mines. There was plenty of building going on and natives were engaged by the week in some cases.

5,098. Do you think that, on the average, the native works a shorter time year in, year out, if the wages are high, than if they are moderate or low?—I do not think it makes very much difference. As I have said in my statement, especially in the case of natives coming a long distance, they come for a stated period without taking into account what he earns. Very few natives come to earn a certain sum, that is my experience; they come to work for six or twelve months and remain that time irrespective of what they earn, as I have said in my statement. There is, however, a limit to that, for if the native on the mines were paid too little he would not come at all.

5,099. Did you say in your statement that if natives return with large sums of money they would remain at home longer than if they returned with less?—Just so.

5,100. So for a period of years the effect of high wages is that the natives work for a shorter period?—Yes.

5,101. Mr. GOCH: Is this farm at Middleberg yours?—No.

5,102. You are living on it, but you do not know all about it?—Yes, I do.

5,103. I am rather anxious to know, what do 55 able-bodied men do on the farm when they do not work?—Nothing.

5,104. Do they not work for themselves?—They do, I suppose, but very little.

5,105. Do they get this land for practically nothing?—Practically nothing.

5,106. Where does the farmer come in that he allows that when they will not work?—Well, the natives, of course, do a certain amount of work; for instance, during the time the crops were being reaped we called out certain natives to put in their three months in lieu of rent; they came out, but there is always a difficulty in getting them out. We called out 16 or 17 and got out 7 or 8, and they turned out at 11.30 or 12 o'clock and left off at 4 o'clock, and consider they have done a day's work.

5,107. And they took the dinner hour between these times?—Yes. Very often they would come to work for an hour and then want food.

5,108. So that they did about four hours' work a day?—Practically, with the time spent in getting to work and back again they put in from four to four-and-a-half hours.

5,109. Are you familiar with the "Plakkers Wet"?—Yes.

5,110. Where there are only five families allowed on a farm?—Yes, but more if required for the work of the farm.

5,111. What did you do with this group of 30 families there, 25 beyond the legal allowance?—The Native Affairs people have not taken this matter in hand yet. I was in charge of these natives who were in a native refugee camp during the war, and when I was ordered to send the natives back on to their farms I could not get them to go. In many cases they simply refused to go, and I had to leave them where they were. This farm was used as a refugee camp.

5,112. If the "Plakkers Wet" were enforced, what would happen to this group of native families?

Where would they go?—I believe it is to be enforced. I do not know how they are to be compelled to go if they do not want to.

5,113. Force will have to be used? How are you going to use force, burn down their huts?—I am afraid it would be a very difficult matter.

5,114. Supposing the law is enforced, and the police are sent to clear them off the farms, which I suppose would be the necessary consequence, what will the natives do?—I do not know what they will do.

5,115. The next farm I believe has no natives?—Many have no natives.

5,116. If the Government were to assign five families on the farm by arrangement with the owner, would they have to go?—I daresay they would, if ordered out.

5,117. And the Government would have to be party with the owner in fixing the rent they would have to pay?—In a case of that sort, I suppose, that would happen.

5,118. You think the rent they are paying at present is nothing?—Nothing.

5,119. What would you consider a fair rent?—That is a difficult thing to say. I think the proper arrangement is to make the native work a certain time for the farmer. This is the best arrangement if the native will carry it out, but you cannot get him to. If you get the native to work three full months, and carry out the other arrangement, too, that single natives should work for wages for the farmer when called upon, we should have plenty of labour. If that were carried out, there is plenty of labour; more than required.

5,120. You mean one man in each family to work three months in lieu of rent?—Yes.

5,121. So that five families would mean five men at work?—Yes.

5,122. The wages on a farm expressed in money are 30s.?—Yes.

5,123. That is to say, five families would pay £7 10s. What land would they get for that?—Sufficient land to cultivate their mealies.

5,124. Can you express it in acres, how many acres they would be entitled to cultivate?—If they only cultivated sufficient for their own use, two acres would be enough, but they cultivate more, that is why they are so independent. They cultivate more and sell the crop.

5,125. Are they not restricted by the farmer?—As a rule they are not.

5,126. And are they allowed to roam about and do what they like?—They are not allowed to pick their own ground; the farmer usually has first pick of the ground.

5,127. Can you give us an idea as to what the effect would be if the law were carried out in that way. Would these natives if moved from one farm to another so as to give five families to each farm there fill the bill for the farmer?—If that was so, it would be a great assistance to the farmer certainly, but I do not think it would be sufficient if we only had five families—that would not be sufficient for us, by any means.

5,128. How many would you want on this farm?—I should say ten or twelve families at least.

5,129. So you think the "Plakkers Wet" deficient in that respect—that it should allow for more?—I believe it does allow for more. You are allowed five, but if you are cultivating more ground than the labour of five families suffices for, you are allowed to have more.

5,130. Do you think it would have the effect of brightening them up to work more than at present?—That is a very difficult question to answer.

5,131. Mr. EVANS: Do you know the Portuguese territory north of the Zambesi at all?—No, sir.

5,132. What do you think would be the effect of a return to free recruiting now?—I do not think it would have much effect. It might have a little

effect in this way, it might do good to some companies. Some compounds are more popular than others on the Rand, and although it is said that natives are allowed to go to whichever compound they please, I am told it is not so, and in many cases they are compelled to go to compounds against their will.

5,133. Is that recently?—Yes, sir, I was told so by a compound manager an hour ago.

5,134. Was that after the natives had made their choice at the place where they were recruited?—I believe so.

5,135. In the case of natives do you think that population figures are any guide as to the number of workers that are obtainable?—No, sir, I do not think they are.

5,136. You do not think that because there is a large population in a certain portion of the country we could take it that a considerable number of labourers could be obtained from that population?—No, sir, I do not think they are quite reliable. Compare the population of the native districts of the Cape Colony with the population of the Portuguese East Coast south of the Sabi.

5,137. Yes?—I do not remember the figures exactly, but the population, I think, is about the same, and you can get the figures of the number of natives that come from Cape Colony to Johannesburg and the number from the East Coast, and I think a great deal more.

5,138. But do not the Cape Colony natives go elsewhere—to the coast ports and public works in their own Colony?—Yes, and a great number of the East Coast natives work elsewhere, in the towns and on the railways.

5,139. What policy would you advocate in order to procure a sufficient labour supply for the farmers?—I do not think we can get sufficient. I cannot give an opinion. I cannot tell you how to get it. We cannot compete with the mines; for instance, we cannot pay the wages.

5,140. Is it your opinion that the labour does not exist in sufficient quantities in South Africa?—Not free labour, unless we can compel the natives to work there is not sufficient.

5,141. Do you think it would be advisable for the Government to charge rent to the natives for Government land?—Certainly.

5,142. Would not the same policy be a good one for farmers to adopt?—Well, the farmers want the labour; they do not want the money.

5,143. Mr. EVANS: Would not the necessity of earning money to pay the rent have the effect of sending the natives out?—Not while they could cultivate some ground other than what they needed for their wants.

5,144. You give in your statement an instance of natives going out to earn taxes?—Yes.

5,145. But do you not think that a rent would have the same effect?—No. At the time these natives were there, they had had no crops for several years. They had no grain to sell, but in a year or two they will not go out. Next year, for instance, when they have to pay their hut tax, they will probably have a few bags of grain to sell and they will not need to go out.

5,146. Then can you suggest any practical way of influencing them so that they will go out?—Well, I have my own idea of what the means should be to procure labour.

5,147. That is?—I think that they should let the boys have more meat and a certain amount of liquor.

5,148. In that case would they be depriving other employers of labour?—I suppose it would make a difference in some parts of the country; in the Cape Colony and in Natal.

5,149. Then supposing the other employers followed suit and also gave the natives liquor and more meat?—And the same pay, well then you would be in the same position as you are in now.

5,150. The effect would be simply to raise the level of the labour costs all round?—No, because you would not give them the liquor, you would sell it to them. You might give them more meat; that would have the effect of raising the costs of course.

5,151. Yes, but would that plan increase the available supply of labour for all the employers?—Yes.

5,152. You think it would?—Yes very much.

5,153. Where are these natives now?—At their homes.

5,154. What would be the great inducement for them to come out?—The inducement would be that they could get liquor; at present they cannot.

5,155. Does that apply to all South African natives?—All of them.

5,156. Do you think that that would make a really substantial improvement in the supply?—Yes, a very great improvement.

5,157. That is the liquor?—Yes, I do not say an unlimited supply, because we all know what a Kaffir is, but a moderate amount of liquor given to every native when he wanted it would make an improvement.

5,158. Is it not the case that when they were able to get liquor there was a shortage here?—Yes.

5,159. Well, that does not quite agree with your present conclusion?—No, it does not, but you must not forget that the supply of labour increases every year; every year the supply is increasing and getting better. Of course the demand has exceeded the supply.

5,160. What I want to get at is your estimate as to the number that would probably come out, supposing there were facilities for getting liquor?—Well, it is very difficult to say. But to make a guess at it, I should say you would increase the supply by half within 12 months.

5,161. 50 per cent.?—Yes.

5,162. That is, we should add 25,000 to what we have now?—Then you must not forget you would also get the number of boys that are going home now. The East Coast boys do not work the length of time now that they did. I am told the East Coast boys put in six months and return home now. Formerly they stayed 18 months or two years.

5,163. And that was on account of the facilities for buying liquor?—All the East Coast boys drink; they get as much liquor as they require; they are brought up to it; they are accustomed to have it.

5,164. Mr. FORBES: How many natives do you consider a farmer will require to cultivate, say, 200 acres—together with herds, houseboys, and so on?—From 8 to 10.

5,165. Would that be sufficient to cultivate 200 acres?—That would be sufficient.

5,166. You were asked about allowing natives to go to work and pay a rent. That would not suit the farmer, would it? He requires the labour?—Yes.

5,167. So it would not suit him to keep Kaffirs on his farm and to allow them to go out to work elsewhere? He would sooner not have them at all?—Yes, he would have no use for them.

5,168. Mr. BRINK: Do you know whether there are any Kaffir locations in the Middleburg district?—There is one location.

5,169. Do you know the extent of it—how many acres?—No. I cannot tell you; but they occupy an ordinary sized farm of 6,000 or 7,000 acres.

5,170. You have told us that you have got 55 able-bodied men on your farm and you say you can only get three to work at a time. If you compel them to work will they not leave your farm and go to the location?—Yes, some have left and are going to other farms.

5,171. Supposing the other farmers press them to work will they not leave and go back to the location?—I daresay if they could live rent free at the location they would go there, certainly.

5,172. They live there very cheaply, of course, and they know that?—Yes.

5,173. Can you tell me how many natives your neighbours just round about you have got on their farm?—No, I cannot. Not many; very few.

5,174. I suppose you know numbers of farms without a single native?—Yes.

5,175. How do these farmers do?—They do the work themselves or leave it undone.

5,176. Supposing they cannot get a native labourer what do these farmers who have no boys on their farms do? What do they have to pay?—They simply cannot get them.

5,177. They cannot get them at any price?—I suppose they could at a price, but they cannot afford to pay the wages they would have to pay. They have not got them and do not try to get them.

5,178. That would be about £2 a month, more or less?—Probably.

5,179. Can a farmer afford to pay a native £2 and give the boy his food and make farming pay?—Oh, yes, I think so. It would be about the outside price he could afford to pay.

5,180. Do you think you have enough natives in the Middleburg district to supply the wants of the local farmers?—If they work, we have.

5,181. Would there be any surplus?—No, not when the farmers are supplied.

5,182. That means when the farmers are supplied for the Middleburg district you have no surplus boys for any other district?—No.

5,183. Are you acquainted with any other districts of the Transvaal?—I cannot say I know any particular district intimately.

5,184. Mr. TAINTON: Has your experience been confined to the East Coast?—No, sir, I worked in Kimberley when I was a youth—I worked with natives.

5,185. Have you any further experience?—Well, all my life pretty well I have worked with natives.

5,186. In what districts?—In Kimberley, Natal, in the Transvaal, and in Portuguese territory.

5,187. Have you done much mining work with them?—Not much.

5,188. How long have you been an employer of natives?—Well, I was an employer of natives from 1889 to 1895.

5,189. Was this labour scarcity that we now hear so much about prevalent throughout your experience?—All the time except during the period that I was on the Delagoa Bay Railway—from 1889 to 1893—then we had all the natives that we wanted there.

5,190. Do I understand you to say that the only time when labour was plentiful in your personal experience is the period when you were working on the Delagoa Bay Railway?—Yes.

5,191. How long was that?—From the end of 1889 to the beginning of 1893.

5,192. Can you give any reason why labour was plentiful at that particular spot at that time?—Yes. We were on the way to Johannesburg, and most of the natives were coming up here; they were on their way to Johannesburg, and they usually stayed on the railway works and worked for a month or two.

5,193. You mean that from your position on the main road you intercepted labourers coming to Johannesburg?—That is right.

5,194. Then your success was really at the expense of the mines here?—No, because the majority of these natives put in a month or two on the railway and then came on to the mines.

5,195. Yes, but you took part of their working period there?—Oh, yes.

5,196. Did you do any actual recruiting there?—Well, we recruited our own natives; when I was on the railway we simply sent out a runner to intercept them. We did not recruit them from their kraals.

5,197. What do you mean by intercepting them?—We sent runners out to meet the Kaffirs on their way to the mines or to the railway works. That is what is meant by recruiting at the present day. I believe very few natives are taken from their kraals; they are merely picked up on their way to the mines in most cases.

5,198. You mean that you stopped them by the use of force?—No, we send a native out to engage them.

5,199. In reply to a member of the Commission, I think you said that you thought by giving the boys liquor it would increase the labour supply. Is that right?—Yes, sir.

5,200. You also said that the East Coast boys had as much liquor as they required at their homes?—Yes.

5,201. Why should they come here for liquor if they can get it there?—Because they come here to earn the money to buy the liquor, and go back and buy it.

5,202. They come here to earn the money to buy the liquor down there?—Yes, at the present time.

5,203. I understood you to say that they manufactured their own liquor there?—Yes, the manufacture it.

5,204. And have they native distilleries?—Yes.

5,205. And do the natives buy the liquor from those distilleries?—Yes.

5,206. There is a flourishing bar trade there?—An enormous trade.

5,207. We have been told by witnesses from that quarter that about one-third of the native male population will come out to work. Are we to understand that—in terms of your answer—it is due to a desire to buy liquor?—Yes, when you speak of East Coast natives.

5,208. You would account for that large proportion coming out in this way that they come to get money to buy liquor down there?—Yes.

5,209. Is there any other reason?—I suppose not. I do not say that they spend all their money in liquor, but the greater part of it, they certainly do.

5,210. What is the effect of the liquor habit on those boys?—It has a very bad effect.

5,211. You would advocate the use of liquor, nevertheless?—Yes, in moderation.

5,212. Mr. WHITESIDE: Mr. Clark, in answer to a member of the Commission you spoke of the greater popularity of some of the compounds. Would you give the reasons of that greater popularity?—Well, it is very difficult to account for. I notice now that most of the new compounds are being built on the very latest principles. They are very well ventilated, and all that sort of thing. When I was at the City and Suburban there were one or two compounds that were never in want of natives, and those compounds were regular rabbit warrens. They were tin shanties, and filthy places that you would not put a pig into, yet it is not the big, well-ventilated compounds which the native prefers. How do you account for that?

5,213. I want you to answer that question?—Well, I think it is this; the natives are accustomed to sleep in stuffy, smoky huts; they are used to it and like it; when you put them into a well-ventilated room there seems to be too much air for them; they do not care for it.

5,214. Do you not think there may be something in the mine itself to account for that unpopularity?—Yes; in some cases soft ground, for instance, they like that.

5,215. Would not the personality of the compound manager also have a great deal to do with it?—Not to a very great extent. The compound manager has very little to do with the natives; he manages the compound, certainly; but the natives work all day or night with the miner.

5,216. So, then, you do not agree with the theory that filthy compounds have a bad effect on the

supply?—No, I do not think they have a very bad effect on the natives' health either. You take the statistics, and you will find out what the death rate at those filthy compounds five or six years ago was, and the death rate at the new compounds to-day; you will find there is not much difference; the difference will be in favour of the filthy compounds. When I speak of the filthy compound I mean little twopenny-halfpenny rooms with no ventilation or air.

5,217. You tell us now that if we had free recruiting it would probably have a good effect on some of the compounds?—There are certain compounds that, if allowed to recruit their own natives, would get more than others.

5,218. Why?—Because they are more popular amongst the natives.

5,219. Do you consider that the present institution, the Native Labour Association, has any particular disadvantages or advantages?—Well, it has an advantage like this, that no big promises are made to natives. In the old days there were free recruiters, and among them there were some good men recruiting natives, but a great many of them promised the natives anything, and that is done away with to-day.

5,220. Are there any disadvantages?—One disadvantage is that the natives do not like being brought to a central compound. When they are brought to a central compound and distributed to the different mines, they have an idea that they are being sold.

5,221. You do not agree with the evidence that has been given before this Commission that natives can contract for any particular mine they wish?—I suppose that in the majority of cases they are allowed to go to any mine they wish, but in many cases they do not go to this mine. As I say, it is only an hour or two ago that I was speaking to a mine manager, and he told me he knew of cases where the natives were not allowed to go to the mine they wanted to go to.

5,222. You tell us, Mr. Clark, that there is sufficient labour for the farms, if some means could be devised to get them to work on the farms?—Yes.

5,223. Do you hold that opinion also with regard to labour for the mines, public works, and so on?—If you could get the natives to work, oh, yes. I think there is quite enough for mines, public works, railways, and everything else, if you could make them work.

5,224. Mr. QUINN: On the third page of your statement, Mr. Clark, you say, "From September, 1895, to September, 1898, I was Compound Manager at the City and Suburban G.M. Company. During the time I was there the company never had sufficient boys. Their complement was 3,000 and the most they ever had was 2,700 during a few months of, I think, 1897." How many stamps were they running on that mine in those days?—160.

5,225. Is it within your knowledge that in 1897—the time you are speaking of—so many boys were available that the mining people thought it was a good time to reduce the wages—I am not quite sure about the year, I think it was in 1897. It was about that time they reduced the wages—about the time we had the large supply.

5,226. Do you know that the main reason given for that reduction was that they had plenty of boys?—I only know that by hearsay, of course.

5,227. Do you think that it would be likely that they would make a general reduction of wages if the shortage of boys existed?—Well, they never had so many boys.

5,228. But on this occasion, 1897, do you think they could have afforded to do such a thing unless they were well stocked, as they said they were?—Yes, I suppose they were well stocked, but the argument was this, that it would not make any difference to the supply.

5,229. Are you aware that, generally speaking, there were ample boys in 1897?—Yes.

5,230. Did you ever hear of the Industrial Commission?—Yes.

5,231. The Industrial Commission sat in the beginning of 1897?—Yes.

5,232. Are you aware that several leading mining men gave evidence before that Commission stating that there were plenty of boys and they were going to reduce wages?—Yes.

5,233. How, then, was the City and Suburban short?—I only know what I was told. I was always told that the full complement of the natives for the mine was 3,000. That was what I was always told when I was there, but whether that was more or less than they required I cannot tell you. I am not a mining engineer and consequently do not know whether they could have worked all that number or not.

5,234. It seems peculiar if you were short there when everywhere else there was a surplus. Now with regard to this farming business, Mr. Clark, you say on page 4 of your statement, "There are 30 native families living on the farm and under their agreement with the owner, one of each family has to work for three months in each year for rent." Now I understand you to say that the value of one of these labourers is 7s. 6d. per month?—I said to take one case.

5,235. Well, give us an average case, what would the value be?—The average case would be, I suppose, of the value of about 25s. per month.

5,236. Not £2?—Oh, no.

5,237. Do I understand you rightly when I understand you to say the farmer could afford to give £2?—Yes.

5,238. When you have 30 boys on a farm, one to each family, and each working three months by way of rent, you would have for that farm £180, more or less, from natives in the shape of labour, reckoning out the labour at £2 per month. Which is the price you could afford to pay?—I do not quite follow you.

5,239. Well, suppose that those 30 families each gave you a labourer, on the terms you laid down, and each labourer's wage had a market value of, say, £2. 30 twos are 60 and 3 sixties would be £180, so that the rent value of that portion of the farm per year would be £180?—That does not seem quite right.

5,240. Well, it is simple addition?—They work for three months at 40s. a month—yes, that is right.

5,241. Now what is the size of your farm, Mr. Clark?—About 3,500 morgen.

5,242. How much of that do you cultivate?—A very small proportion.

5,243. How much?—Probably about 100 acres.

5,244. Out of 3,500 morgen?—Yes.

5,245. Would it be fair to say the ground you give these boys for their labour is worth nothing at all to you? The ground which is given to them—the land they are allowed to squat on—is it worth nothing to you?—Certainly it is worth something if you could cultivate it.

5,246. But you cannot cultivate it?—No.

5,247. But my point is this: this bad arrangement which you complain of really brings you in something which is an addition to your income. You could not cultivate the land. You would not attempt to cultivate the 3,500 morgen?—No.

5,248. So that if these men kept their agreement—I only look at it as a proposal on paper—you would be getting £180 per year for land that is of no use to you?—That is just what I said. The land is too cheap.

5,249. Yes, I am coming to that in a minute. Now under these circumstances the general complaint seems to be that you cannot get labour and you are very short of natives. Your remedy, I understand, is that land is too cheap, and therefore, you would make it dearer: in other words, you would charge them more. If you cannot get

labour now when it is cheap, how do you propose to get labour when it is dear. If a boy will not work to this extent and thus pay for the land he is using, suppose you charged him twice as much, how would your remedy come in then?—I think I was wrong in saying land is too cheap, I should have said it is too plentiful—there is too much of it.

5,250. Ah, that is what I wanted you to say, Mr. Clark, because manifestly, if it was dearer—and you cannot get boys now—you would get less than, for instance, by insisting on three months' labour, however many hours per day it may be, you make it dearer by insisting on five months' labour. You get less still; they clear off?—Yes, land is too plentiful. They simply have so much land which cannot all be cultivated by the farmers themselves.

5,251. So does it not boil down to this, that whatever you get from these natives in the way of labour—whether four or six or ten hours a day, for one month or six, is a gain? You cannot use the land; it is lying fallow, and you would be getting nothing for it; so that, bad as it is, it is really a gain to you; if bad, it might be worse?—It cannot be a great deal worse.

5,252. Can you tell us why you only cultivate 100 acres out of 3,500 morgen?—Well, scarcity of cattle for one reason, scarcity of labour, in dealing with crops is another. I am only making a guess when I say 100.

5,253. Say 300 or 500, I am not binding you down to a hundred on a farm of 3,500 morgen?—Yes.

5,254. The methods of farming adopted on your farm, Mr. Clark, and those of the other farmers—are they up to date?—No.

5,255. Do you use labour-saving appliances as far as possible on the land?—No.

5,256. Why do you not?—Well, I suppose it is on the score of insufficient capital.

5,257. But does that apply generally?—No, it does not, but I think a great deal more labour-saving appliances might be used.

5,258. Yes, that is what I want to get at. Would you say from your knowledge of this country that farming as carried on to-day has a big future? If most of the farms did not lack the up-to-date farm labour-saving appliances such as you would get, say, in the country parts of America, you have nothing of the kind here at all?—In a small way we have labour-saving appliances.

5,259. Not to the extent you might have?—No.

5,260. Then the real reason of all is that if you all had these labour-saving appliances you would have no markets?—Well, there is always a good market here.

5,261. Yes, but if all the farmers were to cultivate—instead of 100 acres out of 3,500 morgen they were to cultivate 1,000 is not the real reason that it would soon bring down the price of produce, and it would not pay to grow it at all, unless you could export?—I do not think that is the reason.

5,262. Well, let us press that a little further: suppose there were ten times as much produce raised in this country, what would you do with it?—Ten times as much as could be sold in the country?

5,263. No, as much as you have been raising lately; what would you do with it?—I suppose we would have to export it if we could not sell it here.

5,264. Could you not sell it here?—I hardly know. I do not know how much we are growing at present. I mean I do not know whether ten times as much as we are growing would be sufficient for the needs of the country.

5,265. How many boys did I understand you to say you could manage with to work 100 acres?—Eight to ten. That was cultivating 200 acres.

5,266. Would that be a reasonably fair allowance for the amount grown all over the country?—I think so; of course it depends on what sort of farming you are doing.

5,267. Approximately?—Yes, that would be 8 or 10 all the year round: not for three months.

5,268. Quite so. When you get labourers to work for money on your farm, how much do you pay them?—We never get them.

5,269. You never get them. If you could get them, it would pay you to give them 40s. per month?—I have offered it lately during the last six months.

5,270. You could make a profit on that, otherwise you would not give them so much?—Yes.

—5,271. Thank you, Mr. Clark.

5,272. The CHAIRMAN: Do these natives squatting on the farm have grazing rights, or do you limit the number of head of stock they may run?—Of course they have no cattle at present.

5,273. But it is part of the usual condition that they have grazing rights?—I can hardly speak of that; I have had hardly sufficient experience.

5,274. The Commission is much obliged to you, Mr. Clark, for the evidence you have given.

Mr. B. H. DICKE, called, sworn and examined.

5,275. The CHAIRMAN: Have you before you a statement headed "Evidence of Mr. R. H. Dicke?" —B. H. Dicke is my name.

5,276. And you hand that in as your evidence-in-chief?—Yes, sir.

5,277. Mr. Dicke's statement was then handed in to the Commission and reads as follows:—

Referring to and in consequence of your advertisement, I herewith take the liberty of explaining to you a special condition affecting the labour supply derived from this, the Zoutpansberg district. To prove to you that I am competent to express an opinion on the native and labour questions, I may state that I have been living amongst the natives as a trader and planter on rather an extensive scale, using and employing a lot of labour, ever since 1890. I am well acquainted with their customs, habits, history, and the laws of the different tribes, having taken great interest in these questions, and speaking their languages pretty fluently. As reference, I should like to give you the names of Mr. Karl F. Wolff, Box 2690, Pretoria, or rather Johannesburg, and Messrs. Mosenthal Bros., Ltd., Pretoria. Now allow me to enter into the questions. (1) Speaking on the labour question and the amount of boys forthcoming, one often hears men utter the sentence, "This year the Kafirs have got to come to work as the crops have been a failure and there will be hunger amongst them." These and similar utterances were heard years ago and are again heard this year. And, to the general surprise, in spite of bad crops and consequent starvation amongst the natives, the boys are not forthcoming, as they were expected to be. Starvation does increase the supply a little, but does not drive into the market anything like the number of boys available for work that it should do. Why is this? Because it is against the native custom to allow his women to wander about alone by themselves, which they would have to do looking for food, if the men were to leave their kraals in numbers to go to work. In times of starvation, the women will have to fetch and carry the grain home. It would be against a native's honour if he allowed his women to go about unprotected. Therefore, although hunger and want of money may pinch him to go to work, his presence at home is more urgently needed. And this year it will be more so than formerly, because the natives will have to wander about a good deal more than formerly in search of eatables. Why is that, you may ask? Are there not now more stores about the country than what there used to be? Yes, just so! There is more competition now and prices are being cut too fine. Add to that the higher transport rates, roads partially closed or going to be closed on account of Rhodesian redwater and the Government's pressure upon the storekeeper by letting them fear that they (the Government) would and could step in any moment, some excited people should commence screaming that the prices charged by the

storekeepers to their poor black brethren are too high, leaving the trader stuck with his stock of grain obtained with risk and high transport rates. You will thus understand that there is this year very little inducement to the traders to lay in a stock of grain. Where formerly the native could be certain to find food with some storekeeper in the neighbourhood, even at high prices, he will not be certain to do so now. Either one of the two: let the Government establish depôts of grain to supply the natives or let them leave the storekeeper with the certainty that they will not be undersold by the Government, provided they do not charge above a certain price to be regulated by the Native Commissioners for their respective districts. The Government derive revenue from the traders' licences, therefore the traders should be protected and the bread not be taken out of their mouths. The fairest way would be to put pressure on the wholesale dealers in town, as their cost prices could most easily be checked by the Government. This could be done by establishing depôts where the small traders and retailers could obtain grain at a certain price, provided they undertake not to sell to the native above a certain price, to be fixed according to circumstances. Let the Government not take away the profit from the wholesale merchant, but let the depôt be a pressure only on the wholesale men not to charge an excessive price. On the contrary, the Government ought to make a fair profit themselves; the idea that Government ought to work without making profits should be dropped in this case. The profit derived from this transaction could be used in supplying starving women whose men are away at work, but only those very much in want ought to be supplied. Having in some way regulated the food supply where starvation is expected, much will have been done towards inducing the native to leave his kraal and women and seek for work. But not all, although that could be done. What is the use of food if one has got no money to buy it? Now, please understand plainly, that I am utterly against supplying the native free of charge and making him thereby more lazy still; on the contrary, let him have nothing without payment, and not too little either. I myself do not see any harm in the storekeepers making a very fair profit indeed, as the native demands in Johannesburg and obtains, a very fair wage. The more he has to pay the more he has to work. But I do not intend to knock my head against a brick wall or soft-notioned ideas. Let us return to the money question. Almost every native has some outstanding debts (some few he inherited in consequence of their complicated inheritance, laws and the liability of the clans). As a rule, the native is an easy creditor, but when hunger is pinching, he demands settlement from his debtors and starts collecting. He cannot leave this business transaction to his women, but must do it himself. Another reason for him to stay at home; another cause why he cannot go to work. It ought to be impressed upon Native Commissioners that questions should be settled quickly and cheaply, not only in their capacity as judges but also as arbitrators. A good Native Commissioner could do much in this way. At present many of these questions (in fact, the greater part) are dealt with by headmen and the policy of the late Government has done much towards driving a lot of settlements, that could be quickly dealt with by an arbitrating N.C., into the claws of the wily headmen, who are lawyers enough to know that quick settlements do not pay No. 1. Headmen are a nuisance and ought to be done away with as much as possible, especially considering what is being done now. Now many, if not most, of the natives would leave old outstanding and their collection alone, if they could raise money somewhere else. What is the use of a native going to Johannesburg and earning money if he knows his family are starving. True, the labour-touting Associations are trying to induce the native to come to work by offering him an advance in grain to his remaining family. But a native is a distrusting creature; experience has made him so. He is not eager to avail himself of the chance thus offered him.

Another system ought to be inaugurated, a system that years ago I proved to work well with boys living on my farms, or to whom I was known. The boys ought to be induced to remit money home. You say, Well! they can do so now. So they could, with a lot of trouble though, and with the off-chance of the remittance never reaching its destination. There is a remedy. Post money order offices for Kaffirs ought to be created. A tall order, you think. Not at all. A thing that could most easily be arranged and worked without a hitch. The first thing to do is make some alteration in the pass-books of the touting labour agents and in the passes issued to the boys. At present the boys are asked to give their names, their names at home, their names amongst white men, their chief's name, etc. What is the good of all this? Is it to be able to locate the boys? If so, this could be done with the greatest difficulty. I propose that the passes be made out and the boys be registered as follows:—

- (1) No. X (a letter denoting the recruiting locality).
- (2) No. (say 3,225), the boy's consecutive number.
- (3) His name in Johannesburg. (4) His name at home. (5) The name of his father, or eldest brother.
- (6) The name of the kraal where he is staying.
- (7) The name of his chief, if in location or on Government ground; if he lives on a farm, the name of his baas and farm or river or mountain.
- (8) The name of the party he wants any remittance to be paid to. The counterfoil in the pass-book to show the same data. The labour agencies will have to supply copies of their pass books, referring to boys collected, every month to the distributing post office order offices of the district, where they have been collecting. Now a boy working at a mine, who wishes to send money home, would simply have to go to the collecting office at the mine, show his pass and deposit the money to be sent against receipt. The collecting official will see by the (1) letter what part of the Transvaal or South Africa he has to send the money to. He will send the amount of money, the letter (say X) and the boy's number to the distributing office. The officer there will look up his book, find the boy's number and his kraal, address, etc., and the party for whom the remittance is intended. He will send a policeman, call the party and hand over the money. The whole arrangement is quite simple. The difficulty is to overcome the distrust of the native, so that he will make use of the institution. I would here propose that this postal-remittance system be not left in the hands of the labour agencies, as their touting agents are men wandering about and often not quite well known as to character, etc. Government ought to take the matter in hand as a sub-division of the postal service. As collecting agents, the mine managers may be sworn in; as distributing agents the Native Commissioners, J.P.'s, missionaries and traders of the very best reputation only. No cost should be spared in investigating and prosecuting any discrepancies. As it is very difficult to convict on a Kaffir's evidence on account of his having been brought up to exaggerate in order to strengthen his case, on which exaggeration as a liar his testimony will be ruled out of Court, the benefit of the doubt ought to go against the culprit, and, if not convicted, any official having had such a case brought against him should be at once dismissed as not deserving the honour of being in Government employ. The Government ought to strictly supervise this system to gain the natives' confidence in it, and as no private association could well dismiss their employees simply on suspicion, the Government ought to take this remittance system under its management. I am confident it would soon work all and induce the natives to come to work more freely. (2) There is another point I should like to draw attention to, viz., there is a lot of talk about higher taxation for Kaffirs in order to induce them to work. Why is this not done. Does Exeter Hall object? Every white man is taxed directly or indirectly and every native living on private ground has to pay rent. Why does Government not ask rent from the natives living on Government ground? It would not be more than right, it would induce the boys to go to work or trek on to the farms and assist our agricultural

resources. At present, these cannot be properly developed for want of skilled labour. For instance the tobacco industry and for producing leaves of a better class for cigar factories. The boys are trekking away from farms that are being worked on to Government ground, where they can linger about in idleness; is that right? (3) Re taxation, a head tax should be asked with a rebate system for boys that have done a certain amount of work with a sliding scale for time so employed. (4) You are asking for the addresses of men that will be able to say something on the native and labour question. Excepting missionaries who by one-sided experience of native character, are bound to have one-sided views, the best man in the whole of this district is undoubtedly Mr. T. D. Gill, of Comandoboone, Spelonken, a man of great knowledge, experience, and expanded far-sighted views.

5,278. The CHAIRMAN: You live in the Pietersburg district, Mr. Dicke?—At present, yes; since the war.

5,279. And previous to that?—I used to live out in the country, used to do farming on an extensive scale, and before that I was trading amongst the natives. I am at present representing three of the leading farming concerns at Pietersburg. That is to say, I have to deal with their produce and do the best I can with it in the Zoutspansberg district.

5,280. You say here that you planted on an extensive scale. What were you growing?—Coffee and tobacco leaf. During the war the leaf disease imported from Natal got into the coffee plantation. I could not get the late Government to bring in a law, prohibiting the introduction of seeds.

5,281. These farming concerns you now represent, what are they growing?—Tobacco and mealies.

5,282. Are they companies or individuals?—One is a company, one belongs to two men, and one belongs to my brother, individually farming.

5,283. How many natives did you employ in your plantation before the war?—Sometimes up to 80, but they were mostly women.

5,284. How many natives are now employed by these farming concerns you represent?—It is very hard to say.

5,285. But you do not know?—I could make a fair guess if you would give me time. About 40 male natives, and, according to crop time, up to 150 women.

5,286. Were you always able to get a sufficient supply of natives for your plantation before the war?—No. It is the hunger years that brought the natives.

5,287. You mean famine years?—Yes. Rinderpest broke the natives so that they had to go out to work, and now they have become accustomed to it, but before that you could hardly get any natives at all. Now they have got more or less accustomed to work, but the hunger years and the rinderpest broke them in.

5,288. You mean the famine years?—Yes.

5,289. Have these farming concerns got plenty of labour now?—No; the labour supply is getting less. I can give you the reason for it, too—One reason anyhow; that is, under the late Government, under the "Plakkers Wet," natives living on farms were charged 12s. 6d., that is, 10s. for a hut and 2s. 6d. for road tax. That is, natives living under the "Plakkers Wet;" whereas natives living outside the farms, and not under the white man, had to pay, besides this, an extra tax of £2 per head. So there was some inducement for the natives to live on farms, and to give their labour to the farmers.

5,290. Is that how you explain the shortage now?—Now they are simply charged £2 all round. So they simply trek on to Government ground, where they are their own bosses.

5,291. You do not think the famine has the effect of sending large numbers of natives out to work?—Yes, more than usual; it would do, certainly, but not so many as most people always imagine.

5,292. The reason being that?—I specified the reason.

5,293. The natives will not leave their women folk to starve?—No.

5,294. The traders in your neighbourhood seem to have a fear in famine years of the Government stepping in to supply grain to the natives?—At present, yes; not before. We got a circular from the Native Commissioner-in-Chief asking whether we would keep on the supplies of grain, but at the same time stating, if we ask too high a price, the Government would step in.

5,295. Is it not your opinion, then, that but for the fear of Government interference in the grain supply traders would have laid in stocks and given the natives credit. I think your statement indicated that if grain could be given to the natives on credit large numbers more would go out to work?—No, I never said that; that must be a misprint.

5,296. I did not say you said that. I only give a general impression. That is not your view?—No.

5,297. Then you think, if grain could be supplied to the natives in famine years, a considerable number would come out to work?—More, yes; if they were sure of getting supplies, certainly.

5,298. Do you think that if a heavier tax was put on the native, large numbers would come out to work?—Yes, certainly; especially those living on Government ground. I do not think those men should be free. There is any amount of Government ground up there, some is now being cut up into land settlements. But there is very little ground that falls under that head. There is any amount of ground where white men cannot live. Now, when I first went up there in 1889 the last natives to be met with, with few exceptions, were at the Koodoos River and Brandtbontjes.

5,299. What did you say about that?—When I went into the low country they were the last natives to be met with. Since then, Government farms have been taken up, and the white men came into the country, and as white men came into the country, the natives trekked, and now you can meet the natives all along the Delagoa Bay footpaths right along the Portuguese frontier. Should you travel down the footpaths where not a single native used to be living, it is all kraals now, right along the Portuguese borders to the Singuidse River, and they used not to be there before.

5,300. Do you mean to say the natives have migrated from where they were down to the Portuguese border?—They trekked away from the white men on to Government ground.

5,301. And you think if a rent was charged to them for squatting on Government ground, they would turn out in large numbers?—If they do not turn out for the mines under present conditions, I do not think you will ever get sufficient labour for the mines. But the agricultural resources of the country could be opened up, which cannot be done now.

5,302. Mr. QUINN: You seem to be very much concerned, Mr. Dicke, about the interests of the storekeeper. On page 21 of your statement, dealing with the question of the effect and the difficulty of obtaining grain, there are a few things in your statement which seem to me novel. You say there is more competition now and prices are cut too fine?—Yes.

5,303. Do you think that interferes with the native labour supply?—No. In an indirect way, yes.

5,304. They get their food too cheap?—I do not mean to say that. The price of mealies supplied to the natives, or anything supplied to the natives, is being cut down so fine now by competition; add to this the risk of keeping a large stock of produce. There is not only the risk of the Government stepping in, because then you could keep but a small stock. The storekeepers say, "Well, if I sell out I can buy some more," but we are afraid up there of the roads being closed with Rhodesian redwater, and if a man would lay in a stock of mealies and

want to make money out of them, a couple of bags would not help him, and he would have to lay in a large stock as there the risk of the Government appears, and he does not care to do that. If there were less stores than formerly, when prices were ruling about 15 to 20 per cent. higher than now, you could make a profit, but now you cannot.

5,305. Were you putting it right with your argument: if there were less stores and higher prices, and no Government coming in to compete, would it be better?—Certainly it would.

5,306. The CHAIRMAN: That is your argument?—Yes.

5,307. Mr. QUINN: How does that affect the native supply?—Then the native knows how he can get mealies and now he does not. I suppose the native lives in the neighbourhood of the stores, and knows his women can get mealies in the store and then he leaves home with a lighter heart, and nowadays he does not know where his women would be able to get food.

5,308. Are there not more stores than before?—Yes, there are a number, but it does not pay them to keep mealies.

5,309. What are they keeping?—Soft goods. I went over the country and asked them what amount of mealies they would require and they said they would not touch mealies.

5,310. How is it that there is so much competition now?—There are more stores.

5,311. Why are there more stores?—Because there is more white population in the country.

5,312. Is that the only reason? Do you think the big profits you were getting had something to do with creating more stores?—The prices are not so big now. I was a trader up to 1893, and in 1893 I left it alone. The profits were not big enough for me.

5,313. I see. There is a great deal to be said on that line?—Yes.

5,314. On page 4 of your statement—it is the same argument—I must say I do not understand it, but perhaps I shall by and by—in the second part of the first paragraph on page 4 you say, "Now, please understand plainly that I am utterly against supplying the native free of charge and making him thereby more lazy still; on the contrary, let him have nothing without payment, and not too little either." You mean not too little payment?—Yes.

5,315. You continue, "I myself do not see any harm in the storekeepers making a very fair profit indeed, as the native demands in Johannesburg, and obtains a very fair wage. The more he has to pay, the more he has to work." That is your argument?—Yes.

5,316.—Where do you draw the line in that argument?—What do you mean?

5,317. When would you put an end to it, how far would you go?—I think a very fair profit would be from 33 per cent. to 40 per cent. I give another paragraph shewing how the prices could be regulated. You must not take one paragraph and set aside another paragraph. The prices could easily be regulated by the Government putting down a stock of supply.

5,318. Excuse me interrupting you, but what you propose to tell us, and the meaning of your argument, if I understand you aright, is that food is too cheap, and if it were much dearer and the Government were not to step in and check the prices and bring them down again, the dearness of food would force the native to work, is that so?—As long as he knows he can get it. At present he does not know he can get it.

5,319. Get what—work?—No, food

5,320. I shall have to try and understand you better as we go on. You continue in your statement, "But I do not intend to knock my head against a brick wall or soft-notioned ideas." What does that mean?—It means that people who are far away from the scene where mealies are being

bought, hear of mealies being sold at £2 10s. a bag and think it outrageous. If they were to enquire they would find that perhaps out of £2 10s. hardly 10s. is profit. The other is all transport. There is a big outcry that at such and such a part of the country the Kaffirs have to pay £2 10s. a bag and they are referred to as "poor Kaffirs," but the transport runs away with the profit.

5,321. These are the "soft-notioned ideas" of people who criticise without knowing?—Yes, that is what I mean.

5,322. On page 7, at the bottom (v. p. 322), "there is another point," you state, "I should like to draw attention to, viz., there is a lot of talk about higher taxation for Kaffirs in order to induce them to work. Why is this not done. Does Exeter Hall object." What is Exeter Hall?—Well, the Society that always protects black people.

5,323. Is that Exeter Hall?—Yes. The old Government tried to put through higher taxation, but could not, as there was a big outcry as to why the Kaffir should pay higher taxes than the white man.

5,324. Would it be putting what you mean correctly to say that in your opinion the labour supply would be greatly increased if the Kaffirs were taxed by Government, a tax to such an extent as would compel them to go out and earn that money?—Yes, certainly. What I mean to say is this—impose this tax, you need not call it tax, dish it up under another name, call it rent for Government ground.

5,325. On the principle that a rose by any other name would smell as sweet?—Exactly, it would make it more palatable.

5,326. You say boys "linger about in idleness" and ask "is that right." Can you give any idea of the numbers in your district, of boys lingering about in idleness on Government land?—Well, I know that very near my farm there is simply a nest of Kaffirs, if there is one there are 6,000 men—8,000—doing nothing. That is just in the neighbourhood.

5,327. How do they live? What do they live on?—On the crops the women plant.

5,328. They produce something and live on it?—The women work.

5,329. They do not go to work?—Very little. If an old piece of ground is pretty well used up, assuming the crops are no good any more, then the man goes to work and chops up new ground, that is all the work he does—cuts down trees and prepares a new piece of ground for the first time—after that he does no more.

5,330. Are there any other farms besides those you speak of, or Government land, or any other part of the country where a similar state of things exists. Do you know of any other big location near by?—Down the Klein Letaba there is a nest of Kaffirs, and they do not work.

5,331. Have you any idea from any source whatever of the numbers there are there?—The Maguamba live down there, there ought to be 4,000 or 5,000 men down there.

5,332. Any others?—Well, it is a whole stretch if you look at the map from Olifant's River right to the Crocodile.

5,333. All over the country there are large numbers not working?—Not working for the agriculturists and not working for the mines, or else doing what they call work, perhaps one out of 30, and they are living rent free, simply paying £2 per head. It is a great inducement to farm boys to trek away. Why do they not have to pay rent? There was always a great outcry by farmers against freehold farms kept by companies. The other farmers used to there which belong to land companies, but these Kaffirs living on Government ground afford a much greater inducement to other Kaffirs not to work. They should pay rent anyhow; that would be getting some return from them.

5,334. You do not think that hunger or bad crops drives natives out to work in great numbers?—It

certainly does, but not to the extent people think and not to the extent that can be done.

5,335. Mr. WHITESIDE: You are well acquainted with the Pietersburg district, Mr. Dicke?—Yes.

5,336. Have you ever come in contact with any recruiters in that district?—Oh, yes.

5,337. Do you think they get good results in the number of boys they are sending down?—Well, as good results as they can under present circumstances.

5,338. What do you mean by "under the present circumstances?"—Why should a Kaffir go to work if he has no necessity. What induces him to go to work?

5,339. The natives are there?—The natives are there.

5,340. Assuming some arrangements might be devised to induce the natives to work, have you ever formed any estimates in your own mind of the number of natives that could be obtained in the districts with which you are acquainted?—No, sir, I can merely give a guess, that is all. I did not intend when I wrote this to come and give evidence; I intended only to give advice as to what I knew and was satisfied would drive the number up.

5,341. In your opinion the natives are there. It simply wants inducement to make them work?—Inducement is too soft a word—pressure, we will say.

5,342. We cannot split terms, but say if some pressure were brought to bear to make natives work, the labour is there?—Not as much as you want, but a great deal more than you get now.

5,343. You said just now that you could not frame any estimate of what you could get from there. How do you arrive at the conclusion that we cannot get what we want?—I see from statistics what you want. I ride all over the country and get a fair idea of how many natives there are. I may make a mistake of 5,000 or even 10,000 or 20,000, but take it at the highest number it will not reach the number you want.

5,344. What statistics are those to which you refer?—I refer to the Zoutpansberg district.

5,345. I mean the statistics of our requirements, you say we cannot get sufficient to fill our requirements, you gained that knowledge from statistics, where did you get them from?—I saw them in the newspaper.

5,346. Mr. TAINTON: Did you intend, Mr. Dicke, to put this in as your chief evidence when you wrote it?—No, sir, I did not intend to come down at all. It only struck me that everyone in South Africa ought to do his best to solve the question, and I tried to give some advice. Taxation I know would drive up the number, especially from an agricultural point of view. If the question of mine labour was settled one way or the other, it would be said that the question is settled, and it would be simply chucked away. But the mines are not all the country and the agricultural resources have to be developed, though I am afraid they will be left in the cold. It is no use for you to get a lot of labour and still all that labour being up there and not available to you nor to us either.

5,347. Would you wish to modify your statement before you put it in?—In what way?

5,348. Modify it, or alter it?—Alter it! No.

5,349. You would not?—No.

5,350. As I understand it, you start from the idea that the native at present requires food, and you suggest a scheme to supply grain to the locations, is that correct?—Yes.

5,351. You also suggest a scheme by which the wages of the men here can be remitted to the locations in order that the families there may purchase food, is that right?—Yes.

5,352. Then most of your statement is taken up with two schemes to enable the native to supply food to his families, is that right?—Yes.

- 5,353. What is the connection between these schemes for supplying the native with money and the labour supply?—If you do not supply them with food, they will not come to work to a great extent.
- 5,354. You mean that when the famine goes so far as to threaten the native families with starvation, then the men remain at home?—A great number of them do not remain at home, but go about the country looking for food which is work lost to you.
- 5,355. They do not go far away for work when starvation threatens?—They do not go to work, their work is looking for food.
- 5,356. Suppose the want of food does not go so far as to threaten starvation, suppose the food supply is somewhat short, what effect has that on the native?—It will bring him out to work.
- 5,357. So that want of food if it does not go so far as to threaten starvation, brings the native out to work?—Yes.
- 5,358. When it goes further and food becomes scarcer and the men are afraid that their families will starve, they will not come out to work?—No.
- 5,359. Your statement is taken up with schemes and suggestions for overcoming difficulties, threatening the natives during famine years?—When he is threatened with starvation let him pay for food and pay well for it. That gives him a want to come out and work, but you must let him know that the food is there.
- 5,360. Where were you trading?—In the Low Country.
- 5,361. What part?—Northern Low Country—Klein Letaba way.
- 5,362. How long were you there trading?—Three years.
- 5,363. What years were they?—1890, 1891 and 1892.
- 5,364. You said in reply to one of the members of the Commission that in your experience the natives would not come out to work?—If they can help it, no.
- 5,365. Was that experience gained when you were trading amongst them?—While trading and while farming amongst them. They are simply unwilling to work.
- 5,366. Unwilling to work?—Not willing as far as they can help it.
- 5,367. How would you make them?—First I would increase the taxation on natives living on Government ground; and, secondly, I would raise the present hut tax and give them a rebate when they went out to work. If they could shew that they had worked for so long at the next collection of hut taxes, let some amount be deducted; that could be worked out.
- 5,368. That principle of rebated taxation for those who have been working underlies the "Plakkers Wet," does it not?—It is the same idea. They pay 12s. 6d. because they work on farms.
- 5,369. It is also the principle of what is known in the Cape Colony as the Glen Grey Act, are you aware of that?—No.
- 5,370. In your experience what is the effect of the "Plakkers Wet" upon the tribes, did it make them come out from their locations and live on private farms?—No, the "Plakkers Wet" is a law that can be worked only by a very sensible official. Anyone with red tape can use the law in such a way that it will be a scourge to the farmer and simply drive the natives away.
- 5,371. Drives them away—where from?—Off the farms.
- 5,372. Where to?—To the locations and on to Government ground.
- 5,373. How does it have that effect?—Because, as I told you, living further up where there are occupation farms, there are more natives on every farm than five families and when the "Plakkers Wet" came into force the others had to trek. You then had to make application for more if you could prove that you wanted more for working the farm, but when they had once trekked it was no use trying to get them back.
- 5,374. Was that the effect throughout the country, or was it local?—Local.
- 5,375. Limited to the Zoutpansberg district?—Yes.
- 5,376. Were there any large areas where the numbers of natives on the farms were less than five families?—Oh, yes.
- 5,377. Did those who left the farms where there were more than five families go to increase the numbers on those farms?—No, they trekked on to Government ground where they had to pay a hut tax of £2 which is nothing to a native.
- 5,378. Do you know of cases where natives left the Transvaal altogether owing to the operation of the law?—No, because up there it was so far away from the border of the country and so unhealthy that very few Native Commissioners went down to collect taxes near the Portuguese border.
- 5,379. Then you never heard of cases where locations and tribes left the country when Native Commissioners attempted to enforce the law?—No, there is plenty of Government ground, and it cannot be enforced on Government ground, only on farms.
- 5,380. Take now the effect of your scheme of higher taxation, what would be the effect of that in your opinion?—To make the Kaffirs work.
- 5,381. Why?—They would have to raise money somewhere to pay their taxes, and if they got a rebate there would be more inducement.
- 5,382. Are there not many natives living on private farms?—Oh, yes, but that is the reason why the "Plakkers Wet" has not been exacted, because those companies would lose the rent. I suppose that is what stopped the "Plakkers Wet."
- 5,383. You are speaking of the operation of that law in the Zoutpansberg district only?—Yes.
- 5,384. And it has not been enforced there because it would interfere with the rents of private landholders?—I suppose that is the idea.
- 5,385. What taxation does the native pay living on private land?—£2 12s. 6d. under the old Government.
- 5,386. What do private landowners charge the natives?—£1 per hut.
- 5,387. And a large number of natives voluntarily live on private farms?—Yes.
- 5,388. Why do they submit to that extra taxation?—Of £1 per hut?
- 5,389. Yes?—Most of them belong to the Basuto tribe or call themselves Basuto. They are very peculiar and always like to stick where their father lived, and not like the Magwamba, live one year here, and the next at another place. The Basuto will submit to a lot before they will trek and would rather live at their old place.
- 5,390. You say that they pay an extra pound per annum in order to preserve family traditions or connection with their father's farm?—Yes.
- 5,391. So that according to your evidence the majority of these people pay voluntarily and willingly this tax of £1 per year rather than live away from where their fathers lived?—Not the majority, a great many.
- 5,392. Taking that view, do you think that your scheme of taxation would have much effect if a man is ready to pay £1 a year for sentiment like that?—Where is he going to get the pound from? He has got to come and work.
- 5,393. But according to your statement he pays a pound extra on private land which is really an extra tax. He taxes himself an extra pound a year for no commercial reason at all?—This pound brings him out to work. He comes and works for it, he has got to pay it and has got to labour.

5,394. Is it not your complaint that natives on private land do not come out to work?—What is it to work for £1?

5,395. How much would you put upon them for taxation; how much would you tax them per year to make them work?—That is on Government ground?

5,396. On any ground?—A pound a hut at the very least.

5,397. Do you think that would bring them out?—It would be some inducement. There is the present hut tax, add to that this rent of £1, and many natives have four or five huts, which would make things total up. Increase the hut tax and introduce the rebate system and they will have to pay a lot in the end which will make them work.

5,398. Mr. BRINK: There are very few farms in the Low Country?—There used to be very few, but there are a lot now.

5,399. What do you call a lot; how many hundred?—In the whole of the Zoutpansberg district?

5,400. I am talking of the Low Country; where you are farming?—There are a couple of hundred white farmers there.

5,401. There is a very large native population there?—Yes.

5,402. Should you have trouble to get labour there—the white farmers have trouble to obtain labour?—Yes.

5,403. If it were not for the women you would not be able to work your farm; am I putting it right?—We prefer women for some kind of work. They are cheaper and they do just the same work. For instance, when plucking tobacco, or reaping mealies, it is quite immaterial whether the hands employed belong to a child or to a man or a woman. It is not hard labour. We want men only to take out the stumps of the trees; for other work we use machinery there.

5,404. Mr. BRINK: Do you think a farmer having natives to work continuously can make farming pay if he has to pay the boys £3 a month?—No, it is out of the question, sir. Of course I have a boy, my head boy—

5,405. This question is in general?—Yes, it is out of the question; they cannot do it.

5,406. Mr. FORBES: You speak of growing tobacco, and that you usually employ about 80 natives?—Yes.

5,407. And sometimes about 150 women extra?—That is when about three farms are concerned.

5,408. How many acres do you cultivate on that farm?—About 400, but you must understand that we work with machinery. We do not work like the ordinary farmer does.

5,409. Do you have these natives continuously or only so many weeks?—Only at cropping time.

5,410. And the women only a few months in the year?—Only at cropping time.

5,411. This concluded the cross-examination of Mr. Dicke, who then made the following statement to the Commission: Excuse me for one moment, you were asking about natives having any complaints to make about compounds. The complaint I frequently hear is this, that the families are torn asunder; two brothers are often sent to different compounds; I think it is an easy matter to settle. A native likes to work where some of his relations work. If he should be sick or if he should die, he likes his people to know at home. Sometimes they do not get such advice and he simply disappears. This is a great objection. Especially when two or three go to work from one kraal; they should be put into one compound. I should like to draw your attention to this.

5,412. The CHAIRMAN: Have you heard that complaint recently?—Not recently.

5,413. The evidence given by the Chairman of the Native Labour Association has been to the effect that that is now done away with?—Well, that is a great point among the natives.

5,414. Is there anything else you would like to say, Mr. Dicke?—No, thank you.

5,415. The Commission is very much obliged to you, Mr. Dicke, for coming here to give your evidence.

The Commission adjourned at 4.45 p.m. till 10.30 a.m. on Thursday, August 20th, 1903.

## FIFTEENTH DAY.

Thursday, 20th August, 1903.

THE COMMISSION SAT AT 10.30 A.M.

Lieutenant-Colonel F. W. PANZERA, called and duly sworn.

5,416. The CHAIRMAN: Have you before you a Memorandum headed, "Evidence of Lieutenant-Colonel F. W. Panzera, Assistant Commissioner, Bechuanaland."?—I have a type-written copy.

5,417. Do you hand that in as your evidence-in-chief?—Yes. There are one or two mistakes I wish to correct. May I say that I have a most fearful cold. I may have some difficulty in making you hear.

The statement was as follows:—

1. District with which witness is acquainted.  
2. Length of time during which witness has known such district. (1) Bechuanaland and the Bechuanaland Protectorate, including N'Gamiland and the Tati district. (2) Ten years. To assist the Commission in deciding on any questions they may wish

to put, I will briefly state duties which have brought me into contact with the native population. During the first three years of my service in this country I had entire engineer's charge of Bechuanaland (Crown Colony) until it became the Bechuanaland Protectorate, being responsible for all works, Civil or Military, including roads, wells, drifts, buildings, forts, barracks, Crown reserves, boundaries, etc., and in carrying out these duties travelled 12,000 miles on horseback (besides other means of transport) about the native and other districts, and amongst other duties was a member of the Protectorate Concession Court, Commandant and R.M. Maclontsie and Tati districts, Secretary Rhama Southern Boundary Commission, etc., etc. Since 1894 I have represented the Imperial Government on the Vryburg-Palapye sections and the Rhodesia Railways; was British member and President of the British Transvaal Joint Commission to decide the Bamalite-Bakgurutse Boundary; Special

Commissioner N'Gamiland (to decide certain native disputes on the boundaries of the native reserve); Acting Assistant Commissioner, Palapye; member Rinderpest Compensation Commission; since the war I have been Assistant Commissioner of Bechuanaland Protectorate for the northern districts, etc. During the last 10 years I have been mixed up with every native question in Bechuanaland and the Protectorate, and have been brought into intimate contact with the following tribes: Batlores (Langberg, etc.), Batlapin (Taungs), Western Barolongs, Eastern Barolongs (Mafeking), Bamwaketse (Kauye), Bakwana (Molopole), Bamelite (Raenoutsa), Bathloka (Gaberones), Bakgatla (Mochudi), Bamangwato (Palapye Serowe), Batawana (N'Gamiland), besides numerous small subsidiary tribes and people, such as the Masarwa, Bakalahadi, Bakubi, Makalaka, etc., and the Bakgurutsi and others in the Tati district.

(3) Character of Natives of such districts.—The character of the natives of most tribes is fairly good.

(a) Usual Work: The Bechuana are essentially a pastoral people, growing sufficient corn (in past times) for their own requirements, and hunting, for sport, food, and to obtain skins for clothing, etc. The men of the northern tribes were, up to quite recent times, the fighters and hunters; the women were the workers. As, however, the country became opened up, the men made a good deal as transport riders. The introduction of ploughs has led the men to a large extent to take the place of women as tillers of the ground, but the women and children still do most of the sowing, weeding, and reaping, etc. The latter also build the huts; the men fencing the "lands," making karosses, etc.

(b) Usual Food: The usual food in the northern district is as follows, and in order of importance as set down:—1, millet; 2, pumpkins; 3, thick milk; 4, meat. It is a mistake to suppose that mealies are eaten by the natives when they can get anything else; they grow them for sale. Among the more Southern Bechuana tribes, European food is increasingly used. (c) Usual Pay: This varies very much, I should say from 10s. per month with food to 3s. 6d. per diem. For earth-work about 2s. per diem and rations. (d) Physique, Aptitudes, Special Ailments: The physique is fair, greatly improving under favourable conditions of work and food. They make fairly good servants, good agriculturists, good workers with spade, pick and shovel; excellent herds and ox-drivers, etc. They are liable to develop chest complaints and to suffer from pneumonia in exposed districts, or in the environs of towns, etc., and running through most tribes (especially those nearest to civilisation) is a strong taint of specific disease. The tribes vary tremendously as regards physique and qualifications for labour. The Bechuana are not naturally good workers; the tribes of the south who have been gradually educated up to work since the Warren Expedition are much better than those in the Protectorate. Of Protectorate tribes, I should put the Bakgatla as far better as a people as labourers than the others of the tribes of Bechuanaland, I should put first the Eastern Barolongs. (e) Special conditions, etc., which would induce, etc.: Numbers have worked in the De Beers mines at Kimberley and always appear to be satisfied and pleased with the conditions there, seeming to like the compound system and the general arrangements. Good food and good wages are naturally inducements. Short engagements (not exceeding four months) and arranging that each gang should if possible consist of men of the same tribe and under one of their own people, or a white man. Mixing tribes and placing them under foreign native gangers is unpopular. n. Deterrents: Underground work, long term of engagement, mixing tribes, placing gangs under native headmen of other tribes. Unhealthiness of District: If there are a few deaths from enteric, pneumonia, etc., and a district gets a bad name in this respect, nothing will induce the men to remain, short of actual force. Deserters spread the news amongst the tribe at home and further recruiting is hopeless. (f) Approximate numbers available: For the Northern Protectorate (exclusive of the Tati district, where the T.C. want the natives for their own mines, etc.) about 2,500.

17133

(g) Enterprise, etc., managed by Europeans: There are very few in the Protectorate. About 400 Bechuana are, I suppose, employed on the railway, and perhaps 1,000 more as employees in stores, hotels, works and by contractors, etc.

Personal Views: I feel personally very strongly on the following points with regard to Bechuanaland and the Protectorate. I have heard it suggested that an increase of taxation would have the effect of driving the natives to work out of their own districts to provide the funds necessary to meet it. This I believe to be absolutely fallacious as regards the pastoral population of the Protectorate.

The hut-tax, only introduced in 1899, is at present 10s. per hut. A native gets from 12s. to £1 for a goat, and from 12s. 6d. to 25s. per bag, according to the season, for mealies.

It is very easy, therefore (except in seasons of failure of crops like the present one), for the native to obtain the money for his extra tax by a little more work at home or by killing a goat, etc. The increased tax may cause intense bitterness of feeling, perhaps, but it will certainly entirely fail to accomplish the object in view, namely, to induce the native to seek work in the Transvaal.

There is only one way, and it is necessarily a very slow process, to solve permanently and satisfactorily the native question as far as labour is concerned. That is to say, to so educate the native tribes that they will desire and value the products of civilisation. As their wants increase as regards clothing, cooking utensils, furniture, improved huts, agricultural implements and European food, they will voluntarily in ever growing numbers go out to work to obtain the means of satisfying those wants.

This is illustrated by the Eastern Barolong (who since '85 have been associated with the white population of Mafeking), who purchase in considerable quantities the articles above named, and hence are eager to earn money.

I have not the very slightest sympathy with the extremists of Exeter Hall, but I do personally think that the most absolute freedom should be enjoyed by every individual subject, irrespective of colour, of His Majesty. Surely this is the principle for which our ancestors have fought and bled in every quarter of the globe.

I venture to maintain that as long as a man is able to satisfy his wants without working, and does not call upon the Government for aid, we have neither the right or the power to make him work by any means of legislation, and that any form of forced labour is impossible. My feeling and my policy will be illustrated by the extract attached.

Extract A. (Marked A). Copied from a letter recently written to a Protectorate chief. I also attach a letter, copy B, of replies to queries just forwarded to the R.C., Bechuanaland Protectorate.

It is my most earnest desire to assist in every way in my power the native labour movement. I have talked to all the chiefs and headmen about the advantages of work, etc. I recently got Khama to call a public meeting to try and induce his people to go out.

[A.]

Francistown,  
July 6th, 1903.

To the Chief . . . . .

My Friend.

About the food question, I want to tell you what the white people do, so that you may understand the conditions under which the Government will treat your people.

There are many white people who are starving in England whom the Government have to help. They first, however, make it a rule that all of a family who can earn money must do so.

They never help a single person until they are satisfied that every soul of their relations who could contribute to their support is giving all he or she can spare.

Now, the Government will do the same by your people. A certain number, we know, are required

P 2

to look after the land, the women, and the stock. If Government aid is required, it must be shown that every man whom it is not necessary to keep at home is at work.

Mind, the Government do not say they must work—the Government do not force any man to work if he wishes to remain idle—but if he might work and will not, he must not expect Government aid.

\* \* \* \*

With kind greetings, I am,  
Your friend,  
(Sgd.) F. W. PANZERA.

Extract B, Qu. I. Population of Northern Protectorate.—It is extremely difficult to give here a reliable approximation of the very scattered population of this vast area.

I estimate the population under Khama (including Masarwa and Bahalahadi as well as Bamangwato, etc.), as 60,000 of all sexes and ages.

I should say the population of N'Gamiland was approximately 12,000 (including the Bakuba).

There are also Bushmen scattered about in the Ghaazi District, etc., who are under no particular chief, and a certain number of Damaras and others, say 5,000.

This would bring the population of the Northern Protectorate (exclusive of the Tati District) to 75,000.

2. Impossible to answer. I should say more than 10,000 for the Northern Protectorate (exclusive of Tati District).

Qu. 2. Able-Bodied Males.—Impossible to answer. I should say more than 10,000 for the Northern Protectorate (exclusive of Tati District).

N.B.—I exclude the Tati District because the T.C. want the natives for their own mines when working, and it would not be fair to let labour agents compete with them.

Qu. 5. Ordinary Food.—1, Millet; 2, pumpkins; 3, thick milk; 4, meat. In order of importance as stated. Mealies are not eaten by the natives when they can get other food. They are grown now for sale. When a hasty meal is required they sometimes eat mealies, as the preparation of millet is rather an elaborate process.

Qu. 6. Available for labour outside District.—Assuming 10,000 to be approximately the correct answer to 2, I should put those available for labour outside the territory at 2,500 at the outside. Owing to the vast extent of the country, the number of scattered cattle-posts, etc., and the number employed in looking after tribal and other cattle, etc.

Qu. 7. No. seeking re-employment.—I should say not more than 25 per cent. seek re-employment, their object in going out to work is to accumulate enough money to acquire cattle, etc., to settle down at home.

Qu. 8. No. of Coolies, Cape Boys, etc., in Protectorate.—I do not suppose there are more than one thousand Coolies and Cape Boys (or Malays) altogether in the Northern Protectorate, all of whom are in regular employment as traders, wagon and cart-drivers, hotel cooks, servants, smiths, etc., and gardeners.

The number of natives employed: (i.) In agriculture, none except in cultivation of native lands; (ii.) on Railways, about 400; (iii.) in Hotels, Stores, etc., about 600.

Qu. 9. No. of Farms owned by Europeans.—No farms except those in Ghanzi District, or practically none. Most farms in Northern Protectorate are worked very economically by owners. They are stock farms, and I do not suppose more than 1,000 boys are employed altogether by white men for herding, etc. What lands they have the owners and their families cultivate themselves.

The almost invariable rule is employment by the month.

There is very little imported labour; by this I mean imported from other districts in South Africa. "Imported" from outside South Africa there is none.

5,418. You wish to give evidence re Bechuanaland?—Yes, the Bechuanaland Protectorate.

5,419. You have resided there for 10 years?—Well, I have served in the country for 10 years, that is to say I was sent out by the War Office to Bechuanaland which in those days included the Protectorate. Bechuanaland was then a Crown Colony, but since the annexation I have served in the Protectorate. I know both districts very well.

5,420. Do you know the native language?—Fairly well, yes. I can always follow evidence. I know all the tribes well.

5,421. You say that the Bechuanas are essentially a pastoral people?—Yes.

5,422. Can you give us any idea of how many leave the country to work elsewhere?—Well, I should like first to tell you the difficulties we have to contend with. In my own district there are over 200,000 square miles. Waters are few and far between and the people are greatly scattered about. We have only had the hut tax since 1899 and that is practically our only means of obtaining statistics with regard to the actual population. These numbers that I give you are merely estimates. I think that from my experience of the natives I have made a fair estimate and I may also say that I have avoided reading any of the evidence given before this Commission, because I did not wish to be biassed in any way. I showed this estimate to a missionary who has for some years been working among the Baman'gwato. His name is Willoughby and he said that my estimate was as nearly accurate as it could be. With regard to N'Gamiland, for which I have given an estimate, I was Special Commissioner there for over a year, fixing boundaries and settling native disputes, and I think my estimate is fairly accurate, but it is absolutely impossible to obtain accurate statistics. Although I have not read any of the evidence, I was told the other day that Mr. Goodyear, the labour agent, had given a higher estimate of numbers than I had. I do not think that proves that either his estimate or mine is wrong on a great many points. My estimate is the number of boys that I think could be spared from the country at one time, but it is extremely likely that Mr. Goodyear gives the numbers for a year and that lots of these boys go out of the country to work two or three times during the year. That would not necessarily upset my estimate. Then in the Southern Protectorate the estimate will be more or less on the hut tax. That is our usual way of knowing the native population, assisted, of course, by practical knowledge of the tribes.

5,423. What is the figure of the numbers available for work outside the territory that you estimate?—I take it that you ask for numbers between certain ages. Well, I estimated the population of Khama's country at 60,000. That is on the hut tax returns of all sexes and ages. In N'Gamiland, 1,200. I may say that both these estimates include a lot of people scattered about and not actually belonging to the tribe themselves, I mean the Bakaladi and Bakuba. Khama's tribe is the Bamangwato, the tribe in N'Gamiland is the Batawana, There is a very strong subsidiary tribe in N'Gamiland called the Makuba, but they practically work for the Batawana.

5,424. What I wanted to get from you was how you arrive at your estimate of the total number available for labour outside the territory?—That is what I was leading up to. I have taken 10,000 as the number approximately between the ages of 18 and 35. Now I take it that only 25 per cent. of these would be available at one time for outside labour, that is 2,500. I have, if anything, underestimated; I thought it the best thing to do, and I take one fourth because a good many of those between the ages mentioned would not be available from sickness and other incidental causes, also there

must be a certain number in a big scattered country left behind at cattle posts to look after the women and work the land and so on.

5,425. Do you think we may look for any large increase in that number in the next few years?—The difficulty to my mind is this. I do not think there is any means of increasing the number beyond giving the people a liking for work, and increasing their wants or educating them up to a want for European articles. That is a very slow process of course.

5,426. You apparently do not think that an increase of the hut tax or a ground rent charged for the land they use would lead them to go out to work in large numbers?—I do not think from personal knowledge of our natives, especially in the Northern Protectorate, that any means of the kind would have any very great effect. I do not think it would have any appreciable difference.

5,427. How would they find the money?—By extra work at home. I do not think it would necessarily drive them out of the country. The hut tax is now 10s. Say that you even double or treble the hut tax, it simply means that they grow some extra mealies or kill some small stock, it does not drive them out of the country; or even if it induces them to go out of the country it does not mean that they go for long. They would simply earn enough money to pay the increased tax.

5,428. Mr. GOCH: Of the 2,500 available, according to your estimates, I think you mentioned that 1,400 were employed. Is that 1,400 included in the 2,500?—No, it is not.

5,429. Of that number do you know that any have gone out to work?—That I cannot tell you. We have no statistics.

5,430. Are they still in the country?—I think it is perfectly safe to estimate that you can get a maximum of 2,500—certainly in the course of a year—and some of the boys might work twice.

5,431. Would they contract for longer periods than six months?—No, I do not think so. That is one point against their going out. They strongly object to working for a period as long as six months, which takes them away too long from the country. The rains are very partial and they suffer from long periods of drought. I think four months would be better than six.

5,432. Do you think they are likely to come twice on a four months' contract?—I think it is very probable to some extent, but I cannot say what would be the percentage. The labour agents would know that better.

5,433. Probably the whole of the 2,500 would come twice?—No, I should not like to say that. A percentage perhaps, say 33 per cent., would come a second time, that is if they liked the treatment and so on. We have found that in regard to natives going down to Kimberley.

5,434. That would give us a further 800?—Possibly.

5,435. You say that that is a very conservative estimate. Could you take a more hopeful view and give us a higher figure?—No, I have thought the matter out very carefully and given you what I thought was a fair estimate—certainly it is not exaggerated. All these things I have underestimated rather than overestimated.

5,436. Yet you think that that number is all that can be got in the course of a year?—That is purely my personal opinion. We have no statistics to go upon. It is simply my personal view from my experience of the country. In order to get that number much increased you will have to wait until the wants of the people are increased. My view is that as far as our people are concerned—the pastoral people of the Protectorate—the only way to really get to the root of the matter and get over the difficulty is to educate them up to wanting things that money will procure. That is naturally a very slow process.

17133

5,437. They would have to acquire a love for the dignity of labour?—Well, I should say a love for the luxuries which the wages for their labour would enable them to procure.

5,438. That will only come in course of time as their wants for European things increase?—Yes, as I said in the Southern Districts, the Eastern Barolongs have been associated with the white population since the Warren Expedition and there is not the slightest difficulty in getting them to work. During the war I employed some hundreds of boys on defensive works and gave them 2s. a day and food. It was very hard work, night and day in the trenches round Mafeking. In times of peace they are eager to work simply because they are going in for European food and clothing and utensils and to a smaller extent furniture. They have got to appreciate the value of money more before they will work to earn it. It would take years to bring the northern people up to the same standard.

5,439. At any rate it seems to be a matter of a great many years to get them to appreciate or educate them to value the products of civilisation?—Well, naturally, you will see it is a slow process.

5,440. It took one thousand years in Europe to bring the people up to that state?—Perhaps it did.

5,441. Can you tell me something of the nature of the tenure of the land that the natives occupy?—There is no tenure. It is tribal land; there is no ownership.

5,442. I suppose the occupation of the land is sufficient security for tenure?—Certainly, every man has a certain amount of land apportioned to him which he cultivates.

5,443. The proportion of this land, is it uniform?—It is a matter for the chief to decide. They have their gardens and so on, and stations on the outlying cattle posts where they look after the tribal cattle. They have cattle of their own as well. The more substantial people own their own cattle.

5,444. Then, generally speaking, they are well-to-do farmers who do not require to work?—No, that would be so, if the conditions of the country were better as regards water. The waters are few and far between. Long periods of drought, often two or three bad seasons running, reduce the native almost to starvation, but my experience is that it does not make much difference with regard to the numbers that go out to work. They simply live from hand to mouth on roots, etc. It is like the mistaken idea that prevails at home that strikes are beneficial to recruiting. A season of drought does not make the men go out to work. I understand that Mr. Goodyear estimated a number of 10,000 yearly. I estimate 2,500 for Khama's country with which I have alone been dealing.

5,445. Of course, I suppose you have statistics from the Southern Protectorate as well?—I know all the tribes there, but I have not included it in my estimate. There are people in the Tati Concessions, but they have not a single opinion above what they want for their own requirements. In fact, when the mines are working, they have to import labour. They are not now working. It is therefore fair to speak only of Khama's country. About one-third of them would work two or even three times during the year if the periods were short. So, taken altogether, I do not think there is very much difference between Mr. Goodyear's estimate and mine.

5,446. Mr. DONALDSON: Mr. Goodyear is recruiting in Khama's country?—Yes.

5,447. He told us that he estimated the number available after the present men who have left, get back, and spread, what he hopes, would be a good report—he expects to get 8,000?—Yes, but not this year.

5,448. He hopes to recruit to that number in the course of two years?—Well, that does not vary very much from my estimate. You see I say 2,500 now.

5,449. He said only 600 up to now?—Quite so. That would probably improve our present conditions

P 3

There is one thing with regard to Khama's natives, they are very subject to pneumonia, especially, I should think, in a place like this. I have sent many boys to Modder River to work on defensive works. They got pneumonia and there were deaths, and the boys got frightened; I had the greatest difficulty in preventing a stampede. A lot did desert, and finally I had to come to an arrangement with Khama by which the terms of service were modified and the boys allowed to return home.

5,450. Is it your opinion that if natives from Khama's country or a small percentage of them got seriously ill here that it would disorganise the labour supply?—I think it might affect it considerably. I mean to say that I think in employing boys from the northern territory, considering the climate here, great care will have to be exercised with regard to sanitary matters, etc

5,451. It is very difficult to get natives to take proper care of themselves?—Yes, I know.

5,452. I gather that in your opinion the thing to guard against is sickness?—That is one of the first things. Personally I do not think that the very high wages affect the question so very much. I think 2s. a day and food is very good wages.

5,453. Mr. EVANS: Is your estimate of 2,500 for service not only in Johannesburg but everywhere?—Yes, certainly, outside their own country.

5,454. This figure, then, is your estimate of the minimum number that are available for outside work?—No, I cannot say that. We have no statistics. That is my estimate of the number that might be available outside the country at any one time.

5,455. The minimum number?—No, the maximum.

5,456. I gathered that it was the minimum?—No, I say that is the maximum number that might be away from the country at any one time, but in the course of time I think the number might increase, but that is not the number that might be outside the country in 12 months because some of them might go twice.

5,457. Yes, then they would go for an average of six months at most?—If they were working on a four months' period they might be away eight months.

5,458. So it means that out of this 10,000 something like 5,000 will go out some time during the year?—Certainly not. I think, sir, that you are twisting my figures. I say distinctly, and I hold to it, that of my estimate of 10,000 between certain ages 25 per cent. may be reckoned upon and with proper recruiting may be relied on to work outside the country and that some may work two periods in one year. That is purely a matter of experience.

5,459. Your estimate would be 2,500. Suppose a possible 3,000. Is that fair?—No, I think that 2,500 would be available, and if satisfied with their treatment I do not think that more than about a third of them would work twice. I distinctly object to giving any evidence that overestimates the matter.

5,460. That is why I suggest a minimum?—If it were a minimum, I should be overestimating the case. I consider 2,500 the maximum.

5,461. Is there a considerable difference between the climate of Khama's country and our climate here?—Well, yes, it is distinctly lower there and it is not so exposed. I know the boys suffer at Kimberley even more than in their own country. When I came away the other day it was as hot as it is here in the middle of summer.

5,462. Mr. PHILIP: Mr. Goodyear estimated he would get 4,000 from the Northern Protectorate. In addition to that—I have not got his evidence in cross-examination here—he said he hoped to be able to get about 5,000 from Khama's country, eventually?—I do not think he can differentiate because the Northern Protectorate includes Khama's country. The Bamangwato are far and away the largest tribe in the Northern Protectorate and Khama's country includes the vast majority of that.

5,463. Mr. TAINTON: You give on page 7 a population of 70,000?—Yes.

5,464. Does your estimate of 2,500 cover the area inhabited by these 70,000 people?—The 2,500 are practically confined to Khama's people; I was not estimating N'Gamiland at all. I do not know that any boys have come out from there to work. Mr. Goodyear is going to try and work N'Gamiland, but I think at present very few boys have come out from there as yet.

5,465. You estimate this 2,500 as the total from the population of 60,000?—Yes. You see the population of 60,000 is of all sexes and ages, which is why I have taken 10,000 of these as being possibly between the ages of 18 and 35—able-bodied men.

5,466. That gives a proportion of 1 in 24 of the total population?—I have taken of this ten thousand, 25 per cent.

5,467. I want to deal with the other point first. The figures you gave were 2,500 as available out of a total population of 60,000. That means 1 in 24 of the total population?—Whatever proportion 2,500 is to 60,000.

5,468. On page 8, paragraph 6, you mention there 10,000?—Yes.

5,469. Where do you get that figure from?—Simply an estimate. There is no means of anything else. The country is a very scattered one, an area of 200,000 square miles. It would be absolutely impossible without a regular census, which would mean the employment of a large number of officials and occupy a long time, to arrive at more than an estimate. I gave a rough estimate of one in six as likely to be between the ages of 18 and 35—as limit given me in the question.

5,470. Do you think that age limit a fair one and covers the working period of the Bechuanas?—I think it is very fair. I daresay you can get a certain number of very fair boys under 18 and you might get a certain number of boys fairly able-bodied over 35 years. Still it is a very fair limit.

5,471. You do not expect we can get any labour from N'Gamiland within a reasonable period?—I should say very few for some time. You might get some perhaps—if Mr. Goodyear works the Botletle River and in N'Gamiland itself you might get perhaps a couple of hundred, but I think it is hardly worth dealing with, is it, in a question of this kind. I imagine a few hundreds does not affect the question much; it is a matter of thousands.

5,472. You say the Bechuanas are a pastoral people?—Yes.

5,473. Have you come in contact with other South African native tribes?—The whole of the tribes in Bechuanaland and up to the Zambesi and in the Bechuanaland Protectorate—

5,474. My question is not finished. You say they are a pastoral people. Have you come into contact with other South African tribes to whom this description of pastoral would not apply?—I do not think it applies so much to the Matabele.

5,475. How would you describe them?—They are a pastoral people to a certain extent, but I do not say that an increased hut tax there would oblige them to go out to work more than our people would. Might I say one thing. I said that because I want to confine myself to the district with which I am acquainted.

5,476. Is the effect of taxation upon a pastoral people different to the effect upon a warlike people?—I should imagine so.

5,477. In the case of the latter the effect is to drive them out to work?—I should think so.

5,478. What is the effect upon the other class—the pastoral class?—My opinion is that the effect of increased taxation would simply be to make them till more land, and work a little harder at home, to produce the amount necessary to meet the increased tax. I do not think it follows they would go out of the country to work.

5,479. You express that view at the bottom of page 4. The effect of increased taxation is simply to stimulate his agricultural energies?—Yes, I think so.

5,480. Is that opinion derived from personal observation or merely what you have heard from others?—From personal observation and from what I have heard from others of natives and those who have to do with natives.

5,481. Is that the general view of those who come in contact with natives?—Well, I do not wish to express any opinion on that subject. I give my own view. I am not responsible for other people's opinions. You can get these from the other people better than from me.

5,482. On page 5 you say you think that the only way to solve the question permanently is to increase the native demand for European goods?—Yes.

5,483. Why do you think the demand for European goods would drive them out to labour?—Because it will create a desire to earn money as distinct from simply sitting down at their kraal after they have earned sufficient money to pay the tax. They will want to earn money for their personal wants or luxuries.

5,484. You say that the effect of taxation is to drive them on to the land?—Yes.

5,485. Why should the demand for European goods not have the same effect?—Because they would want the money obtained from the land to buy these goods. It would also lead them to like to take a trip into civilisation and buy goods. We found in the early days that boys from the Zambesi and the Shangaans used to come down country and buy goods. This happened in the early days before the railways. We found boys taking a trip down to the Kimberley mines very often and coming back with clothing, boots, pots, pans, and other things they had bought.

5,486. Do you find there is much increase in the number of traders' stores in the country since you have known it?—There is a distinct increase in the last 10 years and in the trade done by these stores amongst the natives. There has been a decrease in trading along the roads compared with the old days. There used to be a great deal of transport riding. It has now ceased, on account of the railways, but native trading has certainly increased largely.

5,487. Can you give me a rough estimate of the number of traders?—In the Northern Protectorate altogether?

5,488. Yes.—Well, I could tell you almost exactly after an hour's consideration. In the Southern Protectorate I suppose there are—I am afraid I can't tell you without a good deal of consideration. I could give them you exactly if I had known it was wanted, from the license books.

5,489. I should be very glad if the witness will send us this information?—I will obtain it with pleasure from the books in the office. I can tell you the exact number of licensed hawkers and storekeepers in the northern territory, and they could do the same in the southern territory.

5,490. And also include a statement of population served by these traders?—That will be purely an estimate again. If I give you the number of traders in the Northern Protectorate you can go back to my estimate of the numbers of the Northern Protectorate as to the numbers served by these stores.

5,491. You say on page 8, paragraph 7, that you think not more than 25 per cent. seek re-employment?—Excuse me, I don't remember saying that—(on referring, the witness said)—Oh, I beg your pardon. Yes. Well, I had forgotten that. I said just now about a third, both are rough estimates.

5,492. What is the exact meaning of that? Does it mean that the native goes out to work once, and does not return?—The majority of natives who have

been out to work, unless for some special reason, don't return. The object of a native in going out to work is to earn enough money to buy a rifle to pay "lobola" for a wife, to buy a waggon, stock, and so on. Once he earns enough money to satisfy these wants he squats on the land and remains there.

5,493. What would you put as the average period of service of the natives you are acquainted with, taking his working life?—Out of his own country?

5,494. Yes?—I think the majority do not go out more than once.

5,495. For a few months?—Yes. As I have said, a certain proportion would consent to a second period, but a great many of them come back, and don't go out to work again.

5,496. Do you wish us to understand from the answer that the present generation of Bechuanas work only a few months, or a year, in the course of their lives, outside the country?—Yes; I have been saying so all along. It is true to a great extent of the people of the north. It does not apply so much to the people of the south, because they have been working longer and they have acquired a liking for European things and so on which has given them a love for the money earned by their work, and induces them to go out more. That will, I think, eventually spread to the northern territory, but it has not done so at present to anything like the same extent.

5,497. Mr. WHITESIDE: I think we may take it that you recommend that a six month term of work should be abolished in favour of a lesser period?—I am strongly of opinion that if six months were reduced to four months you would get a great many more boys to work.

5,498. Have you heard natives express any opinion as to their treatment upon the Rand?—Not lately, no. I may say that a great deal of harm was done some years ago before the institution of the present regulations with regard to labour agents. I was not employed at the time in a civil capacity, but I was very much among the natives, and used to hear their opinions. I will give you one case in point. A labour agent came over to recruit for the Johannesburg mines—I don't know what mines—to the Bamelite, and he got the chief to help him. He said he would give the chief £1 a head to help him recruiting. He also told the boys at a meeting in the Kgotlha that they would get certain wages, and certain food on the way, and made various other promises. The boys came over here, and were dissatisfied with the food on the road. When they got over here they found the £1 fee to be paid to the chief was stopped out of their wages. Little things like that created very great dissatisfaction, and practically brought about a cessation of recruiting amongst the Bamelite. Such treatment as that damaged recruiting immensely.

5,499. There is nothing of the kind at the present?—I have heard nothing lately of the kind at all. I have constantly heard boys express their satisfaction with the Kimberley arrangement, and I know they like it very much.

5,500. Can you tell us whether the methods used to recruit boys for the Kimberley Mines are similar to the arrangements for recruiting for the Rand?—I think so. Very much, as far as I am aware.

5,501. Can you suggest anything which would make work on the Rand more attractive to the boys in your Protectorates, or do you think the present arrangements are satisfactory?—I was at Khama's new town, which I visit almost every month, when Mr. Goodyear came up to give an account of the terms and conditions of service upon the Rand. I asked him to have a type-written copy made, and give me the whole thing, and I would go to the chief and get him to help us. Khama called a general meeting of his people. I held a big meeting of the tribe during the day

to announce a judgment. After I had finished, Khama had all these conditions interpreted and gave Mr. Goodyear a fair hearing. As far as I was able to see that day the terms met with general approval amongst the people present. There were, I should say, about 3,000 people present.

5,502. About what time did that take place?—About the second week in June.

5,503. Has there been sufficient time to feel the results of the meeting so far as the recruiting returns are concerned?—I believe Mr. Goodyear's sub-agent, Mr. Clarke, has been recruiting ever since, but I have not heard with what success.

5,504. You speak about educating natives to like work. How do you suggest to go about it?—I say that will naturally bring about the result in time. I said I thought that was the only permanent solution of the difficulty. It will take years. I don't say it is possible to take active steps to bring it about now.

5,505. It is rather a difficult problem?—Yes, I mention this to instance what I consider the difficulties of dealing immediately with any increase in the number.

5,506. Can you tell us whether any of Khama's people have been to the Rand?—Yes, some have, I know.

5,507. In any number?—That I cannot tell you in the least. I do know some boys have been across here to work.

5,508. Do you know what kind of a report they took back?—No. I can't tell you that.

5,509. In answer to another member of the Commission I think I understood you to say that the majority only go out for a few months' service?—Out of the country, yes.

5,510. They go out to get a certain want supplied, such as a rifle, pay "lobola," and so on?—Yes.

5,511. Can they earn sufficient in these few months to get those requirements?—I should think so. If they cannot, that would be an inducement to engage for a second term.

5,512. The CHAIRMAN: On page 7 you state, "Minute of heading under which information is desired by the Transvaal Labour Commission." Then you go on to answer certain questions from 1 to 9?—Yes.

5,513. What list of questions were you referring to? We should like the questions as well as the answers?—I have not got them with me. There was a type-written copy sent me for answers.

5,514. Can you supply the Commission with a list of the questions? The list did not come from us.—Then it must have come from the High Commissioner's office.

5,515. To make these answers intelligent we should like the question to print with them?—Well, question No. 1 was a question as to the population of the country. No. 2 was the numbers between the ages of 18 and 35. No. 3, I forget what it was. It is absolutely impossible for me to answer.

5,516. The same applies to No. 4?—Yes. No. 5 was the usual food of the people. No. 6 the number one estimated available for work at any one time. No. 7 was as to the numbers who would seek re-employment. No. 8 was with regard to the number of Coolies, Cape boys, and aliens in the Northern Protectorate in regular employment—in agriculture, at hotels, with storekeepers, and so on. That is it roughly. I cannot remember the exact terms of question.

5,517. There are three sub-divisions to question 8, and you have only mentioned 1 and 2?—I cannot differentiate between 2 and 3, and 1 was agricultural employment; 2 and 3 were respectively the numbers employed in hotels and the numbers employed as servants in stores and so on. I can't give it to you very distinctly. I thought the list had come from you.

5,518. It was not from us?—No. 9 was with reference to the number of farms owned and occupied by Europeans, and the number of men employed on them.

5,519. In your statement you use the prefix "T.C." on several occasions?—That is the Tati Concessions.

5,520. The Commission is very much obliged to you for your evidence, Col. Panzera?—There is one thing I should like to say, that I put in my statement copies of two letters which I thought might interest the Commission. The latter (B) contains the replies to certain questions put by the Resident Commissioner for the information of the High Commissioner, and on pages 6 and 7 (v. p. 330) there is a copy of a letter sent to a certain Protectorate chief. I merely attached it as I thought it would be of interest to the Commission as showing the lines upon which we work with chiefs to try and bring pressure regarding labour supply, and as it is an official letter, and not intended for publication, I would rather it was not inserted.

5,521. Not even in the record?—Oh, certainly. I only mean I do not want it to appear in the Press.

5,522. Is it your request that the letter should not be published?—I simply attached it as a matter that might interest the Commission as showing the way we deal with natives. If it has not been published I would rather it were not.

5,523. I am sure the reporters will respect your request. Is the spelling of the name right on page 6, the letter you are now referring to?—No. It is Sekgome.

Mr. H. M. Taberer was called and duly sworn.

5,524. The CHAIRMAN: Have you before you a statement headed, "Evidence of Mr. H. M. Taberer, Native Commissioner of the Central Transvaal"?—A copy was handed to the witness by the Secretary.

The statement was handed in as follows:—

The statement which I herewith submit to the Commission must of necessity be limited, in regard to statistics, to the area over which, as Native Commissioner of Pretoria, I have control. These statistics are included in the comprehensive statistical tables submitted to the Commissioner by Sir Godfrey Lagden, the Commissioner for Native Affairs. The natives of the Pretoria district belong chiefly to the Bakathla and Bakwena branches of the Basuto race, and to the Matabele tribe. In the municipal locations of Pretoria are to be found natives of all races south of the Zambezi, and a few natives from the south-eastern portion of Mashonaland are scattered about some of the farms. Very few of these natives proceed to the mines of the Witwatersrand for labour. They obtain what labour they may seek, on farms, at local industries, and at works in and about Pretoria. Within the municipal limits of Pretoria alone there are employed about 13,000 natives per mensem, and still there is an increasing demand for more natives. From observations during the past year, in the Pretoria district, it appears that these natives are very seldom willing to contract for more than three months in the year, and this fact must influence the value of the work performed by those natives who, during the year, have left their kraals in search of work. I attach hereto a return showing the population of Pretoria, Heidelberg, and part of Krugersdorp districts, and giving figures appertaining to labour performed by the natives. The figures, in so far as the Pretoria and Heidelberg districts are concerned, are complete, but in regard to Krugersdorp districts they are not complete. From this return, which has been very carefully compiled during the recent tax collections, it will be seen that, excluding the incompleter returns representing Krugersdorp district, there is in the districts of Pretoria and Heidelberg, a native population of 66,509, of which 14,485 represent men. Of these 4,404 sought labour away from their kraals during

the past year ended 30th June last, including 2,621 who were actually at work on that date. 642 represent those unable to work. 1,285 is the estimated number of those who must remain at home, including those unable to work. 5,723 represent the number estimated as necessary for farming purposes, 810 the number of men in the Pretoria and Heidelberg town locations, and 4,046 the number of men available, but not at work on the 30th June last. From attached return "B," it will be seen that the native population on locations is 16,339, not quite 25 per cent. of the total population of the two districts. Of this number 9,938 are men, of whom, assuming that all the men in the town locations worked, 2,253 were at work during the past year. The natives on district locations number 13,603, scattered over six locations. Of this population 3,128 are men. On private farms the total native population is 50,170, of which 10,547 are men. This population is distributed over 673 farms. The majority of the farms all along the eastern and northern boundaries of the Pretoria district, known as Bushveld farms, are unoccupied by the owners. These farms are used for the purpose of grazing stock in the winter months, and for wood to supply the owners living in towns or on the high veld. It is among these Bushveld farms that the natives are to be found living in excess of the numbers required for farming purposes. The natives living thereon are occasionally required for wood-cutting, and the landowner usually requires a monthly labour supply of from two to six natives for work on his high veld farm if he possesses one. Some of these natives are also required to tend stock when sent to graze on the low veld during the winter months. The labour required by the landowners of these Bushveld farms from the natives living thereon will be seen to be very insignificant, and yet even this small amount of labour is obtained only after great worry and trouble. The reason is that on these Bushveld farms the natives are practically in the same position as those who are on native locations. They are not restricted in regard to the amount of land they can put their wives to cultivate. They have no desire or inducement to improve themselves, and beyond an annual rental per hut, ranging from 10s. to 23, which is sometimes levied by the landowners, they have no serious need to be in possession of ready money. From the statistical returns submitted, it will be seen that out of the 4,404 natives who, during the past year, left their kraals in search of work, only 1,443 came from the established locations, and the balance, 2,961, was made up of natives from private farms. The majority of these 2,961 natives can be taken to have gone from the Bushveld farms, and to have been induced to do so to meet the extra tax imposed upon them by the landlords' rent. One month's labour at the present ruling wage is quite sufficient to meet the highest rent exacted. A remedy seems to lie in the land question. The Squatters' Law, under

which every farm, or divided portion of a farm, is allowed five native families, unless the owner can shew good reason for being allowed more, should be enforced, and the distribution over the land of the balance of the farm natives, together with those now on locations, on a system of individual tenure, might be considered. As long as natives enjoy, as they do, an undue amount of arable land, and can satisfy their immediate and only wants by the work of their women, the Government taxes will not have the effect of inducing them to seek labour to any great extent, since it is well known that a native will obtain the cash he requires by any other possible means than labour. Natives should be scattered as far as possible over the land, and tribal organisation discouraged; even on private land, I would suggest the adoption of a system of individual tenure in respect of all natives squatting thereon, who may be in excess of the numbers required for the agricultural purposes of the landlord. This would take time, but I am of opinion that it would make them self-dependent, encourage individuality and competition, and the native would become more industrious. It would limit the number of natives to whom land could be given, and drive the growing surplus male population to seek continuous labour at industrial centres. While living in large locations in tribal life, natives are slow to develop extra wants. A fair but circumspect allotment of ground for agricultural purposes should be made, every precaution being taken to prevent the native from living on the labour of his wives, for, as long as he can do this, we need never expect any material improvement in his character and mode of life, or any appreciable increase in his wants. Where natives are found employed as squatters on occupied farms, they are invariably far more advanced than those on locations. They appear to become infected with the energy of their European neighbours and masters. Their individuality seems to be developed, they build better houses, are cleaner and more law-abiding, and their wants appear to increase, and they become more industrious consequently. The raising of wages does not in my opinion tend to improve the supply of native labourers. It may bring about a temporary increase in the supply, but is bound in the long run to have the opposite effect. The raising of native wages at the mines only produces a concurrent rise of wages in every other form of labour performed by natives, and therefore increases the cost of living generally. Natives are enriched, their wants are not increased, but they are enabled to work for a shorter period and stay at home for a longer period, and thus instead of improving their economic status, it is made worse. They are encouraged to meet their wants with the shortest period of labour. As the native is, by the raising of his wages, enriched and encouraged to work less, so is the cost of living for the European population and the cost of feeding the natives themselves, proportionately increased.

SCHEDULE A.

STATISTICAL RETURN OF NATIVE POPULATION.

Division and District.	Total Population.			No. of Men between the ages of 18 and 45.	No. of Married Men.	No. of Polygamists.	No. at Work during year.	No. now at Work.	No. unable to Work.	No. who must remain at Home.	No. available but not now at Work.	No. on Farms.	Estimated number required on Farms, at about 10 men per Farm.	No. in Towns.	No. in Locations.	No. on Crown Lands.	No. available for service beyond their own District during any one Year.

H. M. TABERER,

Native Commissioner.  
Central Transvaal, Pretoria.

5,525. Do you wish to hand that in as your evidence-in-chief?—Yes.

5,526. How long have you held your present position for the Central Transvaal?—About 14 months.

5,527. Have you had anything to do with natives previous to that?—I was 2½ years in the Zululand service, my first experience of civil service, and since then I have had seven years as Chief Native Commissioner in Mashonaland and Rhodesia. From that position I came down and took the position of Native Commissioner at Pretoria.

5,528. Do you know any of the native languages? Some of them. I know that Xosa language, which I have learned from my childhood perfectly; Zulu fairly well, and Mashona pretty perfectly.

5,529. What is included in the definition Central Transvaal?—It includes the fiscal districts of Pretoria, Krugersdorp, and Heidelberg. Krugersdorp was included in Central Transvaal quite lately, and for that reason the returns from Krugersdorp district are not complete in my returns.

5,530. You state there are employed in the municipal limits in Pretoria 13,000 natives?—That is the average per month employed within the municipality.

5,531. You say that these natives will not contract for more than three months' work in the year?—I have found that my experience with regard to the natives in the Pretoria district. They do not care to work more than three months in the year. Very few will take on any work if they have to work for more than three months in the year. I have been endeavouring to supply labour by getting boys for the public works such as the railways, and for the Public Works Department, and I invariably find that the *sine qua non*; if they have to work for six months they will not take it on.

5,532. Do you know of any appreciable number re-engaging?—No, I have not had means of finding out.

5,533. What do you mean by the expression, "That the effect of three months' work must influence the work performed"?—In the statistical return what I show is the number of boys who have been out working during the year. You must take it to mean that the majority of these boys will only have worked as far as I calculate for three months in the year. Some take on again, but almost

invariably boys I have got for public works have gone home when they have completed three months' service.

5,534. Have you any means of knowing whether they come out again for a further period of service during the same 12 months?—There would be means of ascertaining, but I have no record to-day.

5,535. Do you mean the number at work within the municipal area? Or to put it another way, would it be fair to say that it means 52,000 have been at work in the same twelve months?—No. Most boys who go into housework stay longer than boys who go to other work. They remain longer at work because they are able to get about more from house to house, and find out who gives the higher wages. They probably stay a little longer. This number I have given includes those actually living in the municipal location. That is 670, I think.

5,536. On page 2 you give the figure 4,046 as the number available, but not at work, on June 30th last?—Yes.

5,537. Would it be fair to look upon these as in some measure, a reserve for those who have finished their three months' contract?—Yes. I should say it would be fair to do so.

5,538. You say that landowners in the bush veld, farmers, have difficulty in getting labour?—Yes, there is a difficulty simply because these private farms are not occupied by the owners, who usually live on the high veld. These natives get a bit out of hand through having no one in charge of them, and farmers have a great difficulty in getting them to come to work on those farms where they are required. They don't require them on their bush-veld farms except in the winter.

5,539. Several witnesses have taken the view that a native only comes out to work, speaking of him in the average, when he has some definite object in view, such as "lobola." That is your experience?—My experience is similar to that of the witnesses you mention. The native may be in immediate want of something. Whatever it may be, whether he wants a suit of clothes or to pay "lobola," he will go out to meet that want, and when he has satisfied it he will return to his kraal.

5,540. When would he come out again?—When he has another want.

5,541. Do you think if the Government exacted a ground rent from natives in locations that would increase the number of boys to go out to work?—If the Government exacted rent and simultaneously limited the amount of ground they could turn over, it would.

5,542. If the Government did not limit the amount of ground, what would be the effect of the additional ground rent?—A native will always meet his want by any other means than labour if possible. If the Government exacts a ground rent he will adopt every means to pay that without going to work. A great deal of his wants are met by cultivation, and I think that if he was allowed limited cultivation he would have to work in order to pay his taxes and supply any other wants he has.

5,543. On page 5 you refer to the raising of wages. Do you think the higher scale of wages will bring any increase in the number of natives?—I do not think so.

5,544. Why?—Simply because he works to meet a want. If you raise his wages, the want is there just the same. If you make the wages high he is able to meet that want with a minimum amount of labour. He goes home, and unless he wants anything more he is able to sit as leisure in his kraal. Only another want will make him go out to work again.

5,545. In your statistical return you have a column headed, "The estimated number required on farms," and you mention ten men per farm?—Yes.

5,546. What is the average acreage cultivated by farmers?—That I could not tell you. I cannot give you an estimate of any kind.

5,547. What would be the average number of natives required on the farms in your district? You fix it at ten in this schedule?—Yes; it is a very difficult matter to note. I know of some farms where men can do with 60 families. Such a farm as Irene. The farmer there can find work for 60 or 70 families, and for more than them. On many farms in the lower veld, natives are not required—they are required on the farms in the high veld. There are many farmers in Pretoria who possess farms in the bush veld. The majority of those farmers do not require more than five families. That does not mean that not more than five men would be employed. However, I think it is a fair estimate.

5,548. On the average, the farmers in the district you are acquainted with require an average of ten men to assist in working their farms?—Yes.

5,549. Mr. QUINN: You could not, I suppose, give the Commission any information with regard to the amount of goods purchased by the natives in those districts of which you have a knowledge?—In stores? No, I could not tell you.

5,550. We have had evidence already by competent witnesses from Basutoland that the wants of the natives there, at all events, have increased enormously. Judging by what you say on page 5, and from what you have said in reply to questions put by the Chairman, you do not agree with that statement?—I do not know anything of Basutoland.

5,551. In your own district?—I think the wants of a native increase as they come in contact with Europeans. I think I have said so. Natives who live on occupied farms and continually come in contact with farmers, have more wants than those who lived with their tribes. The more they are brought into contact with white people the more they go to work, and desire things that are to be bought for money.

5,552. In your opinion the wants would be increased in time?—The native is a being who forgets quickly and those who live in locations soon forget when they return home the wants they may have experienced when out at work. It is when they are in constant contact with Europeans that their wants are found to increase and to become permanent.

5,553. If they were brought more and more into contact with Europeans their wants would increase?—Yes.

5,554. These farms on the Bushveld—can you give any information as to the agreement between the boys and the farmers, the terms on which they are employed?—Yes, I can give you specific instances. Some of the natives live on the farms at a ground rent varying from 10s. to £3 per hut per annum, and in addition the able-bodied men will be called upon to supply certain labour all the year round—continuous labour. It might be two boys, it invariably was two or three boys. Sometimes in the reaping season as many as ten men would be working. They can agree to work as long as they like. On other farms there is no ground rent charged and the boys have to supply the labour asked for on the same lines as it is supplied when both rent and labour are charged.

5,555. Taking the first instance, do they receive pay?—Usually not. If the farmer agrees with the native he has to supply these boys per month, but he may have to pay for any surplus natives that are required.

5,556. What would be the amount of pay?—By labour?

5,557. No, pay?—It is not as high as he will get upon the mines—about £1 or 30s. a month. I may say also that the amount that would be paid for surplus labour is generally agreed upon between them at the beginning of the year.

5,558. Would it be correct to say that a native who lives upon these farms you are speaking of in addition to paying for the ground he occupies, whether 10s. or £3, has also to pay more in the shape of labour?—He supplies a certain amount of labour as well.

5,559. So, under these circumstances, do you consider it hard upon the farmer who cannot get labour, when he gets it on these terms? A boy I understand, first of all, pays him for the ground he uses, and then he is expected to work a certain time in the year for him in addition to that. Is that so?—Yes.

5,560. So that the complaint that the farmers cannot get labour when they try to get it on this basis is not surprising?—In a few instances I should say, where a farmer exacts a rent of £3 per annum, and then expects labour to be supplied gratis in addition to that, I think it is expecting a great deal. But I may say it is very exceptional to find a farmer charging £3.

5,561. Well, take £1?—Well, if it is £1, I think the native ought to supply it.

5,562. What is the extent of these farms up there, are they very extensive?—It varies, the usual size of a Transvaal farm is about 3,000 morgen, I think.

5,563. What amount is under cultivation? I understand there is practically no cultivation on these particular farms—Bushveld farms?—By a farmer himself, no; but unlimited cultivation by the native.

5,564. So that with the immense amount of land he has, and which he calls his farm, he does nothing at all; it costs him nothing to allow the natives to stay there, and if the native was not cultivating it neither would he be cultivating it? Is that not so?—I should say so.

5,565. So that what he appears to give in the way of allowing the natives to squat on his farm and to raise produce is really nothing, he would not be using it if he were not there, and yet he insists upon them paying for it. Whether it is only 10s. or £3 does not matter. Then, in addition, he wants labour as well, free? That is the position?—Yes.

5,566. That seems to be the position?—Yes. The farmer does make use of his low Bushveld farm for the purpose of obtaining wood. I suppose he has his shooting there, and he also sends his cattle there throughout the winter months.

5,567. So that the amount of farming done in these places so far as your knowledge goes—real farming—production of produce to send away is very small indeed?—So far as Europeans are concerned, yes. The natives, of course, do it.

5,568. So far as the Boers are concerned?—Yes. On the majority of Bushveld farms I find they do not cultivate anything.

5,569. They stand to lose nothing practically. They have got the labour here, and these immense farms, and they do nothing with them but allow them to lie idle year after year. The boys come over and cultivate a little, and they pay rent for it, and give labour in addition for the right of doing it?—I think you can look upon a private farm in the same way as upon a block of farms owned by a company. I suppose a certain amount of money is invested in a farm and the farmer wants interest upon it.

5,570. Is it within your knowledge that much money is invested in these Bushveld farms?—I do not know; I have not enquired into it.

5,571. An enquiry would be interesting. The figures which you put in, Mr. Taberer, we have already had given to us by Sir Godfrey Lagden?—Yes, they are included in his figures.

5,572. And of course he deals in his statement practically with what you have dealt with here—the same districts are included?—Yes, the same districts are included in it.

5,573. Mr. WHITESIDE: Mr. Taberer, you have had long experience, I understand, in Mashonaland?—I have had seven years' experience.

5,574. Can you tell us what the position is there as regards labour supply?—I think the position is, I may term it, extremely bad.

5,575. Why do you think it is extremely bad?—Well, returns shew it. I believe there are about (I can only deal with Mashonaland, I do not know much about Matabeleland), but in Mashonaland I think there are 80,000 to 90,000 able-bodied natives, say 80,000, and I understand from the latest returns out of 8,000 boys who are working on the mines only about 600 or 700 come from the country. Therefore, I think one may say the position is bad so far as the Mashonaland native himself is concerned.

5,576. You don't think any natives are available from Mashonaland for service in the Transvaal?—If they will not work locally, I think it is very doubtful if they would come down to the Transvaal. I have had a great deal of experience, I may say, of them, and they are very averse to working in the mines; they don't like it.

5,577. What is their principal occupation?—Cultivating the land, I think, and hunting.

5,578. Have you any idea what proportion of them are cultivating, and what engaged in the pleasant pursuit of hunting?—I think it is common amongst all the natives, they all cultivate the land—they have got it to cultivate, and they cultivate it. There are not many farms occupied, as you know, in Mashonaland. There are, of course, districts like the Melsetter and Enkeldoorn districts, where there are a large number of Dutch farmers. These are well occupied, but I do not think there is a very great demand for farm labour in the country. I should say it would take 10,000 boys all the year round to satisfy the wants of farmers.

5,579. Mr. TAINTON: Will you take Schedule "A" under the heading of the total population? You have three columns?—Yes.

5,580. You apparently divide the native population into three classes. Can you tell us what these classes are?—Men, women, and children.

5,581. Which are the men?—The first column; the children are the last.

5,582. What do you mean by children?—What I mean by children would be any boys that are not taxable, who are not looked upon as adult males,

and any young girls who are unmarried. They will be included amongst the children—unmarried girls and untaxable boys.

5,583. What do you mean by untaxable?—The Hut-tax Ordinance lays down that every adult male native shall pay a tax of £2 per annum.

5,584. Is any age fixed?—So far as I can remember, I do not believe there is.

5,585. Can you give us the age, the average age, of these young men and women? I want to get at the age limit which you class as children?—Any boy under 17—I should say about 17. Some who are 16 would probably be as developed as those who are 19. I should say about 17 would be about the age under which we would look upon them as children, so far as this return is concerned.

5,586. Therefore, if you take these totals, considerably more than 50 per cent. of the population are regarded as children?—That is so, yes.

5,587. Now this column of men, does it include all the males above the age of children?—Yes, it includes all taxable natives.

5,588. That figure compared with the total population gives a percentage of adult males of 21 per cent. Would it be a fair percentage which you might accept as true of most native districts?—Fairly true in healthy parts, where the country is what you might call healthy. You find in low-lying parts the proportion of children is less, because the death-rate among children is high. That is my experience in low-lying districts.

5,589. Now, if you turn to Schedule "A," and you add together the number of married and single men in the first two columns, their percentage of the total population works out at 24. Can you give an explanation of the increase in the number of males in the location?—The only explanation I can give you is the fact that a great many, in fact, the majority of the men in the Pretoria Municipality and Heidelberg locations, are single men.

5,590. Then a percentage of 24 cannot be accepted as a normal figure?—I don't think it differs so much from the 21.

5,591. It is 21 in the one case and 24 in the other. Can you explain the difference?—No, I cannot. I can only say the figures are almost absolutely correct. There is nothing I can explain them by.

5,592. Will you point out in Schedule "A" that column which gives us the number of men at work during the year in the Pretoria district? You have in column 7 the number at work during the year—420?—Yes, sir.

5,593. What does that mean?—It means those who were able to ascertain had gone out to work, practically from the declaration of peace until the time this return was made out, which was about the 30th June last—during the 12 months.

5,594. Does that column 7 include column 8?—It does. You understand that Haman's Kraal is really Pretoria district—420 includes 260.

5,595. Then do these statistics show that in the Pretoria district, where the total population is something over 30,000, only 420 men went out to work?—No, sir. Haman's Kraal is also included in Pretoria.

5,596. I beg your pardon. I am taking the Pretoria figures alone?—Yes.

5,597. It shows that 420 men went out to work from a total population of over 30,000?—That is so. May I explain it is possible there are a few natives on private farms—that is where they are living on occupied farms—who also went out to work.

5,598. They would not be included in these totals?—These totals include natives from the locations and natives also from private farms, where they are living in large numbers. What I mean is these Bushveld farms.

5,599. Can you give any explanation for the low figure?—The natives have money. I do not think

I have been amongst natives who were so well off as I found these Pretoria district natives after the war. It may be the result of the war, when they had no stores round about where they could spend their money, and I should say that that would account for the small number of men who went out to a great extent.

5,600. Is their possession of money an unusual thing in this district? I mean to say is it an exceptional, or is it a constant condition?—Comparatively speaking, I should say the Pretoria district natives are well off for money, but I am informed by those who knew them before the war that they had more money after the war than they were known to have had before, that is to satisfy their immediate wants.

5,601. Can you give any explanation of their possession of money?—Yes, I think I can. In the Pretoria district, under Martial Law, the natives were commandeered very largely for service with the troops in and around Pretoria. Under Martial Regulations, natives were called in to work, and Pretoria district was, I think, exceptionally situated in that respect, in that the natives there were called upon to do a great deal of work, and paid very well for it, I understand.

5,602. Then this abundance of cash is an exceptional condition peculiar to that district?—To that district, and to that year, I believe, owing to the effects of the war.

5,603. Can you give us any explanation of the difference between the number of natives going out from Pretoria and those going out from Haman's Kraal?—If you look at column 7, you will see the total for Pretoria is 420. For Haman's Kraal, which I understand is part of Pretoria district, the total is 2,034?—May I refer you in answer to Schedule "B"? In the Pretoria district, the only location—of course Pretoria Municipality is not included under Pretoria in Schedule "A"—is that first location Sjambokstad. The other five go in Haman's Kraal, as also do a large majority of the Bushveld and farms to which we have referred this morning, where I say there are a large number of natives. That will account, sir, for the great difference between the figures of Haman's Kraal and Pretoria.

5,604. I am not sure that it does, because if you look at column 1 in Schedule "A," the number of men in Haman's Kraal is very little in excess of the number of men in the Pretoria district—5,820 Pretoria, 6,009 Haman's Kraal. How do you explain the much larger percentage of men going out from Haman's Kraal?—Will you look, please, at column 11A—that will partly explain it. In the Pretoria part of the district, there are a large number of occupied farms, and the natives on those farms naturally are employed by the farmers as squatters. You will see that although the population in Pretoria district is smaller, the number of natives required for farming purposes is very much larger.

5,605. That accounts for about 1,000, still leaving a considerable difference?—I know you will find it accounts for 2,000. The difference between the number required on farms in the Haman's Kraal and Pretoria districts is 2,200.

5,604. What column is that?—Column 11A.

5,607. That is the estimated number. I was taking the actual number in Column 11. The difference in the actual figures is only about 1,000. That still leaves a considerable difference?—I may point out that a majority of natives, nearly all the natives who are living on private locations and Bushveld farms, are included in this 3,644. Very few of these natives are required for farm work, although they are on the farms, and it is from these natives in addition to the natives living on locations, that the labour is drawn outside the district.

5,608. These figures, of course, are very important; because it is from these figures that we get the percentages that we require. If you take the total under column 7, you get 4,404 as the total number of men out at work during the year. Is that out of the total population of 66,509 given in the first column?—Yes, sir.

5,609. What is the average period of service of these natives—can you give us an estimate?—I should say about three months, sir. So far as I am aware, the majority, I should say, work for three months only.

5,610. These men go out of the district for work?—It does not mean that they go out of the district. It means that they leave their locations. Probably the majority of them went to Pretoria to work.

5,611. If we take three months as the average in order to reduce the labour supply to a yearly standard, we must divide that figure by four. That, then, will give us a total of a little more than one thousand natives from a total population of 66,000?—You mean that a little over one thousand is the labour available?

5,612. I understand you divide it by four?—Do you want me to say that that one thousand represents the number available during the whole year of the Pretoria district.

5,613. Not the number available, but the number actually at work during the past year?—Yes, that is correct.

5,614. One sixty-sixth of the population?—Apparently, yes. So far as I can gather, and I have been very careful going into the statistics. Of course, it may be that some of the natives went out more than once. It may be that some of them have done so. I do not think it is probable, because, as I say, it has been an abnormal year, and they had a good deal of money in their pockets. There was no necessity for them to go to work, as possibly, and, I think, probably, there will be this year.

5,615. Assuming that the conditions are more normal, do you think we should have to modify these figures greatly to get at the average number coming out?—Yes, I think so.

5,616. Can you give us a rough estimate of what the number is likely to be?—I do not think I can, sir. I do not think you will get—taking them at work three months in the year—I do not think you can get more than 2,500 natives from the Pretoria district at one time—continuous working through the year.

5,617. You have had considerable experience of natives, have you not?—I have had a great deal, sir, yes.

5,618. Do you think, personally, it is an exceptionally low average, the estimate you have just given us for natives?—No, sir, I do not think so, and for this reason. You will see, of course, a great number are required for farming purposes, and I take it, taking the average of ten men per farm, as being what is required for farming purposes, you would have about 10,000 or 11,000 natives available for outside labour; either in the district or any other district, and if they will only work for three months in the year, divide it by four it will bring out the figures I have given you. I think a quarter of the available men is not a very low average.

5,619. Your statement, Mr. Taberer, goes to show that the native is not yet an industrious being?—That is my opinion of him.

5,620. Is that your opinion of natives generally?—Yes.

5,621. Can you suggest to the Commission any methods by which we can make them more industrious within a reasonable period?—No, sir, as I say, the only suggestion I can give is in regard to the land question.

5,622. The land?—Yes; the land question which I think I have referred to somewhere in my evidence-in-chief.

5,623. Then if there is no legislation affecting the land, the labour problem, in your opinion, is likely to remain insoluble?—Yes, that is my opinion.

5,624. Are you a South African by birth?—I was born amongst the natives.

5,625. What district, may I ask?—Close to King William's Town, in Kaffraria. My father has been a missionary there for 40 years.

5,626. Let us take now this suggestion of yours. It is in vague form at present. Can you put it into a more practical shape? You say here, "undue amount of arable land." Do you propose to reduce it to any set limit?—Yes, I should. You have heard probably about the Glen Grey Act. It would be somewhat on that system, a system of individual tenure by the natives, and I also feel that any legislation which would tend to break up the tribal organisations, and the living of large tribes together would tend to make the natives more industrious. I think tribal life is not conducive to industry; in fact, I think it has rather the opposite effect.

5,627. Then your general policy would be to strike at native tribal organisation, break up the locations, and distribute the natives amongst the whites?—Yes, if it were possible.

5,628. Why do you qualify?—Well, I do not think, supposing you had a farm which you had purchased, and the Government came along and said they were going to put 20 natives on your farm, and give them three acres each, I think you would have reason to object, and probably have the law on your side.

5,629. Well, assuming you had law on your side?—Experiences teaches us that the natives who live with the farmers, and see them every day, and work with them every day, live a better life. They appear to have more wants, they live cleaner lives, build better houses, assimilate themselves to their European neighbours, and generally I find they are a better class than the men living under tribal organisations.

5,630. Is this breaking up of the natives the underlying principle of the Glen Grey Act?—I should say so.

5,631. Do you know the Western Province? Very little indeed. I have hardly been into it.

5,632. Are you aware that there are very few pure-blooded Hottentots or natives in that district?—I understand that that is the case.

5,633. Can you give the Commission any explanation of that amalgamation of the races? I understand you to say there are no pure-blooded Hottentots?—Yes, they unite with the white races.

5,634. Can you give any reason for that condition of affairs, or any explanation?—Well, it is rather a delicate question. I think probably it is due—

5,635. Are these people not descendants of the slaves of the former Boer owners?—Yes, I believe so. May I qualify that? I do not know that the Boers have united with them so much. I should rather say that the other nationalities have done it in greater proportions than the Boers.

5,636. The effect, then, of associating white and black people together in the Western Province has been the amalgamation of the races?—No, I do not think it has amalgamated the races. You produce a man who is practically avoided by both sides. He is not recognised by the native tribes and he is not recognised by the Europeans.

5,637. Anywar the mixing up of the races has led to the production of half-castes. Would not the policy of breaking up the native tribes have the same result?—No, I do not think so.

5,638. You do not think that the placing of the two races in close contact would be followed by consequences of that nature?—You would get it, but not to the same extent which apparently happened in the early days of the country. I think experience will tell you that no matter what country is pioneered you get this mixture of races in the pioneer days. Human nature must have its outlet. Take Rhodesia as an example. Pioneers are generally a rough and ready lot. I think you

will find that in the Western Province—I know nothing about, but I should think you will find—that the percentage of men who will cohabit with a black woman or a Hottentot woman is not nearly so great as it apparently must have been in the days gone by. Civilisation, I suppose, improves matters. With the introduction of our own women and the adoption of family life, social progress, which acts as a buffer against cohabitation with black women, is effected.

5,639. Are you aware that in the opinion of observers like Bryce the destiny of this country is to be a black man's country?—Am I aware of his opinion?

5,640. Yes?—I am aware that there are men of the opinion. I did not know Mr. Bryce was of that opinion. It will not affect my opinion.

5,641. You think, then, that this effort to improve the labour supply is not likely to be attended by any evil consequence of that nature?—No, I do not think it would.

5,642. Mr. PERROW: Do you think that the increase of the pay of natives will increase the supply?—No; I think I have stated that if the native is in want a high rate of pay may attract him momentarily, but I do not think it will have a permanent effect in increasing the supply. In fact, I think it will have the opposite effect.

5,643. Do you think that the native leaves home with the idea of earning a certain amount?—That is my opinion. And if he can get it in three months, he leaves work and goes back again. That is why I think you now find the native preferring short contracts, because he knows he can get the money he wants in the time.

5,644. Mr. BRINK: In your statement, Mr. Taberer, you give the native population, and then you say, "This population is distributed over 673 farms." I want to know whether you can tell us how many of these farms are bush veld farms, and how many are high veld farms, or occupied by farmers?—No, sir; I cannot.

5,645. Approximately?—No, sir; I could give you no approximate estimate.

5,646. In your cross-examination you harp on the bush veld farms—the number of natives living on bush veld farms. Now, out of the 673 farms, have you any idea how many are on the high veld?—No.

5,647. By your cross-examination you gave the impression that all these farms are down in the bush veld?—Oh, no; the majority of these farms are on the high veld. Probably not even a fifth are bush veld farms.

5,648. And you have no kaffirs at all in the Pretoria district living on Crown lands, according to your Schedule A?—Not that I have been able to discover.

5,649. I am not putting these questions to catch you. I want to get at the number of natives available for the agricultural part of the community. That is why I put these questions.—I think there are about 3½ Crown land farms which are included in some of the locations in the Pretoria district. The balance of the farms making up the locations are purchased by the natives.

5,650. When you say private farms, do you know that some of the farms are owned by native chiefs living, not in the Pretoria district, but owning private farms?—Yes.

5,651. You know Mamogalie's tribe? How many farms has he?—I think he has four farms.

5,652. You call them private farms?—I call them locations; they are included in the locations.

5,653. Is that Haman's Kraal?—You will find it on Schedule B. Hebron and Jericho belong to Mamogalie.

5,654. Do you know that this tribe living in the Rustenberg district holds a very large location?—I understand that is so.

5,655. If any attempt is made to make these niggers work, won't they go back to their chief and live in the Rustenberg district?—Those who are in these locations, you mean?

5,656. You see what I mean. Supposing these men not living in these locations have a bad season, won't they flock back again to their locations if they are made to work?—I don't quite understand what you mean.

5,657. If they have a bad season and are compelled by circumstances to work, do you think it will make them go to the other side?—No, I don't think so; I don't think the chief would receive them in the other locations.

5,658. Can you tell us the extent of Mama-gatie's location? How many farms, about?—The location includes Kameelfontein, No. 51, Syferfontein, No. 310, Sjambok Zyn Kraal, No. 52, Os Kraal, No. 437, Magalieslaagte, 376. These farms altogether make up an area of 13,125 morgen.

5,659. And this chief holds a tremendous extent of ground in the Rustenberg district?—I understand so.

5,660. Mr. FORBES: You mention that farmers do not cultivate their bush veld farms. You refer to those who do not reside on these farms, don't you?—Yes.

5,661. How far will these farms you have in mind be from the railway, or from a market where the farmer can dispose of his produce?—The bush veld farms?

5,662. Yes?—Some are close against the railways, especially the northern railway.

5,663. The natives cultivate them, you say?—Yes.

5,664. As much land as they like?—Yes, apparently, they have got the run of the farm as far as cultivation is concerned.

5,665. Is it not a fact that the native chooses the best of the land?—I think any man will do that if he has the run of the place.

5,666. When one piece is impoverished he goes to another?—Yes.

5,667. Until he impoverishes the whole lot?—Yes; of course, he does not improve it.

5,668. Mr. PHILLIP: You mention that there are 13,000 boys employed in Pretoria?—13,000.

5,669. Can you tell us where they come from?—The information is obtainable. I got the number, 13,000, from the municipal passes issued every month. From these passes it would be possible to give you the percentage of natives from every part of the country.

5,670. Would it be possible for you to get this?—I could request it. I understand you are having a gentleman who is running the municipal office here to give evidence. I shall see him in the morning. If you like, I can get him to bring you these figures. That is Mr. Schlaeffli. I understand he is to be called. He is in charge of this office, from whence these figures are made up.

5,671. Do you know the number of the farms in the Transvaal outside the Crown lands?—I have not the faintest notion.

5,672. You think your estimate of ten boys per farm is a fair average?—Yes; I may tell you candidly it is an estimate which I will ask you not to put too much value on, because I have only been 15 months in the country, and the developments of works that have been going on on the farms makes it very difficult to say what will be going on in two or three years' time. I should not like to give you the idea that I am giving you figures which you can absolutely rely on.

5,673. Mr. EVANS: Are you acquainted with native affairs in Natal and Zululand?—Very slightly.

5,674. What is the extent of your acquaintance?—My acquaintance was a short one of 2½ years, for two years and a month of which I was Secretary to Zululand—that is, I was stationed in Natal, and

a sort of medium of correspondence between the Crown Colony, which it was then—Zululand—and the Home Government, through the Governor of Natal.

5,675. I see. So you had an opportunity of studying native affairs there?—Yes, in so far as it was possible. I was an acting magistrate also, at the capital in Zululand, for about three months, previous to my going up to Rhodesia.

5,676. During the time you were there, was labour plentiful?—As far as I was concerned, during the time I was in Zululand—it was the time the Charles-town extension of the railway was being built—I noticed during the twelve months I was there, a fair amount of labour left the district which I had control of for the railway.

5,677. Were any large numbers of labourers sent out of the country?—Sent out of the country, yes.

5,678. Did any large number come up to Johannesburg?—Not to my knowledge.

5,679. Do you think that we are not likely to get any appreciable number of labourers from Zululand or Natal?—I don't think I am qualified to give you an opinion, because, as far as I understand, Natal people say that they have not enough labour to supply all their wants, and we can only gauge it by what is going on. If they have to import Indians we must come to the conclusion that the natives, even if their numbers are above what is required for labour, will not come out to work. If they will not come out to work in their own country, I think it is doubtful if they will come on the mines.

5,680. Mr. DONALDSON: In your replies to another member of the Commission you stated that the natives who squatted out on the bush veld farms paid as rent from 10s. to £3 per head?—Those who were called upon to pay it.

5,681. And that, in addition to this, they gave their services?—In some cases.

5,682. Can you specify any of these cases?—I can specify one farm. The owner of the farm is a man named Van der Walt. Their rent is charged the natives, and I think the supply of labour he requires is two boys per month. I can give you the number of natives on the farm if you like. The native population on the farm is 755.

5,683. How many huts will that represent for payment purposes?—150.

5,684. The CHAIRMAN: Do you mean for purposes or tax purposes?—For tax purposes you will have to take the number of the adult male population.

5,685. Mr. DONALDSON: How many would that be?—About a quarter, about 180.

5,686. From each of these men he gets a rent of how much per year?—Thirty shillings.

5,687. Approximately 180 persons would pay him 10s. a year?—Yes.

5,688. And he also gets the free labour of how many natives?—I think it is two all the year round.

5,689. Two from how many people?—From all the population on the farm.

5,690. Oh, for the whole population on the farm he only requires the permanent service of two men?—Probably during the reaping season or when there is any special stress of work he may send for an extra amount, whom over and above the two, he would pay; that is the usual arrangement.

5,691. So that the free labour which he gets off the farm, if you take it that there are 180 able-bodied men, is 1 per cent. of the labour of the farm?—Approximately. One per cent. scattered over one year. I think you will find that two will come out for two months and be replaced by two others.

5,692. If there are, as you think there may be, from 755 people who live on the farm, 180 able-bodied men, the free labour to be got off the farm in the form of rent is just about equal to 1 per cent.?—Yes, just about it. May I remind you that in the winter, of course, he will call upon these natives

to attend to his stock, and he may also send his wagons to have wood cut, but this is spasmodic work about once a month.

5,693. For that extra labour would he pay?—I don't think so; I should say not.

5,694. You have also mentioned that the Government tax now on all natives is £2 per hut?—No, sir, £2 per head on able-bodied natives.

5,695. That is irrespective of whether they live on privately-owned land or in locations?—Quite irrespective of anything.

5,696. Do you know the conditions that were prevalent or in vogue before the war?—Yes.

5,697. What were they?—Before the war every native paid a hut tax of 10s. per head per annum; every native who was not employed by a European or was not squatting on a farm, paid an additional poll-tax of £2 per annum. In addition they pay a dog tax of 10s. per dog, which is also payable now. These are the taxes exacted by the late Government.

5,698. Does that mean that a native on a farmer's property, who at times would work for the farmer, paid 10s. per annum. How did they distinguish between the man who paid 10s. and the man who paid £2 for residence on private or Government land?—Usually the natives on locations paid the £2 poll tax, and it was usually limited to natives on locations.

5,699. And on Government land?—And on Government land.

5,700. Then, since the war the tax has been raised to the detriment of the farmer's labourers?—I don't understand what you mean by detriment.

5,701. Previously you say the farmer's labourers who lived on his farm paid a hut tax of 10s. a year, but that now each able-bodied man has to pay 40s.?—Yes.

5,702. Consequently, under the present administration the Kaffir who lives on a private farm, and who presumably works for the owner of the farm, is put in a worse position than he was under the late Administration?—Yes, he is made to pay more.

5,703. Would the effect of that be that the farmer's labourers would be inclined to leave him and go where they would have to pay the tax but would not be under any obligations to work?—I should say the tendency would be that way, the natural tendency.

5,704. Do you know of any instances?—No, sir, I don't, not of any natives leaving the farmers and going back to locations.

5,705. But you think the tax would have that tendency, though no instances have come under your notice?—Yes, where it has been attempted we have done our best to see that it is not done.

5,706. In your evidence-in-chief you suggest the adoption of a system of individual tenure in respect of all natives squatting?—Yes.

5,707. What do you mean exactly by that?—What I mean is especially in regard to native locations, that every native shall have a small portion of land, which is sufficient to supply the food requirements of his family, and he shall be limited to that area for cultivation, that he shall be charged a perpetual Government rent for the amount of ground which is allotted to him by Government. He should be charged some Government rent for it; some ground rent; he would then be unable to meet his wants by having an enormous amount of ground to cultivate. I think it would tend to make him more industrious.

5,708. With reference to the natives who are in your own district. You have an intimate knowledge of the Central Transvaal; do you think the effect of some legislation of that sort would be to send them out to work, we will say out on the mines of Johannesburg, or the railways, or to send them on to the farmers' land?—I think the effect would be to make it necessary to limit the number of the natives who would squat on a farm. That is, each farm would have just as many squatters as would be required for agricultural purposes; the

rest of the natives should be settled on some form of individual tenure, under which system they will be driven to seek labour somewhere, either from the farmer, who, if he wanted extra labour, would have to pay the ruling price, or they will go into the towns, or to the mines or the railways.

5,709. Your suggestion is that on the locations and Government land, the land which a native may cultivate, should be restricted?—And on private farms, too, if it were possible.

5,710. Mr. GOCH: You state that all the figures you have given here are subject to what Sir Godfrey Lagden has stated in his general return?—No, mine are included in his general return.

5,711. I will draw your attention to an answer that Sir Godfrey Lagden gave here to a question in which he stated that the town of Pretoria was not included in his statement?—Then the figures for Pretoria should be included.

5,712. You say that 13,000 men are employed there?—Actually in the township. As regards Sir Godfrey Lagden's statement, it covers the whole Transvaal except the Pretoria township, the municipality of Pretoria, and therefore to the figures he gave as the total population of the Transvaal your 13,000 should have been added?—I must explain, I cannot be responsible altogether for what he says. If he said it, I should conclude it is so. If he has given you how many natives are employed in the Transvaal during the year, and did not include Pretoria in his statistics, naturally the 13,000 must be added to the number he has given.

5,713. So that actually Sir Godfrey Lagden has dealt with the whole question except the 13,000 men you state are in Pretoria?—May I ask whether in the figures given by Sir Godfrey Lagden he was stating the number of natives from the Transvaal who have been out to work?

5,714. Yes.—I would point out that amongst these 13,000 a great many do not belong to the Transvaal, therefore you cannot altogether add them to his figures.

5,715. According to your statement, there are not more than 260 at work. You give under the heading "Pretoria" in your statistical Schedule A "now at work, 260"?—Yes, who left their kraals.

5,716. Therefore, the presumption is that that would be about all the natives of the Transvaal working in Pretoria; the rest are probably foreigners?—Oh, no, sir, there are many other districts from which natives are drawn to work in Pretoria.

5,717. I want to ask you in regard to the 673 farms where you find 50,170 of the total population of these farms?—Yes.

5,718. The number of men on these farms work out at, you say, 15 per farm. Will you make that clear?—These figures you mention comprise the total of the two districts you are dealing with.

5,719. I think it would be pretty well the whole total. The suggestion you make about moving the natives, on page 4 of your statement, would therefore involve the total disorganisation of the present situation, as it were, with regard to natives. You speak of ten natives to a farm, and we have at present an average of 15?—Yes.

5,720. Now, it would involve moving them on, I suppose, from one farm to another, which would be rather a colossal job, would it not, with such a population?—I do not think it would, because on the farms that are occupied and being worked by the farmers you find the natives are just about as large in number as those farmers require. The movements of natives would principally take place on what are called bush veld farms, and I would distribute them to other farms.

5,721. Some of the farms would have a much larger number?—Very much larger.

5,722. This would be bush veld farms?—Yes.

5,723. You would move them to farms where white people live?—Yes.

5,724. You do not think that would be a very difficult matter?—It would be a difficult matter, but I do not think it insuperable.

5,725. Would it require any force to compel the movement of them, or would you proceed by inducement more than anything else?—We would induce them.

5,726. This inducement would be in the direction of putting them on different farms. They would be allotted a certain amount of land, and would be told what rents they would have to pay for that land?—Yes.

5,727. And under that system, on these farms they would get certain fixity of tenure for the land?—Yes.

5,728. All these points are involved?—Yes, and simultaneously it must be done on the locations.

5,729. You have 16,000 people in the locations, and you would move them to farms?—Yes, if possible; and I think it would be better than leaving them in the location, simply because I feel the abolition of the tribal system would be a benefit.

5,730. Have you thought the matter over as to what amount of land should be allotted to each head of a family, for instance on private farms?—I have, sir. I think four to five acres, but of course if you come across a man with 10 or 15 wives you would have to make him a larger allowance.

5,731. But the question does not seem to matter very largely as to that, because there are only 12 per cent., according to your statement who are polygamists?—Yes.

5,732. It is not a very large proportion?—No.

5,733. You would in that case give to each head of a family four acres?—Quite so.

5,734. In the case of polygamists, you would give them additional land for each wife?—Of course, a great deal would depend upon the nature of the land you put him on, whether he could cultivate it by irrigating or by manuring it, and so forth.

5,735. Of course, you would depend upon the co-operation of the farmer for this?—Yes.

5,736. What is the special inducement to the farmer to give such facilities to the Government for the natives; is it that the natives would be allowed to work for the farmer or pay rent?—I think they would pay rent, but the farmer would have them at his door if he happened to require labour.

5,737. Oh, labour only; he is in no way obliged to employ him?—May I explain that I would give a farmer whatever squatters he requires for his farm as well as any other natives over and above these squatters, to whom I would grant this individual tenure of land I am speaking of.

5,738. Besides these men you would allow squatters on each farm?—Yes, I would allow a man to make what arrangement he likes with his squatters, otherwise you would interfere with the agricultural development of the country. You must thus distribute the natives as squatters over the farms on the same system of individual tenure.

5,739. Supposing this abolition is carried out, and a certain number of families located to each farm, with fixity of tenure to a certain acreage, in addition to the rent they pay the farmer, would there be a slight tax to the Government as well?—I think so, yes.

5,740. Your policy would abolish locations altogether?—It would tend that way.

5,741. You think they would serve the farmers fully as regards the labour they require?—More than fully.

5,742. Practically, it would absorb for this particular district you refer to all the available labour that is to be got for the farms in that way. You have 14,485 able-bodied men in your returns; 10,547 live on farms, and 3,938 live in locations. Now, you would put all these on the farms?—Yes.

5,743. I see you state that 6,223 is the number of natives required on farms?—Yes.

5,744. That leaves 8,262 able-bodied men still available. Now would this be available for labour elsewhere than on the farms, or do you think the farms absorb them all?—I would think they would be available for labour elsewhere.

5,745. Then you have a demand on the part of Pretoria Township for 13,000, which would absorb these, and in that case you will be short of 4,700 of your available men in the district?—As far as Pretoria is concerned.

5,746. So we may take it that the whole of that district absorbs all the labour available or likely to be under the policy you suggest, and none will be available for the mines?—Exactly so.

5,747. Mr. BRINK: You were talking to Mr. Goch about there being 673 farms where natives were squatting, but can you tell us the number of farms in the Pretoria district?—I think almost every farm has natives on it. There are a few that have no natives, but the number of farms on which natives are living is 422.

5,748. In your statement you say, "This population is distributed over 673 farms" ?—Yes; but the remainder would be in the Heidelberg district, and 422 are in the Pretoria district.

5,749. I do not know, perhaps, whether I am making myself quite plain to you. You say there are only 673 farms in the Pretoria district?—No, sir; the number includes Heidelberg as well as Pretoria.

5,750. Do you mean to say that there are 673 farms in the Pretoria and Heidelberg districts?—Yes, the farms on which natives are living and on which native tax has been collected.

5,751. But we want to get at the figure, and, according to your idea, every farmer requires ten men. Some farms, as you know, are subdivided into from 20 to 30 portions, but we can easily find out the figure if you tell us how many farms are in the Pretoria district?—I do not know.

5,752. I am afraid I am not making myself plain. Directly we know the number of farms in the Pretoria district we will get to the balance of population?—I presume any farms over the number, 422, on which I have collected taxes in the Pretoria district, have no natives living on them. If there are any such farms, I say that they have no natives, and since being in control of the district, I have had no man come to me and complain that he had no natives on his farm. (Mr. BRINK: Beers seldom go to the Native Commissioner for natives, because they know they cannot get them?—I am speaking of my own district. (Mr. BRINK: But if we get at the number of farms in the Pretoria district, we get the balance of number at once.)

5,753. The CHAIRMAN: Mr. Taberer does not know the number.

5,754. Mr. BRINK: I only want to point out that Mr. Goch took the number, 673 farms, for the district of Pretoria.

5,755. Mr. GOCH: No, the whole district dealt with, which includes Heidelberg, and the answer was that it was approximately the total number of the district dealt with in the statement, and not only Pretoria.

5,756. Mr. BRINK: I shall be quite satisfied if you will state, Mr. Taberer, that you are not acquainted with the number of farms in the Pretoria district?—I do not know them, and I have only to deal with farms where there are natives.

5,757. It might be possible that there are 673 farms occupied by natives, but there might be another 1,000 farms where you have no natives at all?—Quite possible, but it is not so.

5,758. The CHAIRMAN: Mr. Taberer, the Commission is very much obliged to you for your very full statement which you have given us, and the evidence which you have given since.

Mr. J. IVENS FERRAZ was called and duly sworn.

5,759. The CHAIRMAN: Have you before you, Mr. Ferraz, a document headed "Statement by J. Ivens Ferraz, Esq."?—Yes.

5,760. Have you also a further document headed "Further statement by Mr. J. Ivens Ferraz"?—Yes.

5,761. Do you hand these in as your evidence-in-chief?—Yes. But I must remark that I prepared a second statement in a hurry in order to oblige the Commission, and, not to delay them, I gave it to the Secretary in the shape of pencil notes, which I have not revised. I think the statement is exactly like my pencil notes, but during your cross-examination I shall look through them, and see if there is any mistake.

5,762. Perhaps it would be better if you would read your statement through now?

5,763. The witness checked his statement, which was then handed in to the Commission as follows:—

I was the first representative of the Portuguese Government to come to the Transvaal as "Curator," having opened office in Johannesburg in 1898, and having occupied same until the outbreak of war, all through the same, and after peace until 15th May of last year.

Previous to my opening office, the native emigration from Portuguese territory was scarcely controlled, only a few emigrants paying taxes to the Portuguese Government, and those few simply to throw dust in the eyes of the authorities, the very great majority being smuggled across the border. Those who paid taxes only paid the price of the passport, as ordinary emigrants of the white race would have paid if the passport regulations were strictly enforced. There are, therefore, no records of what was Portuguese native emigration previous to April, 1898.

I have seen the statistics of emigration, brought before that Commission by Mr. Francisco de Mello Breynier, with which I agree. They are correct, and have, in a great part, been supplied from my records. I disagree as regards population.

During the exercise of my office, I was the chief official in charge of emigration affairs, being the principal adviser to the Government, and on reporting for the *modus vivendi*, I stayed the whole time assisting His Excellency Sir Manuel Gorjao, Governor-General of Mozambique. It would be rather puzzling for me, under the above circumstances, to give you any special evidence, my contact with native affairs having been so general, but I will only be too pleased to satisfy the questions of the Commission on any portion they may desire.

Further statement by Mr. J. I. Ferraz.

1. District with which I am acquainted.—Personally, I only know the district of Lourenco Marques; by constant official connection as Curator of Natives for the Portuguese Government, I am acquainted with the whole province of Mozambique as regards native labour, more especially the districts of Lourenco Marques, Gaza and Inhambane.

On the West Coast of Africa I know St. Thome Island and the province of Angola, being more acquainted with the former and with Benguela and Loanda in the latter. St. Thome is an agricultural Colony, deriving its labour from Angola.

2. Length of time during which I have known such districts.—I have been in South Africa for nearly six years, always in contact with Mozambique Province, but during the four years and two months I was Curator of Natives for the Portuguese Government, I had the whole of my time and attention devoted to native labour affairs. I was twice in Portuguese West Africa, once as proxy for the big bankers and Colonial produce exporters of Lisbon, Messrs. Marx, Weinstein and Co., and the second time engaged as manager for the biggest firm there, Soaza, Lara and Co., altogether about 12 months.

3. Character of natives of such districts.

(a) Usual work.—The natives of Lourenco Marques, Gaza and Inhambane are too well known as the best mining boys. The natives from Mozambique District (Macuas) and Zambesia District

would, I think, prove well if you ever had the right sort, but you never had the right sort on the Rand. Previous to the war, several gangs came, brought by the labour agents, Jean Antonioti, Lucio Vellozo du Rocha and Kussel. The first gang (Antonioti's) was a gang of 69 boys distributed to the Durban Roodepoort Deep, a present which he got from the Governor of Quillimane, of convicts, which he was only too glad to get rid of. Never was there seen such scum of the earth, lazy, full of diseases, and with all the vices known, and a few dozen more. If the agent was to blame for bringing such scum to the Rand, not less was the mine to blame for keeping those 69 boys in one single room in their compound, leaving them to purposely suffer the consequences of their dirty habits, that is, as they refused to clean it, they were compelled to stay there. I entered this room, and it must have been a miracle how I escaped alive from the stench. No wonder Mozambique boys died so much on the Rand. The other gangs from Mozambique and the Quillimane all spoke fluent Portuguese, being mostly kitchen boys from town and unfit for the mines. I have no doubt that the real kraal boy will turn out very well. As regards the Portuguese West Coast, the province of Angola is very vast and well populated. The natives coming from the interior to Benguela in and out by thousands every day resemble very much the Inhambane boys, and look humble and submissive. On this subject I enclose a copy of a report of mine in September, 1899, to the Chamber of Mines, which you will find very interesting and useful.

(b) Usual food.—As regards the East Coast natives, the food they are getting seems all right; however, I would advise mandioca flour now and then as an alternative to mealie porridge. They eat this mandioca flour dry, mixed with a sort of curry prepared with dry shrimps, chillies, and monkey nuts; all these articles can be purchased cheap at Inhambane. As regards West Coast natives, white crusted mealie porridge is their special food, palm oil, a very cheap article exported from the Congo to Europe for soap factories, is also essential. Sun-dried fish with no salt, a sort of fish biltong, produced in enormous quantities at Mossamedes, I would strongly recommend to be imported here for all natives in general. It costs less than 1d. per lb. dry weight.

(c) Usual pay.—The present rates are fair, but it was a big mistake (amid many others) when the emigration started, to reduce the pay to 1s. per working day (Sundays included). It discouraged the natives, who were then very eager to come here, and I do not believe they ever have regained much courage. West African natives from the interior live on "barter" or permutation; money is not used by them. They would soon know the value of money, and their needs being very limited, the present pay would make them very contented.

(d) Physique, aptitude, special ailments, etc. All natives I have been speaking of have about the same physique, with the exception of the Northern East Coast, which are better built. I believe the West Coast boys will prove good for such underground work, as they have no fear of death. When I stayed in Catumbella on the Big Lake, no week passed without a native being killed by crocodiles; still they persisted in approaching the lake to get water with the philosophic remark of "It was destined to be."

As regards special ailments, you should be very careful in having all Inhambane boys medically examined, as leprosy rages there. You should also be very careful in winter, as all natives are liable to pneumonia. A Portuguese Ordinance ordering that no native should leave the border without proper clothing, was my proposal; the reason being that out of 140 natives for the New Heriot, 14 died of pneumonia within two weeks after arrival (this being exactly 10 per cent.). The gang was 600 odd, but the other mines were not polite enough to report the fact to me, the Portuguese Curator. I heard only recently of a great mortality among the 300 odd natives from Mozambique before the war; it was

never reported to me, but there must be a reason independent altogether of the origin of the native; either dirt and infection, as in the case of the 69 natives before-mentioned, or chill, or some other reason, which could have been prevented.

(e) Special conditions affecting labour supply which induce or deter.—Make your natives as happy as possible. Be very strict with your compound managers, and especially be very just with your natives, and take my advice under section "Food."

(f) Approximate numbers available.—I do not think there is anyone who can make even an approximate calculation of the number of natives available on the Portuguese East Coast; the population available is certainly far greater than the estimate of Mr. Francisco de Mello Breyner, which comes to just a little above one native for each square mile.

The population of the Province of Angola is still much larger. There is the demand from the Portuguese agriculturists in St. Thome, but that demand is not competition, as I prove in my report herewith, and in special section below.

(g) Enterprises managed by Europeans and number of Natives required for same.—As regards the Portuguese East Coast, I agree with Mr. Mello Breyner, excepting as regards the three railways. The idea that these three railways will reduce the output for the Rand by 60,000 is illusory, firstly, because the three railways will not be built at the same time; secondly, because they will not employ 20,000 natives each; thirdly, and principally, because the great majority of those natives will be natives who would not leave their country for the Rand, but will work locally, having their wives near them and being especially fond of home life.

As regards the Portuguese West Coast, there is a big trade in rubber, wax, native coffee, ivory, and other produce, which the natives barter for with the many white tradesmen. In recruiting, therefore, great care should be taken to safeguard the interests of the merchants, or better, satisfy them in some other way. Recruiting on the Portuguese West Coast should be better, if possible, across land, through Rhodesia. However, it would not be practicable by sea.

The labour employed in St. Thome Island by the agriculturists is all obtained from ransomed prisoners of war from native fights in Angola, who would otherwise be slaughtered. St. Thome can have no demand on natives who emigrate of their own free will; they (the natives) consider those who go there as a sort of slaves, and, if emigration were allowed, the Rand need never fear competition.

5,764. Do I understand that you were the first Curator appointed by the Portuguese authorities to Johannesburg?—Yes.

5,765. What was the reason of the appointment of a Curator here?—Because smuggling across the border was going on on a very big scale, and the Portuguese Government were getting no revenue out of, nor had they any control over, Portuguese native emigration. The Royal Commissioner at that time came here, and had several conferences with Dr. Leyds and Mr. Kruger for several other purposes, but that was the principal purpose, and it was agreed that both countries should legislate for the Portuguese natives. We were to legislate for sending boys here, and the Transvaal were to legislate for the protection of Portuguese natives here, and to carry out these laws they provided a Curator. The Portuguese Ordinance was published in November, 1897, and about the same time, in December, the Transvaal laws were published. I came here in February and opened an office at the beginning of April, 1898, and the first gang of natives came here about the 5th or 6th April, 1898.

5,766. Previous to that there are no records of the number of natives coming from Portuguese territory into this country?—No, the labour agents used to take passports, but these were often used over and over again. There was not sufficient check at the border to inspect these passports, and the natives passed through. Just before I came here, when I

was already appointed, a big bundle of passports were given me which had been used between Ressano Garcia and Komatipoort. The labour agents used to take out these passports and get the boys out of the country, and then there was no more control over them by the Portuguese Government. The emigration department previous to the passing of these laws was of no importance at all.

5,767. You say of no importance at all?—No, for the Portuguese Government had no control over them.

5,768. You state here that you agree generally with the figures supplied to the Commission by Mr. Mello Breyner?—Yes, when he was ascertaining the facts for this Commission he examined the records in my office here, which office is now occupied by another gentleman, and he took much of this data from those records. We found in these statistics records as regards the origin of these natives that many used to come here with contracts issued from Delagoa Bay, while most of them came really from Inhambane, and not Delagoa Bay; my records give therefore the boys as contracted at Delagoa Bay at a much bigger number than really belonged to that district. The fact that a great many of these boys were Inhambane boys, Mr. Mello Breyner was in a position to check, as he was chief labour agent at that time, so in his records he has more correct statements as regards the origin of the boys.

5,769. You wish to say that his statement with regard to the places from where the boys came is probably more full?—Yes, fuller than I can possibly give you.

5,770. Do you know the total number of Portuguese natives who were on the Witwatersrand area in the Transvaal before the war?—Before the war I had the exact numbers of those that went by rail home from the 1st to the 23rd October. There were 65,000 or 67,000—I do not recollect exactly. Then, before the 1st October, during all the month of September, things were very bad here, and the natives were emigrating in very large numbers. Of that I have no record, but I suppose some 5,000 went away in September. The total number came to nearly 70,000. Then there were the boys from Barberton, many of whom went across the border at that time, and of whom there were about 3,000.

5,771. One moment. You say that during September you estimated that something like 5,000 boys returned to Portuguese territory?—Yes.

5,772. But you have no records of them?—No.

5,773. Are there no records—railway records to show that number?—I suppose there will be.

5,774. You think there may be?—Yes.

5,775. Then from the 1st to the 23rd October you say that 65,000 boys went to Portuguese territory?—Yes, something like that, but the exact figure I have quite forgotten.

5,776. In any case you say that 65,000 of 67,000 left in the first three weeks of October?—Yes, from the 1st to the 23rd.

5,777. Then are there no records of the numbers who left after that?—After that I do not know, but I think there were very few.

5,778. Then some of them remained here during the war?—Yes, I suppose 10,000 or 15,000.

5,779. Have you any record in your office of that?—I think in my office I might find records for that. I think they may exist.

5,780. In any case you say that from 10,000 to 15,000 remained here?—Yes.

5,781. So that the number of natives from Portuguese territory on the Witwatersrand previous to the war must have exceeded 80,000?—Yes.

5,782. Have you any idea how many there are now?—I suppose there are a lot of boys in town, and I expect the numbers back now are 80,000.

5,783. You do not know that?—I think 80,000 are back.

5,784. Can we get that figure from your successor in office?—Certainly, he can supply you with the exact figure. The books are arranged in such a way that any such record can be taken from them.

5,785. Mr. Mello Breyner gives us certain estimates of the population of Portuguese East Africa south of latitude 22?—Yes.

5,786. You have seen these figures he gave?—Yes, but he bases that upon the hut-tax, and I think it is very vague. There are a lot of hut-taxes which are not collected, which the officials are unable to collect, and a large amount is paid by the natives in labour. All the Commandants are always employing labour for public works, and consequently considering the hut-tax is paid by 15 days' labour, that means that a considerable number of taxes are paid in that way in the course of the year.

5,787. Do the hut tax figures not include natives who pay the hut-tax in labour?—That I cannot tell you; but I do not think so.

5,788. Do you know why the Portuguese authorities insist on only dealing with large organisations in connection with the importing of labour from Portuguese territory?—It is because the Portuguese Government want someone to be responsible. Previously the natives were sent here by irresponsible touts. I remember at the Ferreira Mine they had a licence to import natives, but they did not receive them, and in fact natives were sent to other mines, such as the New Modderfontein. This licence was not concerned with the Ferreira Mine, but belonged to some other parties, and they carried it on as a sort of business, which, of course, is very objectionable, as far as the question of native labour is concerned. I may mention that that was not the only mine, and that there were many others.

5,789. The Portuguese authorities prefer and insist on dealing with some responsible organisation?—I think so.

5,790. Licences are not now issued to individuals unless they are connected with some responsible organisation?—According to law, any individual may take out a licence, but the Government has the right to refuse, and of course it does refuse.

5,791. Mr. Mello Breyner said he thought that within five or seven years the total number of Portuguese labourers at work in the Transvaal might be increased to 110,000.—I think it is very difficult to guess that, but in my opinion at least that number can be brought here. I would not compromise myself, however, by mentioning any definite figure such as that.

5,792. You think the numbers coming from there will steadily increase?—Yes, they will, and in that time they must increase to about what Mr. Mello Breyner said.

5,793. I think Mr. Mello Breyner also said that that figure would be drawn from the country south of latitude 22?—Yes, south of latitude 22, from where emigration has been going on since the existence of the Rand Mines. Natives there are already trained to come to the Rand, but north of that, I cannot say anything definite. It is very likely they will come in time. Work requires to be known and advertised amongst them.

5,794. You say that north of that latitude the advantages of working here must be advertised amongst the natives?—Yes.

5,795. You are not able to form any estimate as to the numbers which might be got from there?—No, the population there is very dense; perhaps more dense than in the southern portion. They are quite a different kind of native. They are not so savage as the natives of the south, and are more like the Zanzibar boys.

5,796. You mean more civilised?—Yes, and perhaps not so inclined to come down as the other boys, but I cannot say.

5,797. You have not been to that district yourself?—No, I have not been there, and the experience we have had of boys from there does not amount to anything.

5,798. You have also, I believe, had some experience of the Portuguese West Coast?—Yes, I have been there.

5,799. Do you think there is any supply of natives to be got from there?—I am certain there is a very good supply of natives to be had from there, provided you get the Portuguese Government to consent.

5,800. Have they been asked to consent?—No further than that a gentleman who was here before the war, was sent to Lisbon to do something, but he merely enjoyed himself there, and paid no attention to his business.

5,801. Do you know of any other person approaching the Portuguese Government with regard to the getting of the natives from Portuguese West Africa?—No.

5,802. You have handed in a report which you made to the Chamber of Mines in 1899?—Yes.

5,803. That has to do with the natives of Angola, I understand?—Yes.

5,804. In connection with that report, was there any application made to get natives from West Africa?—I do not think there ever was an application made in Lisbon. I know that there were some political people who were asked to assist the gentlemen sent by the Chamber of Mines, but the gentleman sent by them suddenly disappeared, and could not be found.

5,805. You are speaking of the period immediately before the war?—Yes, he must have arrived just at the outbreak of the war.

5,806. That is quite enough, they would not push business at that time?—No.

5,807. Have you spent any time in Angola yourself?—I was there twice for six months each time.

5,808. Do you know any reason why the Portuguese authorities should refuse permission to recruit there?—The only thing might be on account of the trade. Most of these natives are small tradesmen themselves, and barter with the white people. We have a very large exportation, especially of India rubber from there, and the profits of these people are not made on produce, but on articles of Portuguese and also foreign manufacture which they barter with natives. I thought there would be some inducement to these merchants as natives coming from the Rand with their money would buy all their necessaries before returning up-country.

5,809. Do you mean that they would make a very big profit which would compensate them to a large extent for allowing them to come here?—The natives do not use any money in the interior. They generally go to the coast, and all proceeds of their produce they spend in goods.

5,810. You mean they barter in the interior?—Yes. I am certain that if natives were to come here and return to the coast after three years they would leave all their money and not take it into the interior, but take goods instead.

5,811. Mr. GOCH: Do you know the population of the province of Angola?—I do not think anybody knows the population. It is not very civilised yet, and there are many parts which the Portuguese authority have not tapped.

5,812. When you addressed the Chamber of Mines, did you have the assurance of the Lisbon authorities that you could recruit there?—No, I had no assurance, and I intended them to go to Lisbon and get it.

5,813. You did not want to recruit for these natives there yourself?—No.

5,814. It was merely a suggestion on your part?—Yes.

5,815. And you suggested in this paper that probably 30,000 men would come?—I based my statement on the idea that the population is very

great, both on the information I gathered during the time I was there, and on the fact that there is a trading town in Angola where every day an average of about 1,000 natives go in and come out. They usually stay about a fortnight there, and come a distance of about three months' journey to it, and 1,000 entering every day means that there must be about 75,000 natives engaged in the india-rubber trade.

5,816. And it is on this that you base the suggestion that 30,000 can be got?—Yes, there are several other facts. There is the enormous quantity of india-rubber and wax, as well as other produce, which is exported, and which must require a lot of labour to produce. The india-rubber, which is an enormous trade, is taken from a sort of bush plant in the woods.

5,817. That is the trade these natives are thoroughly acquainted with?—Yes. There is another thing; the natives who come to Benguela are traders, but there must be very many other natives in the back regions of Benguela who are industrial men, cultivating india-rubber. These natives come and go and barter again with the natives engaged in these industries.

5,818. You do not know as to whether there is any surplus population of the men there?—That I cannot tell you.

5,819. What you speak of seems to be men fully engaged in business already?—Yes.

5,820. May I ask you, did you suggest that we should draw on these people to come here?—No, I only suggested that you should draw on the surplus population.

5,821. You have no knowledge of the number, or whether there are any?—No. I only know from the information of travellers that the population is very, very big.

5,822. You speak of disagreeing with the statistics furnished by Mr. Mello Breyner. You say, "I disagree as regards population." What is your idea as regards the population on the East Coast?—I do not think anyone can make a correct estimate of the population.

5,823. I understand Mr. Mello Breyner bases his estimates upon official returns?—Yes, from hut taxes; and a great number, as I stated before, pay their hut taxes with a fortnight's labour, and as there are consequently a great number employed in that way, if you add that to the number who actually paid hut taxes there will be a considerable increase.

5,824. Mr. Mello Breyner evidently gives us the best available statistics?—Certainly; I am sure that Mr. Mello Breyner could not give a more *bona fide* report than he did before this Commission.

5,825. You have only a sort of general idea that there may be more?—Yes.

5,826. You do not know?—No.

5,827. You stated that there may be now on the Rand about 800,000 natives at work again?—Yes.

5,828. Do you base that idea on the returns in your office? Are you connected with the labour?—I was connected with the labour up to May of last year.

5,829. Of course, the statistics from the Pass Office which we had before us you would consider quit authentic?—Oh, yes.

5,830. Then you are somewhat wrong in your estimate?—I do not know, because the Pass Office only gives 54,800 as the total number employed.

5,831. Sir Godfrey Lagden gave us information fully on all these points, and his return on the 24th July was 54,800 in round figures as the number employed in all labour districts around here.—Does that include natives employed on the railways?

5,832. Yes, on all the labour districts.—I do not think the railways are included.

5,833. This states Johannesburg, Krugersdorp, Boksburg, Grahamstown, Springs, Heidelberg, and Vereeniging?—Yes, but not the railways.

5,834. According to your idea there must be 30,000 employed upon the railways and elsewhere?—I say about the same number, not quite the same number.

5,835. Mr. DONALDSON: How long did boys coming here from Portuguese territory before the war usually work upon the Rand before returning?—I think I can say, on an average, three years. I have seen many boys who have come here as picanninies go away home with beards. Many boys simply come here for good, so to say.

5,836. Do you give that as your opinion in an official capacity?—Yes, and I have spoken to several of them.

5,837. It is within your knowledge that before the war boys stayed here an average of three years?—During the eighteen months I was receiving natives from Portuguese territory, and up to the time of the war, only some five or six thousand went away out of the total number that passed through my hands. That would be out of a total of 37,000 or 40,000, the number of natives that passed through my hands. At the time of the war there was, of course, a big exodus, besides.

5,838. The CHAIRMAN: Then up to the time of the war, only five or six thousand returned. You had a correct record of them?—I could not supply the correct figures now.

5,839. Mr. DONALDSON: Do I understand you that thirty or forty thousand natives came in during your term of office?—They came in in the ordinary way.

5,840. Of these only five or six thousand went away?—In October 60,000 went away immediately.

5,841. Up to the outbreak of war only five or six thousand went away?—Yes.

5,842. How long were you in office before the war—shall we say 20 months?—No, about 18 months, because November and December can't count.

5,843. Is it your opinion that the average stay of Portuguese natives at work on the Rand fields was about three years?—Yes. I do not know what it is now.

5,844. You have no idea what the average period of service is now?—I really do not know.

5,845. Is there any official who can give us that information now?—Yes, the Curator can give us that information, and the boys collected at the time, and also of those re-engaged.

5,846. Do you think the period of service is as long as before the war?—I cannot say. I think now the wages are raised they are inclined to stay longer again. I do not think they were inclined to do so when wages were low.

5,847. Is it not a fact that in Portuguese territory from south to north natives can get practically an unlimited supply of intoxicants?—Yes, practically an unlimited supply, partly from the small traders and partly from the manufacturers.

5,848. Over the whole province you get marola and caju trees which provide them with liquor?—There is liquor all over the province.

5,849. There is no trouble in getting it?—No.

5,850. They generally avail themselves of it?—I certainly know that.

5,851. Do you think there is any connection now in the difference in the length of service in their not being able to obtain liquor? If they could get liquor, would they work longer?—Some of them might be inclined. Natives go home sometimes just to have a holiday in liquor.

5,852. Mr. EVANS: What portion of Portuguese East Africa are you personally acquainted with?—I have not travelled in the interior except around Lourenço Marques.

5,853. Where have you been exactly? What were the parts?—Marracuene, just near to Komati River and Matolla.

- 5,854. Quite close to Delagoa Bay?—Yes, all about Matolla and all the district of Lourenco Marques. I cannot say very much about the practice of natives by personal connection with them.
- 5,855. The Northern Provinces and the territories of the Zambesi Co. and the Nyassa Co.: do you know personally anything of these territories?—They are thickly populated.
- 5,856. You have never been there?—No.
- 5,857. You have never been in any of the territories to the north?—No.
- 5,858. What makes you come to the conclusion that Mr. Mello Breyner has estimated his population upon too small a basis?—He has based it upon the hut tax, and some pay their hut-tax in labour. Commandants like to employ them upon roads or anything else.
- 5,859. What figures do you arrive at?—My opinion is that no one can give any figures except very roughly.
- 5,860. Now you say that Mr. Mello Breyner's figures come to just a little above one native for each square mile?—I think that upon a rough calculation the surface is 400,000 square miles.
- 5,861. It is given in the records I have here as 310,000?—I simply looked at the map roughly.
- 5,862. How do you arrive at one or even two per square mile? The figure in this statement for the whole of Portuguese East Africa is from between 700,000 and 800,000 males, between 15 and 50?—I saw it in some paper, in the hand of Mr. Breyner, as something like 500,000.
- 5,863. That was for the whole of Portuguese East Africa, which is 310,000 square miles?—I must have made a mistake; I thought I saw about 500,000.
- 5,864. Well, now, do you know that if there are seven or eight hundred thousand males between 15 and 50 that must represent a population of over three millions?—No, I think the population must be less.
- 5,865. Don't you think the basis upon which the census of negroes in America was taken a good one?—Yes, it would be a good basis.
- 5,866. That basis shows that the males between the ages of 15 and 50 form 20 per cent. of the total coloured population, so you see you have to multiply Mr. Mello Breyner's figures by four?—Yes.
- 5,867. Now, then, do you think that a population of 10 per square mile is an under-estimate?—I would not say it is an exaggeration.
- 5,868. That is what Mr. Mello Breyner's figures work out at. It is not an under-estimate?—No.
- 5,869. You refer to Angola. Are you aware that General Gorjao, as Colonial Minister, has recently definitely refused to allow recruiting in Angola on account of insufficient labour for their own purposes?—If such a thing has happened it must be caused by the influence of St. Thomas Island and the tradesmen of Benguela. The labour employed all along the Portuguese West Coast is a thing I do not like to refer to, but if I am asked to say I must speak the truth. That labour is bought. I was in the office of a firm once, and I saw in their books an inventory of their natives. There were so many natives, one at so much, and so on. On the West Coast they pay £20 or £30 per head. I don't think there would be any complaints about the importation of natives from there except from those people who buy their labour at £20 or £30 apiece.
- 5,870. In view of that state of affairs, is it at all likely that we shall succeed in getting labourers there?—No, on account of the refusal. After what you have just told me, you have not much chance of success. It is not, however, that you have lost all chance of success.
- 5,871. Would you not consider that General Gorjao would be very favourable towards us?—I think that General Gorjao would be favourable, but all the people who have interests in St. Thomas Island and all along the coast have very great political influence upon the Minister. In fact, they have almost a control.
- 5,872. Are we likely to get anyone more influential than General Gorjao to advocate our cause?—There is the King, but I don't think the King will interfere in these things.
- 5,873. So, then, we are going as high there as we can?—You can only get recruits by approaching these Angola firms, and trying to come to an agreement with them. I think you might suggest something of the sort to them.
- 5,874. If there is a refusal from headquarters? This is a letter from the Acting Governor-General of Lourenco Marques, dated May 5, in which he says "His Excellency the Minister of Marine and the Colonies, having been asked to permit recruiting of native labour for the Transvaal from Portuguese possessions upon the West Coast of Africa, and being unable to grant the required permission in view of the crisis owing to the want of labourers in those possessions, I am directed to inform the W.N.L.A. of this refusal, which I beg of your Excellency to be good enough to address to the Association."—I think it is rather final.
- 5,875. You think it is rather final?—Yes.
- 5,876. You refer here on the second page of your second statement to the gang of 69 boys distributed to the Durban Roodepoort Deep?—Yes.
- 5,877. When was this?—It was about the middle of my term of office here. I can't quite remember when. It was a gang that came down.
- 5,878. It was in 1898 or 1899?—Yes.
- 5,879. Do you know who was the compound manager then?—It was a young man who had a brother who was a labour agent afterwards.
- 5,880. Was it Mr. Clarence?—Yes.
- 5,881. You said they were all in one room?—Yes, he took me to it and showed me.
- 5,882. Are you sure the 69 natives were all in one room?—A half of them were there. A half worked by day and the other half by night. When I went there, there were about 30 there.
- 5,883. He states they were kept in three large rooms, and that there was never more than 25 in one room?—He showed me only the one room, and did not tell me there were any other rooms. I only saw one room.
- 5,884. Do you know how many boys there were in the room?—I did not count them. There were a good many for one room.
- 5,885. More than 25?—Perhaps not.
- 5,886. Do you know that he had the room cleaned thoroughly every day?—He went there to show me one room which was not clean, and it was very dirty.
- 5,887. Was it not owing to the filthy habits of the boys themselves?—The room resembled a W.C.
- 5,888. Do you know who was manager at the time?—I don't know.
- 5,889. Do you know that the manager had occasion to take a large number of boys before the Pass Inspector and have them fined for their filthy habits?—I don't know that.
- 5,890. Did the compound manager inform you that he had the room thoroughly cleaned and that in one hour it was quite filthy again?—I don't remember it. It may have been.
- 5,891. In your report you blame the compound manager?—Well, why not take some steps to stop their filthy habits.
- 5,892. What steps could be taken?—It would be for them to find out. It would be impossible to compel them to clean it. The boys would refuse. The boys were very much complained of; they were the worst class of boys, they were really convicts from Quilimaine.
- 5,893. Why did the Portuguese Government allow these boys to be brought here?—The Governor of Quilimaine thought they might regenerate by coming to the country; I know he was glad to get rid of them.

5,894. Who was that?—The Governor.

5,895. You said in your report that the mine was to blame for keeping these 69 boys in one single room, and now the state of affairs, it appears, was in consequence of their own filthy habits. What do you say about that?—When I went there really the state of affairs was horrible.

5,896. Was it a state of filthiness that could have been created in a short time?—It did not look as if it could have been created in a short time.

5,897. How could you have dealt with these boys? What could have been done to keep the room in a proper state?—Compel them to be clean by punishment or remove them forcibly. Have the place disinfected in some way. To punish them would be best.

5,898. The mine manager took them before the Pass Inspector, and had them fined?—Yes, we know about that.

5,899. What else could be done?—I agree with you that the compound manager was in a bad fix.

5,900. You refer to the Northern portions of this territory, and you state "I have no doubt that the kraal boy will prove very well." On what do you base your conclusion?—It is the same thing as with the boys from the South and boys from Delagoa Bay—kitchen boys and boys who are accustomed to town generally prove much worse on the mines, and are no good at all.

5,901. Are they of the same tribe as these boys in the north?—Yes, about the same tribe, you can say the same race. It would be just the same with these boys as with boys in the British Colonies. Boys who speak English are no good; boys who speak Kaffir are better.

5,902. What revenue does the Portuguese Government derive from the natives coming into the Transvaal to work?—Thirteen shillings for each one that comes, and if they renew their contract 6d. per month, and when they come back 10s. at the border.

5,903. So that the Portuguese Government is deriving a very handsome revenue out of this recruiting?—A fair revenue; it is one of the Departments which is conducted with the least expense, considering the amount of revenue.

5,904. Have they any other source of revenue equal to this Department?—There is the Customs and the railway.

5,905. Are their net receipts equal to the net receipts of the Native Department?—I daresay more, I think there is no doubt about it. It must be more.

5,906. Then does not the Portuguese territory also benefit by the money brought by the return of the natives?—Yes, and possibly most of it goes into the hands of the Arabs and Indian traders.

5,907. They will pay the Customs dues and the railway receipts out of it?—Yes, the native revenue is very large, the province lives upon the natives.

5,908. It lives upon the natives, and it is to its interest to maintain the existing system?—For the present, unless there should be more enterprise in the province in other industries, agriculture, and so forth. For the present it is very good.

5,909. It would be rather disastrous for the province if this industry should secure its labour from elsewhere?—I think so.

5,910. Mr. PHILIP: You stated there are the same number here as before the war?—About the same.

5,911. During your term of office only 6,000 returned?—No, during my term of office previous to the war of all the natives that came in that period about five or six thousand returned.

5,912. Did they apply for passports to you before their return?—Yes, or the officials at Boksburg or Krugersdorp, who represented me.

5,913. For these passports they paid what?—Ten shillings.

5,914. At the time a great many of the boys were brought in by touts, were they not?—There were some brought in by touts, not a great many; there was a lot of trouble with these touts.

5,915. According to the figures we have had given us, the Labour Association that then existed only imported a moiety of boys, a small proportion, the greater number being brought in by touts?—No, the greater number were brought in by the Association.

5,916. If these boys went away without getting their passports they would get over the border into Portuguese territory again?—Yes.

5,917. They would not be traced so as to be taxed for this 10s.?—It was when General Gorjao came as Governor-General that the policing of the borders was more enforced, and strict orders were given to the Commandants. Before then the Governors did not think it worth the expense to control the natives coming back.

5,918. A great many would return without coming into contact with the authorities?—Yes, a great many did return.

5,919. I notice you recommend a fish diet for numbers of them?—Yes, the natives of Inhambane mix up arrowroot with curry, chillies, and dried shrimps, and look upon this as a sort of luxury.

5,920. You also say that leprosy is prevalent?—Yes.

5,921. It has been discovered that this leprosy arises from salt fish diet?—I don't know.

5,922. That is the opinion to-day?—This fish is not salt fish, it is dried fish.

5,923. Mr. TAINTON: In the last paragraph of your statement you mention the Island of St. Thomas. Is that a large island?—It is not very large, it is a speck beside Madagascar. It is, however, one of the most important Portuguese Colonies. Our rich men come from St. Thomas.

5,924. Where does their wealth come from?—From the cultivation of cocoa and coffee.

5,925. Do you use native agriculturalists?—The natives in there don't work for the white men. They use native labour imported from Angola, especially from Benguela, which is a district of Angola.

5,926. Do you know what number of natives are employed in agriculture on the island?—About 200 per square mile.

5,927. How many would that be?—I really don't know, but, as a rough calculation, I should say above 30,000.

5,928. You say in that paragraph that these natives have been ransomed, as you put it. What do you mean by ransom?—The natives of the interior are continually having tribal wars, and their prisoners they used to slaughter. Afterwards the Government authorised that the natives who were intended to be slaughtered could be ransomed from the native chief, and the natives themselves, and sent to St. Thomas instead to work for the agriculturalists there. These natives are contracted at St. Thomas for four years; after the term of service they either may emigrate back or get employment somewhere. If they are found idle in town or elsewhere they are dealt with as vagabonds. This law is not very just, because the boys cannot find employment, and if they are found as vagabonds they are tried and offered employment, the flogmaster having the right of preference. That is what the law is, and the result is they never return.

5,929. Does the Portuguese Government ever interfere in these native wars?—I don't think they do.

5,930. The natives fight among themselves?—Yes.

5,931. And then the Portuguese people pay the ransom money for captives?—Yes.

5,932. What do they pay for them?—A part of them go to St. Thomas, and a part stay on the coast working for those big firms I have spoken of. In St. Thomas the price in the market is 110,000 reis, about £20.

5,933. When was that?—In 1897.

- 5,934. You say you saw some entries in a book, and the price, on what date was that?—It was the inventory price, the asset, the price at which they were valued, £20, and so on.
- 5,935. When was that?—In 1897, in Benguela.
- 5,936. If I understand you correctly, St. Thomas gets its agriculturalists from prisoners of war who have been bought by Portuguese?—Yes. There are some of these prisoners of war that were bought at one time from the King of Dahomey, a French possession.
- 5,937. That is a long way north?—Yes, but they used the same practice as the Portuguese colonies also. I don't agree with that custom. There is no doubt the object is to avoid the slaughter of these natives. It also encourages the fights and the hunting for natives and prisoners.
- 5,938. That goes without saying. When did these men come from Dahomey to St. Thomas?—Many years ago.
- 5,939. Who is the Governor in Angola?—I don't know if it is the same or if he has changed. In my time it used to be Dr. Ramada Curto.
- 5,940. Where is General Gorjao now?—He is Minister of the Colonies and Navy at Lisbon.
- 5,941. Was he ever on the West Coast?—I can't say, but I think he was.
- 5,942. How long have you been connected with the East Coast?—Since I came here about six years ago.
- 5,943. Are any of the practices which you tell us are prevalent on the West Coast also practised on the East Coast?—No, on the contrary, the Portuguese authorities take careful steps to avoid this thing.
- 5,944. Then the statement made by the British Consul, Mr. Johnson, in his report to his Government in 1894 to the effect that the central districts of Africa were being depopulated in order to send slaves to the coast districts is not correct?—There has been slavery, but it has been done by the Arabs. I don't know anything about that. Some time ago we arrested 700 slaves and gave them liberty.
- 5,945. When was that?—Not quite a year ago. The result of this has been that the gentleman who denounces this slavery was engaged as native labour agent by the Association, went there and was beheaded as revenge by those he denounced.
- 5,946. Do you know anything of the country north of Inhambane?—I have never been there. I know Delagoa Bay and round there.
- 5,947. One of the witnesses here stated that the Government charge for boys was 10s. per year of their labour contract. Is that correct?—Ten shillings a year? According to the *modus vivendi* which I myself translated whilst it was being discussed, the natives, if they are engaged, have to pay 6d. per month. That comes to 6s., and there is 13s. for coming here, and then there is 10s. for going back. There is no other tax.
- 5,948. And 6d. per month?—That is on re-engagement.
- 5,949. The average term of engagement is three years?—According to the *modus vivendi* it cannot be more than two years. Before the war certainly the average was not below three years. A native then could stay as long as he wished. Now the *modus vivendi* stipulates two years as a maximum.
- 5,950. The Government makes more money out of the two years' term?—We do not want the natives to forget their land. We want them to come back.
- 5,951. And you charge them 10s. when they come back?—Yes, I suppose the question of revenue has something to do with it.
- 5,952. You said something about basing your estimate of population on the hut-tax?—Yes, sir, Mr. Mello Breyner based his estimates upon the hut-tax.
- 5,953. You think his estimates are not correct?—If he wants to base them upon the hut-tax he should state whether some pay in labour or barter. I understand he got the figures from the revenue statistics. I do not think the commandants make a record of natives that pay in labour.
- 5,954. You say the boys pay in labour?—Yes.
- 5,955. How did they pay in labour?—They work a fortnight either making roads or in agriculture or in other ways. Many of these Commandants have agriculture carried on in a big way, especially in Manhica.
- 5,956. They have large Government farms?—Yes.
- 5,957. How do they work these farms?—With these natives.
- 5,958. If a boy refuses to pay, what is done?—I do not know.
- 5,959. Have you any idea?—No, I have no idea.
- 5,960. You say the Governor of Quilimane sent a certain body of convicts here?—The natives who were chained together to sweep the streets and do other work.
- 5,961. What were they convicted for?—I do not know.
- 5,962. You don't know what crimes they had committed?—No.
- 5,963. These men were engaged through a Rand labour agent?—I must say that the Rand labour agent came there and posed as a very influential man, but could never get one labourer, so he went to the Governor, and the Governor gave him these convicts. They must have cost him an enormous sum per head.
- 5,964. What profit did the Government make out of it?—None. The Government made the ordinary fees, and of course the Governor was only too glad to rid the town of these men.
- 5,965. Can anyone go to the Portuguese possessions and get prisoners upon these terms?—I do not think so, and the mines cannot want to get these convicts. If there had been great crimes committed he would not have been allowed to take them. If it were only the scum the Governor would have been only too pleased to get rid of the prisoners. I do not blame the Governor for doing that; it would be a good thing for the town to be rid of them.
- 5,966. On the West Coast you buy prisoners, and on the East Coast you sell them?—They were not sold; they were given.
- 5,967. Mr. WHITESIDE: Do you know anything about the compounds on the reef, apart from the instances you have stated?—No, not much.
- 5,968. Have you any experience of the compound managers?—No, not much.
- 5,969. The little information you have, does it point to the fact the natives are treated well?—In most cases, yes.
- 5,970. On page 3 of your statement you say the West African natives from the interior live on barter. Do you refer to the native from Angola?—Yes, in many cases.
- 5,971. In the previous paragraph of the same clause you say that you think we are still feeling the effects of the reduction in pay?—Yes, I think so. I knew that the natives were willing to come to the Rand immediately emigration was permitted, and this small pay produced a sort of discouragement, and it is very difficult when a native is once discouraged to encourage him again.
- 5,972. Then, do you think this feeling will disappear with the increase of wages?—Yes, it has to a great extent disappeared, but it will take some time.
- 5,973. A very long time do you think? Have you any idea?—I think the feeling has considerably improved of late.
- 5,974. Mr. QUINN: I just want to ask you three or four questions upon these figures of Mr. Mello

Breyner. He agreed that the number of working men available would be 800,000, but being a cautious gentleman, he would prefer to take 750,000, but before he began to cut them up and earmark them, out of that 750,000 he deducts two-thirds. This he does to take into account because of the natural disposition of the native to idleness. We cannot, therefore, get more than one-third of them as being available, that is, roughly, a quarter of a million. Now, what is your opinion of that figure. He takes off from 750,000 two-thirds, or 500,000, and wipes them quite out. What do you think of that?—I think two-thirds must be about correct.

5,975. Then you think that is correct?—Yes, especially for anyone who wants to make a cautious declaration.

5,976. Don't you think he has been over-cautious, if anything?—Not over-cautious. I think if I made the same statement I would rather put two-thirds than less.

5,977. Then he goes on, and says that from this figure we must deduct from 80,000 to 100,000 required for the internal needs of the province, public works, for the municipal services of the towns, for agricultural and mining, for the service of the ports, the coasting service, military service, and various industries, including those for domestic service. For these he takes off 100,000. Don't you think the requirements for the various purposes he has named might be met out of the 500,000 indolent natives who stayed at home, and do not go out? A great part of the labour of the province could be done by these natives, who will not come to the Rand. Now, then, a little lower down he tells us about the plans that are out for constructing three lines of railways. I notice you deal with that. You say that the idea of the authorities that the three railways will reduce the number available for the Rand by 60,000 is illusory, as the three railways will not be built at the same time, and also because they will not employ 20,000 each; and again, because the great majority of these natives will be natives who would never leave the country for the Rand, who will work where they can have their wives near them. Men, in fact, who are fond of home life. Is it a fair argument that the very large number of 100,000 boys who he puts on one side as being required for public works and the very large number of a further 60,000 which he puts as being required for railways, that of that vast number of 160,000, is it not likely that a very large proportion could be obtained from the 500,000 indolent boys who work a fortnight, then leave off and work another fortnight, who as you say prefer to stay by their wives? Is it not reasonable to assume that these requirements would be met to a large extent out of this half million?—Certainly.

5,978. In that case, the balance which he leaves as what he considers the number might be able to draw upon would be greatly increased?—Yes, it would be increased.

5,979. Mr. PERROW: You mentioned just now about the Durban Roodepoort Deep?—Yes.

5,980. You have been on that mine once?—Yes, once or twice.

5,981. You visited the compound?—Yes.

5,982. I think you said you saw 20 or 25 boys in the one room?—I do not recollect the number exactly, but it must have been about that.

5,983. You said the remainder were on shift?—Yes.

5,984. How did you get to know that those 25 boys on shift stayed in the same room?—The compound manager showed me one room as the room in which these boys were staying. He didn't tell me there were other rooms where the boys were lodged. If there was a misrepresentation it must have been his fault.

5,985. Did he actually tell you that the boys on shift stayed in the same room?—I don't remember if he told me anything about that. All I know is

that he showed me the one room and made no mention of any other room as being available for boys of the same gang.

5,986. You left with the idea that the 60 boys stayed in the same room?—Yes.

5,987. The CHAIRMAN: We are very much obliged, Mr. Ferraz, for the evidence you have given. The public sitting is now adjourned till 10.30 to-morrow, Friday morning.

[COPY.]

PROJECT FOR EMIGRATION OF NATIVE LABOURERS FROM PORTUGUESE WEST COAST OF AFRICA (PROVINCE OF ANGOLA) submitted to the Chamber of Mines of S.A.R., on the 2nd September, 1899, by Mr. JOAO IVENS FERRAZ, then Curator of Natives for the Portuguese Government, Johannesburg.

2nd September, 1899.

To the Chamber of Mines  
of the South African Republic,  
Johannesburg.

Gentlemen,—

I have in hand your kind favour of the 14th ultimo, and another letter from your Native Department (The Rand Native Labour Association) dated the 12th ultimo, both notifying your intention of sending an emissary (Mr. T. Erskine) to the Portuguese Province of Angola and Lisbon to try and obtain a scheme for the importation of native labourers from that Colony into this country. As you request my assistance, hereby I beg to express a resume of what I think would be the best scheme to regulate such emigration, protecting at the same time the Portuguese and Transvaal Governments, the mining industry of this Republic, the natives themselves, the commerce of Angola, and not interfering with or going against the agriculturalists of the Island of St. Thome.

I authorise you to hand this letter to you emissary, and him to show it to His Excellency the Minister of Colonies in Lisbon, as proof of my opinion derived from personal experience at St. Thome and Angola, and one and a half years as Curator of Natives of the Portuguese Government in the Transvaal, which opinion I solemnly declare to be most impartial.

A. The Portuguese Government, besides the guarantee it would get by the sanction of regulations by the Transvaal Government, must have the responsibility and promise from that Chamber of Mines, as representative of all the mining industry, of the fulfilment by the different mines, of the conditions of any such regulations. Your promise is highly appreciated.

B. That Chamber of Mines must be the only body to receive the natives recruited from the Portuguese Province of Angola into the Transvaal, and must be strictly prohibited to anyone else to import such labourers. Should other bodies or firms be authorised to import for themselves, no protection nor control would be possible, and the carrying out of the regulations would be a failure. When I say "only that Chamber of Mines" I do not exclude the Rand Native Labour Association, which I consider your branch for native labour.

C. No one must be allowed, within the South African Republic, to engage a native from the Province of Angola, except by the intervention of the Rand Native Labour Association, and all deserters or disengaged natives of that Colony must be handed to that Association, who will give them an employer with the approval of the Portuguese Curator. According to my statistics, not more than about ten natives of Angola exist at present in the Transvaal, and there will be no confusion between them and Kaffirs; consequently, with the above disposition, no one of them will be lost out of sight and control of my office. Should this disposition (c) and the last (b) be omitted, and should everyone be permitted to import Angola natives or to engage the disemployed in this Republic I would

soon lose the control of thousands of deserters, and the Portuguese Government would lose considerably. At the same time, the mining industry will benefit a great deal with this disposition. Supposing, per example, that a certain mine receives from the R.N.L.A. a gang of Angola natives contracted for two years at a price of delivery of five pounds per head, and that one hundred of them desert, the mine will lose £500, for the R.N.L.A., who is bound to receive those natives back, will hand them again or others in substitution gratuitously. You know, many thousands of natives desert every month from the mines here, and the considerable loss it brings.

d. The recruiting operations within the Portuguese Province of Angola need not be exclusively entrusted to the Chamber of Mines, but any one going for collecting labour should be licensed and legalised by the districtal Governors. The natives collected by them should be handed then to the agents or agent of the Chamber of Mines' Native Department (R.N.L.A.) for shipment, these agents paying to them their expenses and commission.

e. The natives, besides being entitled to food, shelter, and medical attendance gratuitously must be contracted for a uniform period of two or three years, not more, and at a minimum salary of two pounds (£2) per month (30 working days). Such salary to be raised according to their aptitudes.

f. After expiry of their time of contract, the natives must be repatriated by the Chamber of Mines or the R.N.L.A., and, to cover the expense of returning the time-expired natives to the port from whence they embarked, sufficient money may be retained from the natives' wages for that purpose.

g. Of the native's wages two-thirds shall be handed to him while on the Rand, and the balance of one-third on arrival at the port of embarkation by the Association's representative on the native landing from the ship. With this disposition the Portuguese Government would be certain that, after two years all natives would commence to go home, each with at least sixteen pounds in gold, and, supposing that every year 30,000 natives would come this would represent an income of about £320,000. This gold income that the natives would spend in Angola, will enter into circulation there and in Portugal, this being important. Besides, it is a use among those natives to spend nearly all their money in purchases in the compound shops of the firms that give them shelter before going to the interior, as they now do, with the proceeds of india-rubber that they sell. In consequence of this, as

the firms that first supply them to the Transvaal will be those that will give them shelter, a great deal of business and profit will be coming to those firms when the natives commence to return home. For the mining industry this disposition will be one more protection against desertion, because the natives will not abandon their capitals.

h. The travelling expenses, passages, etc., must not be deducted from their salaries.

i. While in the Transvaal, the natives should internally be under the same rule and regulations as the natives from the Province of Mozambique, paying the same fees, aggregating one pound per annum when due. Regarding the fee to be paid on leaving Angola, it would also be convenient for the Portuguese Government to substitute the actual passport by a special pass as supplied now on the Province of Mozambique at seven shillings and sixpence, that is Rs. 1,680 in gold.

j. The Chamber of Mines must bind herself to import no ransomed natives, and only to bring free labourers to the Transvaal. The Island of St. Thome gets her native labour supply from the province of Angola (Novo Redondo and Bengualla), but only from ransomed natives, most of them prisoners of war condemned to slaughter by their native chiefs. If the Chamber of Mines does not interfere with such natives the agriculturalists will have no reason to complain of concurrence from the Transvaal. Besides, the cost of ransomed natives would be too high for what the mining industry is supposed to pay.

k. Angola natives must only be sent to where the Portuguese regulations are in force in the Transvaal.

l. Female native labourers can also be imported on the same condition as males, but on a reduced salary.

Among these tribes the women work still harder than the men, and are, indeed, good labourers.

I wish to point out that this scheme is not an exclusive one, because the Chamber of Mines of the S.A.R. is the representative of all the mining industry.

I have the honour to be, gentlemen,

Your obedient servant,

(Signed) JOAO IVENS FERRAZ,  
Curator of Natives for the  
Portuguese Government.

## SIXTEENTH DAY.

*Friday, 21st August, 1903.*

THE COMMISSION SAT AT 10.30 A.M.

The Commission sat at 10.30 a.m.

Mr. M. W. LIEFELDT was called, sworn and examined.

5,988. The CHAIRMAN: You are Resident Magistrate at Willowvale?—Yes.

5,989. Have you before you a statement headed "Statement of Mr. Liefeldt"?—I have, sir:

5,990. Do you hand that in as your evidence-in-chief?—Yes.

The statement was as follows:—

District with which witness is acquainted.—Particularly Fingoland and Galekaland. A fair knowledge of the entire native territories.

Length of time during which witness has known each district.—Thirty-three years.

Character of natives of such districts:—

(a) Usual work.—From home, miners of diamonds, gold, coal, harbour and railway works. At home, agriculturalists, transport riders, grooms, store boys, etc.

(b) Usual food.—Mealies, with milk or Kaffir beer, and occasionally meat.

(c) Usual pay.—From 2s. to 3s. per diem, according to their abilities.

(d) Physique, aptitude, special ailments.—Well-built, strong, and enduring, capable of performing 10 hours' work per day, and, when receiving their natural diet, healthy and without special ailments.

(e) Special conditions, if any, which would induce or deter from willingness to come to Transvaal to work.—Material improvement in railway transport,

and more considerate treatment instead of the present overcrowding in open cattle trucks and unnecessary discomfort, together with difficulty or inability to procure food en route, and responsible native being in charge of each batch of labourers to procure their comforts and to warn them against trespassing, with its consequent ill-treatment. Strict adherence to promises given on engagement with granting of permission to a sick man and friend to return home when desired, and last, but not least, higher salary according to distance from home.

(f) Number available.—In my own district, the annual number of labourers leaving district is 5,000 out of a population of 40,000, or, in other words, 75 per cent. of the able-bodied male population.

(g) Enterprises managed by Europeans and number of natives required for such enterprises.—Farming and stock-breeding, and mechanics requiring about 10,000 natives in connection therewith.

General.—Naturally the native sells his labour to the best market, and as long as he can obtain 9d. per hour at the harbour works over-time, in addition to 4s. per working day of 10 hours paid weekly, it cannot be expected that they will work on the Rand at 50s. per mensem.

5,991. You are acquainted with the districts of Fingoland and Galekaland?—Particularly, but I am acquainted with the entire native territories.

5,992. The native territories of the Cape Colony between the Kei River and the Natal border?—Yes.

5,993. You have a knowledge of these territories?—Yes, I have a general knowledge of the territories, and particularly of Fingoland and Willowvale.

5,994. That knowledge extends over a long period?—Thirty-three years I have been Magistrate of the natives there.

5,995. Do you know the native population of these territories?—I cannot state it from memory. I can make a rough calculation.

5,996. We have the Blue Book here, Mr. Liefeldt?—(Witness examined the Blue Book, and said "I don't think the total population is here").

5,997. Very well, what is your calculation?—Approximately, I should say a million.

5,998. That is the approximate native population in the native territories?—Yes.

5,999. Have you any records showing the male population who leave the territory for work every year?—I have the Blue-book before me, Mr. Stanford has it for the past year as 66,695.

6,000. Who left these territories to work elsewhere?—Yes.

6,001. During last year?—Yes.

6,002. The year ending June or December?—The year ending December last.

6,003. Have you any information showing where they went to work?—Yes, sir. Transvaal, 3,799; Orange River Colony, 754; Natal, 12,289; Capetown, 13,551; East London, 10,252; Port Elizabeth, 3,976; Kimberley, 836; other centres, 21,238; total, 66,695.

6,004. Do you happen to know whether this is a normal year or an abnormal year?—No, I should say it is a normal year. The figures of the current year will be in excess of the figures which I have just mentioned.

6,005. Largely in excess, do you think?—The statement goes on to say that in January and February alone there was a total of 17,864 for the two months.

6,006. Has any special cause been operating to cause the increase in the number who go out?—Scarcity of food, that is the cause. The crops during the past season have not been so plentiful as they generally are.

6,007. Does the failure of the crops, then, usually result in a large number going out to work?—Oh, yes.

6,008. A good harvest would reduce the number?—Yes, certainly.

6,009. Do you know whether the number of 3,799 who left for the Transvaal last year is above the number who used to leave previous to the war?—Speaking without any record before me, I should say it was less than the numbers who came to the Transvaal before the war.

6,010. Much less?—Oh, yes; considerably less.

6,011. Can you suggest any reason why that small number came to the Transvaal?—The principal reason is that better remuneration was offered during the Transvaal war in Capetown harbour works. Prices were raised in order to get labour to facilitate the unloading of shipping, and they had not reduced prices. The prices have kept up, and naturally the native goes to the best market.

6,012. Do you know what the wages are which are paid at Capetown Docks?—At the present time, 4s. per diem for a working day of 10 hours, and 9d. per hour overtime.

6,013. Do the natives feed themselves, receiving these wages?—They feed themselves, yes. De Beers' explosive works pay a little less.

6,014. At Somerset West?—Yes. They take a very large number of our labourers.

6,015. Do you know what wages they pay here?—The average is 3s., but the native can earn up to 5s. per diem, according to his ability.

6,016. Do the natives receiving 3s. per day feed themselves?—Yes.

6,017. If the Rand mines offered higher wages, or as high wages as the native receives at De Beers' works or at Cape Docks, would that attract them?—It would attract to a certain degree.

6,018. Would it increase the total number of natives leaving the territories for work?—Oh, yes; quite so.

6,019. The higher wage being paid here would not reduce the number going to Capetown?—Oh, no; the territories are capable of sending a much larger number than actually are sent; it would not be necessary to reduce the numbers.

6,020. Is any figure given in your Blue Book showing male population, say between the ages of 18 and 45?—I am afraid not.

6,021. You refer in your statement to special conditions which would induce or deter from the willingness of natives to come to the Transvaal to work?—Yes.

6,022. "A material improvement in railway transport, and more considerate treatment, instead of overcrowding in open cattle trucks." Is that one condition?—I may say, since I made the statement I have made it my special duty to inquire along the line, and I find that an improvement has already set in, and that the railway officials have already received instructions not to send natives in open trucks, and not to overcrowd them; so that that within the last week, I may state, has been remedied.

6,023. Are you referring now to natives coming up on their own account, when you speak of this inconsiderate treatment, or to natives being brought up by contractors of the Association?—To natives coming up on their own account.

6,024. It is within your knowledge that the Labour Association, in bringing up batches of boys, sends a white man with them to see to their comfort?—I believe they do, sir.

6,025. Do you see many of the natives when they come back from working in the Transvaal?—I see almost every one in my own district. He has to report himself, or is supposed to report himself, on his return.

6,026. Have you heard any complaints from them as to their treatment here?—Yes, complaints are numerous as regards the treatment here.

6,027. What are the chief complaints that they make?—They complain that in the first place the promises made by labour agents are not kept.

6,028. As to wages, do you mean?—As to wages, and as to the destination where they are to be taken

to. They complain that they are knocked about by the men in charge of them. I have seen a native minus his teeth, and remarked, "How did you come to lose your teeth?" and they say, "This is the treatment we receive up at Johannesburg." I have not specially gone into the matter to find out how far these statements are true, but the statements are made by men returning from Johannesburg.

6,029. Are you speaking of complaints made since peace was proclaimed?—Yes.

6,030. Any other complaints they make?—Well, they complain that they are not able to obtain, not even by purchase, food to which they are accustomed. The food they obtain is invariably kiln-dried mealies, to which they attribute the large percentage of scurvy—the men who contract scurvy during their absence.

6,031. Anything else?—I have already stated that the labour agents, in order to obtain boys to come to the Rand, make mis-statements; that is the greatest grievance which they have. For instance, the other day some Association—I do not know what Association—were getting up a very large number of boys to be entrained at Kei Road; he informed the boys they were required at Burgersdorp, and it was only when they received their tickets that they found they were required for Johannesburg, immediately the boys left. They did not engage for Johannesburg, and they were not going there.

6,032. Do the natives, before leaving your territory for work in the Transvaal, have to be formally engaged in your presence?—No, it is not usual.

6,033. You state that in your district the annual number leaving the district for work outside, I presume, is 5,000?—Yes.

6,034. Out of a total population of 40,000?—Yes.

6,035. In other words, 75 per cent. of the able-bodied male population?—Yes.

6,036. The able-bodied male population in your district would be about 7,000?—Yes.

6,037. Is not this a very large proportion to turn out of a district to work?—Mine is an exceptional area—an exceptional district for turning out labourers. I would not take my own district as an average. I should say that it sends more than any other district of its size in proportion.

6,038. Is there any special reason why it should be so?—I endeavour in sending away the men to try all I can to see that any complaints are evaded as far as possible. The Gealekas since they were conquered, when they were conquered, were very poor, and I think it partly due to what influence I have been able to bring to bear upon them. They turn out more readily than has been the case in other districts. I have been with them such a number of years, and I think I have gained some of their confidence.

6,039. You attribute their turning out to work in such large numbers first to their poverty and secondly to your influence?—Yes, a Magistrate has a great deal of influence over people of his district.

6,040. Mr. QUINN: I think you said Mr. Liefeldt, that the native population is calculated at a million?—Yes.

6,041. Would that be a conservative estimate, and have you any actual figures upon which that is based?—No, it is merely approximately true.

6,042. On the safe side, do you think, or is it a fairly good estimate?—I think so.

6,043. Out of this number of 60,000 odd who go out to different parts of South Africa, the figures you have given us from the Blue Book, you gave us 12,229 as going to Natal. Do you know what special attraction for these natives there is in Natal?—The native territories border on the Natal Colony, and if, of course, labour offered in Natal for men from Pondoland and Kokstad districts, it is so much nearer to their homes.

6,044. Can you tell us what rate of pay they get in Natal?—I cannot.

6,045. You have no idea what it is?—No, I have no idea what it is.

6,046. It seems singular that Natal, with its enormous population of natives should be taking over 12,000 from the Cape Colony?—It is just possible, sir—I do not state it as a fact—the natives we state as having gone into Natal may possibly, some of them, find their way up to the Transvaal.

6,047. What proportion of able-bodied men—you have already answered the query in another form to the Chairman—what proportion of able-bodied males would there be in the million—I mean approximately?—As the lowest estimate, I should say about 250,000.

6,048. That is 25 per cent.—one in four?—I should say one-half of the boys who turn out now would be considerably under 18 years of age; they are from 16 years upwards.

6,049. What is the length of time that the boys usually work?—Three to four months.

6,050. Are they very particular on the score of returning within three or four months?—Ninety per cent. of them do return in that period.

6,051. Then, is it your opinion that whatever chances the Witwatersrand Native Labour Association may have had to obtain labourers from the Colony, those chances have been seriously interfered with owing to the fact that they will not recruit boys for less than six months?—I should say that would have a bearing upon it.

6,052. Witnesses from the Colony and Basutoland and other places all give the same reason as being a very important reason why they will not come, that they will not take more than a three months' contract at once. They will not be forced to work six months?—The native does not care to be six months from home.

6,053. How long do they remain after doing a term of service of three months—how long would it be before some natives would be likely to return for a further period of service? Would they come out again more than once in the year?—It is possible, but not probable that they would turn out more than once in twelve months.

6,054. But I suppose they would be susceptible to inducements? I believe on the mines, in their anxiety to keep the natives there when they get them, at the end of the first period of service, they have offered, and, I believe, are still offering a bonus of several pounds to a native to stop on a further six months. I suppose that would tell?—It would induce some to remain, but they are very conservative, and I do not think would easily break from a rule once adopted.

6,055. Do you know anything of the natives of the other parts of South Africa? I mean by that, this: How would you compare the natives you are talking of and that you know are going to Capetown and getting 9d. an hour overtime, how would you compare these natives as labour machines to East Coast natives or those from the Northern Transvaal?—I have no knowledge of others. It is 9d. an hour for extra time. Ten hours' work for 4s and 9d. an hour afterwards.

6,056. But the fact that they are employed on docks makes them out as being a superior class of native labourer, superior to many other tribes?—I should imagine so, but I think the Colonial native already has the experience, and has been more in touch with the white people, has attained a higher state of civilisation, and has been for a longer period at work. He is, therefore, a better labour machine.

6,057. Then, with regard to what you have said in your statement about the money these natives can earn nearer home, I suppose you can have only one opinion as to the effect of trying to get these natives to work for a shilling a day?—We have to pay more than that, sir. On the present line of railway being constructed to the Transkei, they are receiving 2s. 6d. a day.

6,058. What do you think, as an authority on natives, of that attempt of the mining people, immediately after the war, to substitute a shilling a

day, or shift, for the wages paid before the war?—Was that known in your part of the world and discussed among the natives down in the Colony?—I have no recollection of it.

6,059. What do you think the effect would be—stop them absolutely, I suppose?—Do I understand, sir, that they would receive a shilling a shift?

6,060. The mining people after the war raised the natives' wages. They were getting before the war something like £3 a month. While the war was on the Government then in power reduced them to a very much lower figure, and told them they would have to take it whether they wanted to or no. When the mining people came back they thought it was hardly enough, and raised it again, as they said, to a shilling a shift, which really meant a reduction, possibly an enormous reduction, on the pre-war rate of pay. What effect do you think a wage of that kind would have?—It would stop it entirely.

6,061. The method of pay now. The mines do not pay so much a week or month, as do the farmer or merchant, and most other employers of labour do. They have so much a shift, which makes it appear to the natives that they have to work longer than one month for one month's pay. Are not natives very slow to understand these little ways?—They are very slow.

6,062. And they are apt to look on them as tricks?—That would be one of the deceptions. They would say, "I have been engaged at so much per mensem, and now I have to work so many days more than a month, and it is not a month in my country."

6,063. Do you know anything of the kind of food the natives received here before the war and immediately after the war on the mines?—No, I cannot state that from my own knowledge.

6,064. Nor have you heard it talked of?—Except that since the war that they are not able to obtain the food they could obtain before the war. I believe you are dependent on kiln-dried mealies, instead of the harvest of the country.

6,065. The ill-treatment you were speaking of, when the natives come back short of the ornaments of their front teeth, does it refer to treatment in the mines or by the labour agents who handle the boys?—That was at the mine.

6,066. In the compounds or underground?—I cannot say.

6,067. Is it general or only an occasional happening?—It is this way that the native having his tooth knocked out will spread a report which, of course, becomes magnified each time it passes another one's lips, and by the time it has passed through ten mouths, instead of one tooth, it is 20 teeth that he has lost. Still that is spread. It is the harm that a thing of that kind does.

6,068. To any extent?—No, I do not think so. There have been cases. The question was whether these things would induce the men when they return to induce their friends to go.

6,069. I do not think the state of things is bad in that direction?—I think the native in spreading these reports does so, more in the shape of a comparison. For instance, I may say that it is a common saying with them "while before the war we expected a certain amount of ill-treatment, since the war, under the King's Government, we expected an improvement, but we do not get it. On the contrary, matters have not improved."

6,070. Now, these special conditions; in your opinion, would they to some extent possibly tend to an improvement in the supply, for example, better treatment on the railway on the journey up?—Of course, I merely go on what the natives themselves say. The native, unless he is in charge of some man who has been on the line before, in transferring from one line to another, might, for instance, rush into a ladies' waiting-room. The stationmaster, instead of treating them humanely, brutally turns them out. They are trespassing, I admit, but still there is a way of dealing humanely with human beings, and not treating them as brutes.

6,071. The whole of these little things, not large in themselves, but taken together, if remedied, might reasonably be expected to improve things in a measure. Railway travelling, a further improvement in food, and strict adherence to promises given?—Oh, yes.

6,072. Just one other question, do you think that it would be possible for a far greater number of males in the native territories to come out to work than come out now, without interfering with the supply that goes elsewhere, if the inducements were sufficiently good?—I think so. Very large numbers are lazing at their homes.

6,073. Do they spend much money? I mean does the fact that they are going out to work earning money like that, does it have a tendency to increase their wants?—Yes, certainly.

6,074. To any considerable extent?—It increases annually.

6,075. Can you give the Commission any figures showing the amount spent by natives in the native territories for any year or number of years? Are such figures to be had?—I haven't them in my possession, but the native does not hoard his money. He purchases cattle, if they are to be obtained, but, failing cattle, he spends his money.

6,076. That you have seen from your own observations?—Yes.

6,077. The more we can induce him to work, the better for the native himself, in that it raises his status, creates wants in him, and the better it is for the whole country?—Certainly.

6,078. Any policy that is calculated not to encourage natives to work, but rather to drive them out of places where they now work, to deprive them of work by having the work done by others, if it were done on a very large scale, what would be the effect on the natives in the Cape Colony?—Well, instead of having an industrious native, we would have a lazy, discontented one, and the discontented native might be a danger.

6,079. Trade would also suffer?—Trade would suffer enormously.

6,080. Mr. TAINTON: I do not know if you have this Blue Book before you?—Yes, I have.

6,081. On page 98 there is a return showing the number of natives who obtained passes to proceed to seek work here during the years 1901 and 1902?—No, in the years 1901 and 1903.

6,082. Quite so. The total which left your district is given as 5,506?—Yes, sir.

6,083. How many of that total came to the Transvaal?—Of course, none came to the Transvaal after war broke out.

6,084. I want the number. What is the number there given?—285.

6,085. What is the total population of your district?—40,000.

6,086. May we expect that figure of some 300 to be greatly increased in the near future?—Provided the grievances are done away with; otherwise not.

6,087. What grievances?—Well, grievances that they say they have. To go back to the matter of pay, your salaries, the pay given here is so far below what they can obtain elsewhere and lower than what they receive close to their homes.

6,088. To deal with the matter of pay first. The great majority have gone to other centres?—Yes.

6,089. What wages do they receive at those centres?—From 2s. 6d. to 3s. is the general pay, but up to 4s. and 5s. per diem on the explosive works and particularly on the harbours.

6,090. Would 3s. a day be a fair average?—Yes.

6,091. In order, then, to compete against other centres, we should have to raise the wages here to about £4 a month?—Yes, that was, I think, the rate of pay before the war.

6,092. If that increase in the rate of wages is not given, do you think that we shall be able to get any increase on these figures from your district?—No.

6,093. Suppose that we did raise the wages to £4 per month, what effect would that have upon the total number leaving your district to seek employment?—It would be an inducement to a large number to go out. The works such as the harbours can only employ a limited number. They do not take up all the labour that is offered.

6,094. Are the wages on the harbour works higher than elsewhere?—The rate on harbour works is the highest.

6,095. And at the harbour works there is a surplus of labour offering?—Yes.

6,096. If we raise our wages to the level of the harbour works we would draw the surplus from there. Is that your opinion?—You would receive the balance of the unemployed. I do not think it would affect the number that go to the harbour.

6,097. Do you think that an increase in wages has much effect upon the native at his kraal, that it would induce him to go out?—My reply would be in this way. If a native has been in the habit of receiving or is receiving a certain wage, a similar amount will not induce him to leave home. He is a very patient animal, and he will wait until wages similar to those he has been in the habit of receiving are offered before he will leave home.

6,098. So that we will increase the labour supply by increasing the wages; but if that rate of wages is decreased at any time we should lose the labour supply?—Exactly.

6,099. For an indefinite period?—Yes.

6,100. Do you, then, think it is a wise policy, looking at the great demands of the industries of the country upon the native labour supply, to increase the wages in any one department of those industries as against others?—Except in making an allowance for distance. The native does not like going far from home. The greater the distance, I think, the greater the inducement should be for him to go. For instance, he will work readily close to his home, but it takes him an effort to go far from home.

6,101. Then we should have to increase our wages above those obtaining on the harbour works if we wish to attract labour?—No; I take it that the harbour works and the Rand are about the same distance. The mileage may be different, but to the native it is the same. Both are far from home.

6,102. Can you give us any estimate of the improvement in the supply likely to follow the raising of wages to £4 a month up here?—I should say it would induce at least one-third more to leave their homes.

6,103. You mean one-third on this total of 5,500?—Yes, one-third more than go out at present. The colonial native, I may explain, is not obliged in any way to work.

6,104. How do you mean not obliged?—Well, his wants, his real wants, are so small, that unless the inducement to go out is large he would prefer lying at home. He is a cultivator and an agriculturist. He cultivates his own food, and instead of one member of the family going out to work, the higher wages would induce a larger number of that family. The one member is quite sufficient to pay his tax and his immediate wants.

6,105. We have had the opinion expressed by some witnesses that owing to this fact just mentioned by you, an increase in wages furnishes him with the means to supply his wants more readily than when wages are low, and therefore in the long run high wages mean a smaller labour supply?—I do not agree with those witnesses.

6,106. Can you amplify that answer, and give your reasons?—As I said before, the native does not hoard his money; he spends it, and spends it readily. If he cannot spend it on cattle he spends it at the shop and purchases clothes and implements.

6,107. Is that your answer?—Yes. He does not hoard his money, but will spend it.

6,108. Is it a fact that native labour is scarce in the colony?—It is scarce amongst the farming community only, because the farmer cannot afford the same price as the mines, for instance.

6,109. Do you agree with the opinion expressed by the Chief Inspector of Native Locations for 1892, on page 33—"The demand for native labour is greatly in excess of the supply, or rather the demand is greater than is obtainable. We have natives in their thousands, but the difficulty is to get them to work at all, and when at work to work continuously." Do you agree?—He speaks, of course, of the Colony proper. My remarks allude entirely to the native territories.

6,110. You mean the Transkeian territories?—Yes.

6,111. You have no white population there at all except a few traders?—That is so.

6,112. These natives, I take it, who leave the Transkei, go into the Colony to work, do they not?—Not for the farmers, unless occasionally they do a little shearing.

6,113. You have no knowledge of the position of the labour market in Cape Colony?—No.

6,114. Why do you say, then, that the farmers are short?—Because a magistrate frequently gets applications from farmers in the Colony, but the wages they offer, being so far below what the native is in the habit of getting, all efforts to obtain farm servants are without avail.

6,115. What is the usual rate offering?—£1 to 30s. a month.

6,116. Then the natives in the Transkeian territories will not leave their country for agricultural work if offered?—No, they certainly won't leave their country for a shilling a day.

6,117. Is agriculture more popular amongst natives than mining? Well, of course, it is work he has been accustomed to from childhood. They are agriculturists themselves to a certain degree. Each native has his little herd or troop of stock, and he has his garden plot.

6,118. What is the average age of the men leaving these territories in search of work?—From 16 upwards.

6,119. What is the limit—the upper limit?—Well, it depends upon the man's physical condition; up to 50 or 60.

6,120. Do you find many natives leaving their kraals after 40 years of age?—A large number who do leave are over 40.

6,121. Have you any experience of natives in other parts of South Africa?—None whatever. As I said before, I have been up in the Transkei, and not out of it at all for 33 years.

6,122. I think you said, in reply to another member of the Commission, that the average period of service was not long. What is it roughly?—I said three or four months.

6,123. That would not be the case with boys working in the harbours or on the mines, would it?—Yes.

6,124. Then, if we are to take the labour from your district as a standard, this small figure you have given us of labourers leaving your district for the mines must be considerably reduced. We want to get the year's average of work?—Then you must divide it by four or three.

6,125. That gives about 75 out of a population of 40,000. Don't you think that is rather a serious state of affairs for the industries of the country when you give these people an average of £3 a month, and you only get 75 out of a population of 40,000 for the mines?—It is 75 for the one particular centre.

6,126. They are offered here £3 a month. Don't you think it is rather a serious outlook for such industries as mining when we get such poor results?—I take it by offering a higher wage you will get a larger number.

6,127. That is your remedy—a higher wage?—Well, a higher wage, and, if it is possible, better food. One in ten who return have the scurvy, swollen feet, and other ailments.

6,128. I think, in reply to the Chairman, you gave as a reason for the increase in the months of January and February, the shortness of food in your district?—Yes.

6,129. Has that cause much influence upon the natives in the way of driving them out to work?—Yes; the cause is explained in this way, when there is a shortness of food our merchants have to import mealies from America and Australia, and the native has to purchase his food.

6,130. Then you think that droughts are a valuable auxiliary?—It may be for labour.

6,131. If we had a drought every year we would have a better labour supply?—Naturally; if a man cannot grow his crops he will have to work to get money to purchase imported grain.

6,132. The judicious cultivation of locusts would have the same effect, would it not?—Yes, I suppose so. The fact remains that if a man cannot grow a vegetable he has to purchase it.

6,133. Suppose he can grow it, what happens?—I am afraid, then, there will be a falling off in the number who go out to work.

6,134. To what extent?—Considerable. If a native has a great quantity of crops he wastes a lot of his time in beer drinking and so on.

6,135. Have you had a succession of good seasons in the Transkei of late years?—On the contrary, locusts have been followed by droughts.

6,136. Does rinderpest affect the question?—Of course.

6,137. Then, taking these causes you have just mentioned, they have been more active of late years than usual?—Yes.

6,138. The causes that induce natives to go to work have been more active of late years?—They have been.

6,139. And therefore the supply has been greater than it would otherwise have been?—It is greater than it was before.

6,140. I see that certain magistrates report upon the condition of natives, and a number of them refer to this point, the scarcity of food. On page 23 of the Colonial Blue Book on Native Affairs for 1903, Mr. Orpen, who was Chief Inspector of Native Locations in the Herbert district, Griqualand, says: "The great scarcity of food has rendered it absolutely necessary that every man should work to obtain food for himself and family. The farmers complain of scarcity of labour, but this is entirely due to the high wages paid in Kimberley, and on the river diggings, where any sort of native can earn 15s. a week (some of the location men who have worked for years in Kimberley can earn as much as 50s. per week); so the native naturally goes where his labour commands the highest wage, and I can see no solution of this difficulty, as the farmers cannot afford to pay these high wages unless all the lazy natives who loaf about towns and villages are made to work." Does that agree with your observations?—Yes, I agree with Mr. Orpen.

6,141. On page 55, Mr. W. T. Hargreaves, Resident Magistrate of Elliotdale, says, under the head of Labour Supply: "For many years past the Bomvanas have had good crops, and there has been no necessity for them to seek a living. There are thousands of young men well able to work, but who prefer loafing about the locations, and it was only during the last two months when starvation appeared to be staring them in the face that numbers of them obtained passes to seek work. Since the rain has fallen and the crops begin to look well the desire for work has abated somewhat." These two quotations seem to show a very intimate relation in the minds of those gentlemen between the condition of the crops and the labour supply. Do you agree with that?—Yes, I quite agree with it, but I would also

like to state that with the exception of the Pondos they are a very raw native Mr. Hargreave has to deal with.

6,142. Suppose you had a succession of good crops, do you think high wages would induce many natives to go out?—Well, I will put it in this way, that the worse the crops the larger the number of natives who go out. The number of natives taking to work, I think, are increasing annually. In a few years these same Bomvanas in Mr. Hargreaves' district will turn out in larger numbers. A few years ago I do not suppose a single Bomvana went out to work.

6,143. What do you mean by a few years ago?—I don't think a single Bomvana ever worked upon the Kimberley mines, whilst other tribes have been at work ever since the mines opened.

6,144. There is some increasing cause driving them out in greater numbers every year. What cause is that?—There are certain tribes who never went out of their country. Very few Pondos, for instance, at present leave their country. It is only within the last twelve months that a few have been obtained to leave their country for work.

6,145. Can you give us shortly what are the compelling causes which are driving the natives out to work?—The influences, as I told the Chairman before, of the magistrate and the Europeans in their country; and then the wants arising from locusts, rinderpest, and the present drought have also forced them to go out.

6,146. If I understand you correctly, after you supply these wants of food and so forth the causes cease, and the native remains in his location. I want to get at the additional factor which makes the Bomvanas go out in increasing numbers every year, independent of seasons?—They are acquiring more and more European habits, and a greater quantity of clothing is purchased. He also purchases ploughs instead of hoes.

6,147. Generally, then, they have a greater need for money?—Yes.

6,148. Must the industries of South Africa wait until the native has been educated up to need more money before we can solve the labour question?—A native requires to be educated to work, and he is becoming more educated every year. In former times the large tribes never supplied any labour at all.

6,149. How long has the Transkei been opened up? How long have the natives been in contact with Europeans?—The different tribes at different periods. The Fingoes have been under our rule for the past 35 years, the Pondos only within the last four or five years.

6,150. Leave out the Pondos, as they are an exceptional case?—They were the last to come in. The different tribes have been coming into contact with Europeans between the last 5 and 35 years.

6,151. Did not the Fingoes come under colonial rule in the early fifties, or even before?—Yes, into the Colony, but they have returned from the country to the Transkei in the last 35 years.

6,152. They have been under our rule for the past half-century?—Yes.

6,153. Don't you think, then, that this demand, this need for money, is increasing very slowly amongst the natives?—No, I don't think so. The expenditure of their money is much larger in later years. They are spending a great deal more now than they did in former years.

6,154. Do not look so much at the aggregate amount. Take the amount spent by individuals. Do you find much difference in their individual expenditure?—In former years, as long as a man had his 10s. for his blanket and 10s. for his tax it was all he required. It is not so at the present time. He now pays 20s. for his boots alone.

6,155. If you turn to page 76, Mr. Leary, the Resident Magistrate of Mount Ayliff district, under the heading, "General," says: "The natives seem

to be contented and happy. They have up to the present had a good food supply, plenty of beer, and their stock has increased. Owing to the high prices offering for all kinds of stock, there is little or no inducement for natives to work. They can sell a goat for 20s., and this provides them with hut tax and blanket for a year. When it is taken into consideration that goats are prolific and do well in this district, it is not surprising to see that few natives go out to seek employment." Do you agree with that opinion?—I should say this must be an exceptional district if he finds that the sale of a goat will comply with all the requirements of the natives.

6,156. What district is the N'dabeni location in?—I think it must be in the Colony proper; it is not in the territories.

6,157. Perhaps I will find that reference later. Another subject I would like to ask a question or two on is this: On page 8, under the heading "Working of the Proclamation," based upon the Glen Grey Act, it is said there that the people appreciate the benefits to be derived from the form of local self-government offered by that Act. Is that your experience?—I believe it is. The Glen Grey Act does not operate in my own district yet, but I understand that is the case.

6,158. I see lower down it is said the remedy for dissatisfaction upon the general survey of land, and the introduction of individual tenure, so that the removal of grievances is merely a matter of tenure. Does one of the provisions of the Glen Grey Act relate to individual tenure?—The Glen Grey Act, where it has been recently extended by Proclamation, does not embrace all which the original Act did, and the survey of locations, I think, is limited to the district of Glen Grey itself, and Fingoland.

6,159. The object of that Act was to bring pressure to bear upon the native to make him work—that is one of the objects?—Well, the labour clause was.

6,160. Can you give us any recent evidence as to the working of the clause, as to the opinion rather of the working of the clause?—Of the labour clause?

6,161. Yes?—Whether it is due to the clause having been inserted in the original Act, I am not able to say, but at present the number of people who do work seems to point to the fact that there is no longer any occasion to have it in the Act, as it is causing a good deal of irritation, preventing a large number of natives from voluntarily coming under the Act.

6,162. What is the amount of the tax imposed upon the labourers not working for Europeans?—10s.

6,163. Has there been any report by a Committee of the Cape Parliament upon the subject lately?—There has been a report, I believe.

6,164. What was the tenour of the Committee's report upon that clause?—That the clause should be deleted from the Act.

6,165. For what reason?—Principally because its presence was preventing the Act being extended voluntarily to other tribes. Before the Act can be placed in force two-thirds or a majority of people have to ask for it, and as long as the labour clause was in the Act the native was not fool enough, I was going to say, to ask for its extension to his own particular tribe.

6,166. Then, dealing with the labour clause, was the clause effective in driving out people to work?—It had the effect of causing a good deal of irritation. It might have induced to a limited extent people to go out to work, but its general effect was that it acted as an irritant.

6,167. I am asking this question to see whether it is advisable to introduce that experiment here. Can you give us any opinion of the result of that experiment that would be of assistance to us?—The wish of the Government is to extend the Glen Grey Act as far as possible to all native tribes, but if the Act contains a clause which, as I have said before, acts as an irritant, it does not induce people to come voluntarily forward and ask for the extension of the Act.

6,168. I am now dealing with the labour clause; leave out the other provisions. Take the labour clause. It was an experiment directed to the end of inducing natives to work. Can you give us from your experience any evidence which would be of assistance to us in determining whether we should introduce that experiment elsewhere in South Africa? Was the labour clause effective, and did it make natives work?—It probably did, but the evils when compared with the good—well, the balance seems to be on the wrong side. I do not know how I can express it more clearly than that. The native did not like the form in which the clause was introduced, that was because if he did not go to work he was liable to be imprisoned.

6,169. I suppose he did not like the imprisonment?—No, of course not.

6,170. You cannot very well have a clause of that character without some penalty attaching to it?—No, of course not. It would be useless to have a law unless you can punish for infringement.

6,171. I would like to question you upon the other provisions of the Act. Do you agree with the policy of placing the natives upon separate plots of land, giving them individual tenure?—That would have a greater beneficial effect upon the labour question than the actual labour tax. Because the ground is limited, and the native who has no plot of land would then be forced to become a labourer for the rest of his life.

6,172. That was one of the objects behind this legislation. It was to force the surplus natives into the labour market?—Exactly.

6,173. Suppose you carry out the Act and give individual tenure in any one native district in the Transkei, would there be any considerable proportion of natives not on the land who would be surplus natives?—Yes, they are increasing at such a rate.

6,174. Then this labour experiment would place one section of the natives upon the land, and deprive the other of their land?—It would make a certain proportion of them small agriculturalists, and they would advance according. The native will work upon his own piece of ground where he has his title, much more than if he held it under tribal tenure. It forces out labour because the ground is limited, and those who are unable to obtain land must go into the labour market.

6,175. Take the section that is on the land first. One of the provisions entailed these areas or small plots of land upon the owner who originally obtained it. He cannot deal with it?—He cannot alienate.

6,176. It introduces the principal of entail?—Yes.

6,177. Take the other section, the surplus native, what becomes of him?—He is forced out to work.

6,178. Forced out of the locations?—Under tribal tenure the arable land is limited. The native who is in a position to pay for the survey expenses and such-like, obtains his ground, but the lazy one, the one that has no property or means, is thereby forced to leave the location, and go elsewhere and make his living by working.

6,179. Do you think the tendency would be to force him into the towns and centres of industry?—It must.

6,180. If I understand you correctly, this act creates, as to one side of it, a large number of black peasant proprietors upon entailed estates, and the remaining natives become either workers or vagabonds in the town locations. Do you think that is a good policy?—It improves the man on the land; he becomes a small farmer. He will enclose his ground and erect a better and more substantial building than a common kaffir hut, but he will plant trees and such like, and supply the market.

6,181. He becomes, in fact, a small peasant proprietor?—Exactly.

6,182. Then, as an agriculturalist, he will come into competition with white agriculturalists, will he not?—I think there is plenty of room for both to exist. The native would only cultivate a little more than his actual requirements.

6,183. The tendency is to make him an agriculturalist and withdraw him from the open labour market?—It would withdraw him from the labour market, because he is supposed to be constantly at work upon his ground, improving it, and building a house.

6,184. In your experience, does the native improve when he is brought into contact with European centres; do you think that living in or loafing about a town location makes him a better citizen?—Personally I have no experience. I do not suppose that socially he is improved by living in the town locations. Still, there is the fact that by having him in locations he is available for work.

6,185. The Bloemfontein Conference, dealing with this question, made the suggestion that the provision of such locations about the towns should be encouraged with a view to settling the labour difficulty. The tendency of the Glen Grey Act is in the same direction, to create native locations about the town?—Your question was, did it improve him socially?

6,186. One of the resolutions of the Bloemfontein Conference was, that in order to improve the labour supply, it was desirable to form locations of natives in the neighbourhood of towns. The Glen Grey Act, according to your experience, also tends that way?—Yes, exactly.

6,187. Do you know anything of the general opinion in South Africa as to whether this town life improves a native?—I think that the general impression is that socially he does not improve.

6,188. So far, then, as the Glen Grey Act is successful in driving surplus natives upon the market, an exception must be taken against its success that it causes social deterioration amongst the natives?—A proportion of them. It improves one-half, and deteriorates the other.

6,189. Mr. PERROW: You said the natives complain of being badly treated upon the mines?—Yes.

6,190. Is it from hearsay or from your own knowledge?—It is merely a report spread by the discontented native who returns from the mines.

6,191. You mentioned about an overseer knocking out the teeth of a native?—Yes.

6,192. Are you aware that natives fight amongst themselves?—Yes, I know they had faction fights.

6,193. I think there is a mine manager and a compound manager on each mine, and I don't think any boy is allowed to be touched. He would be dismissed at once?—I don't mean to say that the mine manager himself strikes the boys. I mean the ganger who is under the compound manager.

6,194. It is very hard for an overseer to be blamed for what boys do themselves?—This report was spread, but how far it is true I have no evidence.

6,195. You have no proof except from the native himself?—I have no other proof. I merely state this as one of the reasons given by the discontented man who prevents his relatives and others going to work.

6,196. Mr. BRINK: You said farm labourers are scarce in the Cape Colony?—Yes.

6,197. You also say that farmers cannot afford to pay the present wages ruling now?—Yes, the wages paid by the mines and public works.

6,198. Now, your suggestion to this Commission is that by still increasing the present wage we might possibly draw a larger supply of labour to the Rand. That was your suggestion?—Yes.

6,199. Have you any other suggestion to make to the farmer? Where is he going to get labour from?—I am sorry to say I have not.

6,200. You see the difficulty we are in?—That is what I want to put to you.

6,201. Mr. PHILIP: You consider the population of the Transkei territories to be about a million?—Yes.

6,202. In your own district you have about 40,000?—Yes.

6,203. You gave us the figure of 5,000 as being 75 per cent. of the able-bodied male population?—Yes.

6,204. That is 1 in 7?—Of the total population.

6,205. Is it not a rather high percentage?—As I told the Chairman, in my own district the supply has been larger than from other districts.

6,206. I am not talking about supply. I am talking about the actual number of able-bodied men compared to the total population?—That is not a large number.

6,207. I think you mentioned, in answer to Mr. Quinn, that out of a million population there were available for work 250,000 able-bodied men?—Yes.

6,208. That would be a quarter?—In my calculation I had to allow for a tribe like the Pondos, who have recently come in. You would not get so large a proportion of labourers from them—not as many as from those tribes who have been in civilisation longer.

6,209. That is not an answer to my question. According to you, in your district 1 in 7 are males able to work. Out of the total population you give 1 in 4 as able to work. Is not that a wrong figure? If you take the basis upon your own estimate in your own district, it will be 142,000 available instead of 250,000?—I don't think so.

6,210. If you take a seventh of a million, it will be 142,000?—I take my own population as 40,000. We have 29 districts, but some, of course, are considerably smaller, and if we multiply 40,000 by 25, leaving four districts out altogether, you get a million.

6,211. Yes, according to your calculation, but one half of the population would be females?—Yes.

6,212. More females than men?—Yes.

6,213. What percentage do you allow for children?—You could not possibly get more than a seventh able-bodied men, and that is 142,000.

6,214. The CHAIRMAN: Before you go any further, may I draw your attention to page 87 of your Blue Book. There you are given a definite figure to go on. You will find the total Bantu population in the Transkeian territories given as 839,371 for 1902. If you make your calculations on that it is something definite to go upon.

6,215. Mr. PHILIP: Well, taking those figures, on your calculation of 1 in 7 it would give 120,000 able-bodied men. The Blue Book allows 1 in 8, which gives 100,000 roughly?—Taking all districts together, 1 in 8 would be a fair average.

6,216. That would give you 100,000 available for work?—Yes.

6,217. You say that 66,000 go out every year. That is last year's number?—Yes.

6,218. You state that these men only go out for three or four months, and that they very seldom go out a second time?—Yes.

6,219. Only a few go out a second time. So far as we can judge from your figures, considerably more than one-half of your men go out every year, and if you divide 66,000 by four, it will only give us 16,000 available men for the whole year. Is that not so?—Yes, taking every eighth individual as an able-bodied man.

6,220. That really will give you 105,000 men?—Yes.

6,221. 66,000 of these men actually go out now?—Yes, and that leaves another 39,000 to go out.

6,222. Well then, it really comes to this, that as they only go out for three or four months, you cannot get more than 25,000 men taking the whole year through?—That would be on the basis that you take.

6,223. How many men will require to remain at home to look after the tribal affairs and generally attend to the agriculture round the location?—Well, as the men are only away for four months at a time, the balance will be at home—there would be more than one-half at home.

6,224. But there are 66,000 out?—Yes, but only for three or four months.

6,225. From which tribes are most of these men recruited?—Fingoes, Gaikas, Galekas.

6,226. Which are the principal?—The Fingoes.

6,227. Can you give us any figures?—I am sorry I cannot give you any figures from memory, but I will be able to supply you with them.

6,228. What are the wages at East London?—2s. 6d. at the docks.

6,229. Does Kingwilliamstown get its supply from the Transkei?—Kingwilliamstown-Transkei section are employing a number of Transkei natives. That should not be so, as Kingwilliamstown has a very large number of available men itself.

6,230. Mr. EVANS: Can you tell the Commission to what extent wages have increased in your time?—The only labour at first was at the Kimberley Mines and on the Colonial Railways. Wages have increased from £3 per mensem to £5 at present.

6,231. Would that include food and shelter?—The natives were receiving originally £3 from the Kimberley mines, and on an average 2s. a day on railway works. There was no shelter provided on the railway works.

6,232. How far back would that be?—The last ten or twelve years.

6,233. You do not go back further than that?—If you go back further than that the pay per man seldom exceeded 1s. 6d. per day. That was then considered good pay.

6,234. Is the present rate the highest that has existed so far?—Yes.

6,235. On page 38 of the Cape Blue Book on Native Affairs for 1902, the Chief Inspector of Native Locations states: "The question of a labour supply for this Colony (I am not now referring to a supply for the Rand) is a most serious one, and is of very much more importance than many of the questions exercising the minds of our legislators, for unless the farms of our Colony can obtain sufficient labour to carry out the necessary work on the land a very large number of farms will be thrown out of cultivation altogether, whilst many others will only be partially cultivated, thus reducing the food supply." Do you agree with that opinion?—Yes, I entirely agree with it.

6,236. Having regard to that state of affairs, do you consider that high wages at the ports, on the mines, and in Natal are in the interests of Cape Colony?—Not of the farming interests certainly.

6,237. Is not that the most important industry in the Colony?—Yes, farming is supposed to be our backbone.

6,238. Do not you think that the insufficiency of labour for agricultural purposes may, if it continues, lead to the adoption by the Cape of a similar law to that in operation in Natal for prohibiting recruiting for outside altogether?—I think the solution of the question is, as I told Mr. Tainton, the extension of the Glen Grey Act, by which you force a number of people out of their locations to work. If the Glen Grey Act is extended universally throughout the Colony the surplus labour will be so great that the farmer will get a full supply.

6,239. Can the farmer wait for that?—Well, the extension of the Glen Grey Act, unfortunately, is based upon the principle that it should not be forced upon the natives, but that they should accept it of their own free will. There is no reason why its extension should not be universal within the next twelve months.

6,240. What are the conditions to make that feasible. How will you induce the native to accept that Act of his own free will?—By taking that Act which has been in operation in some districts, and removing from it any clauses which may be a source of annoyance to the natives. You will get the native to avail himself of it if he sees the benefits. It has been an experiment, and experiments, as time goes on, show what portion ought to be cut off and what improvements made.

6,241. In your opinion are natives likely in large numbers to agree to come under that Act?—They are coming under it very rapidly at the present time throughout the Transkei.

6,242. To what extent will that affect the labour supply within, say, the next five years?—It will affect it in this way: after the survey of the plots of ground, as is being done at present, is finished, the balance of the natives will be forced into the open labour market, because there will be no room for them. The man who can manage to enclose his ground will be able to live on the land, and the one who is not able to obtain his plot of ground will be forced out to work for a living.

6,243. But that process of forcing out will it not be a very slow process?—No, the one follows upon the other immediately the extension of the Act to a district is put in force. Of course it will take a number of years before we have the full benefit of it.

6,244. Do you consider that that would effectually solve the difficulty of the Cape farmer?—It must, because it throws so many more men who will be dependent for their daily food upon their labour. They must become labourers.

6,245. In your opinion a sufficient number would be forced out to work by the operation of that Act to supply all the needs of the farming community of the Cape Colony?—Yes.

6,246. How long will it take to supply that need in the manner you suggest, how many years?—The extension of the Glen Grey Act is at present proceeding very rapidly. Within the last three months it has already been extended to six or seven additional districts.

6,247. Can you give an expression of opinion as to how long it will take to meet the Colonial demand for labour?—That is so very dependent upon other matters. For instance, the survey of an entire district into individual plots is a very slow process; it will take at least two or three years.

6,248. Supposing we take it at five, will the farmers, do you think, have sufficient labour at the end of five years?—I see no reason why they should not. The labour will be there.

6,249. Has the Glen Grey Act had any effect in helping the farmers? Has not the labour all been absorbed by other employers?—Well, the process as yet has been very slow. Hitherto, in addition to Glen Grey itself it has only operated in Fingoland. This comprises several districts, including Tsomo, Nquankwe, Butterworth, Centani, Idutywa.

6,250. A report was published here that the local traffic at East London in June was congested owing to the scarcity of native labour. Do you know whether that was so?—I don't know whether it was so.

6,251. Do you think it is likely?—No.

6,252. You do not think so?—No.

6,253. In your opinion, they had an ample supply there?—The supply was there. They could not obtain work elsewhere.

6,254. We were informed by Mr. Sloley the other day that the Cape Government Railways were recruiting in Basutoland. Can you tell us why they go to Basutoland, seeing that there is such a large native population in the Cape territory?—I was not aware of that fact.

6,255. It was given here by the Commissioner of Basutoland the other day in evidence?—I did not know that it was so.

6,256. You are acquainted with the report of the Labour Commission which sat in the Cape Colony in 1893 or 1894?—I may have glanced through it at the time, but I am sorry to say I have no knowledge of it at present.

6,257. Amongst their conclusions was the following:—"The want of available farm labour is acutely and increasingly felt in the Western Circle, Worcester, Malmesbury, Piquetburg. Statements received to the effect that several thousands of labourers could be absorbed in that area appear to be well founded, and are strongly supported by evidence of farmers, describing their periodical

wants, difficulties, etc." Then they go on to say:—"The Commission finds that the supplies of other labour within the same area are not adequate." Now, in your opinion, has this insufficiency of agricultural and other labour become worse since this Commission reported?—I don't think that the districts mentioned there are any better off for labour to-day than they were then. The districts mentioned would prefer, I take it, to have families living with them for years as farm servants; that is what the Colonial native labourer does not do. There a young man goes out to work, but does not take his family with him. The family he leaves behind to keep up his home. So long as he can find a roof and a home in his own country he won't go out as a farm labourer.

6,258. Supposing they increased the wages?—The native is so thoroughly attached to his home and his tribe, and taking his family away to him seems a severance from his tribe. It is like taking away a member of his family.

6,259. But don't you think these farmers would accept the labourer without his family—would be very glad to have him?—Then we come back to the fact that the native would only absent himself from home three or four months, and that does not suit the farmer at all. He wants a permanent servant.

6,260. Is that the most that one can get from these labourers?—As I stated this morning, the native does not leave his home for more than four months, taking it as a general thing.

6,261. How does this explanation apply to the position which was stated at a meeting of the Western Province Agricultural Board, where Mr. Merriman presided? At that meeting, which was held on the 22nd June last, they resolved to call the Government's attention to the fact that the scheme for the importation of Italian labourers had failed, and they expressed a hope that an increased vote would be passed by the House for the purpose of importing suitable agricultural labour from any part of the world. Does your explanation also apply to the scarcity from which these people are suffering?—What is the district?

6,262. The Western Province Agricultural Board. They are evidently very short of labour, and I am asking whether your explanation also applies?—Oh, it would apply in that case also, yes.

6,263. Though they prefer families, would they not like single men for three or four months?—Yes.

6,264. Now, coming back to what we were dealing with this morning, am I correct in assuming that it is your opinion that the operation of the Glen Grey Act will in the near future solve the difficulty of the Cape farmers?—Yes.

6,265. That is your opinion?—Yes.

6,266. Have you any idea of the requirements of the Cape farmers?—I take it they require labourers in the garden and the vineyard, and they require women also for work such as washing. That is why I say they would rather have families to remain with them.

6,267. Have you formed any estimate as to the probable number of labourers they would require?—Doubtless the number of families who could be drawn into labour of that kind would be enormous.

6,268. Have you any figure in your mind at all—have you any rough estimate of any kind?—No, I cannot say that I have any figure in my mind, but I take it that each and every one of the farmers of the Western Province could employ two or three or more families on their farms.

6,269. Have you any idea how many farms there are?—I have not.

6,270. Have you any idea how many additional native labourers will be forthcoming as the result of the operation of the Glen Grey Act?—My reply to that would be that the farming population in the Colony would pretty well absorb that surplus.

6,271. I should like to know on what you base your opinion. Have you any estimate in your own mind as to the number required and the probable number likely to be available as the result of the

operations of the Act?—I can only gather it in this way—that the land is naturally limited. If you subtract from a family a certain number and give them ground, so far as the ground goes, you must necessarily then have a certain surplus. Say you take the two oldest brothers, if the ground is to be split up into allotments we have not ground to give to the entire family, although the ground may suffice at present, living in locations under tribal tenure, if you cut it up and give each man 20 or 30 acres, you will find you have a good deal larger surplus of natives than you have ground for.

6,272. What I want to get is a rough estimate of the surplus?—It would only be a very rough one. But, say that sufficient ground is found for three brothers, then one quarter would have to go.

6,273. Then let us see. I think, in answer to Mr. Philip, you accepted Mr. Stanford's estimate of the able-bodied men available from the Transkeian territories for 1902. You will find it in the report on page 47?—Yes.

6,274. You see, Mr. Stanford says: "The approximate population of the territories is 800,000, and taking one in eight as a fair average, 100,000 is arrived at as the approximate number of adult males capable of manual labour." He goes on, "From this must be deducted those men engaged in working at their own houses in the care of their families, stock and cultivated lands, carriers on their own account, those engaged as drivers or leaders by European carriers, and workmen and servants in towns, and on private farms." Now, how many of these 100,000 natives do you think would be available as the result of the operation of the Act? I would point out to you that 66,000 are already working outside the territory, so there remains 33,000 out of 100,000. Out of that 33,000, you must remember you have to provide for those men engaged in working at their own houses, in the care of their families, stock, and cultivated lands, carriers on their own account, and those engaged as drivers or leaders by European carriers, and workmen and servants in towns and on private lands, farms, and so forth. What figure can you arrive at as a probable result of the operation of the Act, taking these figures into consideration?—A large number of these men who figure now as labourers, of course ground could not be found for them. It would reduce the number by the medium of the ground, and the number sent out would of course be greatly increased. You would have to take out of the present number of our workmen a number of those who would be homeless and add those to the 33,000, which would reduce the 66,000 to practically 33,000.

6,275. But the 66,000 are working?—Yes.

6,276. Then if you reduce the number working, you must provide for them in some way?—That is what I say, you would add that number to the 33,000 who are not at work.

6,277. But that 33,000 you see, as Mr. Stanford points out, must be doing a certain amount of local work. These will have to be deducted?—The effect of reducing the population would throw a number of these men mentioned by Mr. Stanford out of employ. At present under tribal tenure every man is working on his own ground, whereas after the introduction of the Glen Grey Act the number of these men mentioned by Mr. Stanford as being employed as agriculturalists would have no home or anything else.

6,278. That is out of the 33,000—how many do you think?—The greater proportion of them I should say.

6,279. Say, 20,000?—I should think about that.

6,280. You have 66,000 working outside the territory already. Add to that 20,000, that makes 86,000. Is 14,000 all that would remain in the whole of the territories of able-bodied men?—The 66,000—I do not know whether I explained myself sufficiently this morning—are only working for a matter of four months, and they come and go. 66,000 are never at any one time absent from their homes. As one brother returns another goes out to take his place.

6,281. What addition to the 66,000 that are absent, say, for three months, would the further operation of the Glen Grey Act produce?—Most of the balance of the figure remaining.

6,282. That is 33,000. Now, can farmers afford to pay the high wages which are being paid for railway construction, for mining, and for work on the coast ports?—No, sir, they cannot.

6,283. Then do not you think that this balance of 33,000 which may become available under the operation of the Glen Grey Act might be absorbed, and most certainly would be absorbed by the mines and railways?—Yes, I suppose a very large proportion of them would be.

6,284. Owing to the high wages?—Owing to high wages.

6,285. Then what becomes of the farmer?—I don't know how the farmer is to obtain his work if he does not pay the same salary. He does not get the native. The native does not work. It does not assist the farmer.

6,286. You expressed a definite opinion this morning, I think, and you reaffirmed it just now, that the operation of the Glen Grey Act is in the near future to solve the labour difficulty, and the Cape farmers. I should like to have that explained if it can be done?—The only explanation I can give is this, that the native being forced out of his territory owing to the land being insufficient, he would then be compelled to seek labour, but if there are two labours offered, if he can get a certain price from the mines or from the railway construction he will not give his services to the farmer. Still the effect of the supply will be if the supply exceed the work, then the farmer gets his share.

6,287. So that if the additional requirements of the Rand, of railway constructions, and of the coast ports exceed 33,000, the farmer can get nothing?—From the territories, no.

6,288. So that your opinion expressed this morning is subject to that qualification?—Yes.

6,289. You are acquainted with the resolutions arrived at by the Bloemfontein Conference?—No; I have glanced through them.

6,290. I will read to you the 8th resolution: "That this Conference, after considering all the available statistics and hearing the reports of the highest official authorities of the several States, has come to the conclusion that the native population of Africa south of the Zambesi does not comprise a sufficient number of adult males capable of work to satisfy the normal requirements of the several Colonies, and at the same time furnish an adequate amount of labour for the large industrial and mining centres." What is your opinion of it? Do you agree with it?—Yes, I must agree to it.

6,291. Mr. DONALDSON: In the former part of your evidence this morning you said that in 1902, 4,000 natives left Cape Colony to go to the Transvaal. I think the exact figures you gave were 3,799?—Yes, I think those are the figures.

6,292. That is not the number recruited specially for Johannesburg or by the Witwatersrand Native Labour Association, is it?—That is the total for the Transvaal. We do not classify beyond the fact that natives obtain passes to go to the Transvaal as distinguished from other labour centres. It does not necessarily mean the Witwatersrand.

6,293. Do you know what proportion of the number were sent up by the agents of the Witwatersrand Native Labour Association?—I cannot say, because this is the total for the territory.

6,294. Would you imagine that the Association, through its agents, sent up half the labour which comes here—or more or less?—They doubtless employed local agents in the Transkei, so it is impossible for me to form any idea who these different agents were working for. We had local agents for the territories.

6,295. But from your knowledge of the natives in your district, in the districts that you know, what proportion of them come to work at the

mines as compared with those who come up here for other purposes?—I can only confine my reply to my own district, and I can only say—none.

6,296. Considering the counter attractions and better pay offered by the Colonial ports, do you think it likely, that for the mines we may expect 13,000 to 14,000 here in the course of the year?—By additional pay?

6,297. No, at the present rate of pay?—No, I am surprised that you get any at all.

6,298. Why I asked you is because that was the estimate given by the Chief Recruiting Agent of the Witwatersrand Native Labour Association. He said for six months 1,500 a month, and for another six months 800 a month, making a total of 13,800. From your knowledge of the native, do you think that estimate is very much over-estimated?—Exceedingly so, at the salary.

6,299. Mr. GOCH: I notice in the Blue Book published on native affairs, 1903, three sections into which this territory is divided, giving a total population of 1,053,000. Is that correct? Take the three sections. You get a summary on the first page, and again on the fifth page and the sixth?—In the absence of any census, the totals given by the Chief Magistrate are taken from the numbers supplied by the various magistrates. These numbers, in the absence of any census, any data to go upon, are as near correct as can be obtained.

6,300. Do you think the estimate given by Mr. Stanford would be a proper portion to arrive at the adult males capable of manual labour? Do you agree with it being about a correct estimate?—Yes.

6,301. Then, in the whole of these territories there are only 131,700 male adults capable of manual labour?—In accordance with the figures, yes.

6,302. Mr. Stanford pointed out that the Transvaal took 18,302 labourers from the Transkeian territories in 1898. Then he says that, owing to the reduction of wages here, they did not go to the Transvaal. He practically states that, and he notes that it fell from the figure in 1898 to 3,799 in 1892, and he ascribes that to the reduction of wages. He gives, in proof of that theory, that in the first two months of 1903, the numbers increased to 2,227 in January, 2,247 in February, and apparently assumes that that rate will be continued. But we find, as a matter of fact, that we have to-day only 11,800 employed here from the Cape Colony now. So that the increase of wages, which has been in force here since the beginning of the year, since February, has evidently not had the effect of bringing back to us the labourers that we had before. Do you think that we are likely to get the 18,000 back again?—The markets for labour, of course, are more at present than they were in 1898. For instance, there are railways in construction in different parts of the Colony, which are absorbing a large quantity of labour. And I don't think that the native looks at it through these spectacles—that the £2 10s. he receives is an increase. In his own mind, he thinks of the £3 or £4 he was paid in 1898, while he only gets 50s. per month, although it may have risen slightly.

6,303. He has got plenty to do in the Colony?—He has at present a good deal to do in the Colony. I may mention that the Transkeian railway itself will absorb a great portion of our labour.

6,304. So, for our purposes, we need not expect very much from there?—No, I can only say it becomes a question of which is the best market. If you can induce him to leave our railways, to leave our 2s. 6d. a day, you may get a few more, but I cannot hold out any hope that you will get a very large proportion of these Transkei natives if work can be found at home.

6,305. We shall probably have to offer £4 per month if we want to get them?—I don't think you would get him for that.

6,306. He would leave your work for that?—Then the thing would work the other way. We probably would not employ all, and the £4 would be a greater inducement for them to come out than 50s.

6,307. If we were compelled to offer £4 it would disorganise your labour, would it not?—No. I would not go so far as to say that, because a number of them would work for us during the remaining eight or nine months they were not working for you.

6,308. They would come here for three months?—They would come here for three months, but at their own homes there is no reason why they should not work six or eight months. They would also be close to their homes, and they would naturally be ready to go back to work.

6,309. Mr. WHITESIDE: Were you aware when you answered, I think it was Mr. Evans, that you agreed with the resolution of the Bloemfontein Conference? My question is this. Were you aware that they came to the decision that they did when they had no actual figures or statistics before them?—No, I was not aware that they had no figures.

6,310. That is the case. Do you consider that one in eight is a fair estimate of the adult male population—that that estimate is unsupported by facts or figures?—Yes, from my knowledge of the native, one in eight gives the able-bodied men.

6,311. But this morning you told us that it was one in four?—Pardon me, I think not.

6,312. When the Transkeian Railway is completed, will it not release a large number of natives for other works?—Yes.

6,313. Is it not the case that, with fair pay and good treatment, a very large number who do not at present work would be induced to go out?—Certainly.

6,314. Mr. TAINTON: I was not able this morning to find the report on the N'dabeni location. Turn to page 94. This location has been established on the Cape Peninsula in close proximity to Cape Town, and under the provisions of a new Act. The resolution of the Bloemfontein Conference apparently refers to this Act when they recommend that similar locations should be established at other urban centres. At the bottom of page 95 in the inspector's report on the condition of the location, under head of "crime" he says: "the magistrate will be better able to report on this matter than myself, but, judging from the number of prisoners that I see marched up to this office each morning, I think the crime is more prevalent amongst the natives of Cape Town than in any country district that I have had supervision over." Is that, do you think, an exceptional result?—That I would explain in this way. This location is formed close to Cape Town, and is inhabited by all the wastrels of South Africa, not by the Cape Colonial native alone. Every bad character, I may say, finds a home in this location, when he will find a home nowhere else. They are the scum, if one may so use the word, of lazy tribes in South Africa.

6,315. When you say a refuge for lazy, bad characters, you mean natives?—Yes, I mean the town loafer, the man who has no home and no character. He will live in a location like that when he would find the other parts of the country not open to him.

6,316. Then, if these locations were established in other town centres, is it not probable that they will be the home for these loose characters?—Well, except in this way, that at present they, being only in this location, naturally they congregate there. You would otherwise have the loss spread over a large area or location. At present you have, if I may so put it, almost all the bad characters in one location.

6,317. But do you think that this particular location attracts bad characters over a considerable radius around Cape Town?—I think that the bad character has naturally during the last three or four years drawn the native down there. The good

native has gone back to his home, but the man that has no home and no character remains in this location.

6,318. If you have nucleus of bad characters in any location, what would be the effect on the natives generally?—Well, like other sores, it will spread.

6,319. We cannot be mealy-mouthed in this matter. Refer to the third paragraph of page 95 of the report of the Magistrate on the same location.—Yes.

6,320. "The point worthy of note is the increase of the female population on the location. At the beginning of last year there were 265 women. Now there are over 467, an increase of 200. The majority of these women make bread, keep eating-houses, and cater for the wants of the single men, and so earn a good living. It is almost impossible to get a domestic servant in the location, although there are great numbers of able-bodied girls. They prefer to assist their mothers and aunts to cater for the wants of the single men, going into service." Now, as a man acquainted with South African conditions in these matters, what meaning would you read into this paragraph respecting the woman population?—That these locations would produce instead of a virtuous Kaffir woman in her kraal, a common prostitute.

6,321. So that would be the effect of the Glen Grey Act, if carried?—Well, it would make the one woman more virtuous and more of a lady, and it would make her sister an outcast.

6,322. It will tend to create centres of crime and prostitution in the neighbourhood of the white settlements?—Yes.

6,323. Mr. EVANS: Do you know who the representatives of the Cape Colony were who decided upon these native affairs at the Bloemfontein Conference?—I know little or nothing of the Conference.

6,324. The representatives of the Cape Colony were Sir Gordon Sprigg, Mr. King, Mr. Molteno, Mr. Macintosh, Mr. Wiener, Mr. Macgregor, Mr. Stanford, and Mr. Wilshire. Now, amongst these men are there not many who are thoroughly acquainted with native affairs?—A man more acquainted with native affairs than our Chief Magistrate, Mr. Stanford, could not be obtained, also in a certain degree Sir Gordon Sprigg. He has a very, very fair idea, indeed. The other gentlemen are not known to me.

6,325. Then this conclusion of the Conference that the Kaffir labour supply is not sufficient for the needs of South Africa, is the opinion of the most experienced and best informed men on native affairs that you are acquainted with?—Yes, that is so.

6,326. The CHAIRMAN: Is there anything you would like to add?—Not at present. If anything should suggest itself to me, I should be most happy at any future time to send any report. It has not only been a pleasure to me, but I do hope that my visit to the Golden City may have had some beneficial effect. I am certain that the little trouble I have taken in the matter has only been a pleasant duty.

Mr. ST. JOHN CARR duly called and sworn.

6,327. The CHAIRMAN: When you were last before the Commission you agreed to revise the figures which you handed in?—Yes, sir.

6,328. Have you before you a statement of these figures, headed "Particulars relative to Recruiting"?—Yes, I have.

6,329. Is it the same statement that you handed in before?—Yes, but on the last sheet, 9, I have added an explanatory statement which will enable members of the Commission to see how the figures were arrived at, as to the number of boys recruited.

6,330. Do you now wish to hand in this statement as your evidence-in-chief?—Yes, unaltered.

The statement was as follows:—

## PARTICULARS RELATIVE TO RECRUITING OF BOYS.

During the six months ended the 30th June, 1903, the following boys were recruited from the districts specified at an average cost as shown :—

Place.	Number of Boys.	Average Cost per Head.
Pondoland ... ..	300	£ s. d. 2 11 11½
Basutoland ... ..	429	2 2 11
Griqualand West ... ..	246	2 5 0
W.N.L.A. ... ..	47	2 10 0
Locally ... ..	1,309	Nil.
	2,331	—

Thus 1,002 boys were recruited and brought to Johannesburg by rail at an average cost per head of £2 6s. 4½d. 1,309 were engaged locally, cost nil. Therefore a total of 2,331 boys were obtained at an average cost of £1 0s. 4d. per head.

	Sanitary.	T.E.D.
Number of Boys required to work present service ... ..	1,260	1,000
Do. deficient ... ..	60	350
Additional number required during ensuing six months to work additional plant ... ..	250	200
Average number required to be recruited monthly to replace time-expired, Deserters, Sick and in Gaol ... ..	150	150
Average cost of Food per Boy per month ... ..	£0 11s. 6½d.	
Do. Wage per Boy per month ... ..	£2 18s. 9½d.—£2 14s. 10d.	

STATEMENT SHEWING NUMBER OF BOYS RECRUITED IN PONDOLAND,  
JANUARY TO JUNE 30TH, 1903.

Month.	Number Recruited.	Cost per Head of Recruiting.	Cost per Head of Railway Fares.	Conditions of Contract.	Scale of Feeding.	Rate of Pay, &c.

June ... ..	185	Do.	Nil.	Do.	

15 per cent. are re-engaged Boys, and drawn from Basutos, Bacas, Pundos, Fingoes, Shangaans, East Coast Boys and Zulus.

SUMMARY.

STATEMENT SHEWING TOTAL NUMBER OF BOYS ON HAND FIRST WEEK EACH MONTH.

Month.	Total Recruited and Engaged.	Number of Six Months Boys.	Average First Week each Month.	Cost per Head.	Discharged.	Missing, in Gaol, &c.	Number Sick.	Number Died.
January ...	371	194	2,167	£ s. d. 1 4 9	239	24	48	6
February ...	390	109	2,185	0 12 7	470	16	104	5
March... ..	457	71	2,051	0 10 8	506	18	66	2
April ... ..	473	301	2,466	1 10 7	332	20	56	Nil.
May ... ..	458	193	2,245	0 16 4	315	28	60	Nil.
June ... ..	182	57	2,316	0 18 8	333	19	38	2

EXPLANATORY STATEMENT.

As an example,

On May 31st ... ..	2,570	Boys were on hand.
June 1st to 8th ... ..	321	„ „ discharged.
	<u>2,249</u>	
June 1st to 8th ... ..	67	Boys were engaged.
	<u>2,316</u>	

During the first week in June there were 2,316 Boys. This includes all Boys engaged during that period, and all Boys discharged during that period.

During the whole month of June, 333 Boys were discharged, and only 182 engaged, thus 156 Boys should be deducted from 2,316, which gives 2,160 at the end of June.

During the first week in July 61 Boys were engaged, which, if added to 2,160, makes 2,221.

During the same period, 318 Boys were discharged, leaving 1,903 Boys.

Now, if we require 2,260 Boys, and only 1,903 Boys are available, there is a deficit of 357 Boys at this period, which is the end of the first week in July. In the interval between this date and the date of compilation of the figures submitted, the Sick, the Missing, in Gaol, and further discharges accounts for the remaining 53.

FRED. OH. GAVIN,

. Manager, Sanitary Department.

6,331. As a result of your revising the figures you have no wish to alter them at all?—No, they are extracts from the records of the Council.

6,332. What is the exact position to-day with regard to the supply of natives to the Municipality? Have you sufficient natives or are you short?—We are short on the engineer's department.

6,333. Do you know how many you are short of?—About 300.

6,334. Has that shortage continued for any length of time?—Yes, for some three or four months.

6,335. Have you anything else to say before the Commission cross-examine you?—I have. It would be for the information of the Commission that I should give exact answers to certain questions which were put to me by the Commission last time, and which I had to answer from memory. If the Commission desires it I will give these figures for their information.

6,336. Yes, will you go on?—The first is question 1,232. I was asked how many boys were in the employ of the Municipality in May, 1901. The answer should be 524 including 60 Coolies.

6,337. Do you know, Mr. Carr, if the Municipality on that date was carrying out any of its work by contract?—No, there was no contract work at all.

6,338. Then the figures you are now giving include all the boys directly employed, and not under contractors engaged by the Municipality?—Yes. Then there is the question 1,248, page 87. I think there was a member of the Commission who took a wrong column of figures in putting the question, and arrived at a conclusion directly in opposition to the fact. The total of the discharged column is referred to.

6,339. Will you tell us on what page of your statement this appears?—In the summary. The total of the discharge column should be 2,200, and not as stated, 2,712. That will alter the whole conclusion. It was suggested there has been a loss in boys instead of our gaining them.

6,340. During the six months' period referred to?—Yes. Of course, in connection with this it must be borne in mind that the work is increasing. It does not follow that the number of boys that do in one month will do for the next. Then with regard to 1,259. I was not sure whether we paid the railway fares of boys to the railway direct or not. I find that we do always pay them direct. Then I was asked to state what was the total number of boys that were recruited by the Witwatersrand Native Labour Association for us (question 1,264). The total is 1,687 to date. Then I am afraid that I appear to have given too definite an answer to question 1,265. One member asked me, "Have you always been short of labour since the war?" I appear to have stated "Yes," but I believe it was not so, only intermittently we have been short. In 1,269 I would like to add that the mine boys do not come to us for employment. We get our own boys.

6,341. The question was, "Was that the effect of the mines reducing their rates to give you a more liberal supply?"—Yes. The consequence of the mines reducing their rate was not necessarily that the boys would come to us to get high wages. I want to make it clear. In 1,279 I should like to say that a few boys get over £3 15s. in the Engineer's Department—just a few. In 1,283 I was asked how the boys were paid. They are paid by the working calendar month.

6,342. Is any reduction made for any days that they are not working?—Of course, they do not get paid for the days they do not work. Now in regard to 1,286, I may say that we always provide boys at the cost of the Engineer's Department. Regarding 1,293 we provide sports once a year. In 1,300 1,301, "Did the cost of recruiting boys by the Witwatersrand Native Labour Association work out higher or lower than the charges of our own recruiter?" I should have replied that the Association charges were higher, the difference being 52s. 6d. as against 45s.

6,343. Does not that include boys from the East Coast?—I cannot answer that question.

6,344. Do you recruit on the East Coast?—No, not now. Then with regard to 1,311, 1,312, there is a question as to the number of natives within the Municipal area. That is a most difficult thing for me to answer, and the only information that I can give is that I can give you the number of natives in Johannesburg District. That is from the Treasury Mine on the east to the Langlaagte on the west, and from the Yokeskei River on the north to the Klipriversberg on the south. There are 61,000 males, 3,000 women, and 1,600 children, and employed on the mines and by employers of 20 or over 22,700.

6,345. That sub-division is between the mines and employers of 20 or over?—Yes. These particulars have been obtained from the Pass Office.

6,346. What was the grand total in that area?—65,600. If you add the 22,700 to it, 88,300. That is the number of natives in the district of Johannesburg.

6,347. Mr. TAINTON: Must this figure of 22,700 be added to the other?—That is so. In 1,375, page 91, I said there that the boys got meat twice or three times a week. I find that they get 2lbs. once a week, on Saturday, instead of two rations separately they get it all in one lot.

6,348. WITNESS: Question 1,382, reads, "In your statement showing the number of boys recruited in Bechuanaland we have for April, 158. Has there been no attempt to get any more since April?—All our recruiters then failed us. We could not get any more from there." I now wish to say that we got 88 in May.

6,349. The CHAIRMAN: From Bechuanaland?—Yes. Then, Mr. Chairman, on 1,422, "I would like to ask you, Mr. Carr, if you have any knowledge of the results of this month's recruiting." I can say we got 271 in July.

6,350. The CHAIRMAN: Have you any knowledge of the excess so far?—The present position is, we have got about 110 boys more than are actually employed at work learning the work they will have to take on at the end of the month. That is the mine sanitation work. I should like to state generally, Mr. Chairman, if I may, the difficulty of giving the Commission the actual number of boys per month. It is very great, because the number of boys vary from day to day. We may have a lot of boys, say, on the 3th of the month, and on the 9th, 300 may be discharged. There is thus a continual changing in the numbers, and it is very difficult to strike an average. The supply of labour is intermittent, and there is no reliable way of arriving at actual figures unless you take them day by day. There is another thing I should like to say with regard to the statement I handed in. You see, there it is stated we want so many boys to work the present service. Now, that does not necessarily mean that that is the total number of boys we have to have on our books for pay. To do our work we require 1,260 boys to be continually employed for that purpose, and of course there is a percentage of sick and missing. I just want to make that clear.

6,351. Does that apply to the Town Engineer's as well as the Sanitary Department?—Yes. I was asked by a member of the Commission to hand in copies of the correspondence with Harding and Co. I hand that in.

[COPY.]

Johannesburg,  
22nd June, 1903.

Messrs. Harding and Co.,  
Box 341,

Kimberley.

Gentlemen,—

I beg to acknowledge receipt of your favour dated the 20th inst., and to point out that until the existing contract is completed I cannot enter into any negotiations regarding increased terms.

I take this opportunity, however, of drawing your attention to the numerous times it has been necessary to write you to complete the existing contract, and to again urge upon you the necessity for bringing it to a speedy termination.

I have the honour to be gentlemen,  
Your obedient servant,  
(Signed) FRED. CH. GAVIN,  
Manager, Sanitary Department.

The Manager,  
The Sanitary Department,  
P.O. Box 1049,  
Johannesburg.

Dear Sir,—

We have not overlooked the fact that we still owe you about 50 boys, and these we are hoping to arrange for at an early date. We have already pointed out to you that 45s. delivered in Johannesburg does not pay us, or, rather, it does not leave sufficient margin for the risks we have to take, and the losses through desertion that we inevitably must suffer. However, although we have in the last month been compelled to pay our recruiters and runners higher wages, we are willing to hold to our undertaking to complete the order for 300 at 45s., but we cannot deliver any beyond that number at the same price, and must ask you for 55s. for Basutoland boys delivered at the Rand. The chief whom we are in touch with and to whom alone we have to pay a very high price for his assistance, promises that all boys will be of the very best class. This matter has been a little delayed owing to the fact that this chief (with others) is now in the Rand, whither he had been summoned to attend a meeting about the labour question.

Yours faithfully,  
(Signed) HARDING & CO.

Messrs. Harding and Co.,  
Box 341,  
Kimberley.

Gentlemen,—

With reference to your telegram of the 30th May, and confirming my wire in reply, I beg to inform you that we can take 200 boys this month.

I beg to draw your special attention to the enclosed copy of letter which I have received from the

Town Engineer in regard to the unsuitability of the boys recently recruited, in consequence of which I have been obliged to give instructions that should any further case of the kind arise those boys who are not up to standard will be returned at the expense of the recruiting agent. Please, therefore, see that boys not fit for service are not recruited.

Please reply.

Town Engineer's Office,  
Johannesburg,  
13th May 1903.

The Manager,  
Sanitary Department.

I have to bring to your notice that we have, at least, 35 young Kafirs (picanninies) who are too young and small to use a pick or shovel; also one old man, who is over 80 years of age and insane. All these have recently arrived, and they are certainly not worth the wages they are paid, and you will well understand that their idleness and inability to work discourages the better and stronger boys.

Will you kindly take steps to prevent unsuitable boys being received for work on the roads.

(Signed) D. LEITCH,  
Town Engineer.

Johannesburg.

Dear Sir,—

In reply to your wire 23rd inst. we wish to point out that we cannot absolutely guarantee to deliver 300 boys in six weeks, the number may reach 500 in that time, the supply of natives fluctuates.

We will do our utmost, and will not supply to any other company or department until we have supplied your order

The first gang of about 100 leave Vryburg on Thursday, 26th March, 1903, for you, via Klerksdorp.

We trust that you will remit us the amount for each batch, on receipt of same at Johannesburg. We urgently need all monies, as we are extending our business northwards.

We will advise you of probable date of arrival at Klerksdorp by wire.

We are, dear sir,  
Yours faithfully,

6,352. Who are Harding and Company?—Recruiting agents.

6,353. Where?—In Bechuanaland. They live in Kimberley. And I also hand in Frank's correspondence, who is a recruiting agent in Pondoland. Then I was requested by the Town Council to hand in a report from the Town Engineer in regard to native labour.

## LABOUR RECRUITING IN NATAL.

To the Editor of the "Rand Daily Mail."

Sir,—In reply to your letter in your paper signed by Mr. A. E. Martienssen, Acting Secretary, W.N.L.A., as to recruiting labour in Natal, I must certainly contradict the statement contained therein, and state that at the meeting of the White League held at Fordsburg, I distinctly mentioned the 500 natives offered to the Association were recruited in Pondoland and East Griqualand and brought to Richmond, Natal, and kept there three weeks awaiting the opportunity to bring them to Johannesburg.

In referring to my correspondence with my clients who offered the boys, I find so far back as 13th January these natives were available. I also offered boys to the Municipality, and have replies dated 31st January and 11th February, but was unable to do anything with them.

I am not a recruiting agent, but simply acting for clients.

I fail to understand why the Association will not engage these boys, and yet are so anxious for labour. This is but one instance.

These boys were not recruited in Natal, so therefore Act 46 (so far as I know) does not interfere with their being engaged for the mines or coming to the Transvaal.

I maintain that the W.N.L.A. is unworkable as constituted, and should be abolished. The continual cry for Asiatics affects all classes, and sufficient native labour is obtainable and should be taken advantage of.

It occurs to me that the Chinese are not wanted to replace the native, but to oust the white man, to work at a small wage, thus benefitting the shareholder.

The only solution I can adduce is to allow free recruiting under certain restrictions; we shall then find sufficient labour for our requirements.

I think I have indicated clearly the error in Mr. Martienssen's letter. I now leave it for the public to judge if the Association is beneficial to the community. If not, then it should be abolished.

Yours, etc.,

(Signed) H. MORTIMER ZEFFERT

Johannesburg,  
14th February, 1903.Manager, Sanitary Department,  
Municipality, Johannesburg.

Sir,—

In reply to your of the 11th inst., I have wired to Mr. Franks (who previously supplied your board with natives). I herewith enclose copy of wire received; the price is 40s. delivered Richmond; you will note he can supply 200 monthly; if you desire delivery Fordsburg or Vrededorp, you will then arrange rail up from Richmond; there will be a boy in charge of same. If you desire, Mr. Franks will come up personally at your expense and make further arrangements with your board. We are only acting as Mr. Franks' agents.

Thanking you, I am, sir,  
Yours respectfully,  
(Signed) H. MORTIMER ZEFFERT.

No. 1189/03.

Report No. 19/03.  
Municipality of Johannesburg,  
Town Engineer's Department,  
August 6th, 1903.

The Town Clerk,

SPECIAL REPORT TO PUBLIC HEALTH  
COMMITTEE.

#### 1.—NATIVE LABOUR.

As some misunderstanding seems to exist in regard to the shortage of native labour in my Department, I beg to submit the following remarks:—

During the summer months, the Department had sufficient labour for the plant then available, but had animals been obtainable to work the whole of the plant, the natives would have been insufficient. Even to-day much of the plant is standing idle owing to the shortaging of animals and stabling; but it is expected that this will not much longer be the case. The policy of the Works Committee so far has been to take on all natives recruited for the Municipality, even if the number exceeded the actual requirements for the time being. This excess did take place on one or two occasions previous to last March.

In May, 1892, twelve boys were lent to Weightman and Amery in order to keep their stone-breakers at work. These boys were not lent because the Department had too many natives, but because it was essential that the output of broken stone should not be diminished, and the contractors professed themselves unable to obtain labour. In one or two other cases, of which details are attached, small numbers of natives were lent to contractors for municipal work; but this was only owing to the difficulties which the contractors experienced in obtaining labour, and to keep up the supply of metal for the roads. All such loans terminated by March 7th, 1903.

The largest number of natives (not counting convict labour) employed at any one time, was 1,014 in January, and of these 189 could at that time have been spared. Last month the number fluctuated between 632 and 673.

Since January last the plant has been increased by 180 carts, and the erection of the destructors has been commenced, so that the requirements are at present at least 220 in excess of what they were in January, giving a total of 1,045.

The shortage of labour has been brought to the notice of the Works Committee on several occasions,

and the manager of the Sanitary Department has been kept informed of our requirements. (See extracts from reports, etc., attached herewith.)

It is estimated that during the current six months not less than 1,050 natives will be required for departmental work, and 1,300 for work which may be done either by contract or departmentally. For the following six months it is likely that about 1,000 natives will be required for departmental work, and 3,100 for work which may be done either by contract or departmentally.

These figures include a reasonable percentage for sick boys, deserters, etc.

Letter to Manager, Sanitary Department, 7th February, 1903:—

"It has been noticed that there is a marked falling-off in the physique of the natives now coming forward for service in my Department, and many of them are far too young to undertake hard work. Can you do anything to alter this state of things?"

Letter sent to M. S. D. by T. E. on March 4th, 1903:—

"I have to bring to your notice that my Department is at present 300 natives short of the required number. It appears that the natives are leaving faster than others can be recruited."

Extract from Report No. 10/03, dd. March 9th, to Works Committee:—

"Since the end of last month there has been a serious falling off in the number of natives employed in the Department. To carry on the work in an efficient manner, at least 1,000 natives should be available. The Manager of the Sanitary Department has been notified of this large decrease in the number of natives."

Letter to M. S. D., 12th March, 1903:—

"Six coolies are required for gardening work at the Cemetery, and one to assist the pumpman at the gaol. Will you kindly arrange for this? Another 12 coolies could with advantage be employed at Joubert Park; can they be obtained?"

Letter to M. S. D., dated March 13th, 1903:—

"I beg to inform you that it is found that immediate employment can be given for another 200 boys. Will you kindly endeavour to obtain these?"

Letter to M. S. D., March 27th, 1903:—

"I beg to inform you that we are still short of boys for road work, and employment can be found for 200 more. Will you kindly do what you can in the matter?"

Extract from Report 13/03, March 31st, to Works Committee:—

"The work of road making has been considerably hindered during the past month by the want of native labour. At present only 680 natives are available. A thousand could be profitably employed. It is not yet known whether the number of boys leaving at the end of the current month will exceed the newcomers, but if so, still greater inconvenience will arise. Frequent communications have been made to the Manager of the Sanitary Department, informing him of the circumstances, and requesting him, if possible, to provide more labour. It is desirable, in order to utilise the plant to the fullest possible extent, that there should not be a scarcity of labour; the want of it will be still more felt when additional stabling and carts are available."

To Manager, Sanitary Department, April 1st, 1903:—

"I beg to inform you that at present only 680 natives are available for road making purposes. Will you kindly endeavour to obtain another 320, or 400, if they can be accommodated?"

To Manager of Sanitary Department, dated May 13th, 1903:—

"I have to bring to your notice that we have at least 35 young Kaffirs (picaninnies), who are too young and small to use a pick and shovel; also one old man, who is 80 years of age and

insane. All these have recently arrived, and they are certainly not worth the wages they are being paid, and you will well understand that their idleness and inability to work discourages the better and stronger boys. Will you kindly take steps to prevent unsuitable boys being received for work on the roads?"

Manager, Sanitary Department, July 11th, 1903:—

"I must again draw your attention to the serious decrease in the number of natives employed by my Department. At present we are no less than 350 short of the number employed on roads at the commencement of the year, and even then the number was not sufficient. Much other work is also now in hand. Will you kindly inform me what prospect there is of obtaining sufficient labour; and as it is a matter of urgency, an early reply will oblige."

Letter from M. S. D. to T. E., dated July 14th, 1903:—

"Town Engineer.—I am obliged for your letter, dated the 11th inst., re scarcity of native labour, and regret that just now great difficulty is being experienced in getting boys, and I do not anticipate that there will be much improvement until the middle of August. I may say, however, that every possible effort is being made, with the view of getting more boys for our service."

Extract from Report 21/03, to Works Committee, dated July 24th:—

"Scarcity of Labour.—Repeated applications have been made to the Manager of the Sanitary Department to provide more labourers, but I understand that he has not been able to comply with them. The shortage is very serious. There are not even enough boys for the ordinary work of the roads, and a considerable number are employed in the erection of the two destructors. It seems well to draw the attention of the Committee to this matter."

#### EXTRACTS FROM MINUTES OF WORKS COMMITTEE MEETING.

Broken stone, Weightman and Amery.

The Deputy Town Engineer reported that the output of stone during last week was much below the number of loads stipulated in the contract. He stated that, on urgent representations from the contractors, he had lent them 12 natives, on the understanding that they paid expenses.

Resolved:

(a) To approve of D.T.E.'s action.

Meeting held May 15th, 1902.

14 to 20 men employed from 1-10-02 till 3-3-03.

Stonebreaker at Ferreira Mine.

The T.E. reported that the contractors for this work, Messrs. Weightman and Amery, having represented that they were unable to obtain the necessary labour to run the stonebreakers up to their full capacity, arrangements had been made for them to have 15 natives, on condition that they paid all expenses in connection therewith.

Meeting held 21st August, 1902.

Stone breaking, City and Suburban.

Resolved:

To approve of the T.E.'s action in letting Messrs. Stowe and Clark have 25 natives, on condition that they paid all expenses.

15 to 25 were employed from 8-9-02 to 7-3-03.

Stone for re-metalling Wolhuter Street.

Resolved:

That the T.E. be authorised to place 100 natives at the Wolhuter Mine for breaking stone.

Meeting held 4th September, 1902.

The natives commenced work at breaking stones on the Robinson Mine on the 1st July, 1902, and ceased work on the 26th February, 1903.

The highest number of boys employed was 246, and the lowest 22.

The natives employed at the Wolhuter Mine commenced work on the 4th September, 1902, and ceased work on the 3rd July, 1903. The highest number of boys employed totalled 128, and the lowest 29.

(Signed) D. LEITCH, M. Inst. C.E.,  
Town Engineer.

6,354. Have you copies of that?—I have only the one, but we can supply others.

6,355. May I ask you to what it relates?—Shall I read it out?

6,356. May I ask you to what it relates? Is it future requirements, or what is it?—It relates to the whole thing.

6,357. Shall we have it read?

6,358. Mr. QUINN: Before you have it read, I should like to know if the Town Engineer is to be called.

The CHAIRMAN: That is entirely a matter in your option.

6,359. Mr. QUINN: If he is to be called, I think this statement can be left over till then.

The CHAIRMAN: Well, we will call him, and he can put his statement in then. Does any member wish to ask Mr. Carr any questions?

6,360. Mr. QUINN: Yes. The figures handed in are still not clear. I understand they have been handed in unaltered. They may be right, but if we cannot understand them they can be of no use to us. I want to go into some of the figures. It is stated the total number of boys recruited for the six months ended June is 2,331?—That is so.

6,361. And discharged 2,500?—Yes.

6,362. Died, 15?—Yes.

6,363. And missing, 125?—Yes.

6,364. Now, add the total discharged, missing, and dead, you get 2,340, I think?—No, the dead and missing are included in the column of discharged.

6,365. Oh! Well, that makes a difference?—Well, you cannot keep them on the books.

6,366. You cannot discharge a missing boy, but so long as we know what we are doing, I suppose it is all right. They are all included in the 2,200?—Yes.

6,367. It is near enough for all practical purposes. I want to point out that the number on your books at the end of June is 2,316?—At the beginning of June we take the first week of each month.

6,368. Are all these figures for the first week?—Yes.

6,369. In each column?—No, in that particular column.

6,370. Well, there you see again that is very mystifying?—Those other columns are for the whole month, the total recruited and engaged.

6,371. The number of boys put down is required for work in the sanitary service. I take it you put down the number you want to work your plant for the mines, and you will have other work six months hence?—You must add the 250. 1,260 is required to work the ordinary service, in which there is no deficiency.

6,372. You have got more boys than you want?—Yes, now.

6,373. Then you put down the number you require for the additional plant in six months' time as 250?—Yes.

6,374. Are you counting on having to supply your own boys for the working of the mines' sanitation?—Yes.

6,375. Is there no prospect of getting the boys who are already doing that work?—Of course, there is a prospect we are trying to get them.

- 6,376. How many are you allowing for that work?  
—200.
- 6,377. How many are engaged upon that work now?—I don't know.
- 6,378. My point is this, if you get these boys, these you have put down for this additional work will be available for something else?—Yes.
- 6,379. The average number required to be recruited monthly to replace time-expired, sick, and in gaol, is 150 for each of the two big departments, this is, 300 in all?—Yes. But let me put you right over those other statements that are attached to that first page. They had no reference to one another. This first page is an estimate, the other documents attached are extracts from the records of the Council.
- 6,380. What I want to come to is this. It is quite clear you want 150 boys each month for each of these two departments, that is 300. The last six months your average recruiting was 344 per month. Your total for these six months is 2,331, divided by six that is 344?—No, it comes to 388.
- 6,381. Are those figures correct?—Yes.
- 6,382. Then for the last six months you have been recruiting 88 boys per month more than you require to keep up your establishment?—No, you must take into account the number of re-engaged boys. Time-expired boys who re-engage are not recruits.
- 6,383. I do not understand that way of putting it?—We recruit a certain number of boys and a certain number of boys are time-expired within the month. Instead of going back to their country they re-engage here. Those are not recruits that are re-engaged, but they must be included here to show what boys we have taken into our employ.
- 6,384. It does not show it at all, it is misleading. If you re-engage them they appear in the 150. I want to understand this:—The statement is made that 150 is wanted for each of the two departments to replace time-expired, sick, and in gaol?—The average recruited is 388, out of this you can take it that 88 are re-engaged and the 300 are the recruits. I do not know whether the rest of the Commission understand this. If a boy is re-engaged, I take it he is not recruited.
- 6,385. The CHAIRMAN: If you add the words on page 1, after "Replaced, time-expired, deserters, sick, and in gaol," "Exclusive of boys re-engaged," that will make it clear.
- Mr. QUINN: Yes, that makes it plain enough now.
- Mr. CARR: I will add those words.
- 6,386. Mr. QUINN: What is the number monthly of re-engaged boys?—Do you want the boys re-engaged every six months?
- 6,387. What I want to know is this: I want some statement of what the monthly average is?—That varies, of course, every month and every week, too.
- 6,388. There are a good many figures here. Cannot you show how much you were short each month?—You would have to show how much you were short each day. You cannot give it every month, it cannot be done.
- 6,389. These figures are misleading. You try to get from them the monthly requirements and the monthly losses, and you cannot get it from them. How many boys are working upon the removal of refuse?—I do not know.
- 6,390. Have you any idea?—No.
- 6,391. I want to show what the saving will be when we get these destructors going. That is my point?—We will get you that information.
- 6,392. Can you tell us how many boys are engaged upon the slop service?—It will only take us a few minutes to get the information.
- 6,393. I will put it in another way. What will be the saving when you get your refuse destructors going?—You are carting rubbish now a very long distance. It requires a great many mules, carts and boys. When the two destructors are built we shall be able to reduce this enormously?—Yes. The work will be done far more efficiently, and there will be more rubbish removal than ever before.
- 6,394. What will be the saving in boys?—That I can only estimate. I should think there would be a saving.
- 6,395. In 2½ or 3 years it is hoped to have the first section of the sewage system going. That will make a great difference in the number of boys employed?—Yes, an enormous difference.
- 6,396. Well, now, this is my question. When the destructors and the first section of your sewage scheme, which will be followed soon by the second section, the chances are you will not require anything like the number of boys you do to-day, even with the extended area. So that the requirements of the Municipal Health Department are likely to be less than now?—Yes, I think so.
- 6,397. Mr. TAINTON: This total of 65,000 natives within the municipal area includes the natives upon the mines?—Yes.
- 6,398. Can you tell us how that compares with the total employed before the war?—No, I cannot.
- 6,399. This statement you have handed in just now from the Council, will that deal with the probable future requirements of the Council?—The Works Department, yes.
- 6,400. If the Town Engineer is called, could he give us figures bearing upon the contingent demands of the town for labour?—I do not know; he will have to answer that question himself. It is difficult to estimate the number of men we shall require some two or three years hence.
- 6,401. Mr. PHILIP: Are you quite positive about these figures—about the total number of boys you give, 61,000 males in the district, exclusive of the mines?—These figures are obtained from the Native Pass people.
- 6,402. Surely that includes 22,000 on the mines?—No; I am informed that 61,000, the number I have specified, or 65,500 including females, and 22,700 on the mines, are two distinct figures; the total is 88,200.
- 6,403. You state that in May, 1901, only 524 boys were employed in municipal work?—Yes.
- 6,404. Did they do the entire work of the sanitary and engineering?—Yes, there was little work for them to do.
- 6,405. At present you require 1,260 boys for the sanitary service alone?—Yes, to be at work.
- 6,406. Do you employ prisoners still upon the roads?—Yes, at present we employ 430.
- 6,407. Do you have to pay for these boys?—Yes.
- 6,408. What is the price?—1s. 6d. per day.
- 6,409. Is that paid to them or to the Government?—Paid to the Government for their keep.
- 6,410. You said you paid these boys by the calendar month?—Yes.
- 6,411. That means that every month Saturday afternoons and Sundays are deducted?—Not in the Sanitary Department, the work goes on just the same.
- 6,412. The rest of the boys do not work on Saturday afternoon or Sunday?—Not in the Engineer's Department.
- 6,413. They are getting paid, you have stated, for 5½ days each week?—Yes.
- 6,414. On page 9 of the statement you handed in it shows you are short of 357 boys. Would that refer to the first week in July?—Yes.
- 6,415. You really require to recruit 300 boys a month to keep up your number?—Yes.
- 6,416. In June you engaged only 182 and 338 boys were discharged?—Yes.
- 6,417. During the first week in July you only engaged 61?—Yes, that is so.
- 6,418. And during the same period you discharged 318?—Yes.

- 6,419. Can you tell us what the results are in the first week in August, or if you are recruiting more or less than in July?—More.
- 6,420. Are you discharging more?—I can't give you these figures off hand.
- 6,421. Well, according to the figures you show in July instead of adding 300 a month you are losing 200 a month?—Will you put that again?
- 6,422. According to your figures for the first week in July, instead of getting 300 fresh boys, you are losing really about 250?—That is only for eight days of the month; we have to deal with the whole month. The figures may be quite altered on the 9th.
- 6,423. The figures are useless in this form?—We get a certain number of boys day by day, and we may lose a certain number of boys. It is difficult to strike an average which can be called a month's supply.
- 6,424. You made the statement that mine boys don't work for the Municipality?—They don't come to us.
- 6,425. Where do you suppose these 1,309 came from that you recruited locally?—A lot of these boys come up on their own account, and others are discharged boys.
- 6,426. Have you anything to show they are not mine boys?—No, except the class of boy, you can easily distinguish them, the officials know a lot of these boys.
- 6,427. Mr. EVANS: You stated just now that the cost of recruiting for the Council by the Native Labour Association was higher than under the Council's own organisation?—Yes.
- 6,428. Were the boys recruited for the same period in both cases?—Yes, the same six months.
- 6,429. Didn't the Council get a certain number of East Coast boys from the Association? You know, they are twelve months' boys?—We couldn't say where they came from exactly.
- 6,430. Were not the Association charging the same to the Council as they charge the mines?—Yes, I believe so.
- 6,431. In that case the charge would be £3 for twelve months' boys, and 32s. 6d. for six months' boys?—You will find that in page 6 of my statement. It is stated also what the cost of recruiting was. The statement shows the number of boys recruited by the Association from January to June, and that the cost was £2 10s. per head.
- 6,432. These are only for two months, March and April?—That is all we have recruited for.
- 6,433. This only gives a matter of 47 boys, the figures you gave us refer to 1,600?—That is the standard cost, £2 10s. per head.
- 6,434. Were you paying the same price for six months' and twelve months' boys from the Association?—I don't think we ever got boys on a twelve months' contract.
- 6,435. You didn't get East Coast boys?—Not that I am aware of.
- 6,436. Mr. GOCH: The error in question, 1,233, one I put to you appears to have been the column discharged totalled 2,200 includes the other three columns?—Now, wait a bit.
- 6,437. It includes the column of missing and in gaol, and also the number sick and who have died?—No. The missing and those that died are included.
- 6,438. To that extent you wish to correct your previous error?—Error in what?
- 6,439. You say the numbers given here are not correct?—Yes.
- 6,440. There was no explanation in your statement that these columns were included. It was not an error of the questioner?—No. I didn't wish to convey that impression at all.
- 6,441. On page 1 of your statement you give the number required for sanitary service and Town Engineer's Department as 2,260?—Yes.
- 6,442. Then you say you are deficient at present of 60 in the Sanitary Department, and 350 in the Town Engineer's?—Yes, 410 in all.
- 6,443. Then you say the additional number required for the two departments 250 and 200, that is 450. Then, say, to make up the leakage, you want 150 in each department per month, which is 300 in all. This together makes 1,100?—What are you adding up? One may not have reference to the other. What has the 300 to do with it?
- 6,444. They have to be recruited monthly to replace the leakage?—That has nothing to do with these others.
- 6,445. Well, that leaves you with 860 short?—Not short at present. That will be the number we will require to have over and above the existing number in the ensuing six months.
- 6,446. Since this date, the 30th June, nearly two months ago, have you been successful in making up what you want?—I don't think we have. Of course, we have a full complement in the Sanitary Department for the service going on at the present time, and some in hand, as I mentioned before.
- 6,447. But you mentioned there is a deficiency of 60 required to work the present service?—Yes.
- 6,448. That leaves 800 to be obtained. Are you getting them?—Of course, we are getting more boys slowly.
- 6,449. You have no difficulty in getting that number?—Yes, we have a difficulty.
- 6,450. This does not include the estimate of boys for the sewage works?—No.
- 6,451. Nor for the tramway works?—No.
- 6,452. The apparent deficiency is for immediate works you know of?—Yes.
- 6,453. You have not ventured to estimate at all the number required for these big works?—No.
- 6,454. Can you give us an estimate?—No. You should get that from the Town Engineer.
- 6,455. The CHAIRMAN: In reply to one of the Commissioners you said there would be a saving of boys when the destructors and the first section of the sewage system was at work. Mr. Goch has referred to the tramways and other large works in contemplation. Do you think the number of boys required on tramway work, additional roads, the two new parks we have got, will exceed the number you will save when this sewage scheme is in operation and the destructors at work?—I should not like to hazard an opinion upon that.
- 6,456. You don't think you can spend over a million upon trams and half a million upon roads without a great deal of labour?—Decidedly, we shall want a great deal more than we shall save in the ways indicated.
- 6,457. We are very much obliged to you, Mr. Carr, for your evidence. The Commission will now adjourn until 10.30 a.m. on Tuesday morning.

## SEVENTEENTH DAY.

Tuesday, 25th August, 1903.

THE COMMISSION MET AT 10.30 A.M.

General DE LA REY called, sworn, and examined. The witness gave his evidence in Dutch, through Mr. Reinecke, Interpreter to the High Court.

(Owing to the fact that the evidence was given through an Interpreter, questions are put to the witness sometimes in the first and sometimes in the third person.)

6,458. The CHAIRMAN: Will you ask the General whether he is aware of the object of the Commission?—Yes, he knows that the Commission is in regard to the Native Labour Question.

6,459. The Commission is divided under two heads, the first is the requirements of the agricultural, mining, and other industries, and the second is the available supply of native labour in Central and Southern Africa. I should like to ask him first with regard to the requirements of the farms. He is himself, I believe, a farmer?—Yes.

6,460. What is the size of the farm he lives upon?—About 3,000 morgen.

6,461. Does he cultivate any large part of it?—Not exactly upon that farm, but also upon others.

6,462. How much will he cultivate?—It depends upon circumstances. Before this he has been more a Government official than a farmer.

6,463. How many Kaffirs are employed upon his farm?—From four to six; that is about the average number of Kaffirs employed on the farms in his district.

6,464. Do they employ more than six, that is, taking the average?—Some have many more, some have less.

6,465. Several witnesses have told us that on the average a farmer in the Transvaal requires 10 Kaffirs all the year round. Does the General think that is a fair number?—That is more than is known to the General. He does not know they employ so many. Some farmers employ more labour, some only two natives, and some have none at all.

6,466. On the farms in his district have the farmers any surplus labour?—There are very few natives in the Lichtenberg District. Labour is very scarce at present. Many farmers cannot employ natives, they are too poor.

6,467. How does the number of natives available in the Lichtenberg District compare with the number available before the war?—It is much less now than the number before the war.

6,468. Have the natives left the district and gone to live elsewhere?—Many left during the war and never returned.

6,469. Are there any native locations in the district?—Yes, several Kaffir locations and mission stations.

6,470. Do these natives turn out well from their locations and mission stations to work?—At present, no; they mostly come up to the mines.

6,471. Some witnesses have told us that under the old Government the incidence of taxation was 12s. 6d. for living on a farm, and £2 for living in a location?—That was the old law.

6,472. The new law is that they pay £2 a head whether they live on a farm or in a location?—Yes.

6,473. Does the General think if we returned to the old law the farmers would get a larger number of natives to live upon their farms?—Yes, I think so, if the Squatters' Law was put in force.

6,474. If the Squatters' Law or Plakkers' Wet was enforced would it benefit the farmers?—It worked very well up to the war. At the present time six natives are enough for each farm.

6,475. Has the General any idea as to the number of natives living in the Lichtenberg District?—Before coming up I asked the Magistrate to send the number of the native population of the district.

6,476. He does not know it?—No.

6,477. But many natives came to the mines from his district previous to the war?—The position is this: The natives had always to be sub-divided. One class were for working on the mines, and the other class for working on the farms. The old natives and the young ones always remain upon the farms, while the middle aged natives come to the gold mines by reason of the higher wages that are paid here.

6,478. What wages were being paid by the farmers in witness's own district?—It depends upon the agreement.

6,479. What is the usual agreement?—The usual agreement is this: The farmer gives the native a certain piece of land to cultivate for his own use, and in consideration of that the native has to assist the farmer upon the land, and should there be any special work to be done upon the farm the native is specially paid for that work.

6,480. Does he get permission to run a large number of cattle?—Nothing is said about it, but he is always free to run a certain amount of cattle.

6,481. Is he free to cultivate as much land as he can?—Yes, as much as he can.

6,482. How much labour has he to give for running the cattle and cultivating the land?—As a general rule the family of the native assist the farmer in his labour.

6,483. What wages are paid for special work? What is the wage per month?—It depends upon the amount of the work. It is generally £1 or £1 10s. a month and not more.

6,484. Mr. DONALDSON: If there were more natives in the district would the farmers be able to make more out of their farms?—In which way?

6,485. I take it that if a farmer has a difficulty in getting labour, it is difficult for him to make his farm pay?—Some cannot get labour at all.

6,486. If the Kaffirs were better distributed among farms it would be easier for the farmer to get labour upon his farm?—If more natives were living upon the farms it would be easier for the farmers to get labour.

6,487. Can the General suggest any means by which more labour can be placed upon these farms?—That is a small question involving a very large reply to answer.

6,488. There is a shortage of labour for the farms?—Yes.

6,489. From what I gather there is very little chance of the farmer getting more labour from any other district?—It is very difficult to get a native away from the place he lives in.

6,490. To solve that difficulty would the best way not be to introduce some measures to take away the natives from their locations and distribute them over the district?—It would be very difficult to enforce a thing like that.

6,491. It might be difficult to enforce it, but if it were to be accomplished would it not have a beneficial effect upon the farmer?—Yes.

6,492. Does the General think if the Kaffirs were in greater numbers and better distributed through the district the farmers would be more prosperous?—Yes.

6,493. It would make the farmer more prosperous if measures could be introduced to distribute labour better than at present?—Experience has taught us that between the farmer and the servant there must be an agreement and no forcing.

6,494. Quite so, and does General De la Rey say that should there be alteration in the tax the effect will be that the natives will remove from the locations to farms?—Yes.

6,495. Mr. EVANS: What is General De la Rey's opinion of locations? Does he consider it advisable to encourage them?—I am not against the established locations, but I am against the establishment of further locations.

6,496. Does he think in the interest of the native himself that to keep him in the location retards his progress?—Experience has taught us that natives who remain in locations are in much more straightened circumstances than those who go out.

6,497. Could not the General give the Commission an expression of opinion as to what he would advise in order to get more natives for the farms?—I think the enforcement of the Squatters' Law.

6,498. Would that be sufficient?—Whatever must be done beyond that must be done by force, and I doubt if that would answer. Anything beyond the Squatters' Law must be done by force.

6,499. Will you suggest any modification, any increase of taxation, for instance?—In some cases it would help but not in the large locations, because the majority of natives are so poor they could never pay and consequently the law would be of no avail, because you cannot put a man in gaol if he cannot pay.

6,500. How would the General treat the natives upon the Government land? Would he allow them to squat on simply paying a hut tax, or does he think it advisable also to charge them rent the same as white men?—Put them upon the same footing as on farm land and allow five or six natives thereon and no more.

6,501. Besides the hut tax, would the General charge them rent as well, because in the case of a native living upon a farm he has to supply labour?—I do not think the enforcement of rent would bring the boys out. He will pay £10 or £15 rent and at that he will remain, but he will not come out to work.

6,502. Does the General think it wise in the interest of the white population to have native reserves set aside for the use of the natives in which white men would not be allowed to come in and live?—I cannot answer that question; it is a question for the Government.

6,503. Would not the General give advice upon the matter as he has an extensive experience?—I can give no opinion now.

6,504. Mr. PHILIP: Is your district both agricultural and pastoral?—Yes, both agricultural and pastoral.

6,505. The farmers there would not require as many men as in Rustenburg?—Some farmers in Lichtenburg have as many as four times the number of Kaffirs as those in Rustenburg. Lichtenburg is a flat country and you can work there as much as you like all the year round.

6,506. Does Lichtenburg suffer from drought?—Yes.

6,507. Is there failure of crops there?—Yes.

6,508. Would that induce the Kaffirs to go out and work more than ordinary?—Yes, under certain circumstances they would.

6,509. Some witnesses have told us that the Kaffirs would not leave their women when food is

scarce?—Yes, they do like to be close to their womenkind and they do not like to leave their wives and work for the white men.

6,510. Will the General please tell us what his objections are to the location system—the location system under the old Government?—It is very difficult to give an opinion.

6,511. I understand that the Government originally brought these natives down from the mountain fastnesses so that they should be placed among the farmers?—No, I think that the natives here are more or less born and bred in the country.

6,512. General De la Rey has said that from four to six natives are required on each farm?—Yes, in some cases less.

6,513. How many does he think the agricultural farmer will require? I mean the farmer who produces crops for the market, the farmer who depends upon the crops for his income?—In Lichtenburg there are farms which have four to six natives.

6,514. Mr. FORBES: How many bags of mealies do you think can be raised from a morgen?—Oh, say from five to six hundred.

6,515. Mr. BRINK: Just now you said that a native, unless he could produce his old certificate, would have to pay £2 instead of 12s. 6d.?—No, I did not say that. What I said was that under the old term he would have to pay the £2 12s. 6d., if he lived on a farm with a farmer.

6,516. But the General knows that that has been altered?—Yes.

6,517. Does he think it would be better to go back to the old system?—Yes, I think it would be better to go back to the old law. I know that with natives living upon private farms it is very difficult sometimes for the farmer to get these boys to work. I do not think the native can find employment at a better rate elsewhere. It is a wrong principle to allow them to live on Government land without doing anything for it.

6,518. The General is well acquainted with some of these locations, which are very large?—Yes.

6,519. Do you think we shall be able to solve the labour question by allowing Kaffir chiefs to buy arms?—I think it would favour the solution of the question.

6,520. Mr. TAINTON: Is it because the Kaffirs make a living out of that land that they do not come to work?—Many have received large sums in compensation after the war. Also, they find they can get money out of the land just as easily as by coming out to work for it.

6,520A. Well, he sees the condition the land is in, it is calling out for labour, the farms are lying waste, the mines are idle. What is his practical solution of the trouble, what is his advice?—According to my conviction there is more labour now than there ever has been before. There are thousands and thousands to-day who have no bread and have to earn it. It is difficult for me to understand why native labour is so scarce in the mines.

6,521. Is it not scarce on farms?—Yes, because the natives have left for the mines.

6,522. But there are not so many natives on the mines as before the war?—Yes, that is what I have heard.

6,523. Well, where are the natives?—I do not know.

6,524. Then from his replies I take it that he has no plan to give us which will help us to improve the supply?—Not at the present moment. I can suggest no way out of the difficulty.

6,525. Are the remainder of the Boers in the same position? Have they any plan by which the matter can be settled?—Each man must speak for himself.

6,526. In reply to one of the members of the Commission, he said that he thought the Squatters' Law should be enforced. What was the first principle or the main provision of that law?—It is a proof of how this labour question can be fixed up or arranged.

6,527. Will he tell us how the Squatters' Law acted, how it improved the labour supply, in what way did it improve the supply?—Many natives lived in lots or on great locations. The law distributed them, and accordingly they spread over the country. They had to chose their employers, and that is why I say the Squatters' Law worked well.

6,528. Did it take natives from the locations and distribute them among the farmers?—No, it was the £2 tax that took them out of the locations.

6,529. The tax of £2 on location ground was too much for them to pay?—Yes.

6,530. In order to avoid payment of the tax they went on to the farms?—Yes.

6,531. Does he know of any case in which natives were asked to leave the locations by the Native Commissioners?—I know of instances where the Commissioner of Natives had authority to go to the chief to ask them to provide for native labour on the mines.

6,532. No, I am talking about the Squatters' Law. Does he know of any case where the Native Commissioner broke up locations?—No, it was not within the power of the Sub-Commissioner to break up locations.

6,533. Does he know of any location north of Pilans Bergen in the Rustenburg district where the natives left the country rather than submit to law?—No, he does not know anything about it.

6,534. Was it the effect of this tax alone that distributed the natives amongst the farms?—I cannot say exactly that it was the tax alone, but the many natives came out of the locations.

6,535. If a tax of £2 drives the natives from the locations to work for farmers, the tax should bring them out of the locations to work for the mines?—Most of the natives do earn their living on the mines. They earn their £2 tax and go and pay it.

6,536. No, but I want to get at the facts. He says that we must apply the Squatters' Law, whose main provision was a tax of £2 which had the effect of making the natives work. Accordingly if we tax the natives they will come out to work? Is that it?—In many instances the £2 tax brought them out.

6,537. There is a tax on them now, but it does not bring them out?—That £2 tax is on the farm.

6,538. No, on the natives. The native has to pay £2, or it is rather more on Government locations. It does not bring him out. How does he explain that it has not acted under the new Government as it did under the old?—I have already said that under the old law they could live for 12s. 6d. on a farm.

6,539. He does not seem to see the point. According to his statement, a tax of £2 was sufficient to make the native work. Now, the evidence we have had, and all the facts given, go to show that it is not making the native work. I want him to explain why it is so?—You say it does not bring them out.

6,540. He said that a native on some of these private lands paid as much as £10 to £15. That shows that the tax did not bring them out. That is what I want to get at?—I do not say that the tax of £2 would drive the native from the location to the mines, but it certainly drives him from the location to the farm where he paid 12s. 6d.

6,541. Did not the law lay down that not more than five families should live on any one farm, and was not that law enforced?—Yes, the law was enforced, but on one farm with perhaps 10 farmers there could possibly be 50 families.

6,542. How was the law enforced?—Complaints were lodged with the Under Secretary in cases where the law was not complied with. They gave notice to the native that he was acting contrary to the law and he must go to another farm.

6,543. Notice was given to the Sub-Commissioner of Natives that the law was violated?—Yes, suppose there were six families instead of five.

6,544. And it was the business of the Sub-Commissioner to see that the law was carried out, and

that only five families remained on the farm?—Yes, he investigated matters, and if he finds the law is being abrogated he would give orders that they must leave the farm.

6,545. Does he advise the present Government to do the same thing?—I am convinced that if they want to give labour to farmers, the Squatters' Law would answer very well.

6,546. Mr. QUINN: Just two or three questions only. I understand the General to state that the natives who remained on the farms were very young ones and old ones, and that the men in between were the class that went to work on the mines. Is that correct?—Yes, that is generally the case. The Boers can do very well with the young and the older natives.

6,547. Would I be right in drawing this conclusion from that answer that the supply for the mines would not be seriously affected by the demands for labour of the farms?—It does make a difference, but we must work together, and in that way solve the difficulty.

6,548. Does the General think that the great scarcity he has been told of as existing in the mines is largely due to the amount of money many of the natives received during the war from the military, in addition to the compensation many have since received?—Yes, I think it is a great deal due to that.

6,549. Ask if natives who have been left to themselves in large numbers increase in number very rapidly, breed very fast?—I cannot say. Even in small lots it is sufficient to increase the family.

6,550. Ask him, please, does he think it would be for the general good of the country, for the farmer, and manufacturer, and mines, that the best policy in the treatment of the natives would be to give them every inducement to work somewhere?—There is always an inducement by the mine-owner and farmers.

6,551. Yes, but suppose there was not this inducement. Suppose the inducement which exists to-day ceased to exist and the natives were thrown back again in large numbers anywhere, would that be to the interests or against the interests of the country?—I think it would be to the prejudice of the country if these inducements were stopped.

6,552. Ask him, please, to tell us whether the number of farms held by companies is a very large number?—Yes, there are many farms.

6,553. Do these companies work these farms?—In Lichtenburg district very little or nothing is done.

6,554. Are they not held more for speculative purposes than for raising produce?—I think it is a case of money being invested by the companies just for the sake of putting the money into something.

6,555. As likely to breed fast?—Yes.

6,556. On all these farms held by companies is there any necessity for labour, are they looking for labour or not?—I cannot say.

6,557. Do I understand the General aright in saying that a large number of farmers to-day are too poor to employ labour?—Yes, it is quite correct.

6,558. And in the other case, where they are not too poor, where they are managing to move on a little, four to six natives on an average farm would be sufficient to carry on the work satisfactorily?—Yes, there are some farmers who employ no natives, but to get a start on the work and get ahead four to six natives are perhaps sufficient.

6,559. This Commission, I am sure, has a very high appreciation of your opinion, and the whole of this community has, and therefore I hope it will not be asking too much to ask you to give us some further opinion of yours as to the best means to be adopted to improve the African labour supply, for the mines and for whatever other purposes it may be required. I shall be very much obliged to you if you can see your way to express your opinion on that. You have not done so yet. We should value your opinion very much indeed?—It will be very difficult to give an opinion just at present.

6,560. We sincerely hope we shall have it from you soon?—I should like to assist the Commission with my experience, but I must tell the Commission that it is a very difficult question.

6,561. That does not assist us, we all know that it is difficult, and we look to gentlemen with your experience, and your extraordinary knowledge of the country to assist us. To tell us it is difficult leaves us in a difficulty?—After the Commission has come to a decision they will carry out this decision, but they will find they will have to come together again to discuss how it is working and to improve upon it.

6,562. We all hope that when the time comes we shall be able to count upon your assistance?—I said to the Government that whatever I could do to assist South Africa, I shall do, and that is my reason for being here to-day.

6,563. The CHAIRMAN: Do you know the names of any witnesses, farmer witnesses, whom you can suggest, whose evidence would be of use to us?—I can give you many names, but I do not know whether they will be able to assist the Commission.

6,564. The Commission is very much obliged to you for coming here and for the evidence you have given.

General PIET CRONJE was called, sworn, and examined.

6,565. The CHAIRMAN: You were Superintendent of Native Affairs under the late Government?—Yes.

6,566. What is the district in which you live now?—Potchefstroom.

6,567. Have you a farm there?—My children are principally carrying on the farm. I am simply with them. I am a bit too old to farm myself now.

6,568. Have you heard the evidence that General De la Rey has given us this morning?—Yes, ever since I came in. I think it had just started then.

6,569. Are you in agreement generally with the evidence which General De la Rey has given us?—Yes.

6,570. Would you like, before the other members of the Commission ask you any questions, to make any general statement to us on the question of native labour?—No, I do not want to make any statement beforehand.

6,571. Mr. QUINN: As you state you are in agreement with the last witness, it would obviously be wasting time to go over the same ground. I want to ask you the last question I asked General De la Rey. Can you express an opinion, are you willing to express an opinion as to what should be done, if anything can be done, to improve the native labour supply?—Yes, as you can imagine yourself, it is very difficult, but I shall try to show you a way. According to my principles there is such a thick wall of natives living in the outlying districts, that if these natives are bound to come and work, if they are under an obligation to come and work, there will, of course, be more labour. I am aware that in drawing a line from Natal towards the sea, between the Boer population and the Portuguese boundary, and from there to the Crocodile River, between the Waterberg to the north of the line, there are so many natives that I am positively sure that out of the able-bodied men alone more labour can be drawn from that line to north of that line than will ever be required in the Transvaal, but it must be distinctly understood they must be compelled to work.

6,572. What method would you suggest should be adopted in order to compel or induce these natives to come to work?—Simply a law must be passed to force them to work.

6,573. Suppose this law cannot be passed. Can you suggest any other method, apart from compulsion, any inducement other than forcing them by law? Can you suggest to us any better means of recruiting, better means of treatment, or anything of that kind which, in your opinion, would be calculated to improve the supply?—If no such law can be passed, then the only thing is to get hold of native chiefs, bring them together, and then ask

them to use their influence to get these niggers to come and work, and of course by giving the chiefs presents, to induce them to use their influence to bring natives out to work. Within this area mentioned by me you will find from 300 to 400 native chiefs. There are a few men whom I can suggest who are well acquainted with the country, and know the chiefs, and who can go there with the object of communication with those chiefs—it would not be necessary for them to come here.

6,574. Mr. TAINTON: From your last reply to Mr. Quinn, I understand your advice is that we should use the power of the chiefs in this matter. Is that right?—Yes.

6,575. Will you tell us how you propose that that should be carried out in practice?—I suggest that competent men be sent out to these chiefs with a small present to each of them, and that these men be asked to use their influence and comply with the request of the Government to send out these natives to come and labour on the mines.

6,576. What would the chiefs do then?—So far as my experience teaches me, I think that the chiefs will be delighted and will be glad then to carry out the request of the Government, and will tell the natives to go out and labour. They will also, of course, be thankful for the small presents they receive. It will depend how these natives are treated here as to the continuation of drawing native labour from that source, as to how the first batch are treated by the mines.

6,577. You say the chief will call his people together. Supposing the people say we do not want to go. What would happen?—Nothing would happen, but as a rule the native is so obedient to his chief, that he would carry out anything he suggests or says.

6,578. Then if the natives did not want to go, they would remain in their locations?—Naturally. It might be that the natives of one or two chiefs would refuse to go, but there are many others who would go, and it would depend as to how these natives were treated whether the natives of the former chiefs would follow suit and come out.

6,579. I understand that the labour agents go to the chiefs now and make them presents, considerable presents, but the boys will not go out?—You must understand that the difference between these labour agents and people sent out by the Government is a very vast difference.

6,580. What is the difference?—They look upon people sent out by the Government with much more respect as having greater authority than these labour agents have.

6,581. Then your plan is for the Government to send men to the chiefs and tell them to send their people out?—Yes.

6,582. Was that the practice under you when you were Native Commissioner?—No, that was not exactly the practice, because we did not require it.

6,583. How did you manage when you were Native Commissioner?—What was the plan adopted?—How do you mean, the plan?

6,584. The plan to bring the natives to work?—The Superintendent of Natives or Sub-Commission was sent out to these chiefs and told them that the Government required so much labour and they must procure it.

6,585. The chiefs made a good deal of money that way, did they not?—Yes.

6,586. I suppose they would like to make that money again?—I think so.

6,587. Suppose we increase the natives' wages, would not that bring them out?—Yes, naturally, if the wages of the natives were increased, it would bring them out.

6,588. What wages do you think would bring them out voluntarily?—From £4 to £5 a month, but that, of course, depends upon the working capacity. There are some stronger and bigger natives, and some insignificant ones, but from £4 to £5 a month

should be the average if a man is capable of work. I make a distinction upon my farm. The natives who are stronger and can work more naturally receive more pay.

6,589. If we keep the wages amongst farmers at 30s., and the wages on the mines at £3, is not that sufficient inducement for the natives to come out?—On my farm extensive work is being done now, and I have paid every native £3 per month, but that is really because there is hard work to be done on the farm. I think that the native working on the mine requires a higher salary, especially as there is a certain amount of risk attaching to work on the mines, and the natives know this. Consequently, I think that wages should be increased above the £3 given by the farmer, and you will find that every farmer who really requires hard work will have no difficulty in paying £3 per month.

6,590. The farmer can in some cases afford to pay £3 per month?—The greater majority cannot even pay £1 10s., and for that reason, you must understand, there are so many that have no labour.

6,591. Then the farmer has to raise wages to £3 before he can get boys to work for him?—You must understand what work he has got, and what ordinary work is done on the farm. When he has hard work to do he requires more labour, and consequently requiring more labour, more hard work requires higher pay.

6,592. I want to get at the price the average farmer can afford to pay. You said just now he cannot afford to pay 30s. ?—There are many farmers who cannot even pay 30s.

6,593. Then before the increase of wages will take effect, it is necessary to largely increase the present tariff? Is that your reply?—I do not speak about raising the salaries of the natives. If the native is to be paid his £2, then I consider it already very high. Then I think they can rather reduce it—as Gen. De la Rey said, those who work for the farmers should be reduced to about 15s. ; they should even bring it down to 12s. 6d.

6,594. You said just now that if we increased wages the natives would come out. I want you to tell us what increase must be made before they will come out?—I have already said that between £4 and £5 is what I reckon should be paid on the mines.

6,595. And the farmers?—You must understand that the farmer, as I have already said, pays according to work done, and that if he requires hard work, he pays 60s. a month, as I have paid myself.

6,596. If we take the railway lines to their kraals, and make the roads easy, will not they come out then to work?—No, I do not think so. The nigger thinks nothing of walking on his feet, and would just as soon walk it.

6,597. If we make the food better will that draw them here?—He does not think so much about his food. He thinks much more about his pay than his food.

6,598. If we increase the taxation, do you think that would have any effect?—I have already stated that the taxation of the natives on the farm is too high already. I do not think it would improve matters to increase taxation. As soon as the nigger sees he cannot pay it, he clears off from the place, and you can never get hold of him again.

6,599. I understand you to say that improving the means of communication will not affect the question much? Raising the wages will not take effect on the mines till a limit of £4 or £5 is reached? And the improvement of food and higher taxation has little influence on the question?—I do not think it would make any difference. As to means of communication, the native is like a baboon. He thinks nothing of walking the distance to the mines from wherever he may be.

6,600. So we fall back in his opinion upon the power of the chiefs backed by the Government?—Yes.

6,601. Is that the only solution he can suggest to the Commission?—Yes, if you cannot pass a law such as I suggest to compel the natives to come out to work, then this is the only solution I can think of.

6,602. Would that meet with the approval of the farmers—the Boer people?—Yes, but you must understand that where I have pointed out these natives there are no farmers living, and consequently every Boer will agree that the Kaffirs from that part of the country should be brought out.

6,603. Mr. BRINK: Some questions were put to General De la Rey as to the number of boys required on each farm. I want to ask General Cronje whether most of the old farms occupied by the present Boer population are not sub-divided into many portions?—Yes, especially where there is a great deal of water.

6,604. And will you ask him whether six to ten natives would be sufficient for a sub-divided farm like that?—It must not be understood that that number would be sufficient for each farm, but for each farmer.

6,605. That is what I want to get from you. You say that every farmer should have, say, from two to six labourers, and not every farm?—Yes, that is right.

6,606. I want to ask the General—I am speaking now of the future and not about the immediate solution of this problem—whether it would not be advisable that these different Kaffir locations should have the area surveyed and should adopt something similar to what they have in the Cape Colony, viz., the Glen Grey Act, giving each family a certain amount of ground sufficient for them to live on?—Yes, it was the same here under the old Government. The idea of the Government was that so many morgen of ground should be given to a native and no more.

6,607. Do you mean in the locations?—Yes.

6,608. Would you ask whether if that was carried out it would have the effect? These natives already possess large tracts of country bought by the chiefs and which is surveyed without any regard to the population?—Yes, it is so in some cases. There are instances where a location is much larger than is required for the population.

6,609. During the time of the late Government, when the General was Superintendent of Native Affairs, were the different chiefs allowed to buy farms?—No.

6,610. And whether the General, in his valuable opinion, having had great experience of native matters, does not think it very wrong, and that we will never be able to solve this labour question—I am talking of the future—as long as these different chiefs are allowed to buy tracts of country?—According to my opinion it is a good thing to give a location to the natives, but to allow them to buy as much ground as they want I look upon as wrong in principle.

6,611. More or less, what is the general view as to what a farmer can pay a native in order to make farming pay; what would be a reasonable wage for a native?—To tell the truth, £1 10s. The majority of farmers that have three, four, or five families on their farms make an agreement with these natives the day they take them, that they will plough such and such a piece of ground with their own oxen, or have it ploughed for them, and besides that they could have ploughed as much as they like, but for that the native must then give three or four of his children to the farmer to work for him, and perhaps one or two of the older men to look after the cattle. You must understand that if a native gets a farm by paying say, £15 a year, he makes perhaps £30, £40, or £50 out of the farm for that year. The natives have seen that it is much better for them to remain on the farm under these conditions rather than work for £1 10s. per month.

The Commission adjourned until 2.30 for lunch.

General MULLER, of Boksburg, was called, sworn, and examined.

6,612. The CHAIRMAN: I understand you live in Boksburg?—Boksburg District.

6,613. Are you a farmer?—I have been a speculator since the war; I am no longer a farmer.

6,614. And previous to the war?—Previous to the war I was a farmer.

6,615. We want some evidence as to the requirements of the farming population of your district?—I cannot give you my district only, but I can give you evidence generally in various other districts in which I have travelled. During the war I became well acquainted with the districts of Middelburg and Lydenburg, and since the war I have also become well acquainted with these districts on account of speculating there.

6,616. You cannot say what the average number of natives is which the average farmer requires in your district to work his farm?—The smaller farmers can start with about four or five Kaffirs but in the Boksburg district the farmers who are getting on, mostly farm on a very large scale, and consequently they require a large number of Kaffirs.

6,617. How many?—I should say from 20 to 25 Kaffirs.

6,618. Do you know whether you can get plenty of Kaffirs in the Boksburg district to-day?—I cannot say. I know they are complaining there about the scarcity of labour and they say that the wages are very high.

6,619. Do you know what wages are paid in that district?—The usual price is £3 per month.

6,620. What was the price before the war?—About the same.

6,621. You speak of knowing other districts of the country, Middelburg for instance. Do the figures that you have given us as to the number of natives on each farm apply to Middelburg as well as Boksburg?—Yes, it would be about the same.

6,622. Do you know whether or not Kaffirs are scarce in the Middelburg district for work on the farms?—They are scarcer there than in the Boksburg district on account of the larger portion of the Kaffirs living in locations. On account of the war or I do not know exactly what, they are so independent that it is so very difficult to obtain labour on the farms.

6,623. Have you any suggestion to make to the Commission as to how a better supply can be obtained for the farmers?—I think that if they enforced the old Squatters' Law and increased the taxation on Kaffirs it would compel them to go out to work on the farms.

6,624. Do you know that the tax on the Kaffir is now £2 per head?—Yes, I have heard that.

6,625. What is your idea with regard to charging Kaffirs rent in the locations?—In my opinion if the Kaffir can show that he has worked for six or seven months, then the tax is sufficiently large, but if he cannot do that then they ought to increase the tax which will force them out to work.

6,626. Mr. EVANS: You suggested increasing the taxation of the Kaffir. Would that be sufficient or would it not be necessary also to limit the quantity of land that he cultivates?—I do not quite follow whether you mean that if they do not pay the taxes they should work a certain portion of ground.

6,627. I will explain it to you. You suggest increasing taxation, but if the Kaffir has plenty of land that he can cultivate would he not get the necessary money in order to pay this increased taxation by getting his wives to cultivate a little more of the land?—Yes, certainly. That would be the effect.

6,628. Then in your opinion it is necessary to accompany the increase of taxation by some alteration of the law so as to limit the quantity of land which the Kaffir can cultivate?—Yes.

6,629. What do you consider a fair wage for a Kaffir on a farm? What can the average farmer really afford to pay?—I consider £2 per month.

6,630. Do you state that as an average or as a maximum?—As an average.

6,631. What would you consider a fair wage for a Kaffir coming to the mines?—I consider £3 would be a fair rate. It is certainly a good deal, but it is the price to which they have been accustomed.

6,632. Now, what in your opinion is the effect of high wages on the Kaffir? Does it shorten the period which he works, or does it lengthen the period which he stays in his kraal?—No, certainly not.

6,633. Let me put the question in another way. I put it to General De la Rey this morning. The Kaffir comes here with the idea to make a certain sum of money, say £10, and if he can earn £10 in six months he will only work six months, well, if it takes him 12 months to earn £10 he will work 12 months. Do you agree with that, what is the effect on the Kaffir?—My opinion and my experience is when you pay the Kaffir good wages he works longer.

6,634. Do you think the high wages on the mines is in the interest of the agricultural community?—I do not think it quite a good thing because the Kaffir goes and works where he gets most pay. If they were to enforce the Squatters' Law, Kaffirs would be free from taxation on the farms and would have to pay if they stayed in the locations which would force them to go upon the farms.

6,635. You think that would give a larger number of labourers for the farmers?—Yes.

6,636. What in your opinion would be the effect on the labour supply if there were more locations?—I am of opinion that you should rather do away with locations.

6,637. Are you in favour of doing away with them entirely?—Yes.

6,638. From the point of view of labour then do you think it a wise policy to discourage and break up tribal organisation, the communal arrangement they live in? Is it better that they should be scattered out over the country as individuals independent of the native chief or that they should be collected under one chief or a number of chiefs?—I think if you could do away with the Kaffir chiefs it would be very much better, because the natives all hang round the chief and live with him.

6,639. Then you are in favour of breaking up the tribal organisation?—I do not mind large communities like Basutoland and Swaziland, but here every small kraal has its own little chief, and that I consider a bad system.

6,640. You are against it?—Yes.

6,641. Do you approve of the Basutoland system?—Yes.

6,642. You do not think it tends to diminish the labour supply for the outside?—I am not very well acquainted with Basutoland, and I do not know what the system has been there lately.

6,643. It is a system where the natives have a big portion of the country exclusively reserved for themselves and where the white man cannot compete with them in agriculture?—If that is so, it would be a good thing to try and find a way to make them work too. I cannot say much about the system in Basutoland, but what I am talking about is the system in this country. The late Government created locations and in my opinion that is a bad principle.

6,644. You think it a bad principle?—Yes.

6,645. I should like an expression of opinion from you on some evidence I will just read to you and which was given by a previous witness: "The raising of wages does not in my opinion tend to improve the supply of native labourers. It may bring about a temporary increase in the supply, but it is bound in the long run to have the opposite effect. The raising of native wages at the mines only produces a concurrent rise of wages in every other form of labour preferred by natives and therefore increases the cost of living generally." Do you agree with that expression of opinion?—My experience is that when the Kaffir

earns a good wage he spends more and only saves sufficient or as much as he needs to go and hand to his chief or his family.

6,646. Then how many years do you consider a Kaffir works in his lifetime?—I know Kaffirs who are getting good wages who are working continually. They just leave for their kraals for a short time and then go back to work again. I cannot say what is the average number of years they do work. What I am saying refers to before the war, but now I find Kaffirs are very independent.

6,647. Mr. BRINK: General Muller, you said you travelled a good deal since you were a speculator in the Middelburg and Lydenburg districts?—Yes.

6,648. Can you tell us whether farmers in these two districts you have mentioned have many labourers or whether they are scarce?—They are very scarce there because it is near to Sekuni's Land, where all the Kaffirs live?

6,649. And in your opinion the farmer who pays the native £2 a month and gives him his food can make farming pay?—It would be very difficult, but if you did not pay that you cannot get Kaffirs and that is why I stated that sum.

6,650. You think it will be very difficult to make farming pay at wages of two pounds per month?—Yes. If the Squatters' Law is enforced, the Kaffirs who go to live on the farms have to work for the farmer, so to say, for nothing, and the only remuneration they have is the ground they are given to cultivate.

6,651. And then as a rule they sell their surplus produce?—Yes, naturally they sell it.

6,652. And as a rule they make it pay well?—Oh, yes. Before the war the Boers used to do well and the Kaffirs also by living on the farms in that manner.

6,653. We had General Cronje, who told us that natives made as much as £30 to £50 per annum?—Yes, I believe that would be so in certain cases where the lands are good.

6,654. Do you know what number of these Kaffirs under the Squatters' Law who were working on the farms with these farmers have trekked away either to Crown lands or locations?—During this war all the Kaffirs were taken away from the farms and the majority have not returned to their farms. They are living on Crown lands, town lands, and lands of large companies.

6,655. Mr. TAINTON: I understood you to say that you are against the present system of maintaining natives in locations?—Yes, because Kaffirs lie about there. If a tax is put on which will force them to go to work to pay the tax, then it would materially assist the farmer.

6,656. You are also against the authority of the chiefs?—Yes, smaller chiefs.

6,657. We wish to get the opinions of witnesses as to how to deal with this question. General Cronje told us this morning that the best way to settle the labour question was to see the chiefs and make them compel the people to come out?—My opinion differs, but I am only giving my opinion. I consider it is on account of the chiefs that Kaffirs do not come to work.

6,658. Would you mind explaining to the Commission why you think that?—Of course the chief considers that he is master of these Kaffirs and he allows them to remain round him and near him.

6,659. If you pay the chief money for his boys does he not send them out to work?—I have never treated with Kaffirs, and I cannot say whether you could purchase them in that way.

6,660. You see General Cronje was head of the Native Labour Department, and I wanted to know whether your experience is the same as his?—No, naturally not, I have different views to him.

6,661. Will you tell us how this law which you recommend will work?—If there might be a law forcing him to work a certain period during the

year and if he cannot prove he has worked that period he should pay a heavy tax and that would force him to work.

6,662. So that is how the Squatters' Law operated?—No, the Squatters' Law was that only a certain number of Kaffirs could live on a farm. Now there are some companies' farms filled with Kaffirs from one end to the other.

6,663. You say that only a certain number of Kaffirs were allowed to remain on the farms under the law. How did they contrive to bring about that result?—The locations were then fairly limited, and if the Kaffirs could not manage to live in the locations they used to go to the farms, but no more than a certain number could go to one farm, so that generally all the farmers got labour.

6,664. But you do not make it quite clear how they got the labour?—I do not know how it was done, but you can believe me that nearly every farmer had Kaffirs on his farm.

6,665. What was the general arrangement made with the Kaffirs who came on the farms in that way? You said just now that in most cases they had practically to work for nothing. Will you explain what the contract or agreement was?—If they went to a farm they used to get as much land as they wanted to plough and then at certain seasons of the year they had all to assist the farmer, say in the reaping or ploughing season, and the younger Kaffirs had to assist in looking after the cattle and so on at a smaller wage.

6,666. You say as much land as they wanted; could you give us a rough idea of what they generally cultivated?—Some of them did get on the ground a good number of cattle, and I know in some cases where they used to get as much as 100 bags of grain.

6,667. Is that per family?—Yes, that is each Kaffir, but perhaps he would have three or four wives.

6,668. Then according to what you said just now it would be a good thing to establish that system again?—Yes, I think it would be a very good thing and assist the farmers very much.

6,669. It would also tend to do away with the present locations, is that so?—Yes, I want to say that close to Germiston where I am living there is a location containing at least 400 or 500 Kaffirs, but I do not know where they work.

6,670. If a native is planting and growing produce on a farm, his produce is sold in the market against the white farmer, does that not tend to bring down the white farmer's price?—Certainly not, because the Kaffir assists the farmer for practically nothing, so that the farmer can afford to sell his produce for the same price as the Kaffir sells and can still gain by it.

6,671. You say that the white farmer is able to sell cheaply because he gets his labour practically for nothing?—Yes, and the Kaffir lived with him on his farm.

6,672. Then this system makes the natives small farmers producing grain?—Yes.

6,673. If I understand you correctly, you wish gradually to do away with locations and bring the natives from the Government land on to private owners' lands where they produce grain and other agricultural produce?—Yes, and at the same time assist the farmers.

6,674. It gradually then tends to mix up the farmers with the natives?—No, I do not think it tends to that. For the past 30 years farmers have been farming like that and it has worked very well up to now.

6,675. Are there any parts of South Africa you know of where this mixing up of Kaffirs and farmers has been in force for a long time and where you can see the results on the white races?—Not in the Transvaal or the Free State. In this country the farmers look upon Kaffirs as their servants. They do their work and that finishes it.

6,676. Do you then care only for the Transvaal and the Free State?—Certainly not, but I do not know what is going on in the other parts. I hear that in the Cape Colony coloured people are put on an equal footing with the whites.

6,677. You know nothing about an increase of half-castes being one of the possible ultimate results of this policy?—Not amongst farmers. They always look upon the Kaffir as their servants, and they will never be taken on an equality with them.

6,678. Let us come back to the first point, which is that you make the native a small farmer. If you bring the natives on to the farms in this way, how do you fill his place in the other departments of labour?—I am only now speaking of the prosperity of agriculture. It proves that prior to the war labour was much cheaper, and that before the gold mines were discovered labour was very much cheaper. That is why I say here that provision should be made to assist the mines as well as the Agricultural Department.

6,679. You have told us how to assist agriculture, will you now tell us how to assist the mines?—The Commission is making enquiries, and it is from these enquiries that the answer must be obtained. It is all a matter of payment.

6,680. Well, we are paying £3 a month now?—Yes, in addition to this my opinion is that an alteration may be made in the Pass Law so as to give Kaffirs a little more liberty. I think then you would find Kaffirs coming to work in the mines in greater numbers. The Kaffirs do not understand the Pass Law at present. I think that is one of the reasons why Kaffirs are to come and work here.

6,681. Can the General inform the Commission what was the position in regard to natives prior to the war?—Well, I do not know now, but before the war there were sufficient Kaffirs, and I do not know the reason they have not got them now.

6,682. If I understand General Muller he makes the suggestion that good would arise from an enforcement of the Plakkers Wet. He has not made any other practical suggestion?—Well, I think it is one of the duties of the Commission to answer the question that has just been put to me.

6,683. We have had a great deal of evidence from witnesses showing the difficulties the Native Labour Association has had to contend with, with regard to labour. Can he tell us anything which will tend to improve its methods?—I have been told that the Labour Association sends the Kaffirs to strange mines. The Labour Association ought to send the boys to the mines that they contract to go to.

6,684. That has been done away with now; is there any other reason why there should be any difficulty with the boys?

6,685. Mr. WHITESIDE: I see you state that there are sufficient Kaffirs to work upon the farms?—Well, if a farmer can get five or six families to work upon his farm, there ought to be no difficulty in regard to the matter of labour.

6,686. Those who do not come to work on the farms, what happens to them?—They remain in the location.

6,687. Assuming that we have a happy set of conditions and both natives and farmers were satisfied, is there sufficient labour to meet all requirements?—I do not know how many Kaffirs are in the country. That is a question I would refer to the Chamber of Mines to answer.

6,688. Let us be specific—get a definite figure. Are there 150,000?—Well, I do not consider there are sufficient Kaffirs to work the mines and railways.

6,689. That is not an answer to my question. I should like something a good deal more definite.

6,690. Mr. QUINN: How many natives are there here?—I cannot answer.

6,691. Ask him how he can answer the last question unless he knows there are insufficient Kaffirs for the mines?—I cannot say exactly; however, in my opinion, there are not sufficient.

6,692. I do not want the exact number. What I want to know is his idea of the native population of the Transvaal?—Perhaps 300,000.

6,693. Where does he get that figure from?—I do not know the exact figure.

6,694. Does he know it within 200,000?—I cannot give the exact number. In good times we had only 100,000 Kaffirs working here. They were not sufficient.

6,695. That is not an answer to my question. I want to know where Gen. Muller gets his idea as to 300,000 natives from?—Taking the principal chiefs in the Transvaal, I think there must be that number.

6,696. Does he mean 300,000 males, or men, women and children?—I consider 300,000 males.

6,697. As a matter of fact, it is merely a matter of opinion that you are giving?—Well, I am giving my evidence from the information I have gleaned from the farms.

6,698. Was Gen. Muller's farm in the Transvaal?—No.

6,699. How long has he lived in the Transvaal?—17 years.

6,700. Where did he live before?—In the Orange River Colony.

6,701. What parts of the Transvaal did Gen. Muller live in for 17 years?—In the Boksburg and Heidelberg districts.

6,702. All the time?—Yes.

6,703. Does he think that would give him a favourable opportunity of judging upon the native question?—I have gone about a good deal. I am well acquainted with all the districts and know their requirements.

6,704. He has answered questions quite opposite to the questions answered this morning by Generals De la Rey and Cronje?—I only say what I know.

6,705. Does he know anything about Portuguese East Africa?—No.

6,706. Does he know we got 80,000 natives from Portuguese East Africa?—No, I do not.

6,707. Does he know that before the war we were getting 80,000?—I know a large number did come from there.

6,708. When all the natives from Portuguese East Africa did come here will the witness still say there was sufficient labour for the mines?—If that number did come from outside there was a sufficient number.

6,709. Both statements are based upon an opinion?—I cannot say what the requirements are. The mines might want 500,000 natives.

I hope they will some day.

Mr. F. W. DYER called, sworn, and examined.

6,710. His statement was as follows:—

Komatipoort,  
30th July, 1903.

Sir,—Your letter dated 27th, with enclosure, to hand last night. In reply thereto, I beg to inform you that I do not think that any evidence I could give would have much weight. I take it that anything I might say I should have to be able to substantiate; this, as I have had practically nothing to do with labour since October, 1899, I am not in a position to do.

A few points I may mention, which, if you consider of any value, use if you can.

1. Is anybody from this end of the country giving evidence except those connected with the R.N.J.A.?

2. An indaba of all chiefs should be got together and point out the exact position to them. Chiefs of tribes likely to clash to be called together separately.

3. If not effective, Government to put some legitimate pressure on natives to compel a pro ratio percentage of natives (fit to work) from each tribe to work for some months each year.

4. Boys from Portuguese territory.

Licences to be granted to men knowing something about it and of good character.

Such men and any boys recruited to be allowed to come out at any of the well known paths, instead of being compelled to go to Ressano Garcia (boys strongly object to this, both up and down). Recruiters to report to the Commandants of Forts nearest their exit, what number of boys they are taking out and fees paid on them accordingly. A deposit could be put in the Portuguese hands to cover this, or the Portuguese could find out from the C.S.A.R. at the two or three stations that would be used, the number of boys each man sent up; or they could place agents there.

5. Boys returning home, to be allowed to get off at whatever station they like to proceed home. Portuguese to make some other arrangement to collect their fees from natives on their homeward journey, which I believe is done.

If there is anything else I can let you know, I shall be pleased to do it.

For about two years (ending about May, 1899) I was manager of the East Coast Branch R.N.L.A.

6,711. The CHAIRMAN: You live at Komatiport?—Yes.

6,712. Have you lived there for some time?—Some years.

6,713. Many years?—Since 1896.

6,714. Are you carrying on business?—Yes.

6,715. Previous to the war were you engaged in recruiting natives?—Yes.

6,716. Did you do a large business in that way?—Yes, all the natives coming through from Komatiport practically came through my hands.

6,717. Had you runners into Portuguese country bringing natives out?—Yes.

6,718. Were you working under a licence from the Portuguese Government?—Yes.

6,719. Can you give us any idea of the numbers you sent in any particular year or passed to Johannesburg?—I am afraid not, without its being a guess. I got no recruits in the ordinary course of events. I had runners and agents who used to send the natives to me.

6,720. Can you give us any idea of the number you were in the habit of sending before the war?—It would be a guess, but I should say several thousands a month.

6,721. It ran into thousands a month?—Yes.

6,722. Since the war have you done anything at all?—Yes, during the last few weeks, but not in Portuguese territory.

6,723. Where are you recruiting natives now?—in the Transvaal.

6,724. What tribes?—A mixture of the Swazis, Shangaans, and a cross which they call Slangaans.

6,725. Are you sending many now?—No, not now.

6,726. How many are you sending in a month on the average?—I have only been at it a few months, quite a few—70 to 80.

6,727. Do you anticipate being able to send any large number?—No, not from this side of the border.

6,728. Have you any suggestion to make by which a larger supply than at present could be got from that neighbourhood to work here?—Well, I think it might work out better in the future than at present, as the Kaffirs are very demoralised, not having quite got over the effects of the war, and on top of that all the boys living in the reserve have been taken out. Perhaps, when they settle down later on, it may improve again a bit.

6,729. Have you any other suggestions?—I do not see how we can get a very much larger supply from there, because we have not a big population of Kaffirs there.

6,730. It is a small population in that neighbourhood in the Transvaal?—Round that neighbourhood, yes.

6,731. Are they engaged in any local work of any kind?—Very few; we are not a big town, and there are only some on railway work and a few in the village.

6,732. When you had this large number passing through your hands before the war, you were in the employ of the R.N.L.A.?—Yes.

6,733. Have you done any work for them since?—No.

6,734. Mr. WHITESIDE: How long have you been connected with recruiting?—Since 1896.

6,735. What districts?—All down there, but not in Komatiport at the beginning of Hector Spruit.

6,736. Have you any experience of the Portuguese East Coast, Inhambane, Gazaland, and round that way?—Not actually recruiting, no.

6,737. You held a licence from the Portuguese Government?—I did at that time.

6,738. Who are you recruiting for now?—I can give it, of course, if it is necessary.

6,739. The CHAIRMAN: That is hardly a question, I think, which should be pressed. Are they railway contractors or anything of that sort?—No, a Johannesburg mine, or group of mines.

6,740. Mr. WHITESIDE: Have you any experience of compounds upon the Rand?—No, except that I have seen some of them up here. I have never lived in Johannesburg.

6,741. Those you have seen, are they, in your opinion, satisfactory from this point of view, that the natives are satisfied with them?—I am speaking now from before the war, as I have not seen any compounds since. Some certainly were not satisfactory. That could easily be seen by the way the boys disliked to go to some of the mines before the war, whereas on others where they were treated decently the compounds were never short of boys, I believe.

6,742. You think that has a great influence on the question of supply, the way they are treated in the compounds on the mines?—It would probably have an effect on the mines where the boys were not treated well.

6,743. Do you know anything about the compound managers?—I have met a few, yes.

6,744. Do you think on the whole they are a capable body of men who are looking after the Kaffirs in the compounds on the Rand?—Yes.

6,745. What is your opinion of the 30s. rate on the native mind?—I take it that a boy is going to give his services where he is best paid, the same as other people. In most cases they can get more than 30s. at almost anything.

6,746. Do you think it was a bad policy to reduce the rate of wages at that date?—I do, very bad.

6,747. I understand the wages having since been increased that the news is fairly well known amongst the boys, but they are rather sceptical about it. They want to see some of their own brothers returning with the actual amount they receive out of the increased wages before they will believe it?—That is exactly what you might expect from the native.

6,748. Do you think sufficient time has elapsed since the rate was raised to its present amount for the boys to be convinced that they will get more on the Rand?—I forget when this rise took place.

6,749. In February?—That is about six months, but the boys have hardly had time to get back, those boys who have actually benefited by the rise.

6,750. That is my point; the boys engaged after the rise?—Yes.

6,751. The boys engaged by the Native Labour Association are engaged on a six months' contract, and consequently proof of that has not yet had time to get back amongst the boys in their kraals?—Yes, that is also a great deterrent, this contract. Before the war there was no contract made whatever for any length of time.

6,752. I am coming to that. Do you consider we are now getting the maximum number of natives from the districts you are acquainted with?—No.

6,753. Any appreciable difference?—I think very possibly an appreciable difference would be made between the number we now have and what we ought to get.

6,754. What would you consider the maximum number of boys that might be obtained monthly, allowing for the different seasons or take 12 months for the district you are acquainted with?—I hardly know how it would average because some seasons when the boys have plenty of Im— from which they make Gwala, they do not care to come out. It might dwindle to 2,000 per month and it might rise as it has done before to 6,000 or over.

6,755. You are satisfied apparently, we are not getting anything like the maximum we may expect?—No, I do not think you are.

6,756. Do you know anything at all about the ill-treatment of the boys on the mines here. I am speaking of pre-war days?—No, I do not think the boys were what you might call ill-treated, because before we started to recruit—at that time they used to call us touts—the boys came out of their own accord, tramped from wherever their homes were, 150 or 200 miles, carrying their "scoff" or something to barter for it, and marched to Kimberley. We had no one looking after them.

6,757. They had to look after themselves?—Yes.

6,758. Do you know what it is like now?—Yes, I have an idea, certainly.

6,759. Can you give us your impressions?—Of the way they were treated?

6,760. Yes?—Coming from the W.N.L.A. depots in the country is, I think, one of the things which prevents the boys from coming through as they used to. They are sent, I believe, in the charge of Portuguese conductors through the country, and there are several of these men, I believe, on the road. A man starts from a place, we shall say, Shai-Shai, and takes the boys a day's journey, when he hands them over to another conductor, and so on they are passed from one conductor to the other until at last they are rounded up in a compound at Ressano Garcia. That is a thing the boys were never used to, and most certainly they do not like it.

6,761. Do you know anything about the boys that are being recruited by the Association being distributed in batches irrespective of their wishes as to the particular mines they want to go to?—I have heard that is the case.

6,762. Is that the information you have received recently or some time ago?—Well, some time ago, but I have not heard of its being altered, unless since I sat in this room, when I heard it mentioned.

6,763. What do you think of the present methods of recruiting, Mr. Dyer?—I think that this concessionary grant, or whatever it is the Association has over Portuguese territory, is wrong. I take it that although these men are there, and having it all their own way, if there were competition it would be better. I saw in the papers that they opened up sparsely populated districts. That, I take it, is a waste of money, because if any boys in these districts want work they will come out without any white man going in to open up these places. Again, it should be arranged that the boys should have, if possible, free ingress and egress to the country.

6,764. It has been asserted that naturally free recruiting competition forces the price of boys up to a very high figure. Now you apparently approve of competition being brought into play. How would you get over this difficulty of competition raising the price?—It could, I think, be done now because there are not the same class of men in the country that there were recruiting before. Previously there were all sorts of men and syndicates competing against one another, and some of them were more or less unscrupulous. One man would be paying runners so much per head for the boys they brought in, and the other people would raise it, and we would have to do the same, and

so it went on fighting against one another. With the class of men now in the country, even supposing they allowed free recruiting, such matters, I think, could be arranged between them so that that should not happen again. I do not think that need raise the cost of the boys any more.

6,765. Do you think the W.N.L.A. is likely to be more successful as time goes on?—The boys may get used to this idea, of course, of being brought across country, and this compound arrangement both up and down.

6,766. But still you are pessimistic, and you do not think it is going to have a good effect?—Not if you are not going to keep that sort of thing up.

6,767. What do you think a fair wage for a mine boy to be?—I do not quite know what they are getting now, but I should say anything between £2 and £3; perhaps some boys on piece-work might get up to £4.

6,768. But to strike an average?—£3 at the outside or less than that.

6,769. If this rate were paid, what would be the average period of labour for each native?—That, of course, the Chamber of Mines or the mine managers ought to be in a better position to judge than I am, as they have past statistics of this sort of thing to go by as to how long the boys stay.

6,770. But before the war they were getting on an average about £3 per month, can you not tell us from your experience how long these boys remained at work, or if they came back again after they went home?—I certainly think they used to come backwards and forwards.

6,771. Frequently?—Some would return for a month, or two or three, to their homes, but they came back again and a lot of them never went away.

6,772. What do you think of the six months' contract?—Well, if it possibly could be arranged it would be better done away with.

6,773. Do you think if it were arranged that the boys could come out on a three or four months' contract we would be more successful in getting a large number of boys?—Yes, but more successful still if it could be done without any agreement whatever as to any time.

6,774. Then you do not believe in the contract system at all?—Not so far as the natives are concerned, but certainly as far as the mines are concerned. I quite understand it is a benefit to them.

6,775. Do you know anything about the food the natives had before the war on the Rand? Did you ever hear about it?—No, I suppose they got their food regularly and meat once or twice a week.

6,776. Did you ever hear any complaints about it?—No.

6,777. The previous witness deposed that compounds are unpopular with the boys. He went on to say that one compound was like a filthy warren, but the boys did not object to it?—As I say I have not seen it since the war.

6,778. Was it a source of complaint from the boys themselves, and do you know whether they disapproved or were dissatisfied?—I know when the boys have a chance they clear, which is not a very good sign.

6,779. How many runners were employed before the war when you were recruiting?—As far as I can remember we used to have between 500 and 600.

6,780. Have you any idea how many are there now?—I believe I saw in some other body's evidence or the newspapers there are about 1,200 now, but I am not certain about it.

6,781. That looks as if they are not very successful with their extra number of runners or there is something wrong with their system?—That is what I say.

6,782. Mr. TAINTON: You said something about disagreeing with the statement of previous
